Chapter 1 **Conventions and feedback**

The following describes the typographical conventions and how to give feedback:

Typographical conventions

The following typographical conventions are used:

monospace Denotes text that can be entered at the keyboard, such as commands, file and program names, and source code.

monospace Denotes a permitted abbreviation for a command or option. The underlined text can be entered instead of the full command or option name.

monospace italic

Denotes arguments to commands and functions where the argument is to be replaced by a specific value.

monospace bold

Denotes language keywords when used outside example code.

italic Highlights important notes, introduces special terminology, denotes internal cross-references, and citations.

Highlights interface elements, such as menu names. Also used for emphasis in descriptive lists, where appropriate, and for ARM® processor signal names.

Feedback on this product

bold

If you have any comments and suggestions about this product, contact your supplier and give:

your name and company

- the serial number of the product
- details of the release you are using
- details of the platform you are using, such as the hardware platform, operating system type and version
- a small standalone sample of code that reproduces the problem
- a clear explanation of what you expected to happen, and what actually happened
- the commands you used, including any command-line options
- sample output illustrating the problem
- the version string of the tools, including the version number and build numbers.

Feedback on content

If you have comments on content then send an e-mail to errata@arm.com. Give:

- the title
- the number, ARM DUI 0452S
- if viewing online, the topic names to which your comments apply
- if viewing a PDF version of a document, the page numbers to which your comments apply
- a concise explanation of your comments.

ARM also welcomes general suggestions for additions and improvements.

ARM periodically provides updates and corrections to its documentation on the ARM Information Center, together with knowledge articles and *Frequently Asked Questions* (FAQs).

Chapter 2 **DS-5 Debugger Commands**

The following topics describe the DS-5 Debugger commands:

- General syntax and usage of DS-5 Debugger commands on page 2-2
- DS-5 Debugger commands listed in groups on page 2-11
- DS-5 Debugger commands listed in alphabetical order on page 2-29.

2.1 General syntax and usage of DS-5 Debugger commands

DS-5 Debugger commands are a comprehensive set of commands to debug embedded applications.

Syntax of DS-5 Debugger commands

Many commands accept arguments and flags using the following syntax:
command [argument] [/flag]
A flag acts as an optional switch and is introduced with a forward slash character. Where a command supports flags, the flags are described as part of the command syntax.
Note
Commands are not case sensitive. Abbreviations are underlined.

Usage of DS-5 Debugger commands

The commands you submit to the debugger must conform to the following rules:

- Each command line can contain only one debugger command.
- When referring to symbols, you must use the same case as the source code.

You can execute the commands by entering them in the debugger command-line console or by running debugger script files. Alternatively in Eclipse, you can open the DS-5 Debug perspective where you can use the menus, icons, and toolbars provided or you can enter DS-5 Debugger commands in the Commands view.

You can enter many debugger commands in an abbreviated form. The debugger requires enough letters to uniquely identify the command you enter. Many commands have alternative names, or aliases, that you might find easier to remember. For example, back and where are aliases for the info stack command. Command names and aliases can be abbreviated. For example, info stack can be abbreviated to i s. The syntax definition for each command shows how it can be abbreviated by underlining it for example, info stack.

In the syntax definition of each command:

- square brackets [...] enclose optional parameters
- braces {...} enclose required parameters
- a vertical pipe | indicates alternatives from which you must choose one
- parameters that can be repeated are followed by an ellipsis (...).

Do not type square brackets, braces, or the vertical pipe. Replace parameters in italics with the value you want. When you supply more than one parameter, use the separator as shown in the syntax definition for each command. If a parameter is a name that includes spaces, enclose it in double quotation marks.

Descriptive comments can be placed either at the end of a command or on a separate line. You can use the # character to identify a descriptive comment.

2.1.1 Using special characters and environment variables in paths

When specifying paths, you can use any of the following:

- a tilde character (~) at the start of a path to refer to your home directory
- an environment variable, for example:
 - %LOG_DIRECTORY%
 - \${LOG_DIRECTORY}

- \$LOG_DIRECTORY
- a backslash (\) or forward slash (/) as a directory separator.

See also

• set escapes-in-filenames on page 2-172.

2.1.2 Using expressions

Some commands accept expressions. There are many types of expressions accepted by the debugger that enable you to extend the operation of a command. For example, binary mathematical expressions, references to module names, or calls to functions.

Using the \$ character to access the content of registers and debugger variables

In an expression you can access the content of registers by using the \$ character and the register name, for example:

print 4+\$R0 # add 4 to the content of R0 register and print result

Results from the print commands are recorded in debugger variables. Other commands, such as breakpoint or watchpoint creating commands, the start command, and the memory command, also use debugger variables to record the ID of the new resource. Each of these debugger variables is assigned a number and can be used subsequently in expressions by using the \$ character.

You can access print results or resource IDs using the debugger variables:

\$ print result or ID in the last assigned debugger variable \$\$ print result or ID in the second-to-last debugger variable \$n print result or ID in the debugger variable with number n.

You can also use the following debugger variables:

\$cwd current working directory
\$cdir current compilation directory
\$entrypoint entry point of the current image

\$idir current image directory \$sdir current script directory

\$datetime current date and time in string format \$timems number of milliseconds since 1st Jan 1970. \$pid current operating system process ID.

\$thread current thread ID for a multi-threaded application

\$core current processor ID for a *Symmetric MultiProcessing* (SMP) systems.

\$vmid current Virtual Machine ID (VMID) for systems that support hypervisor / virtual

machine debugging.

Note

- \$thread is uniquely assigned by the debugger for the current context reported by the OS
 awareness plugin. If no OS awareness plugin is loaded, \$thread tracks the current core,
 \$core.
- \$pid is assigned for the debugger for the current context by the OS awareness plugin. If no OS awareness plugin is loaded, \$pid tracks the current core, \$core.

Using built-in functions within expressions

In an expression you can use built-in functions to provide more functionality. The debugger supports the following:

int strcmp(const char *str1, const char *str2);

Compares two strings and returns an integer.

Return values are:

- Indicates that the second argument string value comes after the first argument string value in the machine collating sequences, str1 < str2.</p>
- Indicates that the two strings are identical in content.
- >0 Indicates that the first argument string value comes after the second argument string value in the machine collating sequences, str2 < str1.

int strncmp(const char *str1, const char *str2, size_t n);

Compares at most n characters of two strings and returns an integer.

Return values are:

- Indicates that the second argument string value comes after the first argument string value in the machine collating sequences, str1 < str2.</p>
- 0 Indicates that the two strings are identical in content.
- >0 Indicates that the first argument string value comes after the second argument string value in the machine collating sequences, str2 < str1.

```
char *strcpy(char *str1, const char *str2);
```

Copies str2 to str1 including "\0" and returns str1.

```
char *strncpy(char *str1, const char *str2, size_t n);
```

Copies at most n characters of str2 to str1 including "0" and returns str1. If str2 has fewer than n characters then fill with "0".

```
void *memcpy(void *s, const void *cs, size_t n);
```

Copies at most n characters from cs to s and returns s.

Example 2-1 Using a built-in strcmp() function with the break command

See also

- *print, inspect* on page 2-141
- set print on page 2-176
- *show print* on page 2-208
- *start* on page 2-222
- *watch* on page 2-250.

2.1.3 Using wildcards

You can use wildcards to enhance your pattern matching. The following types of wildcard pattern matching can be used:

• Globs. This is the default.

Regular expressions.

You can use the DS-5 Debugger command set wildcard-style to change the default setting.

Globs

Globs are a mechanism for examining the contents of strings, and can be used to search variables for strings matching specific patterns. Commands that support wildcards can use globs with the following syntax:

- * Specifies zero or more characters
- ? Specifies only one character
- Specifies an escape character to match on strings containing either * or?

[character] Specifies a range of characters. You can use !character to match characters that are not listed in the range.

Example 2-2 Globs where a wildcard is expected

info functions m* # L

List all functions starting with m

Regular expressions

Commands that support wildcards can use regular expressions. The exact regular expression syntax supported is described in a book called *Mastering Regular Expressions*.

Example 2-3 Regular expressions where a wildcard is expected

info functions m.*

List all functions starting with m

See also

- set wildcard-style on page 2-188
- show wildcard-style on page 2-219
- Jeffrey E. F. Friedl, Mastering Regular Expressions. ISBN 0-596-52812-4, http://oreilly.com.

2.1.4 Using regular expressions in the C expression parser

The C expression parser in the debugger supports regular expressions. Regular expressions are a mechanism for examining the contents of strings, and can be used to search variables for strings matching specific patterns.

The debugger extends C expression syntax to support regular expressions using the =~ and !~ operators in the style of Perl, as shown in the following examples:

Example 2-4 Regular expressions using the =~ and !~ operators

This example evaluates to 1 if the regular expression matches anywhere in the string and 0 if it does not match:

expression =~ regular_expression

This example evaluates to 0 if the regular expression matches anywhere in the string and 1 if it does not match:

expression !~ regular_expression

```
where:
```

```
expression is any expression of type char * or char[]. For example, a variable name.
```

regular_expression is a regular expression in the form /regex/modifiers or m/regex/modifiers. For example, if str is a variable of type char*, the following are valid

```
str =~ /abc/
((char *) void_pointer) !~ m/abc/i
```

The exact regular expression syntax supported is described by the *Mastering Regular Expressions* book in the chapter discussing Java regex support. An exception to this is the parsing of the handling of modifiers. The following modifiers are supported by the debugger:

- i enable case insensitive matching
- m multiline mode (\(^\) and \(^\) match embedded newline)
- s dotall mode (. matches line terminators)

expressions:

x comments mode (permit whitespace and comments).

See also

 Jeffrey E. F. Friedl, Mastering Regular Expressions. ISBN 0-596-52812-4, http://oreilly.com.

2.1.5 Using the C++ scoping resolution operator

In C++, the :: (scope resolution) operator is a global identifier for variable or function names that are out of scope.

The expression evaluator supports scoping operations using the scope resolution, member and member pointer operators. This can be used to reference variables and functions within files, namespaces or classes.

For example:

Example 2-5 demo.cpp

```
static int FILE_STATIC_VARIABLE = 20;
class OuterClass
{
   public:
   OuterClass(int i)
   {
     value = i;
   }
   class InnerClass
   {
     public:
     int demoFunction()
     {
        return 25;
     }
}
```

```
};
  void increment()
    value++;
  int value;
};
namespace NAME_SPACE_OUTER
  const int TEST_VAR= 20;
  namespace NAME_SPACE_INNER
    const int TEST_VAR= 19;
    int nameSpaceFoo ()
      return 60;
 };
};
int main()
  OuterClass oc(14);
  OuterClass *ptr_oc = &oc;
  ptr_oc->increment();
```

You can query this example by using any of the following expressions:

```
OuterClass::InnerClass::demoFunction
"demo.c"::FILE_STATIC_VARIABLE
NAME_SPACE_OUTER::TEST_VAR
NAME_SPACE_OUTER::NAME_SPACE_INNER::TEST_VAR
```

If you set a a breakpoint at ptr_oc->increment() and run to it, then the following expressions can also be used to query the instances of the outer class:

```
oc.value
ptr_oc->value
```

2.1.6 printf() style format string

Certain commands use printf() style format strings to specify how to format values. For example the set print double-format and set print float-format commands specify how to format floating-point values. It works in a similar way to the ANSI C standard library function printf().

Format string syntax

The commands specify the format using a string. If there are no % characters in the string, the message is written out and any arguments are ignored. The % symbol is used to indicate the start of an argument conversion specification.

The syntax of the format string is:

%[flag...][fieldwidth][precision]format

where:

flag An optional conversion modification flag.

"-" result is left-justified

"#" result uses a conversion-dependent alternate form

"+" result includes a sign

" " result includes a leading space for positive values

"0" result is zero-padded

"," result includes locale-specific grouping separator

"(" result encloses negative numbers in parentheses.

fieldwidth An optional minimum field width specified in decimal.

precision An optional precision specified in decimal, with a preceding. (period character)

to identify it.

format The possible conversion specifier characters are:

% A literal % character.

a, A, e, E, f, g or G

Results in a decimal number formatted using scientific notation or floating point notation. The capital letter forms use a capital E in scientific notation rather than an e

d or u Results in a decimal integer. **d** indicates a signed integer. **u** indicates an unsigned integer.

h or H Results in a Hexadecimal character in lower or upper case.

x or X Results in an unsigned Hexadecimal character in lower or upper case.

Results in an octal integer.

c or C Results in a Unicode character in lower or upper case.

s Results in a string.

b or B Results in a string containing either "true" or "false" in lower or upper case.

n Results in a platform-specific line separator.

t or T Prefix for date and time conversion specifier characters. For example:
"%ta %tb %td %tT" results in "Sun Jul 20 16:17:00"

See also

- echo on page 2-67
- *output* on page 2-138
- *print, inspect* on page 2-141
- set print on page 2-176
- *show print* on page 2-208.

2.2 DS-5 Debugger commands listed in groups

The DS-5 Debugger commands grouped according to specific tasks are:

- Breakpoints and watchpoints
- Execution control on page 2-13
- *Tracing* on page 2-15
- *Scripts* on page 2-15
- *Call stack* on page 2-16
- Operating System (OS) on page 2-16
- Files on page 2-18
- Data on page 2-19
- *Memory* on page 2-20
- *Cache* on page 2-21
- *Registers* on page 2-21
- *MMU* on page 2-21
- *Display* on page 2-22
- *Information* on page 2-22
- Log commands on page 2-24
- Set commands on page 2-24
- Show commands on page 2-26
- Flash commands on page 2-27
- Supporting commands on page 2-27.

2.2.1 Breakpoints and watchpoints

List of commands:

break on page 2-40

Sets a software breakpoint.

hbreak on page 2-77

Sets a hardware breakpoint.

tbreak on page 2-229

Sets a temporary software breakpoint that is deleted when it is hit.

thbreak on page 2-231

Sets a temporary hardware breakpoint that is deleted when it is hit.

awatch on page 2-37

Sets a read/write watchpoint for a global/static data symbol.

rwatch on page 2-155

Sets a read watchpoint for a global/static data symbol.

watch on page 2-250

Sets a write watchpoint for a global/static data symbol.

condition on page 2-52

Sets a break condition for a specific breakpoint or watchpoint.

ignore on page 2-81

Sets the ignore counter for a breakpoint or watchpoint condition.

break-script on page 2-42

Assigns a script file to a specific breakpoint for execution when the breakpoint is triggered.

break-stop-on-threads, break-stop-on-cores on page 2-45

Applies an existing breakpoint to one or more threads or processors.

break-stop-on-vmid on page 2-46

Applies an existing hardware breakpoint to a virtual machine.

enable breakpoints on page 2-68

Enables one or more breakpoints or watchpoints by number.

disable breakpoints on page 2-59

Disables one or more breakpoints or watchpoints by number.

delete breakpoints on page 2-56

Deletes one or more breakpoints or watchpoints by number.

resolve on page 2-146

Resolves one or more breakpoints or watchpoints.

clear on page 2-50

Deletes a breakpoint at a specific location.

clearwatch on page 2-51

Deletes a watchpoint at a specific location.

info breakpoints, info watchpoints on page 2-84

Displays information about the status of all breakpoints and watchpoints.

info breakpoints capabilities, info watchpoints capabilities on page 2-85

Displays a list of parameters that you can use with breakpoint and watchpoint commands for the current connection.

set breakpoint on page 2-164

Controls the automatic behavior of breakpoints and watchpoints.

silence on page 2-220

Disables the printing of stop messages for a specific breakpoint.

unsilence on page 2-246

Enables the printing of stop messages for a specific breakpoint.

2.2.2 Execution control

List of commands:

start on page 2-222

Sets a temporary breakpoint and starts running the image until it hits the breakpoint. When the debugger stops, the breakpoint is deleted. By default, the breakpoint is set at the address of the global function main().

set blocking-run-control on page 2-163

Controls whether run control operations such as stepping and running are blocked until the target stops or released immediately.

show blocking-run-control on page 2-196

Displays the current setting for blocking run control operations.

set debug-from on page 2-167

Specifies the address of the temporary breakpoint for subsequent use by the start command.

show debug-from on page 2-200

Displays the current setting for the expression that is used by the start command to set a temporary breakpoint.

run on page 2-154

Starts running the target.

continue on page 2-53

Continues running the target.

advance on page 2-35

Sets a temporary breakpoint and continues running the image until it hits the breakpoint. When the debugger stops, the breakpoint is deleted.

finish on page 2-73

Continues running the device to the next instruction after the selected stack frame finishes.

interrupt, stop on page 2-114

Interrupts the target and stops the current application if it is running.

wait on page 2-249

Instructs the debugger to wait until either the application completes or a breakpoint is hit.

reset on page 2-145

Performs a reset on the target.

reverse-continue on page 2-148

Runs the target backwards.

reverse-next on page 2-149

Rewinds execution to the preceding source line in the current function.

reverse-nexti on page 2-150

Rewinds execution at the instruction level, stepping over all function calls.

reverse-step on page 2-151

Steps backward out of the current source line.

reverse-stepi on page 2-152

Steps backward one instruction.

reverse-step-out on page 2-153

Rewinds execution through the specified number of stack frames.

step on page 2-224

Source level stepping including stepping into all function calls where there is debug information.

stepi on page 2-225

Instruction level stepping including stepping into all function calls.

steps on page 2-226

Source level stepping through statements including stepping into all function calls where there is debug information.

next on page 2-134

Source level stepping over all function calls.

nexti on page 2-135

Instruction level stepping over all function calls.

nexts on page 2-136

Source level stepping through statements but stepping over all function calls.

thread, core on page 2-233

Displays information about the current thread or processor.

thread apply, core apply on page 2-234

Temporarily switches control to a thread or processor to execute a DS-5 Debugger command and then switches back to the original state.

set step-mode on page 2-182

Specifies whether to step into or step over a function with no debug information.

show step-mode on page 2-213

Displays the current step setting for functions without debug information.

handle on page 2-76

Controls the handler settings for one or more signals or exceptions.

info signals, info handle on page 2-105

Displays information about the handling of signals.

2.2.3 Tracing

List of commands:

trace start on page 2-243

Starts the trace capture on the specified trace capture device.

trace stop on page 2-244

Stops the trace capture on the specified trace capture device.

trace clear on page 2-235

Clears the trace capture on the specified trace capture device.

trace list on page 2-239

Lists the connected trace capture devices and trace sources.

trace info on page 2-238

Displays details about trace capture devices and trace sources.

trace dump on page 2-236

Produces a dump of raw trace data.

trace report on page 2-240

Produces a trace report.

2.2.4 Scripts

List of commands:

define on page 2-55 Enables you to derive a new user-defined command from existing commands.

document on page 2-63

Enables you to add integrated help for a new user-defined command.

newvar on page 2-133

Declares and initializes a new debugger convenience variable.

if on page 2-80 Enables you to write scripts that conditionally execute debugger commands.

while on page 2-254

Enables you to write looping scripts that conditionally execute debugger commands.

end on page 2-70 Enables you to terminate conditional scripts.

source on page 2-221

Loads and runs a script file containing debugger commands to control and debug your target.

2.2.5 Call stack

List of commands:

up on page 2-247

Controls and displays the current position in the call stack.

up-silently on page 2-248

Controls the current position in the call stack.

down on page 2-64

Controls and displays the current position in the call stack.

down-silently on page 2-65

Controls the current position in the call stack.

frame on page 2-75

Displays stack frame information at the selected position.

select-frame on page 2-157

Controls the current position in the call stack.

info frame on page 2-91

Displays stack frame information at the selected position.

info stack, backtrace, where on page 2-107

Displays information about the call stack.

set backtrace on page 2-162

Controls the default behavior when using the info stack command.

show backtrace on page 2-195

Displays current behavior settings for use with the info stack command.

Type help followed by a command name for more information on a specific command.

2.2.6 Operating System (OS)

List of commands:

sharedlibrary on page 2-189

Loads shared library symbols.

nosharedlibrary on page 2-137

Discards all loaded shared library symbols except for the symbols that are loaded explicitly using the sharedlibrary command.

info sharedlibrary on page 2-104

Displays the names of the loaded shared libraries.

set os on page 2-174

Controls the OS settings in the debugger.

show os on page 2-207

Displays the current OS settings in the debugger.

set sysroot, set solib-absolute-prefix on page 2-185

Specifies the system root for prefixing shared library paths.

show sysroot, show solib-absolute-prefix on page 2-216

Displays the system root directory in use by the debugger when searching for shared library symbols.

set auto-solib-add on page 2-161

Controls the automatic loading of shared library symbols.

show auto-solib-add on page 2-194

Displays the current automatic setting for use when loading shared library symbols.

set solib-search-path on page 2-181

Specifies additional directories to search for shared library symbols.

show solib-search-path on page 2-212

Displays the current search paths in use by the debugger when searching for shared libraries.

set stop-on-solib-events on page 2-183

Specifies whether the debugger stops execution when it is notified of an event by the dynamic linker.

show stop-on-solib-events on page 2-214

Displays the current debugger setting that controls whether execution stops when shared library events occur.

thread, core on page 2-233

Sets the current thread and displays thread state and stack frame.

thread apply, core apply on page 2-234

Temporarily switches control to a thread or processor to execute a DS-5 Debugger command and then switches back to the original state.

info threads on page 2-110

Displays a list of threads showing ID, current state and related stack frame information.

info processes on page 2-101

Displays a list of processes showing ID, current state and related stack frame information.

info os-log on page 2-98

Displays the contents of the *Operating System* (OS) log buffer for connections that supports this feature.

info os-modules on page 2-99

Displays a list of the *Operating System* (OS) modules for connections that supports this feature.

info os-version on page 2-100

Displays the version of the *Operating System* (OS) for connections that supports this feature.

Type help followed by a command name for more information on a specific command.

2.2.7 Files

List of commands:

load on page 2-117

Loads an image on to the target and records the entry point address for future use by the run and start commands.

loadfile on page 2-118

Loads debug information into the debugger, an image on to the target and records the entry point address for future use by the run and start commands.

file, symbol-file on page 2-72

Loads debug information from an image into the debugger.

reload-symbol-file on page 2-144

Reloads debug information from an already loaded image into the debugger using the same settings as the original load operation.

add-symbol-file on page 2-34

Loads additional debug information into the debugger.

discard-symbol-file on page 2-62

Discards debug information relating to a specific file.

dump on page 2-66

Reads data from memory or an expression and writes to a file.

append on page 2-36

Reads data from memory or an expression and appends to an existing file.

restore on page 2-147

Reads data from a file and writes it to memory.

info files, info target on page 2-89

Displays information about the loaded image and symbols.

info sources on page 2-106

Displays the names of the source files.

cd on page 2-49

Sets the working directory.

pwd on page 2-142

Displays the working directory.

directory on page 2-58

Defines additional directories to search for source files.

show directories on page 2-201

Displays the list of directories to search for source files.

set substitute-path on page 2-184

Modifies the search paths used when displaying source code.

show substitute-path on page 2-215

Displays the current search path substitution rules in use by the debugger when searching for source files.

Type help followed by a command name for more information on a specific command.

2.2.8 Data

List of commands:

list on page 2-115

Displays lines of source code.

set listsize on page 2-173

Modifies the default number of source lines that the list command displays.

show listsize on page 2-206

Displays the number of source lines that the list command displays.

set variable on page 2-187

Specifies an expression and assigns the result to a variable.

whatis on page 2-252

Displays the data type of an expression.

x on page 2-255

Displays the content of memory at a specific address.

disassemble on page 2-61

Displays disassembly for a specific section of memory.

info address on page 2-82

Displays the location of a symbol.

info symbol on page 2-108

Displays the symbol name at a specific address.

info locals on page 2-95

Displays all local variables.

info functions on page 2-92

Displays the name and data types for all functions.

info variables on page 2-111

Displays the name and data types of global and static variables.

info classes on page 2-87

Displays C++ class names.

info members on page 2-96

Displays the name and data types for all class member variables that are accessible in the function corresponding to the selected stack frame.

Type help followed by a command name for more information on a specific command.

2.2.9 Memory

```
List of commands:
```

memory on page 2-121

Specifies the attributes and size for a memory region.

memory auto on page 2-123

Resets the memory regions to the default target settings.

memory debug-cache on page 2-124

Controls the caching by the debugger for all memory regions.

enable memory on page 2-69

Enables one or more user-defined memory regions.

disable memory on page 2-60

Disables one or more user-defined memory regions.

delete memory on page 2-57

Deletes one or more user-defined memory regions.

info memory on page 2-97

Displays the attributes for all memory regions.

memory fill on page 2-125

Writes a specific pattern of bytes to memory.

memory set on page 2-126

Writes to memory.

memory set_typed on page 2-128

Writes a list of values to memory.

dump on page 2-66

Reads data from memory or an expression and writes to a file.

append on page 2-36

Reads data from memory or an expression and appends to an existing file.

restore on page 2-147

Reads data from a file and writes it to memory.

x on page 2-255

Displays the content of memory at a specific address.

disassemble on page 2-61

Displays disassembly for a specific section of memory.

2.2.10 Cache

List of commands:

cache list on page 2-47

Lists the caches and related information available for the current core.

cache print on page 2-48

Provides a structured view of the cache data in the current core.

Type help followed by a command name for more information on a specific command.

2.2.11 Registers

List of commands:

info registers on page 2-102

Displays the name and content of registers for the current stack frame.

info all-registers on page 2-83

Displays the name and content of grouped registers for the current stack frame.

Type help followed by a command name for more information on a specific command.

2.2.12 MMU

List of commands:

mmu list tables on page 2-129

Lists the available translation tables and their associated parameters.

mmu list translations on page 2-130

Lists the available translations and their associated parameters.

mmu print on page 2-130

Prints the contents of a translation table.

mmu translate on page 2-131

Performs translations between virtual and physical addresses.

2.2.13 MMU list

List of commands:

mmu list tables on page 2-129

Lists the available translation tables and their associated parameters.

mmu list translations on page 2-130

Lists the available translations and their associated parameters.

Type help followed by a command name for more information on a specific command.

2.2.14 Display

List of commands:

echo on page 2-67

Displays only textual strings.

output on page 2-138

Displays only the output of an expression.

print, inspect on page 2-141

Displays the output of an expression and records the result in a debugger variable

set print on page 2-176

Controls the current debugger print settings.

show print on page 2-208

Displays the current debugger print settings.

Type help followed by a command name for more information on a specific command.

2.2.15 Information

List of commands:

info address on page 2-82

Displays the location of a symbol.

info all-registers on page 2-83

Displays the name and content of all registers.

info breakpoints, info watchpoints on page 2-84

Displays information about the status of all breakpoints and watchpoints.

info capabilities on page 2-86

Displays a list of capabilities for the target device that is currently connected to the debugger.

info classes on page 2-87

Displays C++ class names.

info cores on page 2-88

Displays information about the running processors.

info files, info target on page 2-89

Displays information about the loaded image and symbols.

info frame on page 2-91

Displays stack frame information at the selected position.

info functions on page 2-92

Displays the name and data types for all functions.

info inst-sets on page 2-94

Displays the available instruction sets.

info locals on page 2-95

Displays all local variables for the current stack frame.

info members on page 2-96 Displays the name and data types for class member variables.

info memory on page 2-97

Displays the attributes for all memory regions.

info os-log on page 2-98

Displays the contents of the *Operating System* (OS) log buffer for connections that support this feature.

info os-modules on page 2-99

Displays a list of loadable kernel modules for connections that support this feature.

info os-version on page 2-100

Displays the version of the *Operating System* (OS) for connections that support this feature.

info processes on page 2-101

Displays information about the user space processes.

info registers on page 2-102

Displays the name and content of all application level registers.

info semihosting on page 2-103

Displays semihosting information for the server, client, or all.

info sharedlibrary on page 2-104

Displays the names of the loaded shared libraries.

info signals, info handle on page 2-105

Displays information about the handling of signals or exceptions.

info sources on page 2-106

Displays the names of the source files.

info stack, backtrace, where on page 2-107

Displays information about the call stack.

info symbol on page 2-108

Displays the symbol name at a specific address.

info threads on page 2-110

Displays information about the available threads.

info variables on page 2-111

Displays the name and data types for all global and static variables.

Type help followed by a command name for more information on a specific command.

2.2.16 Log commands

List of commands:

log config on page 2-119

Specifies the type of logging configuration to output runtime messages from the debugger.

log file on page 2-120

Specifies an output file to receive runtime messages from the debugger.

Type help followed by a command name for more information on a specific command.

set is an alias for set variable.

2.2.17 Set commands

List of commands:

set

set arm on page 2-159

Controls the behavior of the debugger when selecting the instruction set for disassembly and setting breakpoints.

set auto-solib-add on page 2-161

Controls the automatic loading of shared library symbols.

set backtrace on page 2-162

Controls the default behavior when using the info stack command.

set blocking-run-control on page 2-163

Controls whether run control operations such as stepping and running are blocked until the target stops or released immediately.

set breakpoint on page 2-164

Controls the automatic behavior of breakpoints and watchpoints.

set case-insensitive-source-matching on page 2-165

Controls the case sensitivity when the debugger performs source file matching operations.

set debug-agent on page 2-166

Sets a parameter in the launch configuration for DSTREAM/RVI connections.

set debug-from on page 2-167

Specifies the address of the temporary breakpoint for subsequent use by the start command.

set directories on page 2-168

Specifies additional directories to search for source files.

set dtsl-options on page 2-169

Sets a parameter in the connection DTSL configuration.

set endian on page 2-170

Specifies the byte order for use by the debugger.

set escape-strings on page 2-171

Controls how special characters in strings are printed on the debugger command-line.

set escapes-in-filenames on page 2-172

Controls the use of special characters in paths.

set listsize on page 2-173

Modifies the default number of source lines that the list command displays.

set os on page 2-174

Controls the *Operating System* (OS) settings in the debugger.

set print on page 2-176

Controls the current debugger print settings.

set semihosting on page 2-178

Controls the semihosting operations in the debugger.

set solib-search-path on page 2-181

Specifies additional directories to search for shared library symbols.

set step-mode on page 2-182

Specifies whether to step into or step over a function with no debug information.

set stop-on-solib-events on page 2-183

Specifies whether the debugger stops execution when it is notified of an event by the dynamic linker.

set substitute-path on page 2-184

Modifies the search paths used when displaying source code.

set sysroot, set solib-absolute-prefix on page 2-185

Specifies the system root for prefixing shared library paths.

set variable on page 2-187

Specifies an expression and assigns the result to a variable.

set wildcard-style on page 2-188

Specifies the wildcard style to use for pattern matching in strings.

2.2.18 Show commands

List of commands:

show on page 2-191

Displays the current debugger settings.

show architecture on page 2-192

Displays the current target architecture.

show arm on page 2-193

Displays the current instruction set settings in use by the debugger for disassembly and setting breakpoints.

show auto-solib-add on page 2-194

Displays the current automatic setting for use when loading shared library symbols.

show backtrace on page 2-195

Displays the current behavior settings for use with the info stack command.

show blocking-run-control on page 2-196

Displays the current setting for blocking run control operations.

show breakpoint on page 2-197

Displays the current breakpoint and watchpoint behavior settings.

show case-insensitive-source-matching on page 2-198

Displays the current breakpoint and watchpoint behavior settings.

show debug-agent on page 2-199

Displays the current value of a parameter in the launch configuration for DSTREAM/RVI connections.

show debug-from on page 2-200

Displays the current setting for the address of the temporary breakpoint used by the start command.

show directories on page 2-201

Displays the list of search directories.

show dtsl-options on page 2-202

Displays the current value of a parameter in the connection DTSL configuration.

show endian on page 2-203

Displays the current byte order setting.

show escape-strings on page 2-204

Displays the current setting for controlling how special characters in strings are printed on the debugger command-line.

show escapes-in-filenames on page 2-205

Displays the current setting for controlling the use of special characters in paths.

show listsize on page 2-206

Displays the listing size for the list command.

show os on page 2-207 Displays the current Operating System (OS) settings in the debugger.

show print on page 2-208

Displays the current debugger print settings.

show semihosting on page 2-209

Displays the current setting for semihosting operations.

show solib-search-path on page 2-212

Displays the current search path for shared libraries.

show step-mode on page 2-213

Displays the current step setting for functions without debug information.

show stop-on-solib-events on page 2-214

Displays the current debugger setting that controls whether execution stops when shared library events occur.

show substitute-path on page 2-215

Displays all the substitution rules.

show sysroot, show solib-absolute-prefix on page 2-216

Displays the system root prefix for shared library paths.

show version on page 2-218

Displays the current version number of the debugger.

show wildcard-style on page 2-219

Displays the current wildcard style in use for pattern matching.

Type help followed by a command name for more information on a specific command.

2.2.19 Flash commands

List of commands:

flash load on page 2-74

Loads sections from an image into one or more flash devices.

info flash on page 2-90

Displays information about the flash devices on the current target.

Type help followed by a command name for more information on a specific command.

2.2.20 Supporting commands

List of commands:

preprocess on page 2-140

Displays a preprocessed value.

help on page 2-79 Displays help information for a specific command or a group of commands listed according to specific debugging tasks.

pause on page 2-139

Pauses the execution of a script for a specified period of time.

shell on page 2-190

Runs a shell command within the current debug session.

quit, exit on page 2-143

Quits the debugger session.

show version on page 2-218

Displays the current version number of the debugger.

show architecture on page 2-192

Displays the architecture of the current target.

set arm on page 2-159

Controls the behavior of the debugger when selecting the instruction set for disassembly and setting breakpoints.

show arm on page 2-193

Displays the current instruction set settings in use by the debugger for disassembly and setting breakpoints.

info inst-sets on page 2-94

Displays the available instruction sets.

set endian on page 2-170

Specifies the byte order for use by the debugger.

show endian on page 2-203

Displays the current byte order setting in use by the debugger.

info capabilities on page 2-86

Displays a list of capabilities for the target device that is currently connected to the debugger.

set semihosting on page 2-178

Controls the semihosting options in the debugger.

show semihosting on page 2-209

Displays the current semihosting settings.

stdin on page 2-223

Specifies semihosting input requested by application code. For use only in a command-line console with interactive mode.

unset on page 2-245

Modifies the current debugger settings.

2.3 DS-5 Debugger commands listed in alphabetical order

The DS-5 Debugger commands in alphabetical order are:

- add-symbol-file on page 2-34
- advance on page 2-35
- append on page 2-36
- awatch on page 2-37
- *break* on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *cache list* on page 2-47
- *cache print* on page 2-48
- *cd* on page 2-49
- *clear* on page 2-50
- *clearwatch* on page 2-51
- *condition* on page 2-52
- *continue* on page 2-53
- *define* on page 2-55
- *delete breakpoints* on page 2-56
- *delete memory* on page 2-57
- *directory* on page 2-58
- disable breakpoints on page 2-59
- *disable memory* on page 2-60
- disassemble on page 2-61
- discard-symbol-file on page 2-62
- *document* on page 2-63
- down on page 2-64
- *down-silently* on page 2-65
- *dump* on page 2-66
- *echo* on page 2-67
- enable breakpoints on page 2-68
- enable memory on page 2-69
- *end* on page 2-70
- *file, symbol-file* on page 2-72
- *finish* on page 2-73
- *flash load* on page 2-74
- *frame* on page 2-75
- *handle* on page 2-76
- *hbreak* on page 2-77
- *help* on page 2-79
- *if* on page 2-80
- *ignore* on page 2-81
- *info address* on page 2-82
- info all-registers on page 2-83
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- *info capabilities* on page 2-86

- info classes on page 2-87
- *info cores* on page 2-88
- info files, info target on page 2-89
- *info flash* on page 2-90
- *info frame* on page 2-91
- *info functions* on page 2-92
- *info inst-sets* on page 2-94
- *info locals* on page 2-95
- *info memory* on page 2-97
- *info members* on page 2-96
- *info os-log* on page 2-98
- *info os-modules* on page 2-99
- *info os-version* on page 2-100
- *info processes* on page 2-101
- *info registers* on page 2-102
- *info semihosting* on page 2-103
- *info sharedlibrary* on page 2-104
- info signals, info handle on page 2-105
- *info sources* on page 2-106
- info stack, backtrace, where on page 2-107
- info symbol on page 2-108
- *info target* on page 2-109
- *info threads* on page 2-110
- info variables on page 2-111
- *interrupt, stop* on page 2-114
- *list* on page 2-115
- *load* on page 2-117
- *loadfile* on page 2-118
- *log config* on page 2-119
- *log file* on page 2-120
- *memory* on page 2-121
- *memory auto* on page 2-123
- *memory debug-cache* on page 2-124
- *memory fill* on page 2-125
- *memory set* on page 2-126
- *memory set typed* on page 2-128
- *mmu list tables* on page 2-129
- mmu list translations on page 2-130
- *mmu print* on page 2-130
- *mmu translate* on page 2-131
- *newvar* on page 2-133
- *next* on page 2-134
- *nexti* on page 2-135
- *nexts* on page 2-136
- *nosharedlibrary* on page 2-137
- *output* on page 2-138
- *pause* on page 2-139

- preprocess on page 2-140
- print, inspect on page 2-141
- *pwd* on page 2-142
- quit, exit on page 2-143
- reload-symbol-file on page 2-144
- *reset* on page 2-145
- resolve on page 2-146
- restore on page 2-147
- reverse-continue on page 2-148
- reverse-next on page 2-149
- reverse-nexti on page 2-150
- reverse-step on page 2-151
- reverse-stepi on page 2-152
- reverse-step-out on page 2-153
- *run* on page 2-154
- rwatch on page 2-155
- *select-frame* on page 2-157
- *set arm* on page 2-159
- set auto-solib-add on page 2-161
- set backtrace on page 2-162
- set blocking-run-control on page 2-163
- set breakpoint on page 2-164
- set case-insensitive-source-matching on page 2-165
- set debug-agent on page 2-166
- set debug-from on page 2-167
- set directories on page 2-168
- set dtsl-options on page 2-169
- set endian on page 2-170
- set escape-strings on page 2-171
- set escapes-in-filenames on page 2-172
- set listsize on page 2-173
- *set os* on page 2-174
- set print on page 2-176
- set semihosting on page 2-178
- set solib-search-path on page 2-181
- set step-mode on page 2-182
- set stop-on-solib-events on page 2-183
- set substitute-path on page 2-184
- set sysroot, set solib-absolute-prefix on page 2-185
- set trust-ro-sections-for-opcodes on page 2-186
- set variable on page 2-187
- set wildcard-style on page 2-188
- sharedlibrary on page 2-189
- *shell* on page 2-190
- *show* on page 2-191
- *show architecture* on page 2-192
- *show arm* on page 2-193

- show auto-solib-add on page 2-194
- show backtrace on page 2-195
- show blocking-run-control on page 2-196
- show breakpoint on page 2-197
- show case-insensitive-source-matching on page 2-198
- show debug-agent on page 2-199
- show debug-from on page 2-200
- show directories on page 2-201
- show dtsl-options on page 2-202
- show endian on page 2-203
- show escape-strings on page 2-204
- show escapes-in-filenames on page 2-205
- show listsize on page 2-206
- show os on page 2-207
- show print on page 2-208
- show semihosting on page 2-209
- show solib-search-path on page 2-212
- show step-mode on page 2-213
- show stop-on-solib-events on page 2-214
- show substitute-path on page 2-215
- show sysroot, show solib-absolute-prefix on page 2-216
- show trust-ro-sections-for-opcodes on page 2-217
- show version on page 2-218
- show wildcard-style on page 2-219
- silence on page 2-220
- source on page 2-221
- start on page 2-222
- stdin on page 2-223
- step on page 2-224
- stepi on page 2-225
- steps on page 2-226
- tbreak on page 2-229
- thbreak on page 2-231
- thread, core on page 2-233
- thread apply, core apply on page 2-234
- trace clear on page 2-235
- trace dump on page 2-236
- trace info on page 2-238
- trace list on page 2-239
- trace report on page 2-240
- trace start on page 2-243
- trace stop on page 2-244
- unset on page 2-245
- unsilence on page 2-246
- *up* on page 2-247
- up-silently on page 2-248
- wait on page 2-249

- watch on page 2-250
- whatis on page 2-252
- while on page 2-254
- x on page 2-255.

2.3.1 add-symbol-file

This command loads additional debug information into the debugger.

Syntax

add-symbol-file filename [offset] [-option] [-s section address]...

Where:

filename

Specifies the image, shared library, or *Operating System* (OS) module.

_____Note _____

Shared library and OS modules depend on connections that support loading these types of files. This option pends the file until the library or OS module is loaded.

offset

Specifies the offset that is added to all addresses within the image. If offset is not specified then the default for:

- An image is zero.
- A shared library is the load address of the library. If the application has not currently loaded the specified library then the request is pended until the library is loaded and the offset can be determined.
- s Specifies the relocation of symbols being loaded from a relocatable object file.

section Specifies the name of a section in a relocatable file.

address Specifies the address of the section. This can be either an address or an expression that evaluates to an address.

You can use the info files command to display information about the loaded files.

Example

Example 2-6 add-symbol-file

- *cd* on page 2-49
- discard-symbol-file on page 2-62
- *file, symbol-file* on page 2-72
- *load* on page 2-117
- info files, info target on page 2-89
- *info os-modules* on page 2-99
- *loadfile* on page 2-118
- reload-symbol-file on page 2-144.

2.3.2 advance

This command sets a temporary breakpoint and calls the debugger continue command. The temporary breakpoint is subsequently deleted when it is hit.

_____Note _____

Control is returned as soon as the target is running. You can use the wait command to block the debugger from returning control until either the application completes or a breakpoint is hit.

Syntax

advance [-p] [filename:]location|*address

Where:

p Specifies whether or not the resolution of an unrecognized breakpoint location

results in a pending breakpoint being created.

filename Specifies the file.

location Specifies the location:

line_numis a line numberfunctionis a function name.labelis a label name.

+offset | -offset | Specifies the line offset from the current location.

address Specifies the address. This can be either an address or an expression that evaluates

to an address.

Example

Example 2-7 advance

```
advance func1  # Sets a temporary breakpoint at func1 and continues  # running the target advance -p lib.c:20  # Sets a pendable temporary breakpoint at line 20 in lib.c  # and continues running the target
```

- *continue* on page 2-53
- *tbreak* on page 2-229.

2.3.3 append

This command reads data from memory or the result of an expression and appends it to an existing file.

Syntax

```
append [format] memory filename start_address {end_address|+size}
append [format] value filename expression
```

Where:

format Specifies the output format:

binary Binary. This is the default.

ihex Intel Hex-32.

srec Motorola 32-bit (S-records).

vhx Byte oriented hexadecimal (Verilog Memory

Model).

filename Specifies the file.

start_address Specifies the start address for the memory.

end_address Specifies the inclusive end address for the memory.

size Specifies the size of the region.

expression Specifies an expression that is evaluated and the result is returned.

Example

Example 2-8 append

```
append memory myFile.bin 0x8000 0x8FFF # Append content of memory 0x8000-0x8FFF # to binary file myFile.bin
append srec value myFile.m32 myArray # Append content of myArray to # Motorola 32-bit file myFile.m32
```

- Using expressions on page 2-4
- *dump* on page 2-66
- restore on page 2-147.

2.3.4 awatch

This command sets a watchpoint for a data symbol. The debugger stops the target when the memory at the specified address is read or written.

This command records the ID of the watchpoint in a new debugger variable, \$n, where n is a number. You can use this variable, in a script, to delete or modify the watchpoint behavior. If \$n is the last or second-to-last debugger variable, then you can also access the ID using \$ or \$\$, respectively.

Watchpoints are only supported on scalar values.

Some targets do not support watchpoints. Currently you can only set a watchpoint on:

- a hardware target using a debug hardware agent
- Linux applications using gdbserver or undodb-server.

The availability of watchpoints depends on the hardware target. In the case of Linux application debug, the availability of watchpoints also depends on the Linux kernel version and configuration.

The address of the instruction that triggers the watchpoint might not be the address shown in the PC register. This is because of pipelining effects.

Syntax

```
awatch [-d] [-p] {[filename:]symbol|*address} [vmid vmid]
```

Where:

d Disables the watchpoint immediately after creation.

p Specifies whether or not the resolution of an unrecognized watchpoint

location results in a pending watchpoint being created.

filename Specifies the file.

symbol Specifies a global/static data symbol. For arrays or structs you must

specify the element or member.

address Specifies the address. This can be either an address or an expression that

evaluates to an address.

vmid Specifies the Virtual Machine ID (VMID) to apply the breakpoint to. This

can be either an integer or an expression that evaluates to an integer.

Example

Example 2-9 awatch

awatch myVar1 # Set read/write watchpoint on myVar1 awatch *0x80D4 # Set read/write watchpoint on address 0x80D4

- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- rwatch on page 2-155
- *watch* on page 2-250.

2.3.5 <u>b</u>ack<u>t</u>race

backtrace is an alias for info stack.

See info stack, backtrace, where on page 2-107.

2.3.6 <u>b</u>reak

This command sets an execution breakpoint at a specific location. You can also specify a conditional breakpoint by using an if statement that stops only when the conditional expression evaluates to true.

This command records the ID of the breakpoint in a new debugger variable, \$n, where n is a number. You can use this variable, in a script, to delete or modify the breakpoint behavior. If \$n is the last or second-to-last debugger variable, then you can also access the ID using \$ or \$\$, respectively.

-----Note ------

Breakpoints that are set within a shared object or kernel module become pending when the shared object or kernel module is unloaded.

Use set breakpoint to control the automatic breakpoint behavior when using this command.

Syntax

break [-d] [-p] [[filename:]location|*address] [thread|core number...] [if expression]

Where:

d Disables the breakpoint immediately after creation.

p Specifies whether or not the resolution of an unrecognized breakpoint

location results in a pending breakpoint being created.

filename Specifies the file.

location Specifies the location:

line_numis a line numberfunctionis a function name.labelis a label name.

+offset | -offset | Specifies the line offset from the current location.

address Specifies the address. This can be either an address or an expression that

evaluates to an address.

number Specifies one or more threads or processors to apply the breakpoint to. You

can use \$thread to refer to the current thread. If number is not specified then

all threads are affected.

expression Specifies an expression that is evaluated when the breakpoint is hit.

If no arguments are specified then a breakpoint is set at the current PC.

You can use info breakpoints to display the number and status of all breakpoints and watchpoints.

Example

Example 2-10 break

```
break *0x8000
                             # Set breakpoint at address 0x8000
break *0x8000 thread $thread # Set breakpoint at address 0x8000 on
                            # current thread
break *0x8000 thread 1 3
                            # Set breakpoint at address 0x8000 on
                            # threads 1 and 3
break main
                            # Set breakpoint at address of main()
break SVC_Handler
                            # Set breakpoint at address of label SVC_Handler
break +1
                            # Set breakpoint at address of next source line
break my_File.c:main
                            # Set breakpoint at address of main() in my_File.c
break my_File.c:10
                            # Set breakpoint at address of line 10 in my_File.c
break function1 if x>0
                            # Set conditional breakpoint that stops when x>0
```

- *thbreak* on page 2-231.

2.3.7 break-script

This command assigns a script file to a specific breakpoint. When the breakpoint is triggered then the script is executed.

Syntax

break-script number [filename]

Where:

number Specifies the breakpoint number. This is the number assigned by the debugger

when it is set. You can use info breakpoints to display the number and status of

all breakpoints and watchpoints.

filename Specifies the script file that you want to execute when the specified breakpoint is

triggered. If filename is not specified then the currently assigned filename is

removed from the breakpoint.

Usage

Be aware of the following when using scripts with breakpoints:

- You must not assign a script to a breakpoint that has sub-breakpoints. If you do, the
 debugger attempts to execute the script for each sub-breakpoint. If this happens, an error
 message is displayed.
- Take care with the commands you use in a script that is attached to a breakpoint. For
 example, if you use the quit command in a script, the debugger disconnects from the
 target when the breakpoint is hit.
- If you put the continue command at the end of a script, this has the same effect as setting the **Continue Execution** checkbox on the Breakpoint Properties dialog box.

Example

Example 2-11 break-script

break-script 1 myScript.ds

Run myScript.ds when breakpoint 1 is triggered

- *Using expressions* on page 2-4

- set breakpoint on page 2-164
- *tbreak* on page 2-229
- *thbreak* on page 2-231.

2.3.8 break-stop-on-cores

 $break-stop-on-cores\ is\ an\ alias\ for\ break-stop-on-threads.$

See break-stop-on-threads, break-stop-on-cores on page 2-45.

2.3.9 break-stop-on-threads, break-stop-on-cores

This command applies an existing breakpoint to one or more threads or processors.

Syntax

```
\label{lem:break-stop-on-threads} \begin{picture}(100,0) \put(0,0){\line(0,0){100}} \put(0,0){\lin
```

Where:

number

Specifies the breakpoint number. This is a unique breakpoint number assigned by the debugger when it is set. You can use info breakpoints to display the breakpoint numbers and status.

id

Specifies one or more threads or processors to apply the breakpoint to. You can use \$thread or \$core to refer to the current thread or processor. If *id* is not specified then apply the breakpoint to all threads or processors. You can use info cores, or info threads to display the *id* numbers.

Example

Example 2-12 break-stop-on-threads, break-stop-on-cores

```
break-stop-on-threads 1 2  # Apply breakpoint 1 to thread 2
break-stop-on-threads 4 9 11  # Apply breakpoint 4 to threads 9 and 11
break-stop-on-cores 4  # Apply breakpoint 4 to all processors
```

- Using expressions on page 2-4
- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- *condition* on page 2-52
- *delete breakpoints* on page 2-56
- *disable breakpoints* on page 2-59

- *info cores* on page 2-88
- *info threads* on page 2-110
- resolve on page 2-146
- set arm on page 2-159
- set breakpoint on page 2-164
- *tbreak* on page 2-229
- *thbreak* on page 2-231
- *thread, core* on page 2-233.

2.3.10 break-stop-on-vmid

This command applies an existing hardware breakpoint to a Virtual Machine (VM).

Syntax

break-stop-on-vmid number [vmid]

Where:

number Specifies the hardware breakpoint number. This is a unique breakpoint number

assigned by the debugger when it is set. You can use info breakpoints to display

the breakpoint numbers and status.

vmid Specifies the Virtual Machine ID (VMID) to apply the breakpoint to. This can be

either an integer or an expression that evaluates to an integer. If *vmid* is not

specified then the VM effect is removed from the breakpoint.

Example

Example 2-13 break-stop-on-vmid

break-stop-on-vmid 1 2

Apply hardware breakpoint 1 to vmid 2

- Using expressions on page 2-4
- break on page 2-40
- *break-script* on page 2-42
- *clear* on page 2-50
- *condition* on page 2-52
- *delete breakpoints* on page 2-56
- *disable breakpoints* on page 2-59
- enable breakpoints on page 2-68
- *hbreak* on page 2-77
- *ignore* on page 2-81
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- info cores on page 2-88
- *info threads* on page 2-110
- resolve on page 2-146
- *set arm* on page 2-159
- set breakpoint on page 2-164
- *tbreak* on page 2-229
- *thbreak* on page 2-231
- *thread, core* on page 2-233.

2.3.11 cache list

This command lists the caches and related information available for the current core. The output is implementation defined.

Syntax

cache list

Note

The availability of the command and the available caches are dependent on the specific device that the debugger is connected to.

Example

Example 2-14 cache list

```
cache list  # Lists the available caches and views. An example output is:
    L1D:
    L1 data cache, size=32k, views: [tags, tlb]
    ...
L1I:
    L1 instruction cache, size=2k, views: [tags, tlb]
    ...
```

See also

• *cache print* on page 2-48.

2.3.12 cache print

This command provides a structured view of the cache data in the current core. The output is implementation defined.

Syntax

cache print cache [view]...

Where:

view

cache Specifies the cache name.

Specifies the view name for the selected cache. For each cache, views provide

access to different sets of data, or data presented in different formats.

_____Note _____

The availability of the command and the available caches are dependent on the specific device that the debugger is connected to.

Example

Example 2-15 cache print

```
cache print L1D  # Prints L1 data cache. An example output is:
tags:
...
tlb:
...
cache print L1D tags  # Prints L1 data cache. An example output is:
tags:
...
```

See also

• *cache list* on page 2-47.

2.3.13 cd

This command changes the current working directory.

Syntax

cd dir

Where:

dir Specifies the directory.

Example

Example 2-16 cd

cd "\usr\source"

Change the current working directory

- add-symbol-file on page 2-34
- *file, symbol-file* on page 2-72
- *load* on page 2-117
- *loadfile* on page 2-118
- *pwd* on page 2-142.

2.3.14 clear

This command deletes a breakpoint at a specific location.

Syntax

```
clear [[filename:]location|*address]
```

Where:

filename Specifies the file.

location Specifies the location:

line_numis a line number.functionis a function name.labelis a label name.

+offset | -offset | Specifies the line offset from the current location.

address Specifies the address. This can be either an address or an expression that

evaluates to an address.

If no arguments are specified then the breakpoint at the current PC is deleted.

Example

Example 2-17 clear

```
clear *0x8000  # Clear breakpoint at address 0x8000
clear main  # Clear breakpoint at address of main()
clear SVC_Handler  # Clear breakpoint at address of label SVC_Handler
clear +1  # Clear breakpoint at address of next source line
clear my_File.c:main # Clear breakpoint at address of main() in my_File.c
clear my_File.c:10  # Clear breakpoint at address of line 10 in my_File.c
```

- Using expressions on page 2-4
- *clearwatch* on page 2-51
- *condition* on page 2-52
- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *delete breakpoints* on page 2-56
- *disable breakpoints* on page 2-59
- enable breakpoints on page 2-68
- *hbreak* on page 2-77
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- *tbreak* on page 2-229
- *thbreak* on page 2-231.

2.3.15 clearwatch

This command deletes a watchpoint at a specific location.

Syntax

clearwatch [filename:]symbol|*address

Where:

filename Specifies the file.

symbol Specifies a global/static data symbol. For arrays or structs you must

specify the element or member.

address Specifies the address. This can be either an address or an expression that

evaluates to an address.

Example

Example 2-18 clearwatch

- *Using expressions* on page 2-4
- awatch on page 2-37
- *delete breakpoints* on page 2-56
- disable breakpoints on page 2-59
- enable breakpoints on page 2-68
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85.

2.3.16 condition

This command sets a break condition for a specific breakpoint or watchpoint. If the value of a specific expression evaluates to true then the debugger stops the target otherwise execution resumes.

Syntax

condition number [expression]

Where:

number Specifies the breakpoint or watchpoint number. This is the number assigned by

the debugger when it is set. You can use info breakpoints to display the number

and status of all breakpoints and watchpoints.

expression Specifies an expression that is evaluated when the breakpoint or watchpoint is hit.

If no expression is specified then the breakpoint or watchpoint condition is

deleted.

Example

Example 2-19 condition

condition 1 myVar<5

Set break condition myVar<5 for breakpoint number 1

- Using expressions on page 2-4
- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- *delete breakpoints* on page 2-56
- *disable breakpoints* on page 2-59
- enable breakpoints on page 2-68
- *hbreak* on page 2-77
- *ignore* on page 2-81
- info breakpoints, info watchpoints on page 2-84
- *tbreak* on page 2-229
- *thbreak* on page 2-231.

2.3.17 <u>c</u>ontinue

This command continues running the target.

_____Note _____

Control is returned as soon as the target is running. You can use the wait command to block the debugger from returning control until either the application completes or a breakpoint is hit.

Syntax

continue [count]

Where:

count

Specifies the number of times to ignore the breakpoint or watchpoint at the current location.

Example

Example 2-20 continue

continue # Continue running target

continue 5 # Continue running target, ignoring current breakpoint 5 times

- reverse-continue on page 2-148
- *advance* on page 2-35
- *run* on page 2-154
- *start* on page 2-222
- *wait* on page 2-249.

2.3.18 core

core is an alias for threads.

See thread, core on page 2-233.

2.3.19 define

This command enables you to a derive new user-defined command from existing commands. User-defined commands accept arguments separated by whitespace. You can use the arguments in expressions by using \$arg0...\$argn, to refer to specific arguments or \$argv to refer to all the supplied arguments. For example:

```
print 4+$arg0  # add 4 to the first argument and print result
echo $argv  # echo all arguments
```

Syntax

define *cmd*...
end

Where:

cmd

Specifies the command name followed by one or more debugger commands.

Enter each debugger command on a new line and terminate the define command by using the end command.

----- Note -----

Existing built in commands cannot be redefined.

Example

Example 2-21 define

```
# Define add-args command to print sum of first 3 arguments
define add-args
    print $arg0+$arg1+$arg2
end
```

- *document* on page 2-63
- *end* on page 2-70
- *if* on page 2-80
- while on page 2-254
- *Using expressions* on page 2-4.

2.3.20 delete breakpoints

This command deletes one or more breakpoints or watchpoints.

Syntax

delete [breakpoints] number...

Where:

number

Specifies the breakpoint or watchpoint number. This is the number assigned by the debugger when it is set. You can use info breakpoints to display the number and status of all breakpoints and watchpoints.

_____Note _____

Multiple-statements on a single line of source code are assigned sub-numbers, for example n.n. You can specify all multiple-statement breakpoints by specifying n.0 or individually by specifying n.n.

If no *number* is specified then all breakpoints and watchpoints are deleted.

Example

Example 2-22 delete breakpoints

```
delete breakpoints 1  # Delete breakpoint number 1
delete breakpoints 1  2  # Delete breakpoints number 1 and 2
delete breakpoints  # Delete all breakpoints and watchpoints
delete breakpoint $  # Delete breakpoint whose number is in the
# most recently created debugger variable
```

- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- *clearwatch* on page 2-51
- condition on page 2-52
- disable breakpoints on page 2-59
- enable breakpoints on page 2-68
- *hbreak* on page 2-77
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- *tbreak* on page 2-229
- *thbreak* on page 2-231.

2.3.21 <u>delete memory</u>

This command deletes one or more user-defined memory regions.

Syntax

<u>d</u>elete <u>mem</u>ory *number*...

Where:

number

Specifies the region number. This is the number assigned by the debugger when the region is set. You can use info mem to display the number and status of all regions.

Example

Example 2-23 delete memory

```
delete memory 1  # Delete region number 1
delete memory 1 2  # Delete regions number 1 and 2
delete memory $ # Delete memory region whose number is in
# the most recently created debugger variable
```

- disable memory on page 2-60
- enable memory on page 2-69
- *info memory* on page 2-97
- *memory* on page 2-121.

2.3.22 <u>dir</u>ectory

This command specifies additional directories to search for source files. If you use this command without an argument then the search directories are reset to the default settings. You can use the show command to display the current settings.

Syntax

directory [path]...

Where:

path

Specifies an additional directory to search for source files. This is appended to the beginning of the list.

— Note —

Multiple directories can be specified but must be separated with either:

- a space
- a colon (Unix)
- a semi-colon (Windows).

Default

The default directories for searching are:

- compilation directory, \$cdir
- current working directory, \$cwd
- current image directory, \$idir.

Example

Example 2-24 directory

- set substitute-path on page 2-184
- *show directories* on page 2-201
- *show substitute-path* on page 2-215.

2.3.23 disable breakpoints

This command disables one or more breakpoints or watchpoints.

Syntax

disable [breakpoints] number...

Where:

number

Specifies the breakpoint or watchpoint number. This is the number assigned by the debugger when it is set. You can use info breakpoints to display the number and status of all breakpoints and watchpoints.

—— Note ———

Multiple-statements on a single line of source code are assigned sub-numbers, for example n.n. You can specify all multiple-statement breakpoints by specifying n.0 or individually by specifying n.n.

If no *number* is specified then all breakpoints and watchpoints are disabled.

_____Note _____

The breakpoints sub-command is optional.

Example

Example 2-25 disable

```
disable breakpoints 1  # Disable breakpoint number 1
disable breakpoints 1  2  # Disable breakpoints number 1 and 2
disable breakpoints  # Disable all breakpoints and watchpoints
disable breakpoints $ # Disable the breakpoint whose number is in
# the most recently created debugger variable
```

- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- *condition* on page 2-52
- *delete breakpoints* on page 2-56
- enable breakpoints on page 2-68
- *hbreak* on page 2-77
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- *tbreak* on page 2-229
- *thbreak* on page 2-231.

2.3.24 disable memory

This command disables one or more user-defined memory regions.

Syntax

disable memory number...

Where:

number

Specifies the region number. This is the number assigned by the debugger when the region is set. You can use info mem to display the number and status of all regions.

Example

Example 2-26 disable memory

```
disable memory 1  # Disable region number 1
disable memory 1 2  # Disable regions number 1 and 2
disable memory $ # Disable memory region whose number is in
# the most recently created debugger variable
```

- *delete memory* on page 2-57
- enable memory on page 2-69
- *info memory* on page 2-97
- *memory* on page 2-121.

2.3.25 disassemble

This command displays the disassembly for the function surrounding a specific address or the disassembly for a specific address range.

Syntax

```
disassemble [address [address|+size]]
```

Where:

address Specifies an expression that evaluates to an address. Two address

arguments specify an inclusive address range. If no *address* argument is specified then the debugger displays the disassembly for the function

surrounding the program counter for the current frame.

size Specifies the size of the region.

Example

Example 2-27 disassemble

```
disassemble # Display disassembly for current function
disassemble 0x8140 0x8157 # Display disassembly for address range 0x8140-0x8157
disassemble 0x8040 +0x18 # Display disassembly for address range 0x8140-0x8157
disassemble 0xC0040AC0 # Display disassembly for address range 0xC0040AC0-0xC0040ADC
```

- set arm on page 2-159
- *x* on page 2-255.

2.3.26 discard-symbol-file

This command discards debug information relating to a specific file.

Syntax

Where:

filename Specifies the image, shared library, or Operating System (OS) module.

Note Shared library and OS modules depend on connections that support loading these types of files.

You can use the info files command to display information about the loaded files.

Example

Example 2-28 discard-symbol-file

```
discard-symbol-file myFile.axf  # Discard symbols relating to myFile.axf  # Discard symbols relating to shared library discard-symbol-file myModule.ko  # Discard symbols relating to OS module
```

- *add-symbol-file* on page 2-34
- *cd* on page 2-49
- *file, symbol-file* on page 2-72
- *load* on page 2-117
- info files, info target on page 2-89
- *info os-modules* on page 2-99
- *loadfile* on page 2-118
- reload-symbol-file on page 2-144.

2.3.27 document

This command enables you to add integrated help for a new user-defined command.

Syntax

document cmd
...
end
Where:

cmd Specifies the user-defined command name.

Enter the description on one of more lines of text and terminate the document command by using the end command.

____ Note ____

Documentation for existing built in commands cannot be redefined.

Example

Example 2-29 document

Documentation for the new user-defined add-args command document add-args

This user-defined command prints the sum of the first 3 arguments end

- *define* on page 2-55
- *end* on page 2-70
- *if* on page 2-80
- *while* on page 2-254
- *Using expressions* on page 2-4.

2.3.28 <u>do</u>wn

This command moves the current frame pointer down the call stack towards the bottom frame. It also displays the function name and source line number for the specified frame.

_____Note _____

Each frame is assigned a number that increases from the bottom frame (zero) through the call stack to the top frame that is the start of the application.

Syntax

down [offset]

Where:

offset

Specifies a frame offset from the current frame pointer in the call stack. If no *offset* is specified then the default is one.

Example

Example 2-30 down

down # Move and display information 1 frame down from current frame pointer down 2 # Move and display information 2 frames down from current frame pointer

- *down-silently* on page 2-65
- *finish* on page 2-73
- *frame* on page 2-75
- *info frame* on page 2-91
- *info all-registers* on page 2-83
- info registers on page 2-102
- info stack, backtrace, where on page 2-107
- *select-frame* on page 2-157
- *up* on page 2-247
- *up-silently* on page 2-248.

2.3.29 down-silently

This command moves the current frame pointer down the call stack towards the bottom frame.

_____Note _____

Each frame is assigned a number that increases from the bottom frame (zero) through the call stack to the top frame that is the start of the application.

Syntax

down-silently [offset]

Where:

offset

Specifies a frame offset from the current frame pointer in the call stack. If no *offset* is specified then the default is one.

Example

Example 2-31 down-silently

down-silently # Move 1 frame down from current frame pointer down-silently 2 # Move 2 frames down from current frame pointer

- down on page 2-64
- *finish* on page 2-73
- *frame* on page 2-75
- *info frame* on page 2-91
- info all-registers on page 2-83
- info registers on page 2-102
- info stack, backtrace, where on page 2-107
- *select-frame* on page 2-157
- *up* on page 2-247
- *up-silently* on page 2-248.

2.3.30 dump

This command reads data from memory or the result of an expression and writes it to a file.

Syntax

dump [format] memory filename start_address {end_address|+size}
dump [format] value filename expression

Where:

format Specifies the output format:

binary Binary. This is the default.

elf 32-bit ARM ELF. elf64 64-bit ARM ELF. ihex Intel Hex-32.

srec Motorola 32-bit (S-records).

vhx Byte oriented hexadecimal (Verilog Memory

Model).

filename Specifies the file.

start_address Specifies the start address for the memory.

end_address Specifies the inclusive end address for the memory.

size Specifies the size of the region.

expression Specifies an expression that is evaluated to an address and the data from

that address is written to the file.

Example

Example 2-32 dump

```
dump memory myFile.bin 0x8000 0x8FFF # Write content of memory 0x8000-0x8FFF # to binary file myFile.bin
dump srec value myFile.m32 &myArray # Write contents of myArray to # Motorola 32-bit file myFile.m32
```

- Using expressions on page 2-4
- append on page 2-36
- restore on page 2-147.

2.3.31 echo

This command displays textual strings only.

Backslashes can be used as follows:

- C escape sequences, for example, "\n" can be used to print a new line
- Leading and trailing spaces are not displayed unless escaped with a backslash
- Quoted strings are printed literally including the quote marks.

Syntax

echo string

Where:

string Specifies a string of characters.

Example

Example 2-33 echo

```
echo " initializing..."  # Display: " initializing..." (includes quotes)
echo Stage 1\n  # Display: Stage 1 (followed by a new line)
echo \ Init  # Display: Init (includes leading spaces)
echo 4+4  # Display: 4+4
```

- *output* on page 2-138
- *print, inspect* on page 2-141
- *printf() style format string* on page 2-9.

2.3.32 enable breakpoints

This command enables one or more breakpoints or watchpoints.

Syntax

enable [breakpoints] number...

Where:

number

Specifies the breakpoint or watchpoint number. This is the number assigned by the debugger when it is set. You can use info breakpoints to display the number and status of all breakpoints and watchpoints.

----- Note ------

Multiple-statements on a single line of source code are assigned sub-numbers, for example n.n. You can specify all multiple-statement breakpoints by specifying n.0 or individually by specifying n.n.

If no *number* is specified then all breakpoints and watchpoints are enabled.

_____Note _____

The breakpoints sub-command is optional.

Example

Example 2-34 enable

```
enable breakpoints 1  # Enable breakpoint number 1
enable breakpoints 1  2  # Enable breakpoints number 1 and 2
enable breakpoints  # Enable all breakpoints and watchpoints
enable breakpoints $ # Enable the breakpoint whose number is in the
# most recently created debugger variable
```

- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- *condition* on page 2-52
- *delete breakpoints* on page 2-56
- *disable breakpoints* on page 2-59
- *hbreak* on page 2-77
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- *tbreak* on page 2-229
- *thbreak* on page 2-231.

2.3.33 enable memory

This command enables one or more user-defined memory regions.

Syntax

enable memory number...

Where:

number

Specifies the region number. This is the number assigned by the debugger when the region is set. You can use info mem to display the number and status of all regions.

Example

Example 2-35 enable memory

```
enable memory 1  # Enable region number 1
enable memory 1 2  # Enable regions number 1 and 2
enable memory $ # Enable memory region whose number is in
# the most recently created debugger variable
```

- *delete memory* on page 2-57
- *disable memory* on page 2-60
- *info memory* on page 2-97
- *memory* on page 2-121.

2.3.34 end

This command enables you to terminate conditional blocks when using the define, if, and while commands.

Example

Example 2-36 end

```
# Define a while loop containing commands to conditionally execute
# myVar is a variable in the application code
while myVar<10
    step
    wait
    x
    set myVar++
end</pre>
```

- *define* on page 2-55
- *document* on page 2-63
- *if* on page 2-80
- *while* on page 2-254
- *Using expressions* on page 2-4.

2.3.35 exit

exit is an alias for quit.

See quit, exit on page 2-143.

2.3.36 file, symbol-file

This command loads debug information from an image into the debugger and records the entry point address for future use by the run and start commands. Subsequent use of the file command discards existing information before loading the new debug information. The debug information is loaded when required by the debugger.

If you want to append debug information instead of replacing it, you can use the add-symbol-file command.

_____Note _____

The PC register is not set with this command.

Syntax

```
file [filename] [offset] [-option]
symbol-file [filename] [offset] [-option]
```

Where:

filename

Specifies the image. If no *filename* is specified then the current debug information is discarded.

offset

Specifies the offset that is added to all addresses within the image. If offset is not specified then the default for:

- An image is zero.
- A shared library is the load address of the library. If the application has not currently loaded the specified library then the request is pended until the library is loaded and the offset can be determined.

Example

Example 2-37 file, symbol-file

```
file "myFile.axf"  # Load debug information on demand
file "images\myFile.axf"  # Load debug information on demand
file  # Discard all current debug information
```

- add-symbol-file on page 2-34
- *cd* on page 2-49
- *discard-symbol-file* on page 2-62
- *load* on page 2-117
- info files, info target on page 2-89
- *loadfile* on page 2-118
- reload-symbol-file on page 2-144
- *run* on page 2-154
- *start* on page 2-222.

2.3.37 <u>fin</u>ish

This command continues running the target to the next instruction after the selected number of stack frames finish.

Syntax

finish [n]

Where:

Specifies the number of stack frames to finish executing. The default is one.

Example

Example 2-38 finish

finish # Continues running until the current stack frame finishes finish 5 # Continues running until 5 stack frames finish

- reverse-step-out on page 2-153
- down on page 2-64
- *down-silently* on page 2-65
- *frame* on page 2-75
- *next* on page 2-134
- nexts on page 2-136
- *step* on page 2-224
- steps on page 2-226
- *select-frame* on page 2-157
- *up* on page 2-247
- *up-silently* on page 2-248.

2.3.38 flash load

This command loads sections from an image into one or more flash devices.

Syntax

flash load filename [device[:parameter=value]...]...

Where:

filename Specifies the image.

device Specifies the flash device name. Use this option to restrict the load to the specified

device only.

parameter Specifies a parameter or comma separated list of parameters to override.

If no *device* is specified then all devices can be loaded. This is dependent on the sections in the image that correspond to the flash device regions.

You can use info flash to display information about the flash devices on the current target.

Example

Example 2-39 flash load

- *info flash* on page 2-90
- *load* on page 2-117
- *loadfile* on page 2-118.

2.3.39 frame

This command sets the current frame pointer in the call stack and also displays the function name and source line number for the specified frame.

—— Note ———

Each frame is assigned a number that increases from the bottom frame (zero) through the call stack to the top frame that is the start of the application.

Syntax

frame [number]

Where:

number

Specifies the frame number. The default is the current frame.

Example

Example 2-40 frame

frame 1 # Move to and display information for stack frame 1

frame # Display stack frame information at current frame pointer

- down on page 2-64
- down-silently on page 2-65
- *finish* on page 2-73
- *info frame* on page 2-91
- *info all-registers* on page 2-83
- info registers on page 2-102
- info stack, backtrace, where on page 2-107
- *select-frame* on page 2-157
- *up* on page 2-247
- *up-silently* on page 2-248.

2.3.40 handle

This command controls the handler settings for one or more signals or processor exceptions. The default handler settings are dependant on the type of debug activity.

For example, on a Linux kernel connection, by default, all signals are handled by Linux on the target. You can use info signals to display the current settings.

When connected to an application running on a remote target using gdbserver, the debugger handles Unix signals, but on bare-metal, it handles processor exceptions.

Syntax

handle [name]... keyword...

Where:

name Specifies the signal or processor exception name.

keyword Specifies the following keywords:

print Enables the print property. The debugger prints a message

and continues execution when the event occurs.

noprint Disables the print property so the occurrence of an event is

not indicated at all. Using the noprint keyword implies the

properties of the nostop keyword as well.

stop Enables the stop property. The debugger stops execution

and prints a message when the event occurs. Using the stop keyword implies the properties of the print keyword as

well.

nostop Disables the stop property so the occurrence of an event

does not stop execution.

If no name is specified then all handler settings are modified.

Example

Example 2-41 handle

```
handle SVC stop  # When an SVC exception occurs, stop execution and print a message. handle IRQ print  # When an IRQ exception occurs, print a message, but continue execution.
```

handle IRQ noprint # When an IRQ exception occurs, do not print a message. handle noprint nostop # Ignore all events and do not print a message.

See also

• *info signals, info handle* on page 2-105.

2.3.41 hbreak

This command sets a hardware execution breakpoint at a specific location. You can also specify a conditional breakpoint by using an if statement that stops only when the conditional expression evaluates to true.

This command records the ID of the breakpoint in a new debugger variable, \$n, where n is a number. You can use this variable, in a script, to delete or modify the breakpoint behavior. If \$n is the last or second-to-last debugger variable, then you can also access the ID using \$ or \$\$, respectively.

_____Note _____

The number of hardware breakpoints are usually limited. If you run out of hardware breakpoints then delete or disable one that you are no longer using.

Breakpoints that are set within a shared object or kernel module become pending when the shared object or kernel module is unloaded.

Syntax

hbreak [-d] [-p] [[filename:]location|*address] [thread|core number...] [vmid vmid] [if expression]

Where:

d Disables the breakpoint immediately after creation.

p Specifies whether or not the resolution of an unrecognized breakpoint

location results in a pending breakpoint being created.

filename Specifies the file.

location Specifies the location:

line_numis a line number.functionis a function name.labelis a label name.

+offset | -offset | Specifies the line offset from the current location.

address Specifies the address. This can be either an address or an expression that

evaluates to an address.

number Specifies one or more threads or processors to apply the breakpoint to. You

can use \$thread to refer to the current thread. If *number* is not specified then

all threads are affected.

vmid Specifies the Virtual Machine ID (VMID) to apply the breakpoint to. This

can be either an integer or an expression that evaluates to an integer.

expression Specifies an expression that is evaluated when the breakpoint is hit.

If no arguments are specified then a hardware breakpoint is set at the current PC.

Example

Example 2-42 hbreak

```
hbreak *0x8000
                              # Set breakpoint at address 0x8000
hbreak *0x8000 thread $thread # Set breakpoint at address 0x8000 on current thread
hbreak *0x8000 thread 1 3
                             # Set breakpoint at address 0x8000 on threads 1 and 3
hbreak main
                             # Set breakpoint at address of main()
hbreak SVC_Handler
                             # Set breakpoint at address of label SVC_Handler
hbreak +1
                             # Set breakpoint at address of next source line
hbreak my_File.c:main
                             # Set breakpoint at address of main() in my_File.c
hbreak my_File.c:8
                             # Set breakpoint at address of line 8 in my_File.c
hbreak function1 if x>0
                             # Set conditional breakpoint that stops when x>0
```

- Using expressions on page 2-4
- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- *condition* on page 2-52
- *delete breakpoints* on page 2-56
- *disable breakpoints* on page 2-59
- enable breakpoints on page 2-68
- *ignore* on page 2-81
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- resolve on page 2-146
- *tbreak* on page 2-229
- *thbreak* on page 2-231.

2.3.42 <u>h</u>elp

This command displays help information for a specific command or a group of commands listed according to specific debugging tasks.

Syntax

help [command|group]

Where:

command Specifies an individual command.

group Specifies a group name for specific debugging tasks:

group_all Displays all the commands by group.

group_cache Displays the cache commands.

group_breakpoints Displays the breakpoint and watchpoint commands.
group_data Displays the commands that displays source data.
group_display Displays the output and print settings commands.
group_files Displays the commands that interact with files.
group_info Displays the program information commands.
group_log Displays the message logging commands.

group_flash Displays the flash commands.

group_memory Displays the commands that interact with memory.

group_os Displays the operating system commands.

group_registers Displays the register commands.

group_running Displays the target execution and stepping group.
group_show Displays the show commands for debugger settings.
group_set Displays the set commands for debugger settings.
group_scripts Displays the commands for use in script files.

group_stack Displays the call stack commands.
group_support Displays the supporting commands.

Example

Example 2-43 help

help load	# Display help information for load command
help print	# Display help information for print command
help group_breakpoints	# Display group of breakpoint and watchpoint commands
help group_files	# Display group of file commands

2.3.43 if

This command enables you to write scripts that conditionally execute debugger commands.

Syntax

```
if condition
...
else
...
end

Where:

condition

Specifies a conditional expression. Follow the if statement with one or more debugger commands that execute when the expression evaluates to true.

Note

The else statement is optional and the debugger commands that follow it only execute when condition evaluates to false.
```

Enter each debugger command on a new line and terminate the if command by using the end command.

Example

Example 2-44 if

```
# Define an if statement containing commands to conditionally execute
if $pc==0x80000
    break
    info stack full
end
```

- *define* on page 2-55
- *document* on page 2-63
- *end* on page 2-70
- *while* on page 2-254
- *Using expressions* on page 2-4.

2.3.44 ignore

This command sets the ignore counter for a breakpoint or watchpoint condition.

Syntax

ignore number count

Where:

number Specifies the breakpoint or watchpoint number. This is the number assigned by

the debugger when it is set.

count Specifies the number of times to ignore the specified breakpoint or watchpoint.

The ignore counter is incremented only when the condition evaluates to true.

You can use info breakpoints to display the number and status of all breakpoints and watchpoints.

Example

Example 2-45 ignore

```
ignore 2 3  # Ignore breakpoint 2 for 3 hits
ignore $ 3  # Ignore breakpoint, whose number is in the
# most recently created debugger variable, for 3 hits
```

- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- *condition* on page 2-52
- *delete breakpoints* on page 2-56
- disable breakpoints on page 2-59
- enable breakpoints on page 2-68
- *hbreak* on page 2-77
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- *tbreak* on page 2-229.
- *thbreak* on page 2-231.

2.3.45 <u>i</u>nfo <u>ad</u>dress

This command displays the location of a symbol.

Syntax

<u>i</u>nfo <u>ad</u>dress *symbol*

Where:

symbol Specifies the symbol.

Example

Example 2-46 info address

info address mySymbol

Display location of symbol

2.3.46 info all-registers

This command displays the name and content of registers for the current stack frame.

Unless you specify otherwise, the registers listed by this command are the full set made available by the target, including co-processor and floating-point registers where available. You can use the info registers command to display a subset of registers that are most useful when debugging C/C++ applications.

When application code calls a function it is common for any existing register values to be saved, so that the registers can be used by the calling function for other purposes. The original register values are then restored when the function returns. When displaying register values the debugger tries to show the value of the actual registers prior to each function call, according to the currently selected stack frame. A consequence of this is that some registers might be shown with undefined values because the debugger is unable to determine the actual value.

Syntax

```
info all-registers [group]
```

Where:

group

Specifies a group name for a specific registers. If no *group* is specified then all registers and groups are displayed.

Example

Example 2-47 info all-registers

```
info all-registers # Display info for all registers
info all-registers USR # Display info for all user mode registers
```

- *down* on page 2-64
- *down-silently* on page 2-65
- *frame* on page 2-75
- *info registers* on page 2-102
- *select-frame* on page 2-157
- *up* on page 2-247
- *up-silently* on page 2-248.

2.3.47 <u>info</u> <u>b</u>reakpoints, <u>i</u>nfo watchpoints

This command displays information about the status of all breakpoints and watchpoints.

____Note _____

This command sets a default address variable to the location of the last breakpoint or watchpoint listed. Some commands, such as x, use this default value if no address is specified.

Syntax

<u>i</u>nfo <u>b</u>reakpoints

info watchpoints

Example

Example 2-48 info breakpoints, info watchpoints

info breakpoints

Display status for all breakpoints and watchpoints

- awatch on page 2-37
- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- *clearwatch* on page 2-51
- *condition* on page 2-52
- *delete breakpoints* on page 2-56
- disable breakpoints on page 2-59
- enable breakpoints on page 2-68
- *hbreak* on page 2-77
- *ignore* on page 2-81
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- rwatch on page 2-155
- *tbreak* on page 2-229
- *thbreak* on page 2-231
- watch on page 2-250
- *x* on page 2-255.

2.3.48 <u>info</u> <u>breakpoints</u> capabilities, <u>info</u> watchpoints capabilities

This command displays a list of parameters that you can use with breakpoint and watchpoint commands for the current connection.

Syntax

info breakpoints capabilities
info watchpoints capabilities

Example

Example 2-49 info breakpoints capabilities, info watchpoints capabilities

info breakpoints capabilities

Display list of parameters for current connection

- awatch on page 2-37
- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- clearwatch on page 2-51
- *condition* on page 2-52
- *delete breakpoints* on page 2-56
- *disable breakpoints* on page 2-59
- enable breakpoints on page 2-68
- *hbreak* on page 2-77
- *ignore* on page 2-81
- info breakpoints, info watchpoints on page 2-84
- rwatch on page 2-155
- *tbreak* on page 2-229
- *thbreak* on page 2-231
- watch on page 2-250
- x on page 2-255.

2.3.49 <u>i</u>nfo capabilities

This command displays a list of capabilities for the target device that is currently connected to the debugger. For more information, see the documentation for your target.

Syntax

info capabilities

Example

Example 2-50 info capabilities

info capabilities

Display target device capabilities

See also

• *reset* on page 2-145.

2.3.50 <u>i</u>nfo classes

This command displays C++ class names.

Syntax

info classes [expression]

Where:

expression

Specifies a class name or a wildcard expression. You can use wildcard expressions to enhance your pattern matching.

If no expression is specified then all classes are displayed.

Example

Example 2-51 info classes

- *Using wildcards* on page 2-5
- set wildcard-style on page 2-188.

2.3.51 <u>i</u>nfo cores

This command displays a list of processors. It shows the number (a unique number assigned by the debugger), name, current state, and related stack frame including the function names and source line number.

Syntax

<u>i</u>nfo cores

Example

Example 2-52 info cores

info cores

Display all processors

- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- *thread, core* on page 2-233.

2.3.52 <u>i</u>nfo files, <u>i</u>nfo target

This command displays information about the loaded image and symbols.

Syntax

<u>i</u>nfo files

<u>i</u>nfo target

Example

Example 2-53 info files, info target

info files

Display information for loaded image and symbols

- add-symbol-file on page 2-34
- discard-symbol-file on page 2-62
- *file, symbol-file* on page 2-72
- *load* on page 2-117
- *loadfile* on page 2-118
- reload-symbol-file on page 2-144.

2.3.53 <u>i</u>nfo flash

This command displays information about the flash devices on the current target.

Syntax

<u>i</u>nfo flash

Example

Example 2-54 info flash

info flash

Display information about the current flash devices.

See also

• *flash load* on page 2-74.

2.3.54 <u>i</u>nfo <u>f</u>rame

This command gives the following information about the selected frame:

- stack frame address
- current PC address
- saved PC address
- calling frame address
- source language
- frame arguments and associated addresses
- address of the local variables
- stack pointer address for the previous frame
- saved registers and associated location.

Each frame is assigned a number that increases from the bottom frame (zero) through the call stack to the top frame that is the start of the application.

Syntax

info frame [number]

Where:

number Specifies the frame number.

If no arguments are specified then the stack frame information for the current frame pointer is displayed.

Example

Example 2-55 info frame

```
info frame 1  # Display information for stack frame 1  # Display information for stack frame at current location
```

- down on page 2-64
- *down-silently* on page 2-65
- *frame* on page 2-75
- info stack, backtrace, where on page 2-107
- *select-frame* on page 2-157
- *up* on page 2-247
- *up-silently* on page 2-248.

2.3.55 info functions

This command displays the name and data types for all functions.

Syntax

info functions [expression]

Where:

expression

Specifies a function name or a wildcard expression. You can use wildcard expressions to enhance your pattern matching

If no expression is specified then all functions are displayed.

Example

Example 2-56 info functions

```
info functions
info functions m*

# Display info for all functions

# Display info for names starting with m

# (use when set wildcard-style=glob)

info functions my_func[0-9]+

# Display info for names with my_func followed

# by a number (use when set wildcard-style=regex)
```

- *Using wildcards* on page 2-5
- set wildcard-style on page 2-188.

2.3.56 info handle

info handle is an alias for info signals.

See info signals, info handle on page 2-105.

2.3.57 <u>i</u>nfo inst-sets

This command displays the available instruction sets.

Syntax

<u>i</u>nfo inst-sets

Example

Example 2-57 info inst-sets

info inst-sets

Display available instruction sets

- *set arm* on page 2-159
- *show arm* on page 2-193.

2.3.58 <u>i</u>nfo locals

This command displays all local variables that are accessible in the function corresponding to the current stack frame.

Syntax

<u>i</u>nfo locals

Example

Example 2-58 info locals

info locals

Display all local variables for the current stack frame

2.3.59 <u>i</u>nfo <u>memb</u>ers

This command displays the name and data types for all class member variables that are accessible in the function corresponding to the selected stack frame.

Syntax

info members [expression]

Where:

expression

Specifies the name of a class member or a C expression that evaluates to a struct, union or class variable. If no *expression* is specified then all members of the current function identified by **this** pointer are displayed.

—— Note ———

Using high compiler optimization levels such as -02 with --debug can produce a less than satisfactory debug view because the mapping of object code to source code is not always clear. If the compiler optimizes away the **this** pointer then using the info members command without an expression produces an error.

Example

Example 2-59 info members

info members
info members my_Struct[0-9]+

Display members for the current function

Display members for matching struct variables

See also

• *Using expressions* on page 2-4.

2.3.60 <u>i</u>nfo <u>mem</u>ory

This command displays the attributes for all memory regions.

Syntax

<u>i</u>nfo <u>mem</u>ory

Example

Example 2-60 info memory

info memory

Display attributes for all memory regions

- *delete memory* on page 2-57
- disable memory on page 2-60
- enable memory on page 2-69
- *memory* on page 2-121
- *memory debug-cache* on page 2-124.

2.3.61 <u>i</u>nfo os-log

This command displays the contents of the *Operating System* (OS) log buffer for connections that support this feature. On Linux this is the contents of the kernel dmesg log.

_____Note _____

A Linux kernel connection must be established and the target is stopped before you can use this command.

Syntax

info os-log

Example

Example 2-61 info os-log

info os-log

Displays the OS log buffer

- *info os-modules* on page 2-99
- *info os-version* on page 2-100
- *info processes* on page 2-101
- *set os* on page 2-174
- *show os* on page 2-207.

2.3.62 info os-modules

This command displays a list of loadable kernel modules for connections that support this feature.

_____Note _____

A connection must be established and operating system support must be enabled within the debugger before a loadable module can be detected. You can use the set os command to control operating system support in the debugger.

Syntax

<u>i</u>nfo os-modules [-s]

Where:

s Displays the section information of the modules.

Example

Example 2-62 info os-modules

info os-modules

Displays info for loaded OS modules

- *info os-log* on page 2-98
- *info os-version* on page 2-100
- *info processes* on page 2-101
- *set os* on page 2-174
- *show os* on page 2-207.

2.3.63 <u>i</u>nfo os-version

This command displays the version of the *Operating System* (OS) for connections that support this feature.

Syntax

info os-version

Example

Example 2-63 info os-version

info os-version

Displays the version of the OS

- *info os-log* on page 2-98
- *info os-modules* on page 2-99
- info processes on page 2-101
- *set os* on page 2-174
- *show os* on page 2-207.

2.3.64 info processes

This command displays a list of all user space processes. It shows the number (a unique number assigned by the debugger), OS ID (pid), OS Parent ID, kind, OS state, current state, and related stack frame including the function names and source line number.

Syntax

info processes

Example

Example 2-64 info processes

info processes

Display all user space processes

- info os-log on page 2-98
- info os-modules on page 2-99
- *info os-version* on page 2-100
- *info threads* on page 2-110
- *set os* on page 2-174
- *show os* on page 2-207
- *thread, core* on page 2-233.

2.3.65 info registers

This command displays the name and content of registers for the current stack frame. The registers listed by this command are a subset that are most useful when debugging C/C++ applications. You can use the info all-registers command to list the full set of registers.

When application code calls a function it is common for any existing register values to be saved, so that the registers can be used by the calling function for other purposes. The original register values are then restored when the function returns. When displaying register values the debugger tries to show the value of the actual registers prior to each function call, according to the currently selected stack frame. A consequence of this is that some registers might be shown with undefined values because the debugger is unable to determine the actual value.

Syntax

info registers [register]

Where:

register

Specifies the register name. If no *register* is specified then all application level registers are displayed.

Example

Example 2-65 info registers

info registers # Display info for all application level registers info registers pc # Display info for PC register

- down on page 2-64
- down-silently on page 2-65
- *frame* on page 2-75
- *info all-registers* on page 2-83
- *select-frame* on page 2-157
- *up* on page 2-247
- *up-silently* on page 2-248.

2.3.66 <u>i</u>nfo semihosting

This command displays semihosting information.

Syntax

info semihosting [server|clients|all] Where: all Displays information on the semihosting server listener port, a list of the connected clients, and the heap and stack. This is the default. Displays information on the semihosting server listener port. server clients Displays information on each of the semihosting streams stdin, stdout, stderr. This includes a list of the connected clients. heap Displays the heap information that the debugger used to initialize the heap. – Note – This information is only displayed if the debugger performs the initialization. stack Displays the stack information that the debugger used to initialize the stack. — Note -This information is only displayed if the debugger performs the initialization.

Example

Example 2-66 info semihosting

2.3.67 info sharedlibrary

This command displays the names of the loaded shared libraries, the base address, and whether the debug symbols of the shared libraries are loaded or not.

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

info sharedlibrary [/order] [/sort_by] [/group]

Where:

order Specifies the sorting order:

a Ascending order. This is the default.

d Descending order.

sort_by Specifies the sorting order of the shared objects:

b Sort by base addresses. This is the default.

n Sort by library names.

group Specifies whether to group the debug symbols:

s Group loaded symbols followed by unloaded symbols.

sn Group unloaded symbols followed by loaded symbols.

Example

Example 2-67 info sharedlibrary

```
info sharedlibrary  # Display shared libraries by base address, asc info sharedlibrary /n  # Display shared libraries by library name, asc info sharedlibrary /d  # Display shared libraries by base address, desc info sharedlibrary /n /a /s  # Display shared libraries grouped loaded->unloaded  # and by library name, asc
```

- *nosharedlibrary* on page 2-137
- *sharedlibrary* on page 2-189.

2.3.68 <u>i</u>nfo signals, <u>i</u>nfo handle

This command displays information about the handling of signals or processor exceptions.

When connected to an application running on a remote target using gdbserver, the debugger handles Unix signals but on bare-metal it handles processor exceptions.

Syntax

info signals [name]
info handle [name]

Where:

name

Specifies the signal name. If no name is specified then all handler settings

are displayed.

Example

Example 2-68 info signals, info handle

info signals	# Display info for all signals
info signals IRQ	# Display info for IRQ signal

See also

• *handle* on page 2-76.

2.3.69 <u>i</u>nfo sources

This command displays the names of the source files used in the current image being debugged. Where possible the names are resolved to the location on the host system.

Syntax

<u>i</u>nfo sources

Example

Example 2-69 info sources

info sources

Display the names of source files

- add-symbol-file on page 2-34
- *file, symbol-file* on page 2-72
- *load* on page 2-117
- *loadfile* on page 2-118.

2.3.70 info stack, backtrace, where

This command displays a numbered list of the calling stack frames including the function names and source line numbers. You can use set backtrace to control the default call stack display settings.

_____Note _____

Each frame is assigned a number that increases from the bottom frame (zero) through the call stack to the top frame that is the start of the application.

Syntax

```
info stack [n|-n] [full]

backtrace [n|-n] [full]

where [n|-n] [full]
```

Where:

n Specifies n frames from the bottom of the call stack.

-n Specifies n frames from the top of the call stack.

full Specifies the additional display of local variables.

Example

Example 2-70 info stack, backtrace, where

```
info stack  # Display call stack
backtrace -5  # Display top 5 frames of the call stack
backtrace full  # Display call stack including local variables
where  # Display call stack
```

- *down* on page 2-64
- *down-silently* on page 2-65
- *frame* on page 2-75
- *info frame* on page 2-91
- *select-frame* on page 2-157
- set backtrace on page 2-162
- *show backtrace* on page 2-195
- *thread, core* on page 2-233
- *up* on page 2-247
- *up-silently* on page 2-248.

2.3.71 <u>i</u>nfo <u>sy</u>mbol

This command displays the symbol name at a specific address.

Syntax

<u>i</u>nfo <u>sy</u>mbol *address*

Where:

address Specifies the address.

Example

Example 2-71 info symbol

info symbol 0x8000

Display symbol name at address 0x8000

2.3.72 info target

info target is an alias for info files.

See info files, info target on page 2-89.

2.3.73 <u>i</u>nfo threads

This command displays a list of all threads. It shows the number (a unique number assigned by the debugger), OS ID (pid), OS Parent ID, kind, OS state, current state, and related stack frame including the function names and source line number.

_____Note _____

When kernel debugging this command displays kernel threads only. For user space processes you can use the info processes command.

Syntax

<u>i</u>nfo threads

Example

Example 2-72 info threads

info threads

Display all threads

- *break* on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- info processes on page 2-101
- *thread, core* on page 2-233.

2.3.74 <u>i</u>nfo <u>va</u>riables

This command displays the name and data types of global and static variables.

Syntax

info variables [expression]

Where:

expression

Specifies a symbol name or a wildcard expression. You can use wildcard

expressions to enhance your pattern matching.

If no expression is specified then all global and static variables are

displayed.

Example

Example 2-73 info variables

- Using wildcards on page 2-5
- set wildcard-style on page 2-188
- *set variable* on page 2-187.

2.3.75 info watchpoints

info watchpoints is an alias for info breakpoints.

See info breakpoints, info watchpoints on page 2-84.

2.3.76 inspect

inspect is an alias for print.

See print, inspect on page 2-141.

2.3.77 interrupt, stop

This command interrupts the target and stops the current application if it is running.

Syntax

interrupt

stop

Example

Example 2-74 interrupt

interrupt

interrupt current application

- *continue* on page 2-53
- *run* on page 2-154
- *start* on page 2-222.

2.3.78 list

This command displays lines of source code surrounding the current or specified location. The default listing is 10 lines of source code unless you specify start and finish line numbers. You can use the set listsize command to modify the default settings.

Repeated commands display successive source lines in the same direction through the source file.

Syntax

```
list [[filename:]location|+|-|+offset|-offset]|[*address]
```

Where:

filename Specifies the file. location Specifies the location:

line_num is a line number

first, last are start and finish line numbers

function is a function.

Displays the source lines after the current location.

Displays the source lines before the current location.

offset Specifies the line offset from the current location.

address Specifies the address. This can be either an address or an expression that

evaluates to an address.

Default

The default directories for searching are:

- compilation directory, \$cdir
- current working directory, \$cwd
- current image directory, \$idir.

You can use the directory command to define additional search directories.

Example

Example 2-75 list

```
list main
                    # Set current location to main() and display source
list +3
                    # Increment current location then display source
list -
                    # Decrement current location then display source
list *0x8120
                    # Set current location to address 0x8120 and display source
                    # Set current location to line 35 and display source
list 35
list dhry_1.c:10,23 # Display source lines 10 to 23 in dhry_1.c
list *main
                    # Set current location to address of main and display source
```

- Using expressions on page 2-4
- directory on page 2-58

- set listsize on page 2-173
- *show listsize* on page 2-206.

2.3.79 load

This command loads an image on to the target and records the entry point address for future use by the run and start commands.

_____Note _____

The PC register is not set with this command.

Debug information is not loaded with this command. You can use either the add-symbol-file, file, or loadfile command to load debug information.

Syntax

load [filename] [offset]

Where:

filename Specifies the image. If no filename is specified then the executable image

specified by the previous command is loaded. You can use info files to display

information about the current image and symbols.

offset Specifies the offset that is added to all addresses within the image.

Example

Example 2-76 load

load myFile.axf 0x2000 # Load image with offset 0x2000

- *add-symbol-file* on page 2-34
- *cd* on page 2-49
- discard-symbol-file on page 2-62
- file, symbol-file on page 2-72
- flash load on page 2-74
- info files, info target on page 2-89
- *loadfile* on page 2-118
- *run* on page 2-154
- *start* on page 2-222.

2.3.80 <u>loadfile</u>

This command loads debug information into the debugger, an image on to the target and records the entry point address for future use by the run and start commands. Subsequent use of the loadfile command discards existing information before loading the new debug information. The debug information is loaded when required by the debugger.

_____Note _____

The PC register is not set with this command.

Syntax

<u>loadfile</u> [filename] [offset]

Where:

filename Specifies the image. If no filename is specified then the executable image

specified by a previous command is loaded. You can use info files to display

information about the current image and symbols.

offset Specifies the offset that is added to all addresses within the image.

Example

Example 2-77 loadfile

loadfile "myFile.axf" # Load in
loadfile "images\myFile.axf" # Load in
loadfile myFile.axf 0x2000 # Load in

- # Load image and debug information when required
- # Load image and debug information when required
- # Load image with offset 0x2000 and load debug
- # information when required

- add-symbol-file on page 2-34
- *cd* on page 2-49
- discard-symbol-file on page 2-62
- *file, symbol-file* on page 2-72
- flash load on page 2-74
- info files, info target on page 2-89
- *load* on page 2-117
- reload-symbol-file on page 2-144
- *run* on page 2-154
- *start* on page 2-222.

2.3.81 log config

This command specifies the type of logging configuration to output runtime messages from the debugger.

Syntax

log config option

Where:

option

Specifies a predefined logging configuration or a user-defined logging configuration file:

info Output messages using the predefined INFO level configuration. This

is the default.

debug Output messages using the predefined DEBUG level configuration.

filename Specifies a user-defined logging configuration file to customize the

output of messages. The debugger supports log4j configuration files.

You can use this command with the log file command to output messages to a file in addition to the console.

Example

Example 2-78 log config

log config debug

Display all debug messages

- *log file* on page 2-120
- Log4j in Apache Logging Services, http://logging.apache.org

2.3.82 log file

This command outputs messages to a file in addition to the console.

Syntax

log file [filename]

Where:

filename

Specifies the output file. If no filename is specified then output messages are sent

only to the console.

Example

Example 2-79 log file

log file myOutput.log

Output debugger messages to myOutput.log and console

- *cd* on page 2-49
- *log config* on page 2-119.

2.3.83 <u>mem</u>ory

This command defines a memory region. It records the ID of the memory region in a new debugger variable, \$n, where n is a number. You can use this variable, in a script, to delete or modify the status of the memory region. If \$n is the last or second-to-last debugger variable, then you can also access the ID using \$ or \$\$, respectively.

Syntax

memory start_address {end_address|+size} [attributes]...

Where:

start_address Specifies the start address for the region.

end_address Specifies the inclusive end address for the region. You can use 0x0 as a

shortcut to represent the end of the address space.

size Specifies the size of the region.

attributes Specifies additional attributes:

access_mode Specifies the access mode for the region:

na no access ro read-only wo write-only

rw read/write. This is the default.

width Specifies the access width:

8 8-bit 16 16-bit 32 32-bit 64 64-bit.

It is only necessary to specify a specific access width where the memory region is sensitive to this, for example, when accessing some peripherals.

If no width is specified then the debugger uses any available access width and generally provides the

highest performance.

bp | nobp Controls whether or not software breakpoints can be

set in the region. bp is the default.

hbp | nohbp Controls whether or not hardware breakpoints can be

set in the region. hbp is the default.

cache | nocache Controls whether the debugger can cache data read

from the memory region. Enabling the caching of memory can improve debugger performance. Memory regions that can be modified by external sources should not be cached by the debugger. For

example volatile peripherals.

nocache is the default.

verify | noverify Controls whether or not a write operation must

verify the value written by reading the value back and comparing it to the value written. The verify option also requires the rwattribute to be specified so

that the verify operation to be performed. ARM recommends that you mark areas of memory containing peripherals as noverify, because some peripheral registers are volatile such that reading their value changes their contents as a side-effect. verify is the default.

Example

Example 2-80 memory

```
memory 0x1000 0x2FFF cache  # specify RW region 0x1000-0x2FFF (cache)
memory 0x3000 0x7FFF ro 8  # specify 8-bit RO region 0x3000-0x7FFF (nocache)
memory 0x8000 0x0  # specify RW region 0x8000-0xFFFF (nocache)
```

- *delete memory* on page 2-57
- disable memory on page 2-60
- enable memory on page 2-69
- *info memory* on page 2-97
- *memory auto* on page 2-123
- *memory debug-cache* on page 2-124.

2.3.84 memory auto

This command resets the memory regions to the default target settings and discards all user-defined regions.

Syntax

memory auto

Example

Example 2-81 memory auto

memory auto

reset default memory regions

- delete memory on page 2-57
- disable memory on page 2-60
- enable memory on page 2-69
- *info memory* on page 2-97
- *memory* on page 2-121.

2.3.85 memory debug-cache

This command globally controls the caching of memory regions by the debugger. You can use info mem to display the caching attributes.

Syntax

memory debug-cache option

Where:

option Specifies additional options:

off Globally disables debugger caching of memory regions. All memory accesses are performed directly on the target.

on Globally enables debugger caching of memory regions. When

caching is globally enabled the debugger might cache the results of read operations from memory regions that allow

caching. This is the default.

invalidate

Invalidates all the caches, so that the next subsequent read from memory is performed on the target and not the cache.

Example

Example 2-82 memory debug-cache

memory debug-cache off
memory debug-cache invalidate

Disable caching

Invalidates all caches

- *info memory* on page 2-97
- *memory* on page 2-121.

2.3.86 <u>mem</u>ory fill

This command writes a specific pattern of bytes to memory.

Syntax

memory fill start_address {end_address|+offset} fill_size pattern

Where:

start_address Specifies the start address for the region. This can be either an address or

an expression that evaluates to an address.

end_address Specifies the inclusive end address for the region. This can be either an

address or an expression that evaluates to an address.

offset Specifies the length of the region in bytes.

fill_size Specifies the size of the fill pattern in bytes.

pattern Specifies an expression that defines the fill pattern. If the pattern does not

fit exactly into the specified region, then the remaining bytes are filled

with partial bytes from the pattern.

Example

Example 2-83 memory fill

```
memory fill 0x0 0xFFFFFFFF 4 0x12345678 # Fill 0x0 to 0xFFFFFFFF inclusive with int # value 0x12345678 using default access width memory fill main (main+15) 1 (char)0x0 # Fill 16 bytes from symbol main with byte # value 0x0
```

- *info memory* on page 2-97
- *memory set* on page 2-126
- *memory set typed* on page 2-128.

2.3.87 <u>mem</u>ory set

This command writes to memory.

Syntax

memory set address width expression

Where:

address

Specifies an address at which to write the first value. The address must be correctly aligned for the type of the specified expression.

You can also qualify addresses with a flag to define whether the operation should perform a verify action or not.

For example:

memory set EL1N<verify=0>:0x8000 32 0x1234

If there is only one (anonymous) address space, then use:

memory set <verify=0>:0x8000 32 0x1234

width

Specifies the access width (bits) to use when writing to memory. If the width is narrower than the value being written then more than one access is used to write the value. For example:

0	enables the debugger to determine the access width
8	8-bit
16	16-bit

32 32-bit 64 64-bit.

Widths are dependent on the target, address region and address alignment. Some access sizes might not be supported.

expression

Specifies either a single expression or an aggregate of expressions with the same size enclosed in curly braces. If there is more than one expression, then the values are written to memory sequentially with the addresses determined by the width of the type of the values.

This command sets a default address variable to the value of the memory address. Some commands, such as x, use this default value if no address is specified.

Example

Example 2-84 memory set

```
# set variable *(char*)0x1004 = (char)3
memory set 0x1008 \ 0 \ 0x1234 # Equivalent to set variable *(int*)0x1008 = 0x1234
memory set 0x1008 \ 8 \ 0x1234 # Same effect but forces use of 4 writes of one byte each
```

- *info memory* on page 2-97
- *memory fill* on page 2-125
- *memory set typed* on page 2-128
- x on page 2-255.

2.3.88 memory set_typed

This command writes a list of values to memory.

Syntax

memory set_typed address type expressions

Where:

address Specifies an address at which to write the first value. The address must be

correctly aligned for the specified type.

type Specifies the data type to which each of the series of expressions is

converted and the width of each value in memory. For example, long.

expressions Specifies a space separated list of expressions. If an expression contains

spaces it must be enclosed in parentheses. The expressions are evaluated, converted to the specified type, and then written to memory sequentially.

----- Note ------

This command sets a default address variable to the value of the memory address. Some commands, such as x, use this default value if no address is specified.

Example

Example 2-85 memory set_typed

```
memory set_typed 0x8000 (long long) 0x100 0x200 
 # Is equivalent to the following commands: 
 # set variable *((long long*)0x8000) = (long long)0x100 
 # set variable *((long long*)0x8008) = (long long)0x200
```

- *info memory* on page 2-97
- *memory fill* on page 2-125
- *memory set* on page 2-126
- x on page 2-255.

2.3.89 mmu list tables

This command lists the available translation tables and their associated parameters.

Syntax

mmu list tables

Example

Example 2-86 mmu list tables

```
mmu list tables
Available translation tables:
PL1S_S1_TTBR0
parameters: S_TTBCR, S_TTBR0, S_SCTLR
PL1S_S1_TTBR1
parameters: S_TTBCR, S_TTBR1, S_SCTLR
PL1N_S1_TTBR0
parameters: N_TTBCR, N_TTBR0, N_SCTLR
PL1N_S1_TTBR1
parameters: N_TTBCR, N_TTBR1, N_SCTLR
```

- mmu list translations on page 2-130
- *mmu print* on page 2-130
- *mmu translate* on page 2-131.

2.3.90 mmu list translations

This command lists the available translations and their associated parameters.

Syntax

mmu list translations

Example

Example 2-87 mmu list translations

```
mmu list translations
Available address translations:
  PL1S_S1
    parameters: S_SCTLR, S_TTBCR, S_TTBR0, S_TTBR1
  PL1N_S1
    parameters: N_TTBR1, N_TTBCR, N_SCTLR, N_TTBR0
```

See also

- *mmu list tables* on page 2-129
- mmu print
- *mmu translate* on page 2-131.

2.3.91 mmu print

This command prints the contents of a translation table. Printing translation tables might be slow on some targets because it might involve a full traversal of the translation tables on the target.

Syntax

```
mmu print [table] [param1=value1]...
```

where:

Specifies the translation table to print. If you do not specify a table, the command prints all tables for the current translation regime.

param1= value1

Specifies a parameter and its value to govern the interpretation of the table. If you do not specify a required parameter, then it is determined from the current target state.

Example

Example 2-88 mmu print

mmu print PL1S_S1_TTBR0			
Input Address Type	Next Level	Output Address	Properties
+ 0x000000000 TTBR0 - 0x000000000 Fault (x704)	SP:0x0080500000 		

- 0x2C000000	Section		SP:0x002C000000	NS=0, nG=0, S=0	
- 0x2C100000	Fault (x1343)				
- 0x80000000	Section		SP:0x0080000000	NS=0, nG=0, S=1	
- 0x80100000	Fault (x2047)				
+ 0xFFFFFFF	TTBR1	SP:0x009082C300			

See also

- mmu list tables on page 2-129
- *mmu list translations* on page 2-130
- mmu translate.

2.3.92 mmu translate

This command performs translations between virtual and physical addresses. It translates either:

- from a virtual address to a physical address
- from a physical address to one or more virtual addresses.

Physical to virtual address translation might be slow on some targets because it might involve a full traversal of the translation tables on the target.

Syntax

```
mmu translate address [translation] [param1=value1]...
```

where:

address

Specifies the address to translate. If this is a virtual address then a virtual to physical address translation is performed. If this is a physical address then a physical to virtual address translation is performed.

translation Specifies the translation to perform.

param1= value1

Specifies a parameter and its value to govern the interpretation of the table. If you do not specify a required parameter, then it is determined from the current target state.

Example

Example 2-89 mmu translate

```
mmu translate 0x00008000 PL1S_S1 S_TTBR1=0x80000404A SP:0x80F15000
```

mmu translate SP:0x80F15000 Address SP:0x80F15000 maps to 0x00008000 0x80F15000

- *mmu list tables* on page 2-129
- *mmu list translations* on page 2-130

• *mmu print* on page 2-130.

2.3.93 newvar

This command declares and initializes a new debugger convenience variable. Convenience variables have a dynamic type, which means that they take the value and type of anything assigned to them. They can be used in debugger scripts to store information for later use.

Syntax

- Note

```
newvar [global] $name [=initial_value]

Where:

global Specifies that the variable has global scope. If global is not specified, then the variable is only accessible within its enclosing lexical scope.

name Specifies the name of the new variable. The name must be a valid C identifier but prefixed with $.

intial_value Specifies the initial value of the variable. If an initial value is not specified, then by default, the variable is of integer type with value 0.
```

- Debugger scripts and the top-level interactive interpreter are considered separate lexical scopes where non-global convenience variables are not visible to any child or parent debugger script.
- A user-defined command created with define is considered a separate lexical scope and cannot reference non-global convenience variables in surrounding scripts or from the top-level interpreter.
- The if, else, and while commands define new lexical scopes that inherit parent lexical scopes up to the level of a script, top-level interpreter, or user-defined command.
- Any non-global convenience variables, declared within a lexical scope, are destroyed at the end of the lexical scope.

Example

Example 2-90 newvar

```
define advance_hw  # This defines a new command that runs  # to an address using a hardware breakpoint.

hbreak $arg0  # Set a hardware breakpoint at the value of the first parameter. newvar $bp_num = $ # Save the number of the breakpoint in a new variable. continue wait delete $bp_num  # Delete the hardware breakpoint.

end advance_hw 0x00008000
```

- *Memory* on page 2-20
- break on page 2-40
- *watch* on page 2-250.

2.3.94 <u>n</u>ext

This command steps through an application at the source level stopping at the first instruction of each source line but stepping over all function calls. You must compile your code with debug information to use this command successfully.

Syntax next [count] Where: count Specifies the number of source lines to execute. Note ——— Execution stops immediately if a breakpoint is reached, even if fewer than count source lines are executed.

Example

Example 2-91 next

next # Execute one source line
next 5 # Execute five source lines

- reverse-next on page 2-149
- *finish* on page 2-73
- *nexti* on page 2-135
- nexts on page 2-136
- *step* on page 2-224
- *stepi* on page 2-225
- *steps* on page 2-226.

2.3.95 <u>n</u>ext<u>i</u>

This command steps through an application at the instruction level but stepping over all function calls.

Syntax

<u>n</u> ext <u>i</u> [coun	pt]
Where:	
count	Specifies the number of instructions to execute.
	Note
	Execution stops immediately if a breakpoint is reached, even if fewer than <i>count</i> instructions are executed.
Example	
	Example 2-92 next
nexti	# Execute one instruction

Execute five instructions

See also

nexti 5

- reverse-nexti on page 2-150
- next on page 2-134
- *nexts* on page 2-136
- *step* on page 2-224
- stepi on page 2-225
- *steps* on page 2-226.

2.3.96 <u>n</u>ext<u>s</u>

This command steps through an application at the source level stopping at the first instruction of each source statement but stepping over all function calls. You must compile your code with debug information to use this command successfully.

Example

Example 2-93 nexts

nexts nexts 5

- # Execute one source statement
- # Execute five source statements

- *finish* on page 2-73
- *next* on page 2-134
- *nexti* on page 2-135
- *step* on page 2-224
- *stepi* on page 2-225
- *steps* on page 2-226.

2.3.97 nosharedlibrary

This command discards all loaded shared library symbols.

——Note ——

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

nosharedlibrary

Example

Example 2-94 nosharedlibrary

Discards loaded shared library symbols

See also

nosharedlibrary

- info sharedlibrary on page 2-104
- *sharedlibrary* on page 2-189.

2.3.98 output

This command displays only the result of an expression. This is similar to the print command but it does not record the results in a debugger variable.

Syntax

output [/flag] expression

Where:

f1ag

Specifies the output format:

- x Hexadecimal (casts the value to an unsigned integer prior to printing in hexadecimal)
- d Signed decimal. This is the default.
- u Unsigned decimal
- o Octal
- t Binary
- a Absolute hexadecimal address
- c Character
- f Floating-point
- s Default format from the expression.

expression

Specifies an expression that is evaluated and the result is returned.

____ Note _____

If your expression accesses memory then a default address variable is set to the location after the last accessed address. Some commands, such as x, use this default value if no address is specified.

Example

Example 2-95 output

```
output (int*)8  # Cast a number as a pointer
output 4+4  # Display result of expression in decimal
output "initializing..."  # Display progress information
output $PC /x  # Display address in PC register (hexadecimal)
```

- Using expressions on page 2-4
- *echo* on page 2-67
- *print, inspect* on page 2-141
- x on page 2-255
- *printf() style format string* on page 2-9.

2.3.99 pause

This command pauses the execution of a script for a specified period of time.

Syntax

pause number[ms | s]

Where:

number Specifies the period of time.

ms Specifies the time in milliseconds. This is the default.

s Specifies the time in seconds.

Example

Example 2-96 pause

pause 1000 # Pause for 1 second pause 0.5s # Pause for half a second

2.3.100 preprocess

This command displays the preprocessed expression, not the evaluated expression.

Syntax

```
preprocess [expression]

Note ———

This functionality is dependent on the compiler generating accurate macro debug information.
```

Example

Example 2-97 preprocess

```
If your application contained the following code:
```

```
#define BASE_ADDRESS (0x1000)
#define REG_ADDRESS (BASE_ADDRESS + 0x10)
int main () {
    return REG_ADDRESS;
}
During a debug session, you can display the REG_ADDRESS by using:
>preprocess REG_ADDRESS
```

This compares with the expression value as output by the print command:

```
>print/x REG_ADDRESS 0x1010
```

((0x1000) + 0x10)

See also

• print, inspect on page 2-141

2.3.101 print, inspect

This command displays the output of an expression (128 character limit) and also records the result in a new debugger variable, n, where n is a number. Results from the print command can be used successively in expressions using the n character. If you do not want the results recorded in a debugger variable, use the output command instead.

Syntax

print [/flag] [expression]
inspect [/flag] [expression]

Where:

f1ag

Specifies the output format:

- x Hexadecimal (casts the value to an unsigned integer prior to printing in hexadecimal)
- d Signed decimal. This is the default.
- u Unsigned decimal
- o Octal
- t Binary
- a Absolute hexadecimal address
- c Character
- f Floating-point
- Default format from the expression.

expression

Specifies an expression that is evaluated and the result is returned. If no *expression* is specified then the last expression is repeated.

_____Note _____

If your expression accesses memory then a default address variable is set to the location after the last accessed address. Some commands, such as x, use this default value if no address is specified.

Example

Example 2-98 print, inspect

```
print (int*)8  # Cast a number as a pointer
print 4+4  # Display result of expression in decimal
print "initializing..."  # Display progress information
print /x $PC  # Display address in PC register (hexadecimal)
```

- Using expressions on page 2-4
- *echo* on page 2-67
- *output* on page 2-138
- x on page 2-255
- *printf() style format string* on page 2-9.

2.3.102 pwd

This command displays the current working directory.

Syntax

pwd

Example

Example 2-99 pwd

pwd

Display current working directory

See also

• *cd* on page 2-49.

2.3.103 quit, exit

This command quits the debugger session.

Syntax

<u>q</u>uit

exit

Example

Example 2-100 quit, exit

quit

Quit debugger session

2.3.104 reload-symbol-file

This command reloads debug information from an already loaded image into the debugger using the same settings as the original load operation. For example, you can use this command to reload debug information into the debugger after you have rebuilt your image.

____Note ____

The PC register is not set with this command.

Syntax

reload-symbol-file [filename]

Where:

filename

Specifies the image to reload. If is not already loaded then an error is generated.

Example

Example 2-101 reload-symbol-file

reload-symbol-file "myFile.axf"

Reload debug information

- add-symbol-file on page 2-34
- *cd* on page 2-49
- discard-symbol-file on page 2-62
- *file, symbol-file* on page 2-72
- info files, info target on page 2-89
- *load* on page 2-117
- *loadfile* on page 2-118
- *run* on page 2-154
- *start* on page 2-222.

2.3.105 reset

This command performs a reset on the target. The exact behavior of the reset command is dependent on the debug agent and the target.

For example:

- a debug agent can be configured to reset the target in different ways
- the position of the switches on the target.
- a gdbserver connection can be configured to restart gdbserver and run scripts.

For more information, see the documentation for your target or debug agent.

_____Note _____

Reset does not affect the symbols loaded in the debugger. Registers and memory might contain different values after a reset.

Syntax

reset [key]

Where:

key

Specifies the reset key. The reset capabilities are target dependent and might not all be enabled. You can use info capabilities to display a list of capability settings for the target device that is currently connected to the debugger.

Possible options for the reset key are:

app Application restart.

system General hardware reset that is not specific to a bus or

processor.

If no key is specified then the first enabled reset capability is performed.

Example

Example 2-102 reset

See also

• info capabilities on page 2-86.

2.3.106 resolve

This command re-evaluates the specified breakpoints or watchpoints and those with addresses that can be resolve are set. Unresolved addresses remain pending.

Syntax

resolve [number]...

Where:

number

Specifies the breakpoint or watchpoint number. This is the number assigned by the debugger when it is set. You can use info breakpoints to display the number and status of all breakpoints and watchpoints.

If no *number* is specified then all breakpoints and watchpoints are re-evaluated.

Example

Example 2-103 resolve

```
resolve 1  # Resolve breakpoint/watchpoint number 1
resolve 1 2  # Resolve breakpoints/watchpoint number 1 and 2
resolve  # Resolve all breakpoints/watchpoints
resolve $ # Resolve the breakpoint/watchpoint whose number is in
# the most recently created debugger variable
```

- break on page 2-40
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- *condition* on page 2-52
- *delete breakpoints* on page 2-56
- *disable breakpoints* on page 2-59
- *hbreak* on page 2-77
- *ignore* on page 2-81
- info breakpoints, info watchpoints on page 2-84
- *tbreak* on page 2-229
- *thbreak* on page 2-231.

2.3.107 restore

This command reads data from a file and writes it to memory.

Syntax

restore filename [binary] [offset [start_address [end_address|+size]]]

Where:

filename Specifies the file.

binary Specifies binary format. The file format is only required for binary files.

All other files are automatically recognized by the debugger. See the append command for a list of the file formats supported by the debugger.

offset Specifies an offset that is added to all addresses in the image prior to

writing to memory. Some image formats do not contain embedded addresses and in this case the offset is the absolute address where the

image is restored.

start_address Specifies the minimum address that can be written to. Any data prior to

this address is not written. If no start_address is given then the default is

address zero.

end_address Specifies the maximum address that can be written to. Any data after this

address is not written. If no end_address is given then the default is the end

of the address space.

size Specifies the size of the region.

Example

Example 2-104 restore

```
restore myFile.bin binary 0x200  # Restore content of binary file  # myFile.bin starting at 0x200 restore myFile.m32 0x100 0x8000 0x8FFF # Add 0x100 to addresses in Motorola  # 32-bit (S-records) file and restore  # content between 0x8000-0x8FFF
```

- append on page 2-36
- *dump* on page 2-66.

2.3.108 reverse-continue

This command continues running the target backwards until a breakpoint or watchpoint is hit.

____Note _____

Control is returned as soon as the target starts running backwards. You can use the wait command to block the debugger from returning control until the application stops, for example at a breakpoint or watchpoint.

Syntax

reverse-continue [count]

Where:

count

Specifies the number of times to ignore any breakpoints or watchpoints that are hit.

Example

Example 2-105 reverse-continue

reverse-continue reverse-continue 5

- # Continue running the target backwards
- # Continue running the target backwards,
- # ignoring five breakpoint hits

See also

• *continue* on page 2-53.

2.3.109 <u>r</u>everse-<u>n</u>ext

	an application at the source level,	stopping at the preceding source line	
Note			
You must con	npile your code with debug inform	ation to use this command successfu	lly.
Syntax			
<u>r</u> everse- <u>n</u> ext	[count]		
Where:			
count	Specifies the number of source lin Note	nes to rewind. The default is one line	
		breakpoint is reached, even if fewer t	han <i>count</i>
——Note			
	oing is unaware of inline functions de. Use unoptimized code for the b	and might not operate correctly in his sest debug experience.	ghly
Example			
		Example 2-106 rev	erse-next
reverse-next reverse-next	5	# Reverse step one source line # Reverse step five source lines	

See also

• *next* on page 2-134.

2.3.110 <u>r</u>everse-<u>n</u>ext<u>i</u>

This command rewinds execution at the instruction level, stepping over all function calls.

Syntax	
<u>r</u> everse- <u>n</u> ext	i [count]
Where:	
count	Specifies the number of instructions to rewind. The default is one instruction.
	Note
	Execution stops immediately if a breakpoint is reached, even if fewer than <i>count</i> instructions are executed.
	bing is unaware of inline functions and might not operate correctly in highly de. Use unoptimized code for the best debug experience.
Example	
	Example 2-107 reverse-nexti
reverse-next	i # Reverse step one instruction
reverse-next	i 5 # Reverse step five instructions

See also

• *nexti* on page 2-135.

2.3.111 <u>r</u>everse-<u>s</u>tep

	d steps back through an appli all function calls.	ication a specified number of source lines at a time,				
You must con	apile your code with debug in	nformation to use this command successfully.				
Syntax						
<u>r</u> everse- <u>s</u> tep	[count]					
Where:						
count	Specifies the number of sour Note	rce lines to rewind. The default is one line.				
	Execution stops immediately if a breakpoint is reached, even if fewer than co source lines are executed.					
——Note						
	oing is unaware of inline function. de. Use unoptimized code for	tions and might not operate correctly in highly the best debug experience.				
Example						
		Example 2-108 reverse-step				
reverse-step reverse-step	5	# Reverse step one source line # Reverse step five source lines				

See also

• *step* on page 2-224.

2.3.112 <u>r</u>everse-<u>s</u>tep<u>i</u>

This command steps back through an application a specified number of instructions at a time.

Syntax reverse-stepi [count] Where: count Specifies the number of instructions to rewind. The default is one instruction. Note Secution stops immediately if a breakpoint is reached, even if fewer than count instructions are executed. Example Example Example # Reverse step one instruction reverse-stepi # Reverse step five instructions

See also

• *stepi* on page 2-225.

2.3.113 <u>reverse-step-out</u>

This command rewinds execution through the specified number of stack frames.

Syntax

reverse-step-out [count]

Where:

count Specifies the number of stack frames to rewind. The default is one stack frame.

Note Reverse stepping is unaware of inline functions and might not operate correctly in highly optimized code. Use unoptimized code for the best debug experience.

Example

Example 2-110 reverse-step-out

```
reverse-step-out  # Rewinds until the current stack frame finishes reverse-step-out 5  # Rewinds until five stack frames finish
```

See also

• *finish* on page 2-73.

2.3.114 run

The operation of this command depends on what the target is:

Bare-metal

This command sets the PC register to the entry point address previously recorded by the load, loadfile, or file command and starts running the target. Subsequent run commands also reload the executable image if it follows a previous load operation.

Linux application

This command sends a request to the server to restart the application and then start running it.

_____Note _____

Control is returned as soon as the target is running. You can use the wait command to block the debugger from returning control until either the application completes or a breakpoint is hit.

Syntax

run [args]

Where:

args

Specifies the command-line arguments that are passed to the main() function in the application using the argy parameter. The name of the image is always implicitly passed in argv[0] and it is not necessary to pass this as an argument to the run command.

Example

Example 2-111 run

run

Start running the device

- *continue* on page 2-53
- file, symbol-file on page 2-72
- *load* on page 2-117
- *loadfile* on page 2-118
- set semihosting on page 2-178
- show semihosting on page 2-209
- start on page 2-222
- *wait* on page 2-249.

2.3.115 rwatch

This command sets a watchpoint for a data symbol. The debugger stops the target when the memory at the specified address is read.

This command records the ID of the watchpoint in a new debugger variable, \$n, where n is a number. You can use this variable, in a script, to delete or modify the watchpoint behavior. If \$n is the last or second-to-last debugger variable, then you can also access the ID using \$ or \$\$, respectively.

_____Note _____

Watchpoints are only supported on scalar values.

Some targets do not support watchpoints. Currently you can only set a watchpoint on:

- a hardware target using a debug hardware agent
- Linux applications using gdbserver or undodb-server.

The availability of watchpoints depends on the hardware target. In the case of Linux application debug, the availability of watchpoints also depends on the Linux kernel version and configuration.

The address of the instruction that triggers the watchpoint might not be the address shown in the PC register. This is because of pipelining effects.

Syntax

rwatch [-d] [-p] {[filename:]symbol|*address} [vmid vmid]

Where:

d Disables the watchpoint immediately after creation.

p Specifies whether or not the resolution of an unrecognized watchpoint

location results in a pending watchpoint being created.

filename Specifies the file.

symbol Specifies a global/static data symbol. For arrays or structs you must

specify the element or member.

address Specifies the address. This can be either an address or an expression that

evaluates to an address.

vmid Specifies the Virtual Machine ID (VMID) to apply the breakpoint to. This

can be either an integer or an expression that evaluates to an integer.

Example

Example 2-112 rwatch

rwatch myVar1 # Set read watchpoint on myVar1 rwatch *0x80D4 # Set read watchpoint on address 0x80D4

See also

• *Using expressions* on page 2-4

- awatch on page 2-37
- break-stop-on-threads, break-stop-on-cores on page 2-45
- *clearwatch* on page 2-51
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- *watch* on page 2-250.

2.3.116 select-frame

This command moves the current frame pointer in the call stack.

_____Note _____

Each frame is assigned a number that increases from the bottom frame (zero) through the call stack to the top frame that is the start of the application.

Syntax

select-frame *number*

Where:

number Specifies the frame number.

Example

Example 2-113 select-frame

select-frame 1

Move to stack frame 1

- down on page 2-64
- *down-silently* on page 2-65
- *finish* on page 2-73
- *frame* on page 2-75
- *info frame* on page 2-91
- info all-registers on page 2-83
- info registers on page 2-102
- info stack, backtrace, where on page 2-107
- *up* on page 2-247
- *up-silently* on page 2-248.

2.3.117 set

set is an alias for set variable.

See set variable on page 2-187.

2.3.118 set arm

This command controls the behavior of the debugger when selecting the instruction set for disassembly and setting breakpoints.

----- Note -----

Available instruction sets depend on the target that the debugger is connected to.

Syntax

set arm option

Where:

option Specifies additional options:

force-mode Controls the default debugger behavior overriding the

fallback-mode setting.

a32 arm Forces the debugger to use the A32

instruction set.

a64 Forces the debugger to use the A64

instruction set.

t32 | thumb Forces the debugger to use the T32

instruction set.

auto Forces the debugger to use debug

information when available or the fallback-mode if this is not available.

This is the default.

fallback-mode Controls the default debugger behavior when force-mode is

set to auto and debug information is not available.

a32 | arm Forces the debugger to use the A32

instruction set when debug information is not available.

a64 Forces the debugger to use the A64

instruction set when debug information is not available.

t32 | thumb Forces the debugger to use the T32

instruction set when debug information is not available.

auto Forces the debugger to use the current

instruction set of the target. This is the

default.

Example

Example 2-114 set arm

set arm force-mode thumb # Force the use of Thumb

set arm fallback-mode arm # When force-mode is auto, use ARM # if no debug information is available

- break on page 2-40
- *disassemble* on page 2-61
- info inst-sets on page 2-94
- *show arm* on page 2-193
- start on page 2-222
- *tbreak* on page 2-229
- *x* on page 2-255.

2.3.119 set auto-solib-add

This command controls the automatic loading of shared library symbols.

_____Note _____

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

set auto-solib-add {off|on}

Where:

off No automatic loading. When automatic loading is off you must explicitly load

shared library symbols using the sharedlibrary command.

on Loads shared library symbols automatically. This is the default.

Example

Example 2-115 set auto-solib-add

set auto-solib-add off

No automatic loading of shared library symbols

See also

• show auto-solib-add on page 2-194.

2.3.120 set backtrace

This command controls the default behavior when using the info stack command.

Syntax

set backtrace option

Where:

option Specifies additional options:

limit *n* Specifies the maximum limit when displaying the call stack. You can specify zero as the maximum limit to display the entire call stack.

The default call stack limit is 100.

Example

Example 2-116 set backtrace

set backtrace limit 10	# Limit the call stack display to 10 fram	ies
set backtrace limit 0	# No limit, display the entire call stack	(

- info stack, backtrace, where on page 2-107
- *show backtrace* on page 2-195.

2.3.121 set blocking-run-control

This command controls whether run control operations such as stepping and running are blocked until the target stops or released immediately.

Syntax

set blocking-run-control {off|on|script-only}

Where:

off Specifies asynchronous, control is returned before the target stops.

on Specifies synchronous, run control operations are blocked until the target stops.

This has the same effect as issuing a wait command after each run control

operation.

script-only Specifies that run control operations block only when executed as commands

from within a script.

This is the default.

Example

Example 2-117 set blocking-run-control

set blocking-run-control on

Block run control operations until target stops

See also

• show blocking-run-control on page 2-196.

2.3.122 set breakpoint

This command controls the automatic behavior of breakpoints and watchpoints.

Syntax

set breakpoint [option]

Where:

option Specifies additional options:

auto-hw Controls the automatic breakpoint selection when using the break

command

off Disables automatic breakpoint selection.

on Uses the memory map attributes to decide if hardware or

software breakpoints must be used. This is the default.

auto-remove

Controls the automatic removal of breakpoints and watchpoints when disconnecting from the target:

off Disables automatic removal.

on Enables automatic removal. This is the default.

_____Note _____

If the target is running, the debugger temporarily stops the target before removing breakpoints and watchpoints.

skipmode Controls whether to skip all breakpoints and watchpoints:

off Disables skip mode. This is the default.

on Enables skip mode.

Example

Example 2-118 set breakpoint

set breakpoint auto-hw off set breakpoint skipmode on set breakpoint auto-remove off

- # No automatic breakpoint selection
- # Skip all breakpoints and watchpoints
- # No automatic removal of breakpoints and watchpoints

- break on page 2-40
- *show breakpoint* on page 2-197.

2.3.123 set case-insensitive-source-matching

This command controls the case sensitivity of debugger file matching operations.

Syntax

set case-insensitive-source-matching [off|on]

Where:

off Specifies case sensitive file matching. This is the default.

on Specifies case insensitive file matching. This is useful if the file paths or

filenames in the debug data have a different case to those in the filesystem.

Example

Example 2-119 set case-insensitive-source-matching

- show case-insensitive-source-matching on page 2-198
- set escapes-in-filenames on page 2-172
- set wildcard-style on page 2-188.

2.3.124 set debug-agent

This command sets an internal configuration parameter for the debug agent. The available parameters depend on the debug agent, such as DSTREAM or gdbserver.

Syntax

set debug-agent name value

Where:

name Specifies the name of the parameter to set.

value Specifies the value of the parameter. Values are dependent on the parameter being

set. An error is reported if the value is not valid.

Example

Example 2-120 set debug-agent

```
set debug-agent UserOut_P1 1
```

Set value of USER OUT pin1 to 1.

This parameter is available for DSTREAM/RVI connections.

See also

• *show debug-agent* on page 2-199.

2.3.125 set debug-from

This command specifies the address of the temporary breakpoint for subsequent use by the start command. If you do not specify this command then the default value used by the start command is the address of the global function main().

Syntax

set debug-from expression

Where:

expression

Specifies an expression that evaluates to an address. The expression is only evaluated when the start command is processed, therefore, you can refer to symbols that might not exist yet but might be made available in the future. You can use the debugger variable \$entrypoint to refer to the entry point for the currently loaded image.

Example

Example 2-121 set debug-from

```
set debug-from *0x8000  # Set start-at setting to address 0x8000
set debug-from *Sentrypoint  # Set start-at setting to address of Sentrypoint
set debug-from main+8  # Set start-at setting to address of main+8
set debug-from function1  # Set start-at setting to address of function1
```

- Using expressions on page 2-4
- show debug-from on page 2-200
- *start* on page 2-222.

2.3.126 set directories

set directories is an alias for directory.

See *directory* on page 2-58.

2.3.127 set dtsl-options

This command sets a parameter in the connection DTSL configuration.

Syntax

set dtsl-options name value

Where:

name Specifies a name of the parameter to set.

value Specifies the value of the parameter. Values are dependent on the parameter being

set. An error is reported if the value is not valid.

Example

Example 2-122 set dtsl-options

set dtsl-options options.cortexA9.coreTrace.cycleAccurate False
Set DTSL configuration cycleAccurate parameter to false

See also

• *show dtsl-options* on page 2-202.

2.3.128 set endian

This command specifies the byte order for use by the debugger. The endianness of the target is not modified by this command.

Syntax

set endian {auto|be8|big|little}

Where:

auto Uses the same byte order as the image where possible, otherwise it uses the

current endianness of the target. This is the default.

be8 Specifies Byte Invariant Addressing big-endian mode introduced in architecture

ARMv6 (data is big endian and code is little endian).

big Specifies big endian mode.

little Specifies little endian mode.

Example

Example 2-123 set endian

set endian little

Debug using little endian

See also

• *show endian* on page 2-203.

2.3.129 set escape-strings

This command controls how special characters in strings are printed on the debugger command-line.

Syntax

set escape-strings off|on

Where:

off Specifies that any backslash characters in strings are treated as escape sequences.

For example, if the string contains "\t" then this is printed as a tab character.

This is the default.

on Specifies that any backslashes in strings are not treated as escape sequences and

are instead output literally. For example, if the string contains "\t" then this is

printed as a "\" character followed by a "t" character.

Example

Example 2-124 set escape-strings

```
set escape-strings on output "Say \"hello\""
"Say \"hello\""
set escape-strings off output "Say \"hello\""
"Say "hello\""
```

See also

• *show escape-strings* on page 2-204.

2.3.130 set escapes-in-filenames

This command controls the use of special characters in paths.

Syntax

set escapes-in-filenames off|on

Where:

off Specifies that a backslash in a path is treated as a directory separator (with the

exception that it can be used to escape spaces). For example:

C:\test\ file.c

The first backslash is treated as a separator followed by a t, not an escape sequence representing the tab character. The second backslash escapes the space.

This is the default.

on Specifies that a backslash is to be treated as part of an escape sequence to indicate

that the character following is a special character. For example:

C:\\test\\file.c

The backslash in this example is a directory separator and must be identified as a

special character.

Example

Example 2-125 set escapes-in-filenames

set escapes-in-filenames on

Use backslash as an escape character in paths

See also

• *show escapes-in-filenames* on page 2-205.

2.3.131 set listsize

This command modifies the default number of source lines that the list command displays.

Syntax

set listsize n

Where:

n Specifies the number of source lines.

Example

Example 2-126 set listsize

set listsize 20

Set listing size for list command

- *list* on page 2-115
- *show listsize* on page 2-206.

2.3.132 set os

This command controls *Operating System* (OS) settings in the debugger. – Note – An OS aware connection must be established before you can use this command. **Syntax** set os option Where: Specifies additional options: option off Disables OS log capture and printing of Linux log-capture kernel dmesg logs to console. This is the default. Enables OS log capture and printing to console. on - Note -This option automatically checks the connection state and, if required, stops the target before changing this setting. enabled Automatically stops the target and enables OS auto support when an OS image is loaded into the debugger. For example, Linux kernel images are detected by reading the members for the structure returned by the expression init_nsproxy.uts_ns->name. Unloading the image disables OS support. This is the default for Linux kernel connections. Automatically enables OS support when an OS deferred image is loaded into the debugger but only when the target next stops. Unloading the image disables OS support. This is the default for Real-Time Operating System (RTOS) aware connections. off Disables OS support. Enables OS support. Use this option when the OS on image is already loaded into the debugger and the target is stopped. Example

Example 2-127 set os

set os log-capture on # Enable OS log capture and printing to console set os enabled off # Disable OS support in debugger

- *info os-log* on page 2-98
- *info os-modules* on page 2-99

- info os-version on page 2-100
- *info processes* on page 2-101
- *show os* on page 2-207.

2.3.133 set print

This command controls the current debugger print settings.

Syntax

set print option

Where:

option Specifies additional options:

library-not-found-warnings

Controls the printing of "unable to find library..." messages.

off Disables these messages. This is the default.

on Enables these messages.

full-source-path Controls the printing of source file names in messages.

off Disables printing the full path. This is the default.

on Enables printing the full path.

stop-info Controls the printing of event messages when the target

stops.

off Disables printing of event messages. This setting

takes precedence over the silence and unsilence

commands.

on Enables printing of event messages. This is the

default.

current-vmid Controls the printing of current VMID messages when the

target stops.

off Disables printing of VMID messages. This is the

default.

on Enables printing of VMID messages.

double-format format

Controls the formatting of double precision floating-point values. *format* is a printf() style format string. The default

is "%, .16g".

float-format format

Controls the formatting of single precision floating-point values. *format* is a printf() style format string. The default is "%, .6g".

Example

Example 2-128 set print

```
set print library-not-found-warnings off # Disable unfound library messages
set print full-source-path on # Display full source path in messages
set print double-format %+g # Print decimal scientific notation with sign
set print float-format %08.4e # Print decimal scientific notation, zero-pad
# min 8 characters, 4 digit precision
```

- *show print* on page 2-208
- *silence* on page 2-220
- *unsilence* on page 2-246
- *printf() style format string* on page 2-9.

2.3.134 set semihosting

This command controls the semihosting settings in the debugger. Semihosting is used to communicate input/output requests from application code to the host workstation running the debugger.

– Note –

These settings only apply if the target supports semihosting and they cannot be changed while the target is running.

Syntax

set semihosting option

Where:

option

Specifies additional options:

args arguments

Specifies the command-line arguments that are passed to the main() function in the application using the argv parameter. The name of the image is always implicitly passed in argv[0] and it is not necessary to pass this as an argument.

file-base directory

Specifies the base directory where the files that the application opens are relative to.

stderr "stderr" | filename

Specifies either console streams or a file to write stderr for semihosting operations.

stdin "stdin" | filename

Specifies either console streams or a file to read stdin for semihosting operations.

stdout "stdout" | filename

Specifies either console streams or a file to write stdout for semihosting operations.

top-of-memory address

Specifies the top of memory.

stack_heap_options Specifies finer controls to manually configure the base address and limits for the stack and heap. If you use stack_heap_options, then these settings take precedence over the top-of-memory and all of the following options must be specified:

stack-base address

The base address of the stack.

stack-limit address

The end address of the stack.

heap-base address

The base address of the heap.

heap-limit address

The end address of the heap.

vector address

Specifies a breakpoint address for semihosting support. If it is not set, the debugger uses vector catch (if supported) or 0x8.

Example

Example 2-129 set semihosting

set semihosting args 500 # Set 500 as command-line argument set semihosting stdout output.log # Write stdout to output.log set semihosting enabled on # Enable semihosting operations

- show semihosting on page 2-209
- *unset* on page 2-245.

2.3.135 set solib-absolute-prefix

set solib-absolute-prefix is an alias for set sysroot.

See set sysroot, set solib-absolute-prefix on page 2-185.

2.3.136 set solib-search-path

This command specifies additional directories to search for shared library symbols. If you use this command without an argument then any additional search directories, previously added using this command, are removed. You can use show solib-search-path to display the current settings.

_____Note _____

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

set solib-search-path [path]...

Where:

path

Specifies an additional directory to search for shared libraries. The debugger uses the system root directory first, then it searches the additional directories specified with this command. You can use set sysroot to specify the system root directory.

----- Note ------

Multiple directories can be specified but must be separated with either:

- a colon (Unix)
- a semi-colon (Windows).

Example

Example 2-130 set solib-search-path

```
set solib-search-path "\usr\lib"  # Specify search directory
set solib-search-path "/lib":"/My Lib"  # Specify two search directories(Unix)
```

- set sysroot, set solib-absolute-prefix on page 2-185
- *show solib-search-path* on page 2-212
- *show sysroot, show solib-absolute-prefix* on page 2-216.

2.3.137 set step-mode

This command controls the default behavior of the step and steps commands.

Syntax

set step-mode {step-over|stop|step-until-source}

Where:

step-over

If the instruction is a function call then the debugger performs a step-over.

Otherwise, it stops. This is the default.

stop

The debugger stops when execution reaches an address with no source.

step-until-source

The debugger performs steps until it reaches source. To speed up the execution, the debugger might use abstract interpretation and break or run until the line of source is reached.

Example

Example 2-131 set step-mode

set step-mode step-over

- # Step over a function call and stop.
- # Otherwise stop

- *show step-mode* on page 2-213
- step on page 2-224
- *steps* on page 2-226.

2.3.138 set stop-on-solib-events

This command controls whether the debugger stops execution when a shared object is loaded or unloaded.

____Note ____

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

set stop-on-solib-events {off|on}

Where:

off Ignore event. This is the default.

on Stop execution. Use this option only when you want the debugger to stop

execution. For example, you might want to set a breakpoint in a shared library prior to use or perhaps you might want to check the initialization of global

variables.

Example

Example 2-132 set stop-on-solib-events

set stop-on-solib-events on

Stop execution when event occurs

See also

• *show stop-on-solib-events* on page 2-214.

2.3.139 set substitute-path

This command modifies the search paths used by the debugger when it executes any of the commands that look up and display source code. This command is useful when the source files have moved from the original location used during compilation.

Subsequent use of the set substitute-path command appends rules to the current list.

Syntax

set substitute-path path1 path2

Where:

path1 Specifies the existing search path.

path2 Specifies the replacement search path.

Example

Example 2-133 set substitute-path

set substitute-path "\src" "\My Src"

Substitute "\src" with "\My Src"

- *directory* on page 2-58
- *show substitute-path* on page 2-215
- *unset* on page 2-245.

2.3.140 set sysroot, set solib-absolute-prefix

This command specifies the system root directory to search for shared library symbols.

The debugger uses this directory to search for a copy of the debug versions of target shared libraries. The system root on the host workstation must contain an exact representation of the libraries on the target root filesystem.

Note

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

set sysroot path

set solib-absolute-prefix path

Where:

path

Specifies the system root directory.

Example

Example 2-134 set sysroot, set solib-absolute-prefix

set sysroot "\mySystem"

Set system root directory "\mySystem"

- set solib-search-path on page 2-181
- show solib-search-path on page 2-212
- show sysroot, show solib-absolute-prefix on page 2-216.

2.3.141 set trust-ro-sections-for-opcodes

This command controls whether the debugger can read opcodes from read-only sections of images on the host workstation rather than from the target itself.

Syntax

set trust-ro-sections-for-opcodes {off|on}

Where:

off Disables this behavior. Use this option to trace self-modifying code or when the

code on the target is modified before being loaded to the target. This is the default.

on Enables reading opcodes from read-only sections of images on the host machine.

Reading opcodes from the host workstation is usually faster than reading them

from the target.

Example

Example 2-135 set trust-ro-sections-for-opcodes

set trust-ro-sections-for-opcodes on

Enable reading opcodes from host

See also

• *show trust-ro-sections-for-opcodes* on page 2-217.

2.3.142 set <u>var</u>iable

This command evaluates an expression and assigns the result to a variable, register or memory.

Syntax

```
set [variable] expression
```

Where:

expression Specifies an expression and assigns the result to a variable, register or memory address.

Example

Example 2-136 set variable

```
      set variable myVar=10
      # Assign 10 to variable myVar

      set variable $PC=0x8000
      # Assign address 0x8000 to

      set variable $CPSR.N=0
      # Clear N bit

      set variable (*(int*)0x8000)=1
      # Assign 1 to address 0x8000

      set variable *0x8000=1
      # Assign 1 to address 0x8000

      set variable strcpy((char*)0x8000,"My String")
      # Assign string to address 0x8000

      set variable memcpy(void*)0x8000,{10,20,30,40},4)
      # Assign array to address 0x8000
```

- Using expressions on page 2-4
- info variables on page 2-111
- ARM Architecture Reference Manual, http://infocenter.arm.com/help/topic/com.arm.doc.set.architecture/index.html.

2.3.143 set wildcard-style

This command specifies the type of wildcard pattern matching you can use for examining the contents of strings.

Syntax

set wildcard-style glob|regex

Where:

glob Specifies a simpler style of pattern matching using glob expressions to refine your

search. For example, you can use m* to search for strings starting with m.

This is the default.

regex Specifies a more complex style of pattern matching using regular expressions to

refine your search. For example, you can use $my_lib[0-9]+$ to search for strings

starting with my_lib followed by an integer.

Example

Example 2-137 set wildcard-style

set wildcard-style regex

Use regular expression pattern matching

- *Using wildcards* on page 2-5
- show wildcard-style on page 2-219
- info classes on page 2-87
- *info functions* on page 2-92
- info variables on page 2-111
- *sharedlibrary* on page 2-189.

2.3.144 sharedlibrary

This command loads symbols from shared libraries. Be aware that it can only load symbols for shared libraries that are already loaded by the application.

_____Note _____

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

sharedlibrary [expression]

Where:

expression

Specifies a library path or a wildcard expression. You can use wildcard

expressions to enhance your pattern matching.

If no expression is specified then the symbols from all shared libraries are

loaded.

Example

Example 2-138 sharedlibrary

- *Using wildcards* on page 2-5
- info sharedlibrary on page 2-104
- *nosharedlibrary* on page 2-137
- set wildcard-style on page 2-188.

2.3.145 shell

This command runs a shell command within the current debug session. The command is launched in the current working directory. You can use pwd to display the current working directory.

Syntax

shell cmd

Where:

cmd

Specifies the command and associated arguments.

Example

Example 2-139 shell

```
shell dir  # On Windows, list of files in current directory
shell cat my_script.ds # On Linux, list contents of my_script.ds file
```

- *cd* on page 2-49
- *pwd* on page 2-142.

2.3.146 show

This command displays the current debugger settings.

Syntax

show

Example

Example 2-140 show

show

Display current debugger settings

2.3.147 show architecture

This command displays the architecture of the current target.

Syntax

show architecture

Example

Example 2-141 show architecture

show architecture

Display current target architecture

2.3.148 show arm

This command displays the current instruction set settings in use by the debugger for disassembly and setting breakpoints.

Syntax

show arm option

Where:

option Specifies additional options:

force-mode Display the current force-mode behavior.

fallback-mode Display the current fallback-mode behavior.

Example

Example 2-142 show arm

show arm # Display the current instruction set settings show arm force-mode # Display the current force-mode setting

- info inst-sets on page 2-94
- *set arm* on page 2-159.

2.3.149 show auto-solib-add

This command displays the current automatic setting for use when loading shared library
symbols. You can use the set auto-solib-add command to modify this setting.

_____Note _____

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

show auto-solib-add

Example

Example 2-143 show auto-solib-add

show auto-solib-add

display current automatic setting for loading
shared library symbols

See also

• set auto-solib-add on page 2-161.

2.3.150 show backtrace

This command displays current behavior settings for use with the info stack command. You can use the set backtrace commands to modify these settings.

Syntax

show backtrace option

Where:

option Specifies additional options:

limit Displays the current limit when listing the call stack.

Example

Example 2-144 show backtrace

show backtrace limit

Display current call stack limit

- info stack, backtrace, where on page 2-107
- *set backtrace* on page 2-162.

2.3.151 show blocking-run-control

This command displays the current run control setting that defines whether run control operations such as stepping and running are blocked until the target stops or released immediately. You can use the set blocking-run-control command to modify this setting.

Syntax

show blocking-run-control

Example

Example 2-145 show blocking-run-control

show blocking-run-control

Display current run control setting

See also

• set blocking-run-control on page 2-163.

2.3.152 show breakpoint

This command displays current breakpoint and watchpoint behavior settings. You can use the set breakpoint commands to modify these settings.

Syntax

show breakpoint option

Where:

option Specifies additional options:

auto-hw Displays the automatic breakpoint selection setting. The debugger uses

this option to decide what type of breakpoint it must use automatically

when using the break command.

skipmode Displays the breakpoint and watchpoint skipmode setting.

Example

Example 2-146 show breakpoint

show breakpoint auto-hw # Display automatic breakpoint selection setting show breakpoint skipmode # Display breakpoint and watchpoint skipmode setting

See also

• set breakpoint on page 2-164.

2.3.153 show case-insensitive-source-matching

This command displays the current case sensitivity setting for the debugger file matching operations. You can use the set case-insensitive-source-matching command to modify this setting.

Syntax

show case-insensitive-source-matching

Example

Example 2-147 show case-insensitive-source-matching

show case-insensitive-source-matching

Display current case sensitivity setting

- set case-insensitive-source-matching on page 2-165
- *show escapes-in-filenames* on page 2-205
- *show wildcard-style* on page 2-219.

2.3.154 show debug-agent

This command displays the current value of an internal configuration parameter for the debug agent. You can use the set debug-agent command to modify this setting. The available parameters depend on the debug agent, such as DSTREAM or gdbserver.

Syntax

show debug-agent [name]

Where:

name Specifies the parameter to display.

Example

Example 2-148 show debug-agent

show debug-agent

Display all current debug agent configuration parameters

See also

• set debug-agent on page 2-166.

2.3.155 show debug-from

This command displays the current setting for the expression that is used by the start command to set a temporary breakpoint. You can use the set debug-from command to modify this setting.

Syntax

show debug-from

Example

Example 2-149 show debug-from

show debug-from

Display current expression used by start command

- Using expressions on page 2-4
- *start* on page 2-222
- set debug-from on page 2-167.

2.3.156 show <u>dir</u>ectories

This command displays the list of directories to search for source files. You can use the directory command to modify this list.

Syntax

show <u>dir</u>ectories

Example

Example 2-150 show directories

show directories

Display list of search paths

See also

• *directory* on page 2-58.

2.3.157 show dtsl-options

This command displays the current value of a parameter in the connection DTSL configuration. You can use the set dtsl-options command to modify this setting.

Syntax

show dtsl-options [name]

Where:

name Specifies the parameter to display.

Example

Example 2-151 show dtsl-options

show dtsl-options

Display all DTSL configuration parameters

See also

• *set dtsl-options* on page 2-169.

2.3.158 show endian

This command displays the current byte order setting in use by the debugger. You can use the set endian command to modify this setting.

Syntax

show endian

Example

Example 2-152 show endian

show endian

Display current byte order setting

See also

• set endian on page 2-170.

2.3.159 show escape-strings

This command displays the current setting for controlling how special characters in strings are printed on the debugger command-line. You can use the set escape-strings command to modify this setting.

Syntax

show escape-strings

Example

Example 2-153 show escape-strings

show escape-strings	# Display current setting for controlling
	# how special characters in strings are printed

See also

• set escape-strings on page 2-171.

2.3.160 show escapes-in-filenames

This command displays the current setting for controlling the use of special characters in paths. You can use the set escapes-in-filenames command to modify this setting.

Syntax

show escapes-in-filenames

Example

Example 2-154 show escapes-in-filenames

show escapes-in-filenames # Display current setting for controlling # the use of special characters in paths

See also

• set escapes-in-filenames on page 2-172.

2.3.161 show listsize

This command displays the number of source lines that the list command displays. You can use the set listsize command to modify the display size.

Syntax

show listsize

Example

Example 2-155 show listsize

show listsize

Display listing size for list command

- *list* on page 2-115
- *set listsize* on page 2-173.

2.3.162 show os

This command displays the current setting for controlling the *Operating System* (OS) settings. You can use the set os command to modify these settings.

_____Note _____

An OS aware connection must be established before you can use this command.

Syntax

show os option

Where:

option Specifies additional options:

log-capture Displays the current setting for controlling the capturing

and printing of OS logging messages.

enabled Displays the current setting for controlling OS support.

Example

Example 2-156 show os

- info os-log on page 2-98
- info os-modules on page 2-99
- info os-version on page 2-100
- info processes on page 2-101
- *set os* on page 2-174.

2.3.163 show print

This command displays the current debugger print settings. You can use the set print commands to modify these settings.

Syntax

show print option

Where:

option S

Specifies additional options:

library-not-found-warnings

Displays the print settings for "unable to find library..." messages.

full-source-path

Displays the print settings for source paths in messages.

stop-info Displays the print settings for event messages when the target stops.

current-vmid

Displays the print settings for VMID messages when the target stops.

double-format

Displays the print settings that controls the printf() style formatting of double values.

float-format

Displays the print settings that controls the printf() style formatting of floating-point values.

Example

Example 2-157 show print

```
show print library-not-found-warnings  # Display print settings for unfound
# library messages
show print full-source-path  # Display print settings for
# source paths in messages
```

- set print on page 2-176
- *printf() style format string* on page 2-9.

2.3.164 show semihosting

This command displays the current semihosting settings in the debugger. You can use the set semihosting commands to modify these settings.

Syntax

show semihosting option

Where:

option Specifies additional options:

args Displays the command-line arguments that are passed to the

main() function in the application.

enabled

Displays the semihosting enabled setting.

file-base

Displays the setting for the file-base directory.

stdin

Displays the stdin settings.

stdout

Displays the stdout settings.

stderr

Displays the stderr settings.

top-of-memory

Displays the address for the top of memory.

stack-base

Displays the address for the stack base.

stack-limit

Displays the address for the stack limit.

heap-base

Displays the address for the heap base.

heap-limit

Displays the address for the heap limit.

vector

When using a semihosting breakpoint, the address is displayed otherwise a message is displayed indicating that a

vector is in use.

Example

Example 2-158 show semihosting

show semihosting args # Display command-line arguments
show semihosting enabled # Display semihosting enabled setting
show semihosting top-of-memory # Display the top of memory address

See also

• set semihosting on page 2-178.

2.3.165 show solib-absolute-prefix

show solib-absolute-prefix is an alias for show sysroot.

See show sysroot, show solib-absolute-prefix on page 2-216.

2.3.166 show solib-search-path

This command displays the current search paths in use by the debugger when searching for shared libraries. You can use the set sysroot command to specify a system root directory on the host workstation and you can also use the set solib-search-path command to specify additional directories.

____Note ____

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

show solib-search-path

Example

Example 2-159 show solib-search-path

show solib-search-path

Display search path for shared libraries

- set solib-search-path on page 2-181
- set sysroot, set solib-absolute-prefix on page 2-185
- show sysroot, show solib-absolute-prefix on page 2-216.

2.3.167 show step-mode

This command displays the current step setting for functions without debug information. You can use the set step-mode command to modify this setting.

Syntax

show step-mode

Example

Example 2-160 show step-mode

show step-mode

Display current step setting (function without debug)

- set step-mode on page 2-182
- *step* on page 2-224
- *steps* on page 2-226.

2.3.168 show stop-on-solib-events

This command displays the current debugger setting that controls whether execution stops when shared library events occur. You can use the set stop-on-solib-events command to modify this setting.

_____Note _____

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

show stop-on-solib-events

Example

Example 2-161 show stop-on-solib-events

show stop-on-solib-events # Display :

Display stop setting for shared library events

See also

• set stop-on-solib-events on page 2-183.

2.3.169 show substitute-path

This command displays the current search path substitution rules in use by the debugger when searching for source files. You can use the set substitute-path command to modify these substitution rules.

Syntax

show substitute-path

Example

Example 2-162 show substitute-path

show substitute-path

Display all substitution rules

- *directory* on page 2-58
- *set substitute-path* on page 2-184.

2.3.170 show sysroot, show solib-absolute-prefix

This command displays the system root directory in use by the debugger when searching for shared library symbols. You can use the set sysroot command to specify a system root directory on the host workstation.

The debugger uses this directory to search for a copy of the debug versions of target shared libraries. The system root on the host workstation must contain an exact representation of the libraries on the target root filesystem.

You must launch the debugger with --target_os command-line option before you can use this feature. In Eclipse this option is automatically selected when you connect to a target using gdbserver.

Syntax

show sysroot

show solib-absolute-prefix

Example

Example 2-163 show sysroot, show solib-absolute-prefix

show sysroot

Display system root directory

- set solib-search-path on page 2-181
- set sysroot, set solib-absolute-prefix on page 2-185
- *show solib-search-path* on page 2-212.

2.3.171 show trust-ro-sections-for-opcodes

This command displays the current debugger setting that controls whether the debugger can read opcodes from read-only sections of images on the host workstation rather than from the target itself.

Syntax

show trust-ro-sections-for-opcodes

Example

Example 2-164 show trust-ro-sections-for-opcodes

show trust-ro-sections-for-opcodes

Display trust-ro-sections-for-opcodes setting

See also

• set trust-ro-sections-for-opcodes on page 2-186.

2.3.172 show version

This command displays the current version number of the debugger.

Syntax

show version

Example

Example 2-165 show version

show version

Display debugger version number

2.3.173 show wildcard-style

This command displays the current wildcard style in use for pattern matching. You can use the set wildcard-style command to modify this setting.

Syntax

show wildcard-style

Example

Example 2-166 show wildcard-style

show wildcard-style

Display current wildcard style

- Using wildcards on page 2-5
- set wildcard-style on page 2-188
- info classes on page 2-87
- *info functions* on page 2-92
- *info variables* on page 2-111
- *sharedlibrary* on page 2-189.

2.3.174 silence

This command disables the printing of stop messages for a specific breakpoint.

Syntax

silence [number]

Where:

number

Specifies the breakpoint number. This is the number assigned by the debugger when it is set. You can use info breakpoints to display the number and status of all breakpoints and watchpoints.

If no *number* is specified then all stop messages are disabled.

Example

Example 2-167 silence

silence 2	# Disable printing of stop messages for breakpoint 2
silence \$	# This applies to the breakpoint whose number is in
	# the most recently created debugger variable

- set print on page 2-176
- *unsilence* on page 2-246.

2.3.175 source

This command loads and runs a script file to control and debug your target.

The following types of scripts are available:

DS-5 DS-5 Debugger commands.

CMM is a scripting language supported by some third-party debuggers. DS-5

supports a small subset of CMM-style commands, sufficient for running small

target initialization scripts.

Jython Jython is a Java implementation of the Python scripting language. It provides

extensive support for data types, conditional execution, loops and organization of code into functions, classes and modules, as well as access to the standard Jython

libraries. Jython is an ideal choice for larger or more complex scripts.

Syntax

source [/v] filename [args]

Where:

Specifies verbose output. Script commands are interleaved with the debugger

output.

filename Specifies the script file. The following file extensions must be used to identify the

script type:

.ds for DS-5 scripts
.cmm, .t32 for CMM scripts
.py for Jython scripts.

args Zero or more arguments to pass to the script (only supported for Jython scripts).

Example

Example 2-168 source

source myScripts\myFile.ds
source myScripts\myFile.cmm
source myScripts\myFile.cmm
source myScripts\myFile.t32
source /v myFile.ds
Run CMM-style commands from myFile.cmm
Run CMM-style commands from myFile.t232
Run DS-5 Debugger commands from myFile.ds and
display commands interleaved with debugger output
source myScripts\myFile.py
Run a Jython script from file myFile.py

2.3.176 start

This command sets a temporary breakpoint, calls the debugger run command and then deletes the temporary breakpoint. By default, the temporary breakpoint is set at the address of the global function main(). You can use the set debug-from command to change the breakpoint location. If the breakpoint location cannot be found then the breakpoint is set at the image entry point.

This command records the ID of the breakpoint in a new debugger variable, n, where n is a number. If n is the last or second-to-last debugger variable, then you can also access the ID using n or n, respectively.

_____Note _____

Control is returned as soon as the target is running. You can use the wait command to block the debugger from returning control until either the application completes or a breakpoint is hit.

Syntax

start [args]

Where:

args

Specifies the command-line arguments that are passed to the main() function in the application using the argv parameter. The name of the image is always implicitly passed in argv[0] and it is not necessary to pass this as an argument.

Example

Example 2-169 start

start

- # Start running the target to the
- # temporary breakpoint

- *continue* on page 2-53
- *file, symbol-file* on page 2-72
- *load* on page 2-117
- *loadfile* on page 2-118
- *run* on page 2-154
- set arm on page 2-159
- set debug-from on page 2-167
- set semihosting on page 2-178
- show debug-from on page 2-200
- show semihosting on page 2-209
- *wait* on page 2-249.

2.3.177 stdin

This command is only for use with semihosted applications when using the debugger interactively in the command-line console.
Note
This command is not required if you launch the debugger within Eclipse or if you use a telnet

session to interact directly with the application.

Syntax

stdin [input]

Where:

input

Specifies semihosting input requested by application code. This must be terminated by \n to tell the debugger that the input is complete.

You can use this command before the input is required by the application code. All input is buffered by the debugger until requested and then discarded when the semihosting operation finishes.

Example

Example 2-170 stdin

stdin 10000∖n

Pass the number 10000 to the application

2.3.178 step

This command steps through an application at the source level stopping on the first instruction of each source line including stepping into all function calls. You must compile your code with debug information to use this command successfully.

You can modify the behavior of this command with the set step-mode command.

- reverse-step on page 2-151
- *finish* on page 2-73
- *next* on page 2-134
- *nexti* on page 2-135
- *nexts* on page 2-136
- set step-mode on page 2-182
- *show step-mode* on page 2-213
- stepi on page 2-225
- *steps* on page 2-226.

2.3.179 <u>s</u>tep<u>i</u>

This command steps through an application at the instruction level including stepping into all function calls.

Syntax

step <u>i</u> [coun	t]
Where:	
count	Specifies the number of instructions to execute.
	Note
	Execution stops immediately if a breakpoint is reached, even if fewer than <i>count</i> instructions are executed.
Example	
	Example 2-172 step

Execute one instruction

Execute five instructions

See also

stepi

stepi 5

- reverse-stepi on page 2-152
- next on page 2-134
- *nexti* on page 2-135
- nexts on page 2-136
- *step* on page 2-224
- *steps* on page 2-226.

2.3.180 steps

This command steps through an application at the source level stopping on the first instruction of each source statement (for example, statements in a for() loop) including stepping into all function calls. You must compile your code with debug information to use this command successfully.

You can modify the behavior of this command with the set step-mode command.

Syntax steps [count] Where: count Specifies the number of source statements to execute. Note _____ Execution stops immediately if a breakpoint is reached, even if fewer than count source statements are executed. Example Example 2-173 steps

Execute one source statement

Execute five source statements

See also

steps

steps 5

- *finish* on page 2-73
- *next* on page 2-134
- nexti on page 2-135
- *nexts* on page 2-136
- set step-mode on page 2-182
- *show step-mode* on page 2-213
- *step* on page 2-224
- *stepi* on page 2-225.

2.3.181 stop

stop is an alias for interrupt.

See interrupt, stop on page 2-114.

2.3.182 symbol-file

symbol-file is an alias for file.

See file, symbol-file on page 2-72.

2.3.183 tbreak

This command sets an execution breakpoint at a specific location and subsequently deletes it when the breakpoint is hit. You can also specify a conditional breakpoint by using an if statement that stops only when the conditional expression evaluates to true.

This command records the ID of the breakpoint in a new debugger variable, n, where n is a number. You can use this variable, in a script, to delete or modify the breakpoint behavior. If n is the last or second-to-last debugger variable, then you can also access the ID using n0 respectively.

Breakpoints that are set within a shared object or kernel module become pending when the shared object or kernel module is unloaded.

Use set breakpoint to control the automatic breakpoint behavior when using this command.

Syntax

```
tbreak [-d] [-p] [[filename:]location| *address] [thread|core number...] [if expression]
```

Where:

d Disables the breakpoint immediately after creation.

p Specifies whether or not the resolution of an unrecognized breakpoint

location results in a pending breakpoint being created.

filename Specifies the file.

location Specifies the location:

line_numis a line numberfunctionis a function name.labelis a label name.

+offset | -offset | Specifies the line offset from the current location.

address Specifies the address. This can be either an address or an expression that

evaluates to an address.

number Specifies one or more threads or processors to apply the breakpoint to. You

can use \$thread to refer to the current thread. If number is not specified then

all threads are affected.

expression Specifies an expression that is evaluated when the breakpoint is hit.

If no arguments are specified then a breakpoint is set at the current PC.

Example

Example 2-174 tbreak

tbreak main # Set breakpoint at address of main()
tbreak SVC_Handler # Set breakpoint at address of label SVC_Handler
tbreak +1 # Set breakpoint at address of next source line
tbreak my_File.c:main # Set breakpoint at address of main() in my_File.c
tbreak my_File.c:8 # Set breakpoint at address of line 8 in my_File.c
tbreak function1 if x>0 # Set conditional breakpoint that stops when x>0

- Using expressions on page 2-4
- *advance* on page 2-35
- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- *condition* on page 2-52
- *delete breakpoints* on page 2-56
- disable breakpoints on page 2-59
- enable breakpoints on page 2-68
- *hbreak* on page 2-77
- *ignore* on page 2-81
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- resolve on page 2-146
- *set arm* on page 2-159
- *thbreak* on page 2-231.

2.3.184 thbreak

This command sets a hardware execution breakpoint at a specific location and subsequently deletes it when the breakpoint is hit. You can also specify a conditional breakpoint by using an if statement that stops only when the conditional expression evaluates to true.

This command records the ID of the breakpoint in a new debugger variable, \$n, where n is a number. You can use this variable, in a script, to delete or modify the breakpoint behavior. If \$n is the last or second-to-last debugger variable, then you can also access the ID using \$ or \$\$, respectively.

_____Note _____

The number of hardware breakpoints are usually limited. If you run out of hardware breakpoints then delete or disable one that you are no longer using.

Breakpoints that are set within a shared object or kernel module become pending when the shared object or kernel module is unloaded.

Syntax

thbreak [-d] [-p] [[filename:]location|*address] [thread|core number...] [vmid vmid] [if expression]

Where:

d Disables the breakpoint immediately after creation.

p Specifies whether or not the resolution of an unrecognized breakpoint

location results in a pending breakpoint being created.

filename Specifies the file.

location Specifies the location:

line_numis a line number.functionis a function name.labelis a label name.

+offset | -offset | Specifies the line offset from the current location.

number Specifies one or more threads or processors to apply the breakpoint to. You

can use \$thread to refer to the current thread. If number is not specified then

all threads are affected.

address Specifies the address. This can be either an address or an expression that

evaluates to an address.

vmid Specifies the *Virtual Machine ID* (VMID) to apply the breakpoint to. This

can be either an integer or an expression that evaluates to an integer.

expression Specifies an expression that is evaluated when the breakpoint is hit.

If no arguments are specified then a hardware breakpoint is set at the next instruction.

Example

Example 2-175 thbreak

```
thbreak *0x8000
                               # Set breakpoint at address 0x8000
thbreak *0x8000 thread $thread # Set breakpoint at address 0x8000 on
                               # current thread
thbreak *0x8000 thread 1 3
                               # Set breakpoint at address 0x8000 on
                               # threads 1 and 3
thbreak main
                               # Set breakpoint at address of main()
thbreak SVC_Handler
                               # Set breakpoint at address of label SVC_Handler
thbreak +1
                               # Set breakpoint at address of next source line
thbreak my_File.c:main
                               # Set breakpoint at address of main(), my_File.c
thbreak my_File.c:8
                               # Set breakpoint at address of line 8, my_File.c
thbreak function1 if x>0
                               # Set conditional breakpoint that stops when x>0
```

- *Using expressions* on page 2-4
- break on page 2-40
- *break-script* on page 2-42
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clear* on page 2-50
- condition on page 2-52
- *delete breakpoints* on page 2-56
- *disable breakpoints* on page 2-59
- enable breakpoints on page 2-68
- *hbreak* on page 2-77
- *ignore* on page 2-81
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- resolve on page 2-146
- *tbreak* on page 2-229.

2.3.185 thread, core

This command displays the following information:

- Unique *id* number assigned by the debugger.
- Thread or processor state. For example, stopped or running.
- Current stack frame including function names and source line numbers.

Syntax

thread [id]

core [id]

Where:

id

Specifies the unique thread or processor number. If *id* is not specified then the current thread or processor is displayed. You can use info cores, info processes, or info threads to display the *id* numbers.

If *id* is specified then the debugger switches control to that thread or processor before displaying the information. Registers and call stacks are associated with a particular thread or processor. This means that switching context also switches the registers and call stack to those belonging to the current thread or processor.

Example

Example 2-176 thread, core

thread 699 # Set current thread to number 699 core 2 # Set current processor to number 2

- break on page 2-40
- break-stop-on-threads, break-stop-on-cores on page 2-45
- *info cores* on page 2-88
- *info processes* on page 2-101
- *info threads* on page 2-110
- *thread apply, core apply* on page 2-234.

2.3.186 thread apply, core apply

This command temporarily switches control to a specific thread or processor to execute a DS-5 Debugger command and then switches back to the original state.

If an error occurs then the debugger stops processing the command and switches back to the original state.

Syntax

thread apply {all|id} command core apply {all|id} command

Where:

all Specifies all threads or all processors.

id Specifies the unique thread or processor number. You can use info cores, info

processes, or info threads to display the *id* numbers.

command Specifies the DS-5 Debugger command that you want to execute.

If all is specified then the command is executed on each thread or processor successively before switching back.

Example

Example 2-177 thread apply, core apply

thread apply all print /x pc # Cycle through all threads and print address # in PC register (hexadecimal)

- break on page 2-40
- break-stop-on-threads, break-stop-on-cores on page 2-45
- *info cores* on page 2-88
- *info processes* on page 2-101
- *info threads* on page 2-110
- *thread, core* on page 2-233.

2.3.187 trace clear

This command clears the trace on the specified trace capture device. If no device is specified, clears the trace on all connected trace capture devices.

_____Note _____

Trace capture devices do not support clearing while capture is active.

Syntax

trace clear [trace_capture_device]

Where:

trace_capture_device

Specifies the trace capture device.

If no trace_capture_device is specified, then all trace capture devices are cleared.

Example

Example 2-178 trace clear

trace clear trace clear ETB # stops all connected trace capture devices

stops trace capture device named ETB

- *trace start* on page 2-243
- *trace stop* on page 2-244.

2.3.188 trace dump

This command dumps trace data to a directory along with metadata that describes the target trace configuration.

Syntax

trace dump output_path [-option] [trace_capture_device|trace_source]...

Where:

output_path

Specifies the destination of the trace dump. It creates a directory named *output_path*. It creates the metadata and trace data within this directory. It generates an error if this directory already exists.

option

raw

Dumps raw data. Raw data is the captured trace data with trace device specific formatting. The raw option only applies to trace capture devices.

no_metadata

Suppresses the metadata.

no_tracedata

Suppresses the trace data.

trace_capture_device

Specifies the trace capture device.

trace_source

Specifies a trace source.

____Note _____

- If no *trace_capture_device* or *trace_source* is specified then all trace capture device buffers are dumped.
- If a trace capture device is specified and a trace source from that device is also specified then the trace data for that source will be dumped twice. Once within the complete buffer for the device and again as a dump of just the specified trace source.

Example

Example 2-179 trace dump

```
trace dump TraceDump
```

- # Creates a directory named TraceDump.
- # Dumps the buffers of all active trace capture devices into TraceDump
- # along with the metadata describing them.

trace dump TraceDump ETB

- # ETB is the name of a trace capture device.
- # Dumps the contents of the ETB buffer to TraceDump.

trace dump TraceDump DSTREAM -raw

- # DSTREAM is the name of a trace capture device.
- # Dumps the contents of the DSTREAM buffer to TraceDump in raw format.

trace dump TraceDump PTM_1

- # PTM_1 is the name of a trace source.
- # Extracts the trace data for PTM_1 from the trace device buffer
- # and dumps it to TraceDump.

trace dump TraceDump ETB -no_metadata

Dumps the contents of the ETB buffer to TraceDump, but does not write the metadata

trace dump TraceDump ETB -no_tracedata

Writes the metadata for ETB in TraceDump, but does not write the trace data.

trace dump TraceDump ETB -no_tracedata -no_metadata
Creates an empty directory named TraceDump.

- *trace info* on page 2-238
- *trace list* on page 2-239
- *trace report* on page 2-240.

2.3.189 trace info

This command displays detailed information about trace capture devices and trace sources.

Syntax

trace info [-option] [trace_capture_device | trace_source]

Where:

trace_capture_device

Specifies the trace capture device.

trace_source

Specifies the trace capture source.

If no trace_capture_device or trace_source is specified, then all trace capture devices and sources are displayed.

option

Specifies how information is displayed:

showdisabled displays disabled devices and sources.

Example

Example 2-180 trace info

trace info

Display all the enabled trace capture devices and trace sources.

trace info -showdisabled

Display all trace capture devices and trace sources including disabled ones.

trace info ETB

Display the trace capture device or trace source named ETB.

- *trace list* on page 2-239
- *trace dump* on page 2-236
- *trace report* on page 2-240.

2.3.190 trace list

This command lists all of the trace capture devices and trace sources.

Syntax

trace list

Example

Example 2-181 trace list

trace list

List all of the trace capture devices and trace sources

- trace info on page 2-238
- *trace dump* on page 2-236
- *trace report* on page 2-240.

2.3.191 trace report

This command creates a trace report for the currently selected core.

Syntax

trace report [option = value]...

Where:

option Specifies the name of a trace report option to set.

value Specifies the new value of the option.

The option names are not case sensitive. The options are:

OUTPUT_PATH

Specifies the directory to save the trace report files in. The default value is the current working directory.

FILE

Specifies the base file name of the trace report. If trace report generates multiple files, then each file will have a zero-padded number inserted before the file name extension. The default value is Trace_Report.txt.

SPLIT_FILE_SIZE

Specifies the maximum file size, in bytes, that trace report generates. If the file size is larger than SPLIT_FILE_SIZE, trace report generates a new report file. Specifying -1 indicates that there is no maximum file size, so the trace report is not split into separate files. The default value is 1073741824.

START

Specifies the position in the trace buffer to start decoding trace from. The default value is 0, which starts the decoding from the beginning of the buffer.

END

Specifies the position in the trace buffer to stop decoding trace. Specifying -1 indicates that the trace report should decode to the end of the buffer. The default value is -1.

FORMAT

Specifies the format of the report. Valid values are *Comma Separated Values* (CSV) and *Tab Separated Values* (TSV). The default value is TSV. Format values are not case sensitive.

SOURCE

Specifies the trace source to report. Execute the trace list command to view the list of available trace sources. The default is to dump the trace source associated with the current core.

CORE

Specifies the core to report. Execute the info cores command to view the list of cores available. This option is analogous to the SOURCE option, except that the source for the given core will be discovered automatically. You can specify either a SOURCE or CORE but not both.

CONFIG

Specifies a configuration file. This is used to specify decoding details for STM and ITM trace sources. The default configuration is to decode all Ports, Masters, and Channels as binary data. This file is created by exporting it from the Event Viewer Settings dialog.

COLUMNS

Specifies a comma separated list of columns to include in the report. The column names are not case sensitive.

Valid values for instruction trace sources are:

RECORD TYPE

The type of the record.

INDEX

The index of the instruction. Canceled instructions do not have an index.

ADDRESS

The address of the instruction.

OPCODE

The opcode of the instruction, in hexadecimal, with no prefix.

OPCODE WITH PREFIX

The opcode of the instruction, in hexadecimal, with a 0x prefix.

CYCLES

The cycle count of the instruction.

DETAIL

For instruction records, this gives the disassembly of the instruction. For other record types, this gives various information.

FUNCTION

The function of the instruction.

BRANCH

This is true if the instruction is a branch. Otherwise, this is false.

For instruction trace sources, the default is ADDRESS, OPCODE, DETAIL.

Valid values for STM trace sources are:

MASTER

The master number can be 0 to 128.

CHANNEL

The channel number can be 0 to 65535.

TIMESTAMP

An approximate timestamp for each record, if available.

SIZE

Size of the row in bytes.

DATA

The row data.

For STM trace sources, the default is MASTER, CHANNEL, DATA.

Valid values for ITM trace sources are:

PORT

The port number can be 0 to 255.

TIMESTAMP

An approximate timestamp for each record, if available.

SIZE

Size of the row in bytes.

DATA

The row data.

For ITM trace sources, the default is PORT, DATA.

HEADERS

Specifies whether to include the column headers in the report. The default value is false. To include headers, specify true.

Example

Example 2-182 trace report

trace report

- # Produces a default trace report named "Trace_Report.txt" in the current working
 # directory.
- # Instruction trace for the current core is reported.

trace report FILE=MyReport.csv OUTPUT_PATH=C:/files/trace_reports FORMAT=CSV

Produces a comma separated value trace report named "MyReport.csv"

in C:/files/trace_reports.

trace report COLUMNS=RECORD_TYPE,INDEX,ADDRESS,OPCODE_WITH_PREFIX,DETAIL HEADERS=true

Produces a trace report with alternate columns.

The first line of the report will contain the column names.

trace report SOURCE=ITM COLUMNS=PORT, SIZE, DATA HEADERS=true

Produces an ITM trace report with alternate columns.

The first line of the report will contain the column names.

- *trace list* on page 2-239
- trace info on page 2-238
- *trace dump* on page 2-236.

2.3.192 trace start

This command starts the trace capture on the specified trace capture device. If no device is specified, starts trace capture on all connected trace capture devices.

Syntax

trace start [trace_capture_device]

Where:

trace_capture_device

Specifies the trace capture device.

If no trace_capture_device is specified, then all trace capture devices are started.

Example

Example 2-183 trace start

trace start trace start ETB # starts all connected trace capture devices
starts trace capture device named ETB

- trace stop on page 2-244
- *trace clear* on page 2-235.

2.3.193 trace stop

This command stops the trace capture on the specified trace capture device. If no device is specified, stops trace capture on all connected trace capture devices.

Syntax

trace stop [trace_capture_device]

Where:

trace_capture_device

Specifies the trace capture device.

If no trace_capture_device is specified, then all trace capture devices are stopped.

Example

Example 2-184 trace stop

trace stop # stops all connected trace capture devices trace stop ETB # stops trace capture device named ETB

- trace start on page 2-243
- *trace clear* on page 2-235.

2.3.194 unset

This command modifies the current debugger settings.

Syntax

unset option

Where:

option Specifies additional options:

substitute-path [path]

Deletes all the substituted source paths. If path is specified

then only the substitution for *path* is deleted.

semihosting heap-base

Deletes the base address of the heap.

semihosting heap-limit

Deletes the end address of the heap.

semihosting stack-base

Deletes the base address of the stack.

semihosting stack-limit

Deletes the end address of the stack.

semihosting top-of-memory

Deletes the top of memory.

Example

Example 2-185 unset

unset substitute-path

Delete all substitution paths

- set semihosting on page 2-178
- set substitute-path on page 2-184.

2.3.195 unsilence

This command enables the printing of stop messages for a specific breakpoint.

Syntax

unsilence [number]

Where:

number

Specifies the breakpoint number. This is the number assigned by the debugger when it is set. You can use info breakpoints to display the number and status of all breakpoints and watchpoints.

If no *number* is specified then all stop messages are enabled.

Example

Example 2-186 unsilence

unsilence 2 unsilence \$	<pre># Enable printing of stop messages for breakpoint 2 # This applies to the breakpoint whose number is in # the most recently created debugger variable</pre>
	•

- set print on page 2-176
- *silence* on page 2-220.

2.3.196 up

This command moves the current frame pointer up the call stack towards the top frame. It also displays the function name and source line number for the specified frame.

—— Note ———

Each frame is assigned a number that increases from the bottom frame (zero) through the call stack to the top frame that is the start of the application.

Syntax

up [offset]

Where:

offset

Specifies a frame offset from the current frame pointer in the call stack. If no *offset* is specified then the default is one.

Example

Example 2-187 up

up # Move and display information 1 frame up from current frame pointer up 2 # Move and display information 2 frames up from current frame pointer

- down on page 2-64
- *down-silently* on page 2-65
- *info frame* on page 2-91
- info all-registers on page 2-83
- *info registers* on page 2-102
- info stack, backtrace, where on page 2-107
- *finish* on page 2-73
- *frame* on page 2-75
- *select-frame* on page 2-157
- *up-silently* on page 2-248.

2.3.197 up-silently

This command moves the current frame pointer up the call stack towards the top frame.

_____Note _____

Each frame is assigned a number that increases from the bottom frame (zero) through the call stack to the top frame that is the start of the application.

Syntax

up-silently [offset]

Where:

offset

Specifies a frame offset from the current frame pointer in the call stack. If no *offset* is specified then the default is one.

Example

Example 2-188 up-silently

```
up-silently \# Move 1 frame up from current frame pointer up-silently 2 \# Move 2 frames up from current frame pointer
```

- down on page 2-64
- *down-silently* on page 2-65
- *info frame* on page 2-91
- *info all-registers* on page 2-83
- *info registers* on page 2-102
- info stack, backtrace, where on page 2-107
- *finish* on page 2-73
- *frame* on page 2-75
- *select-frame* on page 2-157
- *up* on page 2-247.

2.3.198 wait

This command instructs the debugger to wait until the target stops. For example, when the application completes or a breakpoint is hit. ARM recommends that you specify a time-out parameter to generate an error if the time-out value is reached.

Syntax

wait time-out[ms | s]

Where:

time-out Specifies the period of time.

ms Specifies the time in milliseconds. This is the default.

s Specifies the time in seconds.

Example

Example 2-189 wait

wait 1000 # Wait or time-out after 1 second
wait 0.5s # Wait or time-out after half a second

- *continue* on page 2-53
- *run* on page 2-154
- *start* on page 2-222.

2.3.199 watch

This command sets a watchpoint for a data symbol. The debugger stops the target when the memory at the specified address is written.

This command records the ID of the watchpoint in a new debugger variable, \$n, where n is a number. You can use this variable, in a script, to delete or modify the watchpoint behavior. If \$n is the last or second-to-last debugger variable, then you can also access the ID using \$ or \$\$, respectively.

_____Note _____

Watchpoints are only supported on scalar values.

Some targets do not support watchpoints. Currently you can only set a watchpoint on:

- a hardware target using a debug hardware agent
- Linux applications using gdbserver or undodb-server.

The availability of watchpoints depends on the hardware target. In the case of Linux application debug, the availability of watchpoints also depends on the Linux kernel version and configuration.

The address of the instruction that triggers the watchpoint might not be the address shown in the PC register. This is because of pipelining effects.

Syntax

watch [-d] [-p] {[filename:]symbol|*address} [vmid vmid]

Where:

d Disables the watchpoint immediately after creation.

p Specifies whether or not the resolution of an unrecognized watchpoint

location results in a pending watchpoint being created.

filename Specifies the file.

symbol Specifies a global/static data symbol. For arrays or structs you must

specify the element or member.

address Specifies the address. This can be either an address or an expression that

evaluates to an address.

vmid Specifies the Virtual Machine ID (VMID) to apply the breakpoint to. This

can be either an integer or an expression that evaluates to an integer.

Example

Example 2-190 watch

watch myVar1 # Set write watchpoint on myVar1
watch *0x80D4 # Set write watchpoint on address 0x80D4

See also

• *Using expressions* on page 2-4

- awatch on page 2-37
- break-stop-on-threads, break-stop-on-cores on page 2-45
- break-stop-on-vmid on page 2-46
- *clearwatch* on page 2-51
- info breakpoints, info watchpoints on page 2-84
- info breakpoints capabilities, info watchpoints capabilities on page 2-85
- *rwatch* on page 2-155.

2.3.200 whatis

This command displays the data type of an expression.

Syntax

whatis [expression]

Where:

expression Specifies an expression. If no expression is specified then the last expression is repeated.

—— Note ———

This command does not execute the expression.

Example

Example 2-191 whatis

See also

• Using expressions on page 2-4.

2.3.201 where

where is an alias for info stack.

See info stack, backtrace, where on page 2-107.

2.3.202 while

This command enables you to write scripts with conditional loops that execute debugger commands.

Syntax

```
while condition
...
optional_commands
...
end
```

Where: condition

Specifies a conditional expression. Follow the while statement with one or more debugger commands that execute repeatedly while *condition* evaluates to true.

optional_commands

Specifies optional commands that can also be used inside the while statement to change the loop behavior:

loop_break Exit the loop.

loop_continue Skip the remaining commands and return to the start of the

loop.

Enter each debugger command on a new line and terminate the while command by using the end command.

Example

Example 2-192 while

```
# Define a while loop containing commands to conditionally execute
# myVar is a variable in the application code
while myVar<10
    step
    wait
    x
    set myVar++
end</pre>
```

- *define* on page 2-55
- *document* on page 2-63
- *end* on page 2-70
- *if* on page 2-80
- *Using expressions* on page 2-4.

2.3.203 x

This command displays the content of memory at a specific address.

Syntax

x [/flag]... [address]

Where:

f1ag

Specifies additional flags:

count Specifies the number of values to display. If none specified then the default is 1.

Size of memory:

b 1 byte

h 2 bytes

w 4 bytes (default)

g 8 bytes.

Output format:

x hexadecimal (casts the value to an unsigned integer prior to printing in hexadecimal)

d signed decimal

u unsigned decimal

o octal

t binary

a absolute hexadecimal address

c character

f floating-point

i assembler instruction.

Note	
11016	

If no output format is specified then the initial default is x, unless preceded by another command using output format options in which case the same format is retained.

address

Specifies the address. This can be either an address, a symbol name, or an expression that evaluates to an address. If no *address* is specified then the default value is used. Some commands that access memory can set this default value. For example, x, print, output and info breakpoints.

Note	

This command sets a default address variable to the location after the last accessed address.

Example

Example 2-193 x

```
x 0x8000  # Display memory at address 0x8000
x/3wx 0x8000  # Display 3 words of memory from address 0x8000 (hexadecimal)
x/4b $SP  # Display 4 bytes of memory from address in SP register
x/4i $PC  # Display 4 instructions from address in PC register
x /h 0x8000  # Read a half-word from address 0x8000
```

Chapter 3

CMM-Style Commands Supported by the Debugger

The following topics describe the CMM-style commands:

- General syntax and usage of CMM-style commands on page 3-2
- *CMM-style commands listed in groups* on page 3-3
- *CMM-style commands listed in alphabetical order* on page 3-6.

3.1 General syntax and usage of CMM-style commands

CMM-style commands are a small subset of commands, sufficient for running target initialization scripts. CMM is a scripting language supported by some third-party debuggers.

_____Note _____

For full debug support ARM recommends that you use the DS-5 Debugger commands. See Chapter 2 *DS-5 Debugger Commands* for more information.

Syntax of CMM-style commands

Many commands accept arguments and flags using the following syntax: command [argument] [/flag]...

A flag acts as an optional switch and is introduced with a forward slash character. Where a command supports flags, the flags are described as part of the command syntax.

_____Note _____

Commands are not case sensitive. Abbreviations are underlined.

Usage of CMM-style commands

The commands you submit to the debugger must conform to the following rules:

- Each command line can contain only one debugger command.
- When referring to symbols, you must use the same case as the source code.

To execute CMM-style commands you must create a debugger script file containing the CMM-style commands and then use the DS-5 Debugger source command to run the script.

Many commands can be abbreviated. For example, break.set can be abbreviated to b.s. The syntax definition for each command shows how it can be abbreviated by underlining it for example, break.set.

In the syntax definition of each command:

- square brackets [...] enclose optional parameters
- braces {...} enclose required parameters
- a vertical pipe | indicates alternatives from which you must choose one
- parameters that can be repeated are followed by an ellipsis (...).

Do not type square brackets, braces, or the vertical pipe. Replace parameters in italics with the value you want. When you supply more than one parameter, use the separator as shown in the syntax definition for each command. If a parameter is a name that includes spaces, enclose it in double quotation marks.

Descriptive comments can be placed either at the end of a command or on a separate line. You can use either // or; to identify a descriptive comment.

3.1.1 Using expressions

Some commands accept expressions. In an expression you can access the content of registers and variables by using a function-like notation, for example:

print "The result of my expression is: " v.value(myVar)+4+r(R0)

where v.value() can be used to access the content of a variable and r() can be used to access the content of a register.

3.2 CMM-style commands listed in groups

The supported CMM-style commands grouped according to specific tasks are:

- Controlling breakpoints
- Controlling data and display settings
- Controlling images, symbols, and libraries on page 3-4
- Controlling target execution and connections on page 3-4
- Displaying the call stack and associated variables on page 3-4
- Controlling the debugger and program information on page 3-4
- *Supporting commands* on page 3-5.

3.2.1 Controlling breakpoints

```
List of commands:
```

break.delete on page 3-8

Deletes a specific breakpoint.

break.disable on page 3-9

Disables a specific breakpoint.

break.enable on page 3-10

Enables a specific breakpoint.

break.set on page 3-11

Sets a breakpoint at a specific address.

Type help followed by a command name for more information on a specific command.

3.2.2 Controlling data and display settings

List of commands:

data.dump on page 3-12

Displays data at a specific address or address range.

data.set on page 3-15

Writes data to memory.

print on page 3-18

Displays the output of an expression.

register.set on page 3-19

Sets the value of a register.

var.global on page 3-23

Displays all global variables.

var.local on page 3-24

Displays all local variables.

var.print on page 3-26

Displays the output of an expression.

Type help followed by a command name for more information on a specific command.

3.2.3 Controlling images, symbols, and libraries

List of commands:

data.load.binary on page 3-13

Loads a binary image file.

data.load.elf on page 3-14

Loads an ELF image file.

Type help followed by a command name for more information on a specific command.

3.2.4 Controlling target execution and connections

List of commands:

break on page 3-7

Stops running the target.

go on page 3-16

Starts running the target.

system.down on page 3-20

Disconnects the debugger from the target.

system.up on page 3-21

Connects to the specified target.

Type help followed by a command name for more information on a specific command.

3.2.5 Displaying the call stack and associated variables

List of commands:

var.frame on page 3-22

Displays the stack frame.

Type help followed by a command name for more information on a specific command.

3.2.6 Controlling the debugger and program information

List of commands:

var.new on page 3-25

Creates a new script variable and zero-initializes it.

var.set on page 3-27

Sets and displays the value of an existing script variable.

Type help followed by a command name for more information on a specific command.

3.2.7 Supporting commands

List of commands:

help on page 3-17

Displays help information for a specific command or a group of commands listed according to specific debugging tasks.

wait on page 3-28

Pauses the execution of a script for a specified period of time.

Type help followed by a command name for more information on a specific command.

3.3 CMM-style commands listed in alphabetical order

The CMM-style commands in alphabetical order are:

- *break* on page 3-7
- break.delete on page 3-8
- break.disable on page 3-9
- break.enable on page 3-10
- break.set on page 3-11
- *data.dump* on page 3-12
- *data.load.binary* on page 3-13
- data.load.elf on page 3-14
- *data.set* on page 3-15
- *go* on page 3-16
- *help* on page 3-17
- *print* on page 3-18
- register.set on page 3-19
- *system.down* on page 3-20
- *system.up* on page 3-21
- *var.frame* on page 3-22
- var.global on page 3-23
- var.local on page 3-24
- *var.new* on page 3-25
- *var.print* on page 3-26
- *var.set* on page 3-27
- *wait* on page 3-28.

3.3.1 <u>b</u>reak

This command stops running the target.

Syntax

<u>b</u>reak

Example

Example 3-1 break

break

; Stop running the target

- *go* on page 3-16
- *system.down* on page 3-20
- *system.up* on page 3-21.

3.3.2 <u>b</u>reak.<u>d</u>elete

This command deletes a breakpoint at the specified address.

Syntax

break.delete expression

Where:

expression

Specifies the breakpoint address. This can be either an address, a symbol name, or an expression that evaluates to an address. You can use the syntax *symbol\line* to refer to a specific source line offset from a symbol.

Example

Example 3-2 break.delete

```
break.delete 0x8000 ; Delete breakpoint at address 0x8000
break.delete main ; Delete breakpoint at address of main()
```

break.delete main+4 ; Delete breakpoint 4 bytes after address of main() break.delete main\2 ; Delete breakpoint 2 source lines after address of main()

- break.disable on page 3-9
- break.enable on page 3-10
- *break.set* on page 3-11.

3.3.3 <u>break.disable</u>

This command disables a breakpoint at the specified address.

Syntax

break.disable expression

Where:

expression

Specifies the breakpoint address. This can be either an address, a symbol name, or an expression that evaluates to an address. You can use the syntax *symbol\line* to refer to a specific source line offset from a symbol.

Example

Example 3-3 break.disable

```
break.disable 0x8000 ; Disable breakpoint at address 0x8000
break.disable main ; Disable breakpoint at address of main()
break.disable main+4 ; Disable breakpoint 4 bytes after address of main()
break.disable main\2 ; Disable breakpoint 2 source lines after address of main()
```

- break.delete on page 3-8
- break.enable on page 3-10
- *break.set* on page 3-11.

3.3.4 <u>b</u>reak.<u>en</u>able

This command enables a breakpoint at the specified address.

Syntax

break.enable expression

Where:

expression

Specifies the breakpoint address. This can be either an address, a symbol name, or an expression that evaluates to an address. You can use the syntax *symbol\line* to refer to a specific source line offset from a symbol.

Example

Example 3-4 break.enable

```
break.enable 0x8000 ; Enable breakpoint at address 0x8000
break.enable main ; Enable breakpoint at address of main()
break.enable main+4 ; Enable breakpoint 4 bytes after address of main()
break.enable main\2 ; Enable breakpoint 2 source lines after address of main()
```

- *break.delete* on page 3-8
- break.disable on page 3-9
- *break.set* on page 3-11.

3.3.5 <u>b</u>reak.<u>s</u>et

This command sets a software breakpoint at the specified address.

Syntax

break.set expression [/flag]

Where:

expression Specifies the breakpoint address. This can be either an address, a symbol name,

or an expression that evaluates to an address. You can use the syntax ${\tt symbol}\$

to refer to a specific source line offset from a symbol.

flag Specifies an additional flag:

<u>dis</u>able Disables the breakpoint immediately after setting it.

Example

Example 3-5 break.set

break.set main+4 ; Set breakpoint 4 bytes after address of main()

break.set main\2 ; Set breakpoint 2 source lines after address of main()

- *break.delete* on page 3-8
- *break.disable* on page 3-9
- *break.enable* on page 3-10.

3.3.6 <u>d</u>ata.dump

This command displays data at a specific address or address range. By default, the display size is 0x20 bytes of data unless an address range is specified.

Syntax

data.dump expression [/flag]...

Where:

expression

Specifies the address or address range. This can be either an address, an address range, or an expression that evaluates to an address. You can use -- to specify an address range and ++ to specify an offset from an address.

flag Specifies additional flags:

<u>b</u> yte	Formats the data as 1 byte
<u>w</u> ord	Formats the data as 2 bytes
<u>l</u> ong	Formats the data as 4 bytes
<u>q</u> uad	Formats the data as 8 bytes
width	Specifies the number of columns
<u>n</u> o <u>h</u> ex	Suppresses the hexadecimal output
<u>n</u> o <u>a</u> scii	Suppresses the ASCII output
1e	Formats the data as little endian
be	Formats the data big endian.

If no endianness is specified then the debugger looks for information at the start address of the loaded image otherwise little endian is used.

Example

Example 3-6 data.dump

3.3.7 <u>d</u>ata.load.<u>b</u>inary

This command loads a binary image file.

_____Note _____

Loading a binary image does not change the program counter or any symbols that are currently loaded.

Syntax

data.load.binary filename expression

Where:

filename Specifies the image file.

expression Specifies the load address. This can be either an address, a symbol name, or an expression that evaluates to an address. If none specified then the default is 0x0.

Example

Example 3-7 data.load.binary

```
data.load.binary "myFile.bin" ; Load image at address 0x0 data.load.binary "../my directory/myFile.bin" ; Load image at address 0x0 data.load.binary "myFile.bin" 0x8000 ; Load image at address 0x8000
```

See also

• *data.load.elf* on page 3-14.

3.3.8 <u>d</u>ata.load.<u>e</u>lf

This command loads an ARM *Executable and Linking Format* (ELF) file. This format is described in the ARM ELF specification and uses the .axf file extension.

_____Note _____

Loading an ELF image sets the program counter to the entry point of the image, if present.

Syntax

data.load.elf filename [/flag]...

Where:

filename Specifies the image file.

flag Specifies additional flags:

nocode Do not load code and data to the target.

nosymbol Do not load symbols.

<u>noc</u>lear Symbol table is not cleared before loading the image.

<u>noreg</u> Do not set register values, for example, PC and status registers.

Default

By default, this command loads code and data to the target, clears the existing symbol table before loading the new symbols into the symbol table, and sets the registers.

You must use additional flags if you want to modify the default options. For example, you must use /noclear if you want to load the symbols from multiple images.

Example

Example 3-8 data.load.elf

See also

• *data.load.binary* on page 3-13.

3.3.9 <u>d</u>ata.<u>s</u>et

This command writes data to memory.

Syntax

data.set address [%format] expression [/flag]...

Where:

address Specifies the address or address range. This can be either an address, an address

range, or an expression that evaluates to an address. You can use -- to specify an

address range.

format Specifies additional formatting:

byte Formats the data as 1 byte
word Formats the data as 2 bytes
long Formats the data as 4 bytes
quad Formats the data as 8 bytes

float.ieee Formats the data as a 4 byte floating-point.
float.ieeedbl Formats the data as an 8 byte floating-point.

Formats the data as little endian be Formats the data big endian.

If no endianness is specified then the debugger searches for this information in

the loaded image otherwise little endian is used.

expression Specifies the data.

flag Specifies additional flags:

<u>verify</u> Verifies the write operation.

<u>compare</u> Compares the data in memory but does not write to memory.

Example

Example 3-9 data.set

data.set r(PC) 0x10 ; Write 0x10 to address in PC register data.set 0x100--0x3ff 0x0 ; Zero initialize memory data.set 0x8000--0x100 %w 0x2000 /compare ; Compare data in memory with 0x2000 data.set 0x100--0x3ff 0x0 /verify ; Zero initialize memory and verify

3.3.10 go

This command starts running the device.

Syntax

go

Example

Example 3-10 go

go

; Start running the device

- break on page 3-7
- *system.down* on page 3-20
- *system.up* on page 3-21.

3.3.11 <u>h</u>elp

This command displays help information for a specific command or a group of commands listed according to specific debugging tasks.

Syntax

help [command|group]

Where:

command Specifies an individual command.

group Specifies a group name for specific debugging tasks:

all Displays all the commands. breakpoints Controlling breakpoints.

data Controlling data and display settings.

files Controlling images, symbols and libraries.

running Controlling target execution and stepping.

stack Displaying the call stack and associated variables.

Status Controlling the default settings and program status

information.

support Additional supporting commands.

Example

Example 3-11 help

help var.frame	# Display help information for var.frame command
help print	# Display help information for print command
help breakpoints	# Display group of breakpoint commands
help status	# Display group of status commands

3.3.12 print

This command concatenates the results of one or more expressions.

Syntax

print [%printing_format] expression...

Where:

printing_format Specifies either [ascii | binary | decimal | hex]. If none specified then the

default is decimal format.

expression Specifies an expression that is evaluated and the result is returned.

Example

Example 3-12 print

```
print %h r(R0) ; Display R0 register in hexadecimal print %d r(PC) ; Display PC register in decimal print 4+4 ; Display result of expression in decimal print "Result is " 4+4 ; Display string and result of expression print "Value is: " myVar ; Display string and variable value print v.value(myVar) ; Display variable value
```

3.3.13 <u>r</u>egister.<u>s</u>et

This command sets the value of a register.

Syntax

register.set name expression

Where:

name Specifies the name of a register.

expression Specifies an expression that is evaluated and the result assigned to a register.

Example

Example 3-13 register.set

register.set R0 15 ; Set value of R0 register to 15

register.set R0 (10*10) ; Set value of R0 register to result of expression

register.set R0 r(R0)+1 ; Increment the value of R0 register

register.set PC main ; Set value of PC register to address of main()

3.3.14 <u>sys</u>tem.<u>d</u>own

This command disconnects the debugger from the target.

Syntax

<u>sys</u>tem.<u>d</u>own

Example

Example 3-14 system.down

system.down

; Disconnect from target

- break on page 3-7
- go on page 3-16
- *system.up* on page 3-21.

3.3.15 <u>sys</u>tem.<u>u</u>p

This command connects to the specified target.

Syntax

<u>sys</u>tem.<u>u</u>p

Example

Example 3-15 system.up

system.up

; Connect to target

- break on page 3-7
- *go* on page 3-16
- *system.down* on page 3-20.

3.3.16 <u>v</u>ar.<u>f</u>rame

This command displays the stack frame.

Syntax

var.frame [%printing_format] [/flag]...

Where:

printing_format Specifies either [ascii | binary | decimal | hex]. If none specified then the

default is decimal format.

flag Specifies additional flags:

<u>nov</u>ar Disables the display of variables.

nocaller Disables the display of function callers. This is the default.

<u>args</u> Displays arguments. This is the default.

<u>l</u>ocals Displays local variables. <u>c</u>aller Displays function callers.

json Specifies an output option to display messages in JSON format.

Example

Example 3-16 var.frame

var.frame /novar ; Do not display any variables var.frame /json ; Display stack frame in JSON format

3.3.17 <u>v</u>ar.<u>g</u>lobal

This command displays all global variables.

Syntax

var.global [%printing_format] [/flag]

Where:

printing_format Specifies either [ascii | binary | decimal | hex]. If none specified then the

default is decimal format.

flag Specifies an additional flag:

json Specifies an output option to display messages in JSON format.

Example

Example 3-17 var.global

var.global ; Display all global variables

var.global %h ; Display all global variables in hexadecimal

- var.local on page 3-24
- *var.print* on page 3-26.

3.3.18 <u>v</u>ar.<u>l</u>ocal

This command displays all local variables in a function.

Syntax

var.local [%printing_format] [/flag]

Where:

printing_format Specifies either [ascii | binary | decimal | hex]. If none specified then the

default is decimal format.

flag Specifies an additional flag:

json Specifies an output option to display messages in JSON format.

Example

Example 3-18 var.local

var.local ; Display all local variables

var.local %h ; Display all local variables in hexadecimal

- *var.global* on page 3-23
- *var.print* on page 3-26.

3.3.19 <u>v</u>ar.<u>n</u>ew

This command creates a new script variable and zero-initializes it. Script variables are for use at runtime only.

Syntax

<u>v</u>ar.<u>n</u>ew *name*

Where:

name Specifies the name of a script variable.

Example

Example 3-19 var.new

var.new \myVar

; Create new script variable

See also

• *var.set* on page 3-27.

3.3.20 <u>v</u>ar.print

This command concatenates the results of one or more expressions.

Syntax

var.print [%printing_format] expression... [/flag]

Where:

printing_format Specifies either [ascii | binary | decimal | hex]. If none specified then the

default is decimal format.

expression Specifies an expression that is evaluated and the result is returned. You can

use script variables in an expression by preceding the name with a

backslash. Script variables are for use at runtime only.

flag Specifies an additional flag:

json Specifies an output option to display messages in JSON format.

Example

Example 3-20 var.print

var.print myVar1 " and " myVar2 ; Display concatenated string/variables

var.print %h myVar1 ; Display myVar1 in hexadecimal var.print \myVar ; Display value of script variable

3.3.21 <u>v</u>ar.<u>s</u>et

This command sets and displays the value of an existing script variable. It can also display the result of an expression. Script variables are for use at runtime only.

Syntax

an expression with the name option then the value of that script variable is also

Example

Example 3-21 var. set

updated with the result of the expression.

- *var.new* on page 3-25
- *var.print* on page 3-26.

3.3.22 wait

This command pauses the execution of a script for a specified period of time.

Syntax

wait number{m|s}

Where:

number Specifies the period of time.

m Specifies the time in milliseconds.

s Specifies the time in seconds.

Example

Example 3-22 wait

wait 1000m ; Wait one thousand milliseconds

Appendix A **GNU Free Documentation License**

Version 1.2, November 2002

Copyright (C) 2000,2001,2002 Free Software Foundation, Inc. 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA.

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

0. PREAMBLE

The purpose of this License is to make a manual, textbook, or other functional and useful document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

1 APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you". You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The "Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A "Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called "Opaque".

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The "Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

A section "Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "Acknowledgements", "Dedications", "Endorsements", or "History".) To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

3. COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

4. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

- Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
- List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.
- State on the Title page the name of the publisher of the Modified Version, as the publisher.
- Preserve all the copyright notices of the Document.
- Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.
- Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
- Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.
- Include an unaltered copy of this License.
- Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
- Preserve the network location, if any, given in the Document for public access to a
 Transparent copy of the Document, and likewise the network locations given in the
 Document for previous versions it was based on. These may be placed in the "History"
 section. You may omit a network location for a work that was published at least four years
 before the Document itself, or if the original publisher of the version it refers to gives
 permission.
- For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.
- Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.
- Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.
- Do not retitle any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.
- Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties—for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

5. COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements."

6. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an "aggregate" if the copyright resulting from the compilation is not used to limit the legal rights

of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

8. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled "Acknowledgements", "Dedications", or "History", the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

9. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt otherwise to copy, modify, sublicense, or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

10. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

A.1 ADDENDUM: How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright (C) YEAR YOUR NAME. Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.2 or any later version published by the Free Software Foundation; with no Invariant Sections, no Front-Cover Texts, and no Back-Cover Texts. A copy of the license is included in the section entitled "GNU Free Documentation License".

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the "with...Texts." line with this:

with the Invariant Sections being *list their titles*, with the Front-Cover Texts being *list*, and with the Back-Cover Texts being *list*.

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.
