Chapter 1 Conventions and feedback

The following describes the typographical conventions and how to give feedback:

Typographical conventions

The following typographical conventions are used:

monospace Denotes text that can be entered at the keyboard, such as commands, file and program names, and source code.

monospace Denotes a permitted abbreviation for a command or option. The underlined text can be entered instead of the full command or option name.

monospace italic

Denotes arguments to commands and functions where the argument is to be replaced by a specific value.

monospace bold

Denotes language keywords when used outside example code.

italic Highlights important notes, introduces special terminology, denotes internal cross-references, and citations.

Highlights interface elements, such as menu names. Also used for emphasis in descriptive lists, where appropriate, and for ARM® processor signal names.

Feedback on this product

bold

If you have any comments and suggestions about this product, contact your supplier and give:

your name and company

- the serial number of the product
- details of the release you are using
- details of the platform you are using, such as the hardware platform, operating system type and version
- a small standalone sample of code that reproduces the problem
- a clear explanation of what you expected to happen, and what actually happened
- the commands you used, including any command-line options
- sample output illustrating the problem
- the version string of the tools, including the version number and build numbers.

Feedback on content

If you have comments on content then send an e-mail to errata@arm.com. Give:

- the title
- the number, ARM DUI 0496G
- if viewing online, the topic names to which your comments apply
- if viewing a PDF version of a document, the page numbers to which your comments apply
- a concise explanation of your comments.

ARM also welcomes general suggestions for additions and improvements.

ARM periodically provides updates and corrections to its documentation on the ARM Information Center, together with knowledge articles and *Frequently Asked Questions* (FAQs).

Chapter 2

C and C++ Compiler Errors and Warnings

The following topics describe the error and warning messages for the C and C++ compiler, armcc:

- *Internal errors and other unexpected failures* on page 2-2
- Suppressing armcc error and warning messages on page 2-3
- List of the armcc error and warning messages on page 2-4
- List of the old-style armcc error and warning messages on page 2-64.

2.1 Internal errors and other unexpected failures

Internal errors in the compiler are typically errors that have occurred but have not yet been documented, or they might point to a potential issue in the compiler itself.

For example:

Internal fault: [0x87ecef:5010591]
contains:

- the message description (Internal Fault)
- a six hex digit fault code for the error that occurred (0x87ecef). In previous versions this was a 4 digit code.
- the version number (501 is ARM Compiler v5.01)
- the build number (0591 in this example).

If you see an internal fault, contact your supplier.

To facilitate the investigation, try to send only the single source file or function that is causing the error, plus the compiler options used when compiling the code.

It might be necessary to preprocess the file (that is, to take account of files added with #include). To do this, pass the file through the preprocessor as follows:

```
armcc <options> -E sourcefile.c > PPsourcefile.c
```

where <options> are your normal compile switches, such as -02, -g, -I, -D, but without -c.

Check that the error is still reproducible with the preprocessed file by compiling it with:

```
armcc <options> -c PPsourcefile.c
```

and then provide the PPsourcefile.c file and your compile <options> to your supplier.

2.2 Suppressing armcc error and warning messages

The compiler normally warns of potential portability problems and other hazards.

When porting legacy code (for example, in old-style C) to the ARM, many warnings might be reported. It might be tempting to disable all such warnings with -W. ARM recommends however that for portability reasons, you change the code to make it ANSI compatible rather than suppressing the warnings.

Some warnings are suppressed by default. To override this, use the --strict_warnings switch to enable all suppressed warnings.

By default optimization messages, that is most of the messages between 1593 and 2159, are not warnings. To treat optimization messages as warnings, use the --diag_warning=optimizations option.

2.2.1 See also

Reference

Compiler Reference:

- --diag warning=tag[,tag,...] on page 3-74
- *--strict warnings* on page 3-194
- -W on page 3-219.

2.3 List of the armcc error and warning messages

The error and warning messages for armcc are:

0	unknown error
1	last line of file ends without a new line
2	last line of file ends with a backslash
3	<pre>#include file <entity> includes itself</entity></pre>
4	out of memory
5	cannot open <entity> input file <filename>: <reason></reason></filename></entity>
	For example:
	#include <file.h></file.h>
	results in the message:
	Error: #5: cannot open source input file "file.h": No such file or directory
	because file.h does not exist in the system include directory.
6	comment unclosed at end of file
	Comment started with /* but no matching */ to close the comment.
7	unrecognized token
8	missing closing quote
	For example:
	char foo[] = {"\"};
	In this example, the backslash causes the following quote " to be treated as a literal character rather than closing the string. To fix this, use:
	char foo[] = {"\\"};
9	nested comment is not allowed
	For example:
	/*nested /*comment*/
10	"#" not expected here
11	unrecognized preprocessing directive
	For example:
	#foo
12	parsing restarts here after previous syntax error
13	expected a file name
	For example:
	<pre>#include <stdio.h></stdio.h></pre>
14	extra text after expected end of preprocessing directive
	For example:
	#if EMBEDDED foo
	or:
	#include <stdio.h> foo</stdio.h>

```
or:
             #ifdef SOMETHING
             #endif SOMETHING
             The #endif does not expect or require any argument. Enclosing the trailing part
             of the line in a comment fixes the problem:
             #endif /* SOMETHING */
16
             <entity> is not a valid source file name
17
             expected a "1"
18
             expected a ")"
             For example:
             int main(void
             where there is a missing).
19
             extra text after expected end of number
             For example:
             int a = 37r;
20
             identifier <entity> is undefined
             For example, when compiled for C++, the code:
             void foo( arg ) { }
             results in the message:
             Error: #20: identifier <arg> is undefined
             Another example of code that can cause this error is:
             int foo(void)
               int a = 4;
               a = i;
             which results in the message:
             Error: #20: identifier "i" is undefined
             because i has not been declared.
21
             type qualifiers are meaningless in this declaration
22
             invalid hexadecimal number
23
             integer constant is too large
24
             invalid octal digit
             For example:
             int a = 0378:
25
             quoted string should contain at least one character
             For example:
             char a ='';
26
             too many characters in character constant
             For example:
             char a ='abcd';
```

	results in an error.
	Note
	Only one character is permitted in a single-quoted string. For more than one character, double quotes must be used. Strings must be assigned to an appropriate variable such as a[].
27	<pre>character value is out of range For example: char foo[] = {"\xBBBB" }; results in the message: Warning: #27-D: character value is out of range</pre>
28	expression must have a constant value
29	expected an expression
30	floating constant is out of range
31	expression must have integral type
32	expression must have arithmetic type
33	expected a line number
34	invalid line number
35	<pre>#error directive: <entity></entity></pre>
36	the #if for this directive is missing
37	the #endif for this directive is missing
	An open #if was still active, but was not closed with #endif before the End Of File.
38	directive is not allowed an #else has already appeared
39	division by zero
40	expected an identifier
	This error is raised if preprocessor statements are incorrectly formatted such as for example, if the identifier which must immediately follow a preprocessor command is missing. For example, a missing identifier after #define results in:
	Error: #40: expected an identifier
	This error can also occur when C code containing C++ keywords is compiled with the C++ compiler, for example:
	int *new(void *p) { return p; }
	causes an error because new is a keyword in C++.
41	expression must have arithmetic or pointer type
42	operand types are incompatible (<type> and <type>)</type></type>
44	expression must have pointer type
45	#undef may not be used on this predefined name
46	<pre><entity> is predefined; attempted redefinition ignored</entity></pre>

Macro has been defined twice (with different replacement strings). If it is necessary to do this, undefine the macro (#undef) before the second definition. For example: #define TEST 0 #define TEST 1 causes the compiler to produce: Warning: #47-D: incompatible redefinition of macro "TEST" (declared at line 1) There is no way to control this error directly by a compiler option, but you can use conditional preprocessing. For example: #ifdef TEST_EQUALS_ZERO #define TEST 0 #else #define TEST 1 #endif Compiling with armcc -c foo.c defines TEST to be 1 (the default). Compiling with armcc -c -DTEST_EQUALS_ZERO foo.c defines TEST to be 0. 49 duplicate macro parameter name **50** "##" may not be first in a macro definition 51 "##" may not be last in a macro definition **52** expected a macro parameter name 53 expected a ":" 54 too few arguments in macro invocation 55 too many arguments in macro invocation 56 operand of sizeof may not be a function 57 this operator is not allowed in a constant expression 58 this operator is not allowed in a preprocessing expression **59** function call is not allowed in a constant expression 60 this operator is not allowed in an integral constant expression 61 integer operation result is out of range **62** shift count is negative 63 shift count is too large 64 declaration does not declare anything For example: int; expected a ";" 65 66 enumeration value is out of "int" range This diagnostic message is generated by the compiler when an enum constant is outside the range of a signed int.

incompatible redefinition of macro <entity>

47

For example:
typedef enum
{
 Bit31 = 0x80000000
} Bits;

when compiled in C mode generates the this message as a warning.

_____Note _____

The behavior of the compiler has changed between past versions and also when using --enum_is_int and --strict switches.

C Mode:

- the warning is produced but the compiler promotes the constants to unsigned
- the switch --strict always produces this message as an error.

C++ Mode:

• by default the out-of-range constants are promoted to unsigned without a warning and also when --strict is used

As a work around for cases where the message is an error use the following code example:

```
typedef enum
{
   Bit31 = (int)0x80000000
} Bits;
```

An overflow no longer occurs, and so no error is reported.

____ Note _____

The value of Bit31 is now negative because it is a signed int.

See the following in in the Compiler Reference:

- *Structures, unions, enumerations, and bitfields* on page 6-9.
- 67 expected a "}"
- integer conversion resulted in a change of sign

The constant is too large to be represented in a signed long, and therefore has been given unsigned type.

Example:

```
long 1 = 2147483648;
```

- integer conversion resulted in truncation
- 70 incomplete type is not allowed

Example:

```
typedef struct {
  unsigned char size;
  char string[];
} F00;
```

By not declaring a size for the array in the structure, the compiler is not able to allocate a size of the structure. Incomplete types are permitted in --gnu and --c99 modes.

71 operand of size of may not be a bit field

76	argument to macro is empty
77	this declaration has no storage class or type specifier
78	a parameter declaration may not have an initializer
79	expected a type specifier The ellipses to denote variadic functions, such as, for example, printf(), must follow at least one parameter. Change: int foo(); to: int foo(int bar,);
80	a storage class may not be specified here
81	more than one storage class may not be specified
82	storage class is not first
83	type qualifier specified more than once
84	invalid combination of type specifiers The type name or type qualifier cannot be used in the same declaration as the second type name or type qualifier. For example: typedef int int;
85	invalid storage class for a parameter
86	invalid storage class for a function
87	a type specifier may not be used here
88	array of functions is not allowed
89	array of void is not allowed
90	function returning function is not allowed
91	function returning array is not allowed
92	identifier-list parameters may only be used in a function definition
93	function type may not come from a typedef
94	the size of an array must be greater than zero Zero-sized arrays are permitted only when in GNU mode,gnu. For example: char name[0]; See the following in the <i>Compiler Reference</i> : gnu on page 3-106 GNU extensions to the C and C++ languages on page 4-48.
95	array is too large There is a limit of 4GB on the maximum size of arrays or structures.
96	a translation unit must contain at least one declaration
97	a function may not return a value of this type
98	an array may not have elements of this type

```
99
             a declaration here must declare a parameter
100
             duplicate parameter name
101
             <entity> has already been declared in the current scope
102
             forward declaration of enum type is nonstandard
103
             class is too large
104
             struct or union is too large
105
             invalid size for bit field
             Bit fields must not be larger than the size of the type.
             For example, with --strict:
             struct X{
               int y:5000;
106
             invalid type for a bit field
             Bit fields must have integral type.
             Example:
             struct X{
               float x:5;
               float y:2;
107
             zero-length bit field must be unnamed
108
             signed bit field of length 1
109
             expression must have (pointer-to-) function type
110
             expected either a definition or a tag name
             statement is unreachable
111
112
             expected "while"
114
             <entity> was referenced but not defined
115
             a continue statement may only be used within a loop
116
             a break statement may only be used within a loop or switch
             Example:
             void foo(void){
               int a=0;
               continue;
             }
             or:
             void bar(void){
               int a=0;
               break;
117
             non-void <entity> should return a value
118
             a void function may not return a value
119
             cast to type <type> is not allowed
```

```
120
             return value type does not match the function type
121
             a case label may only be used within a switch
122
             a default label may only be used within a switch
123
             case label value has already appeared in this switch
124
             default label has already appeared in this switch
125
             expected a "("
126
             expression must be an lvalue
127
             expected a statement
128
             loop is not reachable from preceding code
129
             a block-scope function may only have extern storage class
130
             expected a "{"
131
             expression must have pointer-to-class type
132
             expression must have pointer-to-struct-or-union type
133
             expected a member name
134
             expected a field name
135
             <entity> has no member <entity>
136
             <entity> has no field <entity>
137
             expression must be a modifiable lvalue
138
             taking the address of a register variable is not allowed
139
             taking the address of a bit field is not allowed
140
             too many arguments in function call
             Function declaration does not match the number of parameters in an earlier
             function prototype.
             Example:
             extern void foo(int x);
             void bar(void)
               foo(1,2);
             }
141
             unnamed prototyped parameters not allowed when body is present
142
             expression must have pointer-to-object type
143
             program too large or complicated to compile
144
             a value of type <type> cannot be used to initialize an entity of type
             The initializing string for a fixed size character array is exactly as long as the
             array size, leaving no room for a terminating \setminus 0, for example:
             char name[5] = "Hello";
             The name array can hold up to 5 characters. "Hello" does not fit because C strings
             are always null-terminated (for example, "Hello\0"). The compiler reports:
```

```
Error: #144: a value of type "const char [6]" cannot be used to initialize
             an entity of type "char [5]"
             A similar error is also raised if there is an implicit cast of non-zero int to pointer.
             For example:
             void foo_func( void )
               char *foo=1;
             results in the message:
             #144: a value of type "int" cannot be used to initialize an entity of type
             "char *"
             For the cast, this error can be suppressed with the use of the
             --loose implicit cast switch.
145
             <entity> may not be initialized
146
             too many initializer values
147
             declaration is incompatible with <entity>
             This incorrect C code:
             typedef enum { e } E;
             typedef enum { f } F;
             E q(void);
             F q(void);
             is a discretionary error in all modes, and can be downgraded from an Error to a
             Warning with --diag_warning 147, or suppressed completely with
             --diag_suppress 147.
148
             <entity> has already been initialized
149
             a global-scope declaration may not have this storage class
150
             a type name may not be redeclared as a parameter
151
             a typedef name may not be redeclared as a parameter
152
             conversion of nonzero integer to pointer
153
             expression must have class type
154
             expression must have struct or union type
155
             old-fashioned assignment operator
156
             old-fashioned initializer
157
             expression must be an integral constant expression
             expression must be an lvalue or a function designator
158
159
             declaration is incompatible with previous <entity>
160
             external name conflicts with external name of <entity>
161
             unrecognized #pragma
163
             could not open temporary file <entity>
164
             name of directory for temporary files is too long (<entity>)
165
             too few arguments in function call
```

Function prototype is defined with a number of parameters that does not match the number of parameters passed in the function call.

```
For example:
```

```
extern void foo(int x);
void bar(void)
{
   foo();
}
```

- 166 invalid floating constant
- argument of type <type> is incompatible with parameter of type <type>
- 168 a function type is not allowed here
- **169** expected a declaration

This can occur when attempting to compile some C++ header files with the C compiler instead of the C++ compiler. The following message is reported:

Error: #169: expected a declaration

- 170 pointer points outside of underlying object
- invalid type conversion
- 172 external/internal linkage conflict with previous declaration

Errors about linkage disagreements where functions are implicitly declared as extern and then later re-declared as static are suppressed unless compiled with --strict.

Example:

```
extern void foo(void);
static void foo(void){}
```

- floating-point value does not fit in required integral type
- 174 expression has no effect
- 175 subscript out of range

By default, unused declaration warnings are given for:

- local (within a function) declarations of variables, typedefs, and functions
- labels (always within a function)
- top-level static functions and static variables.

The --diag_suppress 177 option suppresses these warnings.

- 178 "&" applied to an array has no effect
- 179 right operand of "%" is zero
- 180 argument is incompatible with formal parameter
- argument is incompatible with corresponding format string conversion

For example when compiling with --strict, the code:

```
unsigned long foo = 0x1234;
printf("%08X", foo);
results in the warning:
```

Warning: #181-D: argument is incompatible with corresponding format string conversion

To avoid the warning, the code could be rewritten as:

```
unsigned long foo = 0x1234;
printf("%01X", foo);
or perhaps:
unsigned int foo = 0x1234;
printf("%0X", foo);
```

%0X can be used for char, short or int. Use 1X for a long integer, even though both ints and longs are 32-bits wide on an ARM.

- 182 could not open source file <entity> (no directories in search list)
- 183 type of cast must be integral
- 184 type of cast must be arithmetic or pointer
- dynamic initialization in unreachable code
- 186 pointless comparison of unsigned integer with zero

For example:

```
unsigned short foo;
if (foo<0) printf("This never happens");</pre>
```

gives a warning that the comparison between an unsigned (for example, char or int) value and zero always evaluates to false.

use of "=" where "==" may have been intended

```
Example:
```

```
int main(void)
{
  int a;
  const int b =1;
  if (a=b)
}
```

- 188 enumerated type mixed with another type
- 189 error while writing <entity> file
- 190 invalid intermediate language file
- 191 type qualifier is meaningless on cast type

The C specification states that a cast does not yield an Ivalue, so a cast to a qualified type has the same effect as a cast to the unqualified version of the type. This warning is just to inform the user that the type qualifier has no effect, although the code is still legal. The warning is suppressible with --diag_suppress 191.

Example:

```
"val2 = (const float)val1;" is equivalent to "val2 = (float)val1;"
```

192 unrecognized character escape sequence

This error is commonly associated with the attempted use of non-ASCII character sets, such as 16-bit Unicode characters. The compiler supports multibyte character sets, such as Unicode. Source files are compiled according to the selected locale of that machine. It is possible to use *Escape processing* (as recommended by Kernighan and Ritchie, section A2.5.2) to encode specific values instead.

```
For example:
```

```
char *p = "\x12\x34\x56\x78"; // 12 34 56 78
```

In character and string escapes, if the character following the \ has no special meaning, the value of the escape is the character itself, for example, \s is the same as s and the warning is given.

- zero used for undefined preprocessing identifier <entity>expected an asm string
- an asm function must be prototyped
- an asm function may not have an ellipsis
- 219 error while deleting file <entity>
- 220 integral value does not fit in required floating-point type
- floating-point value does not fit in required floating-point type
- floating-point operation result is out of range
- function <entity> declared implicitly

This is a common warning that occurs where there is no prototype for a function.

For example:

```
void foo(void)
{
   printf("foo");
}
```

To fix this, add #include <stdio.h> that includes the prototype for printf.

For ANSI C, you can suppress this warning with --diag_suppress 223. This is useful when compiling old-style C in ANSI C mode.

- the format string requires additional arguments
- the format string ends before this argument
- invalid format string conversion
- 227 macro recursion
- trailing comma is nonstandard
- bit field cannot contain all values of the enumerated type
- 230 nonstandard type for a bit field

In strict ANSI C, the only types permitted for a bit field are int, signed int, and unsigned int.

Example:

```
struct X {
char y:2;
};
```

- 231 declaration is not visible outside of function
- 232 old-fashioned typedef of "void" ignored
- 233 left operand is not a struct or union containing this field
- 234 pointer does not point to struct or union containing this field

235	variable <entity> was declared with a never-completed type</entity>
236	controlling expression is constant
237	selector expression is constant
238	invalid specifier on a parameter
239	invalid specifier outside a class declaration
240	duplicate specifier in declaration
241	a union is not allowed to have a base class
242	multiple access control specifiers are not allowed
243	class or struct definition is missing
244	qualified name is not a member of class <type> or its base classes</type>
245	a nonstatic member reference must be relative to a specific object
246	a nonstatic data member may not be defined outside its class
247	<pre><entity> has already been defined A typical example of this is where a variable name has been used more than once. This can sometimes occur when compiling legacy code that relies on tentative declarations. Tentative declarations permit a variable to be declared and initialized as separate statements such as: int a; int a = 1; Tentative declarations are permitted by default for C code, but produce an error with C++ code.</entity></pre>
248	pointer to reference is not allowed
249	reference to reference is not allowed
250	reference to void is not allowed
251	array of reference is not allowed
252	reference <entity> requires an initializer</entity>
253	expected a ","
254	<pre>type name is not allowed This occurs when a typedef name is being used directly in an expression: typedef int footype; int x = footype; // reports Error: #254: type name is not allowed To fix this, first create an instance of that type (for example, a variable of the new type): typedef int footype; footype bar = 1; int x = bar;</pre>
255	type definition is not allowed
256	invalid redeclaration of type name <entity></entity>
257	const <entity> requires an initializer</entity>

258	"this" may only be used inside a nonstatic member function
259	constant value is not known
260	explicit type is missing ("int" assumed)
261	access control not specified (<entity> by default)</entity>
262	not a class or struct name
263	duplicate base class name
264	invalid base class
265	<entity> is inaccessible</entity>
	For C++ only, thediag_warning 265 option downgrades access control errors to warnings.
	For example:
	<pre>class A { void f() {}; }; // private member A a;</pre>
	<pre>void g() { a.f(); } // erroneous access</pre>
	results in the message: Error: #265-D: function "A::f" is inaccessible
266	<pre><entity> is ambiguous</entity></pre>
267	old-style parameter list (anachronism)
268	declaration may not appear after executable statement in block
269	conversion to inaccessible base class <type> is not allowed</type>
274	improperly terminated macro invocation
276	name followed by "::" must be a class or namespace name
277	invalid friend declaration
278	a constructor or destructor may not return a value
279	invalid destructor declaration
280	declaration of a member with the same name as its class
281	global-scope qualifier (leading "::") is not allowed
282	the global scope has no <entity></entity>
283	qualified name is not allowed
284	NULL reference is not allowed
285	initialization with "<>" is not allowed for object of type <type></type>
286	base class <type> is ambiguous</type>
287	derived class <type> contains more than one instance of class <type></type></type>

```
"inline" is not allowed
326
327
             invalid storage class for an inline function
328
             invalid storage class for a class member
329
             local class member <entity> requires a definition
330
             <entity> is inaccessible
332
             class <type> has no copy constructor to copy a const object
333
             defining an implicitly declared member function is not allowed
334
             class <type> has no suitable copy constructor
335
             linkage specification is not allowed
336
             unknown external linkage specification
337
             linkage specification is incompatible with previous <entity>
             If the linkage for a function is redeclared with an incompatible specification to a
             previous declaration this error is produced.
             For example:
             int foo(void);
             int bar(void)
               int x;
               x = foo();
               return x;
             extern "C" int foo(void)
               return 0;
             results in the message:
             Error: #337: linkage specification is incompatible with previous "foo"
             (declared at line 1)
338
             more than one instance of overloaded function <entity> has "C" linkage
339
             class <type> has more than one default constructor
340
             value copied to temporary, reference to temporary used
341
             "operator<entity>" must be a member function
342
             operator may not be a static member function
343
             no arguments allowed on user-defined conversion
344
             too many parameters for this operator function
345
             too few parameters for this operator function
346
             nonmember operator requires a parameter with class type
347
             default argument is not allowed
348
             more than one user-defined conversion from <type> to <type> applies:
349
             no operator <entity> matches these operands
350
             more than one operator <entity> matches these operands:
```

351	first parameter of allocation function must be of type "size_t"
352	allocation function requires "void *" return type
353	deallocation function requires "void" return type
354	first parameter of deallocation function must be of type "void st "
356	type must be an object type
357	base class <type> has already been initialized</type>
358	base class name required <type> assumed (anachronism)</type>
359	<entity> has already been initialized</entity>
360	name of member or base class is missing
361	assignment to "this" (anachronism)
362	"overload" keyword used (anachronism)
363	invalid anonymous union nonpublic member is not allowed
364	invalid anonymous union member function is not allowed
365	anonymous union at global or namespace scope must be declared static
366	<entity> provides no initializer for:</entity>
367	implicitly generated constructor for class <type> cannot initialize:</type>
368	<pre><entity> defines no constructor to initialize the following:</entity></pre>
	This indicates that you have a const structure or structure containing a const. It is issued as a friendly warning to assist with error 369. This can safely be ignored providing that the const members of structures are appropriately initialized.
369	<entity> has an uninitialized const or reference member</entity>
	This indicates that you have a instance of a const structure or structure containing a const that has not been correctly initialized. You must either initialise it correctly for every instance or provide a constructor to initialise it.
370	<entity> has an uninitialized const field</entity>
371	class <type> has no assignment operator to copy a const object</type>
372	class <type> has no suitable assignment operator</type>
373	ambiguous assignment operator for class <type></type>
375	declaration requires a typedef name
377	"virtual" is not allowed
378	"static" is not allowed
379	cast of bound function to normal function pointer (anachronism)
380	expression must have pointer-to-member type
381	extra ";" ignored
	In C, this can be caused by an unexpected semicolon at the end of a declaration line, for example:
	int x;;

	Similarly, in C++, this might be caused by constructions like:
	class X { } ; ;
	which probably resulted from some macro usage:
	<pre>#define M(c) class c { } ; M(X);</pre>
	The extra semicolon is illegal because empty declarations are illegal.
382	nonstandard member constant declaration (standard form is a static constintegral member)
384	no instance of overloaded <entity> matches the argument list</entity>
386	no instance of <entity> matches the required type</entity>
387	delete array size expression used (anachronism)
389	a cast to abstract class <type> is not allowed:</type>
390	function "main" may not be called or have its address taken
391	a new-initializer may not be specified for an array
392	member function <entity> may not be redeclared outside its class</entity>
393	pointer to incomplete class type is not allowed
394	reference to local variable of enclosing function is not allowed
395	single-argument function used for postfix <entity> (anachronism)</entity>
398	cast to array type is nonstandard (treated as cast to <type>)</type>
399	<pre><entity> has an operator new<entity>() but no default operator delete<entity>()</entity></entity></entity></pre>
400	<pre><entity> has a default operator delete<entity>() but no operator new<entity>()</entity></entity></entity></pre>
401	destructor for base class <entity> is not virtual</entity>
403	invalid redeclaration of member <entity></entity>
404	function "main" may not be declared inline
405	member function with the same name as its class must be a constructor
406	using nested <entity> (anachronism)</entity>
407	a destructor may not have parameters
408	copy constructor for class <type> may not have a parameter of type <type></type></type>

452	return type may not be specified on a conversion function
456	excessive recursion at instantiation of <entity></entity>
457	<entity> is not a function or static data member</entity>
458	argument of type <type> is incompatible with template parameter of type <type></type></type>
459	initialization requiring a temporary or conversion is not allowed
460	declaration of <entity> hides function parameter</entity>
461	initial value of reference to non-const must be an lvalue
463	"template" is not allowed
464	<type> is not a class template</type>
467	<pre>invalid reference to <entity> (union/nonunion mismatch)</entity></pre>
468	a template argument may not reference a local type

469	tag kind of <entity> is incompatible with declaration of <entity></entity></entity>
470	the global scope has no tag named <entity></entity>
471	<entity> has no tag member named <entity></entity></entity>
473	<entity> may be used only in pointer-to-member declaration</entity>
476	name followed by "::~" must be a class name or a type name
477	destructor name does not match name of class <type></type>
478	type used as destructor name does not match type <type></type>
479	<entity> redeclared "inline" after being called</entity>
485	<entity> is not an entity that can be instantiated</entity>
486	compiler generated <entity> cannot be explicitly instantiated</entity>
487	inline <entity> cannot be explicitly instantiated</entity>
490	<pre><entity> cannot be instantiated it has been explicitly specialized</entity></pre>
494	declaring a void parameter list with a typedef is nonstandard When the compiler is in ANSI C mode, this error might be produced by a function declaration f(V) where V is a void type.
	In the special syntax f(<void>) that indicates that f is a function taking no arguments, the keyword <void> is required. The name of a void type cannot be used instead.</void></void>
496	template parameter <entity> may not be redeclared in this scope</entity>
497	declaration of <entity> hides template parameter</entity>
498	template argument list must match the parameter list
501	an operator name must be declared as a function
502	operator name is not allowed
503	<entity> cannot be specialized in the current scope</entity>
504	nonstandard form for taking the address of a member function
	The C++ standard requires that a pointer to member be named using a qualified name and a & character such as for &A::f.
	The front end previously accepted nonstandard forms like &f, or even simply f, as a concession to existing practice. This usage now produces a discretionary error.
505	too few template parameters does not match previous declaration
506	too many template parameters does not match previous declaration
507	<pre>function template for operator delete(void *) is not allowed</pre>
508	class template and template parameter may not have the same name
511	enumerated type is not allowed
512	type qualifier on a reference type is not allowed
513	a value of type <type> cannot be assigned to an entity of type <type></type></type>
514	pointless comparison of unsigned integer with a negative constant

```
515
             cannot convert to incomplete class <type>
516
             const object requires an initializer
517
             object has an uninitialized const or reference member
518
             nonstandard preprocessing directive
519
             <entity> may not have a template argument list
520
             initialization with "<...>" expected for aggregate object
521
             pointer-to-member selection class types are incompatible (<type> and
             <type>)
522
             pointless friend declaration
524
             non-const function called for const object (anachronism)
525
             a dependent statement may not be a declaration
526
             a parameter may not have void type
             For example:
             void foo(void a) { }
529
             this operator is not allowed in a template argument expression
530
             try block requires at least one handler
531
             handler requires an exception declaration
532
             handler is masked by default handler
533
             handler is potentially masked by previous handler for type <type>
534
             use of a local type to specify an exception
535
             redundant type in exception specification
536
             exception specification is incompatible with that of previous <entity>
540
             support for exception handling is disabled
541
             omission of exception specification is incompatible with previous <entity>
542
             could not create instantiation request file <entity>
543
             non-arithmetic operation not allowed in nontype template argument
544
             use of a local type to declare a nonlocal variable
545
             use of a local type to declare a function
546
             transfer of control bypasses initialization of:
             Example:
             int main(void){
                int choice = 1;
                int z = 1;
                switch(choice)
                  case 1:
                    int y = 1;
                    z = y + z;
                    break;
                  case 2:
```

```
break;
}
return 0;
```

In the example, y is an initialized variable that is in scope (but unused) in the other cases

The C++ Standard says in section 6.7:

"It is possible to transfer into a block, but not in a way that bypasses declarations with initialization. A program that jumps from a point where a local variable with automatic storage duration is not in scope to a point where it is in scope is ill-formed unless the variable has POD type (3.9) and is declared without an initializer (8.5)."

____ Note _____

The transfer from the condition of a switch statement to a case label is considered a jump in this respect.

The usual way to fix this is to enclose the case that declares y in braces:

```
case 1: {
  int y = 1;
  z = y + z;
}
break;
```

Because y is a POD (Plain Old Data) type, so an alternative is to not use initialization:

```
case 1:
  int y;
  y = 1;
  z = y + z;
  break;
```

- transfer of control into an exception handler
- 549 <entity> is used before its value is set
- 550 <entity> was set but never used
- <entity> cannot be defined in the current scope
- 552 exception specification is not allowed
- 553 external/internal linkage conflict for <entity>
- 554 <entity> will not be called for implicit or explicit conversions
- tag kind of <entity> is incompatible with template parameter of type
 <type>

966
             universal character name specifies an invalid character
967
             a universal character name cannot designate a character in the basic
             character set
968
             this universal character is not allowed in an identifier
969
             the identifier __VA_ARGS__ can only appear in the replacement lists of
             variadic macros
```

970	the qualifier on this friend declaration is ignored
971	array range designators cannot be applied to dynamic initializers
972	property name cannot appear here
975	a variable-length array type is not allowed
976	a compound literal is not allowed in an integral constant expression
977	a compound literal of type <type> is not allowed</type>
978	a template friend declaration cannot be declared in a local class
979	ambiguous "?" operation: second operand of type <type> can be converted to third operand type <type>, and vice versa</type></type>
980	call of an object of a class type without appropriate operator() or conversion functions to pointer-to-function type
982	there is more than one way an object of type <type> can be called for the argument list:</type>
983	typedef name has already been declared (with similar type)
984	operator new and operator delete cannot be given internal linkage
985	storage class "mutable" is not allowed for anonymous unions
986	invalid precompiled header file
987	abstract class type <type> is not allowed as catch type:</type>
988	a qualified function type cannot be used to declare a nonmember function or a static member function
989	a qualified function type cannot be used to declare a parameter
990	cannot create a pointer or reference to qualified function type
991	extra braces are nonstandard
992	invalid macro definition:
	Incorrect use of -D on the compile line, for example, "-D##"
993	subtraction of pointer types <type> and <type> is nonstandard</type></type>
994	an empty template parameter list is not allowed in a template template parameter declaration
995	expected "class"
996	the "class" keyword must be used when declaring a template template parameter
997	<pre><entity> is hidden by <entity> virtual function override intended?</entity></entity></pre>
998	a qualified name is not allowed for a friend declaration that is a function definition
999	<pre><entity> is not compatible with <entity></entity></entity></pre>
1000	a storage class may not be specified here
1001	class member designated by a using-declaration must be visible in a direct base class

1006	a template template parameter cannot have the same name as one of its template parameters
1007	recursive instantiation of default argument
1009	<entity> is not an entity that can be defined</entity>
1010	destructor name must be qualified
1011	friend class name may not be introduced with "typename"
1012	a using-declaration may not name a constructor or destructor
1013	a qualified friend template declaration must refer to a specific previously declared template
1014	invalid specifier in class template declaration
1015	argument is incompatible with formal parameter
1016	prefix form of ARM function qualifier not permitted in this position
1017	Duplicate ARM function qualifiers not permitted
1018	ARM function qualifiers not permitted on this declaration/definition
	ARM function qualifiers include qualifiers such assvc,pure andirq amongst others.
	See the following in the Compiler Reference:
	• Keywords and operators on page 5-5.
1019	function qualifier <entity> not permitted on a non-static member function</entity>
1020	irq functions must take no arguments
1021	irq functions must return no result
1022	cannot have pointer nor reference to <entity> function</entity>
1023	global_reg not allowed on this declaration
1024	invalid global register number; 1 to 8 allowed
	An invalid register is being used inglobal_reg.
	Example:global_reg(786) int x;
1025	svc parameter <entity> is not within permitted range (0 to 0xffffff) for ARM SVC instruction</entity>
	SVC numbers are limited to the range 0 to 0xffffff for the ARM compilers, and 0 to 0xFF for the Thumb compilers.
	For standard semihosting SVCs, $0x123456$ is used for ARM, $0xAB$ is used for Thumb.
1026	taking the address of a global register variable is not allowed
1027	svc_indirect function must have arguments
1028	conflicting global register declaration with <entity></entity>
1029	packed ignored for non-pointer parameter
1030	<pre><entity> <type> previously declared withoutpacked</type></entity></pre>

```
1031
             Definition of <type> in packed <type> must be __packed
             The Compiler Reference states:
             "All substructures of a packed structure must be declared using __packed."
             The compiler faults a non-packed child structure contained in a packed parent
             structure. This includes the case where the substructure is an array.
             For example:
             typedef struct ChildStruct {
              int a:
              } ChildStruct;
             typedef __packed struct ParentStruct {
                ChildStruct child[1];
              } ParentStruct;
             correctly results in the message:
             Error: #1031: Definition of "ChildStruct" in packed "ParentStruct" must be
             __packed
             See the following in the Compiler Reference:
                   packed on page 5-17.
1032
             Definition of nested anonymous <entity> in packed <type> must be __packed
1033
             <entity> incompatible with function definition
1034
             __irg functions must not be the target of a function call
1038
             invalid alignment specified; only integer powers of 2 allowed
1039
             conflicting alignment declaration with <entity>
1040
             under-alignment not allowed
1041
             alignment for an auto object may not be larger than 8
             For example:
             int main(void){
               _{-}align(16) int foo = 10;
             __align is not permitted for a local variable foo, so the error is given.
             See the following in the Compiler Reference:
                   align on page 5-6.
1042
             <entity> cannot be dynamically initialized when compiled position
             independent
1043
             <entity> cannot be const because it contains a mutable member
1044
             option "dep_name" can be used only when compiling C++
1045
             loop in sequence of "operator->" functions starting at class <type>
1046
             <entity> has no member class <entity>
1047
             the global scope has no class named <entity>
1048
             recursive instantiation of template default argument
1049
             access declarations and using-declarations cannot appear in unions
1050
             <entity> is not a class member
```

1051	nonstandard member constant declaration is not allowed
1053	option "parse_templates" can be used only when compiling C++
1054	option "dep_name" cannot be used with "no_parse_templates"
1055	language modes specified are incompatible
1056	invalid redeclaration of nested class
1057	type containing an unknown-size array is not allowed
1058	a variable with static storage duration cannot be defined within an inline function $% \left(1\right) =\left(1\right) \left(1$
1059	an entity with internal linkage cannot be referenced within an inline function with external linkage
1060	argument type <type> does not match this type-generic function macro</type>
1062	friend declaration cannot add default arguments to previous declaration
1063	<entity> cannot be declared in this scope</entity>
1064	the reserved identifier <entity> may only be used inside a function</entity>
1065	this universal character cannot begin an identifier
1066	expected a string literal
1070	incorrect use of va_copy
1071	<pre><entity> can only be used with floating-point types</entity></pre>
1072	complex type is not allowed
1073	invalid designator kind
1074	floating-point value cannot be represented exactly
1075	complex floating-point operation result is out of range
1077	an initializer cannot be specified for a flexible array member
1079	standard requires that <entity> be given a type by a subsequent declaration ("int" assumed)</entity>
1080	a definition is required for inline <entity></entity>
1081	conversion from integer to smaller pointer
1082	a floating-point type must be included in the type specifier for a _Complex or _Imaginary type
1083	Inline assembler syntax error
1084	This instruction not permitted in inline assembler
1085	Missing operand
1086	Operand is wrong type
1087	Operand should be constant
1088	Wrong number of operands
1089	Invalid PSR operand

```
1090
             Expected PSR operand
1091
             Invalid shift specified
1092
             Should be acc0
1093
             Must be a modifiable lvalue
1094
             Expected a register expression
1095
             Expected a label or function name
1096
             Instruction cannot be conditional
1097
             Expected a [ or ]
1098
             Expected a shift operation
1099
             Unexpected ]
1100
             Register specified shift not allowed
1101
             Pre-Indexed addressing not allowed
1102
             Post-Indexed addressing not allowed
1103
             Writeback not allowed in the addressing mode
1104
             Expected {
1105
             Expected }
1106
             Too many registers in register list
1107
             Only ^ valid here
1108
             Cannot mix virtual register and C/C++ expressions in register list
1109
             Only virtual registers can be specified in a register range
1110
             User mode register selection/CPSR update not supported in inline
             assembler. Use embedded assembler or out-of-line assembler
1111
             Expected a coprocessor name
1112
             Expected a coprocessor register name
             These errors are given by the inline assembler if either:
                   the coprocessor number is accidentally omitted from an MCR or MRC
                   instruction
                   an invalid coprocessor number/coprocessor register number has been
                   given.
             An example of correct use is shown below:
             void foo()
             {
               int reg0;
               __asm
```

this feature not supported on target architecture/processor

Example when compiled with armcc --cpu 4T:

MRC p15, 0, reg0, c1, c0, 0

}

```
int main(void) {
  int a,b,c;
  __asm {
  QADD a,b,c
  }
  return(a);
}
```

results in an error message because the saturated add instruction is only supported in ARMv5TE and later.

- 1115 Cannot assign to const operand
- 1116 Register list cannot be empty
- 1117 Unqualified virtual function not allowed
- **1118** Expected a newline
- 1119 Reference to static variable not allowed in __asm function
- 1120 Reference to static function not allowed in __asm function
- 1121 Pointer to data member not allowed in __asm function
- 1122 __asm function cannot have static qualifier
- 1123 base class <type> is a virtual base class of <type>
- 1124 base class <type> is not virtual base class of <type>
- 1125 <entity> has no member function <entity>
- 1126 "__asm" is not allowed in this declaration
- 1127 Member initializer list not permitted for __asm constructors
- 1128 try block not permitted for __asm constructors
- Order of operands not compatible with previous compiler versions
- Non portable instruction (LDM with writeback and base in reg. list, final value of base unpredictable)
- Non portable instruction (STM with writeback and base not first in reg. list, stored value of base unpredictable)
- 1133 Expression operands not permitted with virtual base register
- 1134 literal treated as "long long"

The constant is too large to be represented in a signed long, and therefore has been treated as a (signed) long long.

For example:

```
int foo(unsigned int bar)
{   return (bar == 2147483648);
}
```

gives a warning because 2147483648 is one greater than the maximum value permitted for a signed long. The 11 suffix means that the constant is treated as a (64-bit) long long type rather than a signed long.

To eliminate the warning, explicitly add the 11 or LL suffix to your constants. For example:

```
int foo(unsigned int bar)
{
  return (bar == 2147483648LL);
}
```

See the following in the Compiler Reference:

- long long on page 4-14.
- 1135 literal treated as "unsigned long long"

The constant is too large to be represented in a signed long long, and therefore has been given type unsigned long long. See error number 1134.

- 1137 Expected a comma
- 1138 Unexpected comma after this expression
- 1139 MRRC operation opcode must lie in range 0-15

1274	void return type cannot be qualified
1275	the auto specifier is ignored here (invalid in standard $C/C++$)
1276	a reduction in alignment without the "packed" attribute is ignored
1277	a member template corresponding to <entity> is declared as a template of a different kind in another translation unit</entity>
1278	excess initializers are ignored
1279	va_start should only appear in a function with an ellipsis parameter
1282	variable <entity> cannot be used in a register range</entity>
1283	A physical register name is required here
1284	A register range cannot be specified here
1285	Implicit physical register <entity> has not been defined</entity>
1286	LDRD/STRD instruction will be expanded
	When LDRD and STRD instructions are used in inline assembler the compiler expands these into two LDR or STR instructions before being passed through the compiler optimization stage.
	The optimization stage normally combines the two LDR or STR instruction back into a single LDRD or STRD instruction, however it is possible in some cases that a LDRD or STRD is not used.
1287	LDM/STM instruction may be expanded
	When LDM and STM instructions are used in inline assembler the compiler expands these into a number of LDR or STR instructions before being passed through the compiler optimization stage.
	The optimization stage normally combines the two LDR or STR instruction back into LDM or STM instructions, however it is possible that in some cases that a single LDM or STM instruction is not used.
1288	Implicit ARM register <entity> was not defined due to name clash</entity>
1289	statement expressions are only allowed in block scope
1291	an asm name is ignored on a non-register automatic variable
1292	inline function also declared as an alias; definition ignored
1293	assignment in condition

In a context where a boolean value is required (the controlling expression for if, while, for or the first operand of a conditional expression, an expression contains one of:

- A bitwise not operator (~). It is likely that a logical not operator (!) was intended.
- An assignment operator (=). This could be a mis-typed equality operator (==).

In either case if the operator is intended adding an explicit comparison against 0 might suppress the warning.

This warning can be suppressed with the --diag_suppress 1293 option.

Example:

```
int main(void)
{
  int a,b;
  if (a=b)
}
```

1294 Old-style function <entity>

The compilers accept both old-style and new-style function declarations.

The difference between an old-style and a new-style function declaration is as follows.

```
// new style
int add2(int a, int b)
{
  return a+b;
}
// old style
int oldadd2(a,b)
int a;
int b;
{
  return a+b;
}
```

When compiling old style functions in C mode the compiler reports:

Warning: #1294-D: Old-style function oldadd2

1295 Deprecated declaration <entity> - give arg types

This warning is normally given when a declaration without argument types is encountered in ANSI C mode. In ANSI C, declarations like this are deprecated. However, it is sometimes useful to suppress this warning with the

--diag_suppress 1295 option when porting old code.

```
In C++:
void foo();
means:
void foo(void);
and no warning is generated.
```

1296 extended constant initialiser used

The expression used as a constant initialiser might not be portable.

This warns that there is a constant that does not follow the strict rules of ANSI C even though there is a clause to permit it in the ANSI C specification.

Example compiled with --c90 switch:

```
const int foo_table[] = { (int)"foo", 0, 1, 2};
```

This is not ANSI C standard compliant. Compiling with --diag_suppress 1296 suppresses the warning.

1297 Header file not guarded against multiple inclusion

This warning is given when an unguarded header file is #included.

An unguarded header file is a header file not wrapped in a declaration such as:

```
#ifdef foo_h
#define foo_h
/* body of include file */
#endif
```

This warning is off by default. It can be enabled with:

```
--diag_warning 1297
```

1298 Header file is guarded by '<entity>', but does not #define it

Example:

```
#ifndef MYHEADER_H
//#define MYHEADER_H
#endif
```

To correct the code, remove the comment slashes (//). This warning is off by default. It can be enabled with:

```
--diag_warning 1298
```

- 1299 members and base-classes will be initialized in declaration order, not in member initialisation list order
- 1300 <entity> inherits implicit virtual

This warning is issued when a non-virtual member function of a derived class hides a virtual member of a parent class. For example:

```
struct Base { virtual void f(); };
struct Derived : Base { void f(); };
results in the message:
Warning: #1300-D: f inherits implicit virtual
struct Derived : Base { void f(); };
```

Adding the virtual keyword in the derived class prevents the warning. For C++, the --diag_suppress 1300 option suppresses the implicit virtual warning.

1301 padding inserted in struct <entity>

For the members of the structure to be correctly aligned, some padding has been inserted between members. This warning is off by default and can be enabled with --diag_warning 1301 or --remarks.

For example:

```
struct X {
   char x;
   int y;
}
```

results in the message:

Warning: #1301-D: padding inserted in struct X

The compiler can also warn of padding added at the end of a struct or between structs, see 2530.

type too large to be returned in registers - __value_in_regs ignored

1303	usingforce_new_nothrow: added "throw()"

1349	declaration of <entity> hides handler parameter</entity>
1350	nonstandard cast to array type ignored
1351	this pragma cannot be used in a $_$ Pragma operator (a $\#$ pragma directive must be used)
1352	field uses tail padding of a base class
1353	GNU C++ compilers may use bit field padding
1354	memory mapping conflict with precompiled header file <entity></entity>
1355	abstract class <type> has a non-virtual destructor, calling delete on a pointer to this class is undefined behaviour</type>
1356	an asm name is not allowed on a nonstatic member declaration
1357	static initialisation of <entity> using address of <entity> may cause link failure <option></option></entity></entity>
	See error number 1359.
1358	static initialisation of extern const <entity> using address of <entity> cannot be lowered for ROPI</entity></entity>
1359	static initialisation of <entity> using address of <entity> may cause link failure <option></option></entity></entity>
	Warnings 1357 and 1359 warn against the use of non-PI code constructs and that a subsequent link step might fail.
	For example, when compiled withapcs /ropi:
	char *str = "test"; /* global pointer */
	results in the message:
	Warning: #1357-D: static initialisation of variable "str" using address of string literal may cause link failureropi
	because the global pointer str must be initialized to the address of the char string test in the .constdata section, but absolute addresses cannot be used in a PI

For example, when compiled with --apcs /rwpi:

int bar; int *foo = &bar; /* global pointer */

results in the message:

system.

Warning: #1359-D: static initialisation of variable "foo" using address of bar may cause link failure --rwpi

because the global pointer foo must be initialized to the address of bar in the .data section, but absolute addresses cannot be used in a PI system.

The following workarounds are possible:

- Change your code to avoid use of a global pointer. You can, for example, use a global array or local pointer instead.
- Do the initialization at run-time, for example:

int bar;
int *foo;

Then write code inside a function that sets foo = &bar;. This is because when generating code as opposed to statically initializing data, the compiler has scope to work around the ROPI/RWPI constraints.

See the linker error L6248E.

static initialisation of extern const <entity> using address of <entity>
cannot be lowered for RWPI

For example, when compiled with --apcs /rwpi:

extern int y;
int* const x = &y;
int* foo()
{
 return(x);
}

produces a warning because prefixing y by extern prevents the compiler defining a direct address offset between the variables x and y.

a direct address offset between the variables x and y.

2553	offsetof applied to non-POD types is nonstandard
2554	default arguments are not allowed on a friend declaration of a member function \ensuremath{G}
2555	default arguments are not allowed on friend declarations that are not definitions $% \left(\frac{1}{2}\right) =\frac{1}{2}\left(\frac{1}{2}\right) +\frac{1}{2}\left(\frac{1}$
2556	redeclaration of <entity> previously declared as a friend with default arguments is not allowed</entity>
2557	invalid qualifier for <type> (a derived class is not allowed here)</type>
2558	invalid qualifier for definition of class <type></type>
2560	wide string literal not allowed
2565	template argument list of <entity> must match the parameter list</entity>
2566	an incomplete class type is not allowed
2567	complex integral types are not supported
2570	<pre><entity> was declared "deprecated (<entity>)"</entity></entity></pre>
2571	invalid redefinition of <entity></entity>
2574	explicit specialization of <entity> must precede its first use (<entity>)</entity></entity>
2575	a sealed class type cannot be used as a base class
2576	duplicate class modifier
2577	a member function cannot have both the "abstract" and "sealed" modifiers
2578	a sealed member cannot be pure virtual
2579	nonvirtual function cannot be declared with "abstract" or "sealed" modifier
2580	member function declared with "override" modifier does not override a base class member $% \left(1\right) =\left(1\right) \left(1\right) $
2581	cannot override sealed <entity></entity>
2582	<pre><entity> was declared with the class modifier "abstract"</entity></pre>
2662	unrecognized calling convention <entity>, must be one of:</entity>
2665	attribute <entity> not allowed on parameter declarations</entity>
2666	underlying type of enum type must be an integral type other than bool
2667	some enumerator constants cannot be represented by <type></type>
2668	<entity> not allowed in current mode</entity>
2676	no #pragma start_map_region is currently active: pragma ignored
2677	<pre><entity> cannot be used to name a destructor (a type name is required)</entity></pre>
2678	nonstandard empty wide character literal treated as L'\\0'

2679	"typename" may not be specified here
2680	a non-placement operator delete must be visible in a class with a virtual destructor $% \left(1\right) =\left(1\right) \left($
2681	name linkage conflicts with previous declaration of <entity></entity>
2682	alias creates cycle of aliased entities
2683	subscript must be constant
2684	a variable with static storage duration allocated in a specific register cannot be declared with an initializer
2685	a variable allocated in a specific register must have POD type
2686	predefined meaning of <entity> discarded</entity>
2687	declaration hides built-in <entity></entity>
2688	declaration overloads built-in <entity></entity>
2689	static member function not permitted here
2690	the <entity> attribute can only appear on functions and variables with internal linkage</entity>
2813	empty dependent statement in if-statement
	This remark indicates that an if statement has no dependent statement, and is not followed by an else statement. For example:
	<pre>if (x <= 0); // remark 2813 is generated here { foo(x); }</pre>

You can enable this remark by using --diag_warning 2813 or --remarks. When using the --remarks option, you can suppress this remark by using --diag_suppress 2813.

2815 empty dependent statement in while-statement

This remark indicates that a while statement has no dependent statement. For example:

```
while (x != 0);
```

You can enable this remark by using --diag_warning 2815 or --remarks. When using the --remarks option, you can suppress this remark by using --diag_suppress 2815.

2.4 List of the old-style armcc error and warning messages

The following old-style error and warning messages might still be given:

C3000E SWI number 0x<num> too large

C3002W illegal unaligned load or store access - use __packed instead

C3008W splitting LDM/STM has no benefit

Inappropriate use of the switch "--split_ldm". This option has no significant

benefit for cached systems, or for processors with a write buffer.

C3009E unsupported CPU <entity>

C3015E Unbalanced pragma pop, ignored

#pragma push and #pragma pop save and restore the current pragma state.

A pop must be paired with a push. An error is given for:

#pragma push
:
#pragma pop
:
#pragma pop

C3016W unknown option '-<entity><entity>': ignored

C3017W <entity> may be used before being set

The data flow analysis feature in the compiler is on by default.

_____Note _____

Be aware that data flow analysis is always disabled at -00.

The compiler performs data flow analysis as part of its optimization process, and this information can be used to identify potential problems in the code such as variables being used before being set. However, this is really a by-product of optimization rather than a feature in its own right. The data flow analysis that detects *used before being set* only analyses hardware register use, that is, variables that are held in processor registers. It does not analyze variables or structures that are allocated on the stack, that is, stored in memory rather than in processor registers.

As code (and also register memory usage) generated by the compiler varies with the level of optimization, the warning might appear for code compiled at one level of optimization but not others. You might see it, for example, at -02, but not -01.

_____Note _____

The data flow analysis is not intended to be a fully complete feature. You must only treat the warnings of the form CnnnnW given by the compiler as a guide, and not rely on these warnings to identify faulty code reliably. The compiler never provides as much information as a special purpose tool such as Lint.

C3018W division by zero: <entity>

Constant propagation shows that a divide or remainder operator has a second operand with value 0. It is an error if execution reaches this expression. The compiler returns a result of 0 for a divide by constant 0.

C3038E Function too large or complicated to compile (0x<num>)

C3041U I/O error writing '<entity>': <entity>

C3047U Too many errors

C3048U out of store while compiling with -g. Allocation size was <entity>, system size is <entity>

C3049U out of store. Allocation size was <entity>, system size is <entity>

A storage allocation request by the compiler failed. Compilation of the debugging tables requested with the -g option might require a large amount of memory. Recompiling without -g, or with the program split into smaller pieces, might help.

C3050U Compilation aborted.

C3051E couldn't write file '<entity>': <entity>

C3052E couldn't read file '<entity>': <entity>

C3055U internal fault in inferFileName

C3056E bad option '<s>'

C3057E bad option '<s1> <s2>'

C3064E Overlong filename: <entity>

C3065E type of input file '<entity>' unknown

C3066E The code space needed for this object is too large for this version of the compiler

Split the source file into smaller pieces.

C3075E Can't open <entity> for output

C3078E stdin ('-') combined with other files

C3079E <entity> command with no effect

C3301W configuration file appears to be from a newer version of the compiler

The configuration file is one of the XML files supplied to the compiler with the --arm_linux_config_file switches when using --arm_linux_paths or GCC command-line translation. For example:

armcc --arm_linux_paths --arm_linux_config_file=arm_linux_config.xml

This warning indicates the file is from a newer compiler so might contain unsupported features. To avoid incompatibilities, either use the newer version of the compiler that was used to generate the configuration file, or re-generate the configuration file using your current compiler version.

See the following in the Compiler Reference:

- --arm linux config file=path on page 3-18
- --arm linux paths on page 3-21.

C3302E configuration file has an invalid version string

This represents an error reading from or writing to an ARM Linux configuration file.

Do the following:

- 1. Check that the file can be read from and written to and has valid permissions.
- 2. Try re-generating the configuration file using --arm_linux_configure.

See the following in the *Compiler Reference*:

• *--arm linux configure* on page 3-19.

 ${\bf C3303E} \qquad \text{configuration file was not specified} \\$

See the description for error C3302E.

C3304E I/O error reading configuration file <file>

See the description for error C3302E.

C3305E I/O error writing configuration file <file>

See the description for error C3302E.

C3306E could not parse configuration file <file>

See the description for error C3302E.

 ${\bf C3307E}$ unable to read configuration file

See the description for error C3302E.

C3308W cannot find system include directory

When using an ARM Linux mode, --arm_linux, --arm_linux_paths, or GCC command-line translation, set the ARMCCnINC environment variable to <code>install_directory</code>\include. This ensures that the compiler can find the arm_linux header subdirectory.

See the following in the Compiler Reference:

- --arm linux on page 3-16
- *--arm linux paths* on page 3-21.

See the following in *Introducing the ARM® Compiler toolchain*:

• *Toolchain environment variables* on page 2-14.

C3309E automatic configuration failed - cannot find GCC

This error is produced when you try to automatically configure the tools with

 $\mbox{--arm_linux_configure},$ but GCC cannot be found. Use the

--configure_gcc=path_to_gcc command -line option to specify the path to the GCC executable, such as arm-none-linux-gnueabi-gcc.

See the following in the *Compiler Reference*:

- --arm linux configure on page 3-19
- --configure gcc=path on page 3-43.

 ${f C3310W}$ automatic configuration is incomplete – cannot determine sysroot path from GCC

The GCC that was used for the ARM Linux configuration process did not provide a valid sysroot path. Use --configure_sysroot_sysroot_path to set the path.

See the following in the *Compiler Reference*:

• *--configure sysroot=path* on page 3-46.

C3311E automatic configuration failed - cannot find GLD

This error is produced when you try to automatically configure the tools with --arm_linux_configure, but the GNU linker (ld) could not be found. Use the --configure_gkd=path_to_gcc command-line option to specify the path to the GNU ld executable, such as arm-none-linux-gnueabi-ld.

See the following in the *Compiler Reference*:

• --arm linux configure on page 3-19

• --configure gcc=path on page 3-43.

C3312E automatic configuration failed - could not execute GCC

This error indicates that, when using automatic configuration for ARM Linux with --arm_linux_configure, the respective tools (GCC or GNU ld) could not be executed or failed when invoked. Check that they have execute permissions, and your GNU toolchain installation is working correctly.

See the following in the Compiler Reference:

• *--arm linux configure* on page 3-19.

C3313E automatic configuration failed - could not execute GLD See the description of error C3312E.

C3314W gcc command line translation - ignoring option with no translation: <option>

C3315W gcc command line translation - translation for this command is not fully supported: supported:

C3316W option is not supported under arm linux: <option>

C3317W translated cpu or architecture option <option> is not valid

C3318W unable to read file <file>

C3319W cannot recognise type of file <file> - file will be ignored

C3320W cannot find file <file> - file will be ignored

C3321E automatic configuration failed - could not determine configuration from GCC

When configuring automatically for ARM Linux with --arm_linux_configure, the compiler could not determine sufficient information from GCC to produce the configuration. Try a manual configuration by specifying a sysroot path with --configure_sysroot and a path to the GNU C++ header files with --configure_cpp_headers.

See the following in the *Compiler Reference*:

- --arm linux configure on page 3-19
- --configure cpp headers=path on page 3-39
- --configure sysroot=path on page 3-46.
- C3322W could not accurately determine library configuration from GCC configuration might be incomplete
- C3323E automatic configuration failed GCC internal specs configuration report error: <text>
- C3324W could not determine libstdc++ header file path specify this manually to ensure that C++ code will compile correctly

The path to the libstdc++ header files could not be determined from GCC. Specify this path with --configure_cpp_headers=path

See the following in the *Compiler Reference*:

• *--configure cpp headers=path* on page 3-39.

C3327W cannot determine application entry point function - using <value> as default

C3328W cannot determine library paths from GNU linker - trying to use defaults

C3329W option is missing an argument : <option>

C3330E GCC configuration is invalid

C3331W script file <file> will be treated as a scatter file

C3332E I/O error reading via file <file>

C3333E I/O error closing via file <file>

C3334W invalid GCC version in configuration file - using default

C3335E cannot retry because configuration file does not provide path to GNU executable

Displayed when the ARM Linux configuration file specified for GCC fallback does not include the correct path to qcc.

See the following in *Using the Compiler*:

• *Using GCC fallback when building applications* on page 3-24.

See the following in the *Compiler Reference*:

• -Warmcc,--gcc fallback on page 3-221.

C3336W compilation failed - retrying with GNU tools

Displayed if an armcc compilation fails and GCC fallback is specified. armcc then attempts to run gcc to complete the compilation.

See the following in *Using the Compiler*:

• *Using GCC fallback when building applications* on page 3-24.

See the following in the Compiler Reference:

• -Warmcc,--gcc fallback on page 3-221.

C3337E compilation with GNU tools also failed

Displayed if gcc fails during GCC fallback.

See the following in *Using the Compiler*:

• *Using GCC fallback when building applications* on page 3-24.

See the following in the Compiler Reference:

• -Warmcc,--gcc fallback on page 3-221.

C3338W compilation with GNU tools succeeded

Displayed when GCC fallback succeeds.

See the following in *Using the Compiler*:

• *Using GCC fallback when building applications* on page 3-24.

See the following in the Compiler Reference:

• *-Warmcc,--gcc fallback* on page 3-221.

C3339W ambiguous translation mode options specified - using <option>

Multiple translation mode options --translate_gcc, --translate_g++, and --translate_gld were specified. You must specify only one of these options to select a particular translation mode.

See the following in the Compiler Reference:

- --translate g++ on page 3-197
- *--translate gcc* on page 3-199
- --translate gld on page 3-201.

C3340W

could not obtain license for vectorization (implied by -03) - defaulting to -fno-tree-vectorize

With GCC command-line translation, -03 implies vectorization. However, this requires a license to use the NEON vectorization feature of the compiler. Where a NEON vectorization license is not available, the compiler emits warning C3340W and disables vectorization.

See the following in *Introducing the ARM Compiler toolchain*:

Licensed features of the toolchain on page 2-10.

See the following in the *Compiler Reference*:

-Onum on page 3-155.

C3403E __alloca_state not defined

C3419W dynamic stack alignment veneer inserted in <entity>

This warning is given when compiling __irq functions for --cpu=Cortex-M3-rev0

to force the stack to be 8-byte aligned on entry into the interrupt.

C3421W write to string literal

> There is a write through a pointer that has been assigned to point at a literal string. The behavior is undefined by to the ANSI standard. A subsequent read from the location written might not reflect the write.

C3435E reference to <entity> not allowed

C3447E option '-E' and input file '<filename>' type conflict

C3484E Minimum toplevel array alignment must be 1, 2, 4 or 8

C3486W option '-<optionchar>' causes input file '<filename>' to be ignored

C3487E read from variable '<var>' with offset out of bounds

> For example: void foo(void) { unsigned int pntr; pntr = (unsigned int)&pntr; pntr -= 4; pntr = *(unsigned int*)pntr;

C3488E write to variable '<var>' with offset out of bounds

C3489E __vfp_status() intrinsic not supported for targets without VFP

C3490W instruction set switching using file extension is deprecated

C3493E Function alignment must be a power of 2 and greater than 1

C3494E invalid global register number <num>; 1 to <num> allowed

C3497E invalid syntax for retention constraint: <text>

C3498E option conflicts with an arm linux targeting option: <option>

> Certain options are expected to be used when targeting ARM Linux, for example to select the correct ABI variant options. This message is given to indicate when an incompatible option is specified.

See the following in the Compiler Reference:

--arm linux on page 3-16.

Chapter 3 Assembler Errors and Warnings

The error and warning messages for the assembler, armasm, are listed in the following topic:

• List of the armasm error and warning messages on page 3-2.

3.1 List of the armasm error and warning messages

The error and warning messages for armasm are:

A1017E :INDEX: cannot be used on a pc-relative expression

> The :INDEX: expression operator has been applied to a PC-relative expression, most likely a program label. : INDEX: returns the offset from the base register in a register-relative expression.

> use <label> - <areaname>.

See the following in *Using the Assembler*:

Unary operators on page 8-21.

A1020E Bad predefine: <directive>

The operand to the --predefine (-pd) command line option was not recognized. The directive must be enclosed in quotes if it contains spaces, for example on

--predefine "versionnum SETA 5"

If the SETS directive is used, the argument to the directive must also be enclosed in quotes, which might require escaping depending upon operating system and shell. For example:

--predefine "versionstr SETS \"5A\""

A1021U No input file

No input file was specified on the command line. This might be because there was no terminating quote on a quoted argument.

A1023E File "<filename>" could not be opened: <reason>

A1024E File "<filename>" could not all be loaded: <reason>

A1042E Unrecognized APCS qualifier '<qualifier>'

> There is an error in the argument given to the --apcs command line option. Check the spelling of <qualifier>.

A1051E Cannot open --depend file '<filename>': <reason>

A1055E Cannot open --errors file '<filename>': <reason>

A1056E Target cpu '<cpu>' not recognized

> The name given in the --cpu command line option is not a recognized processor name. Check the spelling of the argument.

Use --cpu=list to list the supported processors and architectures.

A1067E Output file specified as '<filename1>', but it has already been specified as '<filename2>'

More than one output file, -o filename, has been specified on the command line.

Misspelling a command line option can cause this.

A1071E Cannot open listing file '<filename>': <reason>

> The file given in the --list <filename> command line option could not be opened. This could be because the given name is not valid, there is no space, a read-only file with the same name already exists, or the file is in use by another process. Check that the correct path for the file is specified.

A1072E The specified listing file '<filename>' must not be a .s or .o file The filename argument to the --list command line option has an extension that indicates it is a source or object file. This might be because the filename argument was accidentally omitted from the command line. Check that the correct argument is given to the --list command line option.

A1073E The specified output file '<filename>' must not be a source file

The object file specified on the command line has a filename extension that indicates it is a source file. This might be because the object filename was accidentally omitted from the command line.

A1074E The specified depend file '<filename>' must not be a source file

The filename argument to the --depend command line option has an extension that indicates it is a source (.s) file. This might be because the filename argument was accidentally omitted from the command line. Check that the correct arguments are given.

A1075E The specified errors file '<filename>' must not be a source file

The filename argument to the --errors command line option has an extension that indicates it is a source (.s) file. This might be because the filename argument was accidentally omitted from the command line. Check that the correct arguments are given.

A1085W Forced user-mode LDM/STM must not be followed by use of banked R8-R14

The ARM architecture does not permit you to access the banked registers on the instruction following a USER registers LDM or STM. The ARM Architecture Reference Manual says this form of LDM must not be followed by an instruction, which accesses banked registers (a following NOP is a good way to ensure this).

Example:

stmib sp, $\{r0-r14\}^{\wedge}$; Return a pointer to the frame in al. mov r0, sp

change to:

stmib sp, $\{r0-r14\}^{\wedge}$; Return a pointer to the frame in a1. nop

mov r0, sp

A1088W Faking declaration of area AREA |\$\$\$\$\$\$|

This is given when no AREA is given (see A1105E).

A1099E Structure stack overflow max stack size <max>

A1100E Structure stack underflow

A1105E Area directive missing

This is given when no AREA is given (see also A1088W).

A1106E Missing comma

A1107E Bad symbol type, expect label

A1108E Multiply defined symbol '<name>'

A1109E Bad expression type

A1110E Expected constant expression

A constant expression was expected after, for example, SETA.

See the following in *Using the Assembler*:

• *Numeric expressions* on page 8-16.

A1111E Expected constant or address expression

A1112E Expected address expression

A1113E Expected string expression

A string expression was expected after, for example, SETS.

See the following in *Using the Assembler*:

• *String expressions* on page 8-14.

A1114E Expected register relative expression

A1116E String operands can only be specified for DCB

A1117E Register symbol '<name>' already defined

A1118E No current macro expansion

A1119E MEND not allowed within conditionals

MEND means END of Macro (not the English word mend).

See the following in *Using the Assembler*:

• *Use of macros* on page 5-30.

A1120E Bad global name

A1121E Global name '<name>' already exists

A1122E Locals not allowed outside macros

A1123E Bad local name

A1125E Unknown or wrong type of global/local symbol '<name>'

A1126E Bad alignment boundary, must be a multiple of 2

A1127E Bad IMPORT/EXTERN name

A1128E Common name '<sym>' already exists

A1129E Imported name '<sym>' already exists

A1130E Bad exported name

A1131E Bad symbol type for exported symbol '<sym>'

A1132E REQUIRE directive not supported for <entity> format output

A1133E Bad required symbol name

A1134E Bad required symbol type, expect (symbol is either external or label) and (symbol is relocatable and absolute)

A1135E Area name missing

AREA names starting with any non-alphabetic character must be enclosed in bars, for example change:

burs, for example change.

AREA 1_DataArea, CODE, READONLY

to:

AREA |1_DataArea|, CODE, READONLY

A1136E Entry address already set

A1137E Unexpected characters at end of line

This is given when extra characters that are not part of an instruction are found on an instruction line.

For example:

ADD r0, r0, r1 comment

Can be changed to:

ADD r0, r0, r1; comment

A1138E String "<string>" too short for operation, length must be > <oplength>

A1139E String overflow, string exceeds <max> characters

A1140E Bad operand type

A1141E Relocated expressions may only be added or subtracted

A1142E Subtractive relocations not supported for <entity> format output

This can occur when subtracting symbols that are in different areas, for example:

IMPORT sym1
IMPORT sym2
DCD (sym2 - sym1)

A1143E COMMON directive not supported for %s format output

A1144E DCDO directive not supported for %s format output

A1145E Undefined exported symbol '<sym>'

A1146E Unable to open output file <codeFileName>: <reason>

A1147E Bad shift name

A1148E Unknown shift name <name>, expected one of LSL, LSR, ASR, ROR, RRX

A1150E Bad symbol, not defined or external

This typically occurs in the following cases:

 when the current file requires an INCLUDE of another file to define some symbols, for example:

"init.s", line 2: Error: A1150E: Bad symbol 2 00000000 DCD EBI_CSR_0

typically requires a definitions file to be included, for example:

INCLUDE targets/eb40.inc

• when the current file requires IMPORT for some symbols, for example:

"init.s", line 4: Error: A1150E: Bad symbol 4 00000000 LDR r0, =||Image\$\$RAM\$\$ZI\$\$Limit||

typically requires the symbol to be imported, for example:

IMPORT ||Image\$\$RAM\$\$ZI\$\$Limit||

A1151E Bad register name symbol

Example:

MCR p14, 3, R0, Cr1, Cr2

The coprocessor registers CR must be labelled as a lowercase c for the code to build. The ARM register can be r or R:

MCR p14, 3, r0, c1, c2

or

MCR p14, 3, R0, c1, c2

A1152E Unexpected operator

A1153E Undefined symbol

A1154E Unexpected operand, operator expected

A1155E Unexpected unary operator equal to or equivalent to coperator>

A1156E Missing open bracket

A1157E Syntax error following directive

A1158E Illegal line start, should be blank

Some directives, for example, ENTRY, IMPORT, EXPORT, and GET must be on a line without a label at the start of the line. This error is given if a label is present.

A1159E Label missing from line start

Some directives, for example, FUNCTION or SETS, require a label at the start of the line, for example:

my_func FUNCTION

or

label SETS

This error is given if the label is missing.

A1160E Bad local label number

A local label is a number in the range 0-99, optionally followed by a name.

See the following in *Using the Assembler*:

• Local labels on page 8-12.

A1161E Syntax error following local label definition

A1162E Incorrect routine name '<name>'

A1163E Unknown opcode <name> , expecting opcode or Macro

The most common reasons for this are:

 Forgetting to put some white space on the left hand side margin, before the instruction, for example change:

MOV PC,LR

to

MOV PC, LR

Use of a hardware floating point instruction without using the -- fpu switch, for example:

FMXR FPEXC, r1;

must be assembled with armasm -- fpu vfp

Mis-typing the opcode:

ADDD

instead of

ADD

A1164E Opcode not supported on selected processor

The processor selected on the armasm command line does not support this instruction. See the ARM Architecture Reference Manuals,

http://infocenter.arm.com/help/topic/com.arm.doc.subset.architecture.reference/index.html#reference.

All65E Too many actual parameters, expecting <actual> parameters

A1166E Syntax error following label

A1167E Invalid line start

A1168E Translate not allowed in pre-indexed form

A1169E Missing close square bracket

A1170E Immediate 0x<adr> out of range for this operation, must be below (0x<adr>)

This error is given when DCB, DCW or DCWU directives are used with immediates that are too large.

See the following in the Assembler Reference:

• *DCB* on page 6-20

• *DCW and DCWU* on page 6-27.

A1171E Missing close bracket

A1172E Bad rotator <rotator>, must be even and between 0 and 30

A1173E ADR/L cannot be used on external symbols

The ADR and ADRL pseudo-instructions can only be used with labels within the same code area. To load an out-of-area address into a register, use LDR instead.

A1174E Data transfer offset 0x<val> out of range. Permitted values are 0x<mini> to 0x<maxi>

A1175E Bad register range

A1176E Branch offset 0x<val> out of range. Permitted values are 0x<mini> to

0x<maxi>

Branches are PC relative, and have a limited range. If you are using "local labels", you can use the ROUT directive to limit the scope of local labels, to help avoid referring to a wrong label by accident.

See the following in *Using the Assembler*:

• *Local labels* on page 8-12.

A1179E Bad hexadecimal number

A1180E Missing close quote

A1181E Bad operator

A1182E Bad based <base> number

A1183E Numeric overflow

A1184E Externals not valid in expressions

A1185E Symbol missing

A1186E Code generated in data area

An instruction has been assembled into a data area. This can happen if you have omitted the CODE attribute on the AREA directive.

See the following in the Assembler Reference:

AREA on page 6-61.

A1187E Error in macro parameters

A1188E Register value <val> out of range. Permitted values are <mini> to <maxi>

A1189E Missing '#'

A1190E Unexpected '<entity>'

A1191E Floating point register number out of range 0 to <maxi>

A1192E Coprocessor register number out of range 0 to 15

A1193E Coprocessor number out of range 0 to 15

A1194E Bad floating-point number

A1195W Small floating point value converted to 0.0

A1196E Too late to ban floating point

A1198E Unknown operand

This can occur when an operand is accidentally miss-typed.

For example:

armasm init.s -g -PD "ROM_RAM_REMAP SETL {FALS}"

must be:

armasm init.s -q -PD "ROM_RAM_REMAP SETL {FALSE}"

See the following in *Using the Assembler*:

• *Assembly time substitution of variables* on page 8-6.

A1199E Coprocessor operation out of range 0 to <maxi>

A1200E Structure mismatch expect While/Wend

A1201E Substituted line too long, maximum length <max>

A1202E No pre-declaration of substituted symbol '<name>'

See the following in *Using the Assembler*:

• *Assembly time substitution of variables* on page 8-6.

A1203E Illegal label parameter start in macro prototype

A1204E Bad macro parameter default value

A1205E Register < reg> occurs multiply in list

A1206E Registers should be listed in increasing register number order

This warning is given if registers in, for example, LDM or STM instructions are not specified in increasing order and the --checkreglist option is used.

A1207E Bad or unknown attribute

This error is given when an invalid attribute is given in the AREA directive. For

example:

AREA test, CODE, READONLY, HALFWORD HALFWORD is invalid, so remove it.

See the following in the Assembler Reference:

AREA on page 6-61.

A1209E	ΔDRI	cannot	hρ	hazıı	with	PC	ac	destination
AIZUZE	AUNL	Callillot	υe	useu	WILII	r.	as	uestillation

A1210E Non-zero data within uninitialized area '<name>'

A1211E Missing open square bracket

A1212E Division by zero

A1213E Attribute <entity> cannot be used with attribute <entity>

A1214E Too late to define symbol '<sym>' as register list

A1215E Bad register list symbol

A1216E Bad string escape sequence

A1217E Error writing to code file <codeFileName>: <reason>

A1219E Bad APSR, CPSR or SPSR designator

For example:

MRS r0, PSR

It is necessary to specify which status register to use (CPSR or SPSR), such as,

for example:

MRS r0, CPSR

A1220E BLX <address> must be unconditional

A1221E Area attribute '<entity>' not supported for <entity> object file format

A1223E Comdat Symbol '<name>' is not defined

A1224E <entity> format does not allow PC-relative data transfers between areas

A1225E ASSOC attribute is not allowed in non-comdat areas

A1226E SELECTION attribute is not allowed in non-comdat areas

A1227E Comdat Associated area '<name>' undefined at this point in the file

A1228E Comdat Associated area '<name>' is not an area name

A1229E Missing COMDAT symbol

A1230E Missing '}' after COMDAT symbol

A1234E Undefined or Unexported Weak Alias for symbol '<sym>'

 ${f A1237E}$ Invalid register or register combination for this operation

A1238E Immediate value must be word aligned when used in this operation

A1240E Immediate value cannot be used with this operation

A1241E Must have immediate value with this operation

A1242E Offset must be word aligned when used with this operation

A1243E Offset must be halfword aligned with this operation

A1244E Missing '!'

A1245E B or BL from Thumb code to ARM code

A1247E BLX from ARM code to ARM code, use BL

This occurs when there is a BLX <label> branch from ARM code to ARM code within this assembler file. This is not permitted because BLX <label> always results in a state change. The usual solution is to use BL instead.

A1248E BLX from Thumb code to Thumb code, use BL

This occurs when there is a BLX <label> branch from Thumb code to Thumb code within this assembler file. This is not permitted because BLX <label> always results in a state change. The usual solution is to use BL instead.

A1249E Post indexed addressing mode not available

 ${f A1250E}$ Pre indexed addressing mode not available for this instruction, use [Rn, Rm]

A1253E Thumb branch to external symbol cannot be relocated: not representable in

A1254E Halfword literal values not supported

Example:

LDRH R3, =constant

Change the LDRH into LDR, which is the standard way of loading constants into registers.

A1256E DATA directive can only be used in CODE areas

 ${f A1259E}$ Invalid PSR field specifier, syntax is <PSR>_ where <PSR> is either CPSR or SPSR

A1260E PSR field '<entity>' specified more than once

A1261E MRS cannot select fields, use APSR, CPSR or SPSR directly

This is caused by an attempt to use fields for CPSR or SPSR with an MRS instruction, such as:

MRS r0, CPSR_c

A1262U Expression storage allocator failed

A1265U Structure mismatch: IF or WHILE unmatched at end of INCLUDE file

A1267E Bad GET or INCLUDE for file <filename>

A1268E Unmatched conditional or macro

A1269U unexpected GET on structure stack

A1270E File "<entity>" not found

A1271E Line too long, maximum line length is <MaxLineLength>

A1272E End of input file

A1273E '\\' should not be used to split strings

A1274W '\\' at end of comment

A1283E Literal pool too distant, use LTORG to assemble it within 1KB

For Thumb code, the literal pool must be within 1KB of the LDR instruction to

access it. See A1284E and A1471W.

A1284E Literal pool too distant, use LTORG to assemble it within 4KB

For ARM code, the literal pool must be within 4KB of the LDR instruction to access it. To solve this, add an LTORG directive into your assembler source file at a convenient place.

See the following in *Using the Assembler*:

• Load addresses to a register using LDR Rd, =label on page 5-17.

See the following in the Assembler Reference:

• *LTORG* on page 6-16.

A1285E Bad macro name

A1286E Macro already exists

A1287E Illegal parameter start in macro prototype

A1288E Illegal parameter in macro prototype

A1289E Invalid parameter separator in macro prototype

A1290E Macro definition too big, maximum length <max>

A1291E Macro definitions cannot be nested

A1310W Symbol attribute not recognized

A1311U macro definition attempted within expansion

A1312E Assertion failed

A1313W Missing END directive at end of file

The assembler requires an END directive to know when the code in the file terminates. You can add comments or other such information in free format after this directive.

this directive

 ${\bf A1314W}$ Reserved instruction (using NV condition)

A1315E NV condition not supported on targeted CPU

A1316E Shifted register operand to MSR has undefined effect

A1319E Undefined effect (using PC as Rs)

A1320E Undefined effect (using PC as Rn or Rm in register specified shift)

A1321E Undefined effect (using PC as offset register)

A1322E Unaligned transfer of PC, destination address must be 4 byte aligned, otherwise result is UNPREDICTABLE

This error is reported when you try to use an LDR instruction to load the PC from a non word-aligned address. According to the ARM Architecture Reference

Manual, this gives an UNPREDICTABLE result. For example:

AREA Example, CODE

LDR pc, [pc, #6] ; Error - offset must be a multiple of 4

END

A1323E Reserved instruction (Rm = Rn with post-indexing)

A1324E Undefined effect (PC + writeback)

A1327E Non portable instruction (LDM with writeback and base in register list,

final value of base unpredictable)

LDM Operand restriction:

• If the base register <Rn> is specified in <registers>, and base register writeback is specified, the final value of <Rn> is UNKNOWN.

A1328E

Non portable instruction (STM with writeback and base not first in register list, stored value of base unpredictable)

STM Operand restrictions if <Rn> is specified as <registers> and base register writeback is specified:

- If <Rn> is the lowest-numbered register specified in <register_list>, the original value of <Rn> is stored.
- Otherwise, the stored value of <Rn> is UNKNOWN.

A1329E

Unpredictable instruction (forced user mode transfer with write-back to base)

This is caused by an instruction such as PUSH {r0}^ where the ^ indicates access to user registers. The ARM Architectural Reference Manual specifies that writeback to the base register is not available with this instruction.

Instead, the base register must be updated separately. For example:

```
SUB sp, sp,#4
STMID sp, {r0}^
```

Another example is replacing STMFD R0!, {r13, r14}^ with:

```
SUB r0, r0,#8
STM r0, {r13, r14}∧
```

See also A1085W

- A1331E Unpredictable instruction (PC as source or destination)
- A1332E Unpredictable effect (PC-relative SWP)
- A1334E Undefined effect (use of PC/PSR)
- A1335E Useless instruction (PC cannot be written back)
- A1337E Useless instruction (PC is destination)
- A1338E Dubious instruction (PC used as an operand)
- A1339E Unpredictable if RdLo and RdHi are the same register
- ${f A1341E}$ Branch to unaligned destination, expect destination to be <max> byte aligned
- A1342W <name> of symbol in another AREA will cause link-time failure if symbol is
 not close enough to this instruction
- A1344I host error: out of memory
- A1355U A Label was found which was in no AREA

Example:

This can occur where no white-space precedes an assembler directive.

Assembler directives must be indented with white-space, for example use:

```
IF :DEF: F00
; code
ENDIF
instead of:
```

IF :DEF: F00
 ; code
ENDIF

Symbols in the left-hand column are assumed to be labels.

A1356E Instruction not supported on targeted CPU

This occurs if you try to use an instruction that is not supported by the default architecture or processor for armasm.

For example:

SMULBB r0,r0,r1;

can be assembled with:

armasm --cpu 5TE

The processor selected on the armasm command line does not support this instruction. See the ARM Architecture Reference Manuals,

http://infocenter.arm.com/help/topic/com.arm.doc.subset.architecture.refer ence/index.html#reference.

A1406E Bad decimal number

A1407E Overlarge floating point value

A1408E Overlarge (single precision) floating point value

A1409W Small (single precision) floating value converted to 0.0

A1411E Closing '>' missing from vector specifier

A1412E Bad vector length, should be between <min> and <max>

A1413E Bad vector stride, should be between <min> and <max>

A1414E Vector wraps round over itself, length * stride should not be greater than

<max>

A1415E VFPASSERT must be followed by 'VECTOR' or 'SCALAR'

A1416E Vector length does not match current vector length <len>

A1417E Vector stride does not match current vector stride

A1418E Register has incorrect type '<type>' for instruction, expect floating

point/double register type

A1419E Scalar operand not in a scalar bank

A1420E Lengths of vector operands are different

A1421E Strides of vector operands are different

 ${f A1422E}$ This combination of vector and scalar operands is not allowed

A1423E This operation is not vectorizable

A1424E Vector specifiers not allowed in operands to this instruction

A1425E Destination vector must not be in a scalar bank

A1426E Source vector must not be in a scalar bank

A1427E Operands have a partial overlap

A1428E Register list contains registers of varying types

A1429E Expected register list

The assembler reports this when FRAME SAVE and FRAME RESTORE directives are not given register lists.

See the following in the Assembler Reference:

- FRAME RESTORE on page 6-42
- FRAME SAVE on page 6-44.
- A1430E Unknown frame directive
- **A1431E** Frame directives are not accepted outside of PROCs/FUNCTIONS See the following in *Using the Assembler*:
 - *Frame directives* on page 5-37.
- A1432E Floating-point register type not consistent with selected floating-point architecture
- A1433E Only the writeback form of this instruction exists

The addressing mode specified for the instruction did not include the writeback specifier (that is, a '!' after the base register), but the instruction set only supports the writeback form of the instruction. Either use the writeback form, or replace with instructions that have the required behavior.

- A1435E {PCSTOREOFFSET} is not defined when assembling for an architecture {PCSTOREOFFSET} is only defined when assembling for a processor, not for an architecture.
- A1437E {ARCHITECTURE} is undefined {ARCHITECTURE} is only defined when assembling for an architecture, not for a processor.
- ${\bf A1446E}$ Bad or unknown attribute '<attr>'. Use --apcs /interwork instead Example:

```
AREA test1, CODE, READONLY AREA test, CODE, READONLY, INTERWORK
```

This code might have originally been intended to work with SDT. The INTERWORK area attribute is now obsolete. To eliminate the warning:

- remove the ", INTERWORK" from the AREA line.
- assemble with 'armasm --apcs /interwork foo.s' instead
- A1447W Missing END directive at end of file, but found a label named END This is caused by the END directive not being indented.
- A1448E Deprecated form of PSR field specifier used (use _f)
- A1449E Deprecated form of PSR field specifier used (use _c)
- A1450E Deprecated form of PSR field specifier used (use _cxsf for future compatibility)

The assembler, armasm, supports the full range of MRS and MSR instructions, in the form:

```
MRS(cond) Rd, CPSR
MRS(cond) Rd, SPSR
MSR(cond) CPSR_fields, Rm
```

```
MSR(cond) SPSR_fields, Rm
MSR(cond) CPSR_fields, #immediate
MSR(cond) SPSR_fields, #immediate
```

where fields can be any combination of cxsf.

Earlier releases of the assembler permitted other forms of the MSR instruction to modify the control field and flags field:

- cpsr or cpsr_all, control and flags field
- · cpsr flg, flags field only
- cpsr ctl, control field only.

Similar control and flag settings apply for SPSR.

These forms are now deprecated and must not be used. If your legacy code contains them, the assembler reports:

Deprecated form of PSR field specifier used (use _cxsf)

To avoid the warning, in most cases you can simply modify your code to use _c, _f, _cf or _cxsf instead.

See the following in *Using the Assembler*:

- Conditional execution in ARM state on page 6-3
- Conditional execution in Thumb state on page 6-4
- General-purpose registers on page 3-11
- *Access to the inline barrel shifter* on page 3-25.

See also the FAQ armasm: use of MRS and MSR instructions ('Deprecated form of PSR field specifier'),

http://infocenter.arm.com/help/topic/com.arm.doc.fags/ka3724.html.

A1454E

FRAME STATE RESTORE directive without a corresponding FRAME STATE REMEMBER See the following in *Using the Assembler*:

• *Frame directives* on page 5-37.

See the following in the Assembler Reference:

- FRAME STATE REMEMBER on page 6-45
- FRAME STATE RESTORE on page 6-46.

A1456W

INTERWORK area directive is obsolete. Continuing as if --apcs /inter
selected

Example:

AREA test, CODE, READONLY, INTERWORK

This code might have originally been intended to work with SDT. The INTERWORK area attribute is now obsolete. To eliminate the warning:

- 1. Remove the ", INTERWORK" from the AREA line.
- 2. Assemble with armasm --apcs /interwork foo.s instead.

A1457E

Cannot mix INTERWORK and NOINTERWORK code areas in same file

INTERWORK and (default) NOINTERWORK code areas cannot be mixed in the same file. This code might have originally been intended to work with SDT. The INTERWORK area attribute is obsolete in the ARM Compiler toolchain.

Example:

```
AREA test1, CODE, READONLY
...
AREA test2, CODE, READONLY, INTERWORK
```

To eliminate the error:

- move the two AREAs into separate assembler files such as, for example, test1.s and test2.s
- 2. remove the ", INTERWORK" from the AREA line in test2.s
- 3. assemble test1.s with armasm --apcs /nointerwork
- 4. assemble test2.s with armasm --apcs /interwor
- 5. at link time, the linker adds any necessary interworking veneers.

A1458E DCFD or DCFDU not allowed when fpu is None

A1459E Cannot B or BL to a register

This form of the instruction is not permitted. See the *ARM Architecture Reference Manual* for the permitted forms.

 ${\bf A1461E} \qquad \hbox{Specified processor or architecture does not support Thumb instructions}$

It is likely that you are specifying a specific architecture or cpu using the --cpu option and then incorporating some Thumb code in the AREA that is generating this error.

For example:

A1466W

armasm --cpu 4 code.s

StrongARM is an architecture 4 (not 4T) processor and does not support Thumb code.

A1462E Specified memory attributes do not support this instruction

A1463E SPACE directive too big to fit in area, area size limit 2^32

A1464W ENDP/ENDFUNC without corresponding PROC/FUNC

Operator precedence means that expression would evaluate differently in C armasm has always evaluated certain expressions in a different order to C. This warning might help C programmers from being caught out when writing in assembler.

To avoid the warning, either:

- modify the code to make the evaluation order explicit (that is, add more brackets)
- suppress the warning with --unsafe switch.

See the following in *Using the Assembler*:

• *Operator precedence* on page 8-29.

A1467W FRAME ADDRESS with negative offset <offset> is not recommended

 ${f A1468W}$ FRAME SAVE saving registers above the canonical frame address is not recommended

A1469E FRAME STATE REMEMBER directive without a corresponding FRAME STATE RESTORE See the following in *Using the Assembler*:

• Frame directives on page 5-37.

See the following in the Assembler Reference:

- FRAME STATE REMEMBER on page 6-45
- FRAME STATE RESTORE on page 6-46.

A1471W Directive <directive > may be in an executable position

This can occur with, for example, the LTORG directive (see A1283E & A1284E). LTORG instructs the assembler to dump literal pool DCD data at this position.

To prevent this warning from occurring, the data must be placed where the processor cannot execute them as instructions. A good place for an LTORG is immediately after an unconditional branch, or after the return instruction at the end of a subroutine.

As a last resort, you could add a branch over the LTORG, to avoid the data being executed, for example:

```
B unique_label
LTORG
unique_label
```

A1475E

At least one register must be transferred, otherwise result is $\ensuremath{\mathsf{UNPREDICTABLE}}$

A1476E

BX r15 at non word-aligned address is UNPREDICTABLE

A1477E

This register combination results in UNPREDICTABLE behavior

This error is generated when you are assembling an instruction that has UNPREDICTABLE results on execution. You must rewrite your code to avoid this UNPREDICTABLE behaviour. For example, the following instructions all cause this error when assembling to Thumb, and the target architecture is ARMv6T2 or later:

```
ADD sp, r0, #100; error - UNPREDICTABLE use of SP
CMP pc, #1; error - UNPREDICTABLE use of PC
PUSH {r0, pc}; error - use of an UNPREDICTABLE register combination
```

A1479W

Requested alignment <alignreq> is greater than area alignment <align>, which has been increased

This is warning about an ALIGN directive that has a coarser alignment boundary than its containing AREA. This is not permitted. To compensate, the assembler automatically increases the alignment of the containing AREA for you. A simple test case that gives the warning is:

```
AREA test, CODE, ALIGN=3
ALIGN 16
mov pc, 1r
END
```

In this example, the alignment of the AREA (ALIGN=3) is $2^3=8$ byte boundary, but the mov pc, 1r instruction is on a 16-byte boundary, causing the error.

The two alignment types are specified in different ways.

This warning can also occur when using AREA ... ALIGN=0 to align a code section on a byte boundary. This is not possible. Code sections can only be aligned on:

- a four-byte boundary for ARM code, so use "ALIGN=2"
- a two-byte boundary for Thumb code, so use "ALIGN=1".

See the following in the Assembler Reference:

- ALIGN on page 6-59
- *AREA* on page 6-61.

A1480W Macr

Macro cannot have same name as a directive or instruction

A1482E

Shift option out of range, allowable values are from <min> to <max>

A1484W

Obsolete shift name 'ASL', use LSL instead

The ARM architecture does not have an ASL shift operation. The ARM barrel shifter only has the following shift types: ROR, ASR, LSR, and LSL.

An arithmetic (that is, signed) shift left is the same as a logical shift left, because the sign bit always gets shifted out.

Earlier versions of the assembler silently converted ASL to LSL. Use the --unsafe switch to downgrade this error to a warning.

See the following in the Assembler Reference:

- --unsafe on page 2-24
- ASR, LSL, LSR, ROR, and RRX on page 3-72.
- $\begin{array}{lll} A1485E & & \text{LDM/STM instruction exceeds maximum register count <max> allowed with \\ --split_ldm & \end{array}$
- A1486E ADR/ADRL of a symbol in another AREA is not supported in ELF

 The ADR and ADRL pseudo-instructions can only be used with labels within the

same code section. To load an out-of-area address into a register, use LDR instead.

A1487W Obsolete instruction name 'ASL', use LSL instead

The Thumb instruction ASL is now faulted. See the corresponding ARM ASL message A1484W.

A1488W PROC/FUNC at line lineno> in '<filename>' without matching ENDP/ENDFUNC

A1489E <FPU> is undefined

A1490E <CPU> is undefined

{CPU} is only defined by assembling for a processor and not an architecture.

A1491W Internal error: Found relocation at offset <offset> with incorrect alignment

This might indicate an assembler fault. Contact your supplier.

A1492E Immediate 0x<val> out of range for this operation. Permitted values are 0x<min> to 0x<max>

A1493E REQUIRE must be in an AREA

A1495W Target of branch is a data address

armasm determines the type of a symbol and detects branches to data. Specify --diag-suppress 1495 to suppress this warning.

A1496W Absolute relocation of ROPI address with respect to symbol '<symbol>' at offset <offset> may cause link failure

For example, when assembling with --apcs /ropi:

AREA code, CODE codeaddr DCD codeaddr END

because this generates an absolute relocation (R_ARM_ABS32) to a PI code symbol.

A1497W Absolute relocation of RWPI address with respect to symbol '<symbol>' at offset <offset> may cause link failure

For example, when assembling with --apcs /rwpi:

AREA data, DATA dataaddr DCD dataaddr END because this generates an absolute relocation (R_ARM_ABS32) to a PI data symbol.

A1498E Unexpected characters following Thumb instruction

For example:

ADD r0, r0, r1

is accepted as a valid instruction, for both ARM and Thumb, but:

ADD r0, r0, r1, ASR #1

is a valid instruction for ARM, but not for Thumb, so the unexpected characters are ", ASR #1".

A1499E Register pair is not a valid contiguous pair

A1500E Unexpected characters when expecting '<eword>'

A1501E Shift option out of range, allowable values are 0, 8, 16 or 24

A1502W Register <reg> is a caller-save register, not valid for this operation

A1505E Bad expression type, expect logical expression

A1506E Accumulator should be in form accx where x ranges from 0 to <max>

 ${f A1507E}$ Second parameter of register list must be greater than or equal to the

first

A1508E Structure mismatch expect Conditional

A1509E Bad symbol type, expect label, or weak external symbol

A1510E Immediate 0x<imm> cannot be represented by 0-255 and a rotation

A1511E Immediate cannot be represented by combination of two data processing

instructions

 ${\bf A1512E}$ Immediate 0x<val> out of range for this operation. Permitted values are

<mini> to <maxi>

A1513E Symbol not found or incompatible Symbol type for '<name>'

A1514E Bad global name '<name>'

A1515E Bad local name '<name>'

A1516E Bad symbol '<name>', not defined or external

A1517E Unexpected operator equal to or equivalent to <operator>

A1539E Link Order dependency '<name>' not an area

A1540E Cannot have a link order dependency on self

A1541E <code> is not a valid condition code

A1542E Macro names <name1> and <name2>[parameter] conflict

A1543W Empty macro parameter default value

A1544E Invalid empty PSR field specifier, field must contain at least one of

c,x,s,f

A1545U Too many sections for one <objfmt> file

A1546W Stack pointer update potentially breaks 8 byte stack alignment

Example:

PUSH {r0}

The stack must be eight-byte aligned on an external boundary so pushing an odd number of registers causes this warning to be given. This warning is suppressed by default. To enable this warning use --diag_warning 1546.

See the following in the Assembler Reference:

• --diag warning=tag{, tag} on page 2-12.

A1547W

PRESERVE8 directive has automatically been set

Example:

PUSH {r0,r1}

This warning has been given because the PRESERVE8 directive has not been explicitly set by the user, but the assembler has set this itself automatically. This warning is suppressed by default. To enable this warning use --diag_warning 1547.

See the following in the Assembler Reference:

- --diag warning=tag{, tag} on page 2-12
- REQUIRE8 and PRESERVE8 on page 6-76.

A1548W

Code contains LDRD/STRD indexed/offset from SP but REQUIRE8 is not set

Example:

PRESERVE8

STRD r0, [sp, #8]

This warning is given when the REQUIRE8 directive is not set when required.

See the following in the Assembler Reference:

• *REQUIRE8 and PRESERVE8* on page 6-76.

A1549W

Setting of REQUIRE8 but not PRESERVE8 is unusual

Example:

PRESERVE8 {FALSE}

REQUIRE8

STRD r0,[sp,#8]

A1550U Input and output filenames are the same

A1551E Cannot add Comdef area <name> to non-comdat group

A1560E Non-constant byte literal values not supported

A1561E MERGE and STRING sections must be data sections

 ${f A1562E}$ Entry size for Merge section must be greater than 0

A1563W Instruction stalls CPU for <stalls> cycle(s)

The assembler can give information about possible interlocks in your code caused by the pipeline of the processor chosen by the --cpu option. To do this assemble with armasm --diag_warning 1563

_____Note _____

If the --cpu option specifies a multi-issue processor such as Cortex-A8, the interlock warnings are unreliable.

See also warning A1746W.

A1572E Operator SB_OFFSET_11_0 only allowed on LDR/STR instructions

A1573E Operator SB_OFFSET_19_12 only allowed on Data Processing instructions

A1574E Expected one or more flag characters from "<str>
A1575E BLX with bit[0] equal to 1 is architecturally UNDEFINED

A1576E Bad coprocessor register name symbol

A1577E Bad coprocessor name symbol

A1578E Bad floating point register name symbol '<sym>'

Added <no_padbytes> bytes of padding at address <address>

The assembler warns by default when padding bytes are added to the generated code. This occurs whenever an instruction/directive is used at an address that requires a higher alignment, for example, to ensure ARM instructions start on a four-byte boundary after some Thumb instructions, or where there is a DCB

followed by DCD.

For example:

```
AREA Test, CODE, READONLY
THUMB
ThumbCode
MOVS r0, #1
ADR r1, ARMProg
BX r1
; ALIGN; <<< add to avoid the first warning
ARM
ARMProg
ADD r0,r0,#1
BX LR
DCB 0xFF
DCD 0x1234
END
```

Results in the warnings:

```
A1581W: Added 2 bytes of padding at address 0x6 8 00000008 ARM
```

A1581W: Added 3 bytes of padding at address 0x11

13 00000014 DCD 0x1234

The warning can also occur when using ADR in Thumb-only code. The ADR Thumb pseudo-instruction can only load addresses that are word aligned, but a label within Thumb code might not be word aligned. Use ALIGN to ensure four-byte alignment of an address within Thumb code.

See the following in the Assembler Reference:

- *ADR (PC-relative)* on page 3-24
- ADR (register-relative) on page 3-26
- *DCB* on page 6-20
- DCD and DCDU on page 6-21
- *ALIGN* on page 6-59.

```
A1582E Link Order area '<name>' undefined
```

A1583E Group symbol '<name>' undefined

A1584W Mode <mode> not allowed for this instruction

A1585E Bad operand type (<typ1>) for operator <op>

A1586E Bad operand types (<typ1>, <typ2>) for operator <op>

A1587E Too many registers <count> in register list, maximum of <max>

A1593E Bad Alignment, must match transfer size UIMM * <dt>

A1595E Bad Alignment, must match <st> * <dt>, or 64 when <st> is 4

A1596E Invalid alignment <align> for dt st combination

A1598E Bad Register list length

A1599E Out of range subscript, must be between 0 and <max_index>

A1600E Section type must be within range SHT_LOOS and SHT_HIUSER

A1601E Immediate cannot be represented

A1603E This instruction inside IT block has UNPREDICTABLE results

A1604W Thumb Branch to destination without alignment to <max> bytes

A1606E Symbol attribute <attr1> cannot be used with attribute <attr2>

A1607E Thumb-2 wide branch instruction used, but offset could fit in Thumb-1

narrow branch instruction

A1608W MOV pc,<rn> instruction used, but BX <rn> is preferred

 ${f A1609W}$ MOV <rd>, pc instruction does not set bit zero, so does not create a return address

This warning is caused when the current value of the PC is copied into a register while executing in Thumb state. An attempt to create a return address in this fashion fails as bit0 is not set. Attempting to BX to this instruction causes a state change (to ARM).

To create a return address, you can use:

MOV r0, pc ADDS r0, #1

This warning can then be safely suppressed with:

--diag-suppress 1609

A1611E Register list increment of 2 not allowed for this instruction

A1612E <type> addressing not allowed for <instr>

A1615E Store of a single element or structure to all lanes is UNDEFINED

A1616E Instruction, offset, immediate or register combination is not supported by the current instruction set

This can be caused by attempting to use an invalid combination of operands. For example, in Thumb:

MOV r0, #1 ; /* Not permitted */ MOVS r0, #1 ; /* Ok */

See the following in the Assembler Reference:

• Chapter 3 ARM and Thumb Instructions.

A1617E Specified width is not supported by the current instruction set

A1618E Specified instruction is not supported by the current instruction set

A1619E Specified condition is not consistent with previous IT

A1620E Error writing to file '<filename>': <reason>

A1621E CB7 or CBN7 from Thumb code to ARM code

A1622E Negative register offsets are not supported by the current instruction set

A1623E Offset not supported by the current instruction set

A1624W Branch from Thumb code to ARM code

A1625W Branch from ARM code to Thumb code

A1626W BL from Thumb code to ARM code

A1627W BL from ARM code to Thumb code

> This occurs when there is a branch from ARM code to Thumb code (or vice-versa) within this file. The usual solution is to move the Thumb code into a separate assembler file. Then, at link-time, the linker adds any necessary interworking veneers.

A1630E Specified processor or architecture does not support ARM instructions

> ARM M-profile processors, for example Cortex-M3 and Cortex-M1, implement only the Thumb instruction set, not the ARM instruction set. It is likely that the assembly file contains some ARM-specific instructions and is being built for one of these processors.

A1631E Only left shifts of 1, 2 and 3 are allowed on load/stores

A1632E Else forbidden in IT AL blocks

A1633E LDR rx,= pseudo instruction only allowed in load word form

A1634E LDRD/STRD has no register offset addressing mode in Thumb

A1635E CBZ/CBNZ can not be made conditional

A1636E Flag setting MLA is not supported in Thumb

A1637E Error reading line: <reason>

A1638E Writeback not allowed on register offset loads or stores in Thumb

A1639E Conditional DCI only allowed in Thumb mode

A1640E Offset must be a multiple of four

A1641E Forced user-mode LDM/STM not supported in Thumb

A1642W Relocated narrow branch is not recommended

Substituted <old> with <new>

A1643E Cannot determine whether instruction is working on single or double precision values.

Cannot use single precision registers with FLDMX/LSTMX

A1644E

armasm can warn when it substitutes an instruction when assembling.

For example:

A1645W

ADD negative_number is the same as SUB positive_number

- MOV negative_number is the same as MVN positive_number
- CMP negative_number is the same as CMN positive_number.

For the Thumb instruction set, UNPREDICTABLE single register LDMs are transformed into LDRs.

This warning is suppressed by default, but can be enabled with --diag_warning 1645

For example:

AREA foo, CODE ADD r0, #-1 MOV r0, #-1 CMP r0, #-1

When assembled with:

armasm --diag_warning 1645

the assembler reports:

Warning: A1645W: Substituted ADD with SUB 3 00000000 ADD r0, #-1 Warning: A1645W: Substituted MOV with MVN 4 00000004 MOV r0, #-1 Warning: A1645W: Substituted CMP with CMN

5 00000008 CMP r0, #-1

and the resulting code generated is:

foo

0x00000000: e2400001 ..@. SUB r0,r0,#1 0x00000004: e3e00000 MVN r0,#0 0x00000008: e3700001 ..p. CMN r0,#1

A1647E Bad register name symbol, expected Integer register

An integer (core) register is expected at this point in the syntax.

A1648E Bad register name symbol, expected Wireless MMX SIMD register
This message relates to Wireless MMX.

A1649E Bad register name symbol, expected Wireless MMX Status/Control or General Purpose register

This message relates to Wireless MMX.

A1650E Bad register name symbol, expected any Wireless MMX register
This message relates to Wireless MMX.

 ${f A1651E}$ TANDC, TEXTRC and TORC instructions with destination register other than R15 is undefined

This message relates to Wireless MMX.

A1652W FLDMX/FSTMX instructions are deprecated in ARMv6. Please use FLDMD/FSTMD instructions to save and restore unknown precision values.

A1653E Shift instruction using a status or control register is undefined

A1654E Cannot access external symbols when loading/storing bytes or halfwords

 ${\bf A1655E}$ Instruction is UNPREDICTABLE if halfword/word/doubleword is unaligned

A1656E Target must be at least word-aligned when used with this instruction

A1657E Cannot load a byte/halfword literal using WLDRB/WLDRH =constant

A1658W Support for <opt> is deprecated

The option passed to armasm is now deprecated. Use armasm --help to view the currently available options.

See the following in the Assembler Reference:

A1739W	Constant generated using single VMOV instruction; second instruction is a \ensuremath{NOP}
A1740E	Number of bytes in FRAME PUSH or FRAME POP directive must not be less than zero $$
A1741E	Instruction cannot be conditional
A1742E	Expected LSL #Imm
A1744E	Alignment on register must be a multiple of 2 in the range 16 to 256
A1745W	This register combination is DEPRECATED and may not work in future architecture revisions
	This warning is generated when all of the following conditions are satisfied:

• you are using a deprecated register combination, for example: PUSH $\{r0, pc\}$

- you are assembling for a target architecture that supports 32-bit Thumb instructions, in other words ARMv6T2 or later
- you are assembling to ARM code.

_____Note _____

- When assembling to Thumb, rather than ARM code, and the target architecture is ARMv6T2 or later, the assembler generates error A1477E instead.
- When assembling for an architecture or processor that does not support 32-bit Thumb instructions, in other words ARM architectures before ARMv6T2, by default no diagnostic is emitted.

A1746W Instruction stall diagnostics may be unreliable for this CPU

The assembler generates messages to help you optimize the code when building with, for example:

--diag_warning 1563 --cpu=Cortex-A8

However, these messages are not reliable because the assembler make sugggestions for modern processors such as the Cortex-A8 and Cortex-A9.

See also warning A1563W.

A1753E Unrecognized memory barrier option

A1754E Cannot change the type of a scalar register

A1755E Scalar index has already been specified on this register

A1756E Data type must be specified on all registers

A1757W Symbol attributes must be within square brackets; Any other syntax is

deprecated

A1758W Exporting multiple symbols with this directive is deprecated

A1759E Specified processor or architecture does not support Thumb-2EE

instructions

A1760W Build Attribute <from> is '<attr>'

A1761W Difference in build attribute from '<diff>' in <from>

A1762E Branch offset 0x<val> out of range of 16-bit Thumb branch, but offset

encodable in 32-bit Thumb branch

This is caused when assembling for Thumb if an offset to a branch instruction is too large to fit in a 16-bit branch. The .W suffix can be added to the instruction to instruct the assembler to generate a 32-bit branch.

instruct the assembler to generate a 52-bit branch

A1763W Inserted an IT block for this instruction

This indicates that the assembler has inserted a IT block to permit a number of conditional instructions in 32-bit Thumb. For example:

MOVEQ r0,r1

This warning is off by default. It can be enabled using --diag_warning A1763.

A1764W <name> instructions are deprecated in architecture <arch> and above

A1765E Size of padding value on ALIGN must be 1, 2 or 4 bytes

This is caused when the optional padsize attribute is used with an ALIGN directive, but has an incorrect size. It does not refer to the parameter to align to. The parameter can be any power of 2 from 2\^0 to 2\^31

 ${f A1766W}$ Size of padding value for code must be a minimum of <size> bytes; treating as data

A1767E Unexpected characters following attribute

A1768E Missing '='

A1769E Bad NEON or VFP system register name symbol

A1771E Bad floating-point bitpattern when expecting <exp>-bit bitpattern

A1772E Destination type must be signed or unsigned integer, and source type must be 32-bit or 64-bit floating-point

A1773E Floating-point conversion only possible between 32-bit single-precision and 64-bit double-precision types

A1774E Fixed-point conversion only possible for 16-bit or 32-bit signed or unsigned types

A1775E Conversion between these types is not possible

A1776E This operation is not available for 32-bit single-precision floating point types

 ${f A1777E}$ <n> is out of range for symbol type; value must be between <min> and <max>

A1778E <n> is out of range for symbol binding; value must be between <min> and <max>

A1779E DCDO cannot be used on READONLY symbol '<key>'

A1780E Unknown ATTR directive

A1781E Tag #<id> cannot be set by using ATTR

A1782E Tag #<id> should be set with ATTR <cmd>

A1783E Attribute scope must be a label or section name

A1784W Reference to weak definition '<sym>' not relocated

A1785E Macro '<macuse>' not found, but '<macdef>' exists

A1786W This instruction using SP is deprecated and may not work in future architecture revisions

This warning is generated when all of the following conditions are satisfied:

- you explicitly use the SP in a deprecated way, for example:
 ADD sp, r0, #100
- you are assembling for a target architecture that supports 32-bit Thumb instructions, in other words ARMv6T2 or later
- you are assembling to ARM code.

ARM deprecates the explicit use of the SP in ARM instructions in any way that is not possible in the corresponding Thumb instruction. Such deprecated register uses are still possible in ARM instructions for backwards compatibility and you can suppress this warning by using the assembler's command line option --diag_suppress=1786. However, ARM recommends you modify your code, because it might not work in future architecture revisions.

For example you can replace the deprecated use of the SP shown above with a sequence like:

ADD r1, r0, #100 MOV sp, r1

— Note -

- When assembling to Thumb, rather than ARM code, and the target architecture is ARMv6T2 or later, the assembler generates error A1477E instead.
- When assembling for an architecture or processor that does not support 32-bit Thumb instructions, in other words ARM architectures before ARMv6T2, by default no diagnostic is emitted.

A1787W

Use of VFP Vector Mode is deprecated in ARMv7

A1788W

Explicit use of PC in this instruction is deprecated and may not work in future architecture revisions

This warning is generated when all of the following conditions are satisfied:

- you explicitly use the PC in a deprecated way, for example:
 CMP pc, #1
- you are assembling for a target architecture that supports 32-bit Thumb instructions, in other words ARMv6T2 or later
- you are assembling to ARM code.

ARM deprecates most explicit uses of the PC in ARM instructions, although they are still possible for backwards compatibility. You can suppress this warning by using the assembler's command line option --diag_suppress=1788. However, ARM recommends you modify your code, because it might not work in future architecture revisions.

– Note –

- When assembling to Thumb rather than ARM code, and the target architecture is ARMv6T2 or later, the assembler generates error A1477E instead.
- When assembling for an architecture or processor that does not support 32-bit Thumb instructions, in other words ARM architectures before ARMv6T2, by default no diagnostic is emitted.

A1789W

Explicit use of PC in this instruction is deprecated and may not work in future architecture revisions, except as destination register

A1790W

Writeback ignored in Thumb LDM loading the base register

This is caused by incorrectly adding an exclamation mark to indicate base register writeback.

For example:

LDM r0!, {r0-r4}

is not a legal instruction because r0 is the base register and is also in the destination register list. In this case, the assembler ignores the writeback and generates:

LDM r0, {r0-r4}

A1791W

Previous value of tag #<id> will be overridden

ALLIZATO UNIUCI INCU DULTU ALLI IDULES LAU	A1792E	Undefined	build	attributes	taq
--	--------	-----------	-------	------------	-----

A1793E Conversion only possible between 16-bit and 32-bit floating point

A1794E Conversion operations require two data types

A1795E Source and destination vector must contain <n> elements

A1796E Register type not consistent with data type

A1797E Specified FPU is not compatible with CPU architecture

A1798W Output is not WYSIWYG (<output>)

A1799W Output has not been checked for WYSIWYG property

A1800W No output for line

A1801E Instruction is UNPREDICTABLE in current instruction set

A1803E Bad system instruction name

A1804E Bad CP14 or CP15 register name for instruction

A1805W Register is Read-Only

A1806W Register is Write-Only

A1807W Instruction executes as NOP on target CPU

A1808E Generated object file may be corrupt (<reason>)

A1809W Instruction aligns PC before using it; section ought to be at least 4 byte aligned

This warning is generated when all the following conditions apply:

- you are using a PC-relative offset in a Thumb instruction that requires the PC to be word-aligned
- the code section containing this instruction has less than 4-byte alignment
- the instruction is not relocated at link time (because of a relocation emitted by the assembler).

If these conditions are all met, and the code section containing this instruction is not placed at a 4-byte aligned address when linking, the instruction may operate on or with the wrong address at runtime. This is because the instruction aligns the PC to a 4-byte address before using it.

The following example shows an LDR instruction in Thumb that is diagnosed by this warning because the section has an alignment of 2 bytes:

```
AREA ||.text||, CODE, READONLY, ALIGN=1 THUMB
LDR r0, [pc, #8] ; gives warning A1809W
```

A1810E Base register writeback value unclear; use '[rn,#n]!' or '[rn],#n' syntax

A1811E Size of fill value must be 1, 2 or 4 bytes and a factor of fill size

A1812W Instruction cannot be assembled in the opposite instruction set

A1813W 32-bit instruction used where 16-bit could have been used

A1814E No output file

A1815E SHT_ARM_EXIDX sections require a link order dependency to be set

A1816E Unknown opcode '<name>' in CODE16, but exists in THUMB

A1817W ATTR tag #<id> setting ignored in <scope>

A1818W ATTR COMPAT flag <flag> and vendor '<vendor>' setting ignored in <scope>

A1819W ATTR compatible with tag #<id> setting ignored in <scope>

A1820E Register and processor mode not valid for instruction

 ${f A1846E}$ Invalid field specifiers for CPSR or SPSR: must be followed by at least one of c, x, s or f

A1847E Expression requiring more than one relocation not allowed

This can occur during the assembly of ARM instructions when trying to access data in another area. For example, using:

```
LDR r0, [pc, #label - . - 8]
```

or its equivalent:

LDR r0, [pc, #label-{PC}-8]

where label is defined in a different AREA.

Change your code to use the simpler, equivalent syntax:

LDR r0, label

This works if label is either in the same area or in a different area.

A1848W State change in IT block

A1875E Register Rn must be from R0 to R7 in this instruction

Change the specified register to be in the range R0 to R7.

A1903E Line not seen in first pass; cannot be assembled

This occurs if an instruction or directive does not appear in pass 1 but appears in pass 2 of the assembler.

The following example shows when a line is not seen in pass 1:

A1907W Test for this symbol has been seen and may cause failure in the second pass.

This diagnostic is suppressed by default. Enable it to identify situations that might result in errors A1903E, A1909E, or A1908E.

A1908E Label '<name>' value inconsistent: in pass 1 it was <vall>; in pass 2 it was <vall>

The following example generates this error because in pass 1 the value of x is 0x0004+r9, and in pass 2 the value of x is 0x0000+r0:

```
map 0, r0
if :lnot: :def: sym
map 0, r9
field 4
endif
x field 4
sym LDR r0, x
```

A1909E Line not seen in second pass; cannot be assembled

This occurs if an instruction or directive appears in pass 1 but does not appear in pass 2 of the assembler.

The following example shows when a line is not seen in pass 2:

A1916E Unknown built-in variable '<name>'

A1993E This operator requires a relocation that is not supported in <objfmt>

A1994E This directive is not supported in <objfmt>

A1995E Weak definitions are not supported in <objfmt>

A1996E TYPE must only be used after WEAK on IMPORT

A1997E Expected alias for weak extern symbol

A1998E Comdat Associated area must have Comdat Associative selection type

A1999E Comdat Associated area cannot be another Comdat Associated area

Chapter 4 **Linker Errors and Warnings**

The following topics describe the error and warning messages for the linker, armlink:

- Suppressing armlink error and warning messages on page 4-2
- List of the armlink error and warning messages on page 4-3.

4.1 Suppressing armlink error and warning messages

All linker warnings are suppressible with --diag_suppress in the same way as for compiler warnings. For example:

--diag_suppress 6306

Some errors such as L6220E, L6238E and L6784E can be downgraded to a warning by using:

--diag_warning

4.2 List of the armlink error and warning messages

The error and warning messages for armlink are:

L6000U Out of memory.

This error is reported by RVCT v4.0 and earlier. For more details on why you might see this error and possible solutions, see the description for error L6815U.

L6001U Could not read from file <filename>.

L6002U Could not open file <filename>: <reason>

This indicates that the linker was unable to open a file specified on the linker command line. This can indicate a problem accessing the file or a fault with the command line specified. Some common occurrences of this message are:

 L6002U: Could not open file /armlib/{libname}: No such file or directory

Either specify the library path with --libpath or set the ARMCCnLIB environment variable to <code>install_directory</code>\lib.

See the following in the *Linker Reference*:

— --libpath=pathlist on page 2-96.

See the following in *Introducing the ARM Compiler toolchain*:

— Toolchain environment variables on page 2-14.

_____Note _____

In ARM Compiler toolchain v5.0 and later, armlink does not require the ARMCCnLIB environment variables to be set.

• Error: armlink: L6002: Could not open file errors=ver.txt

Caused by the double-dash (--) missing from in front of errors=ver.txt. If
you do not prefix options with -- or - the linker treats them as input files
and fails the link step because it is unable to load all the specified files. The
correct switch is --errors=ver.txt

L6003U Could not write to file <filename>.

An file I/O error occurred while reading, opening, or writing to the specified file.

L6004U Incomplete library member list <list> for <library>.

This can occur where there is whitespace in the list of library objects.

The example below fails:

armlink x.lib(foo.o, bar.o)

Fatal error: L6004U: Missing library member in member list for x.lib.

The example below succeeds:

armlink x.lib(foo.o,bar.o)

Another less common occurrence is caused by a corrupt library, or possibly a library in an unsupported format.

L6005U Extra characters on end of member list for library>.

 ${f L6006U}$ Overalignment value not specified with OVERALIGN attribute for execution region <regionname>.

See the following in the *Linker Reference*:

• Syntax of an input section description on page 4-22

See the following in *Using the Linker*:

Overalignment of execution regions and input sections on page 8-58.

L6007U Could not recognize the format of file <filename>.

The linker can recognize object files in the ELF format, and library files in AR formats. The specified file is either corrupt, or is in a file format that the linker cannot recognize.

L6008U Could not recognize the format of member <mem> from > .

The linker can recognize library member objects in the ELF file format. The specified library member is either corrupt, or is in a file format that the linker cannot recognize.

L6009U File <filename> : Endianness mismatch.

The endianness of the specified file or object did not match the endianness of the other input files. The linker can handle input of either big endian or little endian objects in a single link step, but not a mixed input of some big and some little endian objects.

L6010U Could not reopen stderr to file <filename>: <reason>

An file I/O error occurred while reading, opening, or writing to the specified file.

L6011U Invalid integer constant : <number>.

Specifying an illegal integer constant causes this. An integer can be entered in hexadecimal format by prefixing &, 0x, or 0X. A suffix of k or m can be used to specify a multiple of 1024 or 1024*1024.

L6015U Could not find any input files to link.

The linker must be provided with at least one object file to link.

For example, If you try to link with:

armlink lib.a -o foo.axf

you get the above error.

You must instead use, for example:

armlink foo_1.o foo_2.o lib.a -o foo.axf

L6016U Symbol table missing/corrupt in object/library <object>.

This can occur when linking with libraries built with the GNU tools. This is because GNU ar can generate incompatible information.

The workaround is to replace ar with armar and use the same command line arguments. Alternatively, the error is recoverable by using armar -s to rebuild the symbol table.

 $\begin{tabular}{ll} $L6017U$ & Library < library> symbol table contains an invalid entry, no member at offset 0x<offset>. \end{tabular}$

The library might be corrupted. Try rebuilding it.

L6018U <filename> is not a valid ELF file.

L6019U <filename> is not a valid 64 bit ELF file.

L6020U <filename> is not a valid 32 bit ELF file.

L6022U Object <objname> has multiple .

The object file is faulty or corrupted. This might indicate a compiler fault. Contact your supplier.

L6024U Library < library > contains an invalid member name.

The file specified is not a valid library file, is faulty or corrupted. Try rebuilding it.

L6025U Cannot extract members from a non-library file library>.

The file specified is not a valid library file, is faulty or corrupted. Try rebuilding it.

L6026U ELF file <filename> has neither little or big endian encoding

The ELF file is invalid. Try rebuilding it.

L6027U Relocation #<rel_class>:<rel_number> in <objname>(<secname>) has

invalid/unknown type.

This might indicate a compiler fault. Contact your supplier.

 $L6028 U \qquad \hbox{Relocation \#$<$rel_class>$:$<$rel_number>$ in $$<$objname>$(<$secname>)$ has invalid}$

offset.

This might indicate a compiler fault. Contact your supplier.

L6029U Relocation #<rel_class>:<rel_number> in <objname>(<secname>) is wrt

invalid/missing symbol.

The relocation is with respect to a symbol that is either:

• invalid or missing from the object symbol table

a symbol that is not suited to be used by a relocation.

This might indicate a compiler fault. Contact your supplier.

 ${f L6030U}$ Overalignment <overalignment> for region <regname> must be at least 4 and

a power of 2

See the following in the *Linker Reference*:

• Execution region attributes on page 4-11

• Syntax of an input section description on page 4-22

See the following in *Using the Linker*:

• Overalignment of execution regions and input sections on page 8-58.

L6031U Could not open scatter description file <filename>: <reason>

An I/O error occurred while trying to open the specified file. This could be because of an invalid filename.

L6032U Invalid <text> <value> (maximum <max_value>) found in <object>

L6033U Symbol <symbolname> in <objname> is defined relative to an invalid

section.

L6034U Symbol <symbolname> in <objname> has invalid value.

This is most often caused by a section-relative symbol having a value that exceeds

the section boundaries.

L6035U Relocation #<rel_class>:<rel_number> in ZI Section <objname>(<secname>)

has invalid type.

ZI Sections cannot have relocations other than of type R ARM NONE.

L6036U Could not close file <filename>: <reason>

An I/O error occurred while closing the specified file.

L6037U ' 'arg>' is not a valid argument for option 'coption>'.

The argument is not valid for this option. This could be because of a spelling error, or because of the use of an unsupported abbreviation of an argument.

L6038U Could not create a temporary file to write updated SYMDEFS.

An I/O error occurred while creating the temporary file required for storing the SYMDEFS output.

L6039W

Relocation from #<rel_class>:<rel_number> in <objname>(<secname>) with respect to <symname>. Skipping creation of R-type relocation. No corresponding R-type relocation exists for type <rel_type>.

--reloc is used with objects containing relocations that do not have a corresponding R-type relocation.

L6041U An internal error has occurred (<clue>).

Contact your supplier.

L6042U Relocation #<rel_class>:<rel_number> in <objname>(<secname>) is wrt a mapping symbol(#<idx>, Last Map Symbol = #<last>).

Relocations with respect to mapping symbols are not permitted. This might indicate a compiler fault. Contact your supplier.

L6043U Relocation #<rel_class>:<rel_number> in <objname>(<secname>) is with respect to an out of range symbol(#<val>, Range = 1-<max>).

Relocations can only be made wrt symbols in the range (1-n), where n is the number of symbols.

 ${f L6047U}$ The size of this image (<actual_size> bytes) exceeds the maximum allowed for this version of the linker

L6048U The linker is unable to continue the link step (<id>). This version of the linker will not create this image.

L6049U The linker is unable to continue the link step (<id>). This version of the linker will not link with one or more given libraries.

 ${f L6050U}$ The code size of this image (<actual_size> bytes) exceeds the maximum allowed for this version of the linker.

L6058E Syntax error parsing linker script <script> at line lineno> : <token>
The link ld script has a syntax error at the line number.

See the following in *Using the Linker*:

• Chapter 9 *GNU ld script support in armlink*.

L6064E ELF Executable file <filename> given as input on command line

This might be because you specified an object file as output from from the compiler without specifying the -c compiler option. For example:

armcc file.c -o file.o

armlink file.o -o file.axf

See the following in the Compiler Reference:

• -c on page 3-31.

L6065E Load region <name> (size <size>) is larger than maximum writable contiguous block size of 0x80000000.

The linker attempted to write a segment larger than 2GB. The size of a segment is limited to 2GB.

L6175E EMPTY region <regname> cannot have any section selectors.

L6176E A negative max_size cannot be used for region <regname> without the EMPTY attribute.

Only regions with the EMPTY attribute are permitted to have a negative max-size.

L6177E

A negative max_size cannot be used for region <regname> which uses the +offset form of base address.

Regions using the +offset form of base address are not permitted to have a negative max-size.

L6188E

Special section <sec1> multiply defined by <obj1> and <obj2>.

A special section is one that can only be used once, such as "Veneer\$\$Code".

L6195E

Cannot specify both '<attr1>' and '<attr2>' for region <regname> See the following in the *Linker Reference*:

- Load region attributes on page 4-7
- Execution region attributes on page 4-11
- Address attributes for load and execution regions on page 4-14
- *Inheritance rules for load region address attributes on page 4-18*
- Inheritance rules for execution region address attributes on page 4-19
- Inheritance rules for the RELOC address attribute on page 4-20.

L6200E

Symbol <symbolname> multiply defined by <object1> and <object2>.

A common example where this occurs:

Symbol __stdout multiply defined (by retarget.o and stdio.o).

means that there are two conflicting definitions of __stdout present in retarget.o and stdio.o. The one in retarget.o is your own definition. The one in stdio.o is the default implementation, which was probably linked-in inadvertently.

stdio.o contains a number symbol definitions and implementations of file functions like fopen, fclose, and fflush.

stdio.o is being linked-in because it satisfies some unresolved references.

To identify why stdio.o is being linked-in, you must use the verbose link option switch. For example:

armlink [... your normal options...] --verbose --list err.txt

Then study err.txt to see exactly what the linker is linking in, from where, and why.

You might have to either:

- eliminate the calls like fopen, fclose, and fflush
- re-implement the _sys_xxxx family of functions.

See the following in *Using ARM*® *C* and *C*++ *Libraries and Floating-Point Support*:

• Tailoring input/output functions in the C and C++ libraries on page 2-92.

L6201E

Object <objname> contains multiple entry sections.

The input object specifies more than one entry point. Use the --entry command-line option to select the entry point to use.

See the following in the *Linker Reference*:

• --entry=location on page 2-58.

L6202E

<objname>(<secname>) cannot be assigned to non-root region '<regionname>'

A root region is a region that has an execution address the same as its load address. The region does not therefore require moving or copying by the scatter-load initialization code.

Certain sections must be placed in root region in the image. __main.o and the linker-generated table (Region\$\$Table) must be in a root region. If not, the linker reports, for example:

Region\$\$Table cannot be assigned to a non-root region.

Scatter-loading (__scatter*.o) and decompressor (__dc*.o) objects from the library must be placed in a root region. These can all be placed together using InRoot\$\$Sections:

See also Placing root region library objects,

http://infocenter.arm.com/help/topic/com.arm.doc.faqs/ka3946.html.

L6203E Entry point (<address>) lies within non-root region <regionname>.

The image entry point must correspond to a valid instruction in a root-region of the image.

L6204E Entry point (<address>) does not point to an instruction.

The image entry point you specified with the --entry command-line option must correspond to a valid instruction in the root-region of the image.

See the following in the Linker Reference:

--entry=location on page 2-58.

L6205E Entry point (<address>) must be word aligned for ARM instructions.

This message is displayed because the image entry point you specified with the --entry command-line option is not word aligned. For example, you specified --entry=0x8001 instead of --entry=0x8000.

See the following in the Linker Reference:

• --entry=location on page 2-58.

L6206E Entry point (<address>) lies outside the image.

The image entry point you specified with the --entry command-line option is outside the image. For example, you might have specified an entry address of 0x80000 instead of 0x8000, as follows:

armlink --entry=0x80000 test.o -o test.axf

See the following in the *Linker Reference*:

• --entry=location on page 2-58.

L6208E Invalid argument for --entry command: '<arg>'

See the following in the Linker Reference:

--entry=location on page 2-58.

L6209E

Invalid offset constant specified for --entry (<arg>)

See the following in the *Linker Reference*:

• --entry=location on page 2-58.

L6210E

Image cannot have multiple entry points. (<address1>, <address2>)

One or more input objects specifies more than one entry point for the image. Use the --entry command-line option to select the entry point to use.

See the following in the *Linker Reference*:

• --entry=location on page 2-58.

L6211E

Ambiguous section selection. Object <objname> contains more than one section.

This can occur when using the linker option --keep on an assembler object that contains more than one AREA. The linker must know which AREA you want to keep.

To solve this, use more than one --keep option to specify the names of the AREAs to keep, such as:

```
--keep boot.o(vectors) --keep boot.o(resethandler) ...
```

_____Note _____

Using assembler files with more than one AREA might give other problems elsewhere, so this is best avoided.

L6213E

Multiple First section <object2>(<section2>) not allowed. <object1>(<section1>) already exists.

Only one FIRST section is permitted.

L6214E

Multiple Last section <object2>(<section2>) not allowed.
<object1>(<section1>) already exists.

Only one LAST section is permitted.

L6215E

Ambiguous symbol selection for --First/--Last. Symbol <symbol> has more than one definition.

See the following in the *Linker Reference*:

- --first=section id on page 2-71
- --last=section id on page 2-93.

L6216E

Cannot use base/limit symbols for non-contiquous section <secname>

The exception-handling index tables generated by the compiler are given the section name .ARM.exidx. For more information, see *Exception Handling ABI for the ARM Architecture*,

http://infocenter.arm.com/help/topic/com.arm.doc.ihi0038-/index.html.

At link time these tables must be placed in the same execution region and be contiguous. If you explicitly place these sections non-contiguously using specific selector patterns in your scatter file, then this error message is likely to occur. For example:

```
LOAD_ROM 0x000000000 {
    ER1 0x000000000 {
      file1.o (+RO) ; from a C++ source
```

```
* (+R0)
}
ER2 0x01000000
{
   file2.o (+R0) ; from a C++ source
}
ER3 +0
{
   * (+RW, +ZI)
}
}
```

This might produce the following error if exception-handling index tables are in both file1.0 and file2.0, because the linker cannot place them in separate regions:

Error: L6216E: Cannot use base/limit symbols for non-contiguous section .ARM.exidx

Also, the .init_array sections must be placed contiguously within the same region for their base and limit symbols to be accessible.

The corrected example is:

```
LOAD_ROM 0x00000000
 ER1 0x00000000
 {
   file1.o (+RO); from a C++ source
    * (.ARM.exidx) ; Section .ARM.exidx must be placed explicitly,
                    ; otherwise it is shared between two regions, and
                    ; the linker is unable to decide where to place it.
    *(.init_array) ; Section .init_array must be placed explicitly,
                    ; otherwise it is shared between two regions, and
                    ; the linker is unable to decide where to place it.
    * (+R0)
 ER2 0x01000000
    file2.o (+RO); from a C++ source
 ER3 +0
    * (+RW, +ZI)
}
```

In the corrected example, the base and limit symbols are contained in .init_array in a single region.

For more information, see the following in *Using ARM® C and C++ Libraries and Floating-Point Support*:

- How C and C++ programs use the library functions on page 2-54
- *C++ initialization, construction and destruction* on page 2-56.
- L6217E Relocation #<rel_class>:<rel_number> in <objname>(<secname>) with respect to <symbol>. R_ARM_SBREL32 relocation to imported symbol
- L6218E Undefined symbol <symbol> (referred from <objname>).

Some common examples where this can occur are:

- User Error. Somebody has referenced a symbol and has either forgotten to define it or has incorrectly defined it.
- Undefined symbol __ARM_switch8 or __ARM_ll_<xxxx> functions

The helper functions are automatically generated into the object file by the compiler.

An undefined reference error can, however, still be generated if linking objects from legacy projects where the helper functions are in the h_xxx libraries (h indicates that these are compiler helper libraries, rather than standard C library code).

Re-compile the object or ensure that these libraries can be found by the linker.

- When attempting to refer to a function/entity in C from a function/entity in C++. This is caused by C++ name mangling, and can be avoided by marking C functions extern "C".
- Undefined symbol thunk{v:0,-44} to Foo_i::~Foo_i() (referred from Bar_i.o)

The symbol thunk $\{v:0,-44\}$ to Foo_i::~Foo_i() is a wrapper function round the regular Foo_i::~Foo_i().

Foo_i is a derived class of some other base class, therefore:

- it has a base-class vtable for when it is referred to by a pointer to that base class
- the base-class vtable has an entry for the thunk
- the destructor thunk is output when the actual (derived class) destructor is output.

Therefore, to avoid the error, ensure this destructor is defined.

• Undefined symbol main (referred from kernel.o)

The linker is reporting that your application does not include a main() function.

See the following in Migration and Compatibility:

— C and C++ library changes between RVCT v2.2 and RVCT v3.0 on page 10-5

L6219E

<type> section <object1>(<section1>) attributes {<attributes>}
incompatible with neighboring section <object2>(<section2>).

This error occurs when the default ordering rules used by the linker (RO followed by RW followed by ZI) are violated. This typically happens when one uses +FIRST or +LAST, for example in a scatter file, attempting to force RW before RO.

L6220E

<type> region <regionname> size (<size> bytes) exceeds limit (<limit> bytes).

Example:

Execution region ROM_EXEC size (4208184 bytes) exceeds limit (4194304 bytes).

This can occur where a region has been given an (optional) maximum length in the scatter file, but this size of the code/data being placed in that region has exceeded the given limit. This error is suppressible with --diag_suppress 6220.

For example, this might occur when using .ANY*num* selectors with the ALIGN directive in a scatter file to force the linker to insert padding. You might be able to fix this using the --any_contingency option.

See the following in *Using the Linker*:

• Placing unassigned sections with the .ANY module selector on page 8-25.

See the following in the *Linker Reference*:

- --any contingency on page 2-8
- --diag suppress=tag[,tag,...] on page 2-47.

L6221E

<type1> region <regionname1> with <addrtype1> range [<base1>,<limit1>)
overlaps with <type2> region <regionname2> with <addrtype2> range
[<base2>,<limit2>).

This represents an incorrect scatter file. A non-ZI section must have a unique load address and in most cases must have a unique execution address. This error might be because a load region LR2 with a relative base address immediately follows a ZI execution region in a load region LR1. From RVCT v3.1 onwards, the linker no longer assigns space to ZI execution regions.

See the following in the *Linker Reference*:

Scatter files containing relative base address load regions and a ZI
execution region on page 4-36.

L6222E

Partial object cannot have multiple ENTRY sections, <e_oname>(<e_sname>) and <oname>(<sname>).

Where objects are being linked together into a partially-linked object, only one of the sections in the objects can have an entry point.

It is not possible in this case to use the linker option --entry to select one of the entry points.

L6223E

Ambiguous selectors found for <objname>(<secname>) from Exec regions <region1> and <region2>.

This occurs if the scatter file specifies <objname>(<secname>) to be placed in more than one execution region. This can occur accidentally when using wildcards (*). The solution is to make the selections more specific in the scatter file.

L6224E

Could not place <objname>(<secname>) in any Execution region.

This occurs if the linker can not match an input section to any of the selectors in your scatter file. You must correct your scatter file by adding an appropriate selector.

See the following in *Using the Linker*:

- Section placement with the linker on page 4-19.
- L6225E Number <str...> is too long.
- L6226E Missing base address for region <regname>.
- L6227E Using --reloc with --rw-base without --split is not allowed.

See the following in the *Linker Reference*:

- --reloc on page 2-132
- --rw base=address on page 2-139
- --split on page 2-154.
- **L6228E** Expected '<str1>', found '<str2>'.
- L6229E Scatter description <file> is empty.
- L6230E Multiple execution regions (<region1>,<region2>) cannot select <secname>.
- L6231E Missing module selector.

L6232E Missing section selector.

L6233E Unknown section selector '+<selector>'.

 ${f L6234E}$ <ss> must follow a single selector.

For example, in a scatter file:

```
:
* (+FIRST, +RO)
```

+FIRST means place this (single) section first. Selectors that can match multiple sections (for example, +R0 or +ENTRY) are not permitted to be used with +FIRST (or +LAST). If used together, the error message is generated.

L6235E More than one section matches selector - cannot all be FIRST/LAST.

See the following in *Using the Linker*:

• Placing sections with FIRST and LAST attributes on page 4-21.

See the following in the *Linker Reference*:

• Syntax of an input section description on page 4-22.

L6236E No section matches selector - no section to be FIRST/LAST.

The scatter file specifies a section to be +FIRST or +LAST, but that section does not exist, or has been removed by the linker because it believes it to be unused. Use the linker option --info unused to reveal which objects are removed from your project. Example:

```
ROM_LOAD 0x00000000 0x4000
{
   ROM_EXEC 0x00000000
   {
     vectors.o (Vect, +First) << error here
     * (+R0)
   }
   RAM_EXEC 0x40000000
   {
     * (+RW, +ZI)
   }
}</pre>
```

Some possible solutions are:

- Ensure vectors.o is specified on the linker command-line.
- Link with --keep vectors.o to force the linker not to remove this, or switch off this optimization entirely, with --no_remove. This is not recommended.
- ARM recommends that you add the ENTRY directive to vectors.s, to tell the linker that it is a possible entry point of your application such as, for example:

```
AREA Vect, CODE
ENTRY ; define this as an entry point
Vector_table
```

Then link with --entry Vector_table to define the real start of your code.

See the following in *Using the Linker*:

• Placing sections with FIRST and LAST attributes on page 4-21.

See the following in the *Linker Reference*:

- --entry=location on page 2-58
- --info=topic[,topic,...] on page 2-80
- --keep=section id on page 2-89

- --remove, --no remove on page 2-134
- Syntax of an input section description on page 4-22.

See the following in the Assembler Reference:

• *ENTRY* on page 6-65.

L6237E <objname>(<secname>) contains relocation(s) to unaligned data.

L6238E <objname>(<secname>) contains invalid call from '<attr1>' function to '<attr2>' function <sym>.

This linker error is given where a stack alignment conflict is detected in object code. The *ABI for the ARM Architecture* suggests that code maintains eight-byte stack alignment at its interfaces. This permits efficient use of LDRD and STRD instructions (in ARM Architecture 5TE and later) to access eight-byte aligned double and long long data types.

Symbols such as ~PRES8 and REQ8 are Build Attributes of the objects:

- PRES8 means the object PREServes eight-byte alignment of the stack
- ~PRES8 means the object does NOT preserve eight-byte alignment of the stack (~ meaning NOT)
- REQ8 means the object REQuires eight-byte alignment of the stack.

This link error typically occurs in two cases:

- Where assembler code (that does not preserve eight-byte stack alignment) calls compiled C/C++ code (that requires eight-byte stack alignment).
- Where attempting to link legacy objects that were compiled with older tools with objects compiled with recent tools. Legacy objects that do not have these attributes are treated as ~PRES8, even if they do actually happen to preserve eight-byte alignment.

For example:

Error: L6238E: foo.o(.text) contains invalid call from '~PRES8' function to 'REQ8' function foobar

This means that there is a function in the object foo.o (in the section named .text) that does not preserve eight-byte stack alignment, but which is trying to call function foobar that requires eight-byte stack alignment.

A similar warning that might be encountered is:

Warning: L6306W: ' \sim PRES8' section foo.o(.text) should not use the address of 'REQ8' function foobar

where the address of an external symbol is being referred to.

There are two possible solutions to work-around this issue:

• Rebuild all your objects/libraries.

If you have any assembler files, you must check that all instructions preserve eight-byte stack alignment, and if necessary, correct them. For example, change:

```
STMFD sp!, {r0-r3, lr}; push an odd number of registers to
```

STMFD sp!, {r0-r3, r12, lr}; push even number of registers
The assembler automatically marks the object with the PRES8 attribute if all instructions preserve eight-byte stack alignment, so it is no longer necessary to add the PRESERVE8 directive to the top of each assembler file.

• If you have any legacy objects/libraries that cannot be rebuilt, either because you do not have the source code, or because the old objects must not be rebuilt (for example, for qualification/certification reasons), then you must inspect the legacy objects to check whether they preserve eight-byte alignment or not.

Use fromeIf -c to disassemble the object code. C/C++ code compiled with ADS 1.1 or later normally preserves eight-byte alignment, but assembled code does not.

If your objects do indeed preserve eight-byte alignment, then the linker error L6238E can be suppressed with the use of --diag_suppress 6238 on the linker command line.

By using this, you are effectively guaranteeing that these objects are PRES8. The linker warning L6306W is suppressible with --diag_suppress 6306.

See also Linker Error: L6238E: foo.o(.text) contains invalid call from '~PRES8' function to 'REQ8' function foobar,

http://infocenter.arm.com/help/topic/com.arm.doc.faqs/ka3556.html.

Example:

Cannot call non-interworking ARM symbol 'ArmFunc' in object foo.o from THUMB code in bar.o(.text)

This problem can be caused by foo.c not being compiled with the option --apcs /interwork, to enable ARM code to call Thumb code (and Thumb to ARM) by linker-generated interworking veneers.

 $\begin{tabular}{ll} $L6241E$ & $$\compare\c$

When linking with '--strict', the linker reports conditions that might fail as errors, for example:

Error: L6241E: foo.o(.text) cannot use the address of ' \sim IW' function main as the image contains 'IW' functions.

IW means interworking, and ~IW means non-interworking.

 ${f L6242E}$ Cannot link object <objname> as its attributes are incompatible with the image attributes.

Each object file generated by the compilation tools includes a set of attributes that indicates the options used to build it. The linker checks the attributes of each object file it processes. If it finds attributes that are incompatible with those of object files it has loaded previously, it generates this error.

There are three common reasons for this error, each of which produces a different message:

• Error: L6242E: Cannot link object foo.o as its attributes are incompatible with the image attributes. require four-byte alignment of eight-byte datatypes clashes with require eight-byte alignment of eight-byte data types.

This can occur when you try to link objects built using RVCT 2.0 or later with objects built using ADS or RVCT 1.2. In ADS and RVCT 1.2, double and long long data types were 4-byte aligned (unless you used the -0ldrd compiler option or the __align keyword). In RVCT 2.0, the ABI changed, so that double and long long data types are 8-byte aligned.

This change means that ADS and RVCT 1.2 objects and libraries using double or long long data types are not directly compatible with objects and libraries built using RVCT 2.0 or later, and so the linker reports an attribute clash.

To use RVCT 2.x or 3.0 C objects with legacy ADS C objects, compile the RVCT 2.x or 3.0 C code with the --apcs /adsabi command line option. This option was deprecated in RVCT 2.2 and removed from RVCT 3.1.

- Error: L6242E: Cannot link object foo.o as its attributes are incompatible with the image attributes.
 - ... pure-endian double clashes with mixed-endian double.

This can occur when you are linking objects built using the ARM Compiler toolchain, RVCT or ADS with legacy SDT objects or objects built using either of the compiler options --fpu softfpa or --fpu fpa. SDT used a non-standard format for little-endian double and big-endian long long. However ADS and RVCT use industry-standard double and long long types, except for when the --fpu softfpa or --fpu fpa options are used. (These options are only supported in RVCT 2.1 and earlier). If you attempt to link object files that use the different formats for little-endian double and big-endian long long then the linker reports this error.

ARM recommends you rebuild your entire project using RVCT or the ARM Compiler toolchain. If you do not have the source code for an object or library, then try recompiling your code with --fpu softfpa.

• Error: L6242E: Cannot link object foo.o as its attributes are incompatible with the image attributes.

... FPA clashes with VFP.

This error typically occurs when you attempt to link objects built with different --fpu options. ARM recommends you rebuild your entire project using the same --fpu options.

See *Are legacy objects and libraries compatible with my project?*, http://infocenter.arm.com/help/topic/com.arm.doc.faqs/ka3639.html.

 ${f L6243E}$ Selector only matches removed unused sections – no section to be FIRST/LAST.

All sections matching this selector have been removed from the image because they were unused. For more information, use --info unused.

- L6245E Failed to create requested ZI section '<name>'.
- **L6248E** <objname>(<secname>) in <attr1> region '<r1>' cannot have <rtype> relocation to <symname> in <attr2> region '<r2>'.

This error can occur when you are trying to build position-independent (PI) code. Consider, for example the following code:

```
#include <stdio.h>
char *str = "test";
int main(void)
{
    printf ("%s",str);
}
```

When you compile and link this using:

```
armcc -c --apcs /ropi/rwpi pi.c
armlink --ropi --rwpi pi.o
```

the linker reports the following error message:

Error: L6248E: pi.o(.data) in PI region 'ER_RW' cannot have address type relocation to .conststring in PI region 'ER_RO'.

This is because the compiler generates a global pointer str that needs to be initialized to the address of the string in the .conststring section. However, absolute addresses cannot be used in a PI system, so the link step fails.

To resolve this, you must re-write the code to avoid the explicit pointer. You can do this using either of the following methods:

• Use a global array instead of a global pointer, for example:

```
#include <stdio.h>
const char str[] = "test";
int main(void)
{
    printf ("%s",str);
}
```

• Use a local pointer instead of a global pointer, for example:

```
#include <stdio.h>
int main(void)
{
    char *str = "test";
    printf ("%s",str);
}
```

Note ——

If you are using an array of pointers, such as:

```
char * list[] = {"zero", "one", "two"};
```

the linker reports a separate error for each element in the array. In this case, ARM recommends you declare a two dimensional array for the list, with the first dimension as the number of elements in the array, and the second dimension as the maximum size of an element in the array, for example:

```
char list[3][5] = {"zero", "one", "two"};
```

You must change the printf() statement to, for example:

```
printf("%s", list[1]);
```

See compiler error number 1359.

L6249E Entry point (<address>) lies within multiple sections.

L6250E Object <objname> contains illegal definition of special symbol <symbol>.

L6251E Object <objname> contains illegal reference to special symbol <symbol>.

 $L6252E \qquad \hbox{Invalid argument for --xreffrom/--xrefto command: '<arg>'}$

L6253E Invalid SYMDEF address: <number>.

L6254E Invalid SYMDEF type : <type>.

The content of the symdefs file is invalid.

See the following in *Using the Linker*:

• *Symdefs file format on page 7-22.*

L6255E Could not delete file <filename>: <reason>

An I/O error occurred while trying to delete the specified file. The file was either read-only, or was not found.

This message indicates a problem with the scatter file.

See the following in the *Linker Reference*:

• Chapter 4 Formal syntax of the scatter file.

L6258E Entry point (<address>) lies in an overlaid Execution region.

This message indicates a problem with the scatter file.

See the following in the *Linker Reference*:

• Chapter 4 *Formal syntax of the scatter file*.

L6259E Reserved Word '<name>' cannot be used as a <type> region name. <name> is a reserved word, so choose a different name for your region.

 ${f L6260E}$ Multiple load regions with the same name (<regionname>) are not allowed.

This message indicates a problem with the scatter file.

See the following in the *Linker Reference*:

• Chapter 4 *Formal syntax of the scatter file*.

 ${f L6261E}$ Multiple execution regions with the same name (<regionname>) are not allowed.

This message indicates a problem with the scatter file.

See the following in the *Linker Reference*:

• Chapter 4 *Formal syntax of the scatter file*.

The Region Table contains information used by the C-library initialization code to copy, decompress, or create ZI. This error message is given when the scatter file specifies an image structure that cannot be described by the Region Table.

The error message is most common when PI and non-PI Load Regions are mixed in the same image.

L6265E Non-PI Section <obj>(<sec>) cannot be assigned to PI Exec region <er>>.

This might be caused by explicitly specifying the wrong ARM library on the linker command-line. Either:

- remove the explicit specification of the ARM library
- replace the library, for example, c_t.1, with the correct library.
- L6266E RWPI Section <obj>(<sec>) cannot be assigned to non-PI Exec region <er>>.

A file compiled with --apcs=/rwpi is placed in an Execution Region that does not have the PI attribute.

L6271E Two or more mutually exclusive attributes specified for Load region <regname>

This message indicates a problem with the scatter file.

L6272E Two or more mutually exclusive attributes specified for Execution region <regname>

This message indicates a problem with the scatter file.

 ${f L6273E}$ Section <objname>(<secname>) has mutually exclusive attributes (READONLY and ZI)

This message indicates a problem with the object file.

 $\begin{tabular}{ll} $L6275E$ & COMMON section $$<obj1>(<sec1>)$ does not define $<sym>$ (defined in $$<obj2>(<sec2>)) \end{tabular}$

Given a set of COMMON sections with the same name, the linker selects one of them to be added to the image and discards all others. The selected COMMON section must define all the symbols defined by any rejected COMMON section, otherwise, a symbol which was defined by the rejected section now becomes undefined again. The linker generates an error if the selected copy does not define a symbol that a rejected copy does. This error is normally be caused by a compiler fault. Contact your supplier.

L6276E Address <addr> marked both as <s1>(from <sp1>(<obj1>) via <src1>) and <math><s2>(from <sp2>(<obj2>) via <src2>).

The image cannot contain contradictory mapping symbols for a given address, because the contents of each word in the image are uniquely typed as ARM (\$a) or THUMB (\$t) code, DATA (\$d), or NUMBER. It is not possible for a word to be both ARM code and DATA. This might indicate a compiler fault. Contact your supplier.

L6277E Unknown command '<cmd>'.

L6278E Missing expected <str>.

 $L6279E \qquad \text{Ambiguous selectors found for <sym> ('<sel1>' and '<sel2>')}.$

L6280E Cannot rename <sym> using the given patterns.

See the following in the *Linker Reference*:

• RENAME on page 3-5.

L6281E Cannot rename both <sym1> and <sym2> to <newname>.

See the following in the *Linker Reference*:

RENAME on page 3-5.

L6282E Cannot rename $\langle sym \rangle$ to $\langle newname \rangle$ as a global symbol of that name exists (defined) in $\langle obj \rangle$).

See the following in the *Linker Reference*:

• RENAME on page 3-5.

 ${\bf L6283E} \qquad \hbox{Object $<$ objname> contains illegal local reference to symbol $<$ symbol name>.}$

An object cannot contain a reference to a local symbol, since local symbols are always defined within the object itself.

 $\begin{tabular}{ll} L6285E & Non-relocatable Load region lr_name> contains R-Type dynamic relocations. \\ First R-Type dynamic relocation found in <object>(<secname>) at offset \\ 0x<offset>. \\ \end{tabular}$

This error occurs where there is a PI reference between two separate segments, if the two segments can be moved apart at runtime. When the linker sees that the two sections can be moved apart at runtime it generates a relocation (an R-Type relocation) that can be resolved if the sections are moved from their statically linked address. However the linker faults this relocation (giving error L6285E) because PI regions must not have relocations with respect to other sections as this invalidates the criteria for being position independent.

L6286E Relocation #<rel_class>:<rel_number> in <objname>(<secname>) with respect to {symname|%s}. Value(<val>) out of range(<range>) for (<rtype>)

This can typically occur in handwritten assembler code, where the limited number of bits for a field within the instruction opcode is too small to refer to a symbol so far away. For example, for an LDR or STR where the offset is too large for the instruction (+/-4095 for ARM state LDR/STR instruction). In other cases, please make sure you have the latest patch installed from: http://www.arm.com/support/downloads.

For more information see *Value out of range for relocation*, http://infocenter.arm.com/help/topic/com.arm.doc.faqs/ka3553.html.

L6287E Illegal alignment constraint (<align>) specified for <objname>(<secname>).

An illegal alignment was specified for an ELF object.

L6291E Cannot assign Fixed Execution Region <ername> Load Address:<addr>. Load Address must be greater than or equal to next available Load Address:<load_addr>.

See the following in the *Linker Reference*:

• Execution region attributes on page 4-11.

L6292E Ignoring unknown attribute '<attr>' specified for region <regname>.

This error message is specific to execution regions with the FIXED attribute. FIXED means make the load address the same as the execution address. The linker can only do this if the execution address is greater than or equal to the next available load address within the load region.

See the following in *Using the Linker*:

• *Using the FIXED attribute to create root regions on page 8-17.*

See the following in the *Linker Reference*:

• Execution region attributes on page 4-11.

L6294E <type> region <regionname> spans beyond 32 bit address space (base
 size <size> bytes).

The above error message relates to a problem with the scatter file.

L6295E Relocation #<rel_class>:<rel_number> in <objname>(<secname>) with respect to <symname> SBREL relocation requires image to be RWPI

 $\begin{tabular}{ll} $L6296E$ & Definition of special symbol $$<$sym1>$ is illegal as symbol $<$sym2>$ is absolute. \end{tabular}$

See L6188E.

L6300W Common section <object1>(<section1>) is larger than its definition <object2>(<section2>).

This might indicate a compiler fault. Contact your supplier.

L6301W Could not find file <filename>: <reason>

The specified file was not found in the default directories.

L6302W Ignoring multiple SHLNAME entry.

There can be only one SHLNAME entry in an edit file. Only the first such entry is accepted by the linker. All subsequent SHLNAME entries are ignored.

L6304W Duplicate input file <filename> ignored.

The specified filename occurred more than once in the list of input files.

L6305W Image does not have an entry point. (Not specified or not set due to multiple choices.)

The entry point for the ELF image was either not specified, or was not set because there was more than one section with an entry point linked-in. You must use linker option --entry to specify the single, unique entry, for example:

--entry 0x0

or

--entry <label>

The label form is typical for an embedded system.

L6306W

'<attr1>' section <objname>(<secname>) should not use the address of
'<attr2>' function <sym>.

See L6238E.

L6307W

Relocation #<rel_class>:<rel_num> in <objname>(<secname>) with respect to <sym>. Branch to unaligned destination.

L6308W

Could not find any object matching <membername> in library <libraryname>.

The name of an object in a library is specified on the link-line, but the library does not contain an object with that name.

L6309W

Library libraryname> does not contain any members.

A library is specified on the linker command-line, but the library does not contain any members.

L6310W

Unable to find ARM libraries.

This is most often caused by incorrect arguments to --libpath or an invalid value for the environment variable ARMCCnLIB, if defined.

Set the the correct path with either the --libpath linker option or the ARMCC*n*LIB environment variable. The default path for a Windows installation is:

install_directory\lib

Ensure this path does not include:

- \armlib
- \cpplib
- any trailing slashes (\) at the end. These are added by the linker automatically.

Use --verbose or --info libraries to display where the linker is attempting to locate the libraries.

See the following in the *Linker Reference*:

- --info=topic[,topic,...] on page 2-80
- --libpath=pathlist on page 2-96
- --verbose on page 2-184.

See the following in *Introducing the ARM Compiler toolchain*:

• *Toolchain environment variables* on page 2-14.

L6311W

Undefined symbol <symbol> (referred from <objname>).

See L6218E.

L6312W

Empty <type> region description for region <region>

L6313W

Using <oldname> as an section selector is obsolete. Please use <newname> instead.

For example, use of IWV\$\$Code within the scatter file is obsolete. Replace IWV\$\$Code with Veneer\$\$Code.

L6314W

No section matches pattern <module>(<section>).

Example:

No section matches pattern foo.*o(ZI).

This can occur for two possible reasons:

- The file foo.o is mentioned in your scatter file, but it is not listed on the linker command-line. To resolve this, add foo.o to the link-line.
- You are trying to place the ZI data of foo.o using a scatter file, but foo.o
 does not contain any ZI data. To resolve this, remove the +ZI attribute from
 the foo.o line in your scatter file.

L6315W Ignoring multiple Build Attribute symbols in Object <objname>.

An object can contain at most one absolute BuildAttribute\$\$... symbol. Only the first such symbol from the object symbol table is accepted by the linker. All subsequent ones are ignored.

An object can contain at most one BuildAttribute\$\$... symbol applicable to a given section. Only the first such symbol from the object symbol table is accepted by the linker. All subsequent ones are ignored.

L6318W <objname>(<secname>) contains branch to a non-code symbol <sym>.

This warning means that in the (usually assembler) file, there is a branch to a non-code symbol (in another AREA) in the same file. This is most likely a branch to a label or address where there is data, not code.

For example:

```
AREA foo, CODE
B bar
AREA bar, DATA
DCD 0
END
```

This results in the message:

init.o(foo) contains branch to a non-code symbol bar.

If the destination has no name:

BL 0x200 ; Branch with link to 0x200 bytes ahead of PC

the following message is displayed:

bootsys.o(BOOTSYS_IVT) contains branch to a non-code symbol <Anonymous Symbol>.

This warning can also appear when linking objects generated by GCC. GCC uses linker relocations for references internal to each object. The targets of these relocations might not have appropriate mapping symbols that permit the linker to determine whether the target is code or data, so a warning is generated. By contrast, armcc resolves all such references at compile-time.

L6319W Ignoring <cmd> command. Cannot find section <objname>(<secname>).

For example, when building a Linux application, you might have:

```
--keep *(.init_array)
```

on the linker command-line in your makefile, but this section might not be present when building with no C++, in which case this warning is reported:

Ignoring -- keep command. Cannot find section *(.init_array)

You can often ignore this warning, or suppress it with --diag_suppress 6319.

L6320W Ignoring <cmd> command. Cannot find argument '<argname>'.

L6323W Relocation #<rel_class>:<rel_number> in <objname>(<secname>) with respect to <sym>. Multiple variants exist. Using the <type> variant to resolve ambiguity

L6324W Ignoring <attr> attribute specified for Load region <regname>.

This attribute is applicable to execution regions only. If specified for a Load region, the linker ignores it.

L6325W Ignoring <attr> attribute for region <regname> which uses the +offset form of base address.

This attribute is not applicable to regions using the +offset form of base address. If specified for a region, which uses the +offset form, the linker ignores it.

A region that uses the +offset form of base address inherits the PI, RELOC, or OVERLAY attributes from either:

- the previous region in the description
- the parent load region if it is the first execution region in the load region.

See the following in the *Linker Reference*:

- Inheritance rules for load region address attributes on page 4-18
- Inheritance rules for execution region address attributes on page 4-19
- *Inheritance rules for the RELOC address attribute on page 4-20.*
- L6326W Ignoring ZEROPAD attribute for non-root execution region <ername>.

ZEROPAD only applies to root execution regions. A root region is a region whose execution address is the same as its load address, and so does not require moving or copying at run-time.

See the following in the *Linker Reference*:

• Execution region attributes on page 4-11.

L6329W Pattern <module>(<section>) only matches removed unused sections.

All sections matching this pattern have been removed from the image because they were unused. For more information, use --info unused.

See the following in *Using the Linker*:

• *Elimination of unused sections on page 5-4.*

See the following in the *Linker Reference*:

• --info=topic[,topic,...] on page 2-80.

L6330W Undefined symbol <symbol> (referred from <objname>). Unused section has been removed.

This means that an unused section has had its base and limit symbols referenced. For more information, use --info unused.

See the following in Using the Linker:

• Elimination of unused sections on page 5-4.

See the following in the Linker Reference:

• --info=topic[,topic,...] on page 2-80.

L6331W No eligible global symbol matches pattern <pat>.

L6332W Undefined symbol <sym1> (referred from <obj1>). Resolved to symbol <sym2>.

L6334W Overalignment < overalignment> for region < regname> cannot be negative. See the following in *Using the Linker*:

Overalignment of execution regions and input sections on page 8-58.

L6335W ARM interworking code in <objname>(<secname>) may contain invalid tailcalls to ARM non-interworking code.

> The compiler is able to perform tailcall optimization for improved code size and performance. However, there is a problematic sequence for Architecture 4T code where a Thumb IW function calls (by a veneer) an ARM IW function, which tailcalls an ARM not-IW function. The return from the ARM not-IW function can pop the return address off the stack into the PC instead of using the correct BX instruction. The linker can warn of this situation and report the above warning.

> Thumb IW tailcalls to Thumb not-IW do not occur because Thumb tailcalls with B are so short ranged that they can only be generated to functions in the same ELF section which must also be Thumb.

> The warning is pessimistic in that an object *might* contain invalid tailcalls, but the linker cannot be sure because it only looks at the attributes of the objects, not at the contents of their sections.

> To avoid the warning, either recompile your entire code base, including any user libraries, with --apcs /interwork, or manually inspect the ARM IW function to check for tailcalls (that is, where function calls are made using an ordinary branch B instruction), to check whether this is a real problem. This warning can be suppressed with --diag_suppress L6335W.

L6337W Common code sections <o1>(<s1>) and <o2>(<s2>) have incompatible floating-point linkage

L6339W Ignoring RELOC attribute for execution region <er_name>.

> Execution regions cannot explicitly be given RELOC attribute. They can only gain this attribute by inheriting from the parent load region or the previous execution region if using the +offset form of addressing.

See the following in the Linker Reference:

Execution region attributes on page 4-11.

L6340W options first and last are ignored for link type of <linktype>

> The --first and --last options are meaningless when creating a partially-linked object.

L6366E <object> attributes<attr> are not compatible with the provided cpu and fpu attributes<cli> <diff>.

L6367E <object>(<section>) attributes<attr> are not compatible with the provided cpu and fpu attributes<cli> <diff>

L6368E <symbol> defined in <object>(<section>) attributes<attr> are not compatible with the provided cpu and fpu attributes<cli> <diff>

L6369E <symbol> defined in <object>(ABSOLUTE) are not compatible with the provided cpu and fpu Attributes<cli> <diff>

L6370E cpu <cpu> is not compatible with fpu <fpu>

See the following in the *Linker Reference*:

--cpu=name on page 2-38

--fpu=name on page 2-76.

L6371E Adding attributes from cpu and fpu: <attrs>

L6372E Image needs at least one load region.

 ${f L6373E}$ libattrs.map file not found in System Library directory <dir>. Library selection may be impaired.

L6384E No Load Execution Region of name <region> seen yet at line line>.

This might be because you have used the current base address in a limit calculation in a scatter file. For example:

ER_foo 0 ImageBase(ER_foo)

L6721E Section #<secnum> '<secname>' in <oepname> is not recognized and cannot be processed generically.

L6725W Unused virtual function elimination might not work correctly, because there are dynamic relocations.

 ${f L6728U}$ Link order dependency on invalid section number <to> from section number <from>.

L6730W Relocation #<rel_class>:<index> in <objname>(<secname>) with respect to <name>. Symbol has ABI type <type>, legacy type <legacy_type>.

A change in the linker behavior gives warnings about strict compliance with the ABI.

_____Note _____

The following example produces a warning only if linking with a toolchain that is compliant with an earlier version of the *Application Binary Interface* (ABI). The ARM Compiler toolchain v4.1and later does not give this warning.

Example:

AREA foo, CODE, READONLY
CODE32
ENTRY
KEEP
func proc
NOP
ENDP
DCD foo
END

The warning is related to how the assembler marks sections for interworking. Previously, the section symbol foo would be marked as ARM or Thumb code in the ELF file. The DCD foo above would therefore also be marked as subject to interworking.

However, the ABI specifies that only functions are be subject to interworking and marked as ARM or Thumb. The linker therefore warns that it is expecting DCD <number>, which does not match the symbol type (ARM, or Thumb if you use CODE16) of the area section.

The simplest solution is to move the data into a separate data area in the assembly source file.

Alternatively, you can use --diag_suppress 6730 to suppress this warning.

L6731W Unused virtual function elimination might not work correctly, because the section referred to from <secname> does not exist.

L6733W <objname>(<secname>) contains offset relocation from <lr1name> to <lr2name>, load regions must be rigidly relative.

L6738E Relocation #<rel_class>:<relocnum> in <oepname>(<secname>) with respect to <wrtsym> is a GOT-relative relocation, but _GLOBAL_OFFSET_TABLE_ is undefined.

Some GNU produced images can refer to the symbol named _GLOBAL_OFFSET_TABLE_. If there are no GOT Slot generating relocations and the linker is unable to pick a suitable address for the GOT base the linker issues this error message.

L6739E Version '<vername>' has a dependency to undefined version '<depname>'.

- ${\bf L6740W} \qquad \text{Symbol '<symname>' versioned '<vername>' defined in '<symverscr>' but not found in any input object.}$
- L6741E Versioned symbol binding should be 'local:' or 'global:'.
- L6743E Relocation #<rel_class>:<index> in <oepname>(<spname>) with respect to <symname> that has an alternate def. Internal consistency check failed
- **L6744E** Relocation #<rel_class>:<index> <oepname>(<spname>) with respect to undefined symbol <symname>. Internal consistency check:
- L6747W Raising target architecture from <oldversion> to <newversion>.

 If the linker detects objects that specify the obsolete ARMv3, it upgrades these to ARMv4 to be usable with ARM libraries.
- L6748U Missing dynamic array, symbol table or string table in file <oepname>.
- L6751E No such sorting algorithm <str>> available.
- L6753E CallTree sorting needs Entry Point to lie within a CallTree Sort ER.
- **L6761E** Removing symbol <symname>.
- L6762E Cannot build '<type>' PLT entries when building a <imgtype>.
- L6763W '<optname>' cannot be used when building a shared object or DLL. Switching it off
- L6764E Cannot create a PLT entry for target architecture 4T that calls Thumb symbol <symname>
- **L6765W** Shared object entry points must be ARM-state when linking architecture 4T objects.

This can occur when linking with GNU C libraries. The GNU startup code crt1.0 does not have any build attributes for the entry point, so the linker cannot determine which execution state (ARM or Thumb) the code runs in. Because the GNU C library startup code is ARM code, you can safely ignore this warning, or suppress it with --diag_suppress 6765.

- **L6766W** PLT entries for architecture 4T do not support incremental linking.
- **L6769E** Relocation #<rel_class>:<relocnum> in <oepname>(<secname>) with respect to <wrtsym>. No GOTSLOTexists for symbol.
- L6770E The size and content of the dynamic array changed too late to be fixed.
- $L6772W \qquad \hbox{IMPORT < symname> command ignored when building --sysv.}$

See the following in the *Linker Reference*:

- --sysv on page 2-170
- *IMPORT on page 3-4.*
- L6774W <objname>(<secname>) has debug frame entries of a bad length.

 ${f L6775W}$ <objname>(<secname>) has FDEs which use CIEs which are not in this section.

 ${\bf L6776W}$ The debug frame in <objname>(<secname>) does not describe an executable section.

L6777W The debug frame in <objname>(<secname>) has <actual> relocations (expected <expected>)

L6778W The debug frame in <objname>(<secname>) uses 64-bit DWARF.

L6780W <origvis> visibility removed from symbol '<symname>' through <impexp>.

L6781E Value(<val>) Cannot be represented by partition number <part> for relocation #<rel_class>:<rel_number> (<rtype>, wrt symbol <symname>) in <objname>(<secname>)

Relocation #<rel_class>:<rel_number> in <objname>(<secname>) with respect to <symname>. Value(<val>) Cannot be represented by partition number <part> for relocation type >rtype>

L6782W Relocation #<rel_class>:<relnum> '<rtype>' in <oepname> may not access data correctly alongside <pltgot_type> PLT entries

This indicates that the address for a section points to a location at the end of or outside of the ELF section. This can be caused by an empty inlined data section and indicates there might be a problem with the object file. You can use --diag_warning 6783 to suppress this error.

L6784E Symbol #<symnum> '<symname>' in <oepname>(<secnum>:<secname>) with value <value> has size 0x<size> that extends to outside the section.

The linker encountered a symbol with a size that extends outside of its containing section. This message is only a warning by default in the RVCT 2.2 SP1 and later toolchains. Use --diag_warning 6784 to suppress this error.

 $\begin{tabular}{ll} $L6785U & Symbol '<symname>' marked for import from '<libname>' already defined by '<oepname>' \\ \end{tabular}$

 $L6786W \qquad \text{Mapping symbol $\#$<symnum> '<msym>' in <oepname>(<secnum>:<secname>) defined at unaligned offset=0x<moffset>$

L6787U Region table handler '<handlername>' needed by entry for <regionname> was not found.

L6788E Scatter-loading of execution region <er1name> to [<base1>,<limit1>) will cause the contents of execution region <er2name> at [<base2>,<limit2>) to be corrupted at run-time.

This occurs when scatter-loading takes place and an execution region is put in a position where is overwrites partially or wholly another execution region (which can be itself or another region).

EXEC2 0x4000 0x4000

```
{
    * (+RW,+ZI)
}
}
This generates the error:
LOAD_ROM 0x0000 0x4000
{
    EXEC1 0x4000 0x4000
{
    * (+RW,+ZI)
}
EXEC2 0x0000 0x4000
{
    * (+R0)
}
```

and reports:

Error: L6788E: Scatter-loading of execution region EXEC2 will cause the contents of execution region EXEC2 to be corrupted at run-time.

See the following in *Using the Linker*:

• Chapter 8 *Using scatter files*.

L6789U Library library member <filename> : Endianness mismatch.

L6790E Relocation #<rel_class>:<relnum> in <objname>(<secname>) with respect to <symname>. May not IMPORT weak reference through GOT-generating relocation

L6791E Unknown personality routine <pr> at 0x<offset> <oepname>(<secname>).</pr>

L6792E Descriptor at offset 0x<offset> <oepname>(<secname>).

L6793E Expecting Landing pad reference at offset 0x<offset> in cleanup descriptor <oepname>(<secname>).

L6794E Expecting Landing pad reference at offset 0x<offset> in catch descriptor <oepname>(<secname>).

L6795E Expecting RTTI reference at offset 0x<offset> in catch descriptor <oepname>(<secname>).

 ${f L6796E}$ Descriptor at offset 0x<offset> <oepname>(<secname>) overruns end of section.

L6797E Data at Offset 0x<offset> in exception table <oepname>(<secname>) overruns end of section

L6799E Expecting Landing Pad reference at offset 0x<offset> in Function Specification descriptor <oepname>(<secname>).

A landing pad is code that cleans up after an exception has been raised. If the linker detects old-format exception tables, it automatically converts them to the new format.

This message does not appear unless you are using a later version of the linker with an earlier version of the compiler.

L6800W Cannot convert generic model personality routine at 0x<offset> <oepname>(<secname>).

A personality routine is used to unwind the exception handling stack. If the linker detects old-format exception tables then it automatically converts them to the new format. This message indicates a fault in the compiler. Contact your supplier.

L6801E

<objname>(<secname>) containing <secarmthumb> code cannot use the address
of '~IW (The user intended not all code should interwork)' <funarmthumb>
function <sym>.

The linker can diagnose where a non-interworking (~IW) function has its address taken by code in the other state. This error is disabled by default, but can be enabled by linking with --strict. The error can be downgraded to just a warning with --diag_warning 6801 and subsequently suppressed completely if required with --diag_suppress 6801

Where code, for example, in a.c uses the address of a non-interworking function in t.c:

armcc -c a.c
armcc --thumb -c t.c
armlink t.o a.o --strict

reports:

Error: L6801E: a.o(.text) containing ARM code cannot use the address of '~IW' Thumb function foo.

L6802E Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <armsym>. Thumb Branch to non-Thumb symbol in <armobjname>(<armsecname>).

L6803W Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <armsym>. Thumb Branch is unlikely to reach target in<armobjname>(<armsym>).

L6804W Legacy use of symbol type STT_TFUNC detected

L6805E Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <armsym>. Branch to untyped Absolute symbol in <armobjname>, target state unknown

L6806W Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <othersym>. Branch to untyped symbol in <otherobjname>(<othersecname>), ABI requires external code symbols to be of type STT_FUNC.

L6807E Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <othersym>. Branch to untyped symbol in same section. State change is required.

L6809W Relocation <rel_class>:<idx> in <objname>(<secname>) is of deprecated type <rtype>, please see ARMELF for ABI compliant alternative

Relocation errors and warnings are most likely to occur if you are linking object files built with previous versions of the ARM tools.

To show relocation errors and warnings use the --strict_relocations switch. This option enables you to ensure ABI compliance of objects. It is off by default, and deprecated and obsolete relocations are handled silently by the linker.

See the following in the *Linker Reference*:

• --strict_relocations, --no_strict_relocations on page 2-160.

L6812U Unknown symbol action type, please contact your supplier.

L6813U Could not find Symbol <symname> to rename to <newname>.

See the following in the *Linker Reference*:

RENAME on page 3-5.

L6815U

Out of memory. Allocation Size:<alloc_size> System Size:<system_size>.

This error is reported by ARM Compiler toolchain v4.1 and later. It provides information about the amount of memory available and the amount of memory required to perform the link step.

This error occurs because the linker does not have enough memory to link your target object. This is not common, but might be triggered for a number of reasons, such as:

- linking very large objects or libraries together
- generating a large amount of debug information
- having very large regions defined in your scatter file.

In these cases, your workstation might run out of virtual memory.

This issue might also occur if you use the FIXED scatter-loading attribute. The FIXED attribute forces an execution region to become a root region in ROM at a fixed address. The linker might have to add padding bytes between the end of the previous execution region and the FIXED region, to generate the ROM image. The linker might run out of memory if large amounts of padding are added when the address of the FIXED region is far away from the end of the execution region. The link step might succeed if the gap is reduced.

See the following in the Linker Reference:

• Execution region attributes on page 4-11.

See the following in the *Using the Linker*:

• *Using the FIXED attribute to create root regions on page 8-17.*

While the linker can generate images of almost any size, it requires a larger amount of memory to run and finish the link. Try the following solutions to improve link-time performance, to avoid the Out of memory error:

- 1. Shut down all non-essential applications and processes when you are linking.
 - For example, if you are running under Eclipse, try running your linker from the command-line, or exiting and restarting Eclipse between builds.
- 2. Use the 64-bit version of the linker.

If you are using a 64-bit operating system, it is possible to make use of a 64-bit version of armlink. See the following in the *Introducing the ARM Compiler toolchain*:

- *Changing to the 64-bit linker* on page 2-7.
- 3. Use the --no_debug linker option.

This command tells the linker to create the object without including any debug information. See the following in the *Linker Reference*:

--debug, --no_debug on page 2-41.
Note ————
It is not possible to perform source level debugging if you use this option.

4. Reduce debug information.

If you do not want to use the --no_debug option, there are other methods you can use to try and reduce debug information. See the following in *Using the Compiler*:

• *Methods of reducing debug information in objects and libraries* on page 6-20.

You can also use the fromelf utility to strip debug information from objects and libraries that you do not need to debug. See the following in *Using the fromelf Image Converter*:

- --strip=option[,option,...] on page 4-70.
- 5. Use partial linking.

You can use partial linking to split the link stage over a few smaller operations. Doing this also stops duplication of the object files in memory in the final link.

See the following in the *Linker Reference*:

- *--partial on page 2-119.*
- 6. Increase memory support on Windows operating systems.

On some Windows operating systems it is possible to increase the virtual address space from 2GB (the default) to 3GB. For more information, see the following Microsoft article:

- Memory Support and Windows Operating Systems, http://msdn.microsoft.com/en-us/windows/hardware/gg487508.aspx
- 7. Use the --no_eager_load_debug linker option.

This option is available in RVCT 4.0 build 697 and later. It causes the linker to remove debug section data from memory after object loading. This lowers the peak memory usage of the linker at the expense of some linker performance, because much of the debug data has to be loaded again when the final image is written.

See the following in the *Linker Reference*:

• --eager load debug, --no eager load debug on page 2-52.

If you are still experiencing the same problem, raise a support case.

L6828E

Relocation #<rel_class>:<idx> in <objname>(<secname>) with respect to <symname>, Branch source address <srcaddr> cannot reach next available pool at [<pool_base>,<pool_limit>). Please use the --veneer_pool_size option to increase the contingency.

The --veneer_inject_type=pool veneer generation model requires branches to veneers in the pool to be able to reach the pool limit, which is the highest possible address a veneer can use. If a branch is later found that cannot reach the pool limit, and armlink is able to fit all the veneers in the pool into the lower pool limit, then armlink reduces the pool limit to accommodate the branch. Error message L6828 is issued only if armlink is unable to lower the pool limit.

See the following in the *Linker Reference*:

• --veneer inject type=type on page 2-181.

L6898E

L6915E Library reports error: <msq>

The message is typically one of the following:

• Error: L6915E: Library reports error: scatter-load file declares no heap or stack regions and __user_initial_stackheap is not defined.

Error: L6915E: Library reports error: The semihosting __user_initial_stackheap cannot reliably set up a usable heap region if scatter loading is in use

It is most likely that you have not re-implemented __user_setup_stackheap() or you have not defined ARM_LIB_STACK or ARM_LIB_HEAP regions in the respective scatter file.

See the following in *Developing Software for ARM® Processors*:

Placing the stack and heap on page 3-13.

See the following in *C* and *C*++ *Libraries* and *Floating-Point Support Reference*:

```
— __user_setup_stackheap() on page 2-60
```

— Legacy function user initial stackheap() on page 2-71.

See the following in *Using the Linker*:

- Reserving an empty region on page 8-54.
- Error: L6915E: Library reports error: __use_no_semihosting was requested but <function> was referenced.

Where <function> represents __user_initial_stackheap, _sys_exit, _sys_open, _sys_tmpnam, _ttywrch, system, remove, rename, _sys_command_string, time, or clock

This error can appear when retargeting semihosting-using functions, in order to avoid any SVC/BKPT instructions being linked-in from the C libraries. Ensure that no semihosting-using functions are linked in from the C library by using:

#pragma import(__use_no_semihosting)

See the following in *Using C and C++ Libraries and Floating-Point Support*:

— *Using the libraries in a nonsemihosting environment* on page 2-36.

If there are still semihosting-using functions being linked in, the linker reports this error.

To resolve this, you must provide your own implementations of these C library functions.

The emb_sw_dev directory contains examples of how to re-implement some of the more common semihosting-using functions. See the file retarget.c. See *Using C and C++ Libraries and Floating-Point Support* for more information on using semihosting-using C library functions.

_____Note _____

The linker does not report any semihosting-using functions such as, for example, __semihost(), in your own application code.

To identify which semihosting-using functions are still being linked-in from the C libraries:

- Link with armlink --verbose --list err.txt
- Search err.txt for occurrences of __I_use_semihosting For example:

... Loading member sys_exit.o from c_4.l. reference : __I_use_semihosting definition: _sys_exit

This shows that the semihosting-using function _sys_exit is linked-in from the C library. To prevent this, you must provide your own implementation of this function.

- Error: L6915E: Library reports error:__use_no_heap was requested, but <reason> was referenced
 - If <reason> represents malloc, free, $_$ heapstats, or $_$ heapvalid, the use of $_$ use_no_heap conflicts with these functions.
- Error: L6915E: Library reports error: _use_no_heap_region was requested, but <reason> was referenced
 If <reason> represents malloc, free, _heapstats, _heapvalid, or __argv_alloc, the use of _use_no_heap_region conflicts with these

             Multiple definitions of library script function '<func>'.
L6939E
             Missing alignment for region <regname>.
L6940E
             Alignment <alignment> for region <regname> must be at least 4 and a power
             of 2 or MAX.
L6941W
             chmod system call failed for file <filename> error <per>>
L6942E
             Execution Region <ername> contains multiple <type>, sections:
L6966E
             Alignment <alignment> for region <regname> cannot be negative.
L6967E
             Entry point (<address>) points to a THUMB instruction but is not a valid
             THUMB code pointer.
L6968E
             Could not parse Linux Kernel version \"<kernel>\".
L6969W
             Changing AT Section <name> type from RW to RO in <ername>.
L6971E
             <objname>(<secname>) type <type> incompatible with <prevobj>(<prevname>)
             type revtype> in er <ername>.
             You might see this message when placing __at sections with a scatter file. For
             example, the following code in main.c and the related scatter file gives this error:
             int variable __attribute__((at(0x200000)));
             LR1 0x0000 0x20000
                 ER1 0x0 0x2000
                 {
                     *(+R0)
                 ER2 0x8000 0x2000
                     main.o
                 RAM 0x200000 (0x1FF00-0x2000)
                     *(+RW, +ZI)
```

}

The variable has the type ZI, and the linker attempts to place it at address 0x200000. However, this address is reserved for RW sections by the scatter file. This produces the error:

Error: L6971E: stdio_streams.o(.data) type RW incompatible with main.o(.ARM.__AT_0x00200000) type ZI in er RAM.

To fix this change the address in your source code, for example:

int variable __attribute__((at(0x210000)));

See the following in *Using the Linker*:

- Placing functions and data at specific addresses on page 8-18
- Using __at sections to place sections at a specific address on page 8-37.
- **L6972E** <objname>(<secname>) with required base 0x<required> has been assigned
 base address 0x<actual>.
- **L6973E** Error placing AT section at address 0x<addr> in overlay ER <ername>. See the following in *Using the Linker*:
 - Using at sections to place sections at a specific address on page 8-37.
- ${f L6974E}$ AT section <name> does not have a base address.

See the following in *Using the Linker*:

- Using __at sections to place sections at a specific address on page 8-37.
- L6975E <objname>(<secname>) cannot have a required base and SHF_MERGE.
- L6976E <objname>(<secname>) cannot have a required base and SHF_LINK_ORDER.
- L6977E <objname>(<secname>) cannot be part of a contiguous block of sections
- ${f L6978W}$ <objname>(<secname>) has a user defined section type and a required base address.
- L6979E <objname>(<secname>) with required base address cannot be placed in Position Independent ER <ername>.
- $\begin{array}{ll} \textbf{L6980W} & \text{FIRST and LAST ignored for $$<$ objname>(<$ secname>)$ with required base address.} \end{array}$

See the following in *Using the Linker*:

- **L6981E**__AT incompatible with BPABI and SystemV Image types
 See the following in *Using the Linker*:
 - Restrictions on placing at sections on page 8-38.
- L6982E AT section <objname>(<spname>) with base <base> limit limit> overlaps address range with AT section <obj2name>(<sp2name>) with base <base2> limit limit limit2>.

See the following in *Using the Linker*:

- Using at sections to place sections at a specific address on page 8-37.
- $L6983E \qquad \text{AT section <objname>(<spname>) with required base address
base> out of range for ER <ername> with base <erbase> and limit <erlimit>.$

See the following in *Using the Linker*:

- *Using at sections to place sections at a specific address on page 8-37.*
- $L6984E \qquad \text{AT section $$<$objname>($<$spname>)$ has required base address $$<$base>$ which is not aligned to section alignment $<$alignment>$.$

See the following in *Using the Linker*:

• Using at sections to place sections at a specific address on page 8-37.

L6985E

Unable to automatically place AT section <objname>(<spname>) with required base address <base>. Please manually place in the scatter file using the --no_autoat option.

See the following in *Using the Linker*:

- Using __at sections to place sections at a specific address on page 8-37. See the following in Linker Reference:
- --autoat, --no_autoat on page 2-17.

Chapter 5 ELF Image Converter Errors and Warnings

The following topic describes the error and warning messages for the ELF image converter, frome1f:

• List of the fromelf error and warning messages on page 5-2.

5.1 List of the fromelf error and warning messages

The error and warning messages for fromelf are:

Q0105E Load region #<segindex> extends beyond top of address space.

Q0106E Out of Memory.

Q0107E Failed writing output file '<filename>': <reason>

Q0108E Could not create output file '<filename>': <reason>

Q0119E No output file specified.

Q0120E No input file specified.

Q0122E Could not open file '<filename>': <reason>

If <reason> is Invalid argument, this might be because you have invalid characters on the command-line. For example, on Windows you might have used the escape character \ when specifying a filter with an archive file:

fromeIf --elf --strip=all t.a\(test*.o\) -o filtered/

On Windows, use:

fromelf --elf --strip=all t.a(test*.o) -o filtered/

See the following in *Using the fromelf Image Converter*:

• input_file on page 4-48.

Q0128E File i/o failure.

This error can occur if you specify a directory for the --output command-line option, but you did not terminate the directory with a path separator. For example, --output=my_elf_files/.

See the following in *Using the fromelf Image Converter*:

--output=destination on page 4-57.

Q0129E Not a 32 bit ELF file.

Q0130E Not a 64 bit ELF file.

Q0131E Invalid ELF identification number found.

This error is given if you attempt to use fromelf on a file which is not in ELF format, or which is corrupted. Object (.o) files and executable (.axf) files are in

ELF format.

O0132E Invalid ELF section index found <idx>.

Q0133E Invalid ELF segment index found <idx>.

Q0134E Invalid ELF string table index found <idx>.

 $\mathbf{Q0135E}$ Invalid ELF section entry size found.

 $\mathbf{Q0136E}$ ELF Header contains invalid file type.

Q0137E ELF Header contains invalid machine name.

Q0138E ELF Header contains invalid version number.

See Q0131E.

Q0147E Failed to create Directory <dir>: <reason>

If <reason> is File exists, this might be because you have specified a directory that has the same name as a file that already exists. For example, if a file called filtered already exists, then the following command produces this error:

fromeIf --elf --strip=all t.a(test*.o) -o filtered/

The path separator character / informs fromelf that filtered is a directory.

See the following in *Using the fromelf Image Converter*:

• --output=destination on page 4-57.

 $\mathbf{Q0171E} \qquad \text{Invalid st_name index into string table <idx>.}$

See O0131E.

Q0172E Invalid index into symbol table <idx>.

See Q0131E.

Q0186E This option requires debugging information to be present

The --fieldoffsets option requires the image to be built with dwarf debug tables.

Q0425W Incorrectly formed virtual function elimination header in file

This might indicate a compiler fault, please contact your supplier.

Q0426E Error reading vtable information from file

This might indicate a compiler fault, please contact your supplier.

Q0427E Error getting string for symbol in a vtable

This might indicate a compiler fault, please contact your supplier.

Q0433E Diagnostic style <style> not recognised

Q0440E No relocation sections for <secname>

Q0447W Unknown Diagnostic number (<num>)

Q0448W Read past the end of the compressed data while decompressing section

'<secname>' #<secnum> in <file>

This might indicate an internal fault. Contact your supplier.

Q0449W Write past the end of the uncompressed data buffer of size <bufsize> while

decompressing section '<secname>' #<secnum> in <file>

This might indicate an internal fault. Contact your supplier.

Q0450W Section '<secname>' #<secnum> in file <file> uses a mixture of legacy and

current ABI relocation types.

Q0451W Option '--strip symbols' used without '--strip debug' on an ELF file that

has debug information.

Q0452W Option '--strip filesymbols' used without '--strip debug' on an ELF file

that has debug information.

Q0453W Stripping path names from '<path1>' and '<path2>' produces a duplicate

file name '<filename>'.

Q0454E In ELF file: <details>

Chapter 6 **Librarian Errors and Warnings**

The following topic describes the error and warning messages for the ARM Librarian, armar:

• List of the armar error and warning messages on page 6-2.

6.1 List of the armar error and warning messages

The error and warning messages for armar are:

L6800U	Out of memory	
L6825E	Reading archive ' <archive>' : <reason></reason></archive>	
L6826E	' <archive>' not in archive format</archive>	
L6827E	' <archive>': malformed symbol table</archive>	
L6828E	' <archive>': malformed string table</archive>	
L6829E	' <archive>': malformed archive (at offset <offset>)</offset></archive>	
L6830E	Writing archive ' <archive>' : <reason></reason></archive>	
L6831E	L6831E ' <member>' not present in archive '<archive>'</archive></member>	
L6832E Archive ' <archive>' not found : <reason></reason></archive>		
L6833E	L6833E File ' <filename>' does not exist</filename>	
L6835E	Reading file ' <filename>' : <reason></reason></filename>	
L6836E	' <filename>' already exists, so will not be extracted</filename>	
L6838E	No archive specified	
L6839E	One of the actions -[<actions>] must be specified</actions>	
L6840E	Only one action option may be specified	
L6841E	Position ' <position>' not found</position>	
L6842E	Filename ' <filename>' too long for file system</filename>	
L6843E	Writing file ' <filename>' : <reason></reason></filename>	
L6874W	Minor variants of archive member ' <member>' include no base variant Minor variants of the same function exist within a library. Find the two equivalent</member>	
	objects and remove one of them.	
L6875W	Adding non-ELF object ' <filename>' to archive '<name>'</name></filename>	

Other Errors and Warnings

The following topic describes other error and warning messages that might be displayed by the tools:

•	List of other error and warning messages on page 7-2.
	Note
The	ese error messages can be produced by any of the tools.
W١	nen the message is displayed the X prefixing the message number is repla

When the message is displayed, the X prefixing the message number is replaced by the appropriate letter relating to the application. For example, the code X3900U, is displayed as L3900U by the linker when you have specified an unrecognized option.

7.1 List of other error and warning messages

Other error and warning messages that might be displayed by the tools are:

X3900U Unrecognized option '<dashes><option>'.

<option> is not recognized by the tool. This could be because of a spelling error

or the use of an unsupported abbreviation of an option.

X3901U Missing argument for option '<option>'.

X3902U Recursive via file inclusion depth of limit> reached in file '<file>'.

X3903U Argument '<argument>' not permitted for option '<option>'.

Possible reasons include malformed integers or unknown arguments.

X3904U Could not open via file '<file>'.

X3905U Error when reading from via file '<file>'.

X3906U Malformed via file '<file>'.

X3907U Via file '<file>' command too long for buffer.

X3908U Overflow: '<string>' will not fit in an integer.

X3910W Old syntax, please use '<hyphens><option><separator><parameter>'.

X3912W Option '<option>' is deprecated.

X3913W Could not close via file '<file>'.

X3915W Argument '<argument>' to option '<option>' is deprecated

X3916U Unexpected argument for option '<dashes><option>'

X3917U Concatenated options cannot have arguments: -<option> <arg>

X9905E cannot use --apcs=/hardfp without floating point hardware

X9906E cannot use --apcs=/hardfp with fpu <fpu_option>

X9907E unable to select no floating point support

X9908E --fpmode=none overrides --fpu choice

Appendix A

Revisions for the Errors and Warnings Reference

The following technical changes have been made to the *Errors and Warnings Reference*:

Table A-1 Differences between Issue E and Issue F

Change	Topics affected	
Changes to the compiler messages: changed the version number component of internal compiler errors from two to three digits removed messages 1113 and 2523 because they are no longer valid added the remarks 2813 and 2815.	 Internal errors and other unexpected failures on page 2-2 List of the armcc error and warning messages on page 2-4 	
 Changes to the assembler messages: corrected the E, W or U suffix in many error and warning message codes added more detail for A1322E, A1477E, A1745W, A1786W, A1788W, and A1809W 	List of the armasm error and warning messages on page 3-2	

Table A-1 Differences between Issue E and Issue F (continued)

Change	Topics affected
Changes to the linker messages: • added cross references to the descriptions for L6218E and L6932W • added more detail for L6242E and L6248E.	List of the armlink error and warning messages on page 4-3
Changed the ARMCCnnLIB and ARMCCnnINC environment variables to ARMCCnLIB and ARMCCnINC.	Various topics
 Where appropriate: changed Thumb-1 to 16-bit Thumb changed Thumb-2 to 32-bit Thumb. 	Various topics

Table A-2 Differences between Issue D and Issue E

Change	Topics affected
Changes to the compiler messages: • added more detail for error 1558.	List of the armcc error and warning messages on page 2-4
Changes to the assembler messages: • removed messages A1588E, A1589E, A1597E, A1613E, A1614E, and A1646W, because they are not reachable.	List of the armasm error and warning messages on page 3-2

Table A-3 Differences between Issue C and Issue D

Change	Topics affected	
Changes to the compiler messages: added messages C3335E, C3336W, C3337E, and C3338W removed error C3053W, becauseprofile is deprecated added cross references to various messages.	List of the old-style armcc error and warning messages on page 2-64	
Changes to the assembler messages: added messages A1903E, A1907W, A1908E, and A1909E added cross references to A1450W.	List of the armasm error and warning messages on page 3-2	
Changes to the linker messages: added L6064E corrected examples for L6216E added L6815U updated the description of L6002U updated the description of L6310W added cross references to various messages.	List of the armlink error and warning messages on page 4-3	
Changes to the fromelf messages: • added cross references to various messages.	List of the fromelf error and warning messages on page 5-2	

Table A-4 Differences between Issue B and Issue C

Change	Topics affected	
Added the linker error L6058E.	List of the armlink error and warning messages on page 4-3	
Added the linker error L6828E.	List of the armlink error and warning messages on page 4-3	

Table A-5 Differences between Issue A and Issue B

Change	Topics affected
Added more detail for compiler errors 631 and 634.	List of the armcc error and warning messages on page 2-4
Removed the assembler error A1590E.	List of the armasm error and warning messages on page 3-2
Added more detail for the assembler warning A1746W.	List of the armasm error and warning messages on page 3-2
Added the Linker error L6065E.	List of the armlink error and warning messages on page 4-3
Added more detail for linker errors L6220E, L6221E, L6384E, L6915E, and L6971E.	List of the armlink error and warning messages on page 4-3
Added cross-references for linker errors L6224E and L6469E.	List of the armlink error and warning messages on page 4-3
Added more detail for fromelf errors Q0122E, Q0128E, and Q0147E.	List of the fromelf error and warning messages on page 5-2
