The SCTLR bit assignments are:

![Diagram of SCTLR bit assignments]

**DSSBS, bit [31]**

*When FEAT_SSBS is implemented:*

Default PSTATE.SSBS value on Exception Entry. The defined values are:

- **0b0**  PSTATE.SSBS is set to 0 on an exception to any mode in this security state except Hyp mode
- **0b1**  PSTATE.SSBS is set to 1 on an exception to any mode in this security state except Hyp mode

**Note**

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

This field resets to an IMPLEMENTATION DEFINED value.
Otherwise:

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to an Exception Level that is executing at PL1 are taken to A32 or T32 state:

0b0 Exceptions, including reset, taken to A32 state.
0b1 Exceptions, including reset, taken to T32 state.

This field resets to an IMPLEMENTATION DEFINED choice between:

- 0
- a value determined by an input configuration signal.

AFE, bit [29]

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model. The possible values of this bit are:

0b0 In the translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented.
0b1 In the translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.
The AFE bit is permitted to be cached in a TLB.
This field resets to 0.

TRE, bit [28]

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA. The possible values of this bit are:

0b0 TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.
0b1 TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.

When the value of TTBCR.EAE is 1, this bit is RES1.
The TRE bit is permitted to be cached in a TLB.
This field resets to 0.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.
The possible values of this bit are:

0b0 Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian.
0b1 Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian.
If an implementation does not provide Big-endian support for data accesses at Exception Levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception Levels higher than EL0, this bit is RES1.

This field resets to an IMPLEMENTATION DEFINED choice between:

- 0.
- a value determined by an input configuration signal.

**Bit [24]**

Reserved, RES0.

**SPAN, bit [23]**

*When FEAT_PAN is implemented:*

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

- **0b0** CPSR.PAN is set to 1 in the following situations:
  - In Non-secure state, on taking an exception to EL1.
  - In Secure state, when EL3 is using AArch64, on taking an exception to EL1.
  - In Secure state, when EL3 is using AArch32, on taking an exception to EL3.

- **0b1** The value of CPSR.PAN is left unchanged on taking an exception to EL1.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES1.

**Bit [22]**

Reserved, RES1.

**Bit [21]**

Reserved, RES0.

**UWXN, bit [20]**

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1. The possible values of this bit are:

- **0b0** This control has no effect on memory access permissions.
- **0b1** Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.

The UWXN bit is permitted to be cached in a TLB.

This field resets to 0.

**WXN, bit [19]**

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

- **0b0** This control has no effect on memory access permissions.
- **0b1** Any region that is writable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.

This bit applies only when SCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

This field resets to 0.
nTWE, bit [18]
Traps EL0 execution of WFE instructions to Undefined mode.

0b0 Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

--- Note ---
Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

This field resets to 1.

Bit [17]
Reserved, RES0.

nTWI, bit [16]
Traps EL0 execution of WFI instructions to Undefined mode.

0b0 Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

--- Note ---
Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

This field resets to 1.

Bits [15:14]
Reserved, RES0.

V, bit [13]
Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

0b0 Normal exception vectors. Base address is held in VBAR.

0b1 High exception vectors (Hivecs), base address 0xFFFF0000. This base address cannot be remapped.

This field resets to an IMPLEMENTATION DEFINED choice between:

• 0.
• a value determined by an input configuration signal.

I, bit [12]
Instruction access Cacheability control, for accesses at EL1 and EL0:

0b0 All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache.
If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1\&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

\(\text{0b1}\)

All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache.

If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1\&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

This field resets to 0.

**Bit [11]**

Reserved, RES1.

**EnRCTX, bit [10]**

*When FEAT_CSV2 is implemented:*

Enable EL0 Access to the AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions. The defined values are:

\(\text{0b0}\)

EL0 access to these instructions is disabled, and these instructions are trapped to EL1.

\(\text{0b1}\)

EL0 access to these instructions is enabled.

--- **Note** ---

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

This field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**Bit [9]**

Reserved, RES0.

**SED, bit [8]**

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

\(\text{0b0}\)

SETEND instruction execution is enabled at PL0 and PL1.

\(\text{0b1}\)

SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

This field resets to 0.

**ITD, bit [7]**

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

\(\text{0b0}\)

All IT instruction functionality is enabled at PL1 and PL0.

\(\text{0b1}\)

Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with hw1[3:0]!=1000.
- All encodings of the subsequent instruction with the following values for hw1:
  - 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
— 1011xxxxxxxxxxxx: All instructions in Miscellaneous 16-bit instructions on page F3-4155.
— 10100xxxxxxxxxxx: ADD Rd, PC, #imm
— 01001xxxxxxxxxxx: LDR Rd, [PC, #imm]
— 0100x1xx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
— 010001xx1xxxx1111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

• A 16-bit instruction, that can only be followed by another 16-bit instruction.
• The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see Changes to an ITD control by an instruction in an IT block on page E1-3998.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAZ/WI.

This field resets to 0.

UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return a UNKNOWN value.

This field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

0b0 PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
0b1 PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1. If it is not implemented then this bit is RAO/WI.

This field resets to 1.

LSMAOE, bit [4]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

0b0 For all memory accesses at EL1 or EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

This field resets to 1.

Otherwise:

Reserved, RES1.
nTLSMD, bit [3]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

0b0  All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

0b1  All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

This field resets to 1.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

0b0  All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.

0b1  All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.

The PE ignores SCTLR.C for Non-secure state and data accesses to Normal memory from EL1 and EL0 are Cacheable if either:

•  EL2 is using AArch32 and the value of HCR.DC is 1.
•  EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

This field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

0b0  Alignment fault checking disabled when executing at PL1 or PL0.

Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1  Alignment fault checking enabled when executing at PL1 or PL0.

All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

This field resets to 0.

M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

0b0  EL1 and EL0 stage 1 address translation disabled.

See the SCTLR.I field for the behavior of instruction accesses to Normal memory.

0b1  EL1 and EL0 stage 1 address translation enabled.

In the Non-secure state the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

•  EL2 is using AArch32 and the value of HCR.{DC, TGE} is not {0, 0}.
•  EL2 is using AArch64 and the value of HCR_EL2.{DC, TGE} is not {0, 0}.
This field resets to 0.

**Accessing the SCTLR**

Accesses to this register use the following encodings in the System instruction encoding space:

\[ \text{MRC}\{<c>\}{<q>} \text{<coproc>, (#{<opc1>}, <Rt>, <CRn>, <CRm>{, (#{<opc2>}}) }\]

<table>
<thead>
<tr>

   if SCR.NS == '0' then
      SCTLR_S = R[t];
   else
      SCTLR_NS = R[t];
G8.2.127  SPSR, Saved Program Status Register

The SPSR characteristics are:

**Purpose**

Holds the saved process state for the current mode.

**Configurations**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR are UNDEFINED.

**Attributes**

SPSR is a 32-bit register.

**Field descriptions**

The SPSR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 16 | 15 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | J  | IL | GE | IT[7:2] | E | A | I | F | T | M[4:0] |

- **N**, bit [31]
  
  Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

- **Z**, bit [30]
  
  Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

- **C**, bit [29]
  
  Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

- **V**, bit [28]
  
  Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

- **Q**, bit [27]
  
  Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

- **IT[1:0]**, bits [26:25]
  
  IT block state bits for the T32 IT (If-Then) instruction. See IT[7:2] for explanation of this field.

- **J**, bit [24]
  
  RES0.

  In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.
SSBS, bit [23]

When FEAT_SSBS is implemented:
Speculative Store Bypass Safe. This bit is set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.

Otherwise:
Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:
Privileged Access Never. This bit is set to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

Otherwise:
Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:
Data Independent Timing. This bit is set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

Otherwise:
Reserved, RES0.

IL, bit [20]

Illegal Execution state bit. Shows the value of PSTATE.IL immediately before the exception was taken.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

IT[7:2], bits [15:10]

IT block state bits for the T32 IT (If-Then) instruction. This field must be interpreted in two parts.

- IT[7:5] holds the base condition for the IT block. The base condition is the top 3 bits of the condition code specified by the first condition field of the IT instruction.
- IT[4:0] encodes the size of the IT block, which is the number of instructions that are to be conditionally executed, by the position of the least significant 1 in this field. It also encodes the value of the least significant bit of the condition code for each instruction in the block.

The IT field is 0b00000000 when no IT block is active.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

0b0 Little-endian operation
0b1 Big-endian operation.

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.
When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]
SError interrupt mask bit.
0b0 Exception not masked.
0b1 Exception masked.

I, bit [7]
IRQ mask bit.
0b0 Exception not masked.
0b1 Exception masked.

F, bit [6]
FIQ mask bit.
0b0 Exception not masked.
0b1 Exception masked.

T, bit [5]
T32 Instruction set state bit. Determines the AArch32 instruction set state that the exception was taken from.
0b0 Taken from A32 state.
0b1 Taken from T32 state.

M[4:0], bits [4:0]
Mode. Set to the mode that an exception was taken from.
0b10000 User.
0b10001 FIQ.
0b10010 IRQ.
0b10011 Supervisor.
0b10110 When EL3 is capable of using AArch32 Monitor.
0b10111 Abort.
0b11010 When EL2 is capable of using AArch32 Hyp.
0b11011 Undefined.
0b11111 System.
Other values are reserved.
G8.2.128 SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Abort mode.

**Configurations**

AArch32 System register SPSR_abt[31:0] is architecturally mapped to AArch64 System register SPSR_abt[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_abt are UNDEFINED.

**Attributes**

SPSR_abt is a 32-bit register.

**Field descriptions**

The SPSR_abt bit assignments are:

```
31  30  29  28  27  26  25  24  23  22  21  20  19  16  15  10  9  8  7  6  5  4  0
N  Z  C  V  Q  J  IL  GE  IT[7:2]  E  A  I  F  T  M[4:0]
```

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

This field resets to an architecturally UNKNOWN value.
IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Abort mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode SPSR_abt.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

J, bit [24]
RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.
Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:
Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

IL, bit [20]
Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]
Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]
If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Abort mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Abort mode.
SPSR_abt.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

E, bit [9]
Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.
If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.
This field resets to an architecturally UNKNOWN value.

A, bit [8]
SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.

I, bit [7]
IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.

F, bit [6]
FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.

T, bit [5]
T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.
This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]
Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

0b10000 User.
0b10001 FIQ.
0b10010 IRQ.
0b10011 Supervisor.
0b11011 Abort.
0b11011 Undefined.
0b11111 System.

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in Illegal return events from AArch32 state on page G1-5766.
This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_abt
SPSR_abt is accessible in all modes other than User mode and Abort mode.
Accesses to this register use the following encodings in the System instruction encoding space:
\textit{MRS\{c\}\{q\} \textless Rd\textgreater, SPSR\_abt}

\begin{center}
\begin{tabular}{ccc}
\hline
R & M & M1 \\
\hline
0b1 & 0b1 & 0b0100 \\
\hline
\end{tabular}
\end{center}

\textit{MSR\{c\}\{q\} SPSR\_abt, \textless Rn\textgreater}

\begin{center}
\begin{tabular}{ccc}
\hline
R & M & M1 \\
\hline
0b1 & 0b1 & 0b0100 \\
\hline
\end{tabular}
\end{center}
G8.2.129  SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to FIQ mode.

**Configurations**

AArch32 System register SPSR_fiq[31:0] is architecturally mapped to AArch64 System register SPSR_fiq[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_fiq are UNDEFINED.

**Attributes**

SPSR_fiq is a 32-bit register.

**Field descriptions**

The SPSR_fiq bit assignments are:

```
  31 30 29 28 27 26 25 24 23 22 21 20 19 16 15 10  9  8  7  6  5  4  0
    N  Z  C  V  Q  J  IL  GE  IT[7:2]  E  A  F  T  M[4:0]
```

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode. This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode. This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode. This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode. This field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode. This field resets to an architecturally UNKNOWN value.
IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to FIQ mode, and copied to
PSTATE.IT[1:0] on executing an exception return operation in FIQ mode.
On executing an exception return operation in FIQ mode SPSR_fiq.IT must contain a value that is
valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

J, bit [24]
RES0.
In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.
Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction
set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode,
and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and
copied to PSTATE.PAN on executing an exception return operation in FIQ mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:
Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode,
and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

IL, bit [20]
Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and
copied to PSTATE.IL on executing an exception return operation in FIQ mode.
This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]
Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode,
and copied to PSTATE.GE on executing an exception return operation in FIQ mode.
This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]
If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to FIQ mode, and copied to
PSTATE.IT[7:2] on executing an exception return operation in FIQ mode.
SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

0b10000 User.
0b10001 FIQ.
0b10010 IRQ.
0b10011 Supervisor.
0b10111 Abort.
0b11011 Undefined.
0b11111 System.

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in Illegal return events from AArch32 state on page G1-5766.

This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_fiq

SPSR_fiq is accessible in all modes other than User mode and FIQ mode.

Accesses to this register use the following encodings in the System instruction encoding space:
MRS{<c>}{<q>} <Rd>, SPSR_fiq

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>0b1110</td>
</tr>
</tbody>
</table>

MSR{<c>}{<q>} SPSR_fiq, <Rn>

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b0</td>
<td>0b1110</td>
</tr>
</tbody>
</table>
**G8.2.130 SPSR_hyp, Saved Program Status Register (Hyp mode)**

The SPSR_hyp characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Hyp mode.

**Configurations**

AArch32 System register SPSR_hyp[31:0] is architecturally mapped to AArch64 System register SPSR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_hyp are UNDEFINED.

**Attributes**

SPSR_hyp is a 32-bit register.

**Field descriptions**

The SPSR_hyp bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 16 | 15 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
```

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

This field resets to an architecturally UNKNOWN value.
IT[1:0], bits [26:25]
  If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Hyp mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Hyp mode.

  On executing an exception return operation in Hyp mode SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

  This field resets to an architecturally UNKNOWN value.

J, bit [24]
  RES0.

  In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

  Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
  When FEAT_SSBS is implemented:
    Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Hyp mode, and copied to PSTATE.SSBS on executing an exception return operation in Hyp mode.

    This field resets to an architecturally UNKNOWN value.

  Otherwise:
    Reserved, RES0.

PAN, bit [22]
  When FEAT_PAN is implemented:
    Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Hyp mode, and copied to PSTATE.PAN on executing an exception return operation in Hyp mode.

    This field resets to an architecturally UNKNOWN value.

  Otherwise:
    Reserved, RES0.

DIT, bit [21]
  When FEAT_DIT is implemented:
    Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Hyp mode, and copied to PSTATE.DIT on executing an exception return operation in Hyp mode.

    This field resets to an architecturally UNKNOWN value.

  Otherwise:
    Reserved, RES0.

IL, bit [20]
  Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

  This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]
  Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

  This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]
  If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Hyp mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Hyp mode.

  SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

E, bit [9]
Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.
If the implementation does not support big-endian operation, SPSR_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_hyp.E is RES1.
This field resets to an architecturally UNKNOWN value.

A, bit [8]
SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.
This field resets to an architecturally UNKNOWN value.

I, bit [7]
IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.
This field resets to an architecturally UNKNOWN value.

F, bit [6]
FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.
This field resets to an architecturally UNKNOWN value.

T, bit [5]
T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.
This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]
Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.
0b10000  User.
0b10001  FIQ.
0b10010  IRQ.
0b10011  Supervisor.
0b10110  Abort.
0b10111  Hyp.
0b11011  Undefined.
0b11111  System.
Other values are reserved. If SPSR_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in Illegal return events from AArch32 state on page G1-5766.
This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_hyp

SPSR_hyp is accessible only in Monitor mode.
Accesses to this register use the following encodings in the System instruction encoding space:

\[ \text{MRS}\{<c>\}{<q>} \text{ } <Rd>, \text{SPSR}_\text{hyp} \]

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>

G8.2.131 SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to IRQ mode.

**Configurations**

AArch32 System register SPSR_irq[31:0] is architecturally mapped to AArch64 System register SPSR_irq[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_irq are UNDEFINED.

**Attributes**

SPSR_irq is a 32-bit register.

**Field descriptions**

The SPSR_irq bit assignments are:

|            | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 16 | 15 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| **N**      |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **Z**      |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **C**      |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **V**      |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **Q**      |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **IT[1:0]**|    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **SSBS**   |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **PAN**    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| **DIT**    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode. This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode. This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode. This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode. This field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode. This field resets to an architecturally UNKNOWN value.
IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to IRQ mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the \{J, T\} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE_IL on taking an exception to IRQ mode, and copied to PSTATE_IL on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to IRQ mode, and copied to PSTATE_IT[7:2] on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

0b10000  User.
0b10001  FIQ.
0b10010  IRQ.
0b10011  Supervisor.
0b10111  Abort.
0b11011  Undefined.
0b11111  System.

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in Illegal return events from AArch32 state on page G1-5766.

This field resets to an architecturally UNKNOWN value.

**Accessing the SPSR_irq**

SPSR_irq is accessible in all modes other than User mode and IRQ mode.

Accesses to this register use the following encodings in the System instruction encoding space:
MRS<q> Rd, SPSR_irq

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0000</td>
</tr>
</tbody>
</table>

MSR<q> SPSR_irq, <Rn>

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0000</td>
</tr>
</tbody>
</table>
G8.2.132  SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

Purpose

Holds the saved process state when an exception is taken to Monitor mode.

Configurations

AArch32 System register SPSR_mon[31:0] can be mapped to AArch64 System register SPSR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_mon are UNDEFINED.

Attributes

SPSR_mon is a 32-bit register.

Field descriptions

The SPSR_mon bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 16 | 15 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N  | Z  | C  | V  | Q  | J  | IL | GE | IT[7:2] | E | A | I | F | T | M[4:0] |

N, bit [31]
Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Monitor mode, and copied to PSTATE.N on executing an exception return operation in Monitor mode.
This field resets to an architecturally UNKNOWN value.

Z, bit [30]
Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Monitor mode, and copied to PSTATE.Z on executing an exception return operation in Monitor mode.
This field resets to an architecturally UNKNOWN value.

C, bit [29]
Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Monitor mode, and copied to PSTATE.C on executing an exception return operation in Monitor mode.
This field resets to an architecturally UNKNOWN value.

V, bit [28]
Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Monitor mode, and copied to PSTATE.V on executing an exception return operation in Monitor mode.
This field resets to an architecturally UNKNOWN value.

Q, bit [27]
Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Monitor mode, and copied to PSTATE.Q on executing an exception return operation in Monitor mode.
This field resets to an architecturally UNKNOWN value.
IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Monitor mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Monitor mode.

On executing an exception return operation in Monitor mode SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Monitor mode, and copied to PSTATE.SSBS on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Monitor mode, and copied to PSTATE.PAN on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Monitor mode, and copied to PSTATE.DIT on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Monitor mode, and copied to PSTATE.IL on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Monitor mode, and copied to PSTATE.GE on executing an exception return operation in Monitor mode.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Monitor mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Monitor mode.

SPSR_mon.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

E, bit [9]
Endianness. Set to the value of PSTATE.E on taking an exception to Monitor mode, and copied to PSTATE.E on executing an exception return operation in Monitor mode.
If the implementation does not support big-endian operation, SPSR_mon.E is RES0. If the implementation does not support little-endian operation, SPSR_mon.E is RES1. On executing an exception return operation in Monitor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_mon.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_mon.E is RES1.
This field resets to an architecturally UNKNOWN value.

A, bit [8]
SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Monitor mode, and copied to PSTATE.A on executing an exception return operation in Monitor mode.
This field resets to an architecturally UNKNOWN value.

I, bit [7]
IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Monitor mode, and copied to PSTATE.I on executing an exception return operation in Monitor mode.
This field resets to an architecturally UNKNOWN value.

F, bit [6]
FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Monitor mode, and copied to PSTATE.F on executing an exception return operation in Monitor mode.
This field resets to an architecturally UNKNOWN value.

T, bit [5]
T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Monitor mode, and copied to PSTATE.T on executing an exception return operation in Monitor mode.
This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]
Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Monitor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Monitor mode.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b10000</td>
<td>User.</td>
</tr>
<tr>
<td>0b10001</td>
<td>FIQ.</td>
</tr>
<tr>
<td>0b10010</td>
<td>IRQ.</td>
</tr>
<tr>
<td>0b10011</td>
<td>Supervisor.</td>
</tr>
<tr>
<td>0b10110</td>
<td>Monitor.</td>
</tr>
<tr>
<td>0b10111</td>
<td>Abort.</td>
</tr>
<tr>
<td>0b11010</td>
<td>Hyp.</td>
</tr>
<tr>
<td>0b11011</td>
<td>Undefined.</td>
</tr>
<tr>
<td>0b11111</td>
<td>System.</td>
</tr>
</tbody>
</table>

Other values are reserved. If SPSR_mon.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Monitor mode is an illegal return event, as described in *Illegal return events from AArch32 state* on page G1-5766.
This field resets to an architecturally UNKNOWN value.

Accessing the SPSR_mon

SPSR_mon is only accessible in EL3 modes other than Monitor mode.
Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRS}\{<c>\}{<q>} <Rd>, SPSR\_mon
\]

\[
\begin{array}{ccc}
R & M & M1 \\
\hline
0b1 & 0b1 & 0b100 \\
\end{array}
\]

\[
\text{MSR}\{<c>\}{<q>} SPSR\_mon, <Rn>
\]

\[
\begin{array}{ccc}
R & M & M1 \\
\hline
0b1 & 0b1 & 0b100 \\
\end{array}
\]
G8.2.133  SPSR_svc, Saved Program Status Register (Supervisor mode)

The SPSR_svc characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Supervisor mode.

**Configurations**

AArch32 System register SPSR_svc[31:0] is architecturally mapped to AArch64 System register SPSR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_svc are UNDEFINED.

**Attributes**

SPSR_svc is a 32-bit register.

**Field descriptions**

The SPSR_svc bit assignments are:

```
   31  30  29  28  27  26  25  24  23  22  21  20  19  16  15  10   9   8   7   6   5   4   3   2   1   0
   N  Z  C  V  Q  J  IL  GE  IT[7:2]  E  A  I  F  T  M[4:0]
```

- **N, bit [31]**
  Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.
  This field resets to an architecturally UNKNOWN value.

- **Z, bit [30]**
  Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.
  This field resets to an architecturally UNKNOWN value.

- **C, bit [29]**
  Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.
  This field resets to an architecturally UNKNOWN value.

- **V, bit [28]**
  Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.
  This field resets to an architecturally UNKNOWN value.

- **Q, bit [27]**
  Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.
  This field resets to an architecturally UNKNOWN value.
IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Supervisor mode, and copied
to PSTATE.IT[1:0] on executing an exception return operation in Supervisor mode.
On executing an exception return operation in Supervisor mode SPSR_svc.IT must contain a value
that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

J, bit [24]
RES0.
In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.
Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction
set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Supervisor
mode, and copied to PSTATE.SSBS on executing an exception return operation in Supervisor mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Supervisor
mode, and copied to PSTATE.PAN on executing an exception return operation in Supervisor mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:
Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Supervisor
mode, and copied to PSTATE.DIT on executing an exception return operation in Supervisor mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

IL, bit [20]
Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode,
and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.
This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]
Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor
mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.
This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]
If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Supervisor mode, and copied
to PSTATE.IT[7:2] on executing an exception return operation in Supervisor mode.
SPSR_svc.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

### E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR_svc.E is RES0. If the implementation does not support little-endian operation, SPSR_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_svc.E is RES1.

This field resets to an architecturally UNKNOWN value.

### A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

### I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

### F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

### T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Supervisor mode, and copied to PSTATE.T on executing an exception return operation in Supervisor mode.

This field resets to an architecturally UNKNOWN value.

### M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Supervisor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Supervisor mode.

- 0b10000: User.
- 0b10001: FIQ.
- 0b10010: IRQ.
- 0b10011: Supervisor.
- 0b10111: Abort.
- 0b11011: Undefined.
- 0b11111: System.

Other values are reserved. If SPSR_svc.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Supervisor mode is an illegal return event, as described in *Illegal return events from AArch32 state* on page G1-5766.

This field resets to an architecturally UNKNOWN value.

## Accessing the SPSR_svc

SPSR_svc is accessible in all modes other than User mode and Supervisor mode.

Accesses to this register use the following encodings in the System instruction encoding space:
**MRS{<c>}{<q>} <Rd>, SPSR_svc**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0010</td>
</tr>
</tbody>
</table>

**MSR{<c>}{<q>} SPSR_svc, <Rn>**

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1</td>
<td>0b1</td>
<td>0b0010</td>
</tr>
</tbody>
</table>
G8.2.134  **SPSR_und, Saved Program Status Register (Undefined mode)**

The SPSR_und characteristics are:

**Purpose**

Holds the saved process state when an exception is taken to Undefined mode.

**Configurations**

AArch32 System register SPSR_und[31:0] is architecturally mapped to AArch64 System register SPSR_und[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SPSR_und are UNDEFINED.

**Attributes**

SPSR_und is a 32-bit register.

**Field descriptions**

The SPSR_und bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| N   | Z  | C  | V  | Q  | J  | IL | GE | IT[7:2] | E | A | I | F | T | M[4:0] |

**N, bit [31]**

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

**Z, bit [30]**

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

**C, bit [29]**

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

**V, bit [28]**

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

**Q, bit [27]**

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.
IT[1:0], bits [26:25]
If-Then. Set to the value of PSTATE.IT[1:0] on taking an exception to Undefined mode, and copied to PSTATE.IT[1:0] on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode SPSR_und.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

J, bit [24]
RES0.
In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.
Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:
Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:
Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:
Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.
This field resets to an architecturally UNKNOWN value.
Otherwise:
Reserved, RES0.

IL, bit [20]
Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.
This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]
Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.
This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]
If-Then. Set to the value of PSTATE.IT[7:2] on taking an exception to Undefined mode, and copied to PSTATE.IT[7:2] on executing an exception return operation in Undefined mode.
SPSR_und.IT must contain a value that is valid for the instruction being returned to.
This field resets to an architecturally UNKNOWN value.

**E, bit [9]**

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

This field resets to an architecturally UNKNOWN value.

**A, bit [8]**

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

**I, bit [7]**

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

**F, bit [6]**

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

**T, bit [5]**

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

This field resets to an architecturally UNKNOWN value.

**M[4:0], bits [4:0]**

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

0b10000 User.
0b10001 FIQ.
0b10010 IRQ.
0b10011 Supervisor.
0b11011 Abort.
0b11011 Undefined.
0b1111 System.

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in illegal return events from AArch32 state on page G1-5766.

This field resets to an architecturally UNKNOWN value.

**Accessing the SPSR_und**

SPSR_und is accessible in all modes other than User mode and Undefined mode.

Accesses to this register use the following encodings in the System instruction encoding space:
MRS{<c>}{<q>} <Rd>, SPSR_und

<table>
<thead>
<tr>
<th>R</th>
<th>M</th>
<th>M1</th>

G8.2.135 TCMTR, TCM Type Register

The TCMTR characteristics are:

Purpose

Provides information about the implementation of the TCM.

Configurations

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TCMTR are UNDEFINED.

If EL1 or above can use AArch32 then this register must be implemented.

Attributes

TCMTR is a 32-bit register.

Field descriptions

The TCMTR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the TCMTR

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c>}\{<q>\} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>

G8.2.136  TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

**Configurations**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIALL are UNDEFINED.

**Attributes**

TLBIALL is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by &lt;Rt&gt; is ignored.

**Executing the TLBIALL instruction**

Accesses to this register use the following encodings in the System instruction encoding space:

```plaintext
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>

G8.2.137   TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation only applies to the PE that executes this System instruction.

**Configurations**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIALLH are UNDEFINED.

**Attributes**

TLBIALLH is a 32-bit System instruction.

**Field descriptions**

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

**Executing the TLBIALLH instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this register use the following encodings in the System instruction encoding space:

```

    end if;
## TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

### Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2 and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

### Configurations

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIALLIS are UNDEFINED.

### Attributes

TLBIALLIS is a 32-bit System instruction.

### Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

### Executing the TLBIALLIS instruction

G8.2.142 TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

**Configurations**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIASID are **UNDEFINED**.

**Attributes**

TLBIASID is a 32-bit System instruction.

**Field descriptions**

The TLBIASID input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>29</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ASID</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**ASID, bits [7:0]**

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

**Executing the TLBIASID instruction**

Accesses to this register use the following encodings in the System instruction encoding space:
MCR{<c>}{<q>} {<coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>{, (#)<opc2>}

<table>
<thead>

G8.2.143  TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIASIDIS are UNDEFINED.

Attributes

TLBIASIDIS is a 32-bit System instruction.

Field descriptions

The TLBIASIDIS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>24</td>

G8.2.144  TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet
the following requirements:

• The entry is a stage 2 only translation table entry, from any level of the translation table walk.
• SCR.NS is 1.
• The entry would be used for the specified IPA.
• The entry would be used with the current VMID.
• The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2
translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at any Exception level. Otherwise,
direct accesses to TLBIIPAS2 are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2 is a 32-bit System instruction.

Field descriptions

The TLBIIPAS2 input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>IPA[39:12]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2 instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is
CONSTRUCTED UNPREDICTABLE, and one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction is treated as a NOP.
• The instruction executes as if it had been executed in Monitor mode.

Accesses to this register use the following encodings in the System instruction encoding space:

G8.2.145  TLBIIPAS2IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable

The TLBIIPAS2IS characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configurations**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIIPAS2IS are UNDEFINED.

**Note**

This System instruction is not implemented in architecture versions before Armv8.

**Attributes**

TLBIIPAS2IS is a 32-bit System instruction.

**Field descriptions**

The TLBIIPAS2IS input value bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-28</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>27</td>
<td>IPA[39:12]</td>
</tr>
</tbody>
</table>

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

**Executing the TLBIIPAS2IS instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this register use the following encodings in the System instruction encoding space:
MCR{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>{, (#)<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b100</td>
<td>0b1000</td>
<td>0b0000</td>
<td>0b001</td>
</tr>
</tbody>
</table>

if PSTATE.EL == EL0 then

        TLBIIPAS2IS(R[t]);
    end
G8.2.146   TLBIIPAS2L, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level

The TLBIIPAS2L characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

• The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
• SCR.NS is 1.
• The entry would be used for the specified IPA.
• The entry would be used with the current VMID.
• The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIIPAS2L are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2L is a 32-bit System instruction.

Field descriptions

The TLBIIPAS2L input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td>IPA[39:12]</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2L instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction is treated as a NOP.
• The instruction executes as if it had been executed in Monitor mode.

Accesses to this register use the following encodings in the System instruction encoding space:
MCR{<c>}{<q>} <coproc>, (#<opc1>, <Rt>, <CRn>, <CRm>{, (#<opc2>)}

<table>
<thead>

    //no operation
  else
    TLBIIPAS2L(R[t]);
G8.2.147 TLBIIPAS2LIS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable

The TLBIIPAS2LIS characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:
- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configurations**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIIPAS2LIS are **undefined**.

---

**Note**

This System instruction is not implemented in architecture versions before Armv8.

---

**Attributes**

TLBIIPAS2LIS is a 32-bit System instruction.

**Field descriptions**

The TLBIIPAS2LIS input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28 27</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>IPA[39:12]</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**IPA[39:12], bits [27:0]**

Bits[39:12] of the intermediate physical address to match.

**Executing the TLBIIPAS2LIS instruction**

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is **constrained unpredictable**, and one of the following behaviors must occur:
- The instruction is **undefined**.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.
Accesses to this register use the following encodings in the System instruction encoding space:

\[ MCR\{<c>\}{<q>} \{coproc\}, \{#\}<opc1>, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle, \{#\}<opc2> \]

<table>
<thead>

    TLBIIPAS2LIS(R[t]);
G8.2.148   TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIMVA are UNDEFINED.

Attributes

TLBIMVA is a 32-bit System instruction.

Field descriptions

The TLBIMVA input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>VA</td>
<td>RES0</td>
<td>ASID</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this operation.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
Executing the TLBIMVA instruction

Accesses to this register use the following encodings in the System instruction encoding space:

\[ \text{MCR}\{<c>\}{<q>} <\text{coproc}>, \{#\}<\text{opc1}>, <Rt>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}> \]

G8.2.153  TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

**Purpose**

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

**Configurations**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIMVAH are UNDEFINED.

**Attributes**

TLBIMVAH is a 32-bit System instruction.

**Field descriptions**

The TLBIMVAH input value bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>12</th>
<th>11</th>
<th>0</th>

    else
        TLBIMVAHIS(R[t]);
G8.2.155  TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

**Purpose**

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

**Configurations**

This instruction is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBIMVAIS are UNDEFINED.

**Attributes**

TLBIMVAIS is a 32-bit System instruction.

**Field descriptions**

The TLBIMVAIS input value bit assignments are:

```
+-----+-----+-----+-----+-----+
<table>
<thead>

The TLBTR characteristics are:

**Purpose**

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

**Configurations**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TLBTR are UNDEFINED.

**Attributes**

TLBTR is a 32-bit register.

**Field descriptions**

The TLBTR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Mask</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-1</td>
<td>1111</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>nU, bit [0]</td>
<td>0b11</td>
<td>Not Unified TLB. Indicates whether the implementation has a unified TLB:</td>

    return TLBTR;
else if PSTATE_EL == EL3 then
    return TLBTR;
G8.2.161   **TPIDRPRW, PL1 Software Thread ID Register**

The TPIDRPRW characteristics are:

**Purpose**

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

**Configurations**

AArch32 System register TPIDRPRW[31:0] is architecturally mapped to AArch64 System register TPIDR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TPIDRPRW are UNDEFINED.

---

**Note**

The PE never updates this register.

---

**Attributes**

TPIDRPRW is a 32-bit register.

**Field descriptions**

The TPIDRPRW bit assignments are:

31 0

<table>

G8.2.164 TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

**Purpose**

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using TTBR0 and addresses translated using TTBR1.
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with TTBCR2.

**Configurations**

AArch32 System register TTBCR[31:0] is architecturally mapped to AArch64 System register TCR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TTBCR are UNDEFINED.

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

**Attributes**

TTBCR is a 32-bit register.

**Field descriptions**

The TTBCR bit assignments are:

*When TTBCR.EAE == 0:*

![TTBCR Bit Assignments Diagram]

**EAE, bit [31]**

Extended Address Enable.

0b0 Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

This field resets to 0.

**Bits [30:6]**

Reserved, RES0.

**PD1, bit [5]**

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1.

0b0 Perform translation table walks using TTBR1.
A TLB miss on an address that is translated using TTBR1 generates a Translation fault. 
No translation table walk is performed.

This field resets to 0.

PD0, bit [4]
Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using TTBR0.

0b0 Perform translation table walks using TTBR0.
0b1 A TLB miss on an address that is translated using TTBR0 generates a Translation fault. 
No translation table walk is performed.

This field resets to 0.

Bit [3]
Reserved, RES0.

N, bits [2:0]
Indicate the width of the base address held in TTBR0. In TTBR0, the base address field is bits[31:14-N]. The value of N also determines:

- Whether TTBR0 or TTBR1 is used as the base address for translation table walks.
- The size of the translation table pointed to by TTBR0.

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

This field resets to 0.

When TTBCR.EAE == 1:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 19 | 18 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 3  | 2  | 0  |

<td><strong>TTBR1</strong>.ASID defines the ASID.</td>
</tr>
</tbody>
</table>

This field resets to 0.

**Bits [21:19]**

Reserved, **RES0**.

**T1SZ**, bits [18:16]

See *Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format on page G5-5997* for how **TTBCR.\{T1SZ, T0SZ\}** determine the input address ranges and memory region sizes translated using **TTBR0** and **TTBR1**.

This field resets to 0.

**Bits [15:14]**

Reserved, **RES0**.

**SH0**, bits [13:12]

Shareability attribute for memory associated with translation table walks using **TTBR0**.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b00</td>
<td>Non-shareable</td>
</tr>
<tr>
<td>0b10</td>
<td>Outer Shareable</td>
</tr>
</tbody>
</table>
0b11 Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

This field resets to 0.

**ORGN0, bits [11:10]**

Outer cacheability attribute for memory associated with translation table walks using TTBR0.

- 0b00 Normal memory, Outer Non-cacheable.
- 0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to 0.

**IRGN0, bits [9:8]**

Inner cacheability attribute for memory associated with translation table walks using TTBR0.

- 0b00 Normal memory, Inner Non-cacheable.
- 0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

This field resets to 0.

**EPD0, bit [7]**

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0.

- 0b0 Perform translation table walks using TTBR0.
- 0b1 A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

This field resets to 0.

**T2E, bit [6]**

*When FEAT_AA32HPD is implemented:*

TTBCR2 Enable.

- 0b0 TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register.
- 0b1 TTBCR2 is enabled.

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

*Otherwise:*

Reserved, RES0.

**Bits [5:3]**

Reserved, RES0.

**T0SZ, bits [2:0]**

See *Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format on page G5-5997* for how TTBCR.T1SZ, T0SZ determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

This field resets to 0.

**Accessing the TTBCR**

Accesses to this register use the following encodings in the System instruction encoding space:

G8.2.165   TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If FEAT_A32HPD is not implemented then this register is not implemented and its encoding is UNDEFINED. Otherwise:

- When the value of TTBCR.\{EAE, T2E\} is not \{1, 1\} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of TTBCR.\{EAE, T2E\} is \{1, 1\} TTBCR2 is used with TTBCR.

Configurations

AArch32 System register TTBCR2[31:0] is architecturally mapped to AArch64 System register TCR_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level and FEAT_A32HPD is implemented. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

Attributes

TTBCR2 is a 32-bit register.

Field descriptions

The TTBCR2 bit assignments are:

Bits [31:19]

Reserved, RES0.

HWU162, bit [18]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1.

0b0   For translations using TTBR1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1   For translations using TTBR1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.
**Otherwise:**

Reserved, RES0.

**HWU161, bit [17]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1.

0b0 For translations using TTBR1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU160, bit [16]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1.

0b0 For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HWU159, bit [15]**

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1.

0b0 For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.
HWU062, bit [14]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0.

0b0 For translations using TTBR0, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR0, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [13]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0.

0b0 For translations using TTBR0, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR0, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [12]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0.

0b0 For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.
HWU059, bit [11]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0.

0b0 For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR1.

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled if TTBCR.T2E == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

HPD0, bit [9]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR0.

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled if TTBCR.T2E == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

This field resets to an architecturally UNKNOWN value.

Bits [8:0]

Reserved, RES0.

Accessing the TTBCR2

G8.2.166 TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

Purpose
Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

Configurations
AArch32 System register TTBR0[63:0] is architecturally mapped to AArch64 System register TTBR0_EL1[63:0].
This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TTBR0 are UNDEFINED.
TTBCR.EAE determines which TTBR0 format is used:
- TTBCR.EAE == 0b0: 32-bit format is used. TTBR0[63:32] are ignored.
- TTBCR.EAE == 0b1: 64-bit format is used.
When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.
Used in conjunction with the TTBCR. When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR0.

Attributes
TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

Field descriptions
The TTBR0 bit assignments are:

When TTBCR.EAE == 0:

Bits [63:32]
Reserved, RES0.

TTB0, bits [31:7]
Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:
- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.
This field resets to an architecturally UNKNOWN value.
IRGN[0], bit [6]

This field is bit[0] of IRGN[1:0].

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

- 0b00  Normal memory, Inner Non-cacheable.
- 0b01  Normal memory, Inner Write-Back Write-Allocate Cacheable.
- 0b10  Normal memory, Inner Write-Through Cacheable.
- 0b11  Normal memory, Inner Write-Back no Write-Allocate Cacheable.

--- Note ---

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

This field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

- 0b0  Memory is Outer Shareable.
- 0b1  Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

This field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

- 0b00  Normal memory, Outer Non-cacheable.
- 0b01  Normal memory, Outer Write-Back Write-Allocate Cacheable.
- 0b10  Normal memory, Outer Write-Through Cacheable.
- 0b11  Normal memory, Outer Write-Back no Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

This field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:

- 0b0  Memory is Non-shareable.
- 0b1  Memory is shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

This field resets to an architecturally UNKNOWN value.
IRGN[1], bit [0]
This field is bit[1] of IRGN[1:0].
See IRGN[0] for the field description.

When TTBCR.EAE == 1:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>56</td>
<td>ASID, bits [55:48]</td>
</tr>
<tr>
<td>48</td>
<td>BADDR, bits [47:1]</td>
</tr>
<tr>
<td>1</td>
<td>CnP, bit [0]</td>
</tr>
</tbody>
</table>

Bits [63:56]
Reserved, RES0.

ASID, bits [55:48]
An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.
This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]
Translation table base address, bits[47:x]. Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T0SZ as follows:

- If TTBCR.T0SZ is 0 or 1, x = 5 - TTBCR.T0SZ.
- If TTBCR.T0SZ is greater than 1, x = 14 - TTBCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.
This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:
Common not Private. When TTBCR.EAE == 1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

0b0 The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by:
- The value of TTBR0.CnP on those other PEs.
- The value of TTBCR.EAE on those other PEs.
- The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.

0b1 The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply:
- The translation table entries are pointed to by this instance of TTBR0.
The value of the applicable TTBCR.EAE field is 1.

- The ASID is the same as the current ASID.
- For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

--- Note ---

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-7945.

---

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

G8.2.167  TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

**Configurations**

AArch32 System register TTBR1[63:0] is architecturally mapped to AArch64 System register TTBR1_EL1[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to TTBR1 are UNDEFINED.

TTBCR.EAE determines which TTBR1 format is used:

- TTBCR.EAE == 0b0: 32-bit format is used. TTBR1[63:32] are ignored.
- TTBCR.EAE == 0b1: 64-bit format is used.

Used in conjunction with the TTBCR. When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR1.

**Attributes**

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

**Field descriptions**

The TTBR1 bit assignments are:

*When TTBCR.EAE == 0:*

- **Bits [63:32]**
  
  Reserved, RES0.

- **TTB1, bits [31:7]**
  
  Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONstrained UNPREDICTable, and must be one of the following:

  - Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
  - The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

  This field resets to an architecturally UNKNOWN value.
IRGN[1], bit [6]
This field is bit[1] of IRGN[1:0].
Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

0b00  Normal memory, Inner Non-cacheable.
0b01  Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10  Normal memory, Inner Write-Through Cacheable.
0b11  Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note
The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:
- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

This field resets to an architecturally UNKNOWN value.

NOS, bit [5]
Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

0b0  Memory is Outer Shareable.
0b1  Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.
This field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]
Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

0b00  Normal memory, Outer Non-cacheable.
0b01  Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10  Normal memory, Outer Write-Through Cacheable.
0b11  Normal memory, Outer Write-Back no Write-Allocate Cacheable.

This field resets to an architecturally UNKNOWN value.

IMP, bit [2]
The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.
This field resets to an architecturally UNKNOWN value.

S, bit [1]
Shareable. Indicates whether the memory associated with the translation table walks is Non-shareable:

0b0  Memory is Non-shareable.
0b1  Memory is shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

This field resets to an architecturally UNKNOWN value.
IRGN[0], bit [0]

This field is bit[0] of IRGN[1:0].
See IRGN[1] for the field description.

When TTBCR.EAE == 1:

Bits [63:56]
Reserved, RES0.

ASID, bits [55:48]
An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.
This field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]
Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:
- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T1SZ as follows:
- If TTBCR.T1SZ is 0 or 1, x = 5 - TTBCR.T1SZ.
- If TTBCR.T1SZ is greater than 1, x = 14 - TTBCR.T1SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.
This field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:
Common not Private. When TTBCR.EAE == 1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

0b0 The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by:
- The value of TTBR1.CnP on those other PEs.
- The value of TTBCR.EAE on those other PEs.
- The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.

0b1 The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply:
- The translation table entries are pointed to by this instance of TTBR1.
• The value of the applicable TTBCR.EAE field is 1.
• The ASID is the same as the current ASID.
• For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

--- Note ---

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNpredictable, see CONstrained UNpredictable behaviors due to caching of control or data values on page K1-7945.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the TTBR1

Accesses to this register use the following encodings in the System instruction encoding space:

G8.2.168 VBAR, Vector Base Address Register

The VBAR characteristics are:

**Purpose**

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

**Configurations**

AArch32 System register VBAR[31:0] is architecturally mapped to AArch64 System register VBAR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VBAR are **UNDEFINED**.

**Attributes**

VBAR is a 32-bit register.

**Field descriptions**

The VBAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:5]</td>
<td>Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset. This field resets to an <strong>IMPLEMENTATION DEFINED</strong> value.</td>
</tr>
<tr>
<td>Bits [4:0]</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**Accessing the VBAR**

Access to this register use the following encodings in the System instruction encoding space:

\[

        UNDEFINED;
    elsif SCR.NS == '0' && CP15SDISABLE2 == HIGH then
        UNDEFINED;
    else
        if SCR.NS == '0' then
            VBAR_S = R[t];
        else
            VBAR_NS = R[t];
G8.2.169  VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

**Purpose**

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of MPIDR.

**Configurations**

AArch32 System register VMPIDR[31:0] is architecturally mapped to AArch64 System register VMPIDR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VMPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MPIDR.

**Attributes**

VMPIDR is a 32-bit register.

**Field descriptions**

The VMPIDR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>M</td>
<td>bit [31]</td>
</tr>
<tr>
<td>U</td>
<td>bit [30]</td>
</tr>
<tr>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>Aff2</td>
<td></td>
</tr>
<tr>
<td>Aff1</td>
<td></td>
</tr>
<tr>
<td>Aff0</td>
<td></td>
</tr>
<tr>
<td>MT</td>
<td></td>
</tr>
</tbody>
</table>

**M, bit [31]**

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

- 0b0  This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
- 0b1  This implementation includes the ARMv7 Multiprocessing Extensions functionality.

From Armv8 this bit is RES1.

**U, bit [30]**

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

- 0b0  Processor is part of a multiprocessor system.
- 0b1  Processor is part of a uniprocessor system.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.U.

**Bits [29:25]**

Reserved, RES0.

**MT, bit [24]**

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

- 0b0  Performance of PEs at the lowest affinity level is largely independent.
- 0b1  Performance of PEs at the lowest affinity level is very interdependent.
In a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.MT.

**Aff2, bits [23:16]**

Affinity level 2. See the description of Aff0 for more information.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff2.

**Aff1, bits [15:8]**

Affinity level 1. See the description of Aff0 for more information.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff1.

**Aff0, bits [7:0]**

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.\{Aff2, Aff1, Aff0\} or MPIDR.\_EL1.\{Aff3, Aff2, Aff1, Aff0\} set of fields of each PE must be unique within the system as a whole.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff0.

### Accessing the VMPIDR

Accesses to this register use the following encodings in the System instruction encoding space:

\[ MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} \]

<table>
<thead>
<tr>
<th>coproc</th>

        return MPIDR;
elsif PSTATE.EL == EL2 then
    return MPIDR;
else
    return MPIDR;
G8.2.170 VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

**Purpose**

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of MIDR.

**Configurations**

AArch32 System register VPIDR[31:0] is architecturally mapped to AArch64 System register VPIDR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MIDR.

**Attributes**

VPIDR is a 32-bit register.

**Field descriptions**

The VPIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit 31</th>
<th>Bit 24</th>
<th>Bit 23</th>
<th>Bit 20</th>
<th>Bit 19</th>
<th>Bit 16</th>
<th>Bit 15</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Implementer</td>
<td>Variant</td>
<td></td>
<td>PartNum</td>
<td></td>
<td>Revision</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Implementer, bits [31:24]**

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>ASCII representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x41</td>
<td>A</td>
<td>Arm Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>B</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>C</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>D</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x49</td>
<td>I</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x4D</td>
<td>M</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>N</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>P</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
<tr>
<td>0x51</td>
<td>Q</td>
<td>Qualcomm Inc.</td>
</tr>
<tr>
<td>0x56</td>
<td>V</td>
<td>Marvell International Ltd.</td>
</tr>
<tr>
<td>0x69</td>
<td>i</td>
<td>Intel Corporation</td>
</tr>
</tbody>
</table>

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.
In a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Implementer.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Variant.

**Architecture, bits [19:16]**

Architecture version. Defined values are:

- 0b0001  Armv4.
- 0b0010  Armv4T.
- 0b0011  Armv5 (obsolete).
- 0b0100  Armv5T.
- 0b0101  Armv5TE.
- 0b0110  Armv5TEJ.
- 0b0111  Armv6.
- 0b1111  Architectural features are individually identified in the ID_* registers, see ID registers on page K15-8205.

All other values are reserved.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Architecture.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.PartNum.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

In a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Revision.

**Accessing the VPIDR**

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c>\}\{<q>\} <coproc>, \{#<opc1>\}, <Rt>, <CRn>, <CRm>\{, \{#<opc2>\}\}
\]

G8.2.171 VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

**Purpose**

The control register for stage 2 of the Non-secure PL1&0 translation regime.

--- Note ---

This stage of translation always uses the Long-descriptor translation table format.

**Configurations**

AArch32 System register VTCR[31:0] is architecturally mapped to AArch64 System register VTCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

VTCR is a 32-bit register.

**Field descriptions**

The VTCR bit assignments are:

Bit [31]

Reserved, RES1.

Bits [30:29]

Reserved, RES0.

HWU62, bit [28]

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

- 0: Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 1: Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.
HWU61, bit [27]

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

- **0b0**: Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- **0b1**: Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

HWU60, bit [26]

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

- **0b0**: Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- **0b1**: Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

HWU59, bit [25]

*When FEAT_HPDS2 is implemented:*

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

- **0b0**: Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- **0b1**: Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

This field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

Bits [24:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using VTTBR.

- **0b00**: Non-shareable.
- **0b10**: Outer Shareable.
- **0b11**: Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

This field resets to an architecturally UNKNOWN value.
ORGN0, bits [11:10]
Outer cacheability attribute for memory associated with translation table walks using VTTBR.
0b00  Normal memory, Outer Non-cacheable.
0b01  Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10  Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11  Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.
This field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]
Inner cacheability attribute for memory associated with translation table walks using VTTBR.
0b00  Normal memory, Inner Non-cacheable.
0b01  Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10  Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11  Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.
This field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]
Starting level for translation table walks using VTTBR.
0b00  Start at level 2
0b01  Start at level 1
All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.
This field resets to an architecturally UNKNOWN value.

Bit [5]
Reserved, RES0.

S, bit [4]
Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the behavior is CONSTRAINED UNPREDICTABLE and the stage 2 T0SZ value is treated as an UNKNOWN value, see *Misprogramming VTCR.S on page K1-7960.*
This field resets to an architecturally UNKNOWN value.

T0SZ, bits [3:0]
The size offset of the memory region addressed by VTTBR. The region size is 2(32-T0SZ) bytes.
This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

--- Note ---
This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

---
If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.
This field resets to an architecturally UNKNOWN value.

**Accessing the VTCR**
Accesses to this register use the following encodings in the System instruction encoding space:
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>

  else
    VTCR = R[t];
G8.2.172 VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

**Purpose**

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

**Configurations**

AArch32 System register VTTBR[63:0] is architecturally mapped to AArch64 System register VTTBR_EL2[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to VTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

VTTBR is a 64-bit register.

**Field descriptions**

The VTTBR bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>56</td>
<td>VMID</td>
</tr>
<tr>
<td>48</td>
<td>BADDR</td>
</tr>
</tbody>
</table>

**Bits [63:56]**

Reserved, RES0.

**VMID, bits [55:48]**

The VMID for the translation table.

In a system where the PE resets into EL2 or EL3, this field resets to 0.

**BADDR, bits [47:1]**

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of VTCR.SL0 and VTCR.T0SZ as follows:

- If VTCR.SL0 is 0b00, meaning that lookup starts at level 2, then x is 14 - VTCR.T0SZ.
- If VTCR.SL0 is 0b01, meaning that lookup starts at level 1, then x is 5 - VTCR.T0SZ.
- If VTCR.SL0 is either 0b10 or 0b11 then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.
CnP, bit [0]

When FEAT_TTCNP is implemented:

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

| 0b0 | The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID. |
| 0b1 | The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID. |

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are CONSTRAINED UNPREDICTABLE, see CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-7945.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the VTTBR

Accesses to this register use the following encodings in the System instruction encoding space:

MRRC{<c>}{<q>}{<coproc>, (#)<opc1>, <Rt>, <Rt2>, <CRm>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>CRm</th>
<th>opc1</th>
</tr>
</thead>

G8.3 Debug registers

This section lists the Debug System registers in AArch32 state, in alphabetic order.
DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configurations

AArch32 System register DBGAUTHSTATUS[31:0] is architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0].

AArch32 System register DBGAUTHSTATUS[31:0] is architecturally mapped to External register DBGAUTHSTATUS_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGAUTHSTATUS are UNDEFINED.

This register is required in all implementations.

Attributes

DBGAUTHSTATUS is a 32-bit register.

Field descriptions

The DBGAUTHSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:8]</td>
<td></td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td></td>
<td>0b00</td>
<td>Not implemented. EL3 is not implemented and the Effective value of SCR_NS is 1.</td>
</tr>
<tr>
<td></td>
<td>0b10</td>
<td>Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.</td>
</tr>
<tr>
<td></td>
<td>0b11</td>
<td>Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>0b11</td>
<td>Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.</td>
</tr>
</tbody>
</table>

All other values are reserved.
NSID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

Non-secure Non-invasive debug.

0b00  Not implemented. EL3 is not implemented and the Effective value of SCR.NS is 0.
0b11  Implemented and enabled. EL3 is implemented or the Effective value of SCR.NS is 1.

All other values are reserved.

Otherwise:

Non-secure Non-Invasive Debug.

0b00  Not implemented. EL3 is not implemented and the Effective value of SCR.NS is 0.
0b10  Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11  Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure Invasive Debug.

0b00  Not implemented. EL3 is not implemented or the Effective value of SCR_EL3.NS is 0.
0b10  Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11  Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing the DBGAUTHSTATUS

Access to this register uses the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c>\}{<q>}\ <\text{coproc},\ \{\#<opc1>\},\ <\text{Rt},\ <\text{CRn},\ <\text{CRm}\},\ \{\#<opc2>\}
\]

elsif PSTATE.EL == EL3 then
    return DBGAUTHSTATUS;
G8.3.2 DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

Configurations

AArch32 System register DBGBCR<n>[31:0] is architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].

AArch32 System register DBGBCR<n>[31:0] is architecturally mapped to External register DBGBCR<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBCR<n> are UNDEFINED.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBCR<n> is a 32-bit register.

Field descriptions

The DBGBCR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>24 23 20 19</th>
<th>16 15 14 13 12</th>
<th>9 8</th>
<th>5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>BT</td>
<td>LBN</td>
<td>SSC</td>
<td>RES0</td>
</tr>
</tbody>
</table>

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

0b0000  Unlinked instruction address match. DBGBVR<n> is the address of an instruction.

0b0001  As 0b0000 with linking enabled.

0b0010  Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>.ContextID must match the CONTEXTIDR value.

0b0011  As 0b0010 with linking enabled.

0b0100  Unlinked instruction address mismatch. DBGBVR<n> is the address of an instruction to be stepped.

0b0101  As 0b0100 with linking enabled.

0b0110  Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>.ContextID is a Context ID compared against CONTEXTIDR.
G8.3 Debug registers

LBN, bits [19:16]
Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.
For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.
This field is ignored when the value of DBGBCR<\n>.E is 0.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

SSC, bits [15:14]
Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.
For more information, see Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-5880 and Reserved DBGBCR<\n>.{SSC, HMC, PMC} values on page G2-5891.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

HMC, bit [13]
Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.
For more information on the operation of the SSC, HMC, and PMC fields, see Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-5880.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

Reserved, RES0.
BAS, bits [8:5]
Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.
The permitted values depend on the breakpoint type.
For Address match breakpoints, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>DBGBVR&lt;n&gt;</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBVR&lt;n&gt;+2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBVR&lt;n&gt;</td>
<td>Use for A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved. For more information, see Reserved DBGBCR<n>.BAS values on page G2-5891.

For more information on using the BAS field in Address Match breakpoints, see Using the BAS field in Address Match breakpoints on page G2-5883.

For Context matching breakpoints, this field is RES1 and ignored.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

Reserved, RES0.

Bits [4:3]

PMC, bits [2:1]
Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-5880.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.
E, bit [0]

Enable breakpoint DBGBVR<n>. Possible values are:

0b0  Breakpoint disabled.
0b1  Breakpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

Accessing the DBGBCR<n>

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC\{c\}\{q\} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2}\}
\]

G8.3.3  DBGBVR<n>, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n> characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register DBGBCR<n>. If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register DBGBXVR<n> for VMID matching.

**Configurations**

AArch32 System register DBGBVR<n>[31:0] is architecturally mapped to AArch64 System register DBGBVR<n>_EL1[31:0].

AArch32 System register DBGBVR<n>[31:0] is architecturally mapped to External register DBGBVR<n>_EL1[31:0].

Note

Writes to DBGBVR<n> do not modify DBGBVR<n>_EL1[63:32].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBVR<n> are UNDEFINED.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

How this register is interpreted depends on the value of DBGBCR<n>.BT.

- When DBGBCR<n>.BT is 0b0x0x, this register holds a virtual address.
- When DBGBCR<n>.BT is 0bxx1x, this register holds a Context ID.

For other values of DBGBCR<n>.BT, this register is RES0.

Some breakpoints might not support Context ID comparison. For more information, see the description of the DBGDIDR.CTX_CMPs field.

**Field descriptions**

The DBGBVR<n> bit assignments are:

**When DBGBCR<n>.BT == 0b0x0x:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>VA[31:2]</td>
</tr>
<tr>
<td>2:1</td>
<td>RES0</td>
</tr>
</tbody>
</table>

VA[31:2], bits [31:2]

- Bits[31:2] of the address value for comparison.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, the value of this field is unchanged.

Bits [1:0]

- Reserved, RES0.
When DBGBCR<\textsl{n}\.BT == 0b001x:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContextID</td>
<td></td>
</tr>
</tbody>
</table>

**ContextID, bits [31:0]**

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when all of the following are true:

- CONTEXTIDR_EL2 is implemented.
- HCR_EL2.{E2H, TGE} is {1,1}.
- The PE is executing at EL0.
- EL2 is using AArch64 and is enabled in the current Security state.

Otherwise, the value is compared against CONTEXTIDR.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

When DBGBCR<\textsl{n}\.BT == 0b101x and EL2 is implemented:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContextID</td>
<td></td>
</tr>
</tbody>
</table>

**ContextID, bits [31:0]**

Context ID value for comparison against CONTEXTIDR.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

When DBGBCR<\textsl{n}\.BT == 0bx11x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContextID</td>
<td></td>
</tr>
</tbody>
</table>

**ContextID, bits [31:0]**

Context ID value for comparison against CONTEXTIDR.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

**Accessing the DBGBVR<\textsl{n}>**

Accesses to this register use the following encodings in the System instruction encoding space:
MRC<c>{<q>}{<coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>}{, {#}<opc2>}

<table>

G8.3.4 DBGBXVR<\textit{n}>, Debug Breakpoint Extended Value Registers, \textit{n} = 0 - 15

The DBGBXVR<\textit{n}> characteristics are:

**Purpose**

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register DBGBCR<\textit{n}> and a value register DBGBVR<\textit{n}>, where EL2 is implemented and breakpoint \( n \) supports Context matching.

**Configurations**

AArch32 System register DBGBXVR<\textit{n}>[31:0] is architecturally mapped to AArch64 System register DBGBVR<\textit{n}>_EL1[63:32].

AArch32 System register DBGBXVR<\textit{n}>[31:0] is architecturally mapped to External register DBGBVR<\textit{n}>_EL1[63:32].

--- Note ---

Writes to DBGBXVR<\textit{n}> do not modify DBGBVR<\textit{n}>_EL1[31:0]

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGBXVR<\textit{n}> are UNDEFINED.

Accesses to this register are UNDEFINED in any of the following cases:

- Breakpoint \( n \) is not implemented.
- Breakpoint \( n \) does not support Context matching.
- EL2 is not implemented.

For more information, see the description of the DBGDIDR.CTX_CMPs field.

**Attributes**

How this register is interpreted depends on the value of DBGBCR<\textit{n}>.BT.

- When DBGBCR<\textit{n}>.BT is 0b10xx, this register holds a VMID.
- When DBGBCR<\textit{n}>.BT is 0b11xx, this register holds a Context ID.

For other values of DBGBCR<\textit{n}>.BT, this register is RES0.

**Field descriptions**

The DBGBXVR<\textit{n}> bit assignments are:

*When DBGBCR<\textit{n}>.BT == 0b10xx and EL2 is implemented:*

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>VMID[15:8]</td>
<td>VMID[7:0]</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:16] Reserved, RES0.

VMID[15:8], bits [15:8]

*When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:*

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.
Otherwise:
Reserved, RES0.

VMID[7:0], bits [7:0]
VMID value for comparison. The VMID is 8 bits when any of the following are true:
- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

When DBGBCR<n>.BT == 0b11xx and EL2 is implemented:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContextID2</td>
<td></td>
</tr>
</tbody>
</table>

ContextID2, bits [31:0]

When FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented:
Context ID value for comparison against CONTEXTIDR_EL2.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.
Otherwise:
Reserved, RES0.

Accessing the DBGBXVR<n>

G8.3.5  DBGCLAIMCLR, Debug CLAIM Tag Clear register

The DBGCLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

CLAIM tags are typically used for communication between the debugger and target software.

---

**Configurations**

AArch32 System register DBGCLAIMCLR[31:0] is architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

AArch32 System register DBGCLAIMCLR[31:0] is architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGCLAIMCLR are UNDEFINED.

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMCLR is a 32-bit register.

**Field descriptions**

The DBGCLAIMCLR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ/SBZ</td>
<td>CLAIM</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

On a Warm reset, the value of this field is unchanged.

**Accessing the DBGCLAIMCLR**

Accesses to this register use the following encodings in the System instruction encoding space:
### MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

### G8.3.6 DBGCLAIMSET, Debug CLAIM Tag Set register

The DBGCLAIMSET characteristics are:

**Purpose**

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

--- Note ---

CLAIM tags are typically used for communication between the debugger and target software.

---

Used in conjunction with the DBGCLAIMCLR register.

**Configurations**

AArch32 System register DBGCLAIMSET[31:0] is architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

AArch32 System register DBGCLAIMSET[31:0] is architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGCLAIMSET are UNDEFINED.

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMSET is a 32-bit register.

**Field descriptions**

The DBGCLAIMSET bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>RAZ/SBZ, RESERVED</td>
</tr>
<tr>
<td>7-0</td>
<td>CLAIM, Set CLAIM tags</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

**Accessing the DBGCLAIMSET**

G8.3.8  DBGDEVID, Debug Device ID register 0

The DBGDEVID characteristics are:

**Purpose**

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

**Configurations**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDEVID are UNDEFINED.

This register is required in all implementations.

**Attributes**

DBGDEVID is a 32-bit register.

**Field descriptions**

The DBGDEVID bit assignments are:

```
<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CIDMask</td>
<td>AuxRegs</td>
<td>DoubleLock</td>
<td>VirtExtns</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**CIDMask, bits [31:28]**

Indicates the level of support for the Context ID matching breakpoint masking capability. Defined values are:

- `0b0000`  Context ID masking is not implemented.
- `0b0001`  Context ID masking is implemented.

All other values are reserved. The value of this for Armv8 is `0b0000`.

**AuxRegs, bits [27:24]**

Indicates support for Auxiliary registers. Permitted values for this field are:

- `0b0000`  None supported.
- `0b0001`  Support for External Debug Auxiliary Control Register, EDACR.

All other values are reserved.

**DoubleLock, bits [23:20]**

OS Double Lock implemented. Defined values are:

- `0b0000`  OS Double Lock is not implemented. DBGOSDLR is RAZ/WI.
- `0b0001`  OS Double Lock is implemented. DBGOSDLR is RW.

FEAT_DoubleLock implements the functionality identified by the value `0b0001`.

All other values are reserved.

**VirtExtns, bits [19:16]**

Indicates whether EL2 is implemented. Defined values are:

- `0b0000`  EL2 is not implemented.
- `0b0001`  EL2 is implemented.
All other values are reserved.

**VectorCatch, bits [15:12]**

Defines the form of Vector Catch exception implemented. Defined values are:
- **0b0000**: Address matching Vector Catch exception implemented.
- **0b0001**: Exception matching Vector Catch exception implemented.

All other values are reserved.

**BPAddrMask, bits [11:8]**

Indicates the level of support for the instruction address matching breakpoint masking capability. Defined values are:
- **0b0000**: Breakpoint address masking might be implemented. If not implemented, \( \text{DBGBCR}^{n\text{euro}}[28:24] \) is RAZ/WI.
- **0b0001**: Breakpoint address masking is implemented.
- **0b1111**: Breakpoint address masking is not implemented. \( \text{DBGBCR}^{n\text{euro}}[28:24] \) is RES0.

All other values are reserved. The value of this for Armv8 is **0b1111**.

**WPAddrMask, bits [7:4]**

Indicates the level of support for the data address matching watchpoint masking capability. Defined values are:
- **0b0000**: Watchpoint address masking might be implemented. If not implemented, \( \text{DBGWCR}^{n\text{euro}}.\text{MASK} \) (Address mask) is RAZ/WI.
- **0b0001**: Watchpoint address masking is implemented.
- **0b1111**: Watchpoint address masking is not implemented. \( \text{DBGWCR}^{n\text{euro}}.\text{MASK} \) (Address mask) is RES0.

All other values are reserved. The value of this for Armv8 is **0b0001**.

**PCSample, bits [3:0]**

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:
- **0b0000**: PC Sample-based Profiling Extension is not implemented in the external debug registers space.
- **0b0010**: Only \( \text{EDPCSR} \) and \( \text{EDCIDS} \) are implemented. This option is only permitted if EL3 and EL2 are not implemented.
- **0b0011**: \( \text{EDPCSR} \), \( \text{EDCIDS} \), and \( \text{EDVIDS} \) are implemented.

All other values are reserved.

When \( \text{FEAT\_PCSRv8p2} \) is implemented, the only permitted value is **0b0000**.

Note: \( \text{FEAT\_PCSRv8p2} \) implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of \( \text{PMDEVID\_PCSample} \).

**Accessing the DBGDEVID**

Accesses to this register use the following encodings in the System instruction encoding space:
MRC{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>{, (#)<opc2>}

G8.3.9 DBGDEVID1, Debug Device ID register 1

The DBGDEVID1 characteristics are:

**Purpose**

Adds to the information given by the DBGDIDR by describing other features of the debug implementation.

**Configurations**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDEVID1 are UNDEFINED.

This register is required in all implementations.

**Attributes**

DBGDEVID1 is a 32-bit register.

**Field descriptions**

The DBGDEVID1 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Bits</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-4</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>0-3</td>
<td>PCSROffset</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**PCSROffset, bits [3:0]**

This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in Armv8 are:

- 0b0000: EDPCSR is not implemented.
- 0b0010: EDPCSR implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

--- Note ---

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

**Accessing the DBGDEVID1**

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

G8.3.11 DBGDIDR, Debug ID Register

The DBGDIDR characteristics are:

**Purpose**

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

**Configurations**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDIDR are UNDEFINED.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

**Attributes**

DBGDIDR is a 32-bit register.

**Field descriptions**

The DBGDIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Width</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-28</td>
<td>WRPs</td>
<td>The number of watchpoints implemented, minus 1.</td>
</tr>
<tr>
<td>27-24</td>
<td>BRPs</td>
<td>The number of breakpoints implemented, minus 1.</td>
</tr>
<tr>
<td>23-20</td>
<td>CTX_CMPs</td>
<td>The number of breakpoints that can be used for Context matching, minus 1.</td>
</tr>
<tr>
<td>19-16</td>
<td>Version</td>
<td></td>
</tr>
<tr>
<td>15-12</td>
<td></td>
<td></td>
</tr>
<tr>
<td>11-0</td>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

**WRPs, bits [31:28]**

The number of watchpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented watchpoints, to 0b1111 for 16 implemented watchpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.WRPs.

**BRPs, bits [27:24]**

The number of breakpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented breakpoint, to 0b1111 for 16 implemented breakpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.BRPs.

**CTX_CMPs, bits [23:20]**

The number of breakpoints that can be used for Context matching, minus 1.

Permitted values of this field are from 0b0000 for 1 Context matching breakpoint, to 0b1111 for 16 Context matching breakpoints.

The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.

If AArch64 is implemented, this field has the same value as ID_AA64DFR0_EL1.CTX_CMPs.
Version, bits [19:16]

The Debug architecture version. Defined values are:

- 0b0001  Armv6, v6 Debug architecture.
- 0b0010  Armv6, v6.1 Debug architecture.
- 0b0011  Armv7, v7 Debug architecture, with baseline CP14 registers implemented.
- 0b0100  Armv7, v7 Debug architecture, with all CP14 registers implemented.
- 0b0101  Armv7, v7.1 Debug architecture.
- 0b0110  Armv8, v8 Debug architecture.
- 0b0111  Armv8.1, v8 Debug architecture, with Virtualization Host Extensions.
- 0b1000  Armv8.2, v8.2 Debug architecture.
- 0b1001  Armv8.4, v8.4 Debug architecture.

All other values are reserved.

In any Armv8 implementation, the values 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

- If FEAT_VHE is not implemented, the only permitted value is 0b0110.
- In an Armv8.0 implementation, the value 0b1000 or higher is not permitted.

Bit [15]

Reserved, RES1.

nSUHD_imp, bit [14]

In Armv7-A, was Secure User Halting Debug not implemented.

The value of this bit must match the value of the SE_imp bit.

Bit [13]

Reserved, RES0.

SE_imp, bit [12]

EL3 implemented. The meanings of the values of this bit are:

- 0b0  EL3 not implemented.
- 0b1  EL3 implemented.

The value of this bit must match the value of the nSUHD_imp bit.

Bits [11:0]

Reserved, RES0.

Accessing the DBGDIDR

Arm deprecates any access to this register from EL0.

Accesses to this register use the following encodings in the System instruction encoding space:

\[ \text{MRC}\{<c>\}{<q>}\ <\text{coproc}, \{\#<opc1>, <Rt>, <CRn>, <CRm>, \{\#<opc2>\}} \]

G8.3.12  DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

Configurations

AArch32 System register DBGDRAR[63:0] is architecturally mapped to AArch64 System register MDRAR_EL1[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDRAR are UNDEFINED.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

Field descriptions

The DBGDRAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-48</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>47-12</td>
<td>ROMADDR[47:12]</td>
</tr>
<tr>
<td>11-2</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>2-0</td>
<td>Valid</td>
</tr>
</tbody>
</table>

Bits [63:48]

Reserved, RES0.

ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

If DBGDRAR.Valid == 0b00, then this field is UNKNOWN.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

00: ROM Table address is not valid. Software must ignore ROMADDR.

1: ROM Table address is valid.

Other values are reserved.
Accessing the DBGDRAR

Accesses to this register use the following encodings in the System instruction encoding space:

\[ \text{MRC}\{<c>\}\{<q>\} <\text{coproc}>, \{#<opc1>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#<opc2>\}\} \]

G8.3.13 DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

Purpose

In earlier versions of the Arm Architecture, this register defines the offset from the base address defined in DBGDRAR of the physical base address of the debug registers for the PE. Armv8 deprecates any use of this register.

Configurations

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSAR are UNDEFINED.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

Field descriptions

The DBGDSAR bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:2]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[1:0]</td>
<td>Reserved, RAZ.</td>
</tr>
</tbody>
</table>

This field indicates whether the debug self address offset is valid. For ARMv8, this field is always 0b00, the offset is not valid.

Accessing the DBGDSAR

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}(<c>)(<q>)\ <\text{coproc}>, \ #<\text{opc1}>, \ <\text{Rt}>, \ <\text{CRn}>, \ <\text{CRm}>, \ (#)<\text{opc2}>

### G8.3.14 DBGDSCRext, Debug Status and Control Register, External View

The DBGDSCRext characteristics are:

**Purpose**

Main control register for the debug implementation.

**Configurations**

AArch32 System register DBGDSCRext[31:0] is architecturally mapped to AArch64 System register MDSCR_EL1[31:0].

AArch32 System register DBGDSCRext[15:2] is architecturally mapped to AArch32 System register DBGDSRint[15:2].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSCRext are UNDEFINED.

This register is required in all implementations.

**Attributes**

DBGDSCRext is a 32-bit register.

**Field descriptions**

The DBGDSCRext bit assignments are:

```
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11  7  6  5  2  1  0
  TFO  RXfull  TXfull  RES0  RXO  TXU  RES0  INTdis  TDA  RES0  SC2  SPNIDdis  SPIldis
  NS  RES0  MOE
```

**TFO, bit [31]**

*When FEAT_TRF is implemented:*

Trace Filter override. Used for save/restore of EDSCR.TFO.

When the OS Lock is unlocked, DBGSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.

When the OS Lock is locked, DBGSLSR.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:

- When DBGSLSR.OSLK == 1, access to this field is RW.
- When DBGSLSR.OSLK == 0, access to this field is RO.

*Otherwise:*

Reserved, RES0.
RXfull, bit [30]

DTRRX full. Used for save/restore of `EDSCR.RXfull`.
When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.
When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.RXfull`. Reads and writes of this bit are indirect accesses to `EDSCR.RXfull`.
Arm deprecates use of this bit other than for save/restore. Use `DBGDSCRint` to access the DTRRX full status.
The architected behavior of this field determines the value it returns after a reset.
Accessing this field has the following behavior:
• When `DBGOSLSR.OSLK == 1`, access to this field is RW.
• When `DBGOSLSR.OSLK == 0`, access to this field is RO.

TXfull, bit [29]

DTRTX full. Used for save/restore of `EDSCR.TXfull`.
When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.
When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.TXfull`. Reads and writes of this bit are indirect accesses to `EDSCR.TXfull`.
Arm deprecates use of this bit other than for save/restore. Use `DBGDSCRint` to access the DTRTX full status.
The architected behavior of this field determines the value it returns after a reset.
Accessing this field has the following behavior:
• When `DBGOSLSR.OSLK == 1`, access to this field is RW.
• When `DBGOSLSR.OSLK == 0`, access to this field is RO.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of `EDSCR.RXO`.
When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.
When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.RXO`. Reads and writes of this bit are indirect accesses to `EDSCR.RXO`.
The architected behavior of this field determines the value it returns after a reset.
Accessing this field has the following behavior:
• When `DBGOSLSR.OSLK == 1`, access to this field is RW.
• When `DBGOSLSR.OSLK == 0`, access to this field is RO.

TXU, bit [26]

Used for save/restore of `EDSCR.TXU`.
When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.
When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.TXU`. Reads and writes of this bit are indirect accesses to `EDSCR.TXU`.
The architected behavior of this field determines the value it returns after a reset.
Accessing this field has the following behavior:
• When `DBGOSLSR.OSLK == 1`, access to this field is RW.
• When `DBGOSLSR.OSLK == 0`, access to this field is RO.

Bits [25:24]

Reserved, RES0.
INTdis, bits [23:22]

Used for save/restore of EDSCR.INTdis.

When DBGOSLR.OSLK == 0, this field is RO, and software must treat it as UNK/SBZP.
When DBGOSLR.OSLK == 1, this field is RW and holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.

The architected behavior of this field determines the value it returns after a reset.
Accessing this field has the following behavior:
• When DBGOSLR.OSLK == 1, access to this field is RW.
• When DBGOSLR.OSLK == 0, access to this field is RO.

TDA, bit [21]

Used for save/restore of EDSCR.TDA.
When DBGOSLR.OSLK == 0, software must treat this bit as UNK/SBZP.
When DBGOSLR.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.

The architected behavior of this field determines the value it returns after a reset.
Accessing this field has the following behavior:
• When DBGOSLR.OSLK == 1, access to this field is RW.
• When DBGOSLR.OSLK == 0, access to this field is RO.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of EDSCR.SC2.
When DBGOSLR.OSLK == 0, software must treat this bit as UNK/SBZP.
When DBGOSLR.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.

Accessing this field has the following behavior:
• When DBGOSLR.OSLK == 1, access to this field is RW.
• When DBGOSLR.OSLK == 0, access to this field is RO.

Otherwise:
Reserved, RES0.

NS, bit [18]

Non-secure status. Returns the inverse of IsSecure().
Arm deprecates use of this field.
Access to this field is RO.

SPNIDdis, bit [17]

When EL3 is implemented:

Secure privileged profiling disabled status bit.
0b0 Profiling allowed in Secure privileged modes.
0b1 Profiling prohibited in Secure privileged modes.

This field reads as 0 if any of the following applies, and reads as 1 otherwise:
• FEAT_Debugv8p2 is not implemented and ExternalSecureNonInvasiveDebugEnabled() returns TRUE.
• EL3 is using AArch32 and the value of SDCR.SPME is 1.
• EL3 is using AArch64 and the value of MDCR_EL3.SPME is 1.
  Arm deprecates use of this field.
  Access to this field is RO.

**Otherwise:**
Reserved, RES0.

**SPIDdis, bit [16]**

*When EL3 is implemented:*
Secure privileged AArch32 invasive self-hosted debug disabled status bit. The value of this bit depends on the value of SDCR.SPD and the pseudocode function AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled().

0b0  Self-hosted debug enabled in Secure privileged AArch32 modes.
0b1  Self-hosted debug disabled in Secure privileged AArch32 modes.

This bit reads as 1 if any of the following is true and reads as 0 otherwise:
• EL3 is using AArch32 and SDCR.SPD has the value 0b10.
• EL3 is using AArch64 and MDCR_EL3.SPD32 has the value 0b10.
• EL3 is using AArch32, SDCR.SPD has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.
• EL3 is using AArch64, MDCR_EL3.SPD32 has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.

Arm deprecates use of this field.
Access to this field is RO.

**Otherwise:**
Reserved, RES0.

**MDBGen, bit [15]**
Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

0b0  Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
0b1  Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

On a Warm reset, this field resets to 0.

**HDE, bit [14]**
Used for save/restore of EDSCR.HDE.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBZP.
When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.
The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:
• When DBGOSLSR.OSLK == 1, access to this field is RW.
• When DBGOSLSR.OSLK == 0, access to this field is RO.

**Bit [13]**
Reserved, RES0.

**UDCCdis, bit [12]**
Traps EL0 accesses to the DCC registers to Undefined mode.

0b0  This control does not cause any instructions to be trapped.
0b1  EL0 accesses to the DBGDSCRint, DBGDTRRXint, DBGDTRTXint, DBGDIR, DBGDSAR, and DBGDRAR are trapped to Undefined mode.
Note

All accesses to these registers are trapped, including LDC and STC accesses to DBGDTRXINT and DBGDTRRXINT, and MRRC accesses to DBGDSAR and DBGDRAR.

Traps of EL0 accesses to the DBGDTRXINT and DBGDTRTXINT are ignored in Debug state.

On a Warm reset, this field resets to 0.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of EDSCR.ERR.

When DBGOSLSR.OSLK == 0, software must treat this bit as UNK/SBP.

When DBGOSLSR.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When DBGOSLSR.OSLK == 1, access to this field is RW.
- When DBGOSLSR.OSLK == 0, access to this field is RO.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

- 0b0001 Breakpoint.
- 0b0011 Software breakpoint (BKPT) instruction.
- 0b0101 Vector catch.
- 0b1010 Watchpoint.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the DBGDSRtxt

Individual fields within this register might have restricted accessibility when the OS lock is unlocked, DBGOSLSR.OSLK == 0. See the field descriptions for more detail.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}(<c>){<q>} <\text{coproc}>, {(#)}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>{, {(#)}<\text{opc2}>}
\]

G8.3.15 DBGDSCRint, Debug Status and Control Register, Internal View

The DBGDSCRint characteristics are:

Purpose

Main control register for the debug implementation. This is an internal, read-only view.

Configurations

AArch32 System register DBGDSCRint[30:29] is architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].
AArch32 System register DBGDSCRint[15:2] is architecturally mapped to AArch32 System register DBGDSCRext[15:2].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDSCRint are UNDEFINED.
This register is required in all implementations.

DBGDSCRint. {NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} are UNKNOWN when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither UNPREDICTABLE nor return UNKNOWN values, it is permissible for an implementation to return the values of DBGDSCRext. {NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)

Attributes

DBGDSCRint is a 32-bit register.

Field descriptions

The DBGDSCRint bit assignments are:

<table>
<thead>
<tr>
<th>Position</th>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td>RXfull, bit [30]</td>

<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

Bit [31]  
Reserved, RES0.

RXfull, bit [30]  
DTRRX full. Read-only view of the equivalent bit in the EDSCR.

TXfull, bit [29]  
DTRTX full. Read-only view of the equivalent bit in the EDSCR.

Bits [28:19]  
Reserved, RES0.
NS, bit [18]
Non-secure status.
Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

SPNIDdis, bit [17]
Secure privileged non-invasive debug disable.
Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

SPIDdis, bit [16]
Secure privileged invasive debug disable.
Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

MDBGen, bit [15]
Monitor debug events enable.
Read-only view of the equivalent bit in the DBGDSCRext.

Bits [14:13]
Reserved, RES0.

UDCCdis, bit [12]
User mode access to Debug Communications Channel disable.
Read-only view of the equivalent bit in the DBGDSCRext. Arm deprecates use of this field.

Bits [11:6]
Reserved, RES0.

MOE, bits [5:2]
Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0001</td>
<td>Breakpoint</td>
</tr>
<tr>
<td>0b0011</td>
<td>Software breakpoint (BKPT) instr</td>
</tr>
<tr>
<td>0b0101</td>
<td>Vector catch</td>
</tr>
<tr>
<td>0b1010</td>
<td>Watchpoint</td>
</tr>
</tbody>
</table>

Read-only view of the equivalent bit in the DBGDSCRext.

Bits [1:0]
Reserved, RES0.

Accessing the DBGDSCRint
Accesses to this register use the following encodings in the System instruction encoding space:

\[
MRC\{<c>\}{<q>}\ <coproc>, \ (#)<opc1>, \ <Rt>, \ <CRn>, \ <CRm>, \ (#)<opc2>
\]

<table>

G8.3.16 DBGDTRRXext, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRXext characteristics are:

**Purpose**

Used for save/restore of DBGDTRRXint. It is a component of the Debug Communications Channel.

**Configurations**

AArch32 System register DBGDTRRXext[31:0] is architecturally mapped to AArch64 System register OSDTRRX_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRRXext are UNDEFINED.

**Attributes**

DBGDTRRXext is a 32-bit register.

**Field descriptions**

The DBGDTRRXext bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 0</td>
<td>Update DTRRX without side-effect</td>
</tr>
</tbody>
</table>

Accessing the DBGDTRRXext

Arm deprecates reads and writes of DBGDTRRXext through the System register interface when the OS Lock is unlocked, DBGOSLSR.OSLK = 0.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}(\langle c\rangle\langle q\rangle, \langle \#\rangle\langle opc1\rangle, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle, \langle \#\rangle\langle opc2\rangle)
\]

G8.3.17  DBGDTRRXint, Debug Data Transfer Register, Receive

The DBGDTRRXint characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger
transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural
mappings. It is a component of the Debug Communications Channel.

Configurations

AArch32 System register DBGDTRRXint[31:0] is architecturally mapped to AArch64 System
register DBGDTRRX_EL0[31:0].

AArch32 System register DBGDTRRXint[31:0] is architecturally mapped to External register
DBGDTRRX_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct
accesses to DBGDTRRXint are UNDEFINED.

Attributes

DBGDTRRXint is a 32-bit register.

Field descriptions

The DBGDTRRXint bit assignments are:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
</tr>
<tr>
<td>Update DTRRX</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:0]

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug
Communication Channel and Instruction Transfer Register.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRRXint

Data can be stored to memory from this register using STC.

Accesses to this register use the following encodings in the System instruction encoding space:

\[ MRC{\langle c\rangle}{\langle q\rangle} \langle coproc\rangle, \{\#\langle opc1\rangle\}, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle, \{\#\langle opc2\rangle\} \]

\[
\begin{array}{cccccc}
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
0b1110 & 0b000 & 0b0000 & 0b0101 & 0b000 \\
\end{array}
\]

G8.3.18  DBGDTRTXext, Debug OS Lock Data Transfer Register, Transmit

The DBGDTRTXext characteristics are:

**Purpose**

Used for save/restore of DBGDTRTXint. It is a component of the Debug Communication Channel.

**Configurations**

AArch32 System register DBGDTRTXext[31:0] is architecturally mapped to AArch64 System register OSDTRTX_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTRTXext are UNDEFINED.

**Attributes**

DBGDTRTXext is a 32-bit register.

**Field descriptions**

The DBGDTRTXext bit assignments are:

Return DTRTX without side-effect.

- Reads of this register return the value in DTRTX and do not change TXfull.
- Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTRTXext**

Arm deprecates reads and writes of DBGDTRTXext through the System register interface when the OS Lock is unlocked, DBGOSLSR.OSLK == 0.

Accesses to this register use the following encodings in the System instruction encoding space:

G8.3.19 DBGDTXTXint, Debug Data Transfer Register, Transmit

The DBGDTXTXint characteristics are:

**Purpose**

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

**Configurations**

AArch32 System register DBGDTXTXint[31:0] is architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

AArch32 System register DBGDTXTXint[31:0] is architecturally mapped to External register DBGDTRTX_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGDTXTXint are UNDEFINED.

**Attributes**

DBGDTXTXint is a 32-bit register.

**Field descriptions**

The DBGDTXTXint bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return DTRTX</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Return DTRTX.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the DBGDTXTXint**

Data can be loaded from memory into this register using LDC (immediate) and LDC (literal).

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MCR}\langle c\rangle\langle q\rangle, \langle\#\rangle\langle opc1\rangle, \langle Rt\rangle, \langle CRn\rangle, \langle CRm\rangle, (\#)\langle opc2\rangle
\]

<table>

G8.3.20   DBGOSDLR, Debug OS Double Lock Register

The DBGOSDLR characteristics are:

Purpose

Locks out the external debug interface.

Configurations

AArch32 System register DBGOSDLR[31:0] is architecturally mapped to AArch64 System register
OSDLR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct
accesses to DBGOSDLR are UNDEFINED.

Attributes

DBGOSDLR is a 32-bit register.

Field descriptions

The DBGOSDLR bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  6 |  5 |  4 |  3 |  2 |  1 |  0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | DLK |

Bits [31:1]

Reserved, RES0.

DLK, bit [0]

When FEAT_DoubleLock is implemented:

OS Double Lock control bit.

0b0   OS Double Lock unlocked.

0b1   OS Double Lock locked, if DBGPRCR.CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

Accessing the DBGOSDLR

Accesses to this register use the following encodings in the System instruction encoding space:

\[ \text{MRC}(<c>)(<q>) <\text{coproc}>, (<#>)<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, (<#>)<\text{opc2}> \]

G8.3.21 DBGOSECCR, Debug OS Lock Exception Catch Control Register

The DBGOSECCR characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

Configurations

AArch32 System register DBGOSECCR[31:0] is architecturally mapped to AArch64 System register OSECCR_EL1[31:0].

AArch32 System register DBGOSECCR[31:0] is architecturally mapped to External register EDECCR[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGOSECCR are UNDEFINED.

If DBGOSLSR.OSLK == 0 then DBGOSECCR returns an UNKNOWN value on reads and ignores writes.

Attributes

DBGOSECCR is a 32-bit register.

Field descriptions

The DBGOSECCR bit assignments are:

When DBGOSLSR.OSLK == 1:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>EDECCR</td>
<td></td>
</tr>
</tbody>
</table>

EDECCR, bits [31:0]

Used for save/restore to EDECCR over powerdown.

Reads or writes to this field are indirect accesses to EDECCR.

Accessing the DBGOSECCR

Accesses to this register use the following encodings in the System instruction encoding space:

\[ \text{MRC}\{<c>\}\{<q>\} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\} \]

</table>

OSLA, bits [31:0]

OS Lock Access. Writing the value 0xC5ACCE55 to the DBGOSLAR sets the OS lock to 1. Writing any other value sets the OS lock to 0.

Use DBGOSLSR.OSLK to check the current status of the lock.

Accessing the DBGOSLAR

Accesses to this register use the following encodings in the System instruction encoding space:

\[ MCR\{<c>\}\{<q>\} <coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{#\}<opc2>\} \]

if PSTATE.EL == EL0 then
  UNDEFINED;
elsif PSTATE.EL == EL1 then

G8.3.23  DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

Purpose

Provides status information for the OS Lock.

Configurations

AArch32 System register DBGOSLSR[31:0] is architecturally mapped to AArch64 System register OSLSR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGOSLSR are UNDEFINED.

The OS Lock status is also visible in the external debug interface through EDPRSR.

Attributes

DBGOSLSR is a 32-bit register.

Field descriptions

The DBGOSLSR bit assignments are:

```
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10  9  8  7  6  5  4  3  2  1  0
   RES0   OSLM[1]   OSLM[0]   nTT   OSLK
```

Bits [31:4]

Reserved, RES0.

OSLM[1], bit [3]

This field is bit[1] of OSLM[1:0].

OS lock model implemented. Identifies the form of OS save and restore mechanism implemented.

0b00  OS Lock not implemented.

0b10  OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

•  OSLM[1] is DBGOSLSR[3].
•  OSLM[0] is DBGOSLSR[0].

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]

OS Lock Status. The possible values are:

0b0  OS Lock unlocked.

0b1  OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.
On a Cold reset, this field resets to 1.
On a Warm reset, the value of this field is unchanged.

**OSLM[0], bit [0]**

This field is bit[0] of OSLM[1:0].
See OSLM[1] for the field description.

**Accessing the DBGOSLSR**

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>

  end
elsif PSTATE.EL == EL3 then
  return DBGOSLSR;
G8.3.24  DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

Purpose

Controls behavior of the PE on powerdown request.

Configurations

AArch32 System register DBGPRCR[31:0] is architecturally mapped to AArch64 System register DBGPRCR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGPRCR are UNDEFINED.

Bit [0] of this register is mapped to EDPRCR.CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

Attributes

DBGPRCR is a 32-bit register.

Field descriptions

The DBGPRCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>CORENPDRQ</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:1]

Reserved, RES0.

CORENPDRQ, bit [0]

When FEAT_DoPD is implemented:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0  If the system responds to a powerdown request, it powers down Core power domain.

0b1  If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see Core power domain power states on page H6-7118.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

On a Warm reset, the value of this field is unchanged.

Otherwise:
Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

\[
\begin{align*}
0b0 & \quad \text{If the system responds to a powerdown request, it powers down Core power domain.} \\
0b1 & \quad \text{If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.}
\end{align*}
\]

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see Core power domain power states on page H6-7118.

Note

 Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.

On a Warm reset, the value of this field is unchanged.

Accessing the DBGPRCR

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC\{<c>\}{<q>} <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>\}, \{#<opc2>\}}
\]

<table>

G8.3.25 DBGVCR, Debug Vector Catch Register

The DBGVCR characteristics are:

**Purpose**

Controls Vector Catch debug events.

**Configurations**

AArch32 System register DBGVCR[31:0] is architecturally mapped to AArch64 System register DBGVCR32_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGVCR are UNDEFINED.

This register is required in all implementations.

**Attributes**

DBGVCR is a 32-bit register.

**Field descriptions**

The DBGVCR bit assignments are:

*When EL3 is implemented and EL3 is using AArch32:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSP, bit [27]**

Prefetch Abort vector catch enable in Non-secure state.
The exception vector offset is `0x0C`.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSS, bit [26]**

Supervisor Call (SVC) vector catch enable in Non-secure state.
The exception vector offset is `0x08`.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**NSU, bit [25]**

Undefined Instruction vector catch enable in Non-secure state.
The exception vector offset is `0x04`.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [24:16]**

Reserved, **RES0**.

**MF, bit [15]**

FIQ vector catch enable in Monitor mode.
The exception vector offset is `0x1C`.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MI, bit [14]**

IRQ vector catch enable in Monitor mode.
The exception vector offset is `0x18`.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bit [13]**

Reserved, **RES0**.

**MD, bit [12]**

Data Abort vector catch enable in Monitor mode.
The exception vector offset is `0x10`.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MP, bit [11]**

Prefetch Abort vector catch enable in Monitor mode.
The exception vector offset is `0x0C`.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**MS, bit [10]**

Secure Monitor Call (SMC) vector catch enable in Monitor mode.
The exception vector offset is `0x08`.
On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Bits [9:8]**

Reserved, **RES0**.

**SF, bit [7]**

FIQ vector catch enable in Secure state.
The exception vector offset is 0x1C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SI, bit [6]**

IRQ vector catch enable in Secure state.
The exception vector offset is 0x18.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

Reserved, RES0.

**SD, bit [4]**

Data Abort vector catch enable in Secure state.
The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SP, bit [3]**

Prefetch Abort vector catch enable in Secure state.
The exception vector offset is 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SS, bit [2]**

Supervisor Call (SVC) vector catch enable in Secure state.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SU, bit [1]**

Undefined Instruction vector catch enable in Secure state.
The exception vector offset is 0x04.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [0]**

Reserved, RES0.

*When EL3 is implemented and EL3 is using AArch64:*

**NSF, bit [31]**

FIQ vector catch enable in Non-secure state.
The exception vector offset is 0x1C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSI, bit [30]**

- IRQ vector catch enable in Non-secure state.
- The exception vector offset is 0x18.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [29]**

- Reserved, RES0.

**NSD, bit [28]**

- Data Abort vector catch enable in Non-secure state.
- The exception vector offset is 0x10.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSP, bit [27]**

- Prefetch Abort vector catch enable in Non-secure state.
- The exception vector offset is 0x0C.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSS, bit [26]**

- Supervisor Call (SVC) vector catch enable in Non-secure state.
- The exception vector offset is 0x08.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**NSU, bit [25]**

- Undefined Instruction vector catch enable in Non-secure state.
- The exception vector offset is 0x04.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [24:8]**

- Reserved, RES0.

**SF, bit [7]**

- FIQ vector catch enable in Secure state.
- The exception vector offset is 0x1C.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SI, bit [6]**

- IRQ vector catch enable in Secure state.
- The exception vector offset is 0x18.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bit [5]**

- Reserved, RES0.

**SD, bit [4]**

- Data Abort vector catch enable in Secure state.
- The exception vector offset is 0x10.
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

**SP, bit [3]**

- Prefetch Abort vector catch enable in Secure state.
The exception vector offset is 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]
Supervisor Call (SVC) vector catch enable in Secure state.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]
Undefined Instruction vector catch enable in Secure state.
The exception vector offset is 0x04.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]
Reserved, RES0.

_When EL3 is not implemented:_

```
+---------+---------+---------+---------+---------+---------+---------+
| 31      | 30      | 29      | 28      | 27      | 26      | 25      |
| RES0    | F       | I       | D       | P       | S       | U       |
+---------+---------+---------+---------+---------+---------+---------+
```

Bits [31:8]
Reserved, RES0.

F, bit [7]
FIQ vector catch enable.
The exception vector offset is 0x1C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]
IRQ vector catch enable.
The exception vector offset is 0x18.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]
Reserved, RES0.

D, bit [4]
Data Abort vector catch enable.
The exception vector offset is 0x10.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]
Prefetch Abort vector catch enable.
The exception vector offset 0x0C.
On a Warm reset, this field resets to an architecturally UNKNOWN value.
S, bit [2]

Supervisor Call (SVC) vector catch enable.
The exception vector offset is 0x08.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.
The exception vector offset is 0x04.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing the DBGVCR

Accesses to this register use the following encodings in the System instruction encoding space:

\[

G8.3.26  DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>.

**Configurations**

AArch32 System register DBGWCR<n>[31:0] is architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

AArch32 System register DBGWCR<n>[31:0] is architecturally mapped to External register DBGWCR<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWCR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

**Attributes**

DBGWCR<n> is a 32-bit register.

**Field descriptions**

The DBGWCR<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>29</th>
<th>28</th>
<th>24</th>
<th>23</th>
<th>21</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>MASK</td>
<td>RES0</td>
<td>LBN</td>
<td>SSC</td>
<td>BAS</td>
<td>LSC</td>
<td>PAC</td>
<td>E</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

- 0b00000: No mask.
- 0b00001: Reserved.
- 0b00010: Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0xFFFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.
Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

0b0  Unlinked data address match.
0b1  Linked data address match.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the
Context-matching breakpoint linked to.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for
watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.
For more information, see Execution conditions for which a breakpoint generates Breakpoint
exceptions on page G2-5880, and Reserved DBGBCR<n>.{SSC, HMC, PMC} values on
page G2-5891.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug
event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC
fields.
For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions
for which a watchpoint generates Watchpoint exceptions on page G2-5897.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or
double-word addressed by DBGWVR<n> is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxxxxx1x</td>
<td>Match byte at DBGWVR&lt;n&gt;</td>
</tr>
<tr>
<td>0bxxxxxx1x</td>
<td>Match byte at DBGWVR&lt;n&gt;+1</td>
</tr>
<tr>
<td>0bxxxxxx1x</td>
<td>Match byte at DBGWVR&lt;n&gt;+2</td>
</tr>
<tr>
<td>0bxxxxxx1x</td>
<td>Match byte at DBGWVR&lt;n&gt;+3</td>
</tr>
</tbody>
</table>
In cases where DBGWVR<n> addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;n&gt;[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0bxxxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+4</td>
</tr>
<tr>
<td>0bxx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+5</td>
</tr>
<tr>
<td>0bx1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+6</td>
</tr>
<tr>
<td>0b1xxxx</td>
<td>Match byte at DBGWVR&lt;n&gt;+7</td>
</tr>
</tbody>
</table>

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See Reserved DBGWCR<n>.BAS values on page G2-5905.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

LSC, bits [4:3]
Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:
- 0b01  Match instructions that load from a watchpointed address.
- 0b10  Match instructions that store to a watchpointed address.
- 0b11  Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

PAC, bits [2:1]
Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page G2-5897.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

E, bit [0]
Enable watchpoint n. Possible values are:
- 0b0  Watchpoint disabled.
- 0b1  Watchpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

Accessing the DBGWCR<n>

### G8.3.27 DBGWFAR, Debug Watchpoint Fault Address Register

The DBGWFAR characteristics are:

**Purpose**

Previously returned information about the address of the instruction that accessed a watchpointed address. Is now deprecated and RES0.

**Configurations**

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWFAR are UNDEFINED.

**Attributes**

DBGWFAR is a 32-bit register.

**Field descriptions**

The DBGWFAR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>RES0</th>
</tr>
</thead>
</table>

**Accessing the DBGWFAR**

Accesses to this register use the following encodings in the System instruction encoding space:

G8.3.28  DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>.

Configurations

AArch32 System register DBGWVR<n>[31:0] is architecturally mapped to AArch64 System register DBGWVR<n>_EL1[31:0].

AArch32 System register DBGWVR<n>[31:0] is architecturally mapped to External register DBGWVR<n>_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DBGWVR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWVR<n> is a 32-bit register.

Field descriptions

The DBGWVR<n> bit assignments are:

\[
\begin{array}{cccc}
31 & 2 & 1 & 0 \\
\hline
VA & & & \\
\end{array}
\]

VA, bits [31:2]

Bits[31:2] of the address value for comparison.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

Bits [1:0]

Reserved, RES0.

Accessing the DBGWVR<n>

Accesses to this register use the following encodings in the System instruction encoding space:

\[
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.3.29 DLR, Debug Link Register

The DLR characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configurations

AArch32 System register DLR[31:0] is architecturally mapped to AArch64 System register DLR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DLR are UNDEFINED.

Attributes

DLR is a 32-bit register.

Field descriptions

The DLR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Restart address</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
</tr>
<tr>
<td>Restart address</td>
<td></td>
</tr>
</tbody>
</table>

Accessing the DLR

Accesses to this register use the following encodings in the System instruction encoding space:

\[
MRC\{<c>\}{<q>} <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>\}, \{#<opc2>\}
\]

\[
\begin{array}{cccccc}
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
0b1111 & 0b011 & 0b0100 & 0b0101 & 0b001 \\
\end{array}
\]

\[
\text{if } \neg \text{Halted}() \text{ then}
\]
\[
\text{UNDEFINED;}
\]
\[
\text{else}
\]
\[
\text{return DLR;}
\]

\[
MCR\{<c>\}{<q>} <coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>\}, \{#<opc2>\}
\]

\[
\begin{array}{cccccc}
\text{coproc} & \text{opc1} & \text{CRn} & \text{CRm} & \text{opc2} \\
0b1111 & 0b011 & 0b0100 & 0b0101 & 0b001 \\
\end{array}
\]

\[
\text{if } \neg \text{Halted}() \text{ then}
\]
\[
\text{UNDEFINED;}
\]
\[
\text{else}
\]
\[
\text{DLR} = R[t];
\]
G8.3.30 DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configurations

AArch32 System register DSPSR[31:0] is architecturally mapped to AArch64 System register DSPSR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to DSPSR are UNDEFINED.

Attributes

DSPSR is a 32-bit register.

Field descriptions

The DSPSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>N</td>
<td>Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>30</td>
<td>Z</td>
<td>Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>29</td>
<td>C</td>
<td>Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>28</td>
<td>V</td>
<td>Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>27</td>
<td>Q</td>
<td>Overflow or saturation flag. Set to the value of PSTATE.Q on entering Debug state, and copied to PSTATE.Q on exiting Debug state. This field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>

[Diagram of DSPSR bit assignments]
IT[1:0], bits [26:25]

If-Then. Set to the value of PSTATE.IT[1:0] on entering Debug state, and copied to PSTATE.IT[1:0] on exiting Debug state.

On exiting Debug state DSPSR.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on entering Debug state, and copied to PSTATE.GE on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

IT[7:2], bits [15:10]

If-Then. Set to the value of PSTATE.IT[7:2] on entering Debug state, and copied to PSTATE.IT[7:2] on exiting Debug state.

DSPSR.IT must contain a value that is valid for the instruction being returned to.

This field resets to an architecturally UNKNOWN value.
E, bit [9]

Endianness. Set to the value of PSTATE.E on entering Debug state, and copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR.E is RES0. If the implementation does not support little-endian operation, DSPSR.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR.E is RES1.

This field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on entering Debug state, and copied to PSTATE.T on exiting Debug state.

This field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on entering Debug state, and copied to PSTATE.M[4:0] on exiting Debug state.

- 0b10000 User.
- 0b10001 FIQ.
- 0b10010 IRQ.
- 0b10011 Supervisor.
- 0b10110 Monitor.
- 0b10111 Abort.
- 0b11010 Hyp.
- 0b11011 Undefined.
- 0b11111 System.

Other values are reserved. If DSPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in Illegal return events from AArch32 state on page G1-5766.

This field resets to an architecturally UNKNOWN value.

### Accessing the DSPSR

Accesses to this register use the following encodings in the System instruction encoding space:
MRC\{<c>|<q>|\} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b011</td>
<td>0b0100</td>
<td>0b0101</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if !Halted() then
    UNDEFINED;
else
    return DSPSR;

MCR\{<c>|<q>|\} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b011</td>
<td>0b0100</td>
<td>0b0101</td>
<td>0b000</td>
</tr>
</tbody>
</table>

if !Halted() then
    UNDEFINED;
else
    DSPSR = R[t];
G8.3.31 HDCR, Hyp Debug Control Register

The HDCR characteristics are:

**Purpose**

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

**Configurations**

AArch32 System register HDCR[31:0] is architecturally mapped to AArch64 System register MDCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to HDCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3, and other than for a direct read of the register, the PE behaves as if HDCR.HPMN == PMCR.N.

**Attributes**

HDCR is a 32-bit register.

**Field descriptions**

The HDCR bit assignments are:

<table>
<thead>
<tr>

<td>HPMD</td>
</tr>
</tbody>
</table>

**Bits [31:29]**

Reserved, RES0.

**MTPME, bit [28]**

*When FEAT_MTPMU is implemented and EL3 is not implemented:*

Multi-threaded PMU Enable. Enables use of the PMEVTYPE<0>M.T bits.

- 0b0: FEAT_MTPMU is disabled. The Effective value of PMEVTYPE<0>M.T is zero.
- 0b1: PMEVTYPE<0>M.T bits not affected by this bit.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

On a Cold reset, in a system where the PE resets into EL2 or EL3, this field resets to 1.

*Otherwise:*

Reserved, RES0.
TDCC, bit [27]

*When FEAT_FGT is implemented:*

- Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.
  - 0b0: This control does not cause any register accesses to be trapped.
  - 0b1: If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Hyp Trap exception, unless the access also generates a higher priority exception.

Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:
- `DBGDTRRXext, DBGDTRTText, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXXint`.

The traps are reported with EC syndrome value:
- 0x05 for trapped `MRC` and `MCR` accesses with `coproc == 0b1110`.
- 0x06 for trapped `LDC` to `DBGDTRTXXint` and `STC` from `DBGDTRRXint`.

When the PE is in Debug state, HDCR.TDCC does not trap any accesses to:
- `DBGDTRRXint` and `DBGDTRTXXint`.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

HLP, bit [26]

*When FEAT_PMUv3p5 is implemented:*

- Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.
  - 0b0: Event counter overflow on increment that causes unsigned overflow of `PMEVCNTR<n>[31:0]`.
  - 0b1: Event counter overflow on increment that causes unsigned overflow of `PMEVCNTR<n>[63:0]`.

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is read/write or RAZ/WI.

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range `[HDCR.HPMN..(PMCR.N-1)]`. Otherwise this bit has no effect on the operation of the event counters.

Note

The effect of HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HDCR.HPMN field.

Note

`PMEVCNTR<n>[63:32]` cannot be accessed directly in AArch32 state.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

*Otherwise:*

Reserved, RES0.

**Bits [25:24]**

Reserved, RES0.
HCCD, bit [23]

When `FEAT_PMUv3p5` is implemented:

- Hypervisor Cycle Counter Disable. Prohibits `PMCCNTR` from counting at EL2.
  - 0b0  Cycle counting by `PMCCNTR` is not affected by this bit.
  - 0b1  Cycle counting by `PMCCNTR` is prohibited at EL2.

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

When `FEAT_TRF` is implemented:

- Traps use of the Trace Filter Control registers at EL1 to EL2.
  - 0b0  Accesses to `TRFCR` at EL1 are not affected by this control bit.
  - 0b1  Accesses to `TRFCR` at EL1 generate a Hyp Trap exception.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When `FEAT_PMUv3p1` is implemented:

- Guest Performance Monitors Disable. This control prohibits event counting at EL2.
  - 0b0  Event counting allowed in Hyp mode.
  - 0b1  Event counting prohibited in Hyp mode.

If `FEAT_Debugv8p2` is not implemented, event counting is prohibited unless enabled by the `IMPLEMENTATION DEFINED` authentication interface `ExternalSecureNoninvasiveDebugEnabled()`.

This control applies only to:
- The event counters in the range `[0..(HDCR.HPMN-1)]`.
- If `PMCR.DP` is set to 1, `PMCCNTR`.

The other event counters are unaffected. When `PMCR.DP` is set to 0, `PMCCNTR` is unaffected.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:12]

Reserved, RES0.

TDRA, bit [11]

- Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode.
  - 0b0  This control does not cause any instructions to be trapped.
0b1  Non-secure EL0 and EL1 System register accesses to the DBGDRAR or DBGDSAR are trapped to Hyp mode, unless it is trapped by DBGDSCRext.UDCCdis.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDOSA, bit [10]

**When FEAT_DoubleLock is implemented:**
Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

0b0  This control does not cause any instructions to be trapped.

0b1  Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:
- DBGOSLSR, DBGOSLAR, DBGOSDLR, and DBGPRCR.
- Any implementation defined register with similar functionality that the implementation specifies as trapped by this bit.

--- Note ---
These registers are not accessible at EL0.

---
If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**
Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

0b0  This control does not cause any instructions to be trapped.

0b1  Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:
- DBGOSLSR, DBGOSLAR, and DBGPRCR.
- Any implementation defined register with similar functionality that the implementation specifies as trapped by this bit.

It is implementation defined whether accesses to DBGOSDLR are trapped.

--- Note ---
These registers are not accessible at EL0.

---
If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDA, bit [9]

Trap debug access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers in the (coproc==0b1110) encoding space that are not trapped by either of the following:
- HDCR.TDRA.
- HDCR.TDOSA.

0b0  This control does not cause any instructions to be trapped.
Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by HDCR.TDRA and HDCR.TDOSA, are trapped to Hyp mode, unless it is trapped by DBGDSCRext:UDCCdis.

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**TDE, bit [8]**

Trap Debug exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, ELD.

0b0  The debug target Exception level is EL1.

0b1  If EL2 is enabled for the current Effective value of SCR.NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1.

The HDCR.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see *Routing debug exceptions on page G2-5859*.

When HCR.TGE == 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**HPME, bit [7]**

*When FEAT_PMUv3 is implemented:*

[HDCR.HPMN.(N-1)] event counters enable.

0b0  Event counters in the range [HDCR.HPMN..(PMCR.N-1)] are disabled.

0b1  Event counters in the range [HDCR.HPMN..(PMCR.N-1)] are enabled by PMCNTENSET.

If HDCR.HPMN is less than PMCR.N, the event counters in the range [HDCR.HPMN..(PMCR.N-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

**Note**

The effect of HDCR.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**TPM, bit [6]**

*When FEAT_PMUv3 is implemented:*

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

0b0  This control does not cause any instructions to be trapped.

0b1  Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.
--- Note ---
EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

--- Note ---
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**TPMCR, bit [5]**

*When FEAT_PMUv3 is implemented:*

Trap PMCR accesses. Traps Non-secure EL0 and EL1 accesses to the PMCR to Hyp mode.

0b0  This control does not cause any instructions to be trapped.

0b1  Non-secure EL0 and EL1 accesses to the PMCR are trapped to Hyp mode, unless it is trapped by PMUSERENR.EN.

--- Note ---
EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

--- Note ---
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Otherwise:**
Reserved, RES0.

**HPMN, bits [4:0]**

*When FEAT_PMUv3 is implemented:*

Defines the number of event counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If HPMN is less than PMCR.N, HPMN divides the event counters into two ranges, [0..(HPMN-1)] and [HPMN..(PMCR.N-1)].

For an event counter in the range [0..(HPMN-1)],

- The counter is accessible from EL1 and EL2, and from EL0 if unprivileged access to the counters is enabled.
- If FEAT_PMUv3p5 is implemented, PMCR.LP determines whether the counter overflows at PMEVCNTR<<[31:0] or PMEVCNTR<<[63:0].
- PMCR.E enables the operation of counters in this range.

--- Note ---
If HPMN is equal to PMCR.N, this applies to all event counters.

If HPMN is less than PMCR.N, for an event counter in the range [HPMN..(PMCR.N-1)],

- The counter is accessible only from EL2 and from Secure state.
- If FEAT_PMUv3p5 is implemented, HDCR.HLP determines whether the counter overflows at PMEVCNTR<<[31:0] or PMEVCNTR<<[63:0].
- HDCR.HPME enables the operation of counters in this range.

If this field is set to 0, or to a value larger than PMCR.N, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of HDCR.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if HDCR.HPMN is set to an UNKNOWN non-zero value less than or equal to PMCR.N.
All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in PMCR.N.

Otherwise:
Reserved, RES0.

Accessing the HDCR

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}(c\{q\}) \text{ \{coproc, \{#opc1\}, \{Rt\}, \{CRn\}, \{CRm\}\{, \{#opc2\}\}}
\]

<table>

### HTRFCR, Hyp Trace Filter Control Register

The HTRFCR characteristics are:

**Purpose**

Provides EL2 controls for Trace.

**Configurations**

AArch32 System register HTRFCR[31:0] is architecturally mapped to AArch64 System register TRFCR_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_TRF is implemented. Otherwise, direct accesses to HTRFCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from Monitor mode when SCR.NS == 1.

**Attributes**

HTRFCR is a 32-bit register.

**Field descriptions**

The HTRFCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7-6</td>
<td>Timestamp Control. Controls which timebase is used for trace timestamps.</td>
</tr>
<tr>
<td>5</td>
<td>The timestamp is controlled by TRFCR.TS.</td>
</tr>
<tr>
<td>4</td>
<td>VMID Trace Enable.</td>
</tr>
<tr>
<td>3</td>
<td>VMID tracing is not allowed.</td>
</tr>
<tr>
<td>2</td>
<td>VMID tracing is allowed.</td>
</tr>
</tbody>
</table>

- **TS** bits [6:5]:
  - **0b00**: Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.
  - **0b01**: Physical timestamp. The traced timestamp is the physical counter value.

- **Bit [4]**: Reserved, RES0.

- **CX** bit [3]:
  - **0b0**: VMID tracing is not allowed.
  - **0b1**: VMID tracing is allowed.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.
Bit [2]

Reserved, RES0.

E2TRE, bit [1]
EL2 Trace Enable.

0b0  Tracing is prohibited at EL2.
0b1  Tracing is allowed at EL2.

When SelfHostedTraceEnabled() == FALSE, this field is ignored.
On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

E0HTRE, bit [0]
EL0 Trace Enable.

0b0  Tracing is prohibited at EL0 when HCR.TGE == 1.
0b1  Tracing is allowed at EL0 when HCR.TGE == 1.

This field is ignored if any of the following are true:
- The PE is in Secure state.
- SelfHostedTraceEnabled() == FALSE.
- HCR.TGE == 0.

On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

**Accessing the HTRFCR**

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>
<thead>
<tr>

```

G8.3.33 PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation to software.

**Configurations**

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

**Attributes**

PMMIR is a 32-bit register.

**Field descriptions**

The PMMIR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SLOTS</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SLOTS, bits [7:0]**

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

**Accessing the PMMIR**

Accesses to this register use the following encodings in the System instruction encoding space:

```assembly
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

### Assembly Code Example

        return PMMIR;
G8.3.34 SDCR, Secure Debug Control Register

The SDCR characteristics are:

**Purpose**

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

**Configurations**

AArch32 System register SDCR[31:0] can be mapped to AArch64 System register MDCR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to SDCR are UNDEFINED.

**Attributes**

SDCR is a 32-bit register.

**Field descriptions**

The SDCR bit assignments are:

<table>

</table>

**Bits [31:29]**

Reserved, RES0.

**MTPME, bit [28]**

*When FEAT_MTPMU is implemented:*

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<\n>.MT bits.

0b0 FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<\n>.MT is zero.

0b1 PMEVTYPER<\n>.MT bits not affected by this bit.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

On a Cold reset, in a system where the PE resets into EL3, this field resets to 1.

**Otherwise:**

Reserved, RES0.
TDCC, bit [27]

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.

- **0b0**: This control does not cause any register accesses to be trapped.
- **0b1**: Accesses to the DCC registers in modes other than Monitor mode generate a Monitor Trap exception, unless the access also generates a higher priority exception.

Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- `DBGDTRRXext`, `DBGDTRTExt`, `DBGDSCRint`, `DBGDCCINT`, and, when the PE is in Non-debug state, `DBGDTRRXint` and `DBGDTRTExt`.

When the PE is in Debug state, `SDCR.TDCC` does not trap any accesses to:

- `DBGDTRRXint` and `DBGDTRTExt`.

In a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

- Reserved, RES0.

Bits [26:24]

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR from counting in Secure state.

- **0b0**: Cycle counting by PMCCNTR is not affected by this bit.
- **0b1**: Cycle counting by PMCCNTR is prohibited in Secure state.

This bit does not affect the CPU_CYCLES event or any other event that counts cycles.

In a system where the PE resets into EL3, this field resets to 0.

Otherwise:

- Reserved, RES0.

Bit [22]

Reserved, RES0.

EPMAD, bit [21]

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

- **0b0**: Non-secure access to the Performance Monitors registers from an external debugger is permitted.
- **0b1**: Non-secure access to the Performance Monitors registers from an external debugger is not permitted.

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is 0b0, then the Effective value of this field is 0b1.

In a system where the PE resets into EL3, this field resets to 0.
When FEAT_PMUv3 is implemented:

External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

0b0  Access to Performance Monitors registers from an external debugger is permitted.
0b1  Access to Performance Monitors registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension does not support external debug interface accesses this bit is RES0.
Otherwise, if EL3 is not implemented and the Effective value of SCR:NS is 0b0, then the Effective value of this field is 0b1.
In a system where the PE resets into EL3, this field resets to 0.

Otherwise:
Reserved, RES0.

EDAD, bit [20]

When FEAT_Debugv8p4 is implemented:

External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

0b0  Non-secure access to debug registers from an external debugger is permitted.
0b1  Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted.

If EL3 is not implemented and the Effective value of SCR:NS is 0b0, then the Effective value of this field is 0b1.
In a system where the PE resets into EL3, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

External debug access disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

0b0  Access to debug registers from an external debugger is permitted.
0b1  Access to breakpoint registers, watchpoint registers and OSLAR_EL1 from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of SCR:NS is 0b0, then the Effective value of this field is 0b1.
In a system where the PE resets into EL3, this field resets to 0.

Otherwise:

External debug access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger.

0b0  Access to debug registers from an external debugger is permitted.
0b1  Access to breakpoint registers and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.
     It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of SCR:NS is 0b0, then the Effective value of this field is 0b1.
In a system where the PE resets into EL3, this field resets to 0.
TTRF, bit [19]

*When FEAT_TRF is implemented:*

Trap Trace Filter controls. Controls whether accesses at EL2 and EL1 to the trace filter control registers are trapped to EL3.

- **0b0**: Accesses to HTRFCR and TRFCR registers are not affected by this control bit.
- **0b1**: When not in Monitor mode, accesses to HTRFCR and TRFCR registers generate a Monitor Trap exception, unless the access generates a higher priority exception.

In a system where the PE resets into EL3, this field resets to 0.

*Otherwise:*

Reserved, RES0.

STE, bit [18]

*When FEAT_TRF is implemented:*

Secure Trace Enable. This bit enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

- **0b0**: Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
- **0b1**: Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See [Register controls to enable self-hosted trace](#) on page G3-5920.

If EL3 is not implemented and the Effective value of SCR.NS is 0b0, the PE behaves as if this bit is set to 0b1.

In a system where the PE resets into EL3, this field resets to 0.

*Otherwise:*

Reserved, RES0.

SPME, bit [17]

*When FEAT_Debugv8p2 is implemented and FEAT_PMUv3 is implemented:*

Secure Performance Monitors enable. This allows event counting in Secure state.

- **0b0**: Event counting prohibited in Secure state.
- **0b1**: Event counting allowed in Secure state.

If EL3 is not implemented and the Effective value of SCR.NS is 0b0, then the Effective value of this bit is 0b1.

In a system where the PE resets into EL3, this field resets to 0.

*When FEAT_PMUv3 is implemented:*

Secure Performance Monitors enable. This allows event counting in Secure state.

- **0b0**: Event counting prohibited in Secure state, unless ExternalSecureNoninvasiveDebugEnabled() is TRUE.
- **0b1**: Event counting allowed in Secure state.

If EL3 is not implemented and the Effective value of SCR.NS is 0b0, then the Effective value of this bit is 0b1.

In a system where the PE resets into EL3, this field resets to 0.

*Otherwise:*

Reserved, RES0.

Bit [16]

Reserved, RES0.
SPD, bits [15:14]

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions

0b00 Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface.
0b10 Secure privileged debug disabled. Debug exceptions from EL3 are disabled.
0b11 Secure privileged debug enabled. Debug exceptions from EL3 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER.SUIDEN is 0b1.

If EL3 is not implemented and the Effective value of SCR.NS is 0b0, then the Effective value of this field is 0b11.

In a system where the PE resets into EL3, this field resets to 0.

Bits [13:0]

Reserved, RES0.

Accessing the SDCR

Accesses to this register use the following encodings in the System instruction encoding space:

G8.3.35   SDER, Secure Debug Enable Register

The SDER characteristics are:

Purpose

Controls invasive and non-invasive debug in the Secure EL0 mode.

Configurations

AArch32 System register SDER[31:0] is architecturally mapped to AArch64 System register SDER32_EL3[31:0].

This register is present only when AArch32 is supported at any Exception level, or EL3 is implemented or the implemented Security state is Secure state. Otherwise, direct accesses to SDER are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

• The PE is in Non-secure state.
• EL1 is using AArch64.

Attributes

SDER is a 32-bit register.

Field descriptions

The SDER bit assignments are:

```
31  2  1  0
   |   |   |
  RES0 SUIDEN SUNIDEN

Bits [31:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

0b0  This bit does not affect Performance Monitors event counting at Secure EL0
0b1  If EL3 or EL1 is using AArch32, Performance Monitors event counting is allowed in Secure EL0.

On a Warm reset, this field resets to 0.

SUIDEN, bit [0]

Secure User Invasive Debug Enable.

0b0  This bit does not affect the generation of debug exceptions at Secure EL0.
0b1  If EL3 or EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

On a Warm reset, this field resets to 0.

Accessing the SDER

Accesses to this register use the following encodings in the System instruction encoding space:
\texttt{MRC\{<c>\}<q>\} <coproc>, \{\#\}<opc1>, <Rt>, <CRn>, <CRm>\{, \{\#\}<opc2>\} }

\begin{center}

\end{center}
G8.3.36 TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

**Purpose**

Provides EL1 controls for Trace.

**Configurations**

AArch32 System register TRFCR[31:0] is architecturally mapped to AArch64 System register TRFCR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

**Attributes**

TRFCR is a 32-bit register.

**Field descriptions**

The TRFCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>7</td>
<td>TS</td>
</tr>
<tr>
<td>6</td>
<td>5</td>
</tr>
<tr>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>0</td>
<td>E0TRE</td>
</tr>
<tr>
<td></td>
<td>E1TRE</td>
</tr>
</tbody>
</table>

**Bits [31:7]**

Reserved, RES0.

**TS, bits [6:5]**

Timestamp Control. Controls which timebase is used for trace timestamps.

0b00 Virtual timestamp. The traced timestamp is the physical counter value, minus the value of CNTVOFF.

0b10 **When FEAT_ECV is implemented** Guest Physical timestamp. The traced timestamp is the physical counter value, minus the value of CNTPOFF_EL2.

0b11 Physical timestamp. The traced timestamp is the physical counter value.

All other values are reserved.

This field is ignored if any of the following are true:

- `SelfHostedTraceEnabled()` == FALSE.
- `HTRFCR.TS` is not 0b00.

If FEAT_ECV is implemented, the physical counter uses a fixed physical offset of zero if any of the following are true:

- When EL2 is implemented and enabled in the current Security state and is using AArch32.
- `CNYHCTL_EL2.ECV` is 0.
- `SCR_EL3.ECVEn` is 0.
- `HCR_EL2.{E2H, TGE}` is {1, 1}.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Bits [4:2]**

Reserved, RES0.
E1TRE, bit [1]
EL1 Trace Enable.

- **0b0**: Tracing is prohibited in PL1 modes.
- **0b1**: Tracing is allowed in PL1 modes.

This field is ignored if `SelfHostedTraceEnabled()` == FALSE.

On a Warm reset, this field resets to 0.

E0TRE, bit [0]
EL0 Trace Enable.

- **0b0**: Tracing is prohibited at EL0.
- **0b1**: Tracing is allowed at EL0.

This field is ignored if any of the following are true:
- `SelfHostedTraceEnabled()` == FALSE.
- EL2 is implemented and enabled in the current security state and `HCR.TGE == 1`.

On a Warm reset, this field resets to 0.

### Accessing the TRFCR

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}(<c>){<q>} <\text{coproc}>, (#)<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>(, (#)<\text{opc2}>)

G8.4 Performance Monitors registers

This section lists the Performance Monitors registers in AArch32.
G8.4.1 PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR, increments.

**Configurations**

AArch32 System register PMCCFILTR[31:0] is architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].

AArch32 System register PMCCFILTR[31:0] is architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR are UNDEFINED.

**Attributes**

PMCCFILTR is a 32-bit register.

**Field descriptions**

The PMCCFILTR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>U</td>
<td></td>
<td></td>
<td></td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**P, bit [31]**

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR.NSK bit.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL1.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL1.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**U, bit [30]**

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR.NSU bit.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Count cycles in EL0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Do not count cycles in EL0.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

**NSK, bit [29]**

*When EL3 is implemented:*

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMCCFILTR.P, cycles in Non-secure EL1 are counted. Otherwise, cycles in Non-secure EL1 are not counted.
On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMCCFILTR.U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

**Otherwise:**

Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

0b0 Do not count cycles in EL2.

0b1 Count cycles in EL2.

On a Warm reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**Bits [26:0]**

Reserved, RES0.

**Accessing the PMCCFILTR**

PMCCFILTR can also be accessed by using PMXEVTYPEP with PMSELR.SEL set to 0b11111.

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRC{c}{q} <coproc>, {#<opc1>, <Rt>, <CRn>, <CRm>{, {#<opc2>}}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>

G8.4.2 PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter on page D7-2696* for more information.

PMCCFILTR determines the modes and states in which the PMCCNTR can increment.

**Configurations**

AArch32 System register PMCCNTR[63:0] is architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

AArch32 System register PMCCNTR[63:0] is architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

**Attributes**

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

**Field descriptions**

The PMCCNTR bit assignments are:

```
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**CCNT, bits [63:0]**

Cycle count. Depending on the values of PMCR.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCCNTR**

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRC{<c>{<q>}, <coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>{, (#)<opc2>}
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b0000</td>
<td>0b1001</td>
<td>0b1101</td>
<td>0b0000</td>
</tr>
</tbody>
</table>

G8.4.3 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F. When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see *The PMU event number space and common events* on page D7-2715.

**Configurations**

AArch32 System register PMCEID0[31:0] is architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

AArch32 System register PMCEID0[31:0] is architecturally mapped to External register PMCEID0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are UNDEFINED.

**Attributes**

PMCEID0 is a 32-bit register.

**Field descriptions**

The PMCEID0 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| ID31 | ID30 | ID29 | ID28 | ID27 | ID26 | ID25 | ID24 | ID23 | ID22 | ID21 | ID20 | ID19 | ID18 | ID17 | ID16 | ID15 | ID14 | ID13 | ID12 | ID11 | ID10 | ID9 | ID8 | ID7 | ID6 | ID5 | ID4 | ID3 | ID2 | ID1 | ID0 |

**ID<n>, bit [n], for n = 0 to 31**

ID[n] corresponds to common event n.
For each bit:

0b0  The common event is not implemented, or not counted.
0b1  The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<\text{n}> registers of that earlier version of the PMU architecture.

---

Accessing the PMCEID0

Accesses to this register use the following encodings in the System instruction encoding space:

\[ \text{MRC}{c}\langle q\rangle \langle \text{coproc} \rangle, \{\#}\langle \text{opc1} \rangle, \langle \text{Rt} \rangle, \langle \text{CRm}\rangle, \langle \text{CRn}\rangle, \{\#}\langle \text{opc2}\rangle \]

G8.4.4 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0020 to 0x003F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

--- Note ---

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

---

For more information about the common events and the use of the PMCEIDn registers see *The PMU event number space and common events* on page D7-2715.

**Configurations**

AArch32 System register PMCEID1[31:0] is architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

AArch32 System register PMCEID1[31:0] is architecturally mapped to External register PMCEID1[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1 are UNDEFINED.

**Attributes**

PMCEID1 is a 32-bit register.

**Field descriptions**

The PMCEID1 bit assignments are:

ID<n>, bit [n], for n = 0 to 31

ID[n] corresponds to common event (0x0020 + n).
For each bit:

0b0  The common event is not implemented, or not counted.
0b1  The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

--- Note ---
Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<\n> registers of that earlier version of the PMU architecture.

### Accessing the PMCEID1

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

<table>

PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range $0x4000$ to $0x401F$.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

**Note**

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers see The PMU event number space and common events on page D7-2715.

**Configurations**

AArch32 System register PMCEID2[31:0] is architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

AArch32 System register PMCEID2[31:0] is architecturally mapped to External register PMCEID2[63:32].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are UNDEFINED.

**Attributes**

PMCEID2 is a 32-bit register.

**Field descriptions**

The PMCEID2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDhi&lt;n&gt;, bit[n], for n = 0 to 31</td>
<td></td>
</tr>
</tbody>
</table>

**IDhi<n>, bit [n], for n = 0 to 31**

IDhi[n] corresponds to common event ($0x4000 + n$).

For each bit:

| 0b0 | The common event is not implemented, or not counted. |
| 0b1 | The common event is implemented. |

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

**Note**

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

G8.4.7 PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR<\(n\)>. Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the PMCNTENSET register.

**Configurations**

AArch32 System register PMCNTENCLR[31:0] is architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

AArch32 System register PMCNTENCLR[31:0] is architecturally mapped to External register PMCNTENCLR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR are UNDEFINED.

**Attributes**

PMCNTENCLR is a 32-bit register.

**Field descriptions**

The PMCNTENCLR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td><strong>C</strong>, bit [31] PMCCNTR disable bit. Disables the cycle counter register.</td>
</tr>
<tr>
<td>30 to 0</td>
<td><strong>P&lt;n&gt;</strong>, bit [n] Event counter disable bit for PMEVCNTR&lt;(n)&gt;</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCNTENCLR**

Accesses to this register use the following encodings in the System instruction encoding space:
if PSTATE.EL == EL0 then
    if Halted() & HaveEL(EL3) & EDSCR.SDD == '1' & boolean IMPLEMENTATION_DEFINED "EL3 trap priority when SDD == '1'" & !ELUsingAArch32(EL3) & MDCR_EL3.TPM == '1' then

G8.4.8 PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR\(<n>\). Reading this register shows which counters are enabled.

PMCNTENSET is used in conjunction with the PMCNTENCLR register.

**Configurations**

AArch32 System register PMCNTENSET[31:0] is architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

AArch32 System register PMCNTENSET[31:0] is architecturally mapped to External register PMCNTENSET_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET are UNDEFINED.

**Attributes**

PMCNTENSET is a 32-bit register.

**Field descriptions**

The PMCNTENSET bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P(&lt;n&gt;), bit ([n])</td>
<td></td>
</tr>
</tbody>
</table>

C, bit [31]

PMCCNTR enable bit. Enables the cycle counter register.

- **0b0**: When read, means the cycle counter is disabled. When written, has no effect.
- **0b1**: When read, means the cycle counter is enabled. When written, enables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P\(<n>\), bit \([n]\), for \(n = 0\) to \(30\)

Event counter enable bit for PMEVCNTR\(<n>\).

If \(N\) is less than 31, then bits \([30:N]\) are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, \(N\) is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, \(N\) is the value in PMCR.N.

- **0b0**: When read, means that PMEVCNTR\(<n>\) is disabled. When written, has no effect.
- **0b1**: When read, means that PMEVCNTR\(<n>\) event counter is enabled. When written, enables PMEVCNTR\(<n>\).

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCNTENSET**

Accesses to this register use the following encodings in the System instruction encoding space:

G8.4.9 PMCR, Performance Monitors Control Register

The PMCR characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

**Configurations**

AArch32 System register PMCR[31:0] is architecturally mapped to AArch64 System register PMCR_EL0[31:0].

AArch32 System register PMCR[7:0] is architecturally mapped to External register PMCR_EL0[7:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR are UNDEFINED.

**Attributes**

PMCR is a 32-bit register.

**Field descriptions**

The PMCR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>24 23</th>
<th>16 15</th>
<th>11 10</th>
<th>8 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP</td>
<td>IDCODE</td>
<td>N</td>
<td>RES0</td>
<td>LP LC DR X D C P E</td>
</tr>
</tbody>
</table>

**IMP, bits [31:24]**

Implementer code.

If this field is zero, then PMCR.IDCODE is RES0 and software must use MIDR to identify the PE.

Otherwise, this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as MIDR.Implementer.

Use of this field is deprecated.

This field reads as an IMPLEMENTATION DEFINED value.

Access to this field is RO.

**IDCODE, bits [23:16]**

*When PMCR.IMP != 0x00:*

Identification code. Use of this field is deprecated. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is RO.

*Otherwise:*

Reserved, RES0.

**N, bits [15:11]**

Indicates the number of event counters implemented. This value is in the range of 0b000000-0b111111. If the value is 0b000000 then only PMCCNTR is implemented. If the value is 0b111111 PMCCNTR and 31 event counters are implemented.
In an implementation that includes EL2:

- If EL2 is using AArch32, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of HDCR.HPMN.
- If EL2 is using AArch64 and enabled in the current Security state, reads of this field from EL1 and EL0 return the value of MDCR_EL2.HPMN.

Access to this field is RO.

### Bits [10:8]

Reserved, RES0.

### LP, bit [7]

**When FEAT_PMUv3p5 is implemented:**

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

- **0b0** Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<\(n\)[31:0].
- **0b1** Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<\(n\)[63:0].

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

If EL2 is implemented and HDCR.HPMN or MDCR_EL2.HPMN is less than PMCR.N, this bit does not affect the operation of event counters in the range \([HDCR.HPMN..(PMCR.N-1)]\) or \([MDCR_EL2.HPMN..(PMCR.N-1)]\).

PMEVCNTR<\(n\)[63:32] cannot be accessed directly in AArch32 state.

---

**Note**

The effect of HDCR.HPMN or MDCR_EL2.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of HDCR.HPMN or MDCR_EL2.HPMN.

---

On a Warm reset, this field resets to 0.

### Otherwise:

Reserved, RES0.

### LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

- **0b0** Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[31:0].
- **0b1** Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[63:0].

Arm deprecates use of PMCR.LC = 0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### DP, bit [5]

**When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):**

Disable cycle counter when event counting is prohibited.

- **0b0** Cycle counting by PMCCNTR is not affected by this bit.
- **0b1** When event counting for counters in the range \([0..(HDCR.HPMN-1)]\) or \([0..(MDCR_EL2.HPMN-1)]\) is prohibited, cycle counting by PMCCNTR is disabled.

For more information see *Prohibiting event counting on page D7-2703*
On a Warm reset, this field resets to 0.

Otherwise:
Reserved, RES0.

X, bit [4]

When the implementation includes an PMU event export bus:
Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

0b0  Do not export events.
0b1  Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.
This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

On a Warm reset, this field resets to 0.

Otherwise:
Reserved, RAZ/WI.

D, bit [3]

Clock divider. The possible values of this bit are:

0b0  When enabled, PMCCNTR counts every clock cycle.
0b1  When enabled, PMCCNTR counts once every 64 clock cycles.

If PMCR.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.
Arm deprecates use of PMCR.D = 1.

On a Warm reset, this field resets to 0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

0b0  No action.
0b1  Reset PMCCNTR to zero.

This bit is always RAZ.

Note

Resetting PMCCNTR does not change the cycle counter overflow bit.
The value of PMCR_EL0.LC is ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

0b0  No action.
0b1  Reset all event counters accessible in the current Exception level, not including PMCCNTR, to zero.

This bit is always RAZ.

In EL0 and EL1:

• If EL2 is implemented and enabled in the current Security state, and HDCR.HPMN or MDCR_EL2.HPMN is less than PMCR_EL0.N, a write of 1 to this bit does not reset event counters in the range [HDCR.HPMN..(PMCR.N-1)] or [MDCR_EL2.HPMN..(PMCR.N-1)].
If EL2 is not implemented, EL2 is disabled in the current Security state, or HDCR.HPMN or MDCR_EL2.HPMN is equal to PMCR_EL0.N, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

**Note**

Resetting the event counters does not change the event counter overflow bits.

If FEAT_PMUv3p5 is implemented, the values of HDCR.HLP and PMCR.LP are ignored and bits [63:0] of all affected event counters are reset.

Access to this field is WO.

**E, bit [0]**

Enable.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR, are disabled.</td>
</tr>
<tr>
<td>01</td>
<td>All event counters in the range [0..(PMN-1)] and PMCCNTR, are enabled by PMCNTENSET.</td>
</tr>
</tbody>
</table>

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is HDCR.HPMN.
- If EL2 is using AArch64, PMN is MDCR_EL2.HPMN.
- If PMN is less than PMCR.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR.N-1)].

If EL2 is not implemented, PMN is PMCR.N.

**Note**

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

On a Warm reset, this field resets to 0.

---

**Accessing the PMCR**

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{c\}\{q\} <\text{coproc}>, \{#\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{#\}<\text{opc2}>
\]

G8.4.10 PMEVCNTR<\(n\)>, Performance Monitors Event Count Registers, \(n = 0 - 30\)

The PMEVCNTR<\(n\)> characteristics are:

**Purpose**

Holds event counter \(n\), which counts events, where \(n\) is 0 to 30.

**Configurations**

AArch32 System register PMEVCNTR<\(n\)>[31:0] is architecturally mapped to AArch64 System register PMEVCNTR<\(n\)>_EL0[31:0].

AArch32 System register PMEVCNTR<\(n\)>[31:0] is architecturally mapped to External register PMEVCNTR<\(n\)>_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<\(n\)> are UNDEFINED.

**Attributes**

PMEVCNTR<\(n\)> is a 32-bit register.

**Field descriptions**

The PMEVCNTR<\(n\)> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Event counter (n)</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Event counter (n)</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Event counter \(n\). Value of event counter \(n\), where \(n\) is the number of this register and is a number from 0 to 30.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMEVCNTR<\(n\)> return bits [31:0] of the counter.
- Writes to PMEVCNTR<\(n\)> update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64 at any Exception level, bits [31:0] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMEVCNTR<\(n\)>**

PMEVCNTR<\(n\)> can also be accessed by using PMXEVCNTR with PMSELR.SEL set to the value of <\(n\)>.

If FEAT_FGT is implemented and <\(n\)> is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMEVCNTR<\(n\)> is as follows:

- If <\(n\)> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <\(n\)> is greater than or equal to the number of accessible counters, then reads and writes of PMEVCNTR<\(n\)> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:
If \( n \) is greater than or equal to the number of accessible event counters, then reads and writes of PMEVCNTR\( n \) are constrained unpredictable, and the following behaviors are permitted:

- Accesses to the register are undefined.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and \( n < k \) is less than the number of implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

--- Note ---

In EL0, an access is permitted if it is enabled by PMUSERENR.\{ER,EN\} or PMUSERENR_EL0.\{ER,EN\}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented counters. See HDCR.HPMN and MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}(c)(q) \; \text{<coproc>, \{#<opc1>, <Rt>, <CRn>, <CRm>{, {#<opc2>}}}
\]

G8.4.11 PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

**Purpose**

Configures event counter n, where n is 0 to 30.

**Configurations**

AArch32 System register PMEVTYPER<n>[31:0] is architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[31:0].

AArch32 System register PMEVTYPER<n>[31:0] is architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n> are UNDEFINED.

**Attributes**

PMEVTYPER<n> is a 32-bit register.

**Field descriptions**

The PMEVTYPER<n> bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER&lt;n&gt;.NSK bit.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b0 Count events in EL1.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b1 Do not count events in EL1.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER&lt;n&gt;.NSU bit.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b0 Count events in EL0.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b1 Do not count events in EL0.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>NSK</td>
<td>[29]</td>
<td>Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.</td>
</tr>
</tbody>
</table>

*When EL3 is implemented:*
If the value of this bit is equal to the value of PMEVTYPER<\text{n}.P, events in Non-secure EL1 are counted. Otherwise, events in Non-secure EL1 are not counted. On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**NSU, bit [28]**

*When EL3 is implemented:*
Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMEVTYPER<\text{n}.U, events in Non-secure EL0 are counted. Otherwise, events in Non-secure EL0 are not counted. On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**NSH, bit [27]**

*When EL2 is implemented:*
EL2 (Hyp mode) filtering bit. Controls counting in EL2.

- 0b0: Do not count events in EL2.
- 0b1: Count events in EL2.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**Bit [26]**
Reserved, RES0.

**MT, bit [25]**

*When (FEAT\_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:*

Multithreading.

- 0b0: Count events only on controlling PE.
- 0b1: Count events from any PE with the same affinity at level 1 and above as this PE.

**Note**

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**Bits [24:16]**
Reserved, RES0.
evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. See evtCount[9:0] for more details.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>.
Software must program this field with an event that is supported by the PE being programmed.
The ranges of event numbers allocated to each type of event are shown in Table D7-7 on page D7-2715.
If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior
depends on the value written:
• For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or
  external read of the evtCount field is the value written to the field.
• If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and
  the value returned by a direct or external read of the evtCount field is the value written to the
  field.
• For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted,
  and the value returned by a direct or external read of the evtCount field is UNKNOWN.

——— Note ————

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a
given implementation does not include an event from a set of common IMPLEMENTATION DEFINED
events, then no event is counted and the value read back on evtCount is the value written.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVTYPER<n>

PMEVTYPER<n> can also be accessed by using PMXEVTPYER with PMSELR.SEL set to n.
If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible counters, then the
behavior of permitted reads and writes of PMEVTYPER<n> is as follows:
• If <n> is an unimplemented event counter, the access is UNDEFINED.
• Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible counters, then reads
and writes of PMEVTYPER<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:
If <n> is greater or equal to the number of accessible event counters, then reads and writes of PMEVTYPER<n>
are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:
• Accesses to the register are UNDEFINED.
• Accesses to the register behave as RAZ/WI.
• Accesses to the register execute as a NOP.
• If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of
  implemented counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.
Note

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented counters. See HDCR.HPMN and MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c>\}{<q>}\ \text{<coproc>},\ {#}\text{<opc1>},\ \text{<Rt>},\ \text{<CRn>},\ \text{<CRm>}\{,\ {#}\text{<opc2>}\}
\]

G8.4.12 PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

**Purpose**
Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR\(<n>\). Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the PMINTENSET register.

**Configurations**
AArch32 System register PMINTENCLR[31:0] is architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENCLR[31:0] is architecturally mapped to External register PMINTENCLR_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

**Attributes**
PMINTENCLR is a 32-bit register.

**Field descriptions**
The PMINTENCLR bit assignments are:

</table>

**C, bit [31]**
PMCCNTR overflow interrupt request disable bit.
- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P\(<n>\), bit [n], for n = 0 to 30**
Event counter overflow interrupt request disable bit for PMEVCNTR\(<n>\).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

- 0b0 When read, means that the PMEVCNTR\(<n>\) event counter interrupt request is disabled. When written, has no effect.
- 0b1 When read, means that the PMEVCNTR\(<n>\) event counter interrupt request is enabled. When written, disables the PMEVCNTR\(<n>\) interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMINTENCLR**
Accesses to this register use the following encodings in the System instruction encoding space:
### MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.4.13   PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR\(<n>\). Reading the register shows which overflow interrupt requests are enabled.

PMINTENSET is used in conjunction with the PMINTENCLR register.

**Configurations**

AArch32 System register PMINTENSET[31:0] is architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0].

AArch32 System register PMINTENSET[31:0] is architecturally mapped to External register PMINTENSET_EL1[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET are UNDEFINED.

**Attributes**

PMINTENSET is a 32-bit register.

**Field descriptions**

The PMINTENSET bit assignments are:

<table>
<thead>
<tr>
<th>31 30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>C</strong></td>
<td></td>
</tr>
<tr>
<td><strong>P&lt;(n&gt;), bit ([n])</strong></td>
<td></td>
</tr>
</tbody>
</table>

**C, bit \([31]\)**

PMCCNTR overflow interrupt request enable bit.

- \(0b0\) When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- \(0b1\) When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**P<\(n>\), bit \([n]\), for \(n = 0\) to \(30\)**

Event counter overflow interrupt request enable bit for PMEVCNTR<\(n>\>.

If \(N\) is less than 31, then bits \([30:N]\) are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, \(N\) is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, \(N\) is the value in PMCR.N.

- \(0b0\) When read, means that the PMEVCNTR<\(n>\> event counter interrupt request is disabled. When written, has no effect.
- \(0b1\) When read, means that the PMEVCNTR<\(n>\> event counter interrupt request is enabled. When written, enables the PMEVCNTR<\(n>\> interrupt request.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

**Accessing the PMINTENSET**

PMOVSR, Performance Monitors Overflow Flag Status Register

The PMOVSR characteristics are:

**Purpose**
Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<n>. Writing to this register clears these bits.

**Configurations**
AArch32 System register PMOVSR[31:0] is architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].
AArch32 System register PMOVSR[31:0] is architecturally mapped to External register PMOVSCLR_EL0[31:0].
This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSR are UNDEFINED.

**Attributes**
PMOVSR is a 32-bit register.

**Field descriptions**
The PMOVSR bit assignments are:

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>30</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>C</td>
<td>P&lt;n&gt;, bit [n]</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

C, bit [31]
Cycle counter overflow clear bit. Possible values are:
- 0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
- 0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

PMCR.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMEVCNTR[n].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30
Event counter overflow clear bit for PMEVCNTR<n>.
If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDR.CHPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.
- 0b0 When read, means that PMEVCNTR<n> has not overflowed since this bit was last cleared. When written, has no effect.
- 0b1 When read, means that PMEVCNTR<n> has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n> overflow bit to 0.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>[31:0] or unsigned overflow of PMEVCNTR<n>[63:32]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMOVSR

G8.4.15 PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<n>.

Configurations

AArch32 System register PMOVSSET[31:0] is architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSSET[31:0] is architecturally mapped to External register PMOVSSET_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET are UNDEFINED.

Attributes

PMOVSSET is a 32-bit register.

Field descriptions

The PMOVSSET bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

C, bit [31]

Cycle counter overflow set bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

PMCR.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMCCNTR[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 0 to 30

Event counter overflow set bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

0b0 When read, means that PMEVCNTR<n> has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that PMEVCNTR<n> has overflowed since this bit was last cleared. When written, sets the PMEVCNTR<n> overflow bit to 1.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>[31:0] or unsigned overflow of PMEVCNTR<n>[63:0]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMOVSSET

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\langle c\rangle\langle q\rangle\langle \text{coproc}\rangle, \langle \#\text{opc1}\rangle, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \langle \#\text{opc2}\rangle
\]

G8.4.16  PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

**Purpose**

Selects the current event counter PMEVCNTR<\(n\)> or the cycle counter, CCNT.

PMSELR is used in conjunction with PMXEVTYPER to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with PMXEV CNTR, to determine the value of a selected event counter.

**Configurations**

AArch32 System register PMSELR[31:0] is architecturally mapped to AArch64 System register PMSELR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

**Attributes**

PMSELR is a 32-bit register.

**Field descriptions**

The PMSELR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>5</th>
<th>4</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SEL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:5]**

Reserved, RES0.

**SEL, bits [4:0]**

Selects event counter, PMEVCNTR<\(n\)>, where \(n\) is the value held in this field. This value identifies which event counter is accessed when a subsequent access to PMXEVTYPER or PMXEV CNTR occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR.SEL is 0b11111, it selects the cycle counter and:

- A read of the PMXEVTYPER returns the value of PMCCFILTR.
- A write of the PMXEVTYPER writes to PMCCFILTR.
- A read or write of PMXEV CNTR has CONSTRAINED UNPREDICTABLE effects. See PMXEV CNTR for more details.

For details of the results of accesses to event counters, see PMXEVTYPER and PMXEV CNTR.

For information about the number of counters accessible at each Exception level, see HDCR.HPMN and MDCR_EL2.HPMN.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMSELR**

Accesses to this register use the following encodings in the System instruction encoding space:
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.4.17 PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see SW_INCR.

**Configurations**

AArch32 System register PMSWINC[31:0] is architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

AArch32 System register PMSWINC[31:0] is architecturally mapped to External register PMSWINC_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

**Attributes**

PMSWINC is a 32-bit register.

**Field descriptions**

The PMSWINC bit assignments are:

<table>
<thead>
<tr>
<th>31 30</th>
<th>0</th>
<th>0b0</th>
<th>0b1</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>P&lt;n&gt;, bit [n]</td>
<td>No action. The write to this bit is ignored.</td>
<td>If PMEVCNTR&lt;n&gt; is enabled and configured to count the software increment event, increments PMEVCNTR&lt;n&gt; by 1. If PMEVCNTR&lt;n&gt; is disabled, or not configured to count the software increment event, the write to this bit is ignored.</td>
</tr>
</tbody>
</table>

**Accessing the PMSWINC**

Accesses to this register use the following encodings in the System instruction encoding space:
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>

PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

**Purpose**

Enables or disables User mode access to the Performance Monitors.

**Configurations**

AArch32 System register PMUSERENR[31:0] is architecturally mapped to AArch64 System register PMUSERENR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

**Attributes**

PMUSERENR is a 32-bit register.

**Field descriptions**

The PMUSERENR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:4]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[3]</td>
<td>Event counter read trap control:</td>
</tr>
<tr>
<td></td>
<td>1b0: EL0 reads of the PMXEVCNTR and PMEVCNTR&lt;n&gt;, and EL0 RW access to the PMSELR, are trapped to Undefined mode if PMUSERENR.EN is also 0.</td>
</tr>
<tr>
<td></td>
<td>1b1: Overrides PMUSERENR.EN and enables RO access to PMXEVCNTR and PMEVCNTR&lt;n&gt;, and RW access to PMSELR.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[2]</td>
<td>Cycle counter read trap control:</td>
</tr>
<tr>
<td></td>
<td>1b0: EL0 reads of the PMCCNTR are trapped to Undefined mode if PMUSERENR.EN is also 0.</td>
</tr>
<tr>
<td></td>
<td>1b1: Overrides PMUSERENR.EN and enables access to PMCCNTR.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[1]</td>
<td>Software increment write trap control:</td>
</tr>
<tr>
<td></td>
<td>1b0: EL0 writes to the PMSWINC are trapped to Undefined mode if PMUSERENR.EN is also 0.</td>
</tr>
<tr>
<td></td>
<td>1b1: Overrides PMUSERENR.EN and enables access to PMSWINC.</td>
</tr>
</tbody>
</table>

On a Warm reset, this field resets to 0.
EN, bit [0]

Traps EL0 accesses to the Performance Monitors registers to Undefined mode, as follows:

- PMCR, PMOVSER, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTPER, 
PMXEVCTR, PMCNTENSE, PMCNTECNCL, PMOVSSET, PMEVCNTR<\text{n}>,
  PMEVTPER<\text{n}>, PMCCFILTER, PMSWINC.

- If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.

- If FEAT_PMUv3p4 is implemented, PMMIR.

| b0 | While at EL0, accesses to the specified registers at EL0 are trapped to Undefined mode, unless overridden by one of PMUSERENR.{ER, CR, SW}. |
| b1 | While at EL0, software can access all of the specified registers. |

On a Warm reset, this field resets to 0.

### Accessing the PMUSERENR

G8.4.19 PMXEVCNTR, Performance Monitors Selected Event Count Register

The PMXEVCNTR characteristics are:

Purpose

Reads or writes the value of the selected event counter, PMEVCNTR<\text{n}>. PMSELR.SEL determines which event counter is selected.

Configurations

AArch32 System register PMXEVCNTR[31:0] is architecturally mapped to AArch64 System register PMXEVCNTR_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR are UNDEFINED.

Attributes

PMXEVCNTR is a 32-bit register.

Field descriptions

The PMXEVCNTR bit assignments are:

\[
\begin{array}{c|c}
31 & 0 \\
\hline
& \text{PMEVCNTR}<\text{n}>
\end{array}
\]

PMEVCNTR<\text{n}>, bits [31:0]

Value of the selected event counter, PMEVCNTR<\text{n}>, where \text{n} is the value stored in PMSELR.SEL.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMXEVCNTR return bits [31:0] of the counter.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64 at any Exception level, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMXEVCNTR

If FEAT_FGT is implemented and PMSELR.SEL is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVCNTR is as follows:

- If PMSELR.SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and PMSELR.SEL is greater than or equal to the number of accessible counters, then reads and writes of PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
Accesses to the register behave as if PMSELR_SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.

If EL2 is implemented and enabled in the current Security state, and PMSELR_SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

**Note**

In EL0, an access is permitted if it is enabled by PMUSERENR.{ER,EN} or PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented counters. See HDCR.HPMN and MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c>\}{<q>} \text{ coproc}, \{#<opc1>\}, \text{ <Rt>}, \text{ <CRn>}, \text{ <CRm>}, \{#<opc2>\}
\]

G8.4.20  PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

**Purpose**

When PMSELR.SEL selects an event counter, this accesses a PMEVTYPER<\(n\)> register. When PMSELR.SEL selects the cycle counter, this accesses PMCCFILTR.

**Configurations**

AArch32 System register PMXEVTYPER[31:0] is architecturally mapped to AArch64 System register PMXEVTYPER_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER are UNDEFINED.

**Attributes**

PMXEVTYPER is a 32-bit register.

**Field descriptions**

The PMXEVTYPER bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Event type register or PMCCFILTR</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the PMXEVTYPER**

If FEAT_FGT is implemented, and PMSELR.SEL is not 31 and is greater than or equal to the number of accessible counters, then the behavior of permitted reads and writes of PMXEVTYPER is as follows:

- If PMSELR.SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and PMSELR.SEL is not 31 and is greater than or equal to the number of accessible counters, then reads and writes of PMXEVTYPER are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a \texttt{NOP}
- Accesses to the register behave as if PMSELR.SEL has an unknown value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR.SEL is 31.
- If EL2 is implemented and enabled in the current Security state, and PMSELR.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.
--- Note ---

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented counters. See HDCR.HPMN and MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{c\}\{q\}\ <\text{coproc}, \{#\}opc1>, <Rt>, \langle CRn\rangle, \langle CRm\rangle, \{#\}opc2>\]

<table>

G8.5 Activity Monitors registers

This section lists the Activity Monitoring registers in AArch32.
### G8.5.1 AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

**Purpose**

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

**Configurations**

- AArch32 System register AMCFGR[31:0] is architecturally mapped to AArch64 System register AMCFGR_EL0[31:0].
- AArch32 System register AMCFGR[31:0] is architecturally mapped to External register AMCFGR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are UNDEFINED.

**Attributes**

AMCFGR is a 32-bit register.

**Field descriptions**

The AMCFGR bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Mask</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NCG</td>
<td>0000</td>
<td>Defines the number of counter groups. The number of implemented counter groups is defined as ([\text{AMCFGR.NCG} + 1]). If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of (0b0000). Otherwise, this field has a value of (0b0001).</td>
</tr>
<tr>
<td>RES0</td>
<td></td>
<td>Reserved, (0b0). AMCR.HDBG is (0b0). AMCR.HDBG is read/write.</td>
</tr>
<tr>
<td>RAZ</td>
<td>1111</td>
<td>Reserved, RAZ.</td>
</tr>
<tr>
<td>SIZE</td>
<td>0111</td>
<td>Defines the size of activity monitor event counters. The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as ([\text{AMCFGR.SIZE} + 1]).</td>
</tr>
<tr>
<td>HDBG</td>
<td></td>
<td>Halt-on-debug supported. From Armv8, this feature must be supported, and so this bit is (0b1). (0b0) AMCR.HDBG is RES0. (0b1) AMCR.HDBG is read/write.</td>
</tr>
</tbody>
</table>

**NCG, bits [31:28]**

Defines the number of counter groups.

The number of implemented counter groups is defined as \([\text{AMCFGR.NCG} + 1]\).

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of \(0b0000\). Otherwise, this field has a value of \(0b0001\).

**Bits [27:25]**

Reserved, RES0.

**HDBG, bit [24]**

Halt-on-debug supported.

From Armv8, this feature must be supported, and so this bit is \(0b1\).

\(0b0\) AMCR.HDBG is RES0.

\(0b1\) AMCR.HDBG is read/write.

**Bits [23:14]**

Reserved, RAZ.

**SIZE, bits [13:8]**

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as \([\text{AMCFGR.SIZE} + 1]\).
From Armv8, the counters are 64-bit, and so this field is \( 0b111111 \).

--- Note ---

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

---

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as \([\text{AMCFGR}.N + 1]\).

### Accessing the AMCFGR

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\langle c\rangle\{<q>\} \langle\#\rangle<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \langle\#\rangle<\text{opc2}> \\
\]

G8.5.2 AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

**Purpose**

Provides information on the number of activity monitor event counters implemented within each counter group.

**Configurations**

AArch32 System register AMCGCR[31:0] is architecturally mapped to AArch64 System register AMCGCR_EL0[31:0].

AArch32 System register AMCGCR[31:0] is architecturally mapped to External register AMCGCR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are UNDEFINED.

**Attributes**

AMCGCR is a 32-bit register.

**Field descriptions**

The AMCGCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit assigned</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-16</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>15-8</td>
<td>CG1NC, Counter Group 1 Number of Counters.</td>
</tr>
<tr>
<td>7-0</td>
<td>CG0NC, Counter Group 0 Number of Counters.</td>
</tr>
</tbody>
</table>

**Accessing the AMCGCR**

Accesses to this register use the following encodings in the System instruction encoding space:

```
mrc{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

if PSTATE.EL == EL0 then

G8.5.3 AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

**Purpose**

Disable control bits for the architected activity monitors event counters, AMEVCNTR0<\text<n>>.

**Configurations**

AArch32 System register AMCNTENCLR0[31:0] is architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

AArch32 System register AMCNTENCLR0[31:0] is architecturally mapped to External register AMCNTENCLR0[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are undefined.

**Attributes**

AMCNTENCLR0 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR0 bit assignments are:

| 31 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | P<\text<n>>, bit [\text<n>]| |

**Bits [31:16]**

Reserved, RES0.

**P<\text<n>>, bit [\text<n>], for \text<n> = 0 to 15**

Activity monitor event counter disable bit for AMEVCNTR0<\text<n>>.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

- **0b0** When read, means that AMEVCNTR0<\text<n>> is disabled. When written, has no effect.
- **0b1** When read, means that AMEVCNTR0<\text<n>> is enabled. When written, disables AMEVCNTR0<\text<n>>.

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENCLR0**

Accesses to this register use the following encodings in the System instruction encoding space:

\[\text{MRC (<c>)(<q>) <coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>}, \text{(,#)<opc2>}\]

G8.5.4 AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

**Purpose**

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<\textit{n}>

**Configurations**

AArch32 System register AMCNTENCLR1[31:0] is architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

AArch32 System register AMCNTENCLR1[31:0] is architecturally mapped to External register AMCNTENCLR1[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are UNDEFINED.

**Attributes**

AMCNTENCLR1 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-16</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>15-0</td>
<td>( P&lt;n&gt;, \text{bit [n]} )</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**P<\textit{n}>, bit [\textit{n}], for \textit{n} = 0 to 15**

Activity monitor event counter disable bit for AMEVCNTR1<\textit{n}>

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR_EL0.CG1NC.

Possible values of each bit are:

\( \text{\texttt{0b0}} \) When read, means that AMEVCNTR1<\textit{n}> is disabled. When written, has no effect.

\( \text{\texttt{0b1}} \) When read, means that AMEVCNTR1<\textit{n}> is enabled. When written, disables AMEVCNTR1<\textit{n}>.

On a Cold reset, this field resets to \texttt{0}.

**Accessing the AMCNTENCLR1**

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are UNDEFINED.

--- **Note** ---

The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR.NCG == \texttt{0b0000}.

Accesses to this register use the following encodings in the System instruction encoding space:

G8.5.5 AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, AMEVCNTR0<n>.

Configurations

AArch32 System register AMCNTENSET0[31:0] is architecturally mapped to AArch64 System register AMCNTENSET0_EL0[31:0].

AArch32 System register AMCNTENSET0[31:0] is architecturally mapped to External register AMCNTENSET0[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are UNDEFINED.

Attributes

AMCNTENSET0 is a 32-bit register.

Field descriptions

The AMCNTENSET0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 0 to 15

Activity monitor event counter enable bit for AMEVCNTR0<n>. Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

- 0b0: When read, means that AMEVCNTR0<n> is disabled. When written, has no effect.
- 0b1: When read, means that AMEVCNTR0<n> is enabled. When written, enables AMEVCNTR0<n>.

On a Cold reset, this field resets to 0.

Accessing the AMCNTENSET0

Accesses to this register use the following encodings in the System instruction encoding space:

G8.5.6 AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

**Purpose**

Enable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

**Configurations**

AArch32 System register AMCNTENSET1[31:0] is architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

AArch32 System register AMCNTENSET1[31:0] is architecturally mapped to External register AMCNTENSET1[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are UNDEFINED.

**Attributes**

AMCNTENSET1 is a 32-bit register.

**Field descriptions**

The AMCNTENSET1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>16-15</td>
<td>P&lt;n&gt;, bit [n]</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**P<n>, bit [n], for n = 0 to 15**

Activity monitor event counter enable bit for AMEVCNTR1<n>.

Bits [31:16] are RES0. Bits [15:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

- **0b0** When read, means that AMEVCNTR1<n> is disabled. When written, has no effect.
- **0b1** When read, means that AMEVCNTR1<n> is enabled. When written, enables AMEVCNTR1<n>.

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENSET1**

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1 are UNDEFINED.

--- **Note** ---

The number of auxiliary activity monitor counters implemented is zero when AMCFGR.NCG === 000000.

Accesses to this register use the following encodings in the System instruction encoding space:
MRC(<c>){<q>} <coproc>, (#<opc1>, <Rt>, <CRn>, <CRm>)(#, (#<opc2>)

G8.5.7 AMCR, Activity Monitors Control Register

The AMCR characteristics are:

**Purpose**

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

**Configurations**

AArch32 System register AMCR[31:0] is architecturally mapped to AArch64 System register AMCR_EL0[31:0].

AArch32 System register AMCR[31:0] is architecturally mapped to External register AMCR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are UNDEFINED.

**Attributes**

AMCR is a 32-bit register.

**Field descriptions**

The AMCR bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>18</td>
<td>Reserved, RES0</td>
</tr>
<tr>

<td>CG1RZ</td>
</tr>
<tr>
<td>16</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>10</td>
<td>HDBG</td>
</tr>
<tr>
<td>9</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Bits [31:18]**

Reserved, RES0.

**CG1RZ, bit [17]**

*When FEAT_AMUv1p1 is implemented:*

Counter Group 1 Read Zero.

0b0 System register reads of AMEVCNTR1<n> return the event count at all implemented and enabled Exception levels.

0b1 If the current Exception level is the highest implemented Exception level, system register reads of AMEVCNTR1<n> return the event count. Otherwise, reads of AMEVCNTR1<n> return a zero value.

---

**Note**

Reads from the memory-mapped view are unaffected by this field.

---

**Otherwise:**

Reserved, RES0.

**Bits [16:11]**

Reserved, RES0.

**HDBG, bit [10]**

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

0b0 Activity monitors do not halt counting when the PE is halted in Debug state.

0b1 Activity monitors halt counting when the PE is halted in Debug state.
Bits [9:0]  
Reserved, RES0.

G8.5.8 AMEVCNTR0\(<n>\), Activity Monitors Event Counter Registers 0, \(n = 0 - 15\)

The AMEVCNTR0\(<n>\) characteristics are:

**Purpose**

Provides access to the architected activity monitor event counters.

**Configurations**

AArch32 System register AMEVCNTR0\(<n>\)[63:0] is architecturally mapped to AArch64 System register AMEVCNTR0\(<n>_EL0\)[63:0].

AArch32 System register AMEVCNTR0\(<n>\)[63:0] is architecturally mapped to External register AMEVCNTR0\(<n>\)[63:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0\(<n>\) are UNDEFINED.

**Attributes**

AMEVCNTR0\(<n>\) is a 64-bit register.

**Field descriptions**

The AMEVCNTR0\(<n>\) bit assignments are:

```
  63 0
  ? ? ACNT
```

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If FEAT_AMUv1p1 is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1, HCR_EL2.{E2H, TGE} is not {1,1}, and EL2 is using AArch64 and is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount\(<63:0>\) - AMEVCNTRVOFF0\(<n>_EL2\[63:0>\)).

PCount is the physical count returned when AMEVCNTR0\(<n>\) is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR0\(<n>\)**

If \(<n>\) is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0\(<n>\) are UNDEFINED.

--- **Note** ---

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System instruction encoding space:

G8.5.9 AMEVCNTR1<\(n\)>, Activity Monitors Event Counter Registers 1, \(n = 0 - 15\)

The AMEVCNTR1<\(n\)> characteristics are:

**Purpose**

Provides access to the auxiliary activity monitor event counters.

**Configurations**

AArch32 System register AMEVCNTR1<\(n\)>[63:0] is architecturally mapped to AArch64 System register AMEVCNTR1<\(n\)>\_EL0[63:0].

AArch32 System register AMEVCNTR1<\(n\)>[63:0] is architecturally mapped to External register AMEVCNTR1<\(n\)>[63:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<\(n\)> are UNDEFINED.

**Attributes**

AMEVCNTR1<\(n\)> is a 64-bit register.

**Field descriptions**

The AMEVCNTR1<\(n\)> bit assignments are:

```
+----------------+----------------+
| ACNT           |               |
| 63:0           | 0             |
```

**ACNT, bits [63:0]**

Auxiliary activity monitor event counter \(n\).

Value of auxiliary activity monitor event counter \(n\), where \(n\) is the number of this register and is a number from 0 to 15.

If FEAT_AMUv1p1 is implemented, HCR\_EL2.AMVOFFEN is 1, SCR\_EL3.AMVOFFEN is 1, HCR\_EL2.{E2H, TGE} is not \{1,1\}, EL2 is using AArch64 and is implemented in the current Security state, and AMCR\_EL0.CG1RZ is 0, reads to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF1<\(n\)>\_EL2<63:0>).

PCount is the physical count returned when AMEVCNTR1<\(n\)> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR1<\(n\)>**

If <\(n\)> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<\(n\)> are UNDEFINED.

---

**Note**

AMCGCR.CG1INC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System instruction encoding space:

<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>evtCount</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

- **0x0011 When n == 0** Processor frequency cycles
- **0x4004 When n == 1** Constant frequency cycles
- **0x0008 When n == 2** Instructions retired
- **0x4005 When n == 3** Memory stall cycles

**Accessing the AMEVTYPER0<n>**

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n> are UNDEFINED.

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1<n>, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by AMEVCNTR1<n> might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter AMEVCNTR1<n> is enabled, writes to this register have UNPREDICTABLE results.

**Accessing the AMEVTYPER1<n>**

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n> are UNDEFINED.

---

Note

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System instruction encoding space:
MRC<
>c{q}<

G8.5.12 AMUSERENR, Activity Monitors User Enable Register

The AMUSERENR characteristics are:

**Purpose**
Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR is applicable to both the architected and the auxiliary counter groups.

**Configurations**
AArch32 System register AMUSERENR[31:0] is architecturally mapped to AArch64 System register AMUSERENR_EL0[31:0].
This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR are UNDEFINED.

**Attributes**
AMUSERENR is a 32-bit register.

**Field descriptions**
The AMUSERENR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-1</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td>EN</td>
</tr>
</tbody>
</table>

EN, bit [0]
Traps EL0 accesses to the activity monitors registers to EL1.

- **0b0** EL0 accesses to the activity monitors registers are trapped to EL1.
- **0b1** This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

_____ Note _____
- AMUSERENR can always be read at EL0 and is not governed by this bit.

**Accessing the AMUSERENR**
Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c>\}<\{q\}\} <\text{coproc}, \{\#<opc1>, <Rt>, <CRn>, <CRm>\}, \{\#<opc2>\})
\]

G8.6 RAS registers

This section lists The Reliability, Availability, and Serviceability Extension registers in AArch32.
G8.6.1 DISR, Deferred Interrupt Status Register

The DISR characteristics are:

**Purpose**
Records that an SError interrupt has been consumed by an ESB instruction.

**Configurations**
AArch32 System register DISR[31:0] is architecturally mapped to AArch64 System register DISR_EL1[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to DISR are UNDEFINED.

**Attributes**
DISR is a 32-bit register.

**Field descriptions**
The DISR bit assignments are:

*When the ESB instruction is executed at EL2:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>AET</td>

<td>RES0</td>
</tr>
<tr>
<td>28</td>
<td>DFSC</td>
</tr>
<tr>
<td>27</td>
<td>EA</td>
</tr>
</tbody>
</table>

A, bit [31]
Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

This field resets to an architecturally UNKNOWN value.

Bits [30:12]
Reserved, RES0.

AET, bits [11:10]
Asynchronous Error Type. See the description of HSR.AET for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

EA, bit [9]
External abort Type. See the description of HSR.EA for an SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [8:6]
Reserved, RES0.

DFSC, bits [5:0]
Fault Status Code. See the description of HSR.DFSC for an SError interrupt.

This field resets to an architecturally UNKNOWN value.
When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 0:

<table>
<thead>
<tr>
<th>31 30</th>
<th>16 15 14 13 12 11 10 9 8 4 3 0</th>
</tr>
</thead>
<tbody>

<td>RES0</td>
</tr>
</tbody>
</table>

A, bit [31]
Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.
This field resets to an architecturally UNKNOWN value.

Bits [30:16]
Reserved, RES0.

AET, bits [15:14]
Asynchronous Error Type. See the description of DFSR.AET for an SError interrupt.
This field resets to an architecturally UNKNOWN value.

Bit [13]
Reserved, RES0.

ExT, bit [12]
External abort Type. See the description of DFSR.ExT for an SError interrupt.
This field resets to an architecturally UNKNOWN value.

Bit [11]
Reserved, RES0.

FS[4], bit [10]
This field is bit[4] of FS[4:0].
Fault Status Code. See the description of DFSR.FS for an SError interrupt.
The FS field is split as follows:
• FS[4] is DISR[10].
• FS[3:0] is DISR[3:0].
This field resets to an architecturally UNKNOWN value.

LPAE, bit [9]
Format.
0b0 Using the Short-descriptor translation table format.
This field resets to an architecturally UNKNOWN value.

Bits [8:4]
Reserved, RES0.
FS[3:0], bits [3:0]
This field is bits[3:0] of FS[4:0].

When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 1:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>16</th>
<th>15</th>
<th>14</th>

</tr>
</tbody>
</table>

A, bit [31]
Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.
This field resets to an architecturally UNKNOWN value.

Bits [30:16]
Reserved, RES0.

AET, bits [15:14]
Asynchronous Error Type. See the description of DFSR.AET for an SError interrupt.
This field resets to an architecturally UNKNOWN value.

Bit [13]
Reserved, RES0.

ExT, bit [12]
External abort Type. See the description of DFSR.ExT for an SError interrupt.
This field resets to an architecturally UNKNOWN value.

Bits [11:10]
Reserved, RES0.

LPAE, bit [9]
Format.
0b1 Using the Long-descriptor translation table format.
This field resets to an architecturally UNKNOWN value.

Bits [8:6]
Reserved, RES0.

STATUS, bits [5:0]
Fault Status Code. See the description of DFSR.FS for an SError interrupt.
This field resets to an architecturally UNKNOWN value.
Accessing the DISR

An indirect write to DISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

DISR is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, and any of the following apply:

- EL3 is using AArch64, SCR_EL3.EA == 1, and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and ((SCR_EL3.NS == 0 & SCR_EL3.EE == 0) || HCR_EL2.AMO == 0).
- EL3 is using AArch32, SCR.EA == 1, and any of the following apply:
  - The PE is executing at EL2.
  - The PE is executing at EL1 and (SCR.NS == 0 || HCR.AMO == 0).

Accesses to this register use the following encodings in the System instruction encoding space:

\[ \text{MRC}\{<c>\}{<q>} \text{coproc}, \{#\}<opc1>, <Rt>, <CRn>, <CRm>{, \{#\}<opc2>} \]

<table>
<thead>
<tr>

G8.6.2 ERRIDR, Error Record ID Register

The ERRIDR characteristics are:

**Purpose**

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

**Configurations**

AArch32 System register ERRIDR[31:0] is architecturally mapped to AArch64 System register ERRIDR_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR are UNDEFINED.

**Attributes**

ERRIDR is a 32-bit register.

**Field descriptions**

The ERRIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>NUM</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**NUM, bits [15:0]**

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates that no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

**Accessing the ERRIDR**

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\langle\text{c}\rangle\langle\text{q}\rangle\ <\text{coproc}> , \langle\#\rangle\langle\text{opc1}\rangle, <\text{Rt}>, <\text{CRn}>, <\text{CRm}\rangle{} , \langle\#\rangle\langle\text{opc2}\rangle
\]

<table>

G8.6.3 ERRSELR, Error Record Select Register

The ERRSELR characteristics are:

**Purpose**

Selects an error record to be accessed through the Error Record System registers.

**Configurations**

AArch32 System register ERRSELR[31:0] is architecturally mapped to AArch64 System register ERRSELR_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRSELR are UNDEFINED.

If ERRIDR indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR is UNDEFINED or RES0.

**Attributes**

ERRSELR is a 32-bit register.

**Field descriptions**

The ERRSELR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SEL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**SEL, bits [15:0]**

Selects the error record accessed through the ERX registers.

For example, if ERRSELR.SEL is set to 0x0004, then direct reads and writes of ERXSTATUS access ERR4STATUS.

If ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then all of the following apply:

- The value read back from ERRSELR.SEL is UNKNOWN.
- One of the following occurs:
  - An UNKNOWN error record is selected.
  - The ERX* registers are RAZ/WI.
  - ERX* register reads and writes are NOPs.
  - ERX* register reads and writes are UNDEFINED.

This field resets to an architecturally UNKNOWN value.

**Accessing the ERRSELR**

Accesses to this register use the following encodings in the System instruction encoding space:
MRC(<c>){<q>} <coproc>, <#opc1>, <Rt>, <CRn>, <CRm>{, <#opc2>}

## G8.6.4 ERXADDR, Selected Error Record Address Register

The ERXADDR characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>ADDR for the error record <n> selected by ERRSEL.R.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXADDR[31:0] is architecturally mapped to AArch64 System register ERXADDR_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR are UNDEFINED.

**Attributes**

ERXADDR is a 32-bit register.

**Field descriptions**

The ERXADDR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>ERXADDR accesses bits [31:0] of ERR&lt;n&gt;ADDR, where &lt;n&gt; is the value in ERRSEL.R.SEL.</th>
</tr>
</thead>
</table>

**Accessing the ERXADDR**

If ERRIDR.NUM == 0x0000 or ERRSEL.R.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR is RAZ/WI.
- Direct reads and writes of ERXADDR are NOPs.
- Direct reads and writes of ERXADDR are UNDEFINED.

ERR<n>ADDR describes additional constraints that also apply when ERR<n>ADDR is accessed through ERXADDR.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c>\}{<q>}\ <\text{coproc}, \{#}<opc1>, <Rt>, <CRn>, <CRm>{, \{#}<opc2>}
\]

G8.6.5 ERXADDR2, Selected Error Record Address Register 2

The ERXADDR2 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR<\text{n}>ADDR for the error record <\text{n}> selected by ERRSEL.R SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXADDR2[31:0] is architecturally mapped to AArch64 System register ERXADDR_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR2 are UNDEFINED.

**Attributes**

ERXADDR2 is a 32-bit register.

**Field descriptions**

The ERXADDR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [63:32] of ERR&lt;\text{n}&gt;ADDR</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

ERXADDR2 accesses bits [63:32] of ERR<\text{n}>ADDR, where <\text{n}> is the value in ERRSEL.R SEL.

**Accessing the ERXADDR2**

If ERRIDR.NUM == 0x0000 or ERRSEL.R SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An **UNKNOWN** error record is selected.
- ERXADDR2 is RAZ/WI.
- Direct reads and writes of ERXADDR2 are NOPs.
- Direct reads and writes of ERXADDR2 are UNDEFINED.

ERR<\text{n}>ADDR describes additional constraints that also apply when ERR<\text{n}>ADDR is accessed through ERXADDR2.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c>\}{<q>} \text{coproc}, \{\#<opc1>, <Rt>, <CRn>, <CRm>, \{\#<opc2>\} } \\
\text{if PSTATE.EL == EL0 then UNDEFINED; } \\
\text{elsif PSTATE.EL == EL1 then } \\
\text{if Halted() && HaveEL(EL3) && EDSCR.SDD == `1` && boolean IMPLEMENTATION_DEFINED "EL3 trap priority}
\]

G8.6.6 ERXCTLR, Selected Error Record Control Register

The ERXCTLR characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>CTRL for the error record <n> selected by ERRSELR.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXCTLR[31:0] is architecturally mapped to AArch64 System register ERXCTRL_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTRL are UNDEFINED.

**Attributes**

ERXCTRL is a 32-bit register.

**Field descriptions**

The ERXCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Field Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:0] of ERR&lt;n&gt;CTRL</td>
</tr>
</tbody>
</table>

**Accessing the ERXCTRL**

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTRL is RAZ/WI.
- Direct reads and writes of ERXCTRL are NOPs.
- Direct reads and writes of ERXCTRL are UNDEFINED.

If ERRSELR.SEL is not the index of the first error record owned by a node, then ERR<n>CTRL[31:0] is not present, meaning reads and writes of ERXCTRL are RES0.

Accesses to this register use the following encodings in the System instruction encoding space:

**MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.6.7   ERXCTRLR2, Selected Error Record Control Register 2

The ERXCTRLR2 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>CTRL for the error record <n> selected by ERRSEL.R_SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

Configurations

AArch32 System register ERXCTRLR2[31:0] is architecturally mapped to AArch64 System register ERXCTRLR_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTRLR2 are UNDEFINED.

Attributes

ERXCTRLR2 is a 32-bit register.

Field descriptions

The ERXCTRLR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ERXCTRLR2 accesses bits [63:32] of ERR&lt;n&gt;CTRL, where &lt;n&gt; is the value in ERRSEL.R_SEL.</td>
</tr>
</tbody>
</table>

Accessing the ERXCTRLR2

If ERRIDR.NUM == 0x0000 or ERRSEL.R_SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTRLR2 is RAZ/WI.
- Direct reads and writes of ERXCTRLR2 are NOPs.
- Direct reads and writes of ERXCTRLR2 are UNDEFINED.

If ERRSEL.R_SEL is not the index of the first error record owned by a node, then ERR<n>CTRL[63:32] is not present, meaning reads and writes of ERXCTRLR2 are RES0.

Accesses to this register use the following encodings in the System instruction encoding space:

G8.6.8 ERXFR, Selected Error Record Feature Register

The ERXFR characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>FR for the error record <n> selected by ERRSELR.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXFR[31:0] is architecturally mapped to AArch64 System register ERXFR_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXFR are UNDEFINED.

**Attributes**

ERXFR is a 32-bit register.

**Field descriptions**

The ERXFR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ERXFR accesses bits [31:0] of ERR&lt;n&gt;FR, where &lt;n&gt; is the value in ERRSELR.SEL.</td>
</tr>
</tbody>
</table>

**Accessing the ERXFR**

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

• An UNKNOWN error record is selected.
• ERXFR is RAZ.
• Direct reads of ERXFR are NOPs.
• Direct reads of ERXFR are UNDEFINED.

Accesses to this register use the following encodings in the System instruction encoding space:

\[

G8.6.10  ERXMISC0, Selected Error Record Miscellaneous Register 0

The ERXMISC0 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC0 for the error record <n> selected by ERRSELR.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

Configurations

AArch32 System register ERXMISC0[31:0] is architecturally mapped to AArch64 System register ERXMISC0_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC0 are UNDEFINED.

Attributes

ERXMISC0 is a 32-bit register.

Field descriptions

The ERXMISC0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0] of ERR&lt;n&gt;MISC0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 0</td>
</tr>
</tbody>
</table>

Accessing the ERXMISC0

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC0 is RAZ/WI.
- Direct reads and writes of ERXMISC0 are NOPs.
- Direct reads and writes of ERXMISC0 are UNDEFINED.

ERR<n>MISC0 describes additional constraints that also apply when ERR<n>MISC0 is accessed through ERXMISC0.

Accesses to this register use the following encodings in the System instruction encoding space:

\[ MRC\{c\}\{q\} \langle coproc \rangle, \langle#\rangle \langle opc1 \rangle, \langle Rt \rangle, \langle CRn \rangle, \langle CRm \rangle, \{#\} \langle opc2 \rangle \]

\[

G8.6.11 ERXMISC1, Selected Error Record Miscellaneous Register 1

The ERXMISC1 characteristics are:

Purpose

Accesses bits [63:32] of ERR<\textless{}n\textgreater{}>MISC0 for the error record \textless{}n\textgreater{} selected by ERRSEL.R SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

Configurations

AArch32 System register ERXMISC1[31:0] is architecturally mapped to AArch64 System register ERXMISC0_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC1 are UNDEFINED.

Attributes

ERXMISC1 is a 32-bit register.

Field descriptions

The ERXMISC1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ERXMISC1 accesses bits [63:32] of ERR&lt;\textless{}n\textgreater{}&gt;MISC0, where \textless{}n\textgreater{} is the value in ERRSEL.R SEL.</td>
</tr>
</tbody>
</table>

Accessing the ERXMISC1

If ERRIDR.NUM == 0x0000 or ERRSEL.R SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

• An \textbf{UNKNOWN} error record is selected.
• ERXMISC1 is RAZ/WI.
• Direct reads and writes of ERXMISC1 are NOPs.
• Direct reads and writes of ERXMISC1 are UNDEFINED.

ERR<\textless{}n\textgreater{}>MISC0 describes additional constraints that also apply when ERR<\textless{}n\textgreater{}>MISC0 is accessed through ERXMISC1.

Accesses to this register use the following encodings in the System instruction encoding space:

\[ \text{MRC}\{<c>\}{<q>} \langle\text{coproc}\rangle, \langle\#\text{opc1}\rangle, \langle\text{Rt}\rangle, \langle\text{CRn}\rangle, \langle\text{CRm}\rangle, \langle\#\text{opc2}\rangle \]

G8.6.12 ERXMISC2, Selected Error Record Miscellaneous Register 2

The ERXMISC2 characteristics are:

Purpose

Accesses bits [31:0] of ERR<\text{n}>MISC1 for the error record <\text{n}> selected by ERRSEL.R_SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

Configurations

AArch32 System register ERXMISC2[31:0] is architecturally mapped to AArch64 System register ERXMISC1_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC2 are UNDEFINED.

Attributes

ERXMISC2 is a 32-bit register.

Field descriptions

The ERXMISC2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 0</td>
<td>ERXMISC2 accesses bits [31:0] of ERR&lt;\text{n}&gt;MISC1, where &lt;\text{n}&gt; is the value in ERRSEL.R_SEL.</td>
</tr>
</tbody>
</table>

Accessing the ERXMISC2

If ERRIDR.NUM == 0x0000 or ERRSEL.R_SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC2 is RAZ/WI.
- Direct reads and writes of ERXMISC2 are NOPs.
- Direct reads and writes of ERXMISC2 are UNDEFINED.

ERR<\text{n}>MISC1 describes additional constraints that also apply when ERR<\text{n}>MISC1 is accessed through ERXMISC2.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC\{c\}\{q\} <coproc>, \{#\}<opc1>, \text{<Rt>}, \text{<CRn>}, \text{<CRm>\{, \{#\}<opc2>\}}}
\]

G8.6.13   ERXMISC3, Selected Error Record Miscellaneous Register 3

The ERXMISC3 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR<\(n\)>MISC1 for the error record <\(n\)> selected by ERRSELR.SEL.

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

**Configurations**

AArch32 System register ERXMISC3[31:0] is architecturally mapped to AArch64 System register ERXMISC1_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC3 are UNDEFINED.

**Attributes**

ERXMISC3 is a 32-bit register.

**Field descriptions**

The ERXMISC3 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>ERXMISC3 accesses bits [63:32] of ERR&lt;(n)&gt;MISC1, where &lt;(n)&gt; is the value in ERRSELR.SEL.</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
</tr>
</tbody>
</table>

**Accessing the ERXMISC3**

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An **UNKNOWN** error record is selected.
- ERXMISC3 is RAZ/WI.
- Direct reads and writes of ERXMISC3 are NOPs.
- Direct reads and writes of ERXMISC3 are UNDEFINED.

ERR<\(n\)>MISC1 describes additional constraints that also apply when ERR<\(n\)>MISC1 is accessed through ERXMISC3.

Accesses to this register use the following encodings in the System instruction encoding space:

\[

**Purpose**

Accesses bits [31:0] of ERR<\textless n\textgreater>MISC2 for the error record \textless n\textgreater selected by ERRSELR.SEL.

For details of this, see the \textit{Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile}.

**Configurations**

AArch32 System register ERXMISC4[31:0] is architecturally mapped to AArch64 System register ERXMISC2_EL1[31:0].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC4 are UNDEFINED.

**Attributes**

ERXMISC4 is a 32-bit register.

**Field descriptions**

The ERXMISC4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ERR&lt;\textless n\textgreater&gt;MISC2</td>
</tr>
</tbody>
</table>

Bits [31:0]

ERXMISC4 accesses bits [31:0] of ERR<\textless n\textgreater>MISC2, where \textless n\textgreater is the value in ERRSELR.SEL.

**Accessing the ERXMISC4**

If ERRIDR.NUM \text{==} 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An \textit{UNKNOWN} error record is selected.
- ERXMISC4 is RAZ/WI.
- Direct reads and writes of ERXMISC4 are NOPs.
- Direct reads and writes of ERXMISC4 are UNDEFINED.

ERR<\textless n\textgreater>MISC2 describes additional constraints that also apply when ERR<\textless n\textgreater>MISC2 is accessed through ERXMISC4.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c}\}{<q}\ <\text{coproc},\ <\text{opc1},\ <\text{Rt},\ <\text{CRn},\ <\text{CRm}\}{,\ <\text{opc2}}
\]

<table>

G8.6.15  ERXMISC5, Selected Error Record Miscellaneous Register 5

The ERXMISC5 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR\(<n>\)MISC2 for the error record \(<n>\) selected by ERRSELR.SEL.

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

**Configurations**

AArch32 System register ERXMISC5[31:0] is architecturally mapped to AArch64 System register ERXMISC2_EL1[63:32].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC5 are UNDEFINED.

**Attributes**

ERXMISC5 is a 32-bit register.

**Field descriptions**

The ERXMISC5 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERXMISC5 accesses bits [63:32] of ERR(&lt;n&gt;)MISC2, where (&lt;n&gt;) is the value in ERRSELR.SEL.</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the ERXMISC5**

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC5 is RAZ/W1.
- Direct reads and writes of ERXMISC5 are NOPs.
- Direct reads and writes of ERXMISC5 are UNDEFINED.

ERR\(<n>\)MISC2 describes additional constraints that also apply when ERR\(<n>\)MISC2 is accessed through ERXMISC5.

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

G8.6.16  ERXMISC6, Selected Error Record Miscellaneous Register 6

The ERXMISC6 characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>MISC3 for the error record <n> selected by ERRSELR_SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXMISC6[31:0] is architecturally mapped to AArch64 System register ERXMISC3_EL1[31:0].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC6 are UNDEFINED.

**Attributes**

ERXMISC6 is a 32-bit register.

**Field descriptions**

The ERXMISC6 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 0</td>
</tr>
</tbody>
</table>

ERXMISC6 accesses bits [31:0] of ERR<n>MISC3, where <n> is the value in ERRSELR_SEL.

**Accessing the ERXMISC6**

If ERRIDR_NUM == 0x0000 or ERRSELR_SEL is set to a value greater than or equal to ERRIDR_NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC6 is RAZ/WI.
- Direct reads and writes of ERXMISC6 are NOPs.
- Direct reads and writes of ERXMISC6 are UNDEFINED.

ERR<n>MISC3 describes additional constraints that also apply when ERR<n>MISC3 is accessed through ERXMISC6.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC\{<c>\{<q>\{<coproc>, \{#\}<opc1>, <Rt>, <CRn>, <CRm>\}, \{#\}<opc2>\}}

G8.6.17 ERXMISC7, Selected Error Record Miscellaneous Register 7

The ERXMISC7 characteristics are:

**Purpose**

Accesses bits [63:32] of ERR<\(n\)>MISC3 for the error record <\(n\)> selected by ERRSELR.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXMISC7[31:0] is architecturally mapped to AArch64 System register ERXMISC3_EL1[63:32].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC7 are UNDEFINED.

**Attributes**

ERXMISC7 is a 32-bit register.

**Field descriptions**

The ERXMISC7 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ERXMISC7 accesses bits [63:32] of ERR&lt;(n)&gt;MISC3, where &lt;(n)&gt; is the value in ERRSELR.SEL.</td>
</tr>
</tbody>
</table>

**Accessing the ERXMISC7**

If ERRIDR.NUM == 0x0000 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC7 is RAZ/WI.
- Direct reads and writes of ERXMISC7 are NOPs.
- Direct reads and writes of ERXMISC7 are UNDEFINED.

ERR<\(n\)>MISC3 describes additional constraints that also apply when ERR<\(n\)>MISC3 is accessed through ERXMISC7.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c>\}\{<q>\} \text{coproc}, \{\#\}\text{opc1}, <Rt>, <CRn>, <CRm>\{, \{\#\}\text{opc2}\}
\]

ERXSTATUS, Selected Error Record Primary Status Register

The ERXSTATUS characteristics are:

**Purpose**

Accesses bits [31:0] of ERR<n>STATUS for the error record selected by ERRSELR.SEL.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

AArch32 System register ERXSTATUS[31:0] is architecturally mapped to AArch64 System register ERXSTATUS_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXSTATUS are UNDEFINED.

**Attributes**

ERXSTATUS is a 32-bit register.

**Field descriptions**

The ERXSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0] of ERR&lt;n&gt;STATUS</th>
</tr>
</thead>
</table>

Bits [31:0]

ERXSTATUS accesses bits [31:0] of ERR<n>STATUS, where n is the value in ERRSELR.SEL.

**Accessing the ERXSTATUS**

If ERRIDR.NUM == 0 or ERRSELR.SEL is set to a value greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN record is selected.
- ERXSTATUS is RAZ/WI.
- Direct reads and writes of ERXSTATUS are NOPs.
- Direct reads and writes of ERXSTATUS are UNDEFINED.

Accesses to this register use the following encodings in the System instruction encoding space:

```

G8.6.19 VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

**Purpose**
Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an E58 instruction at EL1.

When a virtual SError interrupt is taken, the syndrome value is reported in DFSR.{AET, ExT} and the remainder of the DFSR is set as defined by VMSAv8-32. For more information, see Chapter G5 The AArch32 Virtual Memory System Architecture.

If the virtual SError interrupt is deferred by an E58 instruction, then the syndrome value is written to VDISR.

**Configurations**
AArch32 System register VDFSR[31:0] is architecturally mapped to AArch64 System register VSESR_EL2[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

**Attributes**
VDFSR is a 32-bit register.

**Field descriptions**
The VDFSR bit assignments are:

```
<table>
<thead>
<tr>
<th>31</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>12</th>
<th>11</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>AET</td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>ExT</td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

**Bits [31:16]**
Reserved, RES0.

**AET, bits [15:14]**
When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[15:4] is set to VDFSR.AET.
When a virtual SError interrupt is deferred by an E58 instruction, VDISR[15:4] is set to VDFSR.AET.
This field resets to an architecturally UNKNOWN value.

**Bit [13]**
Reserved, RES0.

**ExT, bit [12]**
When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[12] is set to VDFSR.ExT.
When a virtual SError interrupt is deferred by an E58 instruction, VDISR[12] is set to VDFSR.ExT.
This field resets to an architecturally UNKNOWN value.

**Bits [11:0]**
Reserved, RES0.
Accessing the VDFSR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{\text{c}\}\{\text{q}\}\ <\text{coproc}>, \{\text{#}\}<\text{opc1}>, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>, \{\text{#}\}<\text{opc2}\}
\]

G8.6.20 VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configurations

AArch32 System register VDISR[31:0] is architecturally mapped to AArch64 System register VDISR_EL2[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDISR is a 32-bit register.

Field descriptions

The VDISR bit assignments are:

When TTBCR.EAE == 0:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>12</th>
<th>11</th>
<th>10</th>
<th>8</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>RES0</td>
<td>AET</td>
<td>RES0</td>
<td>FS[3:0]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR.AET.

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VDFSR.ExT.

This field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.
FS[4], bit [10]

This field is bit[4] of FS[4:0].

Fault status code. Set to 0b10110 when an E58 instruction defers a virtual SError interrupt.

0b10110   Asynchronous SError interrupt.
All other values are reserved.

The FS field is split as follows:
- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

This field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an E58 instruction defers a virtual SError interrupt.

0b0   Using the Short-descriptor translation table format.

This field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

FS[3:0], bits [3:0]

This field is bits[3:0] of FS[4:0].

When TTBCR.EAE == 1:

| 31 | 30 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 6 | 5 | 0 |
|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|
| A  | RES0 | AET | RES0 | STATUS |

A, bit [31]

Set to 1 when an E58 instruction defers a virtual SError interrupt.

This field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR.AET.

This field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VDFSR.ExT.

This field resets to an architecturally UNKNOWN value.
Bits [11:10]
Reserved, RES0.

LPAE, bit [9]
Format.
Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.

0b1 Using the Long-descriptor translation table format.
This field resets to an architecturally UNKNOWN value.

Bits [8:6]
Reserved, RES0.

STATUS, bits [5:0]
Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

0b010001 Asynchronous SError interrupt.
All other values are reserved.
This field resets to an architecturally UNKNOWN value.

Accessing the VDISR

Direct reads and writes of VDISR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System instruction encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

<table>
<thead>
<tr>
<th>coproc</th>

G8.7  Generic Timer registers

This section lists the Generic Timer registers in AArch32.
G8.7.1 CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

**Purpose**

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

**Configurations**

AArch32 System register CNTFRQ[31:0] is architecturally mapped to AArch64 System register CNTFRQ_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTFRQ are UNDEFINED.

**Attributes**

CNTFRQ is a 32-bit register.

**Field descriptions**

The CNTFRQ bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Clock frequency</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the CNTFRQ**

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRC<c>{<q>} <coproc>, {#<opc1>}, <Rt>, <CRn>, <CRm>{, {#<opc2>}}
```

<table>
<thead>
<tr>

ifIsActive(PSTATE.EL) then
  CNTFRQ = R[t];
else
  UNDEFINED;
G8.7.2 CNTHCTL, Counter-timer Hyp Control register

The CNTHCTL characteristics are:

**Purpose**

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

**Configurations**

AArch32 System register CNTHCTL[31:0] is architecturally mapped to AArch64 System register CNTHCTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHCTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHCTL is a 32-bit register.

**Field descriptions**

The CNTHCTL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>EVNTI</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**EVNTIS, bit [17]**

*When FEAT_ECV is implemented:*

Controls the scale of the generation of the event stream.

- 0b0 The CNTHCTL.EVNTI field applies to CNTPCT[15:0].
- 0b1 The CNTHCTL.EVNTI field applies to CNTPCT[23:8].

This field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

**Bits [16:8]**

Reserved, RES0.

**EVNTI, bits [7:4]**

Selects which bit of the counter register CNTPCT is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register CNTPCT is the trigger.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.
This field resets to an architecturally UNKNOWN value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register CNTPCT trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

0b0  A 0 to 1 transition of the trigger bit triggers an event.
0b1  A 1 to 0 transition of the trigger bit triggers an event.

This field resets to an architecturally UNKNOWN value.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the counter register CNTPCT:

0b0  Disables the event stream.
0b1  Enables the event stream.

This field resets to an architecturally UNKNOWN value.

**PL1PCEN, bit [1]**

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode.

0b0  Non-secure EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TV AL are trapped to Hyp mode, unless the it is trapped by CNTKCTL.PL0PTEN.
0b1  This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to an architecturally UNKNOWN value.

**PL1PCTEN, bit [0]**

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode.

0b0  Non-secure EL0 and EL1 accesses to the CNTPCT are trapped to Hyp mode, unless it is trapped by CNTKCTL.PL0PCTEN.
0b1  This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

This field resets to an architecturally UNKNOWN value.

### Accessing the CNTHCTL

Accesses to this register use the following encodings in the System instruction encoding space:

**MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>**

elsif PSTATE.EL == EL3 then
 CNTHCTL = R[t];
G8.7.3 CNTHP_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP_CTL characteristics are:

**Purpose**

Control register for the Hyp mode physical timer.

**Configurations**

AArch32 System register CNTHP_CTL[31:0] is architecturally mapped to AArch64 System register CNTHP_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP_CTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_CTL is a 32-bit register.

**Field descriptions**

The CNTHP_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>3:2</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>1</td>
<td>IMASK</td>
</tr>
<tr>
<td>0</td>
<td>ENABLE</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN. This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

In a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.
ENABLE, bit [0]

 Enables the timer. Permitted values are:

 0b0  Timer disabled.
 0b1  Timer enabled.

 Setting this bit to 0 disables the timer output signal, but the timer value accessible from
 CNTHP_TVAL continues to count down.

   --- Note ---

 Disabling the output signal might be a power-saving option.

 In a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing the CNTHP_CTL

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <Rt>, <CRn>, <CRm>\{, \{#<\text{opc2}>\}\}

G8.7.4   CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP_CVAL characteristics are:

Purpose

Holds the compare value for the Hyp mode physical timer.

Configurations

AArch32 System register CNTHP_CVAL[63:0] is architecturally mapped to AArch64 System register CNTHP_CVAL_EL2[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP_CVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CVAL is a 64-bit register.

Field descriptions

The CNTHP_CVAL bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit 63-0</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CompareValue</td>
</tr>
</tbody>
</table>
```

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHP_CVAL

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRRC{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <Rt2>, <CRm>
```

G8.7.5  CNTHP_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP_TVAL characteristics are:

**Purpose**

Holds the timer value for the Hyp mode physical timer.

**Configurations**

AArch32 System register CNTHP_TVAL[31:0] is architecturally mapped to AArch64 System register CNTHP_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTHP_TVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

**Attributes**

CNTHP_TVAL is a 32-bit register.

**Field descriptions**

The CNTHP_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
<th>TimerValue</th>
</tr>
</thead>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL.ENABLE is 1, the value returned is (CNTHP_CVAL - CNTPCT).

On a write of this register, CNTHP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTHP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTHP_TVAL**

Accesses to this register use the following encodings in the System instruction encoding space:

G8.7.6 CNTHPS_CTL, Counter-timer Secure Physical Timer Control Register (EL2)

The CNTHPS_CTL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the Secure EL2 physical timer.

**Configurations**

AArch32 System register CNTHPS_CTL[31:0] is architecturally mapped to AArch64 System register CNTHPS_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL are UNDEFINED.

**Attributes**

CNTHPS_CTL is a 32-bit register.

**Field descriptions**

The CNTHPS_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:3]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>ISTATUS, bit [2]</td>
<td>The status of the timer. This bit indicates whether the timer condition is met:</td>
</tr>
<tr>
<td>IMASK, bit [1]</td>
<td>Timer interrupt mask bit. Permitted values are:</td>
</tr>
<tr>
<td>ENABLE, bit [0]</td>
<td>Enables the timer. Permitted values are:</td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

0b0  Timer condition is not met.
0b1  Timer condition is met.

When the value of the CNTHPS_CTL.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

0b0  Timer interrupt is not masked by the IMASK bit.
0b1  Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

0b0  Timer disabled.
0b1  Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHPS_TV_AL_EL2 continues to count down.

--- Note ---
Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTHPS_CTL**

This register is accessed using the encoding for CNTP_CTL.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRC}\langle c\rangle|\langle q\rangle\langle \text{coproc}, \langle #\rangle\langle \text{opc1}, \langle R\rangle\langle CRn\rangle, \langle CRm\rangle\langle #\rangle\langle opc2\rangle}\]

<table>
<thead>
<tr>
<th>coproc</th>
<th>opc1</th>
<th>CRn</th>
<th>CRm</th>
<th>opc2</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1111</td>
<td>0b0000</td>
<td>0b1110</td>
<td>0b0010</td>
<td>0b0011</td>
</tr>
</tbody>
</table>

G8.7.7 CNTHPS_CVAL, Counter-timer Secure Physical Timer CompareValue Register (EL2)

The CNTHPS_CVAL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the compare value for the Secure EL2 physical timer.

**Configurations**

AArch32 System register CNTHPS_CVAL[63:0] is architecturally mapped to AArch64 System register CNTHPS_CVAL_EL2[63:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL are UNDEFINED.

**Attributes**

CNTHPS_CVAL is a 64-bit register.

**Field descriptions**

The CNTHPS_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>CompareValue, bits [63:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Holds the EL2 physical timer CompareValue.</td>
</tr>
<tr>
<td>When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:</td>
</tr>
<tr>
<td>• CNTHPS_CTL_EL2.ISTATUS is set to 1.</td>
</tr>
<tr>
<td>• If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.</td>
</tr>
<tr>
<td>When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count</td>
</tr>
</tbody>
</table>

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTHPS_CVAL**

This register is accessed using the encoding for CNTP_CVAL.

Accesses to this register use the following encodings in the System instruction encoding space:

\[
MRRC{<c>}{<q>} <coproc>, {#<opc1>, <Rt>, <Rt2>, <CRm>}

G8.7.8  CNTHPS_TVAL, Counter-timer Secure Physical Timer TimerValue Register (EL2)

The CNTHPS_TVAL characteristics are:

Purpose

Provides AArch32 access from EL0 to the timer value for the Secure EL2 physical timer.

Configurations

AArch32 System register CNTHPS_TVAL[31:0] is architecturally mapped to AArch64 System register CNTHPS_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL are UNDEFINED.

Attributes

CNTHPS_TVAL is a 32-bit register.

Field descriptions

The CNTHPS_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimerValue</td>
<td>The TimerValue view of the EL2 physical timer.</td>
</tr>
</tbody>
</table>

On a read of this register:

- If CNTHPS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHPS_CTL_EL2.ENABLE is 1, the value returned is (CNTHPS_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHPS_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHPS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTHPS_TVAL

This register is accessed using the encoding for CNTP_TVAL.

Accesses to this register use the following encodings in the System instruction encoding space:
### MRC(<c>)(<q>)

```
G8.7.9   CNTHV_CTL, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL characteristics are:

**Purpose**

Provides AArch32 access to the control register for the EL2 virtual timer.

**Configurations**

AArch32 System register CNTHV_CTL[31:0] is architecturally mapped to AArch64 System register CNTHV_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CTL are UNDEFINED.

**Attributes**

CNTHV_CTL is a 32-bit register.

**Field descriptions**

The CNTHV_CTL bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>
| 3   | ISTATUS       | The status of the timer. This bit indicates whether the timer condition is met:
|      |               | 0b0   Timer condition is not met.                                           |
|      |               | 0b1   Timer condition is met.                                              |
| 2   | IMASK         | Timer interrupt mask bit. Permitted values are:
|      |               | 0b0   Timer interrupt is not masked by the IMASK bit.                      |
|      |               | 0b1   Timer interrupt is masked by the IMASK bit.                          |
| 1   | ENABLE        | Enables the timer. Permitted values are:                                   |
|      |               | 0b0   Timer disabled.                                                      |
|      |               | 0b1   Timer enabled.                                                       |
```

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met.

ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is **UNKNOWN**.

This bit is read-only.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHV_TV AL continues to count down.

**Note**
Disabling the output signal might be a power-saving option.

G8.7.10  CNTHV_CVAL, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL characteristics are:

**Purpose**

Provides AArch32 access to the compare value for the EL2 virtual timer.

**Configurations**

AArch32 System register CNTHV_CVAL[63:0] is architecturally mapped to AArch64 System register CNTHV_CVAL_EL2[63:0].

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CVAL are UNDEFINED.

**Attributes**

CNTHV_CVAL is a 64-bit register.

**Field descriptions**

The CNTHV_CVAL bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit Width</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>64</td>
<td>CompareValue</td>
</tr>
</tbody>
</table>
```

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHV_CTL.ISTATUS is set to 1.
- If CNTHV_CTL.IMASK is 0, an interrupt is generated.

When CNTHV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

**Accessing the CNTHV_CVAL**

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRRC{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <Rt2>, <CRm>
```

<table>

AArch32 System Register Descriptions

G8.7 Generic Timer registers

AArch64.AArch32SystemAccessTrap(EL2, 0x04);
else
    CNTV_CVAL = R[t2]:R[t];
elsif PSTATE.EL == EL2 then
    CNTV_CVAL = R[t2]:R[t];
elsif PSTATE.EL == EL3 then
    CNTV_CVAL = R[t2]:R[t];
G8.7.11  CNTHV_TVAL, Counter-timer Virtual Timer TimerValue register (EL2)

The CNTHV_TVAL characteristics are:

**Purpose**

Provides AArch32 access to the timer value for the EL2 virtual timer.

**Configurations**

AArch32 System register CNTHV_TVAL[31:0] is architecturally mapped to AArch64 System register CNTHV_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL are UNDEFINED.

**Attributes**

CNTHV_TVAL is a 32-bit register.

**Field descriptions**

The CNTHV_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHV_CTL.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTHV_CTL.ENABLE is 1, the value returned is (CNTHV_CVAL - CNTVCT).

On a write of this register, CNTHV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTHV_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHV_CTL.ISTATUS is set to 1.
- If CNTHV_CTL.IMASK is 0, an interrupt is generated.

When CNTHV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

**Accessing the CNTHV_TVAL**

This register is accessed using the encoding for CNTV_TVAL.

Accesses to this register use the following encodings in the System instruction encoding space:
MRC{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>{, (#)<opc2>}

MCR{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <CRn>, <CRm>{, (#)<opc2>}

G8.7.12 CNTHVS_CTL, Counter-timer Secure Virtual Timer Control Register (EL2)

The CNTHVS_CTL characteristics are:

**Purpose**

Provides AArch32 access from EL0 to the Secure EL2 virtual timer.

**Configurations**

AArch32 System register CNTHVS_CTL[31:0] is architecturally mapped to AArch64 System register CNTHVS_CTL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL are UNDEFINED.

**Attributes**

CNTHVS_CTL is a 32-bit register.

**Field descriptions**

The CNTHVS_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:3]</th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 3 2 1 0</td>
<td></td>
</tr>
</tbody>
</table>

**ISTATUS, bit [2]**

The status of the timer. This bit indicates whether the timer condition is met:

- 0: Timer condition is not met.
- 1: Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

- 0: Timer interrupt is not masked by the IMASK bit.
- 1: Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

**ENABLE, bit [0]**

Enables the timer. Permitted values are:

- 0: Timer disabled.
- 1: Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHVS_TVAL continues to count down.

**Note**
Disabling the output signal might be a power-saving option.

**Accessing the CNTHVS_CTL**

This register is accessed using the encoding for CNTV_CTL.

Accesses to this register use the following encodings in the System instruction encoding space:

|MRC<coproc><c> {<q>, <Rt>, <CRn>, CRm}, (#)<opc1>, <CRm>{, (#)<opc2>} |
|---|---|---|---|---|---|
|coproc| opc1| CRn| CRm| opc2|
|0b1111| 0b0000| 0b1110| 0b0011| 0b001|

```

G8.7.13 CNTHVS_CV AL, Counter-timer Secure Virtual Timer CompareValue Register (EL2)

The CNTHVS_CV AL characteristics are:

**Purpose**

Provides AArch32 access to the compare value for the Secure EL2 virtual timer.

**Configurations**

AArch32 System register CNTHVS_CV AL[63:0] is architecturally mapped to AArch64 System register CNTHVS_CV AL_EL2[63:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CV AL are UNDEFINED.

**Attributes**

CNTHVS_CV AL is a 64-bit register.

**Field descriptions**

The CNTHVS_CV AL bit assignments are:

```

| CompareValue
```

**CompareValue, bits [63:0]**

Holds the EL2 virtual timer CompareValue.

When CNTHVS_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHVS_CTL.ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

**Accessing the CNTHVS_CVAL**

This register is accessed using the encoding for CNTV_CV AL.

Accesses to this register use the following encodings in the System instruction encoding space:

```
MRRC{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <Rt2>, <CRm>
```

G8.7.14   CNTHVS_TVAL, Counter-timer Secure Virtual Timer TimerValue Register (EL2)

The CNTHVS_TVAL characteristics are:

**Purpose**

Provides AArch32 access to the timer value for the Secure EL2 virtual timer.

**Configurations**

AArch32 System register CNTHVS_TVAL[31:0] is architecturally mapped to AArch64 System register CNTHVS_TVAL_EL2[31:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL are UNDEFINED.

**Attributes**

CNTHVS_TVAL is a 32-bit register.

**Field descriptions**

The CNTHVS_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-31</td>
<td>TimerValue</td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHVS_CTL.ENABLE is 0, the value returned is **UNKNOWN**.
- If CNTHVS_CTL.ENABLE is 1, the value returned is (CNTHVS_CVAL - CNTVCT).

On a write of this register, CNTHVS_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHVS_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTHVS_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHVS_CTL.ISTATUS is set to 1.
- If CNTHVS_CTL.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

**Accessing the CNTHVS_TVAL**

This register is accessed using the encoding for CNTV_TVAL.

Accesses to this register use the following encodings in the System instruction encoding space:
MRC\(\langle c\rangle\langle q\rangle\) <coproc>, (#)\<opc1>, <Rt>, <CRn>, <CRm>, (#)\<opc2>

<table>

</tbody>
</table>

Bits [31:18] Reserved, RES0.

Bits [16:10] Reserved, RES0.

PL0PTEN, bit [9]
Traps PL0 accesses to the physical timer registers to Undefined mode.

0b0 PL0 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL registers are trapped to Undefined mode.

0b1 This control does not cause any instructions to be trapped.
This field resets to an architecturally **UNKNOWN** value.

**PL0VTEN, bit [8]**

Traps PL0 accesses to the virtual timer registers to Undefined mode.

- **0b0**: PL0 accesses to the **CNTV_CTL**, **CNTV_CVAL**, and **CNTV_TVAL** registers are trapped to Undefined mode.
- **0b1**: This control does not cause any instructions to be trapped.

This field resets to an architecturally **UNKNOWN** value.

**EVNTI, bits [7:4]**

Selects which bit of the counter register **CNTVCT** is the trigger for the event stream generated from that counter, when that stream is enabled.

- If **FEAT_ECV** is implemented, and **CNTKCTL.EVNTIS** is 1, this field selects a trigger bit in the range 8 to 23 of the counter register **CNTVCT**.
- Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

This field resets to an architecturally **UNKNOWN** value.

**EVNTDIR, bit [3]**

Controls which transition of the counter register **CNTVCT** trigger bit, defined by EVNTI, generates an event when the event stream is enabled:

- **0b0**: A 0 to 1 transition of the trigger bit triggers an event.
- **0b1**: A 1 to 0 transition of the trigger bit triggers an event.

This field resets to an architecturally **UNKNOWN** value.

**EVNTEN, bit [2]**

Enables the generation of an event stream from the counter register **CNTVCT**:

- **0b0**: Disables the event stream.
- **0b1**: Enables the event stream.

This field resets to an architecturally **UNKNOWN** value.

**PL0VCTEN, bit [1]**

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

- **0b0**: PL0 accesses to the **CNTVCT** are trapped to Undefined mode.
- **0b1**: PL0 accesses to the **CNTFRQ** register are trapped to Undefined mode, if **CNTKCTL.PL0PCTEN** is also 0.

This control does not cause any instructions to be trapped.

This field resets to an architecturally **UNKNOWN** value.

**PL0PCTEN, bit [0]**

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

- **0b0**: PL0 accesses to the **CNTPCT** are trapped to Undefined mode.
- **0b1**: PL0 accesses to the **CNTFRQ** register are trapped to Undefined mode, if **CNTKCTL.PL0VCTEN** is also 0.

This control does not cause any instructions to be trapped.

This field resets to an architecturally **UNKNOWN** value.

## Accessing the CNTKCTL

G8.7.16  **CNTP_CTL, Counter-timer Physical Timer Control register**

The CNTP_CTL characteristics are:

**Purpose**
Control register for the EL1 physical timer.

**Configurations**
AArch32 System register CNTP_CTL[31:0] is architecturally mapped to AArch64 System register CNTP_CTL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP_CTL are UNDEFINED.

**Attributes**
CNTP_CTL is a 32-bit register.

**Field descriptions**
The CNTP_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>ISTATUS, bit [2]</td>
</tr>
<tr>
<td>2</td>
<td>IMASK, bit [1]</td>
</tr>
<tr>
<td>1</td>
<td>ENABLE, bit [0]</td>
</tr>
</tbody>
</table>

**Bits [31:3]**
Reserved, RES0.

**ISTATUS, bit [2]**
The status of the timer. This bit indicates whether the timer condition is met:

- **0b0**  Timer condition is not met.
- **0b1**  Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

This bit is read-only.

**IMASK, bit [1]**
Timer interrupt mask bit. Permitted values are:

- **0b0**  Timer interrupt is not masked by the IMASK bit.
- **0b1**  Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

This field resets to an architecturally UNKNOWN value.

**ENABLE, bit [0]**
Enables the timer. Permitted values are:

- **0b0**  Timer disabled.
- **0b1**  Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from \texttt{CNTP\_TVAL} continues to count down.

\textbf{Note}

Disabling the output signal might be a power-saving option.

This field resets to 0.

G8.7.17 CNTP_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL characteristics are:

**Purpose**

Holds the compare value for the EL1 physical timer.

**Configurations**

AArch32 System register CNTP_CVAL[63:0] is architecturally mapped to AArch64 System register CNTP_CVAL_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP_CVAL are UNDEFINED.

**Attributes**

CNTP_CVAL is a 64-bit register.

**Field descriptions**

The CNTP_CVAL bit assignments are:

![](image)

**CompareValue, bits [63:0]**

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_CVAL**

Accesses to this register use the following encodings in the System instruction encoding space:

\[
\text{MRRC}\{<c>}\{<q>\} \; \text{<coproc>}, \; \{#\text{<opc1>}, \; \text{<Rt>}, \; \text{<Rt2>}, \; \text{<CRm>}}
\]

G8.7.18 CNTP_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer.

**Configurations**

AArch32 System register CNTP_TVAL[31:0] is architecturally mapped to AArch64 System register CNTP_TVAL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTP_TVAL are UNDEFINED.

**Attributes**

CNTP_TVAL is a 32-bit register.

**Field descriptions**

The CNTP_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-31</td>
<td>TimerValue</td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CNTP_CVAL - CNTPCT).

On a write of this register, CNTP_CVAL is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_TVAL**

G8.7.20 CNTPCTSS, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configurations**

AArch32 System register CNTPCTSS[63:0] is architecturally mapped to AArch64 System register CNTPCTSS_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_ECV is implemented. Otherwise, direct accesses to CNTPCTSS are UNDEFINED.

All reads to the CNTPCTSS occur in program order relative to reads to CNTPCT or CNTPCTSS. This register is a self-synchronised view of the CNTPCT counter, and cannot be read speculatively.

**Attributes**

CNTPCTSS is a 64-bit register.

**Field descriptions**

The CNTPCTSS bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>

G8.7.21 CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

**Purpose**

Control register for the virtual timer.

**Configurations**

AArch32 System register CNTV_CTL[31:0] is architecturally mapped to AArch64 System register CNTV_CTL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV_CTL are UNDEFINED.

**Attributes**

CNTV_CTL is a 32-bit register.

**Field descriptions**

The CNTV_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>3</td>
<td>ISTATUS</td>
<td>The status of the timer. This bit indicates whether the timer condition is met:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b0 Timer condition is not met.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b1 Timer condition is met.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted. When the value of the ENABLE bit is 0, the ISTATUS field is UNDEFINED. This bit is read-only.</td>
</tr>
<tr>

<tr>
<td></td>
<td></td>
<td>For more information, see the description of the ISTATUS bit. This field resets to an architecturally UNDEFINED value.</td>
</tr>
<tr>
<td>0</td>
<td>ENABLE</td>
<td>Enables the timer. Permitted values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b0 Timer disabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0b1 Timer enabled.</td>
</tr>
</tbody>
</table>

RES0

ENABLE

IMASK

ISTATUS
Setting this bit to 0 disables the timer output signal, but the timer value accessible from `CNTV_TVAL` continues to count down.

--- Note ---
Disabling the output signal might be a power-saving option.

This field resets to 0.

**Accessing the CNTV_CTL**

G8.7.22 CNTV_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL characteristics are:

**Purpose**

Holds the compare value for the virtual timer.

**Configurations**

AArch32 System register CNTV_CVAL[63:0] is architecturally mapped to AArch64 System register CNTV_CVAL_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV_CVAL are UNDEFINED.

**Attributes**

CNTV_CVAL is a 64-bit register.

**Field descriptions**

The CNTV_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
</table>
| CompareValue   | Holds the EL1 virtual timer CompareValue. When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:  
  • CNTV_CTL.ISTATUS is set to 1.  
  • If CNTV_CTL.IMASK is 0, an interrupt is generated.  
When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count. If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0. The value of this field is treated as zero-extended in all counter calculations. This field resets to an architecturally UNKNOWN value. |

**Accessing the CNTV_CVAL**

G8.7.23 CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Configurations**

AArch32 System register CNTV_TVAL[31:0] is architecturally mapped to AArch64 System register CNTV_TVAL_EL0[31:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTV_TVAL are UNDEFINED.

**Attributes**

CNTV_TVAL is a 32-bit register.

**Field descriptions**

The CNTV_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimerValue</td>
<td></td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the virtual timer.

On a read of this register:
- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CNTV_CVAL - CNTVCT).

On a write of this register, CNTV_CVAL is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CNTP_CVAL) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:
- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is set to 1, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_TVAL**

Accesses to this register use the following encodings in the System instruction encoding space:

G8.7.24 CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

**Purpose**

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in CNTVFF.

**Configurations**

AArch32 System register CNTVCT[63:0] is architecturally mapped to AArch64 System register CNTVCT_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTVCT are UNDEFINED.

The value of this register is the same as the value of CNTPCT in the following conditions:
- When EL2 is not implemented.
- When EL2 is implemented and is using AArch64, HCR_EL2.{E2H, TGE} is {1, 1}, and this register is read from Non-secure EL0.

All reads to the CNTVCT occur in program order relative to reads to CNTVCTSS or CNTVCT.

**Attributes**

CNTVCT is a 64-bit register.

**Field descriptions**

The CNTVCT bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual count value</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the CNTVCT**

Accesses to this register use the following encodings in the System instruction encoding space:

```c
MRRC{<c>}{<q>} <coproc>, (#)<opc1>, <Rt>, <Rt2>, <CRm>
```

<table>
<thead>
<tr>
<th>coproc</th>
<th>CRm</th>

G8.7.25 CNTVCTSS, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS characteristics are:

**Purpose**
Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in CNTPTCT minus the virtual offset visible in CNTVOFF.

**Configurations**
AArch32 System register CNTVCTSS[63:0] is architecturally mapped to AArch64 System register CNTVCTSS_EL0[63:0].

This register is present only when AArch32 is supported at any Exception level and FEAT_ECV is implemented. Otherwise, direct accesses to CNTVCTSS are UNDEFINED.

All reads to the CNTVCTSS occur in program order relative to reads to CNTVCT or CNTVCTSS.

This register is a self-synchronised view of the CNTVCT counter, and cannot be read speculatively.

**Attributes**
CNTVCTSS is a 64-bit register.

**Field descriptions**
The CNTVCTSS bit assignments are:

![Self-Synchronized Virtual count value]

**Bits [63:0]**
Self-Synchronized Virtual count value.

**Accessing the CNTVCTSS**
Accesses to this register use the following encodings in the System instruction encoding space:

\[
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
\]

<table>
<thead>

    return CNTVCTSS;
elsif PSTATE.EL == EL3 then
    return CNTVCTSS;
G8.7.26 CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

**Purpose**

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT and the virtual count value visible in CNTVCT.

**Configurations**

AArch32 System register CNTVOFF[63:0] is architecturally mapped to AArch64 System register CNTVOFF_EL2[63:0].

This register is present only when AArch32 is supported at any Exception level. Otherwise, direct accesses to CNTVOFF are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

---

**Note**

When EL2 is implemented and is using AArch64, if HCR_EL2.{E2H, TGE} is \{1, 1\}, the virtual counter uses a fixed virtual offset of zero when CNTVCT is read from Non-secure EL0.

---

**Attributes**

CNTVOFF is a 64-bit register.

**Field descriptions**

The CNTVOFF bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:0</td>
<td>Virtual offset.</td>
</tr>
</tbody>
</table>

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTVOFF**

Accesses to this register use the following encodings in the System instruction encoding space:

\[ MRRC\{<c>\}\{<q>\} <coproc>, \#<opc1>, <Rt>, <Rt2>, <CRm> \]

<table>
<thead>
<tr>
<th>coproc</th>
<th>CRm</th>

    CNTVOFF = R[t2]:R[t];
Part H
External Debug
Chapter H1

About External Debug

This chapter gives an overview of Armv8 external debug, and specifies the required debug authentication. It contains the following sections:

- Introduction to external debug on page H1-7010.
- External debug on page H1-7011.
- Required debug authentication on page H1-7012.

Note

For information about self-hosted debug, see Chapter D2 AArch64 Self-hosted Debug and Chapter G2 AArch32 Self-hosted Debug.
H1.1 Introduction to external debug

Armv8 supports both:

**Self-hosted debug**

The PE itself hosts a debugger. That is, developers developing software to run on the PE use debugger software running on the same PE.

**External debug**

The debugger is external to the PE. The debugging might be either on-chip, for example in a second PE, or off-chip, for example a JTAG debugger that accesses the chip through a Debug Access Port.

External debug is particularly useful for:

- Hardware bring-up. That is, debugging during development when a system is first powered up and not all of the software functionality is available.
- PEs that are deeply embedded inside systems.

To support external debug, the Arm architecture defines required features that are called *external debug features*.

---

**Note**

An external debugger has a potentially high level of control over and visibility into the PE. The system sets this level using debug authentication. See [Required debug authentication](#) on page H1-7012.

If the debug authentication level is set too low, agents may be able to bypass elements of the security and privilege models. This includes both off-chip agents and on-chip agents such as unprivileged or Non-secure software.

---

H1.1.1 Definition and constraints of a debugger in the context of external debug

When the description of external debug in this Part of the manual describes a *debugger* as controlling external debug this debugger might be a second on-chip PE or an off-chip device such as a JTAG debugger using a Debug Access Port (DAP).

If a Debug Access Port is implemented:

- When debug is prohibited at the Debug Access Port, the port must not generate accesses to the external debug interface of the PE.
- When Secure debug is prohibited at the Debug Access Port, the port must not generate Secure accesses to the external debug interface of the PE.
- When Secure accesses are allowed at the Debug Access Port, the port must be able to generate Secure accesses.

If FEAT_Debugv8p4 is not implemented, accesses to the PE are controlled by the external authentication interface functions, `ExternalInvasiveDebugEnabled()`, `ExternalNoninvasiveDebugEnabled()`, `ExternalSecureNoninvasiveDebugEnabled()` and `ExternalSecureInvasiveDebugEnabled()`. The external authentication interface functions override MDCR_EL3.{EPMAD, EDAD}.

If FEAT_TRF is implemented, the bus Requester, which may be the Debug Access Port, controls the accesses it makes to the PE and MDCR_EL3.{EPMAD, EDAD} control Non-secure access to registers.

The Debug Access Port is not required to use the same authentication interface as the PE.

Arm recommends the following authentication interface:

- When `ExternalSecureInvasiveDebugEnabled()== FALSE` at the PE, Secure debug is disabled at the DAP.
- When `ExternalInvasiveDebugEnabled()== FALSE` at the PE, all debug is prohibited at the DAP.
About External Debug

H1.2 External debug

Debug events allow an external debugger to halt the PE. Armv8 provides the following debug events:

- **Halting Step debug events on page H3-7056:**
  - The debugger can use this resource to make the PE step through code one line at a time.

- **Halt Instruction debug event on page H3-7066:**
  - This might occur when software executes the Halting breakpoint instruction, HLT.

- **Exception Catch debug event on page H3-7067:**
  - This can be programmed to occur on all entries to a given Exception level.

- **External Debug Request debug event on page H3-7071:**
  - An embedded cross-trigger can signal this debug event.

- **OS Unlock Catch debug event on page H3-7072:**
  - This might occur when the state of the OS Lock changes from locked to unlocked.

- **Reset Catch debug events on page H3-7073:**
  - This might occur when the PE exits reset state.

- **Software Access debug event on page H3-7074:**
  - This can be programmed to occur when software tries to access the Breakpoint Value registers, the Breakpoint Control registers, the Watchpoint value registers, or the Watchpoint Control registers. It caused a trap to Debug state.

Breakpoints and watchpoints can also halt the PE.

When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.

- The Instruction Transfer Register, ITR, passes instructions to the PE to execute in Debug state:
  - The ITR contains a single register, EDITR, and associated flow-control flags.

- The Debug Communications Channel, DCC, passes data between the PE and the debugger:
  - The DCC includes the data transfer registers, DTRRX and DTRTX, and associated flow-control flags.
  - Although the DCC is an essential part of Debug state operation, it can also be used in Non-debug state.

- The PE cannot service any interrupts in Debug state.

Chapter H2 Debug State describes Debug state in more detail.
H1.3 Required debug authentication

Any implementation must provide the debug authentication defined in this section, that controls:

- Whether the PE can halt.
- Whether non-invasive debug is permitted.
- Some legacy aspects of the AArch32 self-hosted debug model.

The pseudocode functions shown in Table H1-1, and the conditions that follow that table, define the architectural requirements for debug authentication.

### Table H1-1 Debug authentication functions

<table>
<thead>
<tr>
<th>Pseudocode function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ExternalSecureNoninvasiveDebugEnabled()</td>
<td>Returns TRUE if Secure non-invasive debug is enabled.</td>
</tr>
<tr>
<td>AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()</td>
<td>Returns TRUE if Secure invasive self-hosted debug is enabled in AArch32 state.</td>
</tr>
<tr>
<td>ExternalSecureInvasiveDebugEnabled()</td>
<td>Returns TRUE if Secure invasive debug is enabled.</td>
</tr>
<tr>
<td>ExternalNoninvasiveDebugEnabled()</td>
<td>Returns TRUE if Non-secure non-invasive debug is enabled.</td>
</tr>
<tr>
<td>ExternalInvasiveDebugEnabled()</td>
<td>Returns TRUE if Non-secure invasive debug is enabled.</td>
</tr>
</tbody>
</table>

The following conditions always apply:

- If ExternalInvasiveDebugEnabled() is FALSE then ExternalSecureInvasiveDebugEnabled() is FALSE.
- If ExternalNoninvasiveDebugEnabled() is FALSE then ExternalSecureNoninvasiveDebugEnabled() is FALSE.
- If ExternalInvasiveDebugEnabled() is TRUE then ExternalNoninvasiveDebugEnabled() is TRUE.
- If ExternalSecureInvasiveDebugEnabled() is TRUE then ExternalSecureNoninvasiveDebugEnabled() is TRUE.

If FEAT_Debugv8p4 is implemented:

- ExternalNoninvasiveDebugEnabled() always returns TRUE.
- ExternalSecureNoninvasiveDebugEnabled() returns the same as ExternalSecureInvasiveDebugEnabled().

Arm recommends the use of the interface described in Recommended authentication interface on page K2-7989 to provide this debug authentication. The pseudocode functions in Chapter J1 Armv8 Pseudocode, that are linked to by the entries in the Pseudocode function column of Table H1-1, assume that this interface is implemented.
Chapter H2
Debug State

This chapter describes Debug state. It contains the following sections:

• About Debug state on page H2-7014.
• Halting the PE on debug events on page H2-7015.
• Entering Debug state on page H2-7021.
• Behavior in Debug state on page H2-7024.
• Exiting Debug state on page H2-7051.

——— Note ————
Table K15-1 on page K15-8160 disambiguates the general register references used in this chapter.
H2.1 About Debug state

In external debug, debug events allow an external debugger to halt the PE. The PE then enters Debug state. When the PE is in Debug state:

• It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.

• The Instruction Transfer Register, ITR, passes instructions to the PE to execute in Debug state.

• The Debug Communications Channel, DCC, passes data between the PE and the debugger.

The PE cannot service any interrupts in Debug state.
H2.2 Halting the PE on debug events

For details of debug events, see *Introduction to Halting debug events* on page H3-7054 and *Breakpoint and Watchpoint debug events* on page H2-7016.

On a debug event, the PE must do one of the following:

- Enter Debug state.
- Pend the debug event.
- Generate a debug exception.
- Ignore the debug event.

This behavior depends on both:

- Whether halting is allowed by the current state of the debug authentication interface. See *Halting allowed and halting prohibited*.

- The type of debug event and the programming of the debug control registers.
  - See *Halting debug events* for all Halting debug events.
  - See *Breakpoint and Watchpoint debug events* on page H2-7016 for Breakpoint and Watchpoint debug events.

See also *Other debug exceptions* on page H2-7016.

This means that behavior can be CONSTRAINED UNPREDICTABLE if the conditions change. See *Synchronization and Halting debug events* on page H3-7075.

*Summary of debug events and possible outcomes* on page H3-7054 summarizes the possible outcomes of each type of debug event.

H2.2.1 Halting allowed and halting prohibited

Halting can be either allowed or prohibited:

- Halting is always prohibited in Debug state.

- Halting is always prohibited when DoubleLockStatus() == TRUE.
  - This means that FEAT_DoubleLock is implemented and OS Double lock is locked.

- Halting is also controlled by the IMPLEMENTATION DEFINED authentication interface, and is prohibited when either:
  - The PE is in Non-secure state and ExternalInvasiveDebugEnabled() == FALSE.
  - The PE is in Secure state and ExternalSecureInvasiveDebugEnabled() == FALSE.

  **Note**
  See *Appendix K2 Recommended External Debug Interface* for more information on these functions.

- Otherwise, halting is allowed.

For more information see:

- *Pseudocode description of Halting on debug events* on page H2-7020
- *Required debug authentication* on page H1-7012.

H2.2.2 Halting debug events

The Halting debug events are described in *Chapter H3 Halting Debug Events*.

When a Halting debug event is generated, it causes entry to Debug state if all of:

- Halting is allowed. See *Halting allowed and halting prohibited*.
- The Halting debug event is one of:
  - A Halt Instruction debug event and EDSCR.HDE == 1.
A Software Access debug event and OSLSR_EL1.OSLK == 0, meaning that the OS Lock is unlocked.

Neither a Halt Instruction debug event nor a Software Access debug event.

Note

A Halt Instruction debug event is the only Halting debug event that relies on EDSCR.HDE == 1.

Halting on Breakpoint and Watchpoint debug events is also controlled by EDSCR.HDE. See Breakpoint and Watchpoint debug events.

EDSCR.HDE can be written by software when the OS Lock is locked. Privileged code can use MDCR_EL3.TDOSA and HDCR.TDOSA to trap writes to these registers.

If a Halting debug event does not generate entry to Debug state because the conditions listed in this section do not hold, then:

• If the Halting debug event is a Halt Instruction debug event, the instruction that generated the Halting debug event is treated as UNDEFINED.

• If the Halting debug event is an Exception Catch debug event or a Software Access debug event, it is ignored.

In all other cases the Halting debug event is pended, see Pending Halting debug events on page H3-7075.

Summary of actions from debug events on page H2-7019 summarizes the possible outcome for each type of Debug event.

Note

Halting debug events never generate debug exceptions.

H2.2.3 Breakpoint and Watchpoint debug events

A breakpoint or watchpoint generates an entry to Debug state if all of the following conditions hold:

• Halting debug is enabled, that is EDSCR.HDE == 1.

• Halting is allowed. See Halting allowed and halting prohibited on page H2-7015.

• The OS Lock is unlocked, that is OSLSR.OSLK == 0.

The Address Mismatch breakpoint type is reserved when all of these conditions are met.

MDSCR_EL1.MDE or DBGDSCRext.MDBGen is ignored when determining whether to enter Debug state. A breakpoint or watchpoint that generates entry to Debug state is a Breakpoint or Watchpoint debug event and does not generate a debug exception.

A breakpoint or watchpoint that does not generate an entry to Debug state either:

• Generates a Breakpoint or Watchpoint exception.

• Is ignored.

Note

EDSCR.HDE is ignored when determining whether to generate a debug exception. The debug exception is suppressed only if the PE enters Debug state. This means that the use of Halting debug mode in Non-secure state does not affect the Exception model in Secure state.

See Chapter D2 AArch64 Self-hosted Debug, Chapter G2 AArch32 Self-hosted Debug, and the Note in Other debug exceptions.

H2.2.4 Other debug exceptions

The following events never generate entry to Debug state:

• Breakpoint Instruction exceptions.

• Software Step exceptions.

• Vector Catch exceptions.
The behavior of these events is unchanged when Halting debug mode is enabled, that is when EDSCR.HDE == 1. This means that these events can do one of the following:

- They can generate a debug exception.
- They can be ignored.

For additional information, see Chapter D2 AArch64 Self-hosted Debug and Chapter G2 AArch32 Self-hosted Debug.

### H2.2.5 Debug state entry and debug event prioritization

The following are synchronous debug events:

- Breakpoint debug event.
- Watchpoint debug event.
- Halting Step debug event.
- Halt Instruction debug event.
- Exception Catch debug event.
- Software Access debug event.
- Reset Catch debug event.

Each of these synchronous debug events are treated as a synchronous exception generated by an instruction, or by the taking of an exception or reset. That is, if halting is allowed, the synchronous debug event must be taken before any subsequent instructions are executed. Reset Catch debug events must be taken before the PE executes the instruction at the reset vector.

#### Note

- Reset Catch and Exception Catch debug events might be generated asynchronously, because they can result from an asynchronous exception. However, if halting is allowed after the reset or asynchronous exception has been processed, the Reset Catch or Exception Catch debug event is taken synchronously.

- The Halting Step debug event is generated by the instruction after the stepped instruction. Therefore, if the stepped instruction generates any other synchronous exceptions or debug events these are taken first.

If halting is prohibited then Halting Step debug events and Reset Catch debug events might be pended and taken asynchronously. OS Unlock Catch debug events are always pended and taken asynchronously. See Pending Halting debug events on page H3-7075.

The architecture does not define when asynchronous debug events are taken, and therefore the prioritization of asynchronous debug events is IMPLEMENTATION DEFINED. See Synchronization and Halting debug events on page H3-7075.

The following list shows how the synchronous debug events are prioritized, with 1 being the highest priority.

#### Note

The priority numbering is the same as the numbering for AArch64 synchronous exception priorities listed in Synchronous exception types, routing and priorities on page D1-2348, and in particular Prioritization and recognition of interrupts on page D1-2365. This numbering correlates with the equivalent AArch32 list in Exception prioritization for exceptions taken to AArch32 state on page G1-5746.

The priority for synchronous debug events is as follows:

1. Reset Catch debug event. See Reset Catch debug events on page H3-7073. This debug event has a higher priority than the synchronous exceptions listed in Synchronous exception types, routing and priorities on page D1-2348.

2. Exception Catch debug event. See Exception Catch debug event on page H3-7067. This debug event can be assigned one of two priorities. When it has a priority of 2, it has a higher priority than the synchronous exceptions listed in the Exception model. See Exception Catch debug event on page H3-7067.
Halting Step debug event. See Halting Step debug events on page H3-7056.
This debug event has a higher priority than the synchronous exceptions listed in the Exception model.

This event is not a debug event.

Exception Catch debug event. See Exception Catch debug event on page H3-7067.
This debug event can be assigned one of two priorities, 0 or 5. See Exception Catch debug event on page H3-7067.

These events are not debug events.

Breakpoint exception or debug event or Address Matching Vector Catch exception. See Breakpoint exceptions on page D2-2433, and Vector Catch exceptions on page G2-5909.
These two debug events have the same priority.

This event is not a debug event.

Halt Instruction debug event. See Halt Instruction debug event on page H3-7066.

These events are not debug events.

Software Access debug event. See Software Access debug event on page H3-7074.

These events are not debug events.

Watchpoint exception or debug event. See Watchpoint exceptions on page D2-2451 for exceptions taken from AArch64 state, or Watchpoint exceptions on page G2-5895 for exceptions taken from AArch32 state.

This event is not a debug event.

For Reset Catch debug events and Halting Step debug events the priorities listed in this section only apply when halting is allowed at the time the event is generated. This means that the event is taken synchronously and not pended.

For more information on the prioritization of exceptions see:
• Synchronous exception types, routing and priorities on page D1-2348.
• Prioritization and recognition of interrupts on page D1-2365.
• Exception prioritization for exceptions taken to AArch32 state on page G1-5746. This section covers synchronous and asynchronous exceptions.

Breakpoint debug events and Vector Catch exception

An Address Matching Vector Catch exception has the same priority as a Breakpoint debug event. See Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2349.

The prioritization of these events is unchanged even if the breakpoint generates entry to Debug state instead of a Breakpoint exception. This means that if a single instruction generates both an Address Matching Vector Catch exception and a Breakpoint debug event, there is a CONSTRAINED UNPREDICTABLE choice of:
• The PE entering Debug state due to the Breakpoint debug event.
• A Vector Catch exception.

This only applies if all of the following are true:
• Halting debug is enabled.
• Halting is allowed.
• The OS Lock is unlocked.

An Exception Trapping Vector Catch exception must be generated immediately following the exception that generated it. This means that it does not appear in the priority table.
H2.2.6 Imprecise entry to Debug state

Entry to Debug state is normally precise, meaning that the PE cannot enter Debug state if it can neither complete nor abandon all currently executing instructions and leave the PE in a precise state.

A debugger can write a value of 1 to EDRCR.CBRRQ to allow imprecise entry to Debug state. An External Debug Request debug event must be pending before writing 1 to this bit. Support for this feature is OPTIONAL and it is IMPLEMENTATION DEFINED when it is effective at forcing entry to Debug state.

The PE ignores writes to this bit if either:

- External debugging is not enabled, meaning ExternalInvasiveDebugEnabled() == FALSE.
- Secure external debugging is not enabled, meaning ExternalSecureInvasiveDebugEnabled() == FALSE, and either:
  - EL3 is not implemented and the implemented Security state is Secure state.
  - EL3 is implemented.

Example H2-1 shows how entry to Debug state can be forced.

Example H2-1 Forcing entry to Debug state

The debugger pends an External Debug Request debug event through the CTI to halt a program that has stopped responding. However, the memory system is not responding and a memory access instruction cannot complete. This means that Debug state cannot be entered precisely. The debugger writes a value of 1 to EDRCR.CBRRQ. The PE cancels all outstanding memory accesses and enters Debug state. As some instructions might not have completed correctly, entry to Debug state is imprecise.

When Debug state is entered imprecisely, all memory access instructions executed through the ITR have CONSTRAINED UNPREDICTABLE behavior. The value of all registers is UNKNOWN, but might be useful for diagnostic purposes.

H2.2.7 Summary of actions from debug events

Table H2-1 on page H2-7020 shows the Software and Halting debug events. In Table H2-1 on page H2-7020 the columns have the following meaning:

Debug event type

This means the type of debug event where:

<table>
<thead>
<tr>
<th>Other software</th>
<th>Other Halting</th>
</tr>
</thead>
<tbody>
<tr>
<td>This means one of:</td>
<td>This means one of the following:</td>
</tr>
<tr>
<td>Software Step exceptions on page D2-2466.</td>
<td>Halting Step debug events on page H3-7056.</td>
</tr>
<tr>
<td>Breakpoint Instruction exceptions on page D2-2431.</td>
<td>External Debug Request debug event on page H3-7071.</td>
</tr>
<tr>
<td>Vector Catch exceptions on page D2-2465 for AArch64 state or Vector Catch exceptions on page G2-5909 for AArch32 state.</td>
<td>Reset Catch debug events on page H3-7073.</td>
</tr>
</tbody>
</table>

Other debug events are referred to explicitly.

Authentication

This means halting is allowed by the IMPLEMENTATION DEFINED external authentication interface. It is the result of one of the following pseudocode functions:

- In Secure state ExternalSecureInvasiveDebugEnabled().
In Non-secure state  ExternalInvasiveDebugEnabled().

DLK  This indicates whether FEAT_DoubleLock is implemented and locked, DoubleLockStatus() == TRUE.

OSLK  This is the value of OSLSR.OSLK. It indicates whether the OS Lock is locked.

HDE  This is the value of EDSCR.HDE. It indicates whether Halting debug is enabled.

The letter X in Table H2-1 indicates that the value can be either 0 or 1.

H2.2.8  Pseudocode description of Halting on debug events

The Halted(), Restarting(), HaltingAllowed(), and HaltOnBreakpointOrWatchpoint() functions are described in the Armv8 pseudocode.
H2.3 Entering Debug state

On entry to Debug state, the preferred restart address and PSTATE are saved in DLR and DSPSR. The PE remains in the mode and security state from which it entered Debug state.

If EDRCR.CBRRQ has a value of 0, entry to Debug state is precise. If EDRCR.CBRRQ has a value of 1, then imprecise entry to Debug state is permitted.

If a Watchpoint debug event causes an entry to Debug state, the address of the access that generated the Watchpoint debug event is recorded in EDWAR.

For more information see:

* Determining the memory location that caused a Watchpoint exception on page D2-2459 for a debug event taken from AArch64 state.
* Determining the memory location that caused a Watchpoint exception on page G2-5902 for a debug event taken from AArch32 state.

Other than the effect on PSTATE and EDSCR, entry to Debug state is not a Context synchronization event. The effects of entry to Debug state on PSTATE and EDSCR are synchronized.

H2.3.1 Entering Debug state from AArch32 state

When entering Debug state from AArch32 state, the PE remains in AArch32 state. In AArch32 Debug state the PE executes T32 instructions, regardless of the value of PSTATE.T before entering Debug state.

To allow the debugger to determine the state of the PE, the current Execution state for all four Exception levels can be read from EDSCR.RW, and the current Exception level can be read from EDSCR.EL.

The current endianness state, PSTATE.E, is unchanged on entry to Debug state.

Note

* If EL1 is using AArch32 state, the current endianness state can differ from that indicated by SCTLR.EE.
* If EL2 is using AArch32 state, the current endianness state can differ from that indicated by HSCTLR.EE.
* On entry to Debug state from AArch32 state, PSTATE.SS is copied to DSPSR.SS, even though the PE remains in AArch32 state.

See also Effect of entering Debug state on PSTATE on page H2-7023.

H2.3.2 Effect of Debug state entry on DLR and DSPSR

DLR is set to the preferred restart address for the debug event, that depends on the event type. The value of PSTATE is saved in DSPSR.

For entry to Debug state from AArch32 state, the values saved in DSPSR.IT are always correct for the preferred restart address.

For synchronous Halting debug events, the preferred restart address is the address of the instruction that generated the debug event. It is CONSTRAINED UNPREDICTABLE whether DSPSR_EL0.BTYPE is set to the value of PSTATE.BTYPE or 0 for synchronous debug events other than the following debug events:

* A Halting Step debug event.
* A Breakpoint debug event.
* A Halt Instruction debug event.

For asynchronous Halting debug events, including pending Halting debug events taken asynchronously, the preferred restart address is the address of the first instruction that must be executed on exit from Debug state.
This means that:

- For Breakpoint and Watchpoint debug events, the preferred restart address is the same as the preferred return address for a debug exception, as described in Chapter D2 AArch64 Self-hosted Debug and Chapter G2 AArch32 Self-hosted Debug.

- For Halt Instruction debug events, DLR is set to the address of the HLT instruction and DSPSR.IT is correct for the HLT instruction.

- For Software Access debug events, DLR is set to the address of the accessing instruction and DSPSR.IT is correct for this instruction.

- For Halting Step debug events taken synchronously, DLR and DSPSR are set as the ELR and SPSR would be set for a Software Step exception. This is usually the address of, and PSTATE for, the instruction after the one that was stepped.

- For Exception Catch debug events:
  - If the debug event is generated on taking an exception to a trapped Exception level, the DLR is set to the address of the exception vector the PE would have started fetching from. This is UNKNOWN if the VBAR for the Exception level has never been initialized. The DSPSR records the value of PSTATE after taking the exception. The Exception Catch occurs after the SPSR and the Link register are set, and the debugger can use these registers to determine where in the application program the exception occurred.
    
    ______ Note ______

    Depending on the target Exception level and Execution state for the exception, the Link register is one of ELR_EL1, ELR_EL2, ELR_EL3, ELR_hyp, or LR (R14).

    ______

    — If the debug event is generated on an exception return to a trapped Exception level, the DLR is set to the target address of the exception return and the DSPSR records the value of PSTATE after the exception return.

- Reset Catch debug events taken synchronously behave like Exception Catch debug events.

- For Reset Catch debug events and Exception Catch debug events generated on reset to a trapped Exception level, the DLR is set to the reset address and the DSPSR records the reset value of PSTATE.

- For pending Halting debug events and External Debug Request debug events, DLR is set to the address of the first instruction that must be executed on exit from Debug state and DSPSR.IT is correct for this instruction. See Pending Halting debug events on page H3-7075.

Normally DLR is aligned according to the instruction set state indicated in DSPSR. However, a debug event might be taken at a point where the PC is not aligned.

### H2.3.3 Effect of Debug state entry on System registers, the Event register, and Exclusives monitors

Entering Debug state has no effect on System registers other than DLR and DSPSR. In particular, ESRs, FARs, and FSRs are not updated on entering Debug state. SCR is unchanged, even when entering Debug state from EL3.

Entering Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors.

______ Note ______

Entry to Debug state might set the Event Register or clear the Exclusives monitors, or both. However, this is not a requirement, and debuggers must not rely on any implementation specific behavior.

______

Unless otherwise described in this reference manual, instructions executed in Debug state have their architecturally-defined effects on the System registers, the Event register, and Exclusives monitors.
H2.3.4 Effect of entering Debug state on PSTATE

The effect of an entry to Debug state on PSTATE is described in *Entering Debug state* on page H2-7021 and *Entering Debug state from AArch32 state* on page H2-7021.

On entry to Debug state after PSTATE is saved in DSPSR:

- PSTATE.IL is cleared to 0.
- PSTATE.TCO is set to 1.
- PSTATE.BTYPE is set to 0.
- PSTATE.{IT, T, SS, D, A, I, F, SSBS} are set to UNKNOWN values.

PSTATE.{N, Z, C, V , Q, GE, E, M, nRW, EL, SP, PAN, UAO, DIT} are unchanged.

For more information see *PSTATE in Debug state* on page H2-7024.

H2.3.5 Entering Debug state during loads and stores

The PE can enter Debug state during instructions that perform a sequence of memory accesses, as opposed to a single single-copy atomic access, because of a Watchpoint debug event. The effect of entering Debug state on such an instruction is the same as taking a Data Abort exception during such an instruction.

In addition, when executing in AArch64 state, the PE can enter Debug state during instructions that perform a sequence of memory accesses because of an External Debug Request debug event. The effect of entering Debug state on such an instruction is the same as taking an interrupt exception during such an instruction.

This applies to all memory types.

H2.3.6 Entering Debug state and Software Step

When Software Step is active, a debug event that causes entry to Debug state behaves like an exception taken to an Exception level above the debug target Exception level. That is:

- If the instruction that is stepped generates a synchronous debug event that causes entry to Debug state, or an asynchronous debug event is taken before the step completes, the PE enters Debug state with DSPSR.SS set to 1.
- A pending Halting debug event or an asynchronous debug event can be taken after the step has completed. In this case the PE enters Debug state with DSPSR.SS set to 0.

In addition:

- If the instruction that is stepped generates an exception trapped by an Exception Catch debug event, the PE enters Debug state at the exception vector with DSPSR.SS set to 0. This is because PSTATE.SS is set to 0 by taking the exception.
- If the PE is reset, PSTATE.SS is reset to 0. If the following debug events are enabled, the PE enters Debug state with DSPSR.SS set to 0:
  - Reset Catch debug event at the reset Exception level.
  - Exception Catch debug event at the reset Exception level.
  - Halting Step debug event.
- If Halting Step is also active, then Halting Step and Software Step operate in parallel and can both become active-pending. In this case Halting step has a higher priority than Software step. This means that the PE enters Debug state and DSPSR.SS is set to 0.

H2.3.7 Pseudocode description of entering Debug state

The Debug\texttt{halt} constants are described in *shared/debug/halting/DebugHalt* on page J1-7823 in the Armv8 pseudocode. The \texttt{UpdateEDSCRFields()} and \texttt{Halt()} functions are described in *Chapter J1 Armv8 Pseudocode*.
H2.4 Behavior in Debug state

Instructions are executed in Debug state from the Instruction Transfer Register, ITR. The debugger controls which instructions are executed in Debug state by writing the instructions to the External Debug Instruction Transfer register, EDITR. The Execution state of the PE determines which instruction set is executed:

- If the PE is in AArch64 state it executes A64 instructions.
- If the PE is in AArch32 state it executes T32 instructions:
  - For a 32-bit T32 instruction, EDITR[15:0] specifies the first halfword and EDITR[31:16] specifies the second halfword.
  - For a 16-bit T32 instruction, EDITR[15:0] contains the instruction and EDITR[31:16] is ignored. All 16-bit T32 instructions are UNPREDICTABLE in Debug state.

The PE does not execute A32 instructions in Debug state.

Some instructions are available only in Debug state. See Debug state operations, DCPS, DRPS, MRS, MSR on page H2-7042. In Non-debug state these instructions are UNDEFINED.

The following sections describe behavior in Debug state:

- PSTATE in Debug state.
- Executing instructions in Debug state on page H2-7025.
- Decode tables on page H2-7037.
- Security in Debug state on page H2-7041.
- Privilege in Debug state on page H2-7042.
- Debug state operations, DCPS, DRPS, MRS, MSR on page H2-7042.
- Exceptions in Debug state on page H2-7045.
- Accessing registers in Debug state on page H2-7047.
- Accessing memory in Debug state on page H2-7050.

This section specifies the CONSTRAINED UNPREDICTABLE behaviors that apply in Debug state, but see Changing the value of EDECR.SS when not in Debug state on page H3-7063 for a change in Non-debug state that causes CONSTRAINED UNPREDICTABLE behavior.

H2.4.1 PSTATE in Debug state

PSTATE.{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F, SSBS} are all ignored in Debug state:

- There are no conditional instructions in Debug state.
- In AArch32 state, the PE only executes T32 instructions and PSTATE.IT is ignored.
- Asynchronous exceptions and debug events are ignored.
- Software step is inactive.

Instructions executed in Debug state indirectly read PSTATE.{UAO, PAN, IL, E, M, nRW, EL, SP} as they would in Non-debug state.

——— Note ————

PSTATE.DIT is not guaranteed to have any effect in Debug state.

In Debug state:

- PSTATE.PAN is set to 1 by:
  - A DCPS instruction to EL1 using AArch64 if SCTLR_EL1.SPAN == 0.
  - A DCPS instruction to EL2 using AArch64 if SCTLR_EL2.SPAN == 0.
- PSTATE.UAO is set to 0 by a DCPS instruction to AArch64 state.
- PSTATE.TCO is set to 1 by a DCPS instruction to AArch64 state.
- PSTATE can also be changed by taking exceptions in Debug state, and by the execution of DCPS and DRPS instructions.

When in Debug state, if FEAT_SSBS is implemented, then hardware is permitted to load or store speculatively, regardless of the value of PSTATE.SSBS.
### Executing instructions in Debug state

The instructions executed in Debug state must be either A64 instructions or T32 instructions, depending on the current Execution state.

Each instruction falls into one of the following groups:

- **Debug state instructions.** These are instructions that are changed in Debug state. See *A64 instructions that are changed in Debug state* and *T32 instructions that are changed in Debug state* on page H2-7031.

- **Instructions that are unchanged in Debug state.** See *A64 instructions that are unchanged in Debug state* and *T32 instructions that are unchanged in Debug state* on page H2-7032.

- **Instructions that are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Debug state.** See *A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-7028 and *T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-7034.

All T32 instructions are treated as unconditional, regardless of PSTATE.IT. See *PSTATE in Debug state* on page H2-7024.

If EDSCR.SDD == 1 then an instruction executed in Non-secure state cannot cause entry into Secure state. See *Security in Debug state* on page H2-7041

### Executing A64 instructions in Debug state

The following sections describe the behavior of the A64 instructions in Debug state:

- *A64 instructions that are changed in Debug state.*
- *A64 instructions that are unchanged in Debug state.*
- *A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-7028.

#### A64 instructions that are changed in Debug state

The following A64 instructions are defined in Debug state, but are undefined in Non-debug state:

- DCPS.

  **Note**

  DCPS can be UNDEFINED in certain conditions in Debug state. See *DCPS<n>* on page H2-7042.

- DRPS.
- MSR (DLR_EL0), MSR (DSPSR_EL0), MSR (DLR_EL0), MSR (DSPSR_EL0)

For more information see *Debug state operations, DCPS, DRPS, MRS, MSR* on page H2-7042.

#### A64 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state:

**Any instruction that is UNDEFINED in Non-debug state**

This list of instructions excludes:

- Any instruction listed in *A64 instructions that are changed in Debug state.*
- Any instruction listed in *A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state* on page H2-7028 that is UNDEFINED because an enable or disable bit is not RES0 or RES1

**Instructions that move System or Special-purpose registers to or from a general-purpose register**

This list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes PSTATE access instructions.
These instructions are:

- `MRS <special_reg>, MSR <special_reg>.

--- Note ---

This does not include NZCV, DAIF, DAIFSet, DAIFClr, SPSel, CurrentEL, PAN, UAO, DIT, and TCO.

- `MRS <system_reg>, MSR <system_reg>.

Floating-point moves between a SIMD&FP register and a general-purpose register

These instructions are:

- `FMOV` (between a general-purpose register and a half-precision register).
- `FMOV` (between a general-purpose register and a single-precision register).
- `FMOV` (between a general-purpose register and a double-precision register).
- `FMOV` (between a general-purpose register and a SIMD element).

SIMD moves between a SIMD&FP register and a general-purpose register

These instructions are:

- `INS` (from a general-purpose register to a SIMD element).
- `UMOV` (from a SIMD element to a general-purpose register).

Barriers

These instructions are:

- `DMB`.
- `DSB`.
- `ESB`, when the The Reliability, Availability, and Serviceability Extension is implemented.
- `ISB`.
- `PSB`, when the Statistical Profiling Extension is implemented.
- `SB`, when FEAT_SB is implemented.
- `CSDB`, when FEAT_SSBS is implemented.
- `SSBB`, when FEAT_SSBS is implemented.
- `PSSBB`, when FEAT_SSBS is implemented.

Memory access instructions at various access sizes

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
  - Unscaled (9-bit signed) immediate offset.
  - Immediate (9-bit signed) post-indexed.
  - Immediate (9-bit signed) pre-indexed.
  - Unprivileged (9-bit signed).
- Not literal.
- One of the following types:
  - (Single) register.
  - Exclusive.
  - Exclusive pair.
  - Acquire/Release.
  - Acquire/Release Exclusive.
  - Acquire/Release Exclusive pair.
- 32-bit and 64-bit target register variants.

These instructions are:

- `LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW` (immediate, not literal).
- `LDUR, LDURB, LDURH, LDURSB, LDURSH, LDURSW` (immediate).
• LDTR, LDTRB, LDTRH, LDTRSB, LDTRSH, LDTRSW (immediate).
• LDAR, LDARB, LDARH, LDXR, LDXRB, LDXRH, LDAXR, LDAXRB, LDAXXR.
• LDXP, LDXTP.
• STR, STRB, STRH (immediate).
• STUR, STURB, STURH (immediate).
• STTR, STTRB, STTRH (immediate).
• STL, STLX, STXR, STLXR, STLXRH.
• STXP, STLXP.

• LDAR, LDLAR, LDLARH - Armv8.1 instructions.
• STLL, STLLRBB, STLLRH - Armv8.1 instructions.
• CAS, CASB, CASH, CASP - Armv8.1 instructions.
• SWP, SWPB, SWPH - Armv8.1 instructions.
• LDADD, LDADDB, LDADDH - Armv8.1 instructions.
• LDCLR, LDCLB, LDCLRH - Armv8.1 instructions.
• LDEOR, LDEORB, LDEORH - Armv8.1 instructions.
• LDSET, LDSETB, LDSETH - Armv8.1 instructions.
• LDSMAX, LDSMAXB, LDSMAXH - Armv8.1 instructions.
• LDSMIN, LDSMINB, LDSMINH - Armv8.1 instructions.
• LDUMAX, LDUMAXB, LDUMAXH - Armv8.1 instructions.
• LDUMIN, LDUMINB, LDUMINH - Armv8.1 instructions.
• STADD, STADDB, STADDH - Armv8.1 instructions.
• STCLR, STCLB, STCLRH - Armv8.1 instructions.
• STEOR, STEORB, STEORH - Armv8.1 instructions.

Move immediato to general-purpose register

These instructions are:
• MOVZ, MOVN, MOVK (immediate).
• MOV (between a general-purpose register and the stack pointer).

System instructions, Send Event, NOP, Clear Exclusive, and Prediction

In this context, the System instructions are the Cache maintenance instructions, TLB maintenance instructions, Address translation instructions, and the prediction restriction instructions.

These instructions are:
• IC.
• DC.
• TLBI.
• AT.
• SEV, SEVL.
• NOP.
• CLREX.
• CFP.
• CPP.
• DVP.
Basic pointer authentication instructions

When FEAT_PAuth is implemented, these instructions are:

- AUTIA, AUTIA1716, AUTIASP, AUTI AZ, AUTIZ.
- AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZB.
- AUTDA, AUTDAZ.
- AUTDB, AUTDBZ.
- PACIA, PACIA1716, PACIASP, PACI AZ, PACIZA.
- PACIB, PACIB1716, PACIBSP, PACI BZ, PACIBZ.
- PACDA, PACDZA.
- PACDB, PACDDB.
- PACGA.
- XPACD, XPACI, XPACLRI.

Memory Tagging Extension Instructions

When FEAT_MTE is implemented:

- Loads and stores in Debug state follow the same rules for Tag Checking as loads and stores when not in Debug state.
- If Memory-access mode is enabled and PSTATE.TCO is 0, reads and writes to the external debug interface DTR registers are CONSTRAINED UNPREDICTABLE, with the following permitted behaviors:
  — The PE behaves as if PSTATE.TCO is 0. That is, the load or store operation performs the tag check if required.
  — The PE behaves as if PSTATE.TCO is 1. That is, the load or store operation does not perform the tag check.

For more information see Chapter D6 Memory Tagging Extension.

The following instructions are unchanged in Debug state:

- ADDG <Xd|SP>, <Xn|SP>, #<uimm6>, #<uimm4>
- SUBG <Xd|SP>, <Xn|SP>, #<uimm6>, #<uimm4>

A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state

This subsection describes all instruction not listed in either:

- A64 instructions that are changed in Debug state on page H2-7025.
- A64 instructions that are unchanged in Debug state on page H2-7025.

These instructions are CONSTRAINED UNPREDICTABLE in Debug state. In general, the permissible behaviors are:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- If the instruction reads the PC or PSTATE, it uses an UNKNOWN value.
- If the instruction modifies the PC or PSTATE, other than by advancing the PC to the sequentially next instruction, it sets DLR_EL0 and DSPSR_EL0 to UNKNOWN values.
• If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.

• The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for A64 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed. An example of this is CMP.

### Exception-generating instructions

These instructions are:

- SVC.
- HVC.
- SMC.
- BRK.
- HLT.

These instructions behave in one of the following ways:

- They are **UNDEFINED**.
- They execute as a **NOP**.
- SVC behaves as DCP$1$.
- HVC behaves as DCP$2$.
- SMC behaves as DCP$3$.
- They generate the exception that the instruction would generate in Non-debug state. The exception is taken as described in *Exceptions in Debug state on page H2-7045*

--- **Note**

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSR .SDD is set to 1.

### Instructions that explicitly write to the PC (branches)

These instructions are:

- B, B.cond, BL, BLR, BR, CBZ, CBNZ, RET, TBZ, TBNZ.

These instructions behave in one of the following ways:

- They are **UNDEFINED**.
- They execute as a **NOP**.
- They execute as in Non-debug state without branching and set DSPSR_EL0 and DLR_EL0 to **UNKNOWN** values.

### Exception return and related instructions

These instructions are:

- ERET.

These instructions behave in one of the following ways:

- They are **UNDEFINED**.
- They execute as a **NOP**.
- They execute as in Non-debug state without branching. They set DSPSR_EL0 and DLR_EL0 to **UNKNOWN** values, and either:
  - Execute the DRPS operation instead of performing an exception return, using **UNKNOWN** SPSR values.
  - Not change the Exception level.

### Instructions that request entry to a low-power state

These instructions are:

- WFE, WFI.
These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See Configurable instruction enables and disables, and trap controls on page D1-2367.
- A WFE instruction clears the Event register if it is set.

---

**Note**

This means that these instructions must not suspend execution.

---

### Instructions that read the PC

These instructions are:

- LDR (literal), LDRSW (literal).
- ADR, ADRP.
- PRFM (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, using an UNKNOWN value for the PC operand.

### Instructions that explicitly modify PSTATE, other than DCPS and DRPS

These instructions are:

- ADDS, SUBS, ADCS, SBCS, ANDS, BICS, COMN, COMP.
- FCMP, FCMP.E, FCMP.F, FCMP.E.
- MSR DAIFSet (immediate), MSR DAIFClr (immediate), MSR SPSEL (immediate).
- MSR NZCV (register), MSR DAIF (register), MSR SPSEL (register).
- When FEAT_PAN is implemented, MSR PAN (immediate) and MSR PAN (register).
- When FEAT_UAO is implemented, MSR UAO (immediate) and MSR UAO (register).
- When FEAT_FlagM is implemented, CFIN1, RMIF, SETF8, SETF16.
- When FEAT_DIT is implemented, MSR DIT.
- When FEAT_FlagM2 is implemented, AXFLAG and XAFLAG.
- When FEAT_MTE is implemented, MSR TCO.
- When FEAT_RNG is implemented, MRS RDR and MRS RDRRS.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting DSPSR_EL0 and DLR_EL0 to UNKNOWN values.

### Instructions that read PSTATE.{N, Z, C, V} or other PSTATE fields

These instructions are:

- CSEL, CSINC, CSINV, CSNEG, COMN, COMP, FCSEL, FCMP, FCMP.E.
- ADC, ADCS, SBC, SBCS.
- CFIN1.
- MRS NZCV, MRS DAIF, MRS SPSEL, MRS CurrentEL.
- When FEAT_PAN is implemented, MRS PAN.
- When FEAT_UAO is implemented, MRS UAO.
- When FEAT_FlagM is implemented, CFIN1.
- When FEAT_DIT is implemented, MRS DIT.
- When FEAT_MTE is implemented MRS TCO.
These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
  - For the conditional operations and those using the PSTATE.C flag as an input, these instructions use an UNKNOWN value for the Condition flag.
  - For the MRS instruction, they return an UNKNOWN value.

**Hint instructions**

These instructions are:

- When FEAT_DGH is implemented, DGH.

These instructions behave in one of the following ways:

- They execute as a NOP.
- They execute as in Non-debug state.

**All other instructions**

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state.

--- **Note** ---

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Debug state.

---

**Executing T32 instructions in Debug state**

The following sections describe the behavior of the T32 instructions in Debug state:

- T32 instructions that are changed in Debug state.
- T32 instructions that are unchanged in Debug state on page H2-7032.
- T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-7034.

**T32 instructions that are changed in Debug state**

The following T32 instructions are defined in Debug state, but are undefined in Non-debug state:

- **DCPS**

  --- **Note** ---

  DCPS can be UNDEFINED in certain conditions in Debug state. See DCPS<n> on page H2-7042.

- **MRC p15,3,<Rt>,c4,c5,0 (DSPSR).**
- **MCR p15,3,<Rt>,c4,c5,0 (DSPSR).**
- **MRC p15,3,<Rt>,c4,c5,1 (DLR).**
- **MCR p15,3,<Rt>,c4,c5,1 (DLR).**

In addition, ERET executes the DRPS operation in Debug state.

For more information see Debug state operations, DCPS, DRPS, MRS, MSR on page H2-7042.

---
**T32 instructions that are unchanged in Debug state**

The following list shows the instructions that are unchanged in Debug state. Any T32 instruction that uses the PC or APSR, {N, Z, C, V} as the source or destination register is not included in the list. Moreover, the list only includes the 32-bit T32 encodings.

**Any instruction that is UNDEFINED in Non-debug state**

The list of instructions:
- Excludes any instruction listed in [T32 instructions that are changed in Debug state](#).
- Excludes any instruction listed in [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state](#) that is UNDEFINED because an enable or disable bit is not RES0 or RES1.

**Instructions that move System or Special-purpose registers to or from a general-purpose register**

The list of instructions:
- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes APSR and CPSR access instructions.
- Excludes instructions for accessing banked registers for the current mode.

These instructions are:
- `MRS <banked_reg>, MSR <banked_reg>`.  
  — **Note**  
  This does not apply to cases which are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state in the current mode.
- `MRC, MCR`.  
  — **Note**  
  This includes all allocated System registers in the (cproc==0b111x) encoding space other than an MRC move to APSR_nzcv.
- `MRS SPSR, MSR SPSR`.  
- `VMRS <vfp_system_reg>, VMSR <vfp_system_reg>`.  
  — **Note**  
  This includes all allocated Advanced SIMD and floating-point System registers, other than an a VMRS move to APSR_nzcv.

**Floating-point moves between a SIMD&FP register and a general-purpose register**

These instructions are:
- `VMOV` (between a general-purpose register and a single-precision register).
- `VMOV` (between a general-purpose register and a doubleword floating-point register).

**SIMD moves between a SIMD&FP register and a general-purpose register**

These instructions are:
- `VMOV` (between a general-purpose register and a scalar).

**Barriers**

These instructions are:
- `CSDB`, when [FEAT_SSBS](#) is implemented.
- `DMB`.
- `DSB`.
- `ESB`, when the [The Reliability, Availability, and Serviceability Extension](#) is implemented.
• ISB.
• PSSBB, when FEAT_SSBS is implemented.
• SB, when FEAT_SB is implemented.
• SSBB, when FEAT_SSBS is implemented.

Memory access instructions at various access sizes

The following constraints apply:
• General purpose-registers only.
• One of the following addressing modes:
  — Immediate (8-bit or 12-bit) offset.
  — Immediate (8-bit) post-indexed.
  — Immediate (8-bit) pre-indexed.
  — Unprivileged (8-bit).
• Not literal.
• One of the following types:
  — (Single) register.
  — Dual.
  — Exclusive.
  — Exclusive doubleword.
  — Acquire/Release.
  — Acquire/Release Exclusive.
  — Acquire/Release Exclusive doubleword.

These instructions are:
• LDR.W, LDRB.W, LDRH.W, LDRD, LDRSB.W, LDRSH.W (immediate, not literal).
• LDRT, LDRBT, LDRHT, LDRSBT, LDRSHT (immediate).
• LDREX, LDREXB, LDREXH, LDA, LDAB, LDAH, LDAEX, LDAEXB, LDAEXH.
• LDREXD, LDAEXD.
• STR.W, STRB.W, STRH.W, STRD (immediate).
• STRT, STRBT, STRHT (immediate).
• STREX, STREXB, STREXH, STL, STLB, STLH, STLEX, STLEXB, STLEXH.
• STREXD, STLEXD.

Move to general-purpose register

These instructions are:
• MOVW, MOV (immediate).

System instructions, Send Event, NOP, and Clear Exclusive

The System instructions are Cache maintenance instructions, TLB maintenance instructions, and Address translation instructions. These are encoded in the (coproc==0b1111) System register encoding space.

These instructions are:
• ICIAALLU, ICIAALLUIS, ICIMVAU.
• DCCIMVAC, DCCISW, DCCMVAC, DCCMVAU, DCCSW, DCIMVAC, DCISW.
• TLBIALLLH, TLBIALLHIS, TLBIALLIS, TLBIALNSNH, TLBIALNSNHIS, TLBIASSID, TLBIASSIDIS, TLBIIIPAS2, TLBIIIPAS2IS, TLBIIIPAS2L, TLBIIIPAS2LIS, TLBIMVA, TLBIMVAA, TLBIMVAAIS, TLBIMVAAL, TLBIMVAALIS, TLBIMVAH, TLBIMVAHS, TLBIMVAIS, TLBIMVAAL, TLBIMVAALH, TLBIMVAALHIS, TLBIMVALIS.
• ATS12NSOPR, ATS12NSOPW, ATS12NSOUR, ATS12NSOURW, ATS1CPR, ATS1CPW, ATS1CUR, ATS1CUW, ATS1HR, ATS1HW.
• BPIALL, BPIALLIS, BPIMVA.
T32 instructions that are CONstrained UNPREDICTable in Debug state

This subsection describes all instruction not listed in either:

- T32 instructions that are changed in Debug state on page H2-7031.
- T32 instructions that are unchanged in Debug state on page H2-7032.

These instructions are CONstrained UNPREDICTable in Debug state. In general, the permissible behaviors are:

- The instruction generates an Undefined Instruction exception.
- The instruction executes as a NOP.
- If the instruction reads the PC or PSTATE, it uses an UNKNOWN value.
- If the instruction modifies the PC or PSTATE, other than by advancing the PC to the sequentially next instruction, it sets DLR and DSPSR to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for T32 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed.

Exception-generating instructions

These instructions are:

- SVC.
- HVC.
- SMC.
- UDF.
- BKPT.
- HLT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCPS1.
- HVC behaves as DCPS2.
- SMC behaves as DCPS3.
- They generate the exception the instruction would generate in Non-debug state. The exception is taken as described in Exceptions in Debug state on page H2-7045.

Note

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSR.SDD is set to 1.

Instructions that explicitly write to the PC (branches)

These instructions are:

- B, B (conditional), CBZ, CBNZ BL.
- BX, BLX (register or immediate).
- BXJ, TBB, TBH.
- MOV pc and related instructions.
- LDR pc, LDM (with a register list includes the PC), POP (with a register list that includes the PC).
These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set DSPSR and DLR to UNKNOWN values.

### Exception return and related instructions, other than ERET

These instructions are:

- SRS, RFE, SUBS pc, 1r, and related instructions.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching, setting DLR and DSPSR to UNKNOWN values, and either:
  - Execute the DRPS operation instead of performing an exception return, using UNKNOWN SPSR values.
  - Not changing Exception level or PE mode.

### Instructions that request entry to a low-power state

These instructions are:

- WFE, WFI.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See Configurable instruction enables and disables, and trap controls on page G1-5818.
- A WFE instruction is permitted to clear the Event register if it is set.

**Note**

This means that these instructions must not suspend execution.

### Instructions that read the PC

These instructions are:

- LDR (literal), LDRB (literal), LDRH (literal), LDRSB (literal), LDRSH (literal).
- ADR, ADRL, ADRH.
- PLD (literal), PLI (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state using an UNKNOWN value for the PC operand.

### Instructions that explicitly modify PSTATE, other than DCPS and ERET

These instructions are:

- CMP, TST, TEQ, CMN.
- <opc>S.
- MRC p14,0,APSR_nzcv,c8,c1,0 (accessing DBGDSCRint).
- CPS, SETEND, IT.
- MSR CPSR (immediate), MSR CPSR (register), MSR APSR (immediate), MSR APSR (register).
- VMRS APSR_nzcv, FPSCR.
Debug State
H2.4 Behavior in Debug state

- QADD, QDADD, QSUB, QDSUB.
- SMLABB, SMLABT, SMLATB, SMLATT, SMLAD, SMLAWB, SMLAWT, SMLSD, SMLUD.
- SSAT, SSAT16, USAT, USAT16.
- SADD, SADD8, SADD16, SASX, SSAX, SSUB, SSUB8, SSUB16.
- UADD, UADD8, UADD16, USAX, USAAX, USUB, USUB8, USUB16.
- When FEAT_PAN is implemented, SETPAN.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting DSPR_EL0 and DLR_EL0 to UNKNOWN values.

Instructions that read PSTATE.{N, Z, C, V} or other PSTATE fields

These instructions are:

- SEL, VSEL.
- ADC, SBC, all instructions with an RRX shift.
- MRS CPSR.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
  - For the conditional operations and those using the PSTATE.C flag as an input, these instructions use an UNKNOWN value for the Condition flag.
  - For the MRS instruction, they return an UNKNOWN value

All other instructions

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They have the same behavior as in Non-debug state.

--- Note ---

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are CONSTRAINED UNPREDICTABLE in Debug state. This includes some T32 instructions that specify R15 as a destination or source register.

Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors describes the CONSTRAINED UNPREDICTABLE behavior for these instructions. In Debug state these CONSTRAINED UNPREDICTABLE choices are further restricted:

- Instructions that specify R15 as a destination register:
  - Are not permitted to branch, because the architecture does not define a branch operation in Debug state.
  - Might set DLR and DSPR to UNKNOWN values.
  - Might have any of the other permitted behaviors.

- Instructions that specify R15 as a source operand:
  - Cannot use PC + offset, because there is no architecturally-defined PC in Debug state.
  - Might have any of the other permitted behaviors, including using an UNKNOWN value.
H2.4.3   Decode tables

The syntax in the tables is defined as follows:

1 The bit has a fixed value of 1.
0 The bit has a fixed value of 0.
!= The field has any value other than the value or values specified. The field might be an encoding field in the instruction whose value is supplied by the debugger.

--- Note ---

The instruction encodings in Chapter C6 A64 Base Instruction Descriptions and Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions might show these bits as (0) or (1). A debugger must set these bits to 0 or 1, as appropriate.

Any other value indicates an encoding field in the instruction whose value is supplied by the debugger. Some values might be reserved or undefined, in which case the instruction is UNDEFINED or CONSTRAINED UNPREDICTABLE in Debug state, as it is in Non-debug state.

For more information about the instruction encodings, see:

- Chapter C6 A64 Base Instruction Descriptions.
- Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions.

For information about the syntax used in Table H2-2, Table H2-3, Table H2-4 on page H2-7038, and Table H2-5 on page H2-7039, see:

- Common syntax terms on page C1-181.
- Assembler symbols on page F2-4117.

Table H2-2 shows the A64 instructions that are modified in Debug state. For details of how these are packed in the EDITR see the register description.

H2.4.4 Security in Debug state

If EL3 is implemented or the implemented Security state is Secure state, security in Debug state is governed by the Secure debug disabled flag, EDSCR.SDD.

On entry to Debug state

If entering in Secure state, EDSCR.SDD is set to 0. Otherwise EDSCR.SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled(). That is:

- If ExternalSecureInvasiveDebugEnabled() == TRUE, EDSCR.SDD is set to 0.
- If ExternalSecureInvasiveDebugEnabled() == FALSE, EDSCR.SDD is set to 1.

Note

Normally, if ExternalSecureInvasiveDebugEnabled() == FALSE then halting is prohibited and it is not possible to enter Debug state from Secure state. However, because changes to the authentication signals require a Context synchronization event to guarantee their effect, there is a period during which the PE might halt even though the authentication signals prohibit halting.

In Debug state

The value of EDSCR.SDD does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

Note

- DBGAUTHSTATUS_EL1.{SNID, SID, NSNID, NSID} are not frozen in Debug state.
- If EDSCR.SDD set to 1 in Debug state, then there is no means to enter Secure state from Non-secure state. In this case it is impossible for the PE to be in Secure state. This is a general principle of behavior in Debug state.

In Non-debug state

EDSCR.SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a Context synchronization event is required to guarantee their effect.

Note

- In Non-debug state, EDSCR.SDD is unaffected by the Security state of the PE.
- A Context synchronization event is also required to guarantee that changes in the authentication signals are visible in DBGAUTHSTATUS_EL1.{SNID, SID, NSNID, NSID}.

If EL3 is not implemented and the implemented Security state is Non-Secure state, EDSCR.SDD is RES1.
H2.4.5 Privilege in Debug state

The only additional privileges offered to Debug state are:

- The privilege to execute Debug state operations, DCPS, DRPS, MRS, MSR.
- The privilege to execute DTR access instructions regardless of the Exception level and traps.

The DTR access instructions can be executed at any Exception level, including EL0, regardless of any control register settings that might force these instructions to be undefined or trapped in Non-debug state. These instruction are:

- The MRS and MSR instructions that access DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0 in AArch64 state.
- The MRC and MCR instructions that access DBGDTRTXint and DBGDTRRXint in AArch32 state.

All other instructions operate with the privilege determined by the current Exception level and security state. This applies to all Special-purpose and System registers accesses, memory accesses, and undefined instructions, and includes generating exceptions when the System registers trap or disable an instruction.

H2.4.6 Debug state operations, DCPS, DRPS, MRS, MSR

Armv8 defines operations to change between Exception levels in Debug state. These operations can also change the mode at the current Exception level.

DCPS<n>

Executing a DCPS<n> instruction in Debug state moves the PE to a higher Exception level or to a specific mode at the current Exception level.

If the DCPS<n> instruction is executed in AArch32 state and the target Exception level is using AArch64:

- The current instruction set switches from T32 to A64.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for system calls in Non-debug state. See Execution state on page D1-2315.

Otherwise, the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- In AArch64 state the current endianness is determined by the value of SCTLR_ELx.EE for the target Exception level.
- In AArch32 state the current endianness is determined by the value of SCTLR.EE or HSCTL.R.EE for the target Exception level.

The DCPS<n> instructions are:

In AArch64 state

- DCPS1
- DCPS2
- DCPS3

In AArch32 state, in the T32 instruction set only

- DCPS1
- DCPS2
- DCPS3

The DCPS instructions are undefined in Non-debug state.
Table H2-6 shows the target of the instruction. In Table H2-6 the entries have the following meaning:

<table>
<thead>
<tr>
<th>EL1h/Svc</th>
<th>This means that the target is:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• EL1h if EL1 is using AArch64.</td>
</tr>
<tr>
<td></td>
<td>• EL1 and Supervisor mode if EL1 is using AArch32.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>EL2h/Hyp</th>
<th>This means that the target is:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• EL2h if EL2 is using AArch64.</td>
</tr>
<tr>
<td></td>
<td>• EL2 and Hyp mode if EL2 is using AArch32.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>EL3h/Monitor</th>
<th>This means that the target is:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• EL3h if EL3 is using AArch64.</td>
</tr>
<tr>
<td></td>
<td>• EL3 and Monitor mode if EL3 is using AArch32.</td>
</tr>
</tbody>
</table>

| Svc | Secure Supervisor mode, in EL3 using AArch32. |
| Monitor | Secure Monitor mode, in EL3 using AArch32. |

Table H2-6 Target for DCPS instructions in Debug state

<table>
<thead>
<tr>
<th>Instruction</th>
<th>Target when DCPS instruction executed at stated Exception level:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>EL0</td>
</tr>
<tr>
<td>DCPS1</td>
<td>EL1h/Svc</td>
</tr>
<tr>
<td>DCPS2</td>
<td>EL2h/Hyp</td>
</tr>
<tr>
<td>DCPS3</td>
<td>EL3h/Monitor</td>
</tr>
</tbody>
</table>

In AArch32 Monitor mode, DCPS1 and DCPS3 clear SCR.NS to 0.

--- Note ---

In AArch64 state, at EL3, DCPS<> does not change SCR_EL3.NS.

However:

- **DCPS1** is undefined at EL0 if either:
  - EL2 is implemented and enabled in the current Security state, and is using AArch64 and HCR_EL2.TGE == 1.
  - In Non-secure state, EL2 is implemented and using AArch32 and HCR.TGE == 1.

- **DCPS2** is undefined at all Exception levels if EL2 is not implemented.

- **DCPS2** is undefined at the following Exception levels if EL2 is implemented:
  - At EL0 and EL1 in Secure state if EL2 is disabled in the current Security state.
  - At EL3 if EL3 is using AArch32.

- **DCPS3** is undefined at all Exception levels if either:
  - EDSR.SDD == 1.
  - EL3 is not implemented.

--- Note ---

The references to DCPS1, DCPS2, and DCPS3 in this section link to the descriptions of the instructions in the A64 instruction set. The DCPS<> instructions are also defined in the T32 instruction set, see DCPS1, DCPS2, DCPS3. These instructions are not defined in the A32 instruction set, because A32 instructions cannot be executed in Debug state.
On executing a DCPS instruction:

- If the target Exception level is using AArch64:
  - ELR_ELx of the target Exception level becomes UNKNOWN.
  - SPSR_ELx of the target Exception level becomes UNKNOWN.
  - ESR_ELx of the target Exception level becomes UNKNOWN.
  - DLR_EL0 and DSPSR_EL0 become UNKNOWN.

- If the target Exception level is using AArch32 DLR and DSPSR become UNKNOWN and:
  - If the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become UNKNOWN.
  - If the target Exception level is EL2, then ELR_hyp, SPSR_hyp, and HSR become UNKNOWN.

If the target Exception level is using AArch32, and the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become UNKNOWN.

If FEAT_SSBS is implemented, the DCPS<op> instruction leaves the PSTATE.SSBS bit UNKNOWN.

The DCPSInstruction() function is described in Chapter J1 Armv8 Pseudocode.

**DRPS**

Executing the DRPS operation in Debug state moves the PE to a lower Exception level, or to another PE mode at the current Exception level, by copying the current SPSR to PSTATE.

If DRPS is executed in AArch64 state and the target Exception level is using AArch32:

- The current instruction set switches from A64 to T32.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for exception returns in Non-debug state. See Execution state on page D1-2315.

Otherwise, the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- If targeting an Exception level using AArch64, current endianness is set according to SCTLR_ELx.EE, or SCTLR_EL1.E0E for the target Exception level.
- If targeting an Exception level using AArch32, current endianness is set by SPSR.E as appropriate.

The DRPS instructions are:

In AArch64 state
- DRPS

In AArch32 state, in the T32 instruction set only
- ERET

If the SPSR specifies an illegal exception return, then PSTATE.{M, nRW, EL, SP} are unchanged and PSTATE.IL is set to 1. For further information on illegal exception returns, see Illegal return events from AArch64 state on page D1-2345.

PSTATE.{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F} are ignored in Debug state. This means that the effect of the DRPS operation on these fields is to set them to an UNKNOWN value that might be the value from the SPSR. For more information see PSTATE in Debug state on page H2-7024.

All other PSTATE fields are copied from SPSR.

DRPS is undefined at EL0 and in Non-debug state.
Note

Unlike an exception return, the DRPS operation has no architecturally-defined effect on the Event Register and Exclusives monitors. DRPS might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

On executing a DRPS instruction:

- If the target Exception level is using AArch64:
  - DLR_EL0 and DSPSR_EL0 become UNKNOWN.
- If the target Exception level is using AArch32:
  - DLR and DSPSR become UNKNOWN.

If FEAT_SSBS is implemented, the DRPS instruction leaves the PSTATE.SSBS bit UNKNOWN.

The DRPSInstruction() function is described in Chapter J1 Armv8 Pseudocode.

MRS and MSR

The other Debug state instructions are used to read or write DLR_EL0 and DSPSR_EL0.

These instructions are:

In AArch64 state
- MRS
- MSR (register)

In AArch32 state
- MRC
- MCR

MRS <Xt>, DLR_EL0 ; Copy DLR_EL0 to <Xt>
MRS <Xt>, DSPSR_EL0 ; Copy DSPSR_EL0 to <Xt>
MSR DLR_EL0, <Xt> ; Copy <Xt> to DLR_EL0
MSR DSPSR_EL0, <Xt> ; Copy <Xt> to DSPSR_EL0

These instructions can be executed at any Exception level when in Debug state, including EL0. They are undefined in Non-debug state.

H2.4.7 Exceptions in Debug state

The following sections describe how exceptions are handled in Debug state:

- Generating exceptions when in Debug state.
- Taking exceptions when in Debug state on page H2-7046.
- Reset in Debug state on page H2-7047.

Generating exceptions when in Debug state

In Debug state:

- Instruction Abort exceptions cannot happen because instructions are not fetched from memory.
- Interrupts, including SError and virtual interrupts are ignored and remain pending:
  - The pending interrupt remains visible in ISR.
- Debug exceptions and debug events are ignored.
- SCR.EA is treated as if it were set to 0, regardless of its actual state, other than for the purpose of reading the bit.
- Any attempt to execute an instruction bit pattern that is an allocated instruction at the current Exception level, but is listed in Executing instructions in Debug state on page H2-7025 as undefined in Debug state, generates an exception, that is taken to the current Exception level, or to EL1 if executing at EL0.
--- Note ---
If the exception is taken to an Exception level that is using AArch32 then it is taken as an Undefined Instruction exception.

The priority and syndrome for these exceptions is the same as for executing an encoding that does not have an allocated instruction.

- **Instructions executed at EL2, EL1 and EL0 that are configured by EL3 control registers to trap to EL3:**
  - When the value of EDSR.SDD is 0, generate the appropriate trap exception that is taken to EL3.
  - When the value of EDSR.SDD is 1, are treated as UNDEFINED and generate an exception that is taken to the current Exception level, or to EL1 if the instruction is executed at EL0. If the exception is taken to an Exception level that is using AArch32 it is taken as an Undefined Instruction exception.

  If the exception is taken to an Exception level using AArch64 or to AArch32 Hyp mode, then it is reported with an EC value of 0x00.

  Otherwise configurable traps, enables, and disables for instructions are unaffected by Debug state, and executing an affected instruction generates the appropriate exception.

Otherwise, synchronous exceptions, including Data Aborts, are generated as they would be in Non-debug state and taken to the appropriate Exception level in Debug state.

--- Note ---
If EDSR.SDD == 1 then an exception from Non-secure state is never taken to Secure state. See Security in Debug state on page H2-7041.

--- Taking exceptions when in Debug state ---

When the PE is in Debug state, all exceptions are synchronous. When an exception is generated, it is taken to Debug state. This means that:

- The target Exception level is as defined for the exception in Non-debug state.
- If the target Exception level is using AArch32 then the target PE mode is as defined for the exception in Non-debug state.
- The exception syndrome is reported as defined for the exception in Non-debug state, except for the case described in Data Aborts in Memory access mode on page H4-7084 for which the reporting requirements are relaxed.

The exception syndrome is reported using the syndrome register or registers for the target Exception level. In AArch64 state, these are ESR_ELx, and FAR_ELx. In AArch32 state, these are DFSR, DFAR, HSR, HDFAR, and HPFAR. For example:

- If a Data Abort exception is taken to Abort mode at EL1 or EL3 and the exception is taken from AArch32 state and using the Short-descriptor translation table format, the DFSR reports the exception using the Short-descriptor format fault encoding. For exceptions other than Data Abort exceptions taken to Abort mode, DFSR is not updated.
- If an instruction is trapped to an Exception level using AArch64 due to a configurable trap, disable, or enable, the exception code reported is the same as it would be in Non-debug state.

The effect on auxiliary syndrome registers, such as AFSR, is IMPLEMENTATION DEFINED.

--- Note ---
Generally, the AArch32 Fault Address Registers (FARs) and Fault Status Registers (FSRs) are not described as syndrome registers, although the term is appropriate to their function.

- The PE remains in Debug state and changes to the target mode.
- If EL3 is using AArch32 and the exception is taken from Monitor mode, SCR.NS is cleared to 0.
If the exception is taken to an Exception level using AArch32, the PE continues to execute T32 instructions, regardless of the TE bit in the System register for the target Exception level.

The endianness switches to that indicated by the EE bit of the System register for the target Exception level.

The SPSR for the target Exception level or mode is corrupted and becomes UNKNOWN.

If the target Exception level is using AArch64, ELR_ELx for the target Exception level becomes unknown.

If the target Exception level is EL2 using AArch32, ELR_hyp becomes unknown.

If the target Exception level is EL1 or EL3 using AArch32, LR_<mode> for the target mode becomes unknown.

DLR and DSPSR become UNKNOWN.

The cumulative error flag, EDSCR.ERR, is set to 1. See Cumulative error flag on page H4-7088.

PSTATE.IL is cleared to 0.

PSTATE.{IT, T, SS, D, A, I, F} are set to UNKNOWN values, and PSTATE.{N, Z, C, V, Q, GE} are unchanged. However, these fields are ignored and are not observable in Debug state. For more information see PSTATE in Debug state on page H2-7024.

The debugger must save any state that can be corrupted by an exception before executing an instruction that might generate another exception.

**Pseudocode description of taking exceptions in Debug state**

The pseudocode function `AArch64.TakeException()` shows the behavior when the PE takes an exception to an Exception level using AArch64 in Non-debug state. In Debug state, this is replaced with the function `AArch64.TakeExceptionInDebugState()`.

The pseudocode functions `AArch32.EnterMode()`, `AArch32.EnterHypMode()`, and `AArch32.EnterMonitorMode()` show the behavior when the PE takes an exception to an Exception level using AArch32 in Non-debug state. In Debug state:

- `AArch32.EnterMode()` is replaced with the function `AArch32.EnterModeInDebugState()`.
- `AArch32.EnterHypMode()` is replaced with the function `AArch32.EnterHypModeInDebugState()`.
- `AArch32.EnterMonitorMode()` is replaced with `AArch32.EnterMonitorModeInDebugState()`.

**Reset in Debug state**

If the PE is reset when in Debug state, it exits Debug state and enters Non-debug reset state. When the PE is in reset state, EDSCR.STATUS == 0b000010 and writes to EDITR are ignored.

---

**Note**

If EDECR.RCE == 1 or CTIDEVCTL.RCE == 1, meaning that a Reset Catch debug event is programmed, and if halting is allowed on exiting reset state, then on exiting reset state the PE halts and re-enters Debug state. See Reset Catch debug events on page H3-7073. All PE registers have taken their reset values, which might be UNKNOWN.

---

**H2.4.8 Accessing registers in Debug state**

Register accesses are unchanged in Debug state. The view of each register is determined by either the current Exception level or the mode, or both, and accesses might be disabled or trapped by controls at a higher Exception level.
General-purpose register access, other than AArch64 state SP access

A single general-purpose register can be read by issuing an MSR instruction through the ITR to write DBGDTR_EL0 in AArch64 state, or an MCR instruction through the ITR to write DBGDTRXTXint in AArch32 state. The debugger can then read the DTR register or registers through the external debug interface. The reverse sequence writes to a general-purpose register.

Figure H2-1 shows the reading and writing of general-purpose registers, other than SP, in Debug state in AArch64 state.

Figure H2-1 Reading and writing general-purpose registers, other than SP, in Debug state in AArch64 state

Figure H2-2 on page H2-7049 shows the reading and writing of general-purpose registers in Debug state in AArch32 state.
H2.4 Behavior in Debug state

SIMD and floating-point register, System register, and AArch64 state SP accesses

To read a SIMD and floating-point register or a System register, the debugger must first copy the value into a general-purpose register using:

- An \texttt{FMOV} instruction in AArch64 state or a \texttt{VMOV} instruction in AArch32 state for floating-point transfers to SIMD and FP registers.
- A \texttt{UMOV} instruction in AArch64 state or a \texttt{VMOV} instruction in AArch32 state for SIMD transfers to SIMD and FP registers.
- An \texttt{MRS} instruction in AArch64 state or an \texttt{MRC} instruction in AArch32 state for System registers.
- A \texttt{MOV Xd,SP} instruction for the SP register in AArch64 state.

The debugger can then read out the particular general-purpose register. The reverse sequence writes a register.

PC and PSTATE access

The debugger reads the program counter and PSTATE of the process being debugged through the DLR_EL0 and DSPSR_EL0 System registers. The actual values of PC and PSTATE cannot be directly observed in Debug state:

- Instructions that are used for direct reads and writes of PC and PSTATE in Non-debug state are UNDEFINED in Debug state.
- On taking an exception, ELR_ELx and SPSR_ELx at the target Exception level are UNKNOWN. They do not record the PC and PSTATE.

PSTATE, \{IL, E, M, nRW, EL, SP\} are indirectly read by instructions executed in Debug state, but all other PSTATE fields are ignored and cannot be observed. See also:

- \textit{PSTATE in Debug state} on page H2-7024.
- \textit{Executing instructions in Debug state} on page H2-7025.
- \textit{Exceptions in Debug state} on page H2-7045.
H2.4.9 Accessing memory in Debug state

How the PE accesses memory is unchanged in Debug state. This includes:

- The operation of the MMU, including address translation, tagged address handling, access permissions, memory attribute determination, and the operation of any TLBs.
- The operation of any caches and coherency mechanisms.
- Alignment support.
- Endianness support.
- The Memory order model.

Simple memory transfers

Simple memory accesses can be performed in Debug state by issuing memory access instructions through the ITR and passing data through the DTR registers. Executing instructions in Debug state on page H2-7025 lists the memory access instructions that are supported in Debug state.

Bulk memory transfers

Memory access mode can accelerate bulk memory transfers in Debug state. See DCC and ITR access modes on page H4-7082.
H2.5 Exiting Debug state

The PE exits Debug state when it receives a Restart request trigger event. If EDSCR.ITE == 0 the behavior of any instruction issued through the ITR in Normal access mode or an operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state after the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

--- Note ---
- Implementations can set EDSCR.ITE to 1 to indicate that further instructions can be accepted by ITR before the previous instructions have completed. If any previous instruction has not completed and EDSCR.ITE == 1, then the PE must complete these instructions in Debug state before executing the restart sequence. EDSCR.ITE == 0 indicates that the PE is not ready to restart.
- A debugger must observe that any instructions issued through EDITR that might generate a synchronous exception, as complete, before issuing a restart request. It can do this by observing the completion of a later instruction, as synchronous exceptions must occur in program order. For example, a debugger can observe that an instruction that reads or writes a DTR register is complete because of its effect on the EDSCR.{TXfull, RXfull} flags.

On exiting Debug state, the PE sets the program counter to the address in DLR, where:

- If exiting to AArch32 state:
  - Bits[31:1] of the PC are set to the value of bits[31:1] of DLR.
  - Bit[0] of the PC is set to a CONSTRAINED UNPREDICTABLE choice of 0 or the value of bit[0] in DLR.
- If exiting to AArch64 state:
  - Bits[63:56] of DLR_EL0 might be ignored as part of tagged address handling. See Address tagging in AArch64 state on page D5-2528.
  - Otherwise the PC is set from DLR_EL0.

--- Note ---
Bits[63:32] of DLR_EL0 are ignored when exiting to AArch32 state.

Exit from Debug state can give rise to a PC alignment fault exception when the program counter is used. Unlike an exception return, this might also happen when returning to AArch32 state. For more information, see PC alignment checking on page D1-2327.

On exiting Debug state, PSTATE is set from DSPSR in the same way that an exception return sets PSTATE from SPSR_ELx:

- The same illegal exception return checks that apply to an exception return also apply to exiting Debug state. If the return from Debug state is an illegal exception return then the effect on PSTATE and the PC is the same as for any other illegal exception return. See Exception return on page D1-2344 and Exception return to an Exception level using AArch32 on page G1-5765.
- The checks on the PSTATE.IT bits that apply to exiting Debug state into AArch32 state are the same as those that apply to an exception return. See Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.
- PSTATE.SS is copied from DSPSR.SS if all of the following hold:
  - MDSCR_EL1.SS == 1.
  - The debug target Exception level is using AArch64.
  - Software step exceptions from the restart Exception level are enabled.
Otherwise PSTATE.SS is set to 0.
Note

Unlike a return using ERET, PSTATE.SS must be restored from DSPSR.SS because otherwise it is UNKNOWN.

However, if OSDLR.DLK == 1 and DBGPRCR.CORENPDRQ == 0, meaning FEAT_DoubleLock is implemented and locked in Non-debug state and therefore Software Step exceptions are disabled, but otherwise Software Step exceptions would be enabled from the restart Exception level, it is CONSTRAINED UNPREDICTABLE whether PSTATE.SS is copied from DSPSR.SS.

- If FEAT_SSBS is implemented, on exit from Debug state to AArch64 state, DSPSR_EL0.SSBS is copied to PSTATE.SSBS.
- If FEAT_SSBS is implemented, on exit from Debug state to AArch32 state, DSPSR.SSBS is copied to CPSR.SSBS.
- If FEAT_PAN is implemented, DSPSR_EL0.PAN is copied to PSTATE.PAN.
- If FEAT_UAO is implemented, DSPSR_EL0.UAO is copied to PSTATE.UAO.
- If FEAT_DIT is implemented, on exit from Debug state to AArch64 state, DSPSR_EL0.DIT is copied to PSTATE.DIT.
- If FEAT_DIT is implemented, on exit from Debug state to AArch32 state, DSPSR.DIT is copied to CPSR.DIT.
- If FEAT_MTE is implemented, on exit from Debug state to AArch64 state, DSPSR_EL0.TCO is copied to PSTATE.TCO. On exit from Debug state to AArch32 state, PSTATE.TCO is not updated.
- If FEAT_BTI is implemented, DSPSR_EL0.BTYPE is copied to PSTATE.BTYPE.

Note

- One important difference between Debug state exit and an exception return is that the PE can exit Debug state at EL0. Despite this, the behavior of an exit from Debug state is similar to an exception return. For example, PSTATE.{D, A, I, F} is updated regardless of the value of SCTLR_EL1.UMA.
- Exit from Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors. An exit from Debug state might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

The ExitDebugState() function is described in Chapter J1 Armv8 Pseudocode.
Chapter H3
Halting Debug Events

This chapter describes a particular class of debug events. It contains the following sections:

- Introduction to Halting debug events on page H3-7054.
- Halting Step debug events on page H3-7056.
- Halt Instruction debug event on page H3-7066.
- Exception Catch debug event on page H3-7067.
- External Debug Request debug event on page H3-7071.
- OS Unlock Catch debug event on page H3-7072.
- Reset Catch debug events on page H3-7073.
- Software Access debug event on page H3-7074.
- Synchronization and Halting debug events on page H3-7075.

Note
Table K15-1 on page K15-8160 disambiguates the general register references used in this chapter.
H3.1 Introduction to Halting debug events

External debug defines Halting debug events. The following Halting debug events are available in Armv8:

- Halting Step debug events on page H3-7056.
- Halt Instruction debug event on page H3-7066.
- Exception Catch debug event on page H3-7067.
- External Debug Request debug event on page H3-7071.
- OS Unlock Catch debug event on page H3-7072.
- Reset Catch debug events on page H3-7073.
- Software Access debug event on page H3-7074.

If halting is allowed, a Halting debug event halts the PE. The PE enters Debug state.

In addition, breakpoints and watchpoints might halt the PE if halting is allowed. See Breakpoint and Watchpoint debug events on page H2-7016. Because breakpoints and watchpoints can generate an exception or halt the PE, Breakpoint and Watchpoint debug events are not classified as Halting debug events.

For a definition of Debug state, see Chapter H2 Debug State. For a definition of halting allowed, see Halting allowed and halting prohibited on page H2-7015.

Debug state entry and debug event prioritization on page H2-7017 describes the behavior when multiple debug events are generated by an instruction.

See also Synchronization and Halting debug events on page H3-7075.

Table H3-1 shows the behavior of Breakpoint, Watchpoint, and Halting debug events.

H3.2 Halting Step debug events

Halting Step is a debug resource that a debugger can use to make the PE step through code one instruction at a time. This section describes the Halting Step debug events. It is divided into the following sections:

- Overview of a Halting Step debug event.
- The Halting Step state machine.
- Using Halting Step on page H3-7059.
- Detailed Halting Step state machine behavior on page H3-7059.
- Synchronization and the Halting Step state machine on page H3-7062.
- Stepping T32 IT instructions on page H3-7064.
- Disabling interrupts while stepping on page H3-7064.
- Syndrome information on Halting Step on page H3-7064.
- Pseudocode description of Halting Step debug events on page H3-7065.

The architecture describes the behavior as a simple Halting Step state machine. See The Halting Step state machine.

H3.2.1 Overview of a Halting Step debug event

The behavior of Halting Step is defined by a state machine, shown in Figure H3-1 on page H3-7058. A Halting Step debug event executes a single instruction and then returns control to the debugger. When the debugger software wants to execute a Halting Step:

1. With the PE in Debug state, the debugger activates Halting Step.
2. The debugger signals the PE to exit Debug state and return to the instruction that is to be stepped.
3. The PE executes that single instruction.
4. The PE enters Debug state before executing the next instruction.

However, an exception might be generated while the instruction is being stepped. That is either:

- A synchronous exception generated by the instruction being stepped.
- An asynchronous exception taken before or after the instruction being stepped.

Halting Step has its own enable control bit, EDECR.SS and EDESR.SS.

Note

Because the Halting Step state machine states occur as a result of normal PE operation, the states can be described as both:

- PE states.
- Halting Step states.

H3.2.2 The Halting Step state machine

The state machine states are:

**Inactive**

Halting Step is inactive. No Halting Step debug events can be generated, therefore execution is not affected by Halting Step. The PE is in this state whenever either of the following is true:

- Halting Step is disabled. That is, EDECR.SS is set to 0 and EDESR.SS is set to 0.
- Halting is prohibited. See Halting the PE on debug events on page H2-7015. In this state, if EDECR.SS is set to 1 then a Halting Step debug event is pending.

In Figure H3-1 on page H3-7058 this state is shown in red.

**Active-not-pending**

Halting Step is enabled and active. This is the state in which the PE steps an instruction. EDECR.SS == 1 and EDESR.SS == 0. Software must not set EDECR.SS to 1 unless the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE, as described in Changing the value of EDECR.SS when not in Debug state on page H3-7063.

In Figure H3-1 on page H3-7058 this state is shown in green.
Active-pending

Halting Step is enabled and active. The step has completed, and the PE enters Debug state.

\[ \text{EDESR.SS} = 1. \]

In Figure H3-1 on page H3-7058 this state is shown in green.

Whenever Halting Step is enabled and active, whether the state machine is in the active-not-pending state or in the active-pending state depends on EDESR.SS. Halting Step state machine states on page H3-7059 shows this.

In the simple sequential execution of the program the PE executes the Halting Step state machine, as follows:

1. Initially, Halting Step is inactive.
2. After exiting Debug state, Halting Step is active-not-pending.
3. The PE executes an instruction and Halting Step is active-pending.
4. The pending Debug state entry is taken on the next instruction and the step is complete.

Exceptions and other changes to the PE context can interrupt this sequence.

Figure H3-1 on page H3-7058 shows a Halting Step state machine.
Figure H3-1 Halting Step state machine

a. Step completed occurs when:
   • A debug event, other than a Halting Step debug event, causes entry into Debug state.

b. Step completed occurs when:
   • An instruction is executed without taking an exception.
   • An exception is taken to a state where halting is allowed.
   • A reset.

c. Step completed occurs when:
   • An SMC exception is taken to Secure state where halting is prohibited.

d. An asynchronous exception taken to a state where halting is allowed.

e. An asynchronous exception taken to Secure state where halting is prohibited.
Note

Figure H3-1 on page H3-7058 only describes state transitions to and from the inactive state by exit from Debug state, executing an exception return, or taking an exception. Other changes to the PE context, including writes to registers such as EDECR and OSDLR and changes to the authentication interface can also cause changes to the Halting Step state machine. These can lead to UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior. See Synchronization and the Halting Step state machine on page H3-7062.

The following bits control the state machine, as shown in Table H3-3:

- EDECR.SS. This is the Halting Step enable bit.
- EDESR.SS. This is the Halting Step debug event pending bit.

Table H3-3 shows the Halting Step state machine states. The letter X in a register column means that the relevant bit can be set to either zero or one.

#### H3.2.3 Using Halting Step

To step a single instruction the PE must be in Debug state:

1. The debugger sets EDECR.SS to 1 to enable Halting step.
2. The debugger signals the PE to exit Debug state with DLR set to the address of the instruction being stepped. The PE clears EDESR.SS to 0 and the Halting Step state machine enter the active-not-pending state.
3. The PE executes the instruction being stepped. If an exception is taken to a state where halting is prohibited, then EDESR.SS is always correct for the preferred return address of the exception.
4. The PE enters Debug state before executing the next instruction and the step is complete.

Note

- If FEAT_DoPD is not implemented, EDECR.SS value is in the Debug power domain, meaning that the state machine is maintained over a powerdown of the Core power domain.
- If FEAT_DoPD is implemented, the values of EDECR.SS and EDESR.SS are set to 0 on a Cold reset, and, if the PE was stepping an instruction, EDESR.SS is effectively UNKNOWN after a Warm reset. A debugger must use a Reset Catch debug event to step over a powerdown state.
- A debugger must only change the value of EDECR.SS when the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE as described in Changing the value of EDECR.SS when not in Debug state on page H3-7063.

#### H3.2.4 Detailed Halting Step state machine behavior

The behavior of the Halting Step state machine is described in the following sections:

- Entry the active-not-pending state on page H3-7060.
- PE behavior in the active-not-pending state on page H3-7060.
- Entering the active-pending state on page H3-7061.
• PE behavior in the active-pending state on page H3-7062
• PE behavior in the inactive state when in Non-debug state on page H3-7062.
• PE behavior in Debug state on page H3-7062.

Entering the active-not-pending state

The PE enters the active-not-pending state:

• By exiting Debug state with EDECR.SS == 1.
• By an exception return from a state where halting is prohibited to a state where halting is allowed with EDECR.SS == 1 and EDESR.SS == 0.
• As described in Synchronization and the Halting Step state machine on page H3-7062.

PE behavior in the active-not-pending state

When the PE is in the active-not-pending state it does one of the following:

• It executes one instruction and does one of the following:
  — Completes it without generating a synchronous exception.
  — Generates a synchronous exception.
  — Generates a debug event that causes entry to Debug state.
• It takes an asynchronous exception without executing any instruction.
• It takes an asynchronous debug event into Debug state.

If no exception or debug event is generated

If no exception or debug event is generated the PE sets EDESR.SS to 1. This means that the Halting Step state machine advances to the active-pending state.

If an exception or debug event is generated

The PE sets EDESR.SS according to all of the following:

• The type of exception.
• The target Exception level of the exception.
• If the exception is taken to Secure state, whether halting is prohibited in Secure state.
  — This is determined by the result of ExternalSecureInvasiveDebugEnabled().

If an exception or debug event is generated, the PE sets EDESR.SS to 1 if one of the following applies:

• A synchronous exception is generated by the instruction and one of the following applies:
  — The exception is taken to EL1 or EL2.
  — The exception is taken to EL3, it is not an SMC exception, and ExternalSecureInvasiveDebugEnabled() == TRUE.
  — The exception is an SMC exception.
• An asynchronous exception is generated before executing an instruction and this is either:
  — Taken to EL1 or EL2.
  — Taken to EL3 and ExternalSecureInvasiveDebugEnabled() == TRUE.
• A PE reset occurs.

Otherwise EDESR.SS is unchanged. This happens when:

• No instruction is executed because either:
  — An asynchronous exception is taken to EL3 and ExternalSecureInvasiveDebugEnabled() == FALSE.
  — An asynchronous debug event causes entry to Debug state.
An instruction is executed and either:

- Generates a synchronous exception other than an SMC exception which is taken to EL3, and 
  `ExternalSecureInvasiveDebugEnabled()` == FALSE.
- Generates a synchronous debug event and causes entry to Debug state.

It is **UNPREDICTABLE** whether `EDESR.SS` is set to 1 or unchanged when an SError interrupt is taken to EL3 without executing the instruction, and `ExternalSecureInvasiveDebugEnabled()` == FALSE.

If halting is prohibited after taking the exception or debug event, then the Halting Step state machine advances to the inactive state. Otherwise the Halting Step state machine advances to the active-pending state.

**Note**

The underlying criteria for the value of `EDESR.SS` on an exception are:

- Whether halting is allowed at the target of the exception. If halting is allowed, the PE must step into the exception. If halting is prohibited, the PE must step over the exception.
- Whether the preferred return address of the exception is the instruction itself or the next instruction, if the PE steps over the exception.

Table H3-4 shows the behavior of the active-not-pending state. The letter X indicates that `ExternalSecureInvasiveDebugEnabled()` can be either TRUE or FALSE.

### Table H3-4 Summary of active-not-pending state behavior

</tbody>
</table>

**Entering the active-pending state**

The PE enters the active-pending state by one of the following:

- From the active-not-pending state by:
  - Executing an instruction without taking an exception.
  - Taking an exception so that the PE remains in a state where halting is allowed.
- An exception return from a state where halting is prohibited when `EDESR.SS` == 1.

**Note**

That is, an exception return from Secure state with `ExternalSecureInvasiveDebugEnabled()` == FALSE to Non-secure state with `ExternalInvasiveDebugEnabled()` == TRUE.

- A reset when the value of `EDECR.SS` == 1, regardless of the state the PE was in before the reset occurred.
PE behavior in the active-pending state

When the PE is in the active-pending state, it enters Debug state before executing an instruction. The entry into Debug state has higher priority than all other types of synchronous debug event and synchronous exception. However, the architecture does not define the prioritization of this Debug state entry with respect to any unmasked pending asynchronous exception. If an asynchronous exception is prioritized over the entry to Debug state, then EDESR.SS is unchanged.

For more information on the prioritization of debug events, see Debug state entry and debug event prioritization on page H2-7017.

PE behavior in the inactive state when in Non-debug state

EDESR.SS is not updated by the execution of an instruction or the taking of an exception when Halting Step is inactive. This means that EDESR.SS is not changed by an exception handled in a state where halting is prohibited.

On return to a state where halting is allowed, the Halting Step state machine is restored either to the active-pending state or the active-not-pending state, depending on the value of EDESR.SS. The return to a state where halting is allowed is normally by an exception return, which in some situations is a Context synchronization event.

See also Synchronization and the Halting Step state machine.

PE behavior in Debug state

Halting Step is inactive in Debug state because halting is prohibited, see Halting allowed and halting prohibited on page H2-7015.

Entry to Debug state does not change EDESR.SS.

EDESR.SS is cleared to 0 on exiting Debug state as the result of a restart request. If EDECR.SS == 1, Halting Step enters the active-not-pending state.

Note

This means that EDESR.SS is never cleared to 0 by the execution of an instruction in Debug state, or by taking an exception when in Debug state as described in PE behavior in the active-not-pending state on page H3-7060, because the Halting Step state machine is not in the active-not-pending state. EDESR.SS can be cleared by a write to EDESR, see the register description.

However, if the PE exits Debug state as the result of a PE reset and EDECR.SS == 1, then Halting Step immediately enters the active-pending state, as EDESR.SS is set to the value of EDECR.SS.

H3.2.5 Synchronization and the Halting Step state machine

The Halting Step state machine also changes state if:

- Halting becomes allowed or prohibited other than by exit from Debug state, an exception return, or taking an exception. This means that halting becomes allowed or prohibited because:
  - The security state changes without an exception return. See State and mode changes without explicit context synchronization events on page G2-5916.
  - The external authentication interface changes.
  - FEAT_DoubleLock is implemented and the status, DoubleLockStatus(), changes.
- A write to EDECR when the PE is in Non-debug state changes the value of EDECR.SS.
--- Note ---

Behavior is **CONSTRAINED UNPREDICTABLE** if the value of EDECR.SS is changed when the PE is in Non-debug state, see *Changing the value of EDECR.SS when not in Debug state.*

- A write to EDES when the PE is in Non-debug state clears EDES.SS to 0.

These operations are guaranteed to take effect only after a **Context synchronization event**. If the instruction being stepped generates a **Context synchronization event**, then the PE might use the old or new state.

The PE must perform the required behavior of the new state before or immediately following the next **Context synchronization event**, but it is not required to do so immediately. This means that the PE can perform the required behavior of the old state before the next **Context synchronization event**. This is illustrated in Example H3-1 and Example H3-2.

---

**Example H3-1 Synchronization requirements 1**

EDECR.SS is set to 1 in Debug state, requesting the active-not-pending state on exit from Debug state. On exit from Debug state the PE immediately takes an exception to Secure state. ExternalSecureInvasiveDebugEnabled() == FALSE, meaning that halting is prohibited in Secure state. The PE does not step any instructions but executes the software in Secure state as normal. EDES.SS remains set to 0. If ExternalSecureInvasiveDebugEnabled() subsequently becomes TRUE, meaning that halting is now allowed, the PE must perform the required behavior of the active-not-pending state before or immediately following the next **Context synchronization event**, but it is not required to do so immediately.

---

**Example H3-2 Synchronization requirements 2**

EDECR.SS is set to 1 in Debug state. On exit from Debug the PE executes an MSR instruction that sets OSDLR_EL1.DLK to 1 and DoubleLockStatus() becomes TRUE. This change requires a **Context synchronization event** to guarantee its effect, meaning it is **CONSTRAINED UNPREDICTABLE** whether:

- Halting is allowed:
  - The PE enters Debug state on the next instruction.
- Halting is prohibited:
  - The PE does not enter Debug state.

The value in EDES.SS depends on whether halting was allowed or prohibited when the write to OSDLR_EL1.DLK completed, and so it might be 0 or 1. If a second MSR instruction clears OSDLR_EL1.DLK to 0, the PE must perform the required behavior of the state indicated by EDES.SS before or immediately following the next **Context synchronization event**, but it is not required to do so immediately.

See also *Synchronization and Halting debug events on page H3-7075.*

---

**Changing the value of EDECR.SS when not in Debug state**

If software changes the value of EDECR.SS when the PE is not in Debug state then behavior is **CONSTRAINED UNPREDICTABLE**, and one or more of the following behaviors occurs:

- The value of EDECR.SS becomes UNKNOWN.
- The state of the Halting Step state machine becomes UNKNOWN.
- On a reset of the PE, the value of EDECR.SS and the state of the Halting Step state machine are UNKNOWN.
H3.2.6 Stepping T32 IT instructions

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and another 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

For the purpose of stepping an item, it is IMPLEMENTATIONDEFINED whether:

- The PE considers such a pair of instructions to be one instruction.
- The PE considers such a pair of instructions be two instructions.

It is IMPLEMENTATIONDEFINED whether this behavior depends on the value of the applicable ITD bit. For example:

- The debug logic might consider such a pair of instructions as one instruction, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as two instructions, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as one instruction when the value of the applicable ITD field is 1, and as two instructions when the value of the ITD field is 0.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

The ITD control fields are:

- HSCTLR.ITD
  Applies to execution at EL2 when EL2 is using AArch32.

- SCTLR.ITD
  Applies to execution at EL0 or EL1 when EL1 is using AArch32.

- SCTLR_EL1.ITD
  Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

H3.2.7 Disabling interrupts while stepping

When using Halting Step, the sequence of entering Debug state, interacting with the debugger, and then exiting Debug state for each instruction reduces the rate at which the PE executes instructions. However, the rate at which certain interrupts, such as timer interrupts, are generated might be fixed by the system. This means it might be necessary to disable interrupts while using Halting Step by setting EDSCR.INTdis, to allow the code being debugged to make forward progress.

H3.2.8 Syndrome information on Halting Step

Three EDSCR.STATUS encodings record different scenarios for entering Debug state on a Halting Step debug event:

- Halting Step, normal
  An instruction other than a Load-Exclusive instruction was stepped.

- Halting Step, exclusive
  A Load-Exclusive instruction was stepped.

- Halting Step, no syndrome
  The syndrome data is not available.

If the PE enters Debug state due to a Halting Step debug event immediately after stepping an instruction in the active-not-pending state, EDSCR.STATUS is set to either:

- Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
- Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.
If the stepped instruction was a conditional Load-Exclusive instruction that failed its Condition code check, `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, normal, or Halting Step, exclusive.

Otherwise the PE enters Debug state without stepping an instruction. This means that the Halting Step state machine enters the active-pending state directly from the inactive state, without going through active-not-pending state. In this case, `EDSCR.STATUS` is set to Halting Step, no syndrome. This happens when:

- The PE enters directly into the active-pending state on an exception return to Non-secure state from EL3 when Halting is prohibited in Secure state.
- The active-pending state is entered for other reasons. See Synchronization and the Halting Step state machine on page H3-7062

In addition, `EDSCR.STATUS` is CONSTRAINED UNPREDICTABLE when:

- The instruction being stepped generated a Halting Step debug event before the instruction was executed. In this case `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of:
  - Halting Step, no syndrome, or Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
  - Halting Step, no syndrome, or Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.
- The instruction that was stepped was an Exception Return instruction or an ISB. As these instructions are not in the Load-Exclusive instructions, `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.
- The PE enters directly into the active-pending state on reset because `EDECR.SS` is set to 1. `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.

In all cases, if `EDSCR.STATUS` is not set to Halting Step, no syndrome, then it must indicate whether the stepped instruction was a Load-Exclusive instruction by setting `EDSCR.STATUS` to Halting Step, normal or Halting Step, exclusive.

--- Note ---

In an implementation that always sets `EDSCR.STATUS` to Halting Step, no syndrome is not compliant.

### H3.2.9 Pseudocode description of Halting Step debug events

There are two pseudocode functions for Halting Step debug events:

- `RunHaltingStep()`. This is called after an instruction has executed and any exception generated by the instruction is taken. It is also called after taking a reset before executing any instructions. That is, reset is treated like an asynchronous exception, even if `EDECR.RCE` == 1 or `CTIDEVCTL.RCE` == 1. `RunHaltingStep()` affects the next instruction.
- `CheckHaltingStep()`. This is called before the next instruction is executed. If a step is pending, it generates the debug event.
H3.3 Halt Instruction debug event

A Halt Instruction debug event is generated when EDSCR.HDE == 1, halting is allowed, and the PE executes the Halt instruction, HLT.

The pseudocode for Halt Instruction debug events is described in HLT on page C6-929 for A64 and HLT on page F5-4411 for A32 and T32.

HLT never generates a debug exception. It is treated as UNDEFINED if EDSCR.HDE == 0, or if halting is prohibited.

Note

A debugger can replace a program instruction with a Halt instruction to generate a Halt Instruction debug event. Debuggers that use the HLT instruction must be aware of the Armv8-A rules for concurrent modification of executable code, CMODX. The rules for concurrent modification and execution of instructions do not allow one thread of execution or an external debugger to replace an instruction with an HLT instruction when these same instructions are being executed by a different thread of execution. See Concurrent modification and execution of instructions on page B2-120.

The T32 HLT instruction is unconditionally executed inside an IT block, even when it is treated as undefined. The A32 HLT instruction is CONSTRAINED UNPREDICTABLE if the Condition code field is not 0b1110, with the set of behaviors the same as for BKPT. See Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Note

The HLT instruction is part of the external debug solution for Armv8-A. As such, the presence of the HLT instruction is not indicated in the ID registers. In particular, the AArch32 System register ID_ISAR0. Debug does not indicate the presence of the HLT instruction.

H3.3.1 HLT instructions as the first instruction in a T32 IT block

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and certain other 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

The T32 HLT instruction cannot be combined with an IT instruction in this way. In an implementation that supports the ITD control, if the first instruction in an IT block is an HLT instruction, then the behavior of the instruction depends on the value of the applicable ITD field:

• If the value of the ITD field is 1, then the combination is treated as undefined and an Undefined Instruction exception is generated either by the IT instruction or by the HLT instruction.

• If the value of the ITD field is 0, then the HLT instruction unconditionally executed.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

To set an Halt Instruction debug event on the first instruction of an IT block, debuggers must replace the IT instruction with an HLT instruction to ensure consistent behavior.

The ITD control fields are:

HSCTLR.ITD
Applies to execution at EL2 when EL2 is using AArch32.

SCTLR.ITD
Applies to execution at EL0 or EL1 when EL1 is using AArch32.

SCTLR_EL1.ITD
Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

Note

An HLT instruction is always unconditional, even within an IT block.
H3.4 Exception Catch debug event

Exception Catch debug events:

- Are generated when the corresponding bit in the Exception Catch Control Register, EDECCR, is set to 1 on all entries to a given Exception level. This means:
  - Exceptions taken to the Exception level.
  - Exception returns to the Exception level.
  - It is IMPLEMENTATION DEFINED whether a reset into an Exception level generates an Exception Catch debug event.

- Are taken synchronously, after the exception or reset entry or the exception return has been processed by the PE.

- Ignore the Execution state of the target Exception level.

- Are ignored if halting is prohibited.

For exception returns, the final Exception level of the exception return determines whether an Exception Catch debug event is generated. On an illegal exception return, an Exception Catch debug event is generated only if EDECCR is programmed to generate an Exception Catch debug event for an exception return to the current Exception level.

The EDECCR contains two sets of fields to generate Exception Catch debug events:

- NSE, and when FEAT_Debugv8p2 is implemented, NSR for Non-secure state.
- SE, and when FEAT_Debugv8p2 is implemented, SR for Secure state.

Each field within each set contains one bit for each Exception level in that state. Bits corresponding to Exception levels that are not implemented, or that are not implemented in the Security state, are RES0.

Note

- EDECCR does not replace DBGVCR:
  - DBGVCR is retained in AArch32 state for backwards compatibility.
  - DBGVCR is ignored in AArch64 state and never generates entries to Debug state.
  - DBGVCR cannot be accessed by the external debug interface.

- EDECCR is only visible as OSECCR_EL1 by System register instructions in AArch64 state, and as DBGOSECCR by System register access instructions in AArch32 state, when the OS Lock is locked to allow software to save and restore it over a powerdown.

- Exception Catch debug events are not disabled when the OS Lock is locked.

When an Exception Catch debug event is generated after exception entry, the PE halts and enters Debug state:

- Before the first instruction at the handler is executed.

- After the exception entry has updated the program counter, PSTATE and syndrome registers for the exception. This means that on entering Debug state:
  - The current Exception level is the target Exception level of the exception.
  - The ELR, SPSR, ESR, and other syndrome registers contain information about the exception.
  - DLR contains the exception vector address or the reset address.

When an Exception Catch debug event is generated on exception return, the PE halts and enters Debug state:

- After the exception return has updated the program counter and PSTATE.

- Before the execution of the first instruction at the return address is completed.

The PE does not fetch instructions from the vector address before entering Debug state, if address translation is disabled in the translation regime at the target Exception level.
The following rules define the prioritization of Exception Catch debug events:

- It is IMPLEMENTATION DEFINED whether Exception Catch debug events are higher or lower priority than each of Software Step exceptions and Halting Step debug events.
- Exception Catch debug events are higher priority than all synchronous exceptions other than Software Step exceptions.
- Exception Catch debug events are lower priority than Reset Catch debug events.
- The prioritization of Exception Catch debug events against pending asynchronous exceptions depends on whether FEAT_Debugv8p2 is implemented and is described in Exception Catch debug events when FEAT_Debugv8p2 is implemented and Exception Catch debug events when FEAT_Debugv8p2 is not implemented on page H3-7069.

**Note**

As described in Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2349, an exception trapping form of a Vector Catch debug event might generate a second debug exception as part of the exception entry, before the Exception Catch debug event is taken. See Vector Catch exceptions on page D2-2465 or Vector Catch exceptions on page G2-5909.

### H3.4.1 Exception Catch debug events when FEAT_Debugv8p2 is implemented

When FEAT_Debugv8p2 is implemented, the fields NSR, SR, NSE, and SE in EDECCR control generation of Exception Catch debug events:

- On exception entry but not on exception return.
- On exception return but not on exception entry.
- On exception entry and exception return.

Exception entry, reset and exception return Exception Catch debug events are enabled as shown in Table H3-5.

<table>
<thead>
<tr>
<th>(N)SR&lt;\text{n}&gt;</th>
<th>(N)SE&lt;\text{n}&gt;</th>
<th>Behavior on exception return to EL\text{n}</th>
<th>Behavior on exception taken to EL\text{n}, and if resets are Exception Catch debug events, reset into EL\text{n}</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 0</td>
<td>0</td>
<td>No action.</td>
<td>No action.</td>
</tr>
<tr>
<td>0 1</td>
<td>0</td>
<td>Halt if allowed.</td>
<td>Halt if allowed.</td>
</tr>
<tr>
<td>1 0</td>
<td>0</td>
<td>Halt if allowed.</td>
<td>No action.</td>
</tr>
<tr>
<td>1 1</td>
<td>0</td>
<td>No action.</td>
<td>Halt if allowed.</td>
</tr>
</tbody>
</table>

When an Exception Catch debug event is generated on exception entry, the PE halts and enters Debug state before any asynchronous exception or debug event is taken at the first instruction in the exception handler.

**Note**

There is no prioritization between asynchronous exceptions, asynchronous debug events, and an Exception Catch debug event generated on an exception return.

See also Debug state entry and debug event prioritization on page H2-7017.
H3.4.2 Exception Catch debug events when FEAT_Debugv8p2 is not implemented

When FEAT_Debugv8p2 is not implemented, all Exception Catch debug events are enabled by a combination of the fields NSE and SE in EDECCR, as shown in Table H3-6.

Table H3-6 Summary of Exception Catch debug event control when FEAT_Debugv8p2 is not implemented

<table>
<thead>
<tr>
<th>(N)SE&lt;n&gt;</th>
<th>Behavior on exception taken to ELn, return to ELn, and if resets are Exception Catch debug events, reset into ELn</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No action.</td>
</tr>
<tr>
<td>1</td>
<td>Halt if allowed.</td>
</tr>
</tbody>
</table>

A second unmasked asynchronous exception can be taken before the PE enters Debug state. If this second exception does not generate an Exception Catch debug event, the exception handler executed at the higher Exception level later returns to the trapped Exception level, causing the Exception Catch debug event to be generated again.

When the PE is executing code at a given Exception level, and the corresponding EDECCR bit is 1, it is CONstrained UnPredictable whether an Exception Catch debug event is generated.

Note

It is possible to generate Exception Catch debug events:
- As a trap on all instruction fetches from the trapped Exception level as part of an instruction fetch.
- On entry to the Exception level, as described in Detailed Halting Step state machine behavior on page H3-7059.

This is similar to the implementation options allowed for Vector Catch debug events. The architecture does not require that the event is generated following an ISB operation executed at the Exception level.

Examples of this are:
- If the debugger writes to EDECCR so that the current Exception level is trapped.
- If the OS restore code writes to OSECCR so that the current Exception level is trapped.
- If the code executing in AArch32 state changes the Exception level or security state other than by an exception return, and the target Exception level is trapped. See State and mode changes without explicit context synchronization events on page G2-5916.

H3.4.3 Examples of Exception Catch debug events

If EDECCR == 0x0020, meaning that the Exception Catch debug event is enabled for Non-secure EL1, then the following exceptions generate Exception Catch debug events:
- An exception taken from Non-secure EL0 to Non-secure EL1.
- An exception return from EL2 to Non-secure EL1.
- An exception return from EL3 to Non-secure EL1.

For example, on taking a Data Abort exception from Non-secure EL0 to Non-secure EL1, using AArch64:
- ELR_EL1 and SPSR_EL1 are written with the preferred return address and PE state for a return to EL0.
- ESR_EL1 and FAR_EL1 are written with the syndrome information for the exception.
- DLR_EL0 is set to VBAR_EL1 + 0x400, the synchronous exception vector.
- DSPSR_EL0 is written with the PE state for an exit to EL1.

The following do not generate Exception Catch debug events:
- An exception taken from EL0 to EL2, in either Security state, or EL3.
- An exception return from EL2, in either Security state, to EL0.
- An exception taken from Secure EL0 to Secure EL1.
H3.4 Exception Catch debug event

- An exception return from EL3 to Secure EL1.

**H3.4.4 Pseudocode description of Exception Catch debug events**

The pseudocode function `CheckExceptionCatch()` is described in Chapter J1 Armv8 Pseudocode.
H3.5 External Debug Request debug event

External Debug Request debug events are asynchronous debug events.

An External Debug Request debug event is generated when signaled by the embedded cross-trigger. See Chapter H5 The Embedded Cross-Trigger Interface.

Note
Armv8-A requires the implementation of an embedded cross-trigger.

An implementation might also support IMPLEMENTATION DEFINED ways of generating an External Debug Request debug event.

H3.5.1 Synchronization and External Debug Request debug events

An External Debug Request debug event that is asserted before a Context synchronization event is taken and the PE enters Debug state before the first instruction following the Context synchronization event completes its execution, provided that halting is allowed after completion of the Context synchronization event.

An External Debug Request debug event that is being asserted when the PE comes out of reset is taken, and the PE enters Debug state before the first instruction after the reset completes its execution, provided that halting is allowed when the PE exits reset state.

If the first instruction after the Context synchronization event or after coming out of reset generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

Otherwise, when halting is allowed, External Debug Request debug events must be taken in finite time, without requiring the synchronization of any necessary change to the external authentication interface.

Note
These rules are based on the rules that apply when taking asynchronous exceptions. See Asynchronous exception types, routing, masking and priorities on page D1-2357.

If an unmasked External Debug Request debug event was pending but is changed to not pending before it is taken, then the architecture permits the External Debug Request debug event to be taken, but does not require this to happen. If the External Debug Request debug event is taken then it must be taken before the first Context synchronization event after the External Debug Request debug event was changed to not pending.

Example H3-3 shows an example of the synchronization requirements.

Example H3-3 Synchronization requirements

Secure software locks up in a tight loop, so it executes indefinitely without any synchronization operations. An External debug request must be able to break the PE out of that loop. This is a requirement even if DBGEN or SPIDEN or both are LOW on entry to the loop, meaning that halting is prohibited, and are only asserted HIGH later.

H3.5.2 Pseudocode description of External Debug Request debug events

The ExternalDebugRequest() function is described in Chapter J1 Armv8 Pseudocode.
H3.6   OS Unlock Catch debug event

An OS Unlock Catch debug event is generated when enabled and the state of the OS Lock changes from locked to unlocked. When FEAT_DoPD is implemented, CTIDEVCTL.OSUCE enables an OS Unlock Catch debug event, otherwise EDECR.OSUCE enables an OS Unlock Catch debug event.

When the OS Lock is unlocked, the PE sets EDESR.OSUC to 1 if the OS Unlock Catch debug event is enabled, and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. However, this is an indirect write to EDESR.OSUC, meaning the OS Unlock Catch debug event is not guaranteed to be taken before a subsequent Context synchronization event. If the PE enters Debug state or the OS Unlock Catch debug event is disabled before EDESR.OSUCE becomes set to 1, then EDESR.OSUC might not be set.

OS Unlock Catch debug events are not generated if the OS Lock is unlocked when the PE is in Debug state. See also Synchronization and Halting debug events on page H3-7075.

EDESR.OSUC is cleared to 0 on a Warm reset and on exiting Debug state.

H3.6.1   Using the OS Unlock Catch debug event

When the Core power domain is completely off or in a low-power state, a debugger is permitted to access a debug register that is implemented in the External debug power domain. However, if a debugger attempts to access a debug register that is implemented in the Core power domain when the Core power domain registers cannot be accessed, and that access returns an error, the debugger must retry the access.

Regularly powering down the Core power domain can result in unreliable debugger behavior.

The debugger can program a Reset Catch debug event to halt the PE when it has powered up, and can program the debug registers from Debug state. However, if the PE boot software restores the debug registers, as described in Debug OS Save and Restore sequences on page H6-7123, then newly written values are overwritten by the restore sequence.

The debugger can program an OS Unlock Catch debug event to halt the PE after the restore sequence has completed, and program the debug registers from Debug state.

H3.6.2   Pseudocode description of OS Unlock Catch debug event

The CheckOSUnlockCatch() function is called when the OS Lock is unlocked.

The CheckPendingOSUnlockCatch() function is called before an instruction is executed. If an OS Unlock Catch is pending, it generates the debug event.
H3.7 Reset Catch debug events

A Reset Catch debug event is generated when enabled, and the PE exits reset state. When the Reset Catch debug event is generated, it is recorded by setting EDESR.RC to 1. When FEAT_DoPD is implemented, CTIDEVCTL.RCE enables a Reset Catch debug event, otherwise EDECR.RCE enables a Reset Catch debug event.

If halting is allowed when the event is generated, the Reset Catch debug event is taken immediately and synchronously. On entering Debug state, DLR has the address of the reset vector. The PE must not fetch any instructions from memory.

Otherwise, the Reset Catch debug event is pended and taken when halting is allowed. See Synchronization and Halting debug events on page H3-7075 for more information.

This means that EDESR.RC is set to the value of EDECR.RCE or CTIDEVCTL.RCE on a Warm reset. EDESR.RC is cleared to 0 on exiting Debug state.

H3.7.1 Pseudocode description of Reset Catch debug event

The CheckResetCatch() function is called after reset before executing any instruction.

The CheckPendingResetCatch() function is called before an instruction is executed. If a Reset Catch is pending, it generates the Reset Catch debug event.
H3.8 Software Access debug event

When the value of EDSCR.TDA is 1, software access to the following AArch64 and AArch32 debug System registers generate a Software Access debug event:

- The Breakpoint Value Registers, DBGBVR.
- The Breakpoint Control Registers, DBGBCR.
- The Watchpoint Value Registers, DBGWVR.
- The Watchpoint Control Registers, DBGWCR.

However, EDSCR.TDA is ignored if any of the following applies:

- The value of OSLSR.OSLK == 1, meaning that the OS Lock is locked.
- Halting is prohibited. See Halting allowed and halting prohibited on page H2-7015.
- The register access generates an exception.

--- Note ---

- The only accesses to the specified registers that generate a Software Access debug event are:
  - Accesses to System registers in AArch64 state.
  - Accesses to System registers in the (coprec==0b1110) encoding space in AArch32 state.
- Accesses by a PE using the external debug interface never generate a Software Access debug event.

H3.8.1 Pseudocode description of Software Access debug event

The CheckSoftwareAccessToDebugRegisters() function is described in Chapter J1 Armv8 Pseudocode.
## H3.9 Synchronization and Halting debug events

The behavior of external debug depends on:

- Indirect reads of:
  - External debug registers.
  - System registers, including system debug registers.
  - Special-purpose registers.
- The state of the external authentication interface.

For some registers, all read and write accesses that update the register occur in program order, without any additional synchronization, but others require an explicit **Context synchronization event**. For more information on the synchronization of register updates, see:

- *Synchronization requirements for AArch64 System registers* on page D13-2863.
- *Synchronization of changes to the external debug registers* on page H8-7138.
- *State and mode changes without explicit context synchronization events* on page G2-5916.

Changes to the external authentication interface do not require explicit synchronization to affect External Debug Request debug events. See *Synchronization and External Debug Request debug events* on page H3-7071.

For changes that require explicit synchronization, it is CONSTRAINED UNPREDICTABLE whether instructions between the change and the **Context synchronization event** observe the old state or the new state.

This means that any change to these registers or the external authentication interface requires explicit synchronization by a **Context synchronization event** before the change takes effect. This ensures that for instructions appearing in program order after the change, the change affects the following:

- The generation and behavior of Breakpoint and Watchpoint debug events. See *Synchronization and debug exceptions* on page D2-2479 for exceptions taken from AArch64 state, or *Synchronization and debug exceptions* on page G2-5916 for exceptions taken from AArch32 state.
- The generation of all Halting debug events by instructions.
- Taking a pending Halting debug event or other asynchronous Debug event. See:
  - **Pending Halting debug events**.
  - *Synchronization and External Debug Request debug events* on page H3-7071.
- The behavior of the Halting Step state machine. See *Synchronization and the Halting Step state machine* on page H3-7062.

### H3.9.1 Pending Halting debug events

A Halting debug event might be pending:

1. If Halting Step of an instruction sets EDESR.SS is set to 1, and halting is prohibited following the step, then the Halting Step state machine is inactive but a Halting Step debug event is pending.
2. If a Reset Catch debug event sets EDESR.RC to 1, and halting is prohibited following reset, then a Reset Catch debug event is pending.
3. If an OS Unlock Catch debug event sets EDESR.OSUC to 1, then an OS Unlock Catch debug event is pending.

Pending Halting debug events are taken asynchronously when halting is allowed.

Pending Halting debug events are discarded by a Cold reset. The debugger can also force a pending event to be dropped by writing to EDESR.

Any Halting debug event that is observed as pending in the EDESR before a **Context synchronization event** is taken and the PE enters Debug state before the first instruction following the **Context synchronization event** completes its execution. This is only possible if halting is allowed after completion of the **Context synchronization event**.
If the first instruction after the *Context synchronization event* generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken, unless both:

- A Halting Step debug event is pending. $EDESR.SS == 1$.
- The *Context synchronization event* is an exception return from a state where halting is prohibited to a state where halting is allowed.

__________  **Note**  ____________

This applies to an exception return from Secure state with $\text{ExternalSecureInvasiveDebugEnabled()} \equiv \text{FALSE}$ to Non-secure state with $\text{ExternalInvasiveDebugEnabled()} \equiv \text{TRUE}$.

In this case the order in which the debug events are handled is specified to avoid a double-step. See *Entering the active-pending state* on page H3-7061.

If an asynchronous exception is also pending after the *Context synchronization event* then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

__________  **Note**  ____________

These rules are based on the rules that apply to taking asynchronous exceptions. See *Asynchronous exception types, routing, masking and priorities* on page D1-2357.
Chapter H4
The Debug Communication Channel and Instruction Transfer Register

This chapter describes communication between a debugger and the implemented debug logic, using the Debug Communications Channel (DCC) and the Instruction Transfer Register (ITR), and associated control flags. It contains the following sections:

• Introduction on page H4-7078.
• DCC and ITR registers on page H4-7079.
• DCC and ITR access modes on page H4-7082.
• Flow control of the DCC and ITR registers on page H4-7086.
• Synchronization of DCC and ITR accesses on page H4-7090.
• Interrupt-driven use of the DCC on page H4-7096.
• Pseudocode description of the operation of the DCC and ITR registers on page H4-7097.

---- Note -----
Where necessary, Table K15-1 on page K15-8160 disambiguates the general register references used in this chapter.
H4.1 Introduction

The Debug Communications Channel, DCC, is a channel for passing data between the PE and an external agent, such as a debugger. The DCC provides a communications channel between:

- An external debugger, described as the debug host.
- The debug implementation on the PE, described as the debug target.

The DCC can be used:

- As a 32-bit full-duplex channel.
- As a 64-bit half-duplex channel.

The DCC is an essential part of Debug state operation and can also be used in Non-debug state.

The Instruction Transfer Register, ITR, passes instructions to the PE to execute in Debug state.

The PE includes flow-control mechanisms for both the DCC and ITR.
H4.2 DCC and ITR registers

The DCC comprises data transfer registers, the DTRs, and associated flow-control flags. The data transfer registers are DTRRX and DTRTX.

The ITR comprises a single register, EDITR, and associated flow-control flags.

In AArch64 state, software can access the data transfer registers as:

- A receive and transmit pair for 32-bit full duplex operation:
  - The write-only DBGDTRTX_EL0 register to transmit data.
  - The read-only DBGDTRRX_EL0 register to receive data.
- A single 64-bit read/write register, DBGDTR_EL0, for 64-bit half-duplex operation.
- The read/write OSDTRTX_EL1 and OSDTRRX_EL1 registers for save and restore.

In AArch32 state, software can only access the data transfer registers as:

- A receive and transmit pair, for 32-bit full duplex operation:
  - The write-only DBGDTRTXint register to transmit data.
  - The read-only DBGDTRRXint register to receive data.
- The read/write DBGDTRTXext and DBGDTRRXext registers for save and restore.

The data transfer registers are also accessible by the external debug interface as a pair of 32-bit registers, DBGDTRRX_EL0 and DBGDTRTX_EL0. Both registers are read/write, allowing both 32-bit full-duplex and 64-bit half-duplex operation.

The DCC flow-control flags are EDSCR. {RXfull, TXfull, RXO, TXU}:

- The RXfull and TXfull ready flags are used for flow-control and are visible to software in the Debug system registers in DCCSR.
- The RX overrun flag, RXO, and the TX underrun flag, TXU, report flow-control errors.
- The flow-control flags are also accessible by software as simple read/write bits for saving and restoring over a powerdown when the OS Lock is locked in DSCR.
- The flow-control flags are accessible from the external debug interface in EDSCR.

Figure H4-1 on page H4-7080 shows the System register and external debug interface views of the EDSCR and DTR registers in both AArch64 state and AArch32 state. These figures do not include the save and restore views.
**H4.2 DCC and ITR registers**

**Figure H4-1** System register and external debug interface views of EDSCR and DTR registers, Normal access mode

EDITR and the ITR flow-control flags, EDSCR.ITE, ITO are accessible only by the external debug interface:

- The EDITR specifies an instruction to execute in Debug state.
- The ITR empty flag, ITE, is used for flow-control.
- The ITR overrun flag, ITO, reports flow-control errors.

**Figure H4-2** External debug interface views of EDSCR and EDITR registers, Normal access mode

The sticky overflow flag, EDSCR.ERR, is used by both the DCC and ITR to report flow-control errors.

To save and restore the DCC registers for an external debugger over powerdown, software uses:

- The MDSCR_EL1, OSDTRTX_EL1, and OSDTRRX_EL1 registers in AArch64 state.
• The DBGDSCRext, DBGDTRTXext, and DBGDTRRXext registers in AArch32 state.

**Note**
There is no save and restore mechanism for the ITR registers as the ITR is only used in Debug state.

![System register interface diagram](image)

**Figure H4-3 System register views of EDSCR and DTR registers for save and restore**
H4.3 **DCC and ITR access modes**

The DCC and ITR support two access modes:

<table>
<thead>
<tr>
<th>DCC and ITR access mode, links to description</th>
<th>Applies when:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal access mode</td>
<td>EDSCR.MA == 0 or the PE is in Non-debug state</td>
</tr>
<tr>
<td>Memory access mode on page H4-7083</td>
<td>EDSCR.MA == 1 and the PE is in Debug state</td>
</tr>
</tbody>
</table>

**H4.3.1 Normal access mode**

The Normal access mode allows use of the DCC as a communications channel between target and host. It also allows the use of the ITR for issuing instructions to the PE in Debug state.

In Normal access mode, if there is no overrun or underrun, the following occurs:

**For accesses by software:**

- Direct writes to DBGDTRTX update the value in DTRTX and indirectly write 1 to TXfull.
- Direct reads from DBGDTRRX return the value in DTRRX and indirectly write 0 to RXfull.
- In AArch64 state, direct writes to DBGDTR_EL0 update both DTRTX and DTRRX, indirectly write 1 to TXfull, and do not change RXfull:
  - DTRTX is set from bits[31:0] of the transfer register.
  - DTRRX is set from bits[63:32] of the transfer register.
- In AArch64 state, direct reads from DBGDTR_EL0 return the concatenation of DTRRX and DTRTX, indirectly write 0 to RXfull, and do not change TXfull:
  - Bits[31:0] of the transfer register are set from DTRRX.
  - Bits[63:32] of the transfer register are set from DTRTX.

_________
**Note**

For DBGDTR_EL0, the word order is reversed for reads with respect to writes.

Software reads TXfull and RXfull using DCCSR.

**For accesses by the external debug interface:**

- Writes to EDITR trigger the instruction to be executed if the PE is in Debug state:
  - If the PE is in AArch64 state, this is an A64 instruction.
  - If the PE is in AArch32 state, this is a T32 instruction. The T32 instruction is a pair of halfwords where the first halfword is taken from the lower 16-bits, and the second halfword is taken from the upper 16-bits.
- Reads of DBGDTRTX_EL0 return the value in DTRTX and indirectly write 0 to TXfull.
- Writes to DBGDTRTX_EL0 update the value in DTRTX and do not change TXfull.
- Reads of DBGDTRRX_EL0 return the value in DTRRX and do not change RXfull.
- Writes to DBGDTRRX_EL0 update the value in DTRRX and indirectly write 1 to RXfull.

TXfull and RXfull are visible to the external debug interface in EDSCR.

The PE detects overrun and underrun by the external debug interface, and records errors in EDSCR. [TXU, RXO, ITO, ERR]. See *Flow control of the DCC and ITR registers* on page H4-7086.

See also *Synchronization of DCC and ITR accesses* on page H4-7090.
H4.3.2 Memory access mode

When the PE is in Debug state, Memory access mode can be selected to accelerate word-aligned block reads or writes of memory by an external debugger. Memory access mode can only be enabled in Debug state, and no instructions can be issued directly by the debugger when in Memory access mode.

If there is no overrun or underrun when in Memory access mode, an access by the external debug interface results in the following:

- External reads from DBGDTRTX_EL0 cause:
  1. The existing value in DTRTX to be returned. This clears EDSCR.TXfull to 0.
  2. The equivalent of LDR W1,[X0],#4, if in AArch64 state, or LDR R1,[R0],#4, if in AArch32 state, to be executed.
  3. The equivalent of the MSR DBGDTRX_EL0,X1 instruction, if in AArch64 state, or the MCR p14,0,R1,c0,c5,0 instruction, if in AArch32 state, to be executed.
  4. EDSCR.{TXfull, ITE} to be set to {1,1}, and X1 or R1 to be set to an UNKNOWN value.

- External writes to DBGDTRRX_EL0 cause:
  1. The value in DTRRX to be updated. This sets EDSCR.RXfull to 1.
  2. The equivalent of the instruction MRS X1,DBGDTRRX_EL0, if in AArch64 state, or MRC p14,0,R1,c0,c5,0 if in AArch32 state, to be executed.
  3. The equivalent of the instruction STR W1,[X0],#4, if in AArch64 state, or STR R1,[R0],#4, if in AArch32 state, to be executed.
  4. EDSCR.{RXfull, ITE} to be set to {0,1}, and X1 or R1 to be set to an UNKNOWN value.

- External reads from DBGDTRTX_EL0 return the last value written to DTRRX.
- External writes to EDITR generate an overrun error.

During these accesses, EDSCR.{TXfull, RXfull, ITE} are used for flow control.

Note

An overrun or underrun might result in EDSCR.ERR being set to 1 asynchronously to the sequence of operations that are outlined in this section. As this is timing-dependent, it is UNPREDICTABLE when the EDSCR.ERR flag affects the instructions and therefore whether neither instruction, only the first instruction, or both instructions are executed. If the second instruction is executed, then the first instruction must have been executed. However, in each case X1 or R1 is set to an UNKNOWN value. This means that:

- In both cases, if the memory access instruction is not executed, then the base register X0 or R0 is not updated, meaning the debugger can determine the last accessed location.
- In the list describing External reads from DBGDTRTX_EL0, DTRTX and EDSCR.TXfull get set to UNKNOWN values. If the load was executed, then the value that was read by the PE is lost. This means the operation might need to be repeated by the debugger, and it is not advisable to use Memory access mode to read from read-sensitive locations using the underrun and overrun detection for flow control.
- In the list describing External writes to DBGDTRRX_EL0, EDSCR.RXfull is set to an UNKNOWN value.

A Data Abort from the memory access can also set EDSCR.ERR to 1. See Data Aborts in Memory access mode on page H4-7084.

The architecture does not require precisely when these flags are set or cleared by the sequence of operations outlined in this section. For example, in the case of an external write to DBGDTRRX_EL0, in AArch64 state, RXfull might be cleared after step 2, or it might not be cleared until after step 3, as an implementation is free to fuse these steps into a single operation. The architecture does require that the flags are set as at step 4 when the PE is ready to accept a further read or write without causing an overrun error or an underrun error.

The process outlined in this section represents a simple sequential execution model of Memory access mode. An implementation is free to pipeline, buffer, and re-order instructions and transactions, as long as the following remain true:

- Data items are transferred into and out of the DTR in order and without loss of data, other than as a result of an overrun or an underrun.
• Data Aborts occur in order.
• The constraints of the memory type are met.

• In the list describing External reads from DBGDTRTX_EL0 on page H4-7083:
  — The MSR equivalent operation at step 3 of the sequence reads the value loaded by step 2.
  — If the list is performed in a loop, for all but the first iteration of this list, the value read by step 1 returns the values written by the MSR equivalent operation at the previous iteration of step 3.

• In the list describing External writes to DBGDTRRX_EL0 on page H4-7083:
  — The MRS equivalent operation at step 2 of the sequence returns the value written at step 1.
  — The STR equivalent at step 3 of the sequence writes the value read at step 2.

• If the PE cannot accept a read or write, as applicable, during the sequence, then the flags are updated to indicate an overrun or underrun.

See Flow control of the DCC and ITR registers on page H4-7086 for more information on overrun and underrun.

Ordering, access sizes and effect on Exclusives monitors

For the purposes of memory ordering, access sizes, and effect on the Exclusives monitor, accesses in Memory access mode are consistent with Load/Store word instructions executed by the PE.

The simple sequential access model of Memory-access mode, as stated in Memory access mode on page H4-7083, must also be ordered with respect to instructions executed as a result of explicit writes to EDITR in Normal mode both before and after accesses to the DTR registers in Memory-access mode.

Data Aborts in Memory access mode

If a memory access generates a Data Abort, then:

• The Data Abort exception is taken. See Exceptions in Debug state on page H2-7045:
  — This means EDSCR.ERR is set to 1, see Cumulative error flag on page H4-7088.
  — If the Data Abort occurs on stage 2 of an address translation, then the values returned in the ISV field and in bits[23:14] of the ISS are UNKNOWN.
    If this Data Abort is taken to EL2 using AArch64, the ISS is returned by ESR_EL2. ISS encoding for an exception from a Data Abort on page D13-2987 describes the usual encoding of this ISS.
    If EL2 is using AArch32 and this Data Abort is taken to Hyp mode, the ISS is returned by HSR. ISS encoding for exception from a Data Abort on page G8-6342 describes the usual encoding of this ISS.

  • Register R0 retains the address that generated the abort.
  • Register R1 is set to an UNKNOWN value.
  • EDSCR.TXfull, for a load, or EDSCR.RXfull, for a store, is set to an UNKNOWN value.
  • DTRTX, for a load, or DTRRX, for a store, is set to an UNKNOWN value.
  • EDSCR.ITE is set to 1.

Illegal Execution state exception

If PSTATE.IL is set to 1 when EDSCR.MA == 1, then on an external write access to DBGDTRRX_EL0 or an external read from DBGDTRTX_EL0, it is CONSTRAINED UNPREDICTABLE whether the PE:

• Takes an Illegal Execution state exception without performing any operations. In this case:
  — EDSCR.ERR is set to 1, see Cumulative error flag on page H4-7088.
  — Register R0 is unchanged.
  — Register R1 is set to an UNKNOWN value.
  — EDSCR.TXfull or EDSCR.RXfull, as applicable, is set to an UNKNOWN value.
— DTRTX or DTRRX, as applicable, is set an unknown value.
— EDSCR.ITE is set to 1.

See also Exceptions in Debug state on page H2-7045.

• Ignores PSTATE.IL.

Note

The typical usage model for Memory access mode involves executing instructions in Normal access mode to set up X0 before setting EDSCR.MA to 1. These instructions generate an Illegal state exception if PSTATE.IL is set to 1.

Alignment constraints

If the address in R0 is not aligned to a multiple of four, the behavior is as follows:

• For each external DTR access a constrained unpredictable choice of:
  1. The PE makes an unaligned memory access to R0. If alignment checking is enabled for the memory access, this generates an Alignment fault.
  2. The PE makes a memory access to Align(X[0], 4) in AArch64 state, or Align(R[0], 4) in AArch32 state.
  3. The PE generates an Alignment fault, regardless of whether alignment checking is enabled.
  4. The PE does nothing.

• Following each memory access, if there is no Data Abort, R0 is updated with an unknown value.

• For external writes to DBGDTRRX_EL0, if the PE writes to memory, an unknown value is written.

• For external reads of DBGDTRTX_EL0 an unknown value is returned.

• The RXfull and TXfull flags are left in an unknown state, meaning that a DBGDTRTX_EL0 read can trigger a TX underrun, and a DBGDTRTX_EL0 write can trigger an RX overrun.

H4.3.3 Memory-mapped accesses to the DCC and ITR

 Writes to the flags in EDSCR by external debug interface accesses to the DCC and the ITR registers are indirect writes, because they are a side-effect of the access. The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see Register access permissions for memory-mapped accesses on page H8-7142.
H4.4 Flow control of the DCC and ITR registers

- Ready flags.
- Buffering writes to EDITR.
- Overrun and underrun flags.
- Cumulative error flag on page H4-7088.

H4.4.1 Ready flags

In Normal access mode:

- For the DTR registers there are two ready flags:
  - EDSCR.RXfull == 1 indicates that DBGDTRRX_EL0 contains a valid value that has been written by the external debugger and not yet read by software running on the target.
  - EDSCR.TXfull == 1 indicates that DBGDTRTX_EL0 contains a valid value that has been written by software running on the target and not yet read by an external debugger.

- For the ITR register there is a single ready flag:
  - EDSCR.ITE == 1 indicates that the PE is ready to accept an instruction to the ITR.

**Note**
The architecture permits a PE to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, as long as those instructions are discarded if EDSCR.ERR is set, either by an underrun or overrun or by any of the other error conditions described in this architecture, such as an instruction generating an abort.

In Memory access mode:

- EDSCR.{RXfull, ITE} == {0,1} indicates that DBGDTRRX_EL0 is empty and the PE is ready to accept a word external write to DBGDTRRX_EL0.
- EDSCR.{TXfull, ITE} == {1,1} indicates that DBGDTRTX_EL0 is full and the PE is ready to accept a word external read from DBGDTRTX_EL0.

All other values indicate that the PE is not ready, and result in a DTR overrun or underrun error, an ITR overrun error, or both, as defined in Overrun and underrun flags.

EDSCR.{ITE, RXfull, TXfull} shows the status of the ITR and DCC registers. It ignores the question of whether a read or write cannot be accepted because, for example, EDSCR.ERR is set or the OPTIONAL Software Lock is locked for memory-mapped accesses (EDLSR.SLK == 1).

H4.4.2 Buffering writes to EDITR

The architecture permits a processor to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, provided that:

- Those instructions are discarded if EDSCR.ERR is set to 1, either by an underrun or an overrun, or by any other error conditions described in this architecture, such as an instruction generating an abort.
- The PE maintains the simple sequential execution model with the order of instructions determined by the order in which the PE accepts the EDITR writes. In particular, the buffered instructions must be executed in the Execution state consistent with a simple sequential execution of the instructions, even if one of the previous instructions is a state changing operation, such as DCPS or DRPS.

H4.4.3 Overrun and underrun flags

Each of the ready flags has a corresponding overrun or a corresponding underrun flag. These are sticky status flags that are set if the register is accessed using the external debug interface when the corresponding ready flag is not in the ready state.
If the PE is in Debug state and Memory access mode, the corresponding error flag is also set if the PE is not ready to accept an operation because a previous load or store is still in progress. The sticky status flag remains set until cleared by writing 1 to EDRCR.CSE.

Note
The architecture permits a PE to continue to accept and buffer data to write to memory in Memory access mode.

Table H4-1 shows DCC and ITR ready flags and the overrun and underrun flags associated with them.

### Table H4-1 DCC and ITR ready flags and the associated overrun/underrun flags

<table>
<thead>
<tr>
<th>External debug interface access</th>
<th>Overrun/Underrun condition</th>
<th>EDCR flag</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write DBGDTRRX_EL0</td>
<td>EDSCR.RXfull == '1'</td>
<td></td>
</tr>
<tr>
<td>Read DBGDTRTX_EL0</td>
<td>EDSCR.TXfull == '0'</td>
<td></td>
</tr>
<tr>
<td>Write EDITR</td>
<td>Halted() &amp;&amp; (EDSCR.ITE == '0'</td>
<td></td>
</tr>
</tbody>
</table>

When an overrun or underrun flag is set to 1, the cumulative error flag, EDCR.ERR, described in [Cumulative error flag](#) on page H4-7088, is also set to 1.

In the event of an external write to DBGDTRRX_EL0 or EDITR generating an overrun, or an external read from DBGDTRTX_EL0 generating an underrun:

- For a write, the written value is ignored.
- For a read, an UNKNOWN value is returned.

EDSCR.TXfull, EDSCR.RXfull or EDSCR.ITE, as applicable, are not updated.

There is no overrun or underrun detection on external reads of DBGDTRRX_EL0 or external writes of DBGDTRTX_EL0.

There is no overrun or underrun detection of direct reads and direct writes of the DTR System registers by software:

- If RXfull == 0, a direct read of DBGDTRRX or DBGDTR_EL0 returns UNKNOWN.
- If TXfull == 1, a direct write of:
  - DBGDTRTX sets DTRTX to UNKNOWN.
  - DBGDTR_EL0 sets DTRRX and DTRTX to UNKNOWN.

See [DCC accesses in Non-debug state](#) for more information.

### Accessing 64-bit data

In AArch64 state, a software access to the DBGDTR_EL0 register and an external debugger access to both DBGDTRRX_EL0 and DBGDTRTX_EL0 can perform a 64-bit half-duplex operation.

However, there is only overrun and underrun detection on one of the external debug registers. That is:

- If software directly writes a 64-bit value to DBGDTR_EL0, only TXfull is set to 1, meaning:
  - A subsequent external write to DBGDTRRX_EL0 would not be detected as an overrun.
  - If the external debugger reads DBGDTRTX_EL0 first, software might observe MDCCSR_EL0.TXfull == 0 and send a second value before the external debugger reads DBGDTRRX_EL0, leading to an undetected overrun.
- On external writes to both DBGDTRRX_EL0 and DBGDTRTX_EL0 only RXfull is set to 1, meaning:
  - A subsequent direct write of DBGDTRTX_EL0 would not be detected as an overrun.
If the external debugger writes to DBGDTRRX_EL0 first, software might observe MDCCSR_EL0.RXfull == 1 and read a full 64-bit value, before the external debugger writes to DBGDTRTX_EL0, leading to an undetected underrun.

To avoid this, debuggers need to be aware of the data size used by software for transfers and ensure that 64-bit data is read or written in the correct order. If the PE is in Non-debug state, this order is as follows:

- The external debugger must check EDSCR.{RXfull, TXfull} before each transfer.
- To receive a 64-bit value from the target, the external debugger must read DBGDTRRX_EL0 before reading DBGDTRTX_EL0.
- To send a 64-bit value to the target, the external debugger must write to DBGDTRTX_EL0 before writing DBGDTRRX_EL0.

Because three accesses are required to transfer 64 bits of data, 64-bit transfers are not recommended for regular communication between host and target. The use of underrun and overrun detection means that only one access is required for 32 bits of data when using 32-bit transfers.

In Debug state, the debugger controls the instructions executed by the PE, so these limitations do not apply. 64-bit transfers provide a means to transfer a 64-bit general register between the host and the target in Debug state.

### H4.4.4 Cumulative error flag

The cumulative error flag, EDSCR.ERR, is set to 1:

- On taking an exception from Debug state.
- On any signalled overrun or underrun in the DCC or ITR.

When EDSCR.ERR == 1:

- External reads of DBGDTRTX_EL0 do not have any side-effects.
- External writes to DBGDTRRX_EL0 are ignored.
- External writes to EDITR are ignored.
- No further instructions can be issued in Debug state. This includes any instructions previously accepted as external writes to EDITR that occur in program order after the instruction or access that caused the error.

This allows a debugger to stream data, or, in Debug state, instructions, to the target without having to:

- Check EDSCR.{RXfull, TXfull, ITE} before each access.
- Check EDSCR.{ITO, RXO, TXU} following each access, for overrun or underrun.
- Check PSTATE or other syndrome registers, or both, for an exception following each instruction executed in Debug state that might generate a synchronous exception.

The cumulative error flag remains set until cleared to 0 by writing 1 to EDRCR.CSE. However, the effect of writing 1 to EDRCR.CSE to clear EDSCR.ERR is CONSTRAINED UNPREDICTABLE when both of the following apply:

- The PE is in Debug state.
- The value of EDSCR.ITE is 0.

When these conditions apply and a value of 1 is written to EDRCR.CSE, either or both of the following might occur:

- EDSCR.ERR is not cleared to 0.
- Any instructions in EDITR that have not been executed might be executed subsequently, rather than being ignored.

#### Note

This means that a debugger must poll EDSCR.ITE until it has the value 1, indicating that EDITR is empty, before writing to EDRCR.CSE to clear the EDSCR.ERR flag to 0.

For overruns and underruns, EDSCR.{ITO, RXO, TXU} record the error type.
Pseudocode description of clearing the error flag

The `ClearStickyErrors()` pseudocode function is described in Chapter J1 *Armv8 Pseudocode*. 
H4.5 Synchronization of DCC and ITR accesses

In addition to the standard synchronization requirements for register accesses, the following subsections describe additional requirements that apply for the DCC and ITR registers:

• Summary of System register accesses to the DCC.
• DCC accesses in Non-debug state on page H4-7091.
• Synchronization of DCC interrupt request signals on page H4-7094.
• DCC and ITR access in Debug state on page H4-7094.

In these sections, accesses by the external debug interface are referred to as external reads and external writes. Accesses to System registers are referred to as direct reads, direct writes, indirect reads, and indirect writes.

Note

In Synchronization requirements for AArch64 System registers on page D13-2863 external reads and external writes are described as forms of indirect access. This whole section uses more explicit terminology.

The DTR registers and the DCC flags, TXfull and RXfull, form a communication channel, with one end operating asynchronously to the other. Implementations must respect the ordering of accesses to these registers in order to maintain the correct behavior of the channel.

External reads of, and external writes to DBGDTRRX_EL0 and DBGDTRTX_EL0 are asynchronous to direct reads of, and direct writes to, DBGDTRRX, DBGDTRTX, and in AArch64 state DBGDTR_EL0, made by software using System register access instructions. The direct reads and direct writes indirectly write to the DCC flags. The external reads and external writes indirectly read the DCC flags to check for underrun and overrun.

Throughout this section:

DCC flags Means any or all of the following:
  • The EDSCR.RXfull.TXfull ready flags.
  • The EDSCR.RXO overrun flag.
  • The EDSCR.TXU underrun flag.
  • The EDSCR.ERR cumulative error flag.

ITR flags Means any or all of the following:
  • The EDSCR.ITE ready flag.
  • The EDSCR.ITO overrun flag.
  • The EDSCR.ERR cumulative error flag.

H4.5.1 Summary of System register accesses to the DCC

System register accesses to the DTR registers are direct reads and writes of those registers, as shown in Table H4-2 on page H4-7091. Several of these instructions access the same registers using different encodings.

DBGDTRRX_EL0 and DBGDTRTX_EL0 are encoded as MRS and MSR accesses respectively to the same System register, even though they access different underlying register values. DBGDTRRX and DBGDTRTX are similarly encoded as MRC and MCR accesses respectively to the same System register. The encoding means that direct reads and writes using these encodings must be ordered with respect to each other. For more information, see Synchronization requirements for AArch64 System registers on page D13-2863 and Synchronization of changes to AArch32 System registers on page G8-6138.
Table H4-2 shows a summary of System register accesses to the DCC.

H4.5.2 DCC accesses in Non-debug state

In Non-debug state DCC accesses are as described in Normal access mode on page H4-7082:

- If a direct read of DCCSR returns RXfull == 1, then a following direct read of DBGDTRRX, or in AArch64 state of DBGDTR_EL0, returns valid data and indirectly writes 0 to DCCSR.RXfull as a side-effect.
- If a direct read of DCCSR returns TXfull == 0, then a following direct write to DBGDTRTX, or in AArch64 state to DBGDTR_EL0, writes the intended value, and indirectly writes 1 to DCCSR.TXfull as a side-effect.

No Context synchronization event is required between these two instructions. Overrun and underrun detection prevents intervening external reads and external writes affecting the outcome of the second instruction.

The indirect write to the DCC flags as part of the DTR access instruction is made atomically with the DTR access.

Because a direct read of DBGDTRRX is an indirect write to DCCSR.RXfull, it must occur in program order with respect to the direct read of DCCSR, meaning it must not return a speculative value for DTRRX that predates the RXfull flag returned by the read of DCCSR. The direct write to DBGDTRTX must not be executed speculatively.

Direct reads of DBGDTRRX, or in AArch64 state DBGDTR_EL0, and DCCSR, must occur in program order with respect to other direct reads of the same register using the same encoding.

The following accesses have an implied order within the atomic access:

- In the simple sequential execution of the program the indirect write of the DCC flags occurs immediately after the direct DTR access.

Note

For an access to DBGDTR_EL0, this means the indirect write happens after both DBGDTRRX_EL0 and DBGDTRTX_EL0 have been accessed.
• In the simple sequential execution model, for an external read of DBGDTRTX_EL0 or an external write of DBGDTRRX_EL0:
  — The check of the DCC flags for overrun or underrun occurs immediately before the access.
  — If there is no underrun or overrun, the update of the DCC flags occurs immediately after the access.
  — If there is underrun or overrun, the update of the DCC underrun or overrun flags occurs immediately after the access.

All observers must observe the same order for accesses.

Note

These requirements do not create order where order does not otherwise exist. It applies only for ordered accesses.

Without explicit synchronization following external writes and external reads:

• The value written by the external write to DBGDTRRX_EL0 that does not overrun, must be observable to direct reads of DBGDTRRX and DBGDTR_EL0 in finite time.

• The DCC flags that are updated as a side-effect of the external write or external read must be observable:
  — To subsequent external reads of EDSCR.
  — To subsequent external reads of DBGDTRRX_EL0 when checking for underrun.
  — To subsequent external writes to DBGDTRTX_EL0 when checking for overrun.
  — To direct reads of DCCSR in finite time.

However, explicit synchronization is required to guarantee that a direct read of DCCSR returns up-to-date DCC flags. This means that if a signal is received from another agent that indicates that DCCSR must be read, an ISB is required to ensure that the direct read of DCCSR occurs after the signal has been received. This also synchronizes the value in DBGDTRRX, if applicable. However, if that signal is an interrupt exception triggered by COMMIRQ, COMMTX, or COMMRX, the exception entry is sufficient synchronization. See Synchronization of DCC interrupt request signals on page H4-7094.

Explicit synchronization is required following a direct read or direct write:

• To ensure that a value directly written to DBGDTRTX is observable to external reads of DBGDTRTX_EL0.

• To ensure that a value directly written to DBGDTR_EL0 is observable to external reads of DBGDTRTX_EL0 and DBGDTRRX_EL0.

• To guarantee that the indirect writes to the DCC flags that were a side-effect of the direct read or direct write have occurred, and therefore that the updated values are:
  — Observable to external reads of EDSCR.
  — Observable to external reads of DBGDTRRX_EL0 when checking for underrun.
  — Observable to external writes of DBGDTRTX_EL0 when checking for overrun.
  — Returned by a following direct read of DCCSR.

See also Memory-mapped accesses to the DCC and ITR on page H4-7085 and Synchronization of changes to the external debug registers on page H8-7138.

Note

These ordering rules mean that software:

• Must not read DBGDTRRX without first checking DCCSR.RXfull or if the previously-read value of DCCSR.RXfull is 0.
  It is not sufficient to read both registers and then later decide whether to discard the read value, as there might be an intervening write from the external debug interface.

• Must not write DBGDTRTX without first checking DCCSR.TXfull or if the previously-read value of DCCSR.TXfull is 1.
  The write to DBGDTRTX overwrites the value in DTRTX, and the external debugger might or might not have read this value.
Must ensure there is an explicit *Context synchronization event* following a DTR access, even if not immediately returning to read DCCSR again. This synchronization operation can be an exception return.

**Derived requirements**

The rules for DCC accesses in Non-debug state are as follows:

- **Following a direct read of DBGDTRRX when RXfull is 1:**
  - If an external write to DBGDTRRX checks the RXfull flag for overrun and observes that the value of RXfull is 0, the value returned by the previous direct read must not be affected by the external write.
  - If an external read of ESCR returns a RXfull value of 0, then the value returned by the previous direct read must not be affected by a following external write to DBGDTRRX, and the following external write does not overrun.

- **Following a direct read of DBGDTR_EL0, when RXfull is 1:**
  - If an external write to DBGDTRRX checks the RXfull flag for overrun and observes that the value of RXfull is 0, the value returned by the previous direct read must not be affected by the external write and by a following direct write to DBGDTRTX.
  - If an external read of ESCR returns a RXfull value of 0, then the value returned by the previous direct read must not be affected by subsequent external writes to DBGDTRRX and DBGDTRTX in any order, and the following external write of DBGDTRRX will not overrun.

- **Following a direct write to DBGDTRTX, when TXfull is 0:**
  - If an external read of DBGDTRTX checks the TXfull flag for underrun and observes that the value of TXfull is 1, the value returned by the external read must be the value written by the previous direct write.
  - If an external read of ESCR returns a TXfull value of 1, then the value returned by a following external read of DBGDTRRX must be the value written by the previous direct read, and the subsequent external read will not underrun.

- **Following a direct write to DBGDTR_EL0, when TXfull is 0:**
  - If an external read of DBGDTRTX checks the TXfull flag for underrun and observes that the value of TXfull is 1, the values returned by the external read and by a subsequent external read of DBGDTRRX must be the value written by the previous direct write.
  - If an external read of ESCR returns a TXfull value of 1, then the value returned by subsequent external reads of DBGDTRRX and DBGDTRTX, in any order, must be the value written by the previous direct read, and the subsequent external read of DBGDTRTX does not underrun.

- **Following an external read of DBGDTRTX that does not underrun, if a direct read of DCCSR returns a TXfull value of 0,** then the value returned by the external read must not be affected by a following direct write to DBGDTRTX.

- **Following a first external read DBGDTRRX and a following second external read of DBGDTRTX that does not underrun,** if a direct read of DCCSR returns a TXfull value of 0, then the values returned by the external reads must not be affected by a following direct write to DBGDTR_EL0.

- **Following an external write to DBGDTRRX that does not overrun,** if a direct read of DCCSR returns an RXfull value of 1, then the value returned by a following direct read of DBGDTRRX or DBGDTR_EL0 must be the value written by the previous external write.

- **Following a first external write to DBGDTRTX and a following second external write to DBGDTRRX that does not overrun,** if a direct read of DCCSR returns an RXfull value of 1, then the value returned by a subsequent direct read of DBGDTR_EL0 must return the values written by the previous external writes.
H4.5 Synchronization of DCC and ITR accesses

H4.5.3 Synchronization of DCC interrupt request signals

Following an external read or external write access to the DTR registers, the interrupt request signals, COMMIRQ, COMMTX, and COMMRX, must be updated in finite time without explicit synchronization.

The updated values must be observable to a direct read of DCCSR or DBGDTRRX, or a direct write of DBGDTRTx executed after taking an interrupt exception generated by the interrupt request. The updated values must also be observable to a direct write of DBGDTRTx executed after taking an interrupt exception generated by the interrupt request.

Note

The requirement that indirect writes to registers are observable to direct reads in finite time does not imply that all observers will observe the indirect write at the same time. For more information, see Synchronization requirements for AArch64 System registers on page D13-2863 and Synchronization of changes to AArch32 System registers on page G8-6138.

Following a direct read of DBGDTRRX or a direct write to DBGDTRRX, software must execute a Context synchronization event to guarantee the interrupt request signals have been updated in finite time. This synchronization operation can be an exception return.

H4.5.4 DCC and ITR access in Debug state

In Debug state, stricter observability rules apply for instructions issued through the ITR, to maintain communication between a debugger and the PE, without requiring excessive explicit synchronization.

In Normal access mode, without explicit synchronization:

- A direct read or direct write of the DTR registers by an instruction written to EDITR must be observable to an external write or an external read in finite time:
  - A direct read of DBGDTRRX must be observable to an external write of DBGDTRRX_EL0.
  - A direct read of DBGDTR_EL0 must be observable to an external write of DBGDTRRX_EL0 and DBGDTRTX_EL0.
  - A direct write of DBGDTRTX must be observable to an external read of DBGDTRRX_EL0.
  - A direct write of DBGDTR_EL0 must be observable to an external read of DBGDTRRX_EL0 and DBGDTRTX_EL0.

This includes the indirect write to the DCC flags that occurs atomically with the access as described in DCC accesses in Non-debug state on page H4-7091.

The subsequent external write or external read must observe either the old or the new values of both the DTR contents and DCC flags. If the old values are observed, this typically results in overrun or underrun, assuming the old values of the DCC flags indicate an overrun or underrun condition, as would normally be the case.

This means the debugger can observe the direct read or direct write without explicit synchronization and without explicitly testing the DCC flags in EDSCR, because it can rely on overrun and underrun tests.

- External reads of DBGDTRTX_EL0 that do not underrun and external writes to DBGDTRRX_EL0 that do not overrun must be observable to an instruction subsequently written to EDITR on completion of the first external access. This includes the indirect write to the DCC flags.

  This means that without explicit synchronization and without the need to first check the DCC flags in DCCSR:
  - If the instruction is a direct read of DBGDTRRX, it observes the external write.
  - If the instruction is a direct write of DBGDTRTX, it observes the external read.

- Writes to EDITR that do not overrun commit an instruction for execution immediately. The instruction must complete execution in finite time without requiring any further operation by the debugger.

- After an external write to the EDITR, the ITR flags that are updated as a side effect of that write must be observable by:
  - An external read of the EDSCR that follows the external write to the EDITR.
  - When checking for overrun, another external write to the EDITR that follows the original external write to the EDITR.
In Memory access mode, these requirements shift to the instructions implicitly executed by external reads and external writes of the DTR registers, as described in Memory access mode on page H4-7083.
H4.6   Interrupt-driven use of the DCC

Arm recommends implementations provide a level-sensitive DCC interrupt request through the IMPLEMENTATION DEFINED interrupt controller as a private peripheral interrupt for the originating PE.

Note

• In addition to connection to the interrupt controller Arm also recommends COMMIRQ, COMMTX, and COMMRX signals that might be implemented for use by any legacy system peripherals.

• GICv3 reserves a private peripheral interrupt number for the COMMIRQ interrupt.

The DCCINT register provides a first level of interrupt masking within the PE, meaning only a single interrupt source, COMMIRQ, is needed at the interrupt controller.

See also Synchronization of DCC interrupt request signals on page H4-7094.
H4.7 Pseudocode description of the operation of the DCC and ITR registers

The basic operation of the DCC and ITR registers is shown by the following pseudocode functions. These functions do not cover the behavior when OSLSR.OSLK == 1, meaning that the OS Lock is locked:

- `DBGDTR_EL0[]`
- `DBGDTRRX_EL0[]`
- `DBGDTRTX_EL0[]`
- `EDITR[]`
- `CheckForDCCInterrupts()`

For the definition of the DTR Registers, see `shared/debug/dccanditr/DTR` on page J1-7820.
The Debug Communication Channel and Instruction Transfer Register
H4.7 Pseudocode description of the operation of the DCC and ITR registers
Chapter H5

The Embedded Cross-Trigger Interface

This chapter describes the embedded cross-trigger interface. It contains the following sections:

- *About the Embedded Cross-Trigger (ECT)* on page H5-7100.
- *Basic operation on the ECT* on page H5-7102.
- *Cross-triggers on a PE in an Armv8 implementation* on page H5-7106.
- *Description and allocation of CTI triggers* on page H5-7107.
- *CTI registers programmers’ model* on page H5-7111.
- *Examples* on page H5-7112.
H5.1   About the Embedded Cross-Trigger (ECT)

The Embedded Cross-Trigger, ECT, allows a debugger to:

- Send trigger events to a PE. For example, this might be done to halt the PE.
- Send a trigger event to one or more PEs, or other system components, when a trigger event occurs on another PE or system component. For example, this might be done to halt all PEs when one individual PE halts.

Figure H5-1 shows the logical structure of an ECT.

![Figure H5-1 Structure of an embedded cross-trigger](image)

The ECT can deliver many types of trigger events, which are described in the following sections:

- Debug request trigger event on page H5-7107.
- Restart request trigger event on page H5-7108.
- Cross-halt trigger event on page H5-7108.
- Performance Monitors overflow trigger event on page H5-7108.
- Generic trace external input trigger events on page H5-7109.
- Generic trace external output trigger events on page H5-7109.
- Generic CTI interrupt trigger event on page H5-7109.

An Armv8-A implementation must:

- Include a cross-trigger interface, CTI.
- Implement at least the input and output triggers defined in this architecture.

In addition, see Cross-triggers on a PE in an Armv8 implementation on page H5-7106.

Arm recommends that this cross-trigger interface includes:

- The ability to route trigger events between Trace Units, which typically have advanced event triggering logic.
- An output trigger to the interrupt controller.

Also, Arm recommends that the Embedded Cross-Trigger includes the capability to send and receive IMPLEMENTATION DEFINED system trigger events to and from other system components, including a system counter, using a system CTI. See Halt-on-debug on page I2-7330.

--- Note ---

The ECT and CTI must only signal trigger events for external debugging. They must not route software events, such as interrupts. For example, the Performance Monitors overflow input trigger is provided to allow entry to Debug state on a counter overflow, and the output trigger to the interrupt controller is provided to generally allow events from the external debug sub-system to be routed to a software agent. However, the combination of the two must not be used as a mechanism to route Performance Monitors overflows to an interrupt controller.
H5.1 About the Embedded Cross-Trigger (ECT)

### Note

CTI version 1 (CTIv1) is defined by the CoreSight™ SoC Technical Reference Manual. CTIv2 extends CTIv1 with the addition of the input channel gate see Implementation with CTIv2.

#### H5.1.1 Implementation with a CoreSight CTI

For details of the recommended connections in an Armv8-A implementation, see Appendix K2 Recommended External Debug Interface. See also CoreSight™ SoC Technical Reference Manual.

#### H5.1.2 Implementation with CTIv2

If the CTI implemented is CTIv2 then:

- The CTIDEVARCH, CTIDEVAFF0, and CTIDEVAFF1 registers must be implemented.
- If the channel gate function is implemented, it applies to both input and output channels.
- The input channel gate function must be implemented if either of the following is true:
  - The CTM is implemented and the architecture variant is Armv8.5 or higher.
  - The CTIDEVARCH.REVISION field reads as 0b0001 or higher.

Implementation of CTIv2 features in architecture variants below Armv8.5 is OPTIONAL, but Arm recommends that CTIv2 is implemented, CTIv2 must be implemented from Armv8.5.
H5.2 Basic operation on the ECT

The ECT comprises a Cross-Trigger Matrix, CTM, and one Cross-Trigger Interface, CTI, for each PE. The ECT might also include other CTIs for other system components. The CTM passes events between the CTI blocks over channels. The CTM can have a maximum of 32 channels.

The main interfaces of the cross-trigger interface, CTI, are:

• The input triggers:
  — These are trigger event inputs from the PE to the CTI.

• The output triggers:
  — These are trigger event outputs from the CTI to the PE.

• The input channels:
  — These are channel event inputs from the cross-trigger matrix, CTM, to the CTI.

• The output channels:
  — These are channel event outputs from the CTI to the CTM.

Each CTI block has:

• Up to 32 input triggers that come from the PE:
  — The input triggers are numbered 0-31.

• Up to 32 output triggers that go to the PE:
  — The output triggers are numbered 0-31.

If the CTI is not powered up when the Core power domain is powered up, the CTI ignores all input triggers and input channel events, and does not generate any output triggers or output channel events.

Figure H5-2 on page H5-7103 shows the logical internal structure of a CTI.
**Figure H5-2 Structure of a cross-trigger interface**

---

**Note**

- The number of triggers is IMPLEMENTATION DEFINED. Figure H5-2 shows eight input and eight output triggers.
- The number of channels is IMPLEMENTATION DEFINED. Figure H5-2 shows four channels.
- In Figure H5-2 the input channel gate function is a CTIv2 feature.

When the CTI receives an input trigger event, this generates channel events on one or more internal channels, according to the *mapping function* defined by the `Input trigger → output channel mapping registers, CTIINEN<n>`.

The CTI also contains an *application trigger* and *channel pulse* to allow a debugger to create channel events directly on internal channels by writing to the CTI control registers.
Channel events on each internal channel are passed to a corresponding output channel that is controlled by a channel gate. The channel gate can block propagation of channel events from an internal channel to an output channel.

--- Note ---
If the CTM is implemented:
- The gate function must be implemented.
- If the CTI is CTIv1, the gate function applies to output triggers only.

The output channels from a CTI are combined, using a logical OR function, with the output channels from all other CTIs to form the input channels on other CTIs. The input channels of this CTI are the logical OR of the output channels on all other CTIs. This is the cross-trigger matrix, CTM. Therefore, the number of input channels must equal the number of output channels.

--- Note ---
The number of input triggers and output triggers is not required to be the same.

The internal channels form an internal cross-trigger matrix within the CTI. This delivers events directly from the input triggers to the output triggers. Therefore the number of internal channels is the same as the number of input and output channels on the external CTM, and there is a direct mapping between the two.

Channel events received on each input channel are passed to the corresponding internal channel. It is IMPLEMENTATION DEFINED whether the cross-trigger gate also blocks propagation of channel events from input channels to internal channels.

--- Note ---
If CTIv2 is implemented, the cross-trigger gate also blocks propagation of channel events from input channels to internal channels.

When the CTI receives a channel event on an internal channel this generates trigger events on one or more output triggers, according to the mapping function defined by the Input channel → output trigger mapping registers, CTIOUTEN<n>.

The CTI contains the input and output trigger interfaces to the PE and the interface of the cross-trigger matrix. The architecture does not define the signal protocol used on the trigger interfaces, and:
- It is IMPLEMENTATION DEFINED whether the CTI supports multicycle input trigger events.
- It is IMPLEMENTATION DEFINED whether the CTM supports multicycle channel events.

See Multicycle events on page H5-7105.

However, an output trigger is asserted until acknowledged. The output trigger can be:
- Self-acknowledging. This means that no further action is required from the debugger.
- Acknowledged by the debugger writing 1 to the corresponding bit of CTIINTACK.

The time taken to propagate a trigger event from the first PE, through its CTI, across the CTM to another CTI, and thereby to a second PE is IMPLEMENTATION DEFINED.

--- Note ---
Arm recommends that this path is not longer than the shortest software communication path between those PEs. This is because if the first PE halts, the Cross-halt trigger event can propagate through the ECT and halt the second PE without causing software on the second PE to malfunction because the first PE is in Debug state and is not responding.
H5.2.1 Multicycle events

A multicycle event is one with a continuous state that might persist over many cycles, as opposed to a discrete event. A typical implementation of a multicycle event is a level-based signal interface, whereas a discrete event might be implemented as a pulse signal or message.

CTI support for multicycle trigger events is IMPLEMENTATION DEFINED. Use of multicycle trigger events is deprecated. Of the architecturally defined input trigger events, the Performance Monitors overflow trigger event and Generic trace external output trigger events can be multicycle input triggers.

CTM support for multicycle channel events is IMPLEMENTATION DEFINED. A CTM that does not support multicycle channel events cannot propagate a multicycle trigger event between CTIs.

--- Note ---
A full ECT might comprise a mix of CTIs, some of which can support multicycle trigger events. In bridging these components, multicycle channel events become single channel events at the boundary between the CTIs.

An ECT that supports multicycle trigger events

When an ECT supports multicycle trigger events, an input trigger event to the CTI continuously asserts channel events on all output channels mapped to it until either:

• The input trigger event is removed.
• The channel mapping function is disabled.

This means that an input trigger that is asserted for multiple cycles causes any channels that are mapped to it to become active for multiple cycles. Consequently, any output triggers mapped from that channel are asserted for multiple cycles.

--- Note ---
The output trigger remains asserted for at least as long as the channel remains active. This means that even if the output trigger is acknowledged, it remains asserted until the channel deactivates.

The CTI does not guarantee that these events have precisely the same duration, as the triggers and channels can cross between clock domains.

CTIAPPSET and CTIAPPCLEAR can set a channel active for multiple cycles. CTIAPPnPULSE generates a single channel event. CTICHINSTATUS and CTICHOUTSTATUS can report whether a channel is active.

An ECT that does not support multicycle trigger events

When an ECT does not support multicycle trigger events, an input trigger event to the CTI generates a single channel event on all output channels mapped to it, regardless of how long the input trigger event is asserted.

This means that an input trigger event that is asserted for multiple cycles generates a single channel event on any channels mapped to it. Consequently any self-acknowledging output triggers mapped from those channels are single trigger events.

--- Note ---
A single event is typically a single cycle, but there is no guarantee that this is always the case.

---
CTIAPPSET and CTIAPPCLEAR can only generate a single channel event. CTIAPPnPULSE generates a single channel event. If the ECT does not support multicycle channel events, use of CTIAPPSET and CTIAPPCLEAR is deprecated, and the debugger must only use CTIAPPnPULSE. CTICHINSTATUS and CTICHOUTSTATUS must be treated as UNKNOWN.
H5.3 Cross-triggers on a PE in an Armv8 implementation

An Armv8 PE must include a cross-trigger interface, and the implementation must include at least the input and output triggers defined in this architecture. The number of channels in the cross-trigger matrix is IMPLEMENTATION DEFINED, but there must be a minimum of three. Software can read CTIDEVID.NUMCHAN to discover the number of implemented channels.

The CTM must connect to all PEs in the same Inner Shareability domain as the Armv8-A PE, but can also connect to additional PEs. Arm strongly recommends that the CTM connects all PEs implementing a CTI in the system. This includes Armv7-A PEs and other PEs that can be connected using a CoreSight CTI module.

--- Note ---

In a uniprocessor system the CTM is OPTIONAL. In a multiprocessor system the CTM is required. The CTM might be connected other CTI modules for non-PEs, such as triggers for system visibility components. Arm recommends that the CTM is implemented.

Any CTI connected to a PE that is not an Armv8-A PE must implement at least:

- The Debug request trigger event.
- The Restart trigger event.
- The Cross-halt trigger event.

For more information about the CTI, see the CoreSight™ SoC Technical Reference Manual. Armv8-A refines the generic CTI by defining roles for each of the implemented input and output triggers.
H5.4 Description and allocation of CTI triggers

Table H5-1 shows the output trigger events defined by the architecture and the related trigger numbers.

<table>
<thead>
<tr>
<th>Number</th>
<th>Source</th>
<th>Destination</th>
<th>Event description</th>

<td>PE Trace Unit</td>
<td>CTI</td>
<td>OPTIONAL Generic trace external output trigger events on page H5-7109</td>
</tr>
</tbody>
</table>

Note: Input triggers to the CTI are outputs from other blocks.

Table H5-1 and Table H5-2 show the minimum set of trigger events defined by the architecture. However:

- The Generic trace external input and output trigger events are only required if the OPTIONAL PE Trace Unit is implemented. If the OPTIONAL PE Trace Unit is not implemented, these trigger events are reserved.
- Support for the generic CTI interrupt trigger event is IMPLEMENTATION DEFINED because details of interrupt handling in the system, including any interrupt controllers, are IMPLEMENTATION DEFINED. Details regarding how the CTI interrupt is connected to an interrupt controller and its allocated interrupt number lie outside the scope of the architecture. Arm strongly recommends that implementations provide a means to generate interrupts based on external debug events.
- The other trigger events are required by the architecture.

An Armv8-A implementation can extend the CTI with additional triggers. These start with the number eight.

H5.4.1 Debug request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to force the PE into Debug state. The trigger event is asserted until acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to CTIINTACK[0].
A debugger must poll CTITRIGOUTSTATUS[0] until it reads as 0, to confirm that the output trigger has been
deasserted before generating any event that must be ordered after the write to CTIINTACK, such as a write to
CTIAPPPULSE to activate another trigger.

If the PE is already in Debug state, the PE ignores the trigger event, but the CTI continues to assert it until it is
removed by the debugger. See also External Debug Request debug event on page H3-7071.

H5.4.2 Restart request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to request the
PE to exit Debug state. If the PE is in Non-debug state, the request is ignored by the PE.

If a Restart request trigger event is received at or about the same time as the PE enters Debug state, it is
CONSTRAINED UNPREDICTABLE whether:
• The request is ignored by the PE. In this case the PE enters Debug state and remains in Debug state.
• The PE enters Debug state and then immediately restarts.

Debuggers must program the CTI to send Restart request trigger events only to PEs that are halted. To enable the
PE to disambiguate discrete Restart request trigger events, after sending a Restart request trigger event, the debugger
must confirm that the PE has restarted and halted before sending another Restart request trigger event. Debuggers
can use EDPRSR.{SDR, HALTED} to determine the Execution state of the PE.

Note
Before generating a Restart request trigger event for a PE, a debugger must ensure any Debug request trigger event
targeting that PE is cleared. Debug request trigger event on page H5-7107 describes how to do this.

The trigger event is self-acknowledging, meaning that the debugger requires no further action to remove the trigger
event. The trigger event is acknowledged even if the request is ignored by the PE. See also Exiting Debug state
on page H2-7051.

H5.4.3 Cross-halt trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted by a PE when it is entering
Debug state.

Note
To reduce the latency of halting, Arm recommends that an implementation issues the Cross-halt trigger event early
in the committed process of entering Debug state. This means that there is no requirement to wait until all aspects
of entry to Debug state have completed before issuing the trigger event. Speculative emission of Cross-halt trigger
events is not allowed. The Cross-halt trigger event must not be issued early enough for a subsequent Debug request
trigger event, that might be derived from the Cross-halt trigger event, to be recorded in the EDSCR.STATUS field.
This applies to Debug request trigger events that are acting as inputs to the PE.

H5.4.4 Performance Monitors overflow trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted each time the PE asserts
a new Performance Monitors counter overflow interrupt request. See Chapter D7 The Performance Monitors
Extension.

If the CTI supports multicycle trigger events, then the trigger event remains asserted until the overflow is cleared
by a write to PMOVSCLR_EL0. Otherwise, the trigger event is asserted when the value of PMOVSCLR_EL0
changes from zero to a non-zero value.
H5.4 Description and allocation of CTI triggers

Note

- This does not replace the recommended connection of Performance Monitors overflow trigger event to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI.

- Events can be counted when `ExternalNoninvasiveDebugEnabled()` == FALSE, and, in Secure state, when `ExternalSecureNoninvasiveDebugEnabled()` == FALSE. Secure software must be aware that overflow trigger events are nevertheless visible to the CTI.

H5.4.5 Statistical Profiling Extension sample trigger event

If the Statistical Profiling Extension is implemented, and a sample record is written to memory, CTI input trigger 2 is asserted. This trigger might also be directly connected to other IMPLEMENTATION DEFINED debug features.

For more information see Chapter D9 The Statistical Profiling Extension.

H5.4.6 Generic trace external input trigger events

These are output trigger events from the CTI, and input trigger events to the OPTIONAL PE Trace Unit, that are used in conjunction with the Generic trace external output trigger events to pass trigger events between:

- The PE and the OPTIONAL PE Trace Unit.
- The OPTIONAL PE Trace Unit and any other component attached to the CTM, including other Trace Units.

There are four Generic trace external input trigger events.

The trigger events are self-acknowledging. This means that the debugger does not have to take any further action to remove the events.

H5.4.7 Generic trace external output trigger events

These are input trigger events to the CTI, and output trigger events from the OPTIONAL PE Trace Unit, used in conjunction with the Generic trace external input trigger events to pass trigger events between:

- The PE and the OPTIONAL PE Trace Unit.
- The OPTIONAL PE Trace Unit and any other component attached to the CTM, including other Trace Units.

There are four Generic trace external output trigger events.

H5.4.8 Generic CTI interrupt trigger event

This is an output trigger event from the CTI, and an input to an IMPLEMENTATION DEFINED interrupt controller, and can transfer trigger events from the PE, PE Trace Units, or any other component attached to the CTI and CTM to software as an interrupt. The Generic CTI interrupt trigger event must be connected to the interrupt controller as an interrupt that can target the originating PE.

Note

- Arm recommends that the Generic CTI interrupt trigger event is a private peripheral interrupt, but implementations might instead make this trigger event available as a shared peripheral interrupt or a local peripheral interrupt.

- GICv3 reserves a private peripheral interrupt number for this interrupt.

It is IMPLEMENTATION DEFINED whether this trigger event is:

- Self-acknowledging. This means that the debugger is not required to take any further action, and that the interrupt controller must treat the trigger event as a pulse or edge-sensitive interrupt.
• Acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to CTINTACK[2]. This means that the interrupt controller must treat the trigger event as a level-sensitive interrupt.

Arm recommends that the Generic CTI interrupt trigger event is a self-acknowledging trigger event.
H5.5 CTI registers programmers’ model

The CTI registers programmers’ model is described in Chapter H8 About the External Debug Registers. The following sections contain information specific to the CTI:

• External debug register resets on page H8-7158.
• External debug interface register access permissions on page H8-7145.
• Cross-trigger interface registers on page H8-7156.
• The individual register descriptions in Cross-Trigger Interface registers on page H9-7272.

See also Memory-mapped accesses to the external debug interface on page H8-7142.

H5.5.1 CTI reset

An External Debug reset resets the CTI. See External debug register resets on page H8-7158 for details of CTI register resets. All CTI output triggers and output channels are deasserted on an External Debug reset.

——— Note ————

An indirect read of an output trigger might not observe the deasserted state until the processor is Cold reset. For more information, see Synchronization of changes to the external debug registers on page H8-7138.

H5.5.2 CTI authentication

The CTI ignores the state of the IMPLEMENTATION DEFINED authentication interface. This means that:

• CTITRIGINSTATUS shows the status of the input triggers and CTICHINSTATUS shows the status of the input channels, regardless of the value of ExternalNoninvasiveDebugEnabled().

——— Note ————

The PE does not generate the Cross-halt trigger event and the PE Trace Unit does not generate Generic trace external output trigger events when ExternalNoninvasiveDebugEnabled()==FALSE. However, the PE can generate Performance Monitors overflow trigger events.

———

• The CTI can generate external triggers regardless of the value of ExternalInvasiveDebugEnabled().

——— Note ————

The PE ignores Debug request and Restart request trigger events when ExternalInvasiveDebugEnabled()==FALSE. The PE Trace Unit ignores Generic trace external input trigger events when ExternalNoninvasiveDebugEnabled()==FALSE. The behavior of Generic CTI interrupt requests is part of the IMPLEMENTATION DEFINED handling of these interrupts, but it is permissible for an interrupt controller to receive these requests even when ExternalInvasiveDebugEnabled()==FALSE.
H5.6 Examples

The CTI is fully programmable and allows for flexible cross-triggering of events within a PE and between PEs in a multiprocessor system. For example:

- The Cross-halt trigger event and the Debug request trigger event can be used for cross-triggering in a multiprocessor system.
- The Cross-halt trigger event and the Generic interrupt trigger event can be used for event-driven debugging in a multiprocessor system.
- The Performance Monitors overflow trigger event and the Debug request trigger event can force entry to Debug state on overflow of a Performance Monitors event counter, for event-driven profiling.

--- Note ---

This does not replace the recommended connection of Performance Monitors overflow trigger events to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI. Arm recommends that the Performance Monitors overflow signal is directly available as a local interrupt source.

---

- The Generic trace external input and Generic trace external output trigger events can pass trace events into and out of the event logic of the PE Trace Unit. They can do this:
  - To pass trace events between Trace Units.
  - In conjunction with the Performance Monitors overflow trigger event, to couple the Performance Monitors to the PE Trace Unit.
  - In conjunction with the Debug request trigger event, to trigger entry to Debug state on a trace event.
  - In conjunction with other CTIs, to signal a trace trigger event onto a CoreSight trace interconnect.

The following sections describe some examples in more detail:

- Halting a single PE.
- Halting all PEs in a group when any one PE halts on page H5-7113.
- Synchronously restarting a group of PEs on page H5-7113.
- Halting a single PE on Performance Monitors overflow on page H5-7113.

Example H5-1 Halting a single PE

To halt a single PE, set:

1. **CTIGATE[0]** to 0, so that the CTI does not pass channel events on internal channel 0 to the CTM.
2. **CTIOUTEN0[0]** to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 0.

--- Note ---

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instance of **CTIOUTEN<n>** for which <n> is 0.

---

3. **CTIAPPnPULSE[0]** to 1, to generate a channel event on channel 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to **CTIINTACK[0]**, before restarting the PE.
Example H5-2 Halting all PEs in a group when any one PE halts

To program a group of PEs so that when one PE in the group halts, all of the PEs in that group halt, set the following registers for each PE in the group:

1. CTIGATE[2] to 1, so that each CTI passes channel events on internal channel 2 to the CTM.
2. CTIINEN0[2] to 1, so that each CTI generates a channel event on channel 2 in response to a Cross-halt trigger event.
3. CTIOUTEN0[2] to 1, so that each CTI generates a Debug request trigger event in response to a channel event on channel 2.

Note
The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instances of CTIINEN<n> and CTIOUTEN<n> for which <n> is 0.

When a PE has halted, clear the Debug request trigger event by writing a value of 1 to CTIINTACK[0], before restarting the PE.

Example H5-3 Synchronously restarting a group of PEs

To restart a group of PEs, for each PE in the group:

1. If the PE was halted because of a Debug request trigger event, the debugger must ensure the trigger event is deasserted. It can do this by:
   a. Writing 1 to CTIINTACK[0] to clear the Debug request trigger event.
   b. Polling CTITRIGOUTSTATUS[0], until it reads as 0, to confirm that the trigger event has been deasserted.
2. Set CTIGATE[1] to 1, so that each CTI passes channel events on internal channel 1 to the CTM.
3. Set CTIOUTEN1[1] to 1, so that each CTI generates a Restart request trigger event in response to a channel event on channel 1.

Note
This example must use the instance of CTIOUTEN<n> for which <n> is 1.

4. Set CTIAPPULSE[1] to 1 on any one PE in the group, to generate a channel event on channel 1.

Example H5-4 Halting a single PE on Performance Monitors overflow

To halt a single PE on a Performance Monitors overflow set:

1. CTIGATE[3] to 0, so that the CTI does not pass channel events on internal channel 3 to the CTM.
2. CTIINEN1[3] to 1, so that the CTI generates a channel event on channel 3 in response to a Performance Monitors overflow trigger event.

Note
This step of this example must use the instance of CTIINEN<n> for which <n> is 1.

3. CTIOUTEN0[3] to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 3.
Note

This step of this example must use the instance of CTIOUTEN<n> for which <n> is 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to CTIINTACK[0], before restarting the PE. Clear the overflow status by writing to PMOVSCLR_EL0.
Chapter H6
Debug Reset and Powerdown Support

This chapter describes the reset and powerdown support in the Debug architecture. It contains the following sections:

- About Debug over powerdown on page H6-7116.
- Power domains and debug on page H6-7117.
- Core power domain power states on page H6-7118.
- Emulating low-power states on page H6-7121.
- Powerup request mechanism on page H6-7120.
- Debug OS Save and Restore sequences on page H6-7123.
- Reset and debug on page H6-7129.

______ Note ________
Where necessary, Table K15-1 on page K15-8160 disambiguates the general register references used in this chapter.
H6.1 About Debug over powerdown

Armv8 external debug defines a logical model for the hardware on which a PE executes. This hardware is logically split into the **Core power domain** and the **Debug power domain**, and the model contains descriptions of the states of those domains. See:

- *Power domains and debug* on page H6-7117.
- *Core power domain power states* on page H6-7118.

An implementation may allow power domains to be powered up and down independently. Debug over powerdown provides:

- A facility for software executing on the PE to save and restore the PE state on behalf of a self-hosted or external debugger or both. See *Debug OS Save and Restore sequences* on page H6-7123.

- A facility for an external debugger to request power up of the Core power domain. See *Powerup request mechanism* on page H6-7120.

- A facility for an external debugger, or software executing on the PE, to request emulation of powerdown of the Core power domain. See *Emulating low-power states* on page H6-7121.
H6.2 Power domains and debug

Armv8 external debug has two logical power domains, each with its own reset:

- The Debug power domain contains the interface between the PE and the external debugger, and is powered up whenever an external debugger is connected to the SoC. It remains powered up while the external debugger is connected. When the Core power domain is completely off or in a low-power state, a debugger is permitted to access a register that is implemented in the Debug power domain. Registers in this domain are reset by an External Debug reset.

- The Core power domain contains the rest of the PE, and might be allowed to power up and power down independently of the Debug power domain.

____ Note ______

- The model of two logical power domains has an impact on the reset and access permission requirements of the debug programmers’ model.

- The power domains are described as logical because the architecture defines the requirements but does not require two physical power domains. Any power domain split that meets the requirements of the programmers’ model is a valid implementation.

The Core power domain contains several types of registers:

- Non-debug logic refers to all registers and logic that are not associated with debug.
- Self-hosted debug logic refers to registers and logic associated solely with the self-hosted debug aspects of the architecture.
- Shared debug logic refers to registers and logic associated with both the self-hosted and external debug aspects of the architecture.
- External debug logic refers to registers and logic associated solely with the external debug aspects of the architecture.

For information about which groups of registers and components are in each power domain, and which registers change power domain if FEAT_DoPD is implemented, see:

- Access permissions for the External debug interface registers on page H8-7151.
- Cross-trigger interface registers on page H8-7156.
- Management register access permissions on page K2-7992.
- Access permissions for external views of the Performance Monitors on page I3-7339.
The Arm architecture does not define the power states of the PE as these are not normally visible to software. However, they are visible to the external debugger. Armv8 external debug uses a four logical power states model for the Core power domain. The four logical power states are as follows:

**Normal**

The Core power domain is fully powered up and the debug registers are accessible.

**Standby**

The Core power domain is on, but there are measures to reduce energy consumption. In a typical implementation, the PE enters standby by executing a `WFI` or `WFE` instruction, and exits on a wake-up event. There can be other IMPLEMENTATION DEFINED measures the OS can take to enter standby.

The PE preserves the PE state, including the debug logic state. Changing from standby to normal operation does not involve a reset of the PE.

Standby is the least invasive OS energy saving state. Standby implies only that the PE is unavailable and does not clear any debug settings. For standby, the Debug architecture requires only the following:

- An External Debug Request debug event is a wake-up event when halting is allowed. This means that the PE must exit standby to handle the debug event. If the PE executed a `WFE` or a `WFI` instruction to enter standby, then it retires that instruction.
- If the external debug interface is accessed, the PE must respond to that access. Arm recommends that, if the PE executed a `WFI` or `WFE` instruction to enter standby, then it does not retire that instruction.

Standby is transparent, meaning that to software and to an external debugger it is indistinguishable from normal operation.

**Retention**

The OS takes some measures, including IMPLEMENTATION DEFINED code sequences and registers, to reduce energy consumption. The PE state, including debug settings, is preserved in low-power structures, allowing the Core power domain to be at least partially turned off.

Changing from low-power retention to normal operation does not involve a reset of the PE. The saved PE state is restored on changing from low-power retention state to normal operation. If software has to use an IMPLEMENTATION DEFINED code sequence before entering, or after leaving, a retention state, this is referred to as a software-visible retention state. It is IMPLEMENTATION DEFINED whether the value of `DBGPRCR.CORENPDRQ` is set to its Cold reset value on leaving the software-visible retention state. See the description of `DBGPRCR.CORENPDRQ` for more information.

External Debug Request debug events stay pending and registers in the Core power domain cannot be accessed.

**Powerdown**

The OS takes some measures to reduce energy consumption by turning the Core power domain off. These measures must include the OS saving any PE state, including the debug settings, that must be preserved over powerdown.

If `FEAT_DoubleLock` is implemented, it is used during powerdown.

Changing from powerdown to normal operation must include:

- A Cold reset of the PE after the power level has been restored.
- The OS restoring the saved PE state.

External Debug Request debug events stay pending and debug registers in the Core power domain cannot be accessed.
An implementation might support enabling and disabling threads, either dynamically or once at reset time. Threads that are disabled in this way must appear to the external debugger as either:

- Powered off, meaning they are either:
  - In a powerdown state.
  - In a retention state.
- Held in reset state.

Armv8 external debug uses a simpler two states model for the Debug power domain. The two states are:

- **Off**: The Debug power domain is turned off.
- **On**: The Debug power domain is turned on.

The available power states, including the cross-product of Core power domain and Debug power domain power states is **IMPLEMENTATION DEFINED**. Implementations are not required to implement all of these states and might include additional states. These additional states must appear to the debugger as one of the logical power states defined by this model. The control of power states is **IMPLEMENTATION DEFINED**.

--- **Note** ---

As a result, it is **IMPLEMENTATION DEFINED** whether it is possible for the Debug power domain to be on when the Core power domain is off.

---

If the Debug power domain is implemented but is not powered up when the Core power domain is powered up, the Reset Catch debug event and the OS Unlock Catch debug event are disabled.
H6.4 Powerup request mechanism

If a powerup request mechanism is implemented, asserting the powerup request requests the power controller to power up the Core power domain, and to emulate any subsequent powerdown requests, until the powerup request mechanism is deasserted.

H6.4.1 Powerup request mechanism if FEAT_DoPD is implemented

If FEAT_DoPD is implemented, the external debug component implements an OPTIONAL powerup request mechanism.

If the powerup request mechanism is implemented, the powerup request must be a CoreSight Class 0x9 ROM table block that contains both:

- A parent entry for the debug registers of the PE.
- A parent entry for the PMU registers of the PE, if the OPTIONAL PMU with an external debug interface is implemented.

A parent entry of a component is an entry in a ROM table that either locates the component, or locates another ROM table that contains the parent entry for the component.

Note

The ROM table and any descendants might describe other debug components, including debug components for other PEs.

The ROM table might have a parent entry in a second ROM table and that parent entry might also have a powerup request mechanism in the second ROM table. This applies recursively.

The parent entries for the debug components have the following properties:

For the debug registers and Performance Monitors registers:

These components are in the Core power domain.

The POWERIDVALID bit is 1.

All parent entries must have the same IMPLEMENTATION DEFINED POWERID value.

Note

The IMPLEMENTATION DEFINED POWERID value does not need to be unique for each PE.

For the CTI registers:

This component is in the Debug power domain.

The POWERIDVALID bit is IMPLEMENTATION DEFINED.

If the POWERIDVALID bit is 1, the entries must have a valid POWERID value.

For more information about Coresight Class 0x9 ROM Tables, see ARM® CoreSight™ Architecture Specification.

On reset, if FEAT_DoPD is implemented, DBGPRCR.CORENPDRQ is set to to an IMPLEMENTATION DEFINED choice between 0 and 1 if the powerup request is implemented and asserted, and 0 otherwise.

H6.4.2 Powerup request mechanism if FEAT_DoPD is not implemented

If FEAT_DoPD is not implemented, the bit EDPRCR.COREPURQ is the powerup request mechanism.

The control registers DBGPRCR.CORENPDRQ and EDPRCR.COREPURQ provide an interface between the power controller and the PE. They typically map directly to signals in the recommended external debug interface.

On reset, if FEAT_DoPD is not implemented, DBGPRCR.CORENPDRQ is set to the value of EDPRCR.COREPURQ.
**H6.5 Emulating low-power states**

DBGPRCR.CORENPDRQ and the powerup request mechanism can request the power controller to emulate states where the Core power domain is completely off or in a low-power state where the Core power domain registers cannot be accessed. This simplifies the requirements on software by sacrificing entirely realistic behavior.

If FEAT_DoPd is not implemented, EDPRSR.{SPD, PU} indicates the Core power domain power state. For more information see:

- The DBGPRCR_EL1 and DBGPRCR System register descriptions.
- The EDPRCR and EDPRSR external debug register descriptions.
- Appendix K2 Recommended External Debug Interface.

The measures to emulate powerdown are IMPLEMENTATION DEFINED. The ability of the debugger to access the state of the PE and the system might be limited as a result of the measures adopted.

In an emulated powerdown state, the debugger must be able to access all debug, PMU, CTI, and trace unit registers that are accessible on the external debug interface and are in one of:

- The Debug power domain.
- The Core power domain.
- When a trace unit with a separate trace unit Core power domain is implemented, and the trace unit Core power domain is powered on, the trace unit Core power domain.

That is, the debugger must be able to read and write to such registers without receiving errors. This allows an external debugger to debug the powerup sequence.

Arm recommends that any IMPLEMENTATION DEFINED registers that are on the external debug interface and in either the Core power domain or the Debug power domain are also accessible in an emulated powerdown state.

If FEAT_DoubleLock is implemented, `DoubleLockStatus() == FALSE` when DBGPRCR.CORENPDRQ == 1.

Otherwise, the behavior of the PE in emulated powerdown must be similar to that in a real powerdown state. In particular, the PE must not respond to other system stimuli, such as interrupts.

Example H6-1 and Example H6-2 are examples of two approaches to emulating powerdown.

**Example H6-1 An example of emulating powerdown**

The PE is held in Standby state, isolated from any system stimuli. It is IMPLEMENTATION DEFINED whether the PE can respond to debug stimuli such as an External Debug Request debug event.

If the PE can enter Debug state, then the external debugger is able to use the ITR to execute instructions, such as loads and stores. This causes the external debugger to interact with the system. If the external debugger restarts the PE, the PE leaves Standby state and restarts fetching instructions from memory.

**Example H6-2 Another example of emulating powerdown**

The PE is held in Warm reset. This limits the ability of an external debugger to access the resources of the PE. For example, the PE cannot be put into Debug state.

On exit from emulated powerdown the PE is reset. However, the debug registers that are only reset by a Cold reset must not be reset. Typically this means that a Warm reset is substituted for the Cold reset. As such, the effect of accessing any register that is reset by a Warm reset while the PE is in the emulated powerdown state will have an IMPLEMENTATION DEFINED effect on that register.
Note

- Warm reset and Cold reset have different effects apart from resetting the debug registers. In particular, 
  RMR_ELx is reset by a Cold reset and controls the reset state on a Warm reset. This means that if a Cold reset 
  is substituted by a Warm reset, the behavior of the reset code might be different.

- The timing effects of powering down are typically not factored in the powerdown emulation. Examples of 
  these timing effects are clock and voltage stabilization.

- Emulation does not model the state lost during powerdown, meaning that it might mask errors in the state 
  storage and recovery routines.
H6.6 Debug OS Save and Restore sequences

In Armv8-A, the following registers provide the OS Save and Restore mechanism:

- The OS Lock Access Register, OSLAR, locks the OS Lock to restrict access to debug registers before starting an OS Save sequence, and unlocks the OS Lock after an OS Restore sequence.
- The OS Lock Status Register, OSLSR, shows the status of the OS Lock.
- The PE can be configured to generate an OS Unlock Catch debug event on page H3-7072 when the OS Lock is unlocked.
- If FEAT_DoubleLock is implemented, the OS Double Lock locks out an external debug interface entirely. This is only used immediately before a powerdown sequence.

See also:
- FEAT_DoubleLock on page A2-64
- Reset and debug on page H6-7129
- Appendix K8 Example OS Save and Restore Sequences

H6.6.1 EDPRSR.{DLK, SPD, PU} and the Core power domain

If FEAT_DoPD is not implemented, a debugger uses EDPRSR.{DLK, SPD, PU} to determine whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read.

### Table H6-1 Interpretation of the EDPRSR.{DLK, SPD, PU} bits

<td>0</td>
<td>0</td>
<td>Not known</td>
<td>Error</td>
<td>Not known</td>
<td></td>
</tr>
</tbody>
</table>

If FEAT_DoPD is implemented, accesses to EDPRSR return an error when the Core power domain is off or in a retention state, meaning successful reads of EDPRSR always return 1 for EDPRSR.PU.

When FEAT_Debugv8p4 is implemented, and whenever FEAT_DoubleLock is not implemented, EDPRSR.DLK is always 0.

If FEAT_DoubleLock is not implemented, DoubleLockStatus() always returns FALSE.

If the Core power domain is powered up and DoubleLockStatus() == TRUE, then:

- When FEAT_Debugv8p2 is not implemented, EDPRSR.{DLK, SPD, PU} can read either \{1, UNKNOWN, 1\} or \{UNKNOWN, 0, 0\};
- When FEAT_Debugv8p2 is implemented, and FEAT_Debugv8p4 is not implemented, EDPRSR.{DLK, SPD, PU} can only read \{UNKNOWN, 0, 0\}.
H6.6.2 EDPRSR.SPD when the Core domain is in either retention or powerdown state

If FEAT_DoPD is not implemented, when the Core power domain is in either the retention or powerdown state, EDPRSR.SPD is not cleared following a read of EDPRSR and it is IMPLEMENTATION DEFINED whether:

- EDPRSR.SPD shows whether the state of the debug registers in the Core power domain has been lost since the last time that EDPRSR was read. This means that:
  - When the Core power domain is in the powerdown state, EDPRSR.SPD is RAO, this indicates that the state of the debug registers has been lost.
  - When the Core power domain is in the retention state, EDPRSR.SPD indicates whether the state of the debug registers was lost before the Core power domain entered retention state.

- EDPRSR.SPD is RAZ, and:
  - On leaving the powerdown state, EDPRSR.SPD is set to 1 which indicates that the state of the debug registers has been lost.
  - On leaving the retention state, EDPRSR.SPD reverts the value it had on entering the retention state.

Note

If FEAT_DoPD is implemented, accesses to EDPRSR return an error when the Core power domain is off or in a retention state.

H6.6.3 EDPRSR.{DLK, R} and reset state

If FEAT_DoPD is implemented, accesses to EDPRSR return an error when the Core power domain is off or in a retention state, meaning successful reads of EDPRSR always return 1 for EDPRSR.PU.

When FEAT_Debugv8p4 is implemented, and whenever FEAT_DoubleLock is not implemented, EDPRSR.DLK is always 0.

If FEAT_DoubleLock is not implemented, DoubleLockStatus() always returns FALSE.

If FEAT_DoubleLock is implemented and enabled, the behavior of all registers and fields except EDPRSR.DLK is the same as their behavior if FEAT_Debugv8p4 is not implemented.

If FEAT_Debugv8p4 is implemented EDPRSR.DLK is always 0 and does not give any information about the OS Double Lock.

EDPRSR.R is UNKNOWN when DoubleLockStatus() == TRUE. OSDLR_EL1.DLK is cleared to 0 by a reset. If the Core power domain is powered up and entered reset state with the OS Double Lock locked, it is CONSTRAINED UNPREDICTABLE whether a read of EDPRSR while the PE is in reset state returns:

- EDPRSR.{DLK, R, PU} == {1, UNKNOWN, 1} indicating that the OS Double Lock is locked. This is not permitted from Armv8.2.
- EDPRSR.{DLK, R, PU} == {0, 1, 1} indicating that the PE is in reset state.
- EDPRSR.{DLK, R, PU} == {UNKNOWN, UNKNOWN, 0} indicating that the registers in the Core power domain cannot be accessed because the OS Double Lock is locked.

If the PE was powered up and the OS Double Lock was unlocked when the PE was reset, then EDPRSR.{DLK, R, PU} reads as {0, 1, 1} while the PE is in reset state.

On leaving reset state, EDPRSR.{DLK, R} reads as {0, 0}.
H6.6.4 Debug registers to save over powerdown

Table H6-2 shows the different requirements for self-hosted debug over powerdown and external debug over powerdown:

- The column labeled Self-hosted lists registers that software must preserve over powerdown so that it can support self-hosted debug over powerdown. This does not require use of the OS Save and Restore mechanism.

- The column labeled External lists registers that software must preserve over powerdown so that it can support external debug over powerdown. This requires use of the OS Save and Restore mechanism:
  - Some external debug registers are not normally accessible to software executing on the PE. Additional debug registers are provided that give software the required access to save and restore these external debug registers when OSLR.OSLK is locked. These registers include OSECCR, OSDTRRX, and OSDTRTX.

- Some registers might only present in some implementations, or might not be accessible at all Exception levels or in Non-secure state. DBGVCR32_EL2 and SDER32_EL3 are only required to support AArch32.

Table H6-2 does not include registers for the optional Trace and Performance Monitor extensions.

a. The OS Lock must be locked to save and restore for external debug. When the OS Lock is locked, DSCR is part of the software save and restore mechanism for external debug. It provides a mechanism for an operating system to access some fields of EDSCR that are otherwise read-only or not visible to software. This allows the operating system to save and restore these settings over a powerdown for the external debugger.

b. This register is new in Armv8-A. Sequences written for Armv7 do not preserve the register over powerdown.

c. Read DBGCLAIMCLR to save, write DBGCLAIMSET to restore.
**H6.6.5  OS Save sequence**

To preserve the debug logic state over a powerdown, the state must be saved to nonvolatile storage. This means the OS Save sequence must:

1. Lock the OS Lock by:
   - Writing the key value 0xC5A9CE55 to the DBGOSLAR in AArch32 state.
   - Writing 1 to OSLAR_EL1.OSLK in AArch64 state.
2. Execute an ISB instruction.
3. Walk through the debug registers listed in Debug registers to save over powerdown on page H6-7125 and save the values to the nonvolatile storage.

If the FEAT_DoubleLock is implemented, before removing power from the Core power domain, software must:

1. Lock the OS Double Lock by:
   - Writing 1 to DBGOSDLR.DLK in AArch32 state.
   - Writing 1 to OSDLR_EL1.DLK in AArch64 state.

If FEAT_DoubleLock is not implemented, OSDLR_EL1 and DBGOSDLR ignore writes.

2. Execute a Context synchronization event.

**H6.6.6  OS Restore sequence**

After a powerdown, the OS Restore sequence must perform the following steps to restore the debug logic state from the non-volatile storage:

1. Lock the OS Lock, as described in OS Save sequence. The OS Lock is generally locked by the Cold reset, but this step ensures that it is locked.
2. Execute an ISB instruction.
3. To ensure that, if an external debugger clears the OS Lock before the end of this sequence, no debug exceptions are generated:
   - Write 0 to MDSCR_EL1 if executing in AArch64 state.
   - Write 0 to DBGDSCRext if executing in AArch32 state.
4. Walk through the debug registers listed in Debug registers to save over powerdown on page H6-7125, and restore the values from the nonvolatile storage. The last register to be restored must be:
   - MDSCR_EL1 if executing in AArch64 state.
   - DBGDSCRext if executing in AArch32 state.
5. Execute an ISB instruction.
6. Unlock the OS Lock by:
   - Writing any non-key value to DBGOSLAR if executing in AArch32 state.
   - Writing 0 to OSLAR_EL1.OSLK if executing in AArch64 state.
7. Execute a Context synchronization event.

**Note**

The OS Restore sequence overwrites the debug registers with the values that were saved. If there are valid values in these registers immediately before the restore sequence, then those values are lost.

**H6.6.7  Debug behavior when the OS Lock is locked**

The main purpose of the OS Lock is to prevent updates to debug registers during an OS Save or OS Restore operation. The OS Lock is locked on a Cold reset.
When the OS Lock is locked:

- Access to debug registers through the System register interface is mainly unchanged except that:
  - Certain registers are read and written without side-effects.
  - Fields in DSCR and OSECCR that are normally read-only become read/write.
  This allows the state to be saved or restored. For more information, see the relevant register description in Chapter H9 External Debug Register Descriptions.
- Access to debug registers by the external debug interface is restricted to prevent an external debugger modifying the registers that are being saved or restored. For more information see External debug interface register access permissions summary on page H8-7146.
- Debug exceptions, other than Breakpoint Instruction exceptions are not generated.
- Breakpoint and Watchpoint debug events are not generated. The OS Lock has no effect on Breakpoint Instruction exceptions and other debug events.

H6.6.8 Debug behavior when the OS Lock is unlocked

When the OS Lock is unlocked, the PE sets EDESR.OSUC to 1 if the OS Unlock Catch debug event is enabled and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. See OS Unlock Catch debug event on page H3-7072.

H6.6.9 Debug behavior when the OS Double Lock is locked

If the FEAT_DoubleLock is implemented, software locks the OS Double Lock immediately before a powerdown sequence.

The OS Double Lock ensures that it is safe to remove core power by forcing the debug interfaces to be quiescent.

When DoubleLockStatus() == TRUE:

- The external debug interface only has restricted access to the debug registers, so that it is quiescent before removing power. See External debug interface register access permissions summary on page H8-7146.
- Debug exceptions, other than Breakpoint Instruction exceptions, are not generated.
- Halting is prohibited. See Halting allowed and halting prohibited on page H2-7015.

Note

Pending Halting debug events might be lost when core power is removed.

- No asynchronous debug events are WFI or WFE wake-up events.

If the FEAT_DoubleLock is not implemented, the PE ensures these conditions are met before allowing power to be removed.

Software must synchronize the update to OSDLR before it indicates to the system that core power can be removed. The interface between the PE and its power controller is IMPLEMENTATION DEFINED.

Typically software indicates that core power can be removed by entering the Wait For Interrupt state. This means that software must explicitly synchronize the OSDLR update before issuing the WFI instruction.

OSDLR.DLK is ignored and DoubleLockStatus() == FALSE if either:

- The PE is in Debug state.
- DBGPRCR.CORENPDRQ is set to 1.
--- Note ---

It is possible to enter Debug state with OSDLR.DLK set to 1. This is because a Context synchronization event is required to ensure the OS Double Lock is locked, meaning that Debug state might be entered before the OSDLR update is synchronized.

---

Because OSDLR.DLK is ignored when DBGPRCR.CORENPDRQ is set to 1, an external debugger can write to DBGPRCR.CORENPDRQ, and the FEAT_DoubleLock is not always implemented, software must not rely on using the OS Double Lock to disable debug exceptions or to prohibit halting, or both. Arm deprecates use of the OS Double Lock for these purposes, and instead recommends that software:

- Uses the OS Lock to disable debug exceptions during save or restore sequences.
- Uses the debug authentication interface to prohibit halting and external debug access to debug registers at times other than immediately prior to removing power.

As the purpose of the OS Double Lock is to ensure that it is safe to remove core power, if the FEAT_DoubleLock is implemented, it is important to avoid race conditions that defeat this purpose. Arm recommends that:

- Once the write to OSDLR.DLK has been synchronized by a Context synchronization event and DoubleLockStatus() == TRUE, a PE must:
  - Not allow a debug event generated before the Context synchronization event to cause an entry to Debug state or act as a wake-up event for a WFI or WFE instruction after the Context synchronization event has completed.
  - Complete any external debug access started before the Context synchronization event completes.

--- Note ---

A debug register access might be in progress when software sets OSDLR.DLK to 1. An implementation must not permit the synchronization of locking the OS Double Lock to stall indefinitely while waiting for that access to complete. This means that any debug register access that is in progress when software sets OSDLR.DLK to 1 must complete or return an error in finite time.

---

- If a write to DBGPRCR or EDPRCR made when OSDLR.DLK == 1 changes DBGPRCR.CORENPDRQ or EDPRCR.CORENPDRQ from 1 to 0, meaning DoubleLockStatus() changes from FALSE to TRUE, then before signaling to the system that the CORENPDRQ field has been cleared and emulation of powerdown is no longer requested, meaning the system can remove core power, the PE must ensure that all the requirements for DoubleLockStatus() == TRUE listed in this section are met.

In a standard OS Save sequence, the OS Lock is locked before the OS Double Lock is locked. This means that writes to CORENPDRQ are ignored by the time the OS Double Lock is locked. However, if DoubleLockStatus() == FALSE, an external debugger can clear the OS Lock at any time, and then write to EDPRCR.
H6.7 Reset and debug

All registers in the Core power domain are either:
- Reset by both a Cold and a Warm reset.
- Reset only by a Cold reset and are not changed by a Warm reset.

For more information, see Reset on page D1-2329.

All registers in the Debug power domain are reset by an External Debug reset.

Figure H6-1 shows this reset scheme. The following three reset signals are an example implementation of the reset scheme:
- CORERESET, which must be asserted for a Warm reset.
- CPUPORESET, which must be asserted for a Cold reset.
- PRESETDBG, which must be asserted for an External Debug reset.

As shown in the figure, the external debug logic is split between the Debug power domain and the Core power domain.

---

**Figure H6-1** Power and reset domains

For more information about power domains and power states, see Power domains and debug on page H6-7117.

When power is first applied to the Debug power domain, PRESETDBG must be asserted.

When power is first applied to the Core power domain, CPUPORESET must be asserted.

---

**Note**

In this scheme, logic in the Warm reset domain is reset by asserting either CORERESET or CPUPORESET. This implies a particular implementation style that permits these approaches.

CPUPORESET is not normally asserted on moving from a low-power state, where power has not been removed, to a full-power state. This can occur, for example, on exiting a low-power retention state. See also Emulating low-power states on page H6-7121 and the EDPRSR register description.
H6.7.1 External debug interface accesses to registers in reset

If a reset signal is asserted and the external debug interface:

- Writes a register, or indirectly writes a register or register field as a side-effect of an access:
  — Then, if the register or register field is reset by that reset signal, it is CONstrained UNPredictable (Constrained UNPredictable) whether the register or register field takes the reset value or the value written. The reset value might be UNKNOWN.
  — Otherwise the register or register field takes the value that is written.

- Reads a register, or indirectly reads a register or register field, as part of an access:
  — Then, if the register or register field is reset by that reset signal, the value returned is UNKNOWN.
  — Otherwise, the value of the register or register field is returned.

It is IMPLEMENTATION DEFINED whether any register can be accessed when External Debug reset is being asserted. The result of these accesses is IMPLEMENTATION DEFINED.
This chapter describes the OPTIONAL PC Sample-based Profiling Extension that provides a non-invasive external debug component.

It contains the following section:

•  *About the PC Sample-based Profiling Extension* on page H7-7132.
H7.1 About the PC Sample-based Profiling Extension

The PC Sample-based Profiling Extension is an optional extension that provides coarse-grained, non-invasive profiling by an external debugger. See also Non-invasive behavior on page D7-2697.

PC Sample-based Profiling creates samples so that tools can populate a statistical model of the performance of software executing on the PE.

Note

Data returned by periodic sampling of PC Sample-based Profiling registers is sufficient to allow tools to estimate the distribution of time spent executing software on the PE.

The delay between an instruction being executed by the PE and its address appearing in the PC Sample Register is not defined, and Armv8 does not require that the sampled instruction was recently executed. For example, if a piece of software executes a load instruction that reads the PC Sample Register of the PE it is running on, there is no guaranteed relationship between the address of the load instruction and the value read. The PC Sample Register is intended only for use by an external agent to provide statistical information for software profiling.

It must be possible to sample references to branch targets. It is implementation defined whether references to other instructions can be sampled. The branch target for a conditional branch instruction that fails its condition check is the instruction that follows the conditional branch instruction. The branch target for an exception is the exception vector address.

To keep the implementation and validation cost low, a reasonable degree of inaccuracy in the sampled data is acceptable. Arm does not define a reasonable degree of inaccuracy but recommends the following guidelines:

• In exceptional circumstances, such as a change in Security state or other boundary condition, it is acceptable for the sample to represent an instruction that was not committed for execution.

• Under unusual non-repeating pathological cases, the sample can represent an instruction that was not committed for execution. These cases are likely to occur as a result of asynchronous exceptions, such as interrupts, where the chance of a systematic error in sampling is very unlikely.

• Under normal operating conditions, the sample must reference an instruction that was committed for execution, including its context, and must not reference instructions that are fetched but not committed for execution.

Note

In the Armv7 PC Sample-based Profiling Extension, an offset was applied to the sampled program counter value and this offset and the instruction set state indicated in bits [1:0] of the sampled value. In the Armv8 PC Sample-based Profiling Extension, the sampled value is the address of an instruction that has executed, with no offset and no indication of the instruction set state.

H7.1.1 Controlling the PC Sample-based Profiling Extension

PC Sample-based Profiling is controlled by the implementation defined authentication interface ExternalNoninvasiveDebugEnabled().

PC Sample-based Profiling is prohibited unless both:

• It is allowed by the implementation defined authentication interface ExternalNoninvasiveDebugEnabled().

• At least one of the following applies:
  — The PE is executing in Non-secure state.
  — EL3 is not implemented.
— EL3 is implemented, the PE is executing in Secure state, and non-invasive debug is allowed by the IMPLEMENTATION DEFINED authentication interface ExternalSecureNoninvasiveDebugEnabled().
— EL3 is implemented, EL3 or EL1 is using AArch32, the PE is executing at EL0 in Secure state, and the value of SDER.SUNIDEN is 1.

The state of the IMPLEMENTATION DEFINED authentication interface is visible through DBGAUTHSTATUS_EL1. See Recommended authentication interface on page K2-7989.

H7.1.2 Registers implemented by the PC Sample-based Profiling Extension

The options for implementing the PC Sample-based Profiling extension are:

• The extension is implemented in the external debug register space. EDDEVID.PCSample and identifies the implemented level of profiling, and EDDEVID1.PCSROffset also indicates that this option is implemented. From Armv8.2 this option is not permitted.

• FEAT_PCSRv8p2 is implemented, meaning the PC Sample-based Profiling extension is implemented in the Performance Monitors memory-mapped register space. PMDEVID.PCSample identifies the implemented level of profiling.

If PC Sample-based Profiling is implemented in the external debug register space:

• The following external debug registers can be implemented:
  — EDCIDSR.
  — EDPCSR.
  — EDVIDSR.

  See External debug interface register map on page H8-7149.

• If FEAT_VHE is implemented, EDSCR.SC2 controls what PC Sample-based Profiling samples.

If FEAT_PCSRv8p2 is implemented, the following registers can be implemented in the Performance Monitors memory-mapped register space:

• PMCID1SR and PMCID2SR.
• PMPCSR.
• PMVIDSR.

See Performance Monitors external register views on page I5-7350.

If the PC Sample-based Profiling Extension is implemented with FEAT_PCSRv8p2 but the Performance Monitors Extension is not implemented, then the PC Sample-based Profiling Extension is implemented in its own memory-mapped register space, within the area that is reserved for the Performance Monitors, see Table H7-1. If CoreSight compliance is required:

• The management registers are defined as in Table K2-3 on page K2-7991.
• The support for PC Sample-based profiling is defined in the following registers:
  — PMDEVTYPE.MAJOR has the value 0x8.
  — PMDEVARCH.ARCHID has the value 0x0A10.

H7.1 About the PC Sample-based Profiling Extension

H7.1.3 Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN

The architecture permits IMPLEMENTATION DEFINED extensions to external debug to define mechanisms that make the values of the PC Sample-based profiling registers UNKNOWN. However, it requires that any such mechanism is disabled by default. This means that powerup or a hard reset of the PE must leave the PE in a state where the PC Sample-based Profiling Extension, if implemented, exhibits its architecturally-defined behavior.

Note

A mechanism that, when enabled, makes the PC Sample-based profiling registers UNKNOWN might use other sample-based profiling events that are appropriate for a use that is independent of PC Sample-based Profiling.

If no instruction has been retired since the PE left Debug state, Reset state, or a state where PC Sample-based profiling is prohibited, the sampled value is UNKNOWN. If an instruction has been retired but this is the first time the PMPCSR or EDPCSR is read since the PE left Reset state, the sampled value is permitted but not required to return the value \( 0xFFFFFFFF \).

H7.1.4 Pseudocode description of PC Sample-based Profiling

When PC Sample-based Profiling is implemented but not with FEAT_PCSRv8p2, the functionality is described by the pseudocode functions:

- CreatePCSample(), which populates a variable of type PCSample.
- EDPCSRlo[], which writes a PC sample to the EDPCSR and associated registers.

When FEAT_PCSRv8p2 is implemented, the functionality is described by the pseudocode functions:

- CreatePCSample(), which populates a variable of type PCSample.
- PMPCSR[], which writes a PC Sample to the PMPCSR and associated registers.

Chapter H8
About the External Debug Registers

This chapter provides some additional information about the external debug registers. It contains the following sections:

- *Relationship between external debug and System registers* on page H8-7136.
- *Endianness and supported access sizes* on page H8-7137.
- *Synchronization of changes to the external debug registers* on page H8-7138.
- *Memory-mapped accesses to the external debug interface* on page H8-7142.
- *External debug interface register access permissions* on page H8-7145.
- *External debug interface registers* on page H8-7149.
- *Cross-trigger interface registers* on page H8-7156.
- *External debug register resets* on page H8-7158.

**Note**

Where necessary, *Table K15-1 on page K15-8160* disambiguates the general register references used in this chapter.
# H8.1 Relationship between external debug and System registers

Table H8-1 shows the relationship between external debug registers and System registers. Where no relationship exists, the registers are not listed.

---

In addition:

- EDSCR.{TXfull, RXfull} are read-only aliases for DCCSR.{TXfull, RXfull}.
- EDPBCR.CORENPDRQ is a read/write alias for DBGPDCR.CORENPDRQ.
- EDPSCR.OSLP is a read-only alias for OSLR.OSLK.
- If the FEAT_DoubleLock is implemented, EDPSCR.DLK is a read-only function of OSLR.DLK.
H8.2 Endianness and supported access sizes

The debug registers, Performance Monitors registers, and CTI registers are implemented as memory-mapped peripherals. The Arm architecture requires memory-mapped peripherals to be little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the debug registers, Performance Monitors registers, and CTI registers, implementations must:

• Comply with the requirements of Supported access sizes on page I1-7320.
• Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.

——— Note ————

These requirements mean that a system implementing the debug registers using a 32-bit bus, such as an AMBA APB3, with a wider system interconnect must implement a bridge between the system and the debug bus that can split 64-bit accesses.

For accesses from the external debug interface, the size of an access is determined by the interface. For an access from an ADIv5-compliant Memory Access Port, MEM-AP, this is specified by the MEM-AP CSW register.
H8.3 Synchronization of changes to the external debug registers

This section describes the synchronization requirements for the external debug interface.

For more information on how these requirements affect debug, see:

- Synchronization and debug exceptions on page D2-2479 for exceptions taken from AArch64 state.
- Synchronization and debug exceptions on page G2-5916 for exceptions taken from AArch32 state.
- Synchronization and Halting debug events on page H3-7075.
- Synchronization of DCC and ITR accesses on page H4-7090.

This section refers to accesses from the external debug interface as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

**Note**

Synchronization requirements for AArch64 System registers on page D13-2863 and Synchronization of changes to AArch32 System registers on page G8-6138 define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads, and external writes as indirect writes.

For general information about synchronization, access completion, ordering, and observability, see Synchronization of memory-mapped registers on page I1-7322.

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. With the exception of DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, and DBGWVR<n>_EL1, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

Synchronization of DCC and ITR accesses on page H4-7090 describes the synchronization requirements for the DCC and ITR.

Changes to the IMPLEMENTATION DEFINED authentication interface are external writes to the authentication status registers by the Requester of the authentication interface. See Synchronization and the authentication interface on page H8-7139.

The external agent must be able to guarantee completion of a write. For example by:

- Marking the memory as Device-nGnRnE and executing a DSBB barrier, if the system supports this property.
- Reading back the value written.
- Some guaranteed property of the connection between the PE and the external agent.

**Note**

For an external Debug Access Port, access completion is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, accesses complete in order.

However, the external agent cannot force synchronization of completed writes without halting the PE. Executing an ISB instruction, either in Debug state or in Non-debug state, and exiting from Debug state forces synchronization.

For any given observer, external writes to the following register groups are guaranteed to be observable in the same order in which they complete:

- The breakpoint registers, DBGBCR<n>_EL1 and DBGBVR<n>_EL1.
- The watchpoint registers, DBGWCR<n>_EL1 and DBGWVR<n>_EL1.

This guarantee only applies to external writes to registers within one of these groups. There is no guarantee regarding the ordering of the observability of external writes within these groups with respect to external writes to registers, for example EDSCR, or between breakpoints and watchpoints, including watchpoints linked to context matching breakpoints.
About the External Debug Registers

H8.3 Synchronization of changes to the external debug registers

--- Note ---

This means that a debugger can rely on the external writes to be observed in the same order in which they complete. It does not mean that a debugger can rely on the external writes being observed in finite time.

---

In a simple sequential execution an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

If two or more interfaces simultaneously access a register, the behavior must be as if the accesses occurred atomically and in any order. This is described in Examples of the synchronization of changes to the external debug registers.

Some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means that simultaneous writes must be merged. Registers that have this property and support both external debug and System register access include DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, PMCR_EL0.{C,P}, PMOVSET_EL0, PMOVSCLR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, and PMSWINC_EL0. This last register is OPTIONAL and deprecated in the external debug interface.

H8.3.1 Synchronization and the authentication interface

Changes to the authentication interface are indirect writes to the state of the PE by the Requester of the authentication interface.

For an external debug interface read of any Authentication Status register, or an indirect read of the authentication interface made in determining the response to a subsequent external debug interface access, a change on the authentication interface must be observable following a subsequent explicit Context synchronization event, and:

- It is IMPLEMENTATION DEFINED whether a change is guaranteed to be observable in finite time.
- It is IMPLEMENTATION DEFINED whether a change is guaranteed to be observable following an entry to Debug state.

For a System register read of DBGAUTHSTATUS_EL1, a change on the authentication interface is guaranteed to be observable only after a Context synchronization event.

--- Note ---

- In some systems the authentication interface is fixed by configuration, or changed under the control of software. These systems can require explicit synchronization for any change to the authentication interface.
- In other systems, the authentication interface is controlled dynamically by an external agent. In these systems, it is desirable that changes to the authentication interface do not require explicit synchronization by software executing on the PE to be observable by subsequent external debug interface accesses, and are either observable in finite time or are synchronized by entry to Debug state. Otherwise there are scenarios where a debugger is not able to halt and debug the system.

---

H8.3.2 Examples of the synchronization of changes to the external debug registers

Example H8-1, Example H8-2 on page H8-7140, and Example H8-3 on page H8-7140 show the synchronization of changes to the external debug registers.

**Example H8-1 Order of synchronization of Breakpoint and Watchpoint register writes**

Initially DBGVR<n>_EL1 is 0x8000 and DBGBCR<n>_EL1 is 0x0181. This means that a breakpoint is enabled on the halfword T32 instruction at address 0x8000.

A sequence of external writes occurs in the following order:

1. 0x0000 is written to DBGBCR<n>_EL1, disabling the breakpoint.
2. 0x9000 is written to DBGVR<n>_EL1[31:0].
3. \(0x0061\) is written to DBGCR\(n\)_EL1, enabling a breakpoint on the halfword at address \(0x9002\).

The external writes must be observable to indirect reads in the same order as the external writes complete. This means that at no point is there a breakpoint enabled on either of the halfwords at address \(0x8002\) and \(0x9000\).

Similarly a breakpoint or watchpoint must be disabled:
- If both halves of a 64-bit address have to be updated.
- If any of the DBGCR\(n\)_EL1 or DBGWCR\(n\)_EL1 fields are modified at the same time as updating the address.

---

**Example H8-2 Simultaneous accesses to DTR registers**

Initially EDSCR.\{TXfull, TXU, ERR\} are 0. Then:
- \(0x00CD0A7A\) is directly written to DBGDTRX_EL0 by an MSR instruction.
- DBGDTRX_EL0 is indirectly read by the external debug interface.

These accesses might happen at the same time and in any order.

If the direct write of \(0x00CD0A7A\) to DBGDTRX_EL0 is handled first, then:
- The external debug interface read of DBGDTRX_EL0 clears EDSCR.TXfull to 0.
- EDSCR.\{TXU, ERR\} are unchanged.
- The external debug interface read returns \(0x00CD0A7A\).

If the indirect read of DBGDTRX_EL0 by the external debug interface is handled first, then:
- The external debug interface read of DBGDTRX_EL0 causes an underrun and as a result EDSCR.\{TXU, ERR\} are both set to 1.
- The external debug interface returns an UNKNOWN value.
- Writing \(0x00CD0A7A\) to DBGDTRX_EL0 sets DTRX to \(0x00CD0A7A\) and EDSCR.TXfull to 1.

---

**Example H8-3 Simultaneous writes to CLAIM registers**

Initially all CLAIM tag bits are 0. Then:
- \(0x01\) is written to DBGCLAIMSET_EL1 by a direct write, followed by an explicit *Context synchronization event*.
- \(0x02\) is written to DBGCLAIMSET_EL1 by an external write.

These events might happen at the same time and in either order.

After this:
- DBGCLAIMCLR_EL1 is read by a direct read.
- DBGCLAIMCLR_EL1 is read by an external read.

In this case, a direct read can return either \(0x01\) or \(0x03\), and the external read can return either \(0x02\) or \(0x03\).

The only permitted final result for the CLAIM tags is the value \(0x03\), because this would be the result regardless of whether \(0x01\) or \(0x02\) is written first. This is because the external write is guaranteed to be observable to a direct read in finite time. See *Synchronization requirements for AArch64 System registers* on page D13-2863.

It is not possible for a direct read to return \(0x01\) and the external read to return \(0x02\), because the writes to DBGCLAIMCLR_EL1 are serialized.

In the following scenario, there is only one permitted result. Both observers observe the value \(0x03\), and then, at the same time, two writes occur:
- \(0x04\) is written to DBGCLAIMSET_EL1 by a direct write, followed by an explicit *Context synchronization event*.
- \(0x01\) is written to DBGCLAIMCLR_EL1 by an external write.
In this case only permitted final result for the CLAIM tags is the value 0x06.
H8.4 Memory-mapped accesses to the external debug interface

Support for memory-mapped access to the external debug interface is OPTIONAL. When memory-mapped access to the external debug interface is supported, the external debug interface is accessed as a little-endian memory-mapped peripheral.

If the external debug interface is CoreSight compliant, then an OPTIONAL Software Lock can be implemented for memory-mapped accesses to each component.

The Software Lock is OPTIONAL and deprecated. If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented. If it is not implemented, the behavior is as if it is unlocked. The Software Locks are controlled by EDLSR and EDLAR, PMLSR and PMLAR, and CTILSR and CTILAR. See Management registers and CoreSight compliance on page K2-7991.

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components in the Core power domain.

With the exception of these registers and the effect of the Software Lock, the behavior of the memory-mapped accesses is the same as for other accesses to the external debug interface.

--- Note ---

The recommended memory-mapped accesses to the external debug interface are not compatible with the memory-mapped interface defined in Armv7. In particular:

- The memory map is different.
- Memory-mapped accesses do not behave differently to Debug Access Port accesses when OSLSR.OSLK == 1, meaning that the OS Lock is locked.

The following sections give more information about these memory-mapped accesses:

- Register access permissions for memory-mapped accesses.
- Synchronization of memory-mapped accesses to external debug registers on page H8-7144.

See also Supported access sizes on page I1-7320.

H8.4.1 Register access permissions for memory-mapped accesses

It is IMPLEMENTATION DEFINED whether unprivileged memory-mapped accesses are allowed. Privileged software is responsible for controlling memory-mapped accesses using the MMU.

If FEAT_Debugv8p4 is implemented, the Secure view of a debug component is mapped into Secure physical memory and the Non-secure view is mapped into Non-secure physical memory.

If FEAT_Debugv8p4 is implemented, the access permissions are different in each Security state, but Secure and Non-secure views of the debug components are identical. Arm recommends the views are located at the same address in the Secure and Non-secure physical address maps.

If memory-mapped accesses are made through an ADIv5 interface, the Debug Access Port can block the access using DBGSWENABLE. This is outside the scope of the Armv8-A architecture. See Arm® Debug Interface Architecture Specification ADIv5.0 to ADIv5.2.

Effect of the OPTIONAL Software Lock on memory-mapped access

For memory-mapped accesses, if other controls permit access to a register, the OPTIONAL Software Lock is implemented, and EDLSR.SLK, PMLSR.SLK, or CTILSR.SLK is set to 1, meaning the Software Lock is locked, then with the exception of the LAR itself:

- If other controls permit access to a register, then writes are ignored. That is:
  - Read/write (RW) registers become read-only, writes ignored (RO/WI).
  - Write-only (WO) registers become writes ignored (WI).
• Reads and writes have no side-effects. A side-effect is where a direct read or a direct write of a register creates an indirect write of the same or another register. When the Software Lock is locked, the indirect write does not occur.

• Writes to EDLR, PMLR, and CTILR are unaffected.

This behavior must also apply to all IMPLEMENTATION DEFINED registers.

For example, if EDLSR.SLK is set to 1:

• EDSCR.{TXfull, TXU, ERR} are unchanged by a memory-mapped read from DBGDTRTX_EL0.
• EDSCR.{RXfull, RXO, ERR} are unchanged by a memory-mapped write to DBGDTRRX_EL0 that is ignored.
• EDSCR.{ITE, ITO, ERR} are unchanged by a memory-mapped write to EDITR that is ignored.
• OSLR.OSLK is unchanged by a memory-mapped write to OSLAR_EL1 that is ignored.
• EDPCSR[63:32], EDCIDSR, and EDVIDSR are unchanged by a memory-mapped read from EDPCSR[31:0].

—— Note ———

Updating EDVIDSR, EDCIDSR, and EDPCSR hi are side-effects of reading EDPCSR lo, such that these registers contain the matching context for EDPCSR lo. The process that updates EDPCSR lo with PC samples is not a side-effect of the access. Reads of EDPCSR lo made when the Software Lock is locked can be used to profile software.

——— ———

• PMPCSR[63:32], PMCID1SR/PMCID2SR, and PMVIDSR are unchanged by a memory-mapped read from PMPCSR[31:0].

—— Note ———

Updating PMVIDSR, PMCID1SR/PMCID2SR, and PMPCSR[31:0] are side-effects of reading PMPCSR[63:32], such that these registers contain the matching context for PMPCSR[63:32]. The process that updates PMPCSR[63:32] with PC samples is not a side-effect of the access. Reads of PMPCSR[63:32] made when the Software Lock is locked can be used to profile software.

——— ———

• EDPRSR.{SDR, SPMAD, SDAD, SR, SPD} are unchanged by a memory-mapped read from EDPRSR.
• EDPRSR.SDAD is not set if an error response is returned due to a memory-mapped read or write of any debug register as the result of the value of the EDAD field.

• The CLAIM tags are unchanged by memory-mapped writes to DBGCLAIMSET_EL1 and DBGCLAIMCLR_EL1 which are ignored.

Similarly, if PMLSR.SLK is set to 1, then EDPRSR.SPMAD is not set if an error response is returned to a memory-mapped read or write of any Performance Monitors register due to the value of the EPMAD field.

Behavior of a not permitted memory-mapped access

Where the architecture requires that an external debug interface access generates an error response, a memory-mapped access must also generate an error response. However, it is IMPLEMENTATION DEFINED how the error response is handled, as this depends on the system.

Arm recommends that the error is returned as either:

• A synchronous external Data Abort.
• An SError interrupt.
H8.4.2 Synchronization of memory-mapped accesses to external debug registers

The synchronization requirements for memory-mapped accesses to the external debug interface is described in *Synchronization of changes to the external debug registers on page H8-7138* and *Synchronization of memory-mapped registers on page I1-7322*.

The synchronization requirements between different routes to the external debug interface, that is, between Debug Access Port accesses and memory-mapped accesses are IMPLEMENTATION DEFINED.
H8.5 External debug interface register access permissions

Some external accesses to debug registers and Performance Monitor registers are not permitted and return an error response if:

- The Core power domain is powered down or is in low-power state where the registers cannot be accessed.
- \text{OSLSR.OSLK} == 1, meaning the OS Lock is locked.
- \text{FEAT\_DoubleLock} is implemented and \text{DoubleLockStatus()} == \text{TRUE}, meaning the OS Double Lock is locked.
- The access is disabled by either the authentication interface or secure monitor.

Not all registers are affected in all of these cases. For details, see \textit{External debug interface register access permissions summary} on page H8-7146.

H8.5.1 External debug over powerdown and locks

Accessing registers using the external debug interface is not possible when the Debug power domain is off. In this case all accesses return an error.

External accesses to debug and Performance Monitors registers in the Core power domain are not permitted and return an error response if:

- The Core power domain is off or in low-power state where the registers cannot be accessed.
- \text{OSLSR.OSLK} == 1, meaning that the OS Lock is locked. This allows software to prevent external debugger modification of the registers while it saves and restores them over powerdown.
- \text{FEAT\_DoubleLock} is implemented and \text{DoubleLockStatus()} == \text{TRUE}. This means that the OS Double Lock is locked. The OS Double Lock ensures that it is safe to remove Core power by forcing the debug interface to be quiescent.

If \text{FEAT\_DoubleLock} is not implemented, the hardware must provide another method to safely remove Core power.

The OS Lock condition does not apply to the following debug registers:

- \text{OSLAR\_EL1}. This means that an external debugger can override this lock.
- \text{EDESR}. This means that an external debugger can program a debug event for when software unlocks the OS Lock. See \textit{OS Unlock Catch debug event} on page H3-7072.
- The ID registers that describe the PE to the debugger.

See also \textit{Debug registers to save over powerdown} on page H6-7125.

H8.5.2 External access disabled

Accesses are further controlled by the external authentication interface. An untrusted external debugger cannot program the breakpoint and watchpoint registers to generate spurious debug exceptions. If external invasive debugging is not enabled, these external accesses to the registers are disabled. If EL3 is implemented, then \text{SDCR} provides additional external access controls for those registers.

The disable applies to:

- The \text{DBGVR<n>\_EL1}, \text{DBGBCR<n>\_EL1}, \text{DBGWVR<n>\_EL1}, and \text{DBGWCR<n>\_EL1} registers.
- From Armv8.2, the \text{OSLAR\_EL1} register.

If \text{FEAT\_Debugv8p2} is not implemented, it is \text{IMPLEMENTATION DEFINED} whether the disable applies to \text{OSLAR\_EL1}.

If \text{FEAT\_Debugv8p4} is not implemented, the external debug interface cannot access these registers if any of the following are true:

- \text{ExternalInvasiveDebugEnabled()} == \text{FALSE}.
- \text{ExternalSecureInvasiveDebugEnabled()} == \text{FALSE}, EL3 is not implemented, and the PE behaves as if the Security state is Secure.
- \text{ExternalSecureInvasiveDebugEnabled()} == \text{FALSE}, EL3 is implemented and \text{SDCR.EDAD} == 1.
If FEAT_Debugv8p4 is implemented, Non-secure accesses from the external debug interface to these registers are not permitted if any of the following are true:

- EL3 is not implemented and the PE behaves as if the Security state is Secure.
- EL3 is implemented and SDCR.EDAD == 1.

The AllowExternalDebugAccess() pseudocode function describes these accessibility rules.

PEs might also provide an optional external debug interface to the Performance Monitor registers. The authentication interface and SDCR provide similar external access disable controls for those registers.

If FEAT_Debugv8p4 is not implemented, the external debug interface cannot access the Performance Monitor registers if any of the following are true:

- ExternalNoninvasiveDebugEnabled() == FALSE.
- ExternalSecureNoninvasiveDebugEnabled() == FALSE, EL3 is not implemented and the PE behaves as if the Security state is Secure.
- ExternalSecureNoninvasiveDebugEnabled() == FALSE, EL3 is implemented and SDCR.EPMAD == 1.

___ Note ___

- Arm recommends that secure software that is not making use of debug hardware does not lock out the external debug interface.
- Armv8-A does not provide the equivalent control over access to Trace extension registers, which means if FEAT_Debugv8p4 is implemented, the Non-secure and Secure views are identical.

If FEAT_Debugv8p4 is implemented, Non-secure accesses from the external debug interface to these registers are not permitted if any of the following are true:

- EL3 is not implemented and the PE behaves as if the Security state is Secure.
- EL3 is implemented and SDCR.EPMAD == 1.

The AllowExternalPMUAccess() pseudocode function describes these accessibility rules.

### H8.5.3 Behavior of a not permitted access

For an external debug interface access by a Debug Access Port, the Debug Access Port receives the error response and must signal this to the external debugger. For an ADIV5 implementation of a Debug Access Port, the error sets a sticky error flag in the Debug Access Port that the debugger can poll, and that suppresses further accesses until it is explicitly cleared.

When an error is returned because external access is disabled, and this is the highest priority error condition, a sticky error flag in EDPRSR is indirectly written to 1 as a side-effect of the access:

- For a debug register access when AllowExternalDebugAccess() == FALSE, EDPRSR.SDAD is indirectly written to 1.
- For Performance Monitor register access when AllowExternalPMUAccess() == FALSE, EDPRSR.SPMAD is indirectly written to 1.

The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see Register access permissions for memory-mapped accesses on page H8-7142.

If no error is returned, or the error is returned because of a higher priority error condition, the flag in EDPRSR is unchanged.

See also Behavior of a not permitted memory-mapped access on page H8-7143.

For more information, see Arm® Debug Interface Architecture Specification.

### H8.5.4 External debug interface register access permissions summary

For accesses to:

- IMPLEMENTATION DEFINED registers, see IMPLEMENTATION DEFINED registers on page H8-7147.
• OPTIONAL registers for CoreSight compliance, see Management registers and CoreSight compliance on page K2-7991.
• Reserved, unallocated, or unimplemented registers, writes to read-only registers, and reads of write-only registers, see Reserved and unallocated registers.

For all other external debug interface, CTI, and Performance Monitor registers, Table H8-3 on page H8-7152, Table H8-4 on page H8-7153, Table H8-6 on page H8-7157 and Table I3-1 on page I3-7340, show the response of the PE to accesses by the external debug interface.

### H8.5.5 IMPLEMENTATION DEFINED registers

For debug registers, Performance Monitors registers, CTI registers, register access permissions for IMPLEMENTATION DEFINED registers are IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there are additional constraints on memory-mapped accesses to registers. These constraints must also apply to IMPLEMENTATION DEFINED registers.

For more information see Register access permissions for memory-mapped accesses on page H8-7142.

If FEAT_DoPD is not implemented, the power domain of these registers in which these registers are implemented is also IMPLEMENTATION DEFINED. The registers must apply the constraint that if the OPTIONAL Software Lock is locked, writes are ignored and accesses have no side-effects.

If FEAT_DoPD is implemented, then:

• For debug registers and Performance Monitors registers, IMPLEMENTATION DEFINED registers are implemented in the Core power domain. Accesses return an error when the Core power domain is off or in a low-power state.
• For CTI registers, IMPLEMENTATION DEFINED registers are implemented in the Debug power domain.

### H8.5.6 Reserved and unallocated registers

The default access requirements for reserved and unallocated registers are described in Access requirements for reserved and unallocated registers on page I1-7324.

_____ Note _______

Reads of RO and writes to RO refers to the default access permissions for a register. For example, when the SLK field is set, meaning that the relevant registers become RO, a memory-mapped write to a RW register is ignored, and not treated as a reserved access.

The following reserved registers are RES0 in all conditions, other than when debug power is off:

• All reserved CTI registers.
• For the debug registers, and Performance Monitors registers, if the implementation is CoreSight architecture compliant, and either FEAT_DoPD is not implemented or the Core power domain is on, all reserved registers in the range 0xF00 - 0xFFF. See Management register access permissions on page K2-7992.

Otherwise, the architecture defines that:

1. If debug power is off, all register accesses, including reserved accesses, return an error.
2. For reserved debug registers and Performance Monitors registers, if FEAT_DoPD is implemented, and the Core power domain is off or in a low-power state, the response is an error. Otherwise the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0, when any of the following hold:

   | OFF | The Core power domain is either completely off or in a low-power state in which the Core power domain registers cannot be accessed. |
   | DLK | FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE. The OS Double Lock is locked. |
   | OSLK | OSLSR.OSLK == 1. The OS Lock is locked. |
3. In addition, for reserved debug registers in the address ranges 0x400 - 0x4FC and 0x800 - 0x8FC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:

   EDAD AllowExternalDebugAccess() == FALSE. External debug is disabled.

   ——— Note ———

   See also Behavior of a not permitted access on page H8-7146.

4. In addition, for reserved Performance Monitors registers in the address ranges 0x000 - 0xEFC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:

   EPMAD AllowExternalPMUAccess() == FALSE. External Performance Monitor access is disabled.

   ——— Note ———

   See also Behavior of a not permitted access on page H8-7146.

5. For reads of WO locations, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires a write to the location to return an error.

6. For writes of RO locations, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires a read to the location to return an error.

7. For reads and writes of locations for features that are not implemented, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires an access to the location to return an error if the feature is implemented.
H8.6 External debug interface registers

The external debug interface register map is described by:

- Performance Monitors external register views on page I5-7350.
- Cross-trigger interface registers on page H8-7156.
- External debug interface register map.

| 0xFD0–0xFFC | Management registers | Management registers and CoreSight compliance on page K2-7991             |

a. Supported only if the OPTIONAL PC Sample-Based Profiling is implemented but FEAT_PCSRv8p2 is not implemented. See Chapter H7 The PC Sample-based Profiling Extension.

b. A 64-bit register mapped to a pair of 32-bit locations. Doubleword accesses to this register are not guaranteed to be 64-bit single copy atomic. See Endianness and supported access sizes on page H8-7137. Software must ensure a breakpoint or watchpoint is disabled before altering the value register.

c. Implemented breakpoints and watchpoints only. n is the breakpoint or the watchpoint number.

---

**Note**

All other locations are reserved.
### H8.6.1 Access permissions for the External debug interface registers

Table H8-3 on page H8-7152 and Table H8-4 on page H8-7153 show the access permissions for the external debug interface registers in an Armv8-A Debug implementation. The terms are defined as follows:

**Domain**

This describes the power domain in which the register is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.

If FEAT_DoPD is implemented, most External debug interface registers are in the Core power domain, as shown in Table H8-3 on page H8-7152.

If FEAT_DoPD is not implemented, most of the registers are in the Debug Power Domain, as shown in Table H8-4 on page H8-7153.

**Conditions**

This lists the conditions under which the access is attempted.

To determine the access permissions for a register, read these columns from left to right, and stop at first column that lists the condition as being true.

The conditions are:

- Off: The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed, and if FEAT_DoPD is not implemented, EDPRSR.PU will read as 0.

  **Note**

  When the Core power domain is off, or in a low-power state, a debugger is permitted to access a debug register that is implemented in the external Debug power domain.

  When the Debug power domain is off, all accesses to the registers in the external Debug power domain return an error.

- DLK: FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE. The OS Double Lock is locked. If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented and so Table H8-3 on page H8-7152 does not include this column.

- OSLK: OSLR.OSLK == 1. The OS Lock is locked.

- EDAD: AllowExternalDebugAccess() == FALSE. External debug access is disabled for the access. If FEAT_Debugv8p4 is implemented, this applies only for Non-secure accesses to the register. See also Behavior of a not permitted access on page H8-7146.

- EPMAD: AllowExternalPMUAccess() == FALSE. Access to the external Performance Monitors is disabled for the access. If FEAT_Debugv8p4 is implemented, this applies only for Non-secure accesses to the register. See also Behavior of a not permitted access on page H8-7146.

- SLK: The Software Lock is implemented and SoftwareLockStatus() == TRUE. This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked. See Register access permissions for memory-mapped accesses on page H8-7142. If FEAT_DoPD is implemented, the Software Lock is not locked or not implemented, this column is ignored.

- Default: This provides the default access permissions, if there are no conditions that prevent access to the register.

The access permissions are:

- This means that the default access permission applies. See the Default column, or the SLK column, if applicable.

- RO: This means that the register or field is read-only, and:
  - Unless the register description states otherwise, a RO field in an RW register ignores writes.
  - Where the SLK control makes a RW register RO, the register ignores writes.
**About the External Debug Registers**

**H8-6 External debug interface registers**

**RW**
This means that the register or field is read/write. Individual fields within the register might be RO or WO. See the relevant register description for details.

**RC**
This means that a read of the register bit clears the field to 0.

**WO**
This means that the register or field is write-only. Unless the register description states otherwise, a WO field in a RW register returns an UNKNOWN value on a read of the register.

**WI**
This means that the register or field ignores writes.

**IMP DEF**
This means that the access permissions are IMPLEMENTATION DEFINED.

If optional memory-mapped access to the external debug interface is supported, there might be additional constraints on memory-mapped accesses. See *Register access permissions for memory-mapped accesses on page H8-7142*.

For the reset values for the external debug interface registers, see *Table H8-7 on page H8-7159*.

a. Implemented only if the PC Sample-based profiling Extension is implemented.
b. If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether an error is returned. See External access disabled on page H8-7145. If no error is returned, the access is permitted.
c. Some bits are in the Debug power domain and some bits are in the Core power domain. See register field descriptions for information.
d. Implemented breakpoints and watchpoints only. \( n \) is the breakpoint or watchpoint number.
e. It is IMPLEMENTATION DEFINED whether an error is returned. See External debug over powerdown and locks on page H8-7145. If no error is returned, the access is permitted.
H8.7 Cross-trigger interface registers

The embedded Cross-trigger Interface, CTI, is located within its own block of the external debug memory map. There must be one such block for each PE.

If the CTI of a PE does not implement the CTIDEVAFF0 or CTIDEVAFF1 registers it must be located 64KB above the debug registers in the external debug interface.

When FEAT_Debugv8p4 is implemented, each debug component has a Secure and Non-secure view. The Secure view of a debug component is mapped into Secure physical memory and the Non-secure view of a debug component is mapped into Non-secure memory. Apart from access conditions, the Non-secure and Secure views of the debug components are identical.

Table H8-5 shows the CTI register map.

*a. Implemented triggers only (including triggers that are not connected). \( n \) is the trigger number.*

For the reset values of the CTI registers, see Table H8-8 on page H8-7160.
H8.8   External debug register resets

Each register or field has a defined reset domain:

• Registers and fields in the Warm reset domain are also reset by a Cold reset and unchanged by an External
  Debug reset that is not coincident with a Cold reset or a Warm reset.

• Registers and fields in the Cold reset domain are unchanged by a Warm reset or an External Debug reset that
  is not coincident with a Cold reset.

• Registers and fields in the External Debug reset domain are unchanged by a Cold reset or a Warm reset that
  is not coincident with an External Debug reset.

A reset might change the value of a register. Specific rules apply to the observability of registers in the External
Debug reset domain by indirect reads from the Core power domain when an External Debug reset is asserted without
a coincident Cold reset. For more information, see Synchronization of changes to the external debug registers on
page H8-7138.

Table H8-7 on page H8-7159 and Table H8-8 on page H8-7160 show the external debug register and CTI register
resets. For other debug registers and Performance Monitors registers, see Management register resets on
page K2-7998 and Power domains and Performance Monitors registers reset on page I3-7341.

Note
By reference to Figure H6-1 on page H6-7129 the power domain can be deduced from the reset domain. Table K2-9
on page K2-7998 also shows reset power domains.

Table H8-7 on page H8-7159 and Table H8-8 on page H8-7160 do not include:

• Read-only identification registers, such as Processor ID Registers and PMCFGR, that have a fixed value from
  reset.

• Read-only status registers, such as EDSCR.RW, that are evaluated each time the register is read and that have
  no meaningful reset value.

• Write-only registers, such as EDRCR, that only have an effect on writes, and have no meaningful reset value.

• Read/write registers, such as breakpoint and watchpoint registers, and EDPRCR.CORENPDRQ, that alias
  other registers. The reset values are described by the descriptions of those other registers.

• IMPLEMENTATION DEFINED registers. The reset values and reset domains of these registers are also
  IMPLEMENTATION DEFINED and might be UNKNOWN.

All other fields in the registers are set to an IMPLEMENTATION DEFINED value that can be UNKNOWN. The register is
in the specified reset domain.

Note
An IMPLEMENTATION DEFINED reset value, which can be UNKNOWN, means that hardware is not required to reset
the register on the specified reset, but software must not rely on the register being preserved over reset.

a. If FEAT_DoPD is not implemented, the powerup request is the EDPRCR.COREPURQ control bit.
b. If FEAT_DoPD is not implemented, on a Cold reset into AArch64 state, DBGPRCR_EL1.CORENPDRQ resets to the value of EDPRCR.COREPURQ. On a Cold reset into AArch32 state, DBGPRCR.CORENPDRQ resets to the value of EDPRCR.COREPURQ. If an External Debug reset and a Cold reset coincide, both EDPRCR.COREPURQ and the CORENPDRQ field of the appropriate System register are reset to 0.

Table H8-8 shows the reset values for the CTI registers

Chapter H9
External Debug Register Descriptions

This chapter provides a description of the external debug registers.

It contains the following sections:

• *About the debug registers* on page H9-7162.
• *External debug registers* on page H9-7163.
• *Cross-Trigger Interface registers* on page H9-7272.
H9.1 About the debug registers

The following sections describe the registers that are accessible through the external debug interface:

- *External debug registers* on page H9-7163.
- *Cross-Trigger Interface registers* on page H9-7272.
H9.2 External debug registers

This section describes the debug registers that are accessible through the external debug interface and are used for external debug.

This section lists the registers that are accessible through the external debug interface.
H9.2.1  DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

**Configurations**

External register DBGAUTHSTATUS_EL1[31:0] is architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0].

External register DBGAUTHSTATUS_EL1[31:0] is architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0].

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

DBGAUTHSTATUS_EL1 is a 32-bit register.

**Field descriptions**

The DBGAUTHSTATUS_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8-7</td>
<td>SNID</td>
</tr>
<tr>
<td>5-4</td>
<td>SID</td>
</tr>
<tr>
<td>3-2</td>
<td>NSID</td>
</tr>
<tr>
<td>1-0</td>
<td>NSID</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

*When FEAT_Debugv8p4 is implemented:*

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

*Otherwise:*

Secure non-invasive debug.

*0b00*  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.

*0b10*  Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.

*0b11*  Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

**SID, bits [5:4]**

Secure invasive debug.

*0b00*  Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.

*0b10*  Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.

*0b11*  Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.
NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

Non-secure non-invasive debug.
- 0b00: Not implemented. EL3 is not implemented and the effective value of SCR_EL3.NS is 0.
- 0b11: Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

If the effective value of SCR_EL3.NS is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.
All other values are reserved.

Otherwise:

Non-secure non-invasive debug.
- 0b00: Not implemented. EL3 is not implemented and the effective value of SCR_EL3.NS is 0.
- 0b10: Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
- 0b11: Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.
All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.
- 0b00: Not implemented. EL3 is not implemented and the effective value of SCR_EL3.NS is 0.
- 0b10: Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
- 0b11: Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.
All other values are reserved.

Accessing the DBGAUTHSTATUS_EL1:

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFB8</td>
<td>DBGAUTHSTATUS_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.2   DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose
Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

Configurations
External register DBGBCR<n>_EL1[31:0] is architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].
External register DBGBCR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGBCR<n>[31:0].
DBGBCR<n>_EL1 is in the Core power domain.
If breakpoint n is not implemented then accesses to this register are:
- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes
DBGBCR<n>_EL1 is a 32-bit register.

Field descriptions
The DBGBCR<n>_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>24</td>
<td>BT</td>
</tr>
<tr>
<td>23</td>
<td>LBN</td>
</tr>
<tr>
<td>20</td>
<td>SSC</td>
</tr>
<tr>
<td>19</td>
<td>RES0</td>
</tr>
<tr>
<td>16</td>
<td>BAS</td>
</tr>
<tr>
<td>15</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td></td>
</tr>
<tr>
<td>13</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td></td>
</tr>
<tr>
<td>9</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]
Reserved, RES0.

BT, bits [23:20]
Breakpoint Type. Possible values are:
- 0b0000: Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.
- 0b0001: As 0b0000 but linked to a Context matching breakpoint.
- 0b0010: Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value.
- 0b0011: As 0b0010, with linking enabled.
- 0b0100: Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction to be stepped.
- 0b0101: As 0b0100, with linking enabled.
Unlinked CONTEXTIDR_EL1 match. DBGBVR<\(n\rangle\_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.

As 0b0110, with linking enabled.

Unlinked VMID match. DBGBVR<\(n\rangle\_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.

As 0b1000, with linking enabled.

Unlinked VMID and Context ID match. DBGBVR<\(n\rangle\_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1, and DBGBVR<\(n\rangle\_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.

As 0b1010, with linking enabled.

Unlinked CONTEXTIDR_EL2 match. DBGBVR<\(n\rangle\_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.

As 0b1100, with linking enabled.

Unlinked Full Context ID match. DBGBVR<\(n\rangle\_EL1.ContextID is compared against CONTEXTIDR_EL1, and DBGBVR<\(n\rangle\_EL1.ContextID2 is compared against CONTEXTIDR_EL2.

As 0b1110, with linking enabled.

Constraints on breakpoint programming mean some values are reserved under certain conditions. For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page D2-2442 and *Reserved DBGBCR<\(n\rangle\_EL1.BT values* on page D2-2447.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**LBN, bits [19:16]**

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<\(n\rangle\_EL1.E is 0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**SSC, bits [15:14]**

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint \(n\) is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the \{HMC, SSC, PMC\} fields. For more information, including the effect of programming the fields to a reserved set of values, see *Reserved DBGBCR<\(n\rangle\_EL1.[SSC, HMC, PMC] values* on page D2-2448.

For more information on the operation of the SSC, HMC, and PMC fields, see *Execution conditions for which a breakpoint generates Breakpoint exceptions* on page D2-2442.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.
HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see *Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-2442.*

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

*When AArch32 is supported at any Exception level:*

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.
For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0011</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBVR&lt;n&gt;_EL1 + 2</td>
<td>Use for T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for A64 and A32 instructions</td>
</tr>
</tbody>
</table>

All other values are reserved.
For more information, see *Using the BAS field in Address Match breakpoints on page G2-5883.*

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Match instruction at</th>
<th>Constraint for debuggers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>-</td>
<td>Use for a match anywhere breakpoint</td>
</tr>
<tr>
<td>0b0011</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for stepping T32 instructions</td>
</tr>
<tr>
<td>0b1100</td>
<td>DBGBVR&lt;n&gt;_EL1 + 2</td>
<td>Use for stepping T32 instructions</td>
</tr>
<tr>
<td>0b1111</td>
<td>DBGBVR&lt;n&gt;_EL1</td>
<td>Use for stepping A64 and A32 instructions</td>
</tr>
</tbody>
</table>

For more information, see *Using the BAS field in Address Match breakpoints on page G2-5883.*

For Context matching breakpoints, this field is RES1 and ignored.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

*Otherwise:*

Reserved, RES1.
Bits [4:3]
Reserved, RES0.

PMC, bits [2:1]
Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event
for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields,
and there are constraints on the permitted values of the \{HMC, SSC, PMC\} fields. For more
information see the DBGBCR\(<n>_EL1.SSC description.
For more information on the operation of the SSC, HMC, and PMC fields, see Execution conditions
for which a breakpoint generates Breakpoint exceptions on page D2-2442.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

E, bit [0]
Enable breakpoint DBGBVR\(<n>_EL1. Possible values are:
0b0 Breakpoint disabled.
0b1 Breakpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Accessing the DBGBCR\(<n>_EL1:

--- Note ---
SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new
definition from Armv8.4. Refer to the Pseudocode definitions for more information.

---

DBGBCR\(<n>_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x408 + (16 * n)</td>
<td>DBGBCR(&lt;n&gt;_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and
  SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and
  !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.3  DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

**Purpose**

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

**Configurations**

External register DBGBVR<n>_EL1[63:0] is architecturally mapped to AArch64 System register DBGBCR<n>_EL1[63:0].

External register DBGBVR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGBCR<n>[31:0].

If the breakpoint is context-aware and EL2 is implemented then External register DBGBVR<n>_EL1[63:32] is architecturally mapped to AArch32 System register DBGBCR<n>[31:0]. Otherwise, there is no External register access to DBGBVR<n>_EL1[63:32] from AArch32 state.

DBGBVR<n>_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

**Attributes**

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

- When DBGBCR<n>_EL1.BT == 0b000, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT == 0b001, 0b011, or 0b110, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT == 0b100, this register holds a VMID.
- When DBGBCR<n>_EL1.BT == 0b101, this register holds a VMID and a Context ID.
- When DBGBCR<n>_EL1.BT == 0b111, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

**Field descriptions**

The DBGBVR<n>_EL1 bit assignments are:

When DBGBCR<n>_EL1.BT == 0b000:

- **RESS[14:4]**, bits [63:53]:
  - Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.
  - Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:
    - The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

**VA[52:49], bits [52:49]**

*When FEAT_LVA is implemented:*

- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On an External debug reset, the value of this field is unchanged.
- On a Warm reset, the value of this field is unchanged.

*Otherwise:*

**VA[48:2], bits [48:2]**

If the address is being matched in an AArch64 stage 1 translation regime:
- This field contains bits[48:2] of the address for comparison.
- When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.
- On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On an External debug reset, the value of this field is unchanged.
- On a Warm reset, the value of this field is unchanged.

**Bits [1:0]**

Reserved, RES0.

*When DBGBCR<n>_EL1.BT == 0b001x:*

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ContextID</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**ContextID, bits [31:0]**

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when FEAT_VHE is implemented, EL2 is using AArch64, HCR_EL2.E2H is 1, and either:
- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against the following:
- CONTEXTIDR when the PE is executing at AArch32
- CONTEXTIDR_EL1 when the PE is executing at AArch64.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
- On an External debug reset, the value of this field is unchanged.
- On a Warm reset, the value of this field is unchanged.
When DBGBCR<\text{n}>_EL1.BT == 0b011x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

63 32 31 0

\begin{tabular}{|c|}
\hline
RES0 \hline
\end{tabular}

\begin{tabular}{|c|}
\hline
ContextID \hline
\end{tabular}

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

When DBGBCR<\text{n}>_EL1.BT == 0b100x and EL2 is implemented:

63 48 47 40 39 32 31 0

\begin{tabular}{|c|c|}
\hline
RES0 & VMID[15:8] \hline
\end{tabular}

\begin{tabular}{|c|c|}
\hline
VMID[7:0] & RES0 \hline
\end{tabular}

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

\textbf{When FEAT_VHE is implemented and VTCR_EL2.VS == 1:}

Extension to VMID[7:0]. See DBGBVR<\text{n}>_EL1.VMID[7:0] for more details.
If EL2 is using AArch32, this field is RES0.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

\textit{Otherwise:}

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.
The VMID is 8 bits when any of the following are true:
\begin{itemize}
  \item EL2 is using AArch32.
  \item VTCR_EL2.VS is 0.
  \item FEAT_VMID16 is not implemented.
\end{itemize}
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Bits [31:0]

Reserved, RES0.
When DBGBCR<n>_EL1.BT == 0b101x and EL2 is implemented:

| Bits [63:48] | Reserved, RES0. |
| VMID[15:8], bits [47:40] | When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1: |
| VMID[7:0], bits [39:32] | VMID value for comparison. |
| ContextID, bits [31:0] | Context ID value for comparison against CONTEXTIDR_EL1. |

Otherwise:

| Bits [31:0] | Reserved, RES0. |

When DBGBCR<n>_EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

---

**ContextID2, bits [63:32]**

Context ID value for comparison against CONTEXTIDR_EL2.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.
External Debug Register Descriptions
H9.2 External debug registers

Bits [31:0]
Reserved, RES0.

When DBGBCR<\(n\)> EL1.BT == 0b111x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

ContextID2, bits [63:32]
Context ID value for comparison against CONTEXTIDR_EL2.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

ContextID, bits [31:0]
Context ID value for comparison against CONTEXTIDR_EL1.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Accessing the DBGVR<\(n\)> EL1:

Note
SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGVR<\(n\)> EL1[63:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>(0 \times 400 + (16 \times n))</td>
<td>DBGVR&lt;(n)&gt; EL1</td>
<td>63:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.4 DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

**Purpose**

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0. The architecture does not define any functionality for the CLAIM tag bits.

--- Note ---

CLAIM tags are typically used for communication between the debugger and target software. Used in conjunction with the DBGCLAIMSET_EL1 register.

**Configurations**

External register DBGCLAIMCLR_EL1[31:0] is architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

External register DBGCLAIMCLR_EL1[31:0] is architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

DBGCLAIMCLR_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMCLR_EL1 is a 32-bit register.

**Field descriptions**

The DBGCLAIMCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:8]</td>
<td>RAZ/SBZ</td>
</tr>
<tr>
<td>Bits [7:0]</td>
<td>CLAIM</td>
</tr>
</tbody>
</table>

Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

On a Cold reset, this field resets to 0.

**Accessing the DBGCLAIMCLR_EL1:**

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xA4</td>
<td>DBGCLAIMCLR_EL1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.5 DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

**Purpose**

- Used by software to set the CLAIM tag bits to 1.
- The architecture does not define any functionality for the CLAIM tag bits.

**Note**

CLAIM tags are typically used for communication between the debugger and target software.

**Configurations**

- External register DBGCLAIMSET_EL1[31:0] is architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].
- External register DBGCLAIMSET_EL1[31:0] is architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].
- DBGCLAIMSET_EL1 is in the Core power domain.
- An implementation must include eight CLAIM tag bits.

**Attributes**

DBGCLAIMSET_EL1 is a 32-bit register.

**Field descriptions**

The DBGCLAIMSET_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RAZ/SBZ</td>
</tr>
<tr>
<td>8-0</td>
<td>CLAIM</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

- Reserved, RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

**CLAIM, bits [7:0]**

- Set CLAIM tag bits.
- This field is RAO.
- Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.
- Writing 0 to one of these bits has no effect.

**Accessing the DBGCLAIMSET_EL1:**

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA0</td>
<td>DBGCLAIMSET_EL1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.6  DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

**Purpose**

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

**Configurations**

External register DBGDTRRX_EL0[31:0] is architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

External register DBGDTRRX_EL0[31:0] is architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

DBGDTRRX_EL0 is in the Core power domain.

**Attributes**

DBGDTRRX_EL0 is a 32-bit register.

**Field descriptions**

The DBGDTRRX_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Update DTRRX</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Update DTRRX.

Writes to this register:

- If RXfull is set to 1, set DTRRX to UNKNOWN.
- If RXfull is set to 0, update the value in DTRRX.

After the write, RXfull is set to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**Accessing the DBGDTRRX_EL0:**

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x080</td>
<td>DBGDTRRX_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.7   DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

Configurations

External register DBGDTRTX_EL0[31:0] is architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

External register DBGDTRTX_EL0[31:0] is architecturally mapped to AArch32 System register DBGDTRXTxin[31:0].

DBGDTRTX_EL0 is in the Core power domain.

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions

The DBGDTRTX_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Return DTRTX</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
</tr>
</tbody>
</table>

Reads of this register:

- If TXfull is set to 1, return the last value written to DTRTX.
- If TXfull is set to 0, return an UNKNOWN value.

After the read, TXfull is cleared to 0.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Accessing the DBGDTRTX_EL0:

If EDSCRITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
• It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRTX_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x08C</td>
<td>DBGDTRTX_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.

• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.

• Otherwise accesses to this register generate an error response.
H9.2.8  DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

**Purpose**

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

**Configurations**

External register DBGWCR<n>_EL1[31:0] is architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

External register DBGWCR<n>_EL1[31:0] is architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

DBGWCR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

**Attributes**

DBGWCR<n>_EL1 is a 32-bit register.

**Field descriptions**

The DBGWCR<n>_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>0b00000</td>
</tr>
<tr>
<td>29</td>
<td>MASK</td>
<td>0b00000</td>
</tr>
<tr>
<td>28</td>
<td>RES0</td>
<td>0b00000</td>
</tr>
<tr>
<td>24</td>
<td>LBN</td>
<td>0b00000</td>
</tr>
<tr>
<td>23</td>
<td>SSC</td>
<td>0b00000</td>
</tr>
<tr>
<td>21</td>
<td>BAS</td>
<td>0b00000</td>
</tr>
<tr>
<td>19</td>
<td>LSC</td>
<td>0b00000</td>
</tr>
<tr>
<td>16</td>
<td>PAC</td>
<td>0b00000</td>
</tr>
<tr>
<td>15</td>
<td>E</td>
<td>0b00000</td>
</tr>
</tbody>
</table>

When the E field is zero, all the other fields in the register are ignored.

**Bits [31:29]**

Reserved, RES0.

**MASK, bits [28:24]**

Address mask. Only objects up to 2GB can be watched using a single mask.

- 0b08000  No mask.
- 0b08001  Reserved.
- 0b08010  Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00001 masking 3 address bits (0b000000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Bits [23:21]
Reserved, RES0.

WT, bit [20]
Watchpoint type. Possible values are:
0b0  Unlinked data address match.
0b1  Linked data address match.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

LBN, bits [19:16]
Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

SSC, bits [15:14]
Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.
For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2453.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

HMC, bit [13]
Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.
For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2453.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

BAS, bits [12:5]
Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<\alpha>_EL1 is being watched.

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxxxxxx1</td>
<td>Match byte at DBGWVR&lt;\alpha&gt;_EL1</td>
</tr>
<tr>
<td>xxxxxxx1x</td>
<td>Match byte at DBGWVR&lt;\alpha&gt;_EL1 + 1</td>
</tr>
<tr>
<td>xxxxxxx1xx</td>
<td>Match byte at DBGWVR&lt;\alpha&gt;_EL1 + 2</td>
</tr>
<tr>
<td>xxxxxxx1xxx</td>
<td>Match byte at DBGWVR&lt;\alpha&gt;_EL1 + 3</td>
</tr>
</tbody>
</table>
In cases where DBGWVR<\textsuperscript{n}>_EL1 addresses a double-word:

<table>
<thead>
<tr>
<th>BAS</th>
<th>Description, if DBGWVR&lt;\textsuperscript{n}&gt;_EL1[2] == 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxx1xxxx</td>
<td>Match byte at DBGWVR&lt;\textsuperscript{n}&gt;_EL1 + 4</td>
</tr>
<tr>
<td>xx1xxxxx</td>
<td>Match byte at DBGWVR&lt;\textsuperscript{n}&gt;_EL1 + 5</td>
</tr>
<tr>
<td>x1xxxxxx</td>
<td>Match byte at DBGWVR&lt;\textsuperscript{n}&gt;_EL1 + 6</td>
</tr>
<tr>
<td>1xxxxxxx</td>
<td>Match byte at DBGWVR&lt;\textsuperscript{n}&gt;_EL1 + 7</td>
</tr>
</tbody>
</table>

If DBGWVR<\textsuperscript{n}>_EL1[2] == 1, only BAS[3:0] is used. Arm deprecates setting DBGWVR<\textsuperscript{n}>_EL1[2] == 1.

The valid values for BAS are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See Restricted DBGWCR<\textsuperscript{n}>.BAS values on page G2-5905.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

LSC, bits [4:3]
Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- 00: Match instructions that load from a watchpointed address.
- 01: Match instructions that store to a watchpointed address.
- 10: Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

PAC, bits [2:1]
Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2453.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

E, bit [0]
Enable watchpoint n. Possible values are:

- 0: Watchpoint disabled.
- 1: Watchpoint enabled.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.
Accessing the DBGWCR<n>_EL1:

**Note**
SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWCR<n>_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x808 + (16 * n)</td>
<td>DBGWCR&lt;n&gt;_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
**H9.2.9 DBGWVR<\textit{n}>_EL1, Debug Watchpoint Value Registers, \textit{n} = 0 - 15**

The DBGWVR<\textit{n}>_EL1 characteristics are:

**Purpose**

Holds a data address value for use in watchpoint matching. Forms watchpoint \textit{n} together with control register DBGWCR<\textit{n}>_EL1.

**Configurations**

External register DBGWVR<\textit{n}>_EL1[63:0] is architecturally mapped to AArch64 System register DBGWVR<\textit{n}>_EL1[63:0].

External register DBGWVR<\textit{n}>_EL1[31:0] is architecturally mapped to AArch32 System register DBGWVR<\textit{n}>[31:0].

DBGWVR<\textit{n}>_EL1 is in the Core power domain.

If watchpoint \textit{n} is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

**Attributes**

DBGWVR<\textit{n}>_EL1 is a 64-bit register.

**Field descriptions**

The DBGWVR<\textit{n}>_EL1 bit assignments are:

```
<table>
<thead>
<tr>
<th>63</th>
<th>53</th>
<th>52</th>
<th>49</th>
<th>48</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
</table>
```

**RESS[14:4], bits [63:53]**

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

**VA[52:49], bits [52:49]**

*When FEAT_LVA is implemented:*

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

*Otherwise:*

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RES0.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Bits [1:0]

Reserved, RES0.

Accessing the DBGWVR<n>_EL1:

--- Note ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWVR<n>_EL1[63:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x800 + (16 * n)</td>
<td>DBGWVR&lt;n&gt;_EL1</td>
<td>63:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.10   **EDAA32PFR, External Debug Auxiliary Processor Feature Register**

The EDAA32PFR characteristics are:

**Purpose**

Provides information about implemented PE features.

--- **Note** ---

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported at any Exception level.

---

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D13-2867.

**Configurations**

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDAA32PFR is a 64-bit register.

**Field descriptions**

The EDAA32PFR bit assignments are:

<table>
<thead>
<tr>
<th>Bit 63:20</th>
<th>Bit 19:10</th>
<th>Bit 11:8</th>
<th>Bit 7:4</th>
<th>Bit 3:0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>MSA_frac</td>
<td>EL3</td>
<td>EL2</td>
<td>PMSA</td>
</tr>
</tbody>
</table>

**Bits [63:20]**

Reserved, RES0.

**MSA_frac, bits [19:16]**

*When EDAA32PFR.PMSA == 0b0000 and EDAA32PFR.VMSA == 0b1111:*

Memory System Architecture fractional field. This holds the information on additional Memory System Architectures supported. Defined values are:

- 0b0001: PMSAv8-64 supported in all translation regimes. VMSAv8-64 not supported.
- 0b0010: PMSAv8-64 supported in all translation regimes. In addition to PMSAv8-64, stage 1 EL1&0 translation regime also supports VMSAv8-64.

All other values are reserved.

--- **Note** ---

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

---

*Otherwise:*

Reserved, RES0.

**EL3, bits [15:12]**

*When EDPFR.EL3 == 0b0000:*

AArch32 EL3 Exception level handling. Defined values are:

- 0b0000: EL3 is not implemented or can be executed in AArch64 state.
- 0b0001: EL3 can be executed in AArch32 state only.

All other values are reserved.

--- **Note** ---

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.
Otherwise:
Reserved, RAZ.

EL2, bits [11:8]

When EDPFR.EL2 == 0b0000:
AArch32 EL2 Exception level handling. Defined values are:
0b0000   EL2 is not implemented or can be executed in AArch64 state.
0b0001   EL2 can be executed in AArch32 state only.
All other values are reserved.

Note EDPFR.EL1, EL0 indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:
Reserved, RAZ.

PMSA, bits [7:4]
Indicates support for a 32-bit PMSA. Defined values are:
0b0000   PMSA-32 not supported.
0b0100   PMSAv8-32 supported.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

VMSA, bits [3:0]

When EDAA32PFR.PMSA != 0b0000:
Indicates support for a VMSA in addition to a 32-bit PMSA Defined values are:
0b0000   VMSA not supported.
All other values are reserved.

When EDAA32PFR.PMSA == 0b0000:
Defined values are:
0b0000   VMSAv8-64 supported.
0b1111   Memory system architecture described by EDAA32PFR.MSA_frac.
All other values are reserved.
In Armv8-A, the only permitted value is 0b0000.

Otherwise:
Reserved, RAZ.

Accessing the EDAA32PFR:
EDAA32PFR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x060</td>
<td>EDAA32PFR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.
H9.2.11 EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

**Purpose**

Allows implementations to support IMPLEMENTATION DEFINED controls.

**Configurations**

It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain.

If FEAT_DoPD is implemented, this register is implemented in the Core power domain.

If FEAT_DoPD is not implemented, the power domain that this register is implemented in is IMPLEMENTATION DEFINED.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, OSLSR_EL1.OSLK = 1, and when the Core is powered off.

**Attributes**

EDACR is a 32-bit register.

**Field descriptions**

The EDACR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to an architecturally UNKNOWN value.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to an architecturally UNKNOWN value.
  - On a Warm reset, the value of this field is unchanged.

**Accessing the EDACR:**

EDACR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x094</td>
<td>EDACR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.
H9.2.12 EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

**Purpose**
Provides information to identify an external debug component.
For more information, see About the Component Identification scheme on page K2-8002.

**Configurations**
Implementation of this register is OPTIONAL.
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.
This register is required for CoreSight compliance.

**Attributes**
EDCIDR0 is a 32-bit register.

**Field descriptions**
The EDCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8 Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>7:0 PRMBL_0</td>
<td>Preamble</td>
</tr>
<tr>
<td></td>
<td>Reads as 0x0D.</td>
</tr>
</tbody>
</table>

**Accessing the EDCIDR0:**
EDCIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF0</td>
<td>EDCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.13 EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Component Identification scheme on page K2-8002.*

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR1 is a 32-bit register.

**Field descriptions**

The EDCIDR1 bit assignments are:

```
+---+---+---+---+---+
|   |   |   |   |   |
| 31| 30| 29| 28| 27|
| RES0 | CLASS | PRMBL_1 |
+---+---+---+---+---+
```

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class.

- **0b1001** CoreSight component.

- Other values are defined by the CoreSight Architecture.

  This field reads as 0x9.

**PRMBL_1, bits [3:0]**

Preamble.

Reads as 0b0000.

**Accessing the EDCIDR1:**

EDCIDR1 can be accessed through the external debug interface:

```
<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF4</td>
<td>EDCIDR1</td>
</tr>
</tbody>
</table>
```

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.14 EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Component Identification scheme* on page K2-8002.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR2 is a 32-bit register.

**Field descriptions**

The EDCIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>8 - 0</td>
<td>PRMBL_2</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble.

Reads as 0x05.

**Accessing the EDCIDR2:**

EDCIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFF8</td>
<td>EDCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.15   EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Component Identification scheme* on page K2-8002.

**Configurations**

Implementation of this register is **OPTIONAL**.

If `FEAT_DoPD` is implemented, this register is in the Core power domain. If `FEAT_DoPD` is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDCIDR3 is a 32-bit register.

**Field descriptions**

The EDCIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PRMBL_3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble.

Reads as 0xB1.

**Accessing the EDCIDR3:**

EDCIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFFC</td>
<td>EDCIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `FEAT_DoPD` is not implemented or `IsCorePowered()` accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.
H9.2.16 EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

**Purpose**

Contains the sampled value of the Context ID, captured on reading EDPCSR[31:0].

**Configurations**

EDCIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDCIDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

--- **Note**

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

**Attributes**

EDCIDSR is a 32-bit register.

**Field descriptions**

The EDCIDSR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTEXTIDR</td>
<td></td>
</tr>
</tbody>
</table>

**CONTEXTIDR, bits [31:0]**

Context ID. The value of CONTEXTIDR that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register, and EDCIDSR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent EDPCSR sample.

Because the value written to EDCIDSR is an indirect read of CONTEXTIDR, it is constrained unpredictable whether EDCIDSR is set to the original or new value if EDPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**Accessing the EDCIDSR:**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-7134.
EDCIDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xA4</td>
<td>EDCIDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.17   EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configurations

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions

The EDDEVAFF0 bit assignments are:

```
31  0
   0
```

MPIDR_EL1lo, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the EDDEVAFF0:

EDDEVAFF0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFA8</td>
<td>EDDEVAFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
• Otherwise accesses to this register generate an error response.
H9.2.18 EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVAFF1 is a 32-bit register.

**Field descriptions**

The EDDEVAFF1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>MPIDR_EL1hi</td>
</tr>
</tbody>
</table>

**MPIDR_EL1hi, bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the EDDEVAFF1:**

EDDEVAFF1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFAC</td>
<td>EDDEVAFF1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.19   EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers’ model architecture of the external debug component.

Configurations

Implementation of this register is OPTIONAL.
If FEAT_DoPD is implemented, this register is in the Core power domain.
If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

The EDDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ARCHITECT</td>
</tr>
<tr>
<td>21</td>
<td>REVISION</td>
</tr>
<tr>
<td>19</td>
<td>ARCHVER</td>
</tr>
<tr>
<td>16</td>
<td>ARCHPART</td>
</tr>
<tr>
<td>0</td>
<td>PRESENT</td>
</tr>
</tbody>
</table>

ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is Arm Limited.
Bits [31:28] are the JEP106 continuation code, 0x4.
Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.
This field is 1 in Armv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.
For debug, the revision defined by Armv8-A is 0x8.
All other values are reserved.

ARCHVER, bits [15:12]

Defines the architecture version of the component. This is the same value as
ID_AA64DFR0_EL1.DebugVer and DBGIDR.Version. The defined values of this field are:

- 0b0110: Armv8.0 Debug architecture.
- 0b0111: Armv8.0 Debug architecture with Virtualization Host Extensions.
- 0b1000: Armv8.2 Debug architecture.
- 0b1001: Armv8.4 Debug architecture.

FEAT_Debugv8p4 adds the functionality indicated by the value 0b1001.FEAT_Debugv8p2 adds the
functionality indicated by the value 0b1000. If FEAT_VHE is not implemented, the only permitted
value is 0b0110.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHVER is
ARCHID[15:12].
ARCHPART, bits [11:0]

0xA15 The part number of the Armv8-A debug component.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHPART is ARCHID[11:0].

Accessing the EDDEVARCH:

EDDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFBC</td>
<td>EDDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.20 EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

**Purpose**

Provides extra information for external debuggers about features of the debug implementation.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVID is a 32-bit register.

**Field descriptions**

The EDDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31 28 27 24 23</td>
<td>AuxRegs</td>
</tr>
<tr>
<td>8 7 4 3 0</td>
<td>DebugPower</td>
</tr>
<tr>
<td></td>
<td>PCSample</td>
</tr>
</tbody>
</table>

**Bits [31:28]**

Reserved, RES0.

**AuxRegs, bits [27:24]**

Indicates support for Auxiliary registers. Defined values are:

- 0b0000 None supported.
- 0b0001 Support for External Debug Auxiliary Control Register, EDACR.

All other values are reserved.

**Bits [23:8]**

Reserved, RES0.

**DebugPower, bits [7:4]**

Indicates support for the FEAT_DoPD feature. Defined values are:

- 0b0000 FEAT_DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.
- 0b0001 FEAT_DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain.

FEAT_DoPD implements the functionality added by the value 0b0001.

All other values are reserved.

**PCSample, bits [3:0]**

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

- 0b0000 PC Sample-based Profiling Extension is not implemented in the external debug registers space.
- 0b0010 Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.
- 0b0011 EDPCSR, EDCIDSR, and EDVIDSR are implemented.

All other values are reserved.
When \texttt{FEAT\_PCSRv8p2} is implemented, the only permitted value is \texttt{0b0000}.

\textbf{Note}

\texttt{FEAT\_PCSRv8p2} implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of \texttt{PMDEVID.PCSample}.

**Accessing the EDDEVID:**

EDDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC8</td>
<td>EDDEVID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When \texttt{FEAT\_DoPD} is not implemented or \texttt{IsCorePowered()} accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.21 EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

**Purpose**

Provides extra information for external debuggers about features of the debug implementation.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVID1 is a 32-bit register.

**Field descriptions**

The EDDEVID1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>4</td>
<td>3</td>
</tr>
<tr>
<td>0</td>
<td>PCSROffset</td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**PCSROffset, bits [3:0]**

This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in Armv8 are:

- 0b0000 EDPCSR not implemented.
- 0b0100 EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

**Note**

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

**Accessing the EDDEVID1:**

EDDEVID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC4</td>
<td>EDDEVID1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.22   EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Configurations

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions

The EDDEVID2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

Bits [31:0]

Reserved, RES0.

Accessing the EDDEVID2:

EDDEVID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFC0</td>
<td>EDDEVID2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.23 EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs debug logic.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDDEVTYPE is a 32-bit register.

**Field descriptions**

The EDDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8</td>
<td>SUB, bits [7:4]</td>
</tr>
<tr>
<td>4</td>
<td>MAJOR, bits [3:0]</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as 0x5 to indicate this is a debug logic component.

**Accessing the EDDEVTYPE:**

EDDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFCC</td>
<td>EDDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.24 EDDFR, External Debug Feature Register

The EDDFR characteristics are:

**Purpose**

Provides top level information about the debug system.

--- **Note** ---

Debuggers must use `EDDEVARCH` to determine the Debug architecture version.

---

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D13-2867.

**Configurations**

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDDFR is a 64-bit register.

**Field descriptions**

The EDDFR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>44</td>
<td>TraceFilt</td>
<td>Armv8.4 Self-hosted Trace Extension version. Defined values are:</td>
</tr>
<tr>
<td>43</td>
<td></td>
<td>0b0000 Armv8.4 Self-hosted Trace Extension is not implemented.</td>
</tr>
<tr>
<td>40</td>
<td></td>
<td>0b0001 Armv8.4 Self-hosted Trace Extension is implemented.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>All other values are reserved.</td>
</tr>
<tr>
<td>39</td>
<td>UNKOWN</td>
<td>FEAT_TRF implements the functionality added by 0b0001.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>From Armv8.4, the permitted values are 0b0000 and 0b0001.</td>
</tr>
<tr>
<td>32</td>
<td>CTX_CMPs</td>
<td>Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.</td>
</tr>
<tr>
<td>28</td>
<td></td>
<td>In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.CTX_CMPs.</td>
</tr>
<tr>
<td>27</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>23</td>
<td>WRPs</td>
<td>Number of watchpoints, minus 1. The value of 0b0000 is reserved.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.WRPs.

Bits [19:16]
Reserved, RES0.

BRPs, bits [15:12]
Number of breakpoints, minus 1. The value of 0b0000 is reserved.
In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.BRPs.

PMUVer, bits [11:8]
Performance Monitors Extension version.
This field does not follow the standard ID scheme, but uses the alternative ID scheme described in Alternative ID scheme used for the Performance Monitors Extension version on page D13-2869
Defined values are:
0b0000 Performance Monitors Extension not implemented.
0b0001 Performance Monitors Extension, PMUv3 implemented.
0b0100 PMUv3 for Armv8.1. As 0b0001, and also includes support for:
  • Extended 16-bit PMEVTYPER<n>_EL0.evtCount field.
  • If EL2 is implemented, the MDCR_EL2.HPMD control bit.
0b0101 PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR_EL1 register.
0b0110 PMUv3 for Armv8.5. As 0b0101, and also includes support for:
  • 64-bit event counters.
  • If EL2 is implemented, the MDCR_EL2.HCCD control bit.
  • If EL3 is implemented, the MDCR_EL3.SCCD control bit.
0b1111 IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.
All other values are reserved.
FEAT_PMUv3 implements the functionality identified by the value 0b0001.
FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.
FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.
FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.
From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.
From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.
From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

TraceVer, bits [7:4]
Trace support. Indicates whether System register interface to a PE trace unit is implemented.
Defined values are:
0b0000 PE trace unit System registers not implemented.
0b0001 PE trace unit System registers implemented.
All other values are reserved.
A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.
In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64DFR0_EL1.TraceVer.
UNKNOWN, bits [3:0]
Reserved, UNKNOWN.

**Accessing the EDDFR:**

EDDFR[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD28</td>
<td>EDDFR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to EDDFR[31:0] are RO.
- Otherwise accesses to EDDFR[31:0] are IMPDEF.

EDDFR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD2C</td>
<td>EDDFR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to EDDFR[63:32] are RO.
- Otherwise accesses to EDDFR[63:32] are IMPDEF.
**H9.2.25   EDECCR, External Debug Exception Catch Control Register**

The EDECCR characteristics are:

**Purpose**

Controls Exception Catch debug events.

**Configurations**

- External register EDECCR[31:0] is architecturally mapped to AArch64 System register OSECCR_EL1[31:0].
- External register EDECCR[31:0] is architecturally mapped to AArch32 System register DBGOSECCR[31:0].
- EDECCR is in the Core power domain.

**Attributes**

EDECCR is a 32-bit register.

**Field descriptions**

The EDECCR bit assignments are:

*When FEAT_Debugv8p2 is implemented:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>16-14</td>
<td>SE0, SE1, SE2, SE3, NSE0, NSE1, NSE2, NSE3, SR0, SR1, SR2, SR3, NSR0, NSR1, NSR2, NSR3</td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**NSR<\(n\), bit \([n+12]\), for \(n = 0\) to \(3\)**

Controls Non-secure exception catch on exception return to EL<\(n\)> in conjunction with NSE<\(n\)>.

For information, see Table H3-5 on page H3-7068.

0b0 If the corresponding NSE<\(n\)> bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level <\(n\)>.

If the corresponding NSE<\(n\)> bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level <\(n\)>.
If the corresponding NSE\(<n>\) bit is 0, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level \(<n>\).
If the corresponding NSE\(<n>\) bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level \(<n>\).

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0.

--- Note ---

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the NSR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSR field is programmed with a reserved value then:
- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

SR\(<n>\), bit \([n+8]\), for \(n = 0\) to 3

Controls Secure exception catch on exception return to EL\(<n>\) in conjunction with SE\(<n>\). For information, see Table H3-5 on page H3-7068.

- If the corresponding SE\(<n>\) bit is 0, then Exception Catch debug events are disabled for Secure Exception level \(<n>\).
- If the corresponding SE\(<n>\) bit is 1, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level \(<n>\).

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0.

--- Note ---

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level is permitted to generate an Exception Catch debug event.

A value of the SR field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SR field is programmed with a reserved value then:
- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SR by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

NSE\(<n>\), bit \([n+4]\), for \(n = 0\) to 3

Coarse-grained Non-secure exception catch for EL\(<n>\). This controls whether Exception Catch debug events are enabled for Non-secure EL\(<n>\). This also controls:
- The behavior of exception catch on exception entry to EL\(<n>\).
The behavior of exception catch on exception return to EL<\(n\)> in conjunction with NSR<\(n\>).

- If the corresponding NSR<\(n\)> bit is 0, then Exception Catch debug events are disabled for Non-secure Exception level <\(n\)>.
- If the corresponding NSR<\(n\)> bit is 1, then Exception Catch debug events are enabled for exception returns to Non-secure Exception level <\(n\)>.

0b1
- If the corresponding NSR<\(n\)> bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Non-secure Exception level <\(n\)>.
- If the corresponding NSR<\(n\)> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure Exception level <\(n\)>.

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0.

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for NSE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

SE<\(n\)> bit [\(n\)], for \(n = 0\) to 3

Coarse-grained Secure exception catch for EL<\(n\>). This field controls whether Exception Catch debug events are enabled for Secure EL<\(n\>).

- The behavior of exception catch on exception entry to EL<\(n\)>.
- The behavior of exception catch on exception return to EL<\(n\)> in conjunction with SR<\(n\>).

0b0
- If the corresponding SR<\(n\)> bit is 0, then Exception Catch debug events are disabled for Secure Exception level <\(n\)>.
- If the corresponding SR<\(n\)> bit is 1, then Exception Catch debug events are enabled for exception returns to Secure Exception level <\(n\)>.

0b1
- If the corresponding SR<\(n\)> bit is 0, then Exception Catch debug events are enabled for exception entry, reset entry and exception return to Secure Exception level <\(n\)>.
- If the corresponding SR<\(n\)> bit is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure Exception level <\(n\)>.

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0.

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

- The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
- The value returned for SE by a read of EDECCR is UNKNOWN.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.
Otherwise:

Bits [31:8]

Reserved, RES0.

NSE<\text{n}>, bit [n+4], for n = 0 to 3

Coarse-grained Non-secure exception catch. If EL3 and EL2 are not implemented and the PE behaves as if SCR_EL3.NS is set to 0, this field is reserved, RES0. Otherwise, possible values for this field are:

0b0  Exception Catch debug events are disabled for Non-secure Exception level \text{<n>}.  
0b1  Exception Catch debug events are enabled for Non-secure Exception level \text{<n>}.  

A value of the NSE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the NSE field is programmed with a reserved value then:

• The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
• The value returned for NSE by a read of EDECCR is \text{UNKNOWN}.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

SE<\text{n}>, bit [n], for n = 0 to 3

Coarse-grained Secure exception catch.

0b0  Exception Catch debug events are disabled for Secure Exception level \text{<n>}.  
0b1  Exception Catch debug events are enabled for Secure Exception level \text{<n>}.  

If EL3 is not implemented and the PE behaves as if SCR_EL3.NS is set to 1, this field is reserved, RES0.

A value of the SE field that enables an Exception Catch debug event for an Exception level that is not implemented is reserved. If the SE field is programmed with a reserved value then:

• The PE behaves as if it is programmed with a defined value, other than for a read of EDECCR.
• The value returned for SE by a read of EDECCR is \text{UNKNOWN}.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.
Accessing the EDECCR:

EDECCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x098</td>
<td>EDECCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.26   EDECR, External Debug Execution Control Register

The EDECR characteristics are:

**Purpose**

 Controls Halting debug events.

**Configurations**

 If FEAT_DoPD is implemented, this register is in the Core power domain.
 If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

EDECR is a 32-bit register.

**Field descriptions**

The EDECR bit assignments are:

```
+------+-
| RES0 | OSUCE|
+------+-
      | RES0|
      | RES0|
+------+-+------+-
| SS    | RCE   |
+------+-+------+-
```

**Bits [31:3]**

Reserved, RES0.

**SS, bit [2]**

Halting step enable. Possible values of this field are:

- **0b0** Halting step debug event disabled.
- **0b1** Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is constrained unpredictable as described in *Changing the value of EDECR.SS when not in Debug state* on page H3-7063.

On a Cold reset, when FEAT_DoPD is implemented, this field resets to 0.
On a Cold reset, when FEAT_DoPD is not implemented, the value of this field is unchanged.
On an External debug reset, when FEAT_DoPD is implemented, the value of this field is unchanged.
On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 0.
On a Warm reset, the value of this field is unchanged.

**RCE, bit [1]**

When **FEAT_DoPD** is not implemented:

Reset Catch Enable.

- **0b0** Reset Catch debug event disabled.
- **0b1** Reset Catch debug event enabled.

On a Cold reset, when FEAT_DoPD is implemented, this field resets to 0.
On a Cold reset, when FEAT_DoPD is not implemented, the value of this field is unchanged.
On an External debug reset, when FEAT_DoPD is implemented, the value of this field is unchanged.
On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 0.
On a Warm reset, the value of this field is unchanged.

Otherwise:
Reserved, RES0.

OSUCE, bit [0]

When FEAT_DoPD is not implemented:
OS Unlock Catch Enable.
0b0 OS Unlock Catch debug event disabled.
0b1 OS Unlock Catch debug event enabled.
On a Cold reset, when FEAT_DoPD is implemented, this field resets to 0.
On a Cold reset, when FEAT_DoPD is not implemented, the value of this field is unchanged.
On an External debug reset, when FEAT_DoPD is implemented, the value of this field is unchanged.
On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 0.
On a Warm reset, the value of this field is unchanged.

Otherwise:
Reserved, RES0.

Accessing the EDECR:

EDECR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x024</td>
<td>EDECR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are RO.

• When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are RW.

• Otherwise accesses to this register generate an error response.
H9.2.27 EDESR, External Debug Event Status Register

The EDESR characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Configurations

EDESR is in the Core power domain.

Attributes

EDESR is a 32-bit register.

Field descriptions

The EDESR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>SS</td>
</tr>
<tr>
<td>2</td>
<td>Reset Catch debug event pending</td>
</tr>
<tr>
<td>1</td>
<td>OSUC</td>
</tr>
<tr>
<td>0</td>
<td>RC</td>
</tr>
</tbody>
</table>

Bits [31:3]

Reserved, RES0.

SS, bit [2]

When FEAT_DoPD is implemented:

Halting step debug event pending. Possible values of this field are:

0b0 Reading this means that a Halting step debug event is not pending. Writing this means no action.

0b1 Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

On a Cold reset, this field resets to 0.

Otherwise:

Halting step debug event pending. Possible values of this field are:

0b0 Reading this means that a Halting step debug event is not pending. Writing this means no action.

0b1 Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

On a Warm reset, this field resets to the value in EDECR.SS.

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

0b0 Reading this means that a Reset Catch debug event is not pending. Writing this means no action.

0b1 Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

On a Warm reset, when FEAT_DoPD is implemented, this field resets to the value in CTIDEVCTL.RCE.
On a Warm reset, when FEAT_DoPD is not implemented, this field resets to the value in EDECR.RCE.

**OSUC, bit [0]**

OS Unlock Catch debug event pending. Possible values of this field are:

- **0b0**  
  Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.

- **0b1**  
  Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

On a Warm reset, this field resets to 0.

**Accessing the EDESR:**

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is CONstrained UNPREDICTABLE whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

EDESR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x020</td>
<td>EDESR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.28  EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

**Purpose**

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configurations**

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

EDITCTRL is a 32-bit register.

**Field descriptions**

The EDITCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
<td>0x0</td>
</tr>
</tbody>
</table>
| 0   | IME, Integration mode enable | 0b0   Normal operation.  
|     |                      | 0b1   Integration mode enabled. |

The following resets apply:

- Whichever power domain the register is implemented in, this field resets to 0.
- Otherwise, the value of this field is unchanged.

**Accessing the EDITCTRL:**

EDITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xF00</td>
<td>EDITCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.

• Otherwise accesses to this register are IMPDEF.
H9.2.29 EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

**Purpose**
Used in Debug state for passing instructions to the PE for execution.

**Configurations**
EDITR is in the Core power domain.

**Attributes**
EDITR is a 32-bit register.

**Field descriptions**
The EDITR bit assignments are:

*When AArch32 is supported at any Exception level and in AArch32 state:*

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-15</td>
<td>T32Second</td>
</tr>
<tr>
<td>15-0</td>
<td>T32First</td>
</tr>
</tbody>
</table>

**T32Second, bits [31:16]**
Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see Behavior in Debug state on page H2-7024.

**T32First, bits [15:0]**
First halfword of the T32 instruction to be executed on the PE.

*When AArch64 is supported at any Exception level and in AArch64 state:*

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>A64 instruction to be executed on the PE</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the EDITR:**
If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.
EDITR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x084</td>
<td>EDITR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` accesses to this register are WI.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
H9.2.30   EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.
The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configurations

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.
If FEAT_DoPD is not implemented, this register is in the Debug power domain.
Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

The EDLAR bit assignments are:

When Software Lock is implemented:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th>KEY</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>0</td>
</tr>
</tbody>
</table>

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component’s registers through a memory-mapped interface.
Writing any other value to this register locks the lock, disabling write accesses to this component’s registers through a memory mapped interface.

Otherwise:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th>RES0</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>0</td>
</tr>
</tbody>
</table>

Otherwise

Bits [31:0]

Reserved, RES0.
Accessing the EDLAR:

EDLAR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFB0</td>
<td>EDLAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
H9.2.31   EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

**Purpose**

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configurations**

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

**Attributes**

EDLSR is a 32-bit register.

**Field descriptions**

The EDLSR bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:3</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>2</td>
<td>nTT, bit [2]</td>
</tr>
<tr>
<td>1</td>
<td>SLK, bit [1]</td>
</tr>
</tbody>
</table>

**When Software Lock is implemented:**

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

- **0b0**: Lock clear. Writes are permitted to this component's registers.
- **0b1**: Lock set. Writes to this component's registers are ignored, and reads have no side effects.

On a Cold reset, when FEAT_DoPD is implemented, this field resets to 1.

On a Cold reset, when FEAT_DoPD is not implemented, the value of this field is unchanged.

On an External debug reset, when FEAT_DoPD is implemented, the value of this field is unchanged.

On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 1.

On a Warm reset, the value of this field is unchanged.
Outside:
Reserved, RAZ.

SLI, bit [0]
Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:
0b0 Software Lock not implemented or not memory-mapped access.
0b1 Software Lock implemented and memory-mapped access.

Accessing the EDLSR:
EDLSR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFB4</td>
<td>EDLSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
• Otherwise accesses to this register generate an error response.
H9.2.32 EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

**Purpose**

Holds a sampled instruction address value.

**Configurations**

EDPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

--- **Note**

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

--- **Attributes**

EDPCSR is a pair of 32-bit registers.

If FEAT_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

**Field descriptions**

The EDPCSR bit assignments are:

*When FEAT_VHE is not implemented or EDSCR.SC2 == 0:*

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>PC Sample high word, EDPCSRhi</td>
<td></td>
<td>PC Sample low word</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:32]**

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**Bits [31:0]**

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
• No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
• No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values. Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

When FEAT_VHE is implemented and EDSR.SC2 == 1:

<table>
<thead>
<tr>
<th>NS</th>
<th>EL</th>
<th>RES0</th>
<th>PC Sample high word, EDPCSRhi</th>
<th>PC Sample low word</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61 60</td>
<td>56 55</td>
<td>32 31</td>
</tr>
</tbody>
</table>

NS, bit [63]
Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

0b0 Sample is from Secure state.
0b1 Sample is from Non-secure state.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

EL, bits [62:61]
Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

0b00 Sample is from EL0.
0b01 Sample is from EL1.
0b10 Sample is from EL2.
0b11 Sample is from EL3.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Bits [60:56]
Reserved, RES0.
**Bits [55:32]**

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**Bits [31:0]**

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**Accessing the EDPCSR:**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-7134.

EDPCSR[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xA0</td>
<td>EDPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDPCSR[31:0] are RO.
- Otherwise accesses to EDPCSR[31:0] generate an error response.
EDPCSR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xA0</td>
<td>EDPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDPCSR[63:32] are RO.
- Otherwise accesses to EDPCSR[63:32] generate an error response.
H9.2.33 EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

**Purpose**

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D13-2867.

**Configurations**

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

**Attributes**

EDPFR is a 64-bit register.

**Field descriptions**

The EDPFR bit assignments are:
AMU, bits [47:44]
Indicates support for Activity Monitors Extension. Defined values are:
- 0b0000  Activity Monitors Extension is not implemented.
- 0b0001  FEAT_AMUv1 is implemented.
- 0b0010  FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.
FEAT_AMUv1 implements the functionality identified by the value 0b0001.
FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.
In Armv8.0, the only permitted value is 0b0000.
In Armv8.4, the permitted values are 0b0000 and 0b0001.
From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

UNKNOWN, bits [43:40]
From Armv8.2:
Reserved, UNKNOWN.
Otherwise:
Reserved, RES0.

SEL2, bits [39:36]
Secure EL2. Defined values are:
- 0b0000  Secure EL2 is not implemented.
- 0b0001  Secure EL2 is implemented.

All other values are reserved.

SVE, bits [35:32]
Scalable Vector Extension. Defined values are:
- 0b0000  SVE is not implemented.
- 0b0001  SVE is implemented.

All other values are reserved.

UNKNOWN, bits [31:28]
From Armv8.2:
Reserved, UNKNOWN.
Otherwise:
Reserved, RES0.

GIC, bits [27:24]
System register GIC interface support. Defined values are:
- 0b0000  GIC CPU interface system registers not implemented.
- 0b0001  System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
- 0b0011  System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.
In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.GIC.
AdvSIMD, bits [23:20]
Advanced SIMD. Defined values are:

0b0000  Advanced SIMD is implemented, including support for the following SISD and SIMD operations:
  • Integer byte, halfword, word and doubleword element operations.
  • Single-precision and double-precision floating-point arithmetic.
  • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.

0b0001  As for 0b0000, and also includes support for half-precision floating-point arithmetic.

0b1111  Advanced SIMD is not implemented. All other values are reserved.

This field must have the same value as the FP field. The permitted values are:
  • 0b0000 in an implementation with Advanced SIMD support, that does not include the FEAT_FP16 extension.
  • 0b0001 in an implementation with Advanced SIMD support, that includes the FEAT_FP16 extension.
  • 0b1111 in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.AdvSIMD.

FP, bits [19:16]
Floating-point. Defined values are:

0b0000  Floating-point is implemented, and includes support for:
  • Single-precision and double-precision floating-point types.
  • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.

0b0001  As for 0b0000, and also includes support for half-precision floating-point arithmetic.

0b1111  Floating-point is not implemented. All other values are reserved.

This field must have the same value as the AdvSIMD field. The permitted values are:
  • 0b0000 in an implementation with floating-point support, that does not include the FEAT_FP16 extension.
  • 0b0001 in an implementation with floating-point support, that includes the FEAT_FP16 extension.
  • 0b1111 in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.FP.

EL3, bits [15:12]
AArch64 EL3 Exception level handling. Defined values are:

0b0000  EL3 is not implemented or cannot be executed in AArch64 state.

0b0001  EL3 can be executed in AArch64 state only.

0b0010  EL3 can be executed in both Execution states.

When the value of EDAA32PFR.EL3 is non-zero, this field must be 0b0000. All other values are reserved.
In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL3.

**EL2, bits [11:8]**

AArch64 EL2 Exception level handling. Defined values are:
- 0b0000   EL2 is not implemented or cannot be executed in AArch64 state.
- 0b0001   EL2 can be executed in AArch64 state only.
- 0b0010   EL2 can be executed in both Execution states.

When the value of EDAA32PFR.EL2 is non-zero, this field must be 0b0000.
All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL2.

**EL1, bits [7:4]**

AArch64 EL1 Exception level handling. Defined values are:
- 0b0000   EL1 cannot be executed in AArch64 state.
- 0b0001   EL1 can be executed in both Execution states.
- 0b0010   EL1 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL1.

**EL0, bits [3:0]**

AArch64 EL0 Exception level handling. Defined values are:
- 0b0000   EL0 cannot be executed in AArch64 state.
- 0b0001   EL0 can be executed in both Execution states.
- 0b0010   EL0 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64 state in at least one Exception level, this field returns the value of ID_AA64PFR0_EL1.EL0.

### Accessing the EDPFR:

EDPFR[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD20</td>
<td>EDPFR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- When IsCorePowered() and !DoubleLockStatus() accesses to EDPFR[31:0] are RO.
- Otherwise accesses to EDPFR[31:0] are IMPDEF.

EDPFR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD24</td>
<td>EDPFR</td>
<td>63:32</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to EDPFR[63:32] are RO.
- Otherwise accesses to EDPFR[63:32] are IMPDEF.
H9.2.34 EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

**Purpose**

Provides information to identify an external debug component.
For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

Implementation of this register is OPTIONAL.
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.
This register is required for CoreSight compliance.

**Attributes**

EDPIDR0 is a 32-bit register.

**Field descriptions**

The EDPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>8-0</td>
<td>PART_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

**Accessing the EDPIDR0:**

EDPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE0</td>
<td>EDPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.35 EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Peripheral identification scheme on page K2-7999.*

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR1 is a 32-bit register.

**Field descriptions**

The EDPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8-7</td>
<td>DES_0</td>
</tr>
<tr>
<td>4-3</td>
<td>PART_1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

**PART_1, bits [3:0]**

Part number, most significant nibble.

**Accessing the EDPIDR1:**

EDPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE4</td>
<td>EDPIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.36  EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see *About the Peripheral identification scheme on page K2-7999*.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain. This register is required for CoreSight compliance.

**Attributes**

EDPIDR2 is a 32-bit register.

**Field descriptions**

The EDPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>RES0</td>
</tr>
<tr>
<td>7-4</td>
<td>REVISION</td>
</tr>
<tr>
<td>3</td>
<td>JEDEC</td>
</tr>
<tr>
<td>2-0</td>
<td>DES_1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

**Accessing the EDPIDR2:**

EDPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE8</td>
<td>EDPIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.37  EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

**Purpose**

Provides information to identify an external debug component.

For more information, see About the Peripheral identification scheme on page K2-7999.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR3 is a 32-bit register.

**Field descriptions**

The EDPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit 31</th>
<th>Bit 8</th>
<th>Bit 7</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>RES0</td>
<td>RES0</td>
<td>RES0</td>
<td>RES0</td>
</tr>
<tr>
<td>REVAND</td>
<td>REVAND</td>
<td>REVAND</td>
<td>REVAND</td>
<td>REVAND</td>
<td>REVAND</td>
</tr>
<tr>
<td>CMOD</td>
<td>CMOD</td>
<td>CMOD</td>
<td>CMOD</td>
<td>CMOD</td>
<td>CMOD</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using EDPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

**Accessing the EDPIDR3:**

EDPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFE</td>
<td>EDPIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.38 EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

**Purpose**

Provides information to identify an external debug component. For more information, see *About the Peripheral identification scheme on page K2-7999.*

**Configurations**

Implementation of this register is *OPTIONAL.*

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

EDPIDR4 is a 32-bit register.

**Field descriptions**

The EDPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7:4</td>
<td>SIZE, bits</td>
</tr>
<tr>
<td>3:0</td>
<td>DES_2, bits</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

**Accessing the EDPIDR4:**

EDPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xFD0</td>
<td>EDPIDR4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.39  **EDPRCR, External Debug Power/Reset Control Register**

The EDPRCR characteristics are:

**Purpose**
Controls the PE functionality related to powerup, reset, and powerdown.

**Configurations**
EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.
If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.
CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR_EL1.

**Attributes**
EDPRCR is a 32-bit register.

**Field descriptions**
The EDPRCR bit assignments are:

*When FEAT_DoPD is implemented:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>CORENPDRQ</td>
</tr>
<tr>
<td>29</td>
<td>CWRR, bit [1]</td>
</tr>
<tr>
<td>28</td>
<td>Warm reset request. Write-only bit that reads as zero. The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:</td>
</tr>
<tr>
<td>27</td>
<td>• The request is ignored.</td>
</tr>
<tr>
<td>26</td>
<td>• Only this PE is Warm reset.</td>
</tr>
<tr>
<td>25</td>
<td>• This PE and other components of the system, possibly including other PEs, are Warm reset.</td>
</tr>
<tr>
<td>24</td>
<td>Arm deprecates use of this bit, and recommends that implementations ignore the request.</td>
</tr>
<tr>
<td>23</td>
<td>0b0  No action.</td>
</tr>
<tr>
<td>22</td>
<td>0b1  Request Warm reset.</td>
</tr>
</tbody>
</table>

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

• ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
• ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
• ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.
On a Warm reset, this field resets to 0.
Accessing this field has the following behavior:
• When OSLockStatus() or SoftwareLockStatus(), access to this field is WI.
• Otherwise, access to this field is WO.

CORENPDRQ, bit [0]
Core no powerdown request. Requests emulation of powerdown.
This request is typically passed to an external power controller. This means that whether a request
causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power
controller must not allow the Core power domain to switch off while this bit is 1.
0b0 If the system responds to a powerdown request, it powers down Core power domain.
0b1 If the system responds to a powerdown request, it does not powerdown the Core power
domain, but instead emulates a powerdown of that domain.
When this bit reads as UNKNOWN, the PE ignores writes to this bit.
This field is in the Core power domain, and permitted accesses to this field map to the
DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.
In an implementation that includes the recommended external debug interface, this bit drives the
DBGNOPWRDWN signal.
It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an
IMPLEMENTATION DEFINED software-visible retention state. For more information about retention
states, see Core power domain power states on page H6-7118.

Note
 Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This
means that a debugger can request emulation of powerdown regardless of whether invasive debug
is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted,
this field is an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted,
this field is set to 0.
On a Warm reset, the value of this field is unchanged.
Accessing this field has the following behavior:
• When OSLockStatus(), access to this field is UNKNOWN.
• When SoftwareLockStatus(), access to this field is RO.
• Otherwise, access to this field is RW.

Otherwise:

Bits [31:4]
Reserved, RES0.
COREPURQ, bit [3]
Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0    Do not request power up of the Core power domain.
0b1    Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

--- Note ---
Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On an External debug reset, this field resets to 0.
Accessing this field has the following behavior:
• When SoftwareLockStatus(), access to this field is RO.
• Otherwise, access to this field is RW.

Bit [2]
Reserved, RES0.

CWRR, bit [1]
Warm reset request. Write-only bit that reads as zero.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:
• The request is ignored.
• Only this PE is Warm reset.
• This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

0b0    No action.
0b1    Request Warm reset.

This field is in the Core power domain.

The PE ignores writes to this bit if any of the following are true:
• ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
• ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
• ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBG_RSTREQ signal.

On a Warm reset, this field resets to 0.
Accessing this field has the following behavior:
• When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or SoftwareLockStatus(), access to this field is WI.
• Otherwise, access to this field is WO.
CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0  If the system responds to a powerdown request, it powers down Core power domain.
0b1  If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPSCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see Core power domain power states on page H6-7118.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, this field resets to the value in EDPSCR.COREPURQ.

On a Warm reset, the value of this field is unchanged.

Accessing this field has the following behavior:
  • When !IsCorePowered(), or DoubleLockStatus() or OSLockStatus(), access to this field is UNKNOWN.
  • When SoftwareLockStatus(), access to this field is RO.
  • Otherwise, access to this field is RW.

Accessing the EDPSCR:

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPSCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x310</td>
<td>EDPSCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are RO.
• When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are RW.
• Otherwise accesses to this register generate an error response.
### H9.2.40 EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

**Purpose**

Holds information about the reset and powerdown state of the PE.

**Configurations**

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

**Attributes**

EDPRSR is a 32-bit register.

**Field descriptions**

The EDPRSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>12</td>
<td>SDR, bit [11]</td>
</tr>
<tr>
<td>11</td>
<td>Sticky Debug Restart. Set to 1 when the PE exits Debug state.</td>
</tr>
<tr>
<td>10</td>
<td>Permitted values are:</td>
</tr>
<tr>
<td>9</td>
<td>0b0 The PE has not restarted since EDPRSR was last read.</td>
</tr>
<tr>
<td>8</td>
<td>0b1 The PE has restarted since EDPRSR was last read.</td>
</tr>
</tbody>
</table>

**Note**

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is **UNKNOWN** on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRSR:
- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is **CONSTRAINED UNPREDICTABLE** whether this bit clears to 0 or is unchanged.

This field is in the Core power domain and the Warm reset domain. This field resets to an architecturally **UNKNOWN** value.
Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RC.

**SPMAD, bit [10]**

*When FEAT_Debugv8p4 is implemented:*

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

Permitted values are:

- 0b0: No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.
- 0b1: At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RC.

**Otherwise:**

Sticky EPMAD error.

- 0b0: No external debug interface accesses to the Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.
- 0b1: At least one external debug interface access to the Performance Monitors registers has failed and returned an error because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or OSLockStatus(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RC.
EPMAD, bit [9]

When FEAT_Debugv8p4 is implemented:

External Performance Monitors Access Disable status.

- 0b0  External Non-secure Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE for a Non-secure access.
- 0b1  External Non-secure Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

Otherwise:

External Performance Monitors access disable status.

- 0b0  External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.
- 0b1  External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or OSLockStatus(), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

SDAD, bit [8]

When FEAT_Debugv8p4 is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

- 0b0  No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.
- 0b1  At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

- 0b0  No external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.
At least one external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is constrained UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is UNKNOWN on reads if OSLockStatus() == TRUE and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

EDAD, bit [7]

When FEAT_Debugv8p4 is implemented:

External Debug Access Disable status.

0b0 External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE for a Non-secure access.

0b1 External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable status.

0b0 External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.

0b1 External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE.

This bit is not valid and reads UNKNOWN if OSLockStatus() == TRUE and external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

Otherwise:

External Debug Access Disable status.

0b0 External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.

0b1 External access to breakpoint registers, watchpoint registers disabled. It is IMPLEMENTATION DEFINED whether accesses to OSLAR_EL1 are enabled or disabled. AllowExternalDebugAccess() == FALSE.
This field is in the Core power domain.
Accessing this field has the following behavior:
• When (FEAT_DoPD is not implemented and !IsCorePowered()), or DoubleLockStatus() or EDPRSR.R == 1, access to this field is UNKNOWN.
• Otherwise, access to this field is RO.

DLK, bit [6]

When FEAT_Debugv8p4 is implemented:
This field is RES0.

When FEAT_Debugv8p2 is implemented and FEAT_DoubleLock is implemented:
Double Lock.
From Armv8.2, this field is deprecated.
This field is in the Core power domain.
Accessing this field has the following behavior:
• When IsCorePowered() and !DoubleLockStatus(), access to this field is RAZ.
• Otherwise, access to this field is UNKNOWN.

When FEAT_DoubleLock is implemented:
Double Lock.
This field returns the result of the pseudocode function DoubleLockStatus().
If the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:
• EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
• EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.
This field is in the Core power domain.
0b0 DoubleLockStatus() returns FALSE.
0b1 DoubleLockStatus() returns TRUE and the Core power domain is powered up.
Accessing this field has the following behavior:
• When FEAT_DoPD is not implemented and !IsCorePowered(), access to this field is UNKNOWN.
• Otherwise, access to this field is RO.

Otherwise:
Reserved, RES0.

OSLK, bit [5]
OS Lock status bit.
A read of this bit returns the value of OSLSR_EL1.OSLK.
This field is in the Core power domain.
Accessing this field has the following behavior:
• When (FEAT_DoPD is not implemented and !IsCorePowered()), DoubleLockStatus() and EDPRSR.R == 1, access to this field is UNKNOWN.
• Otherwise, access to this field is RO.

HALTED, bit [4]
Halted status bit.
0b0 PE is in Non-debug state.
0b1 PE is in Debug state.
This field is in the Core power domain.
Accessing this field has the following behavior:
- When FEAT_DoPD is not implemented and !IsCorePowered(), access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

**SR, bit [3]**

Sticky core Reset status bit.
Permitted values are:
- 0b0: The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.
- 0b1: The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:
- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain and the Warm reset domain.
This field resets to 1.
Accessing this field has the following behavior:
- When (FEAT_DoPD is not implemented and !IsCorePowered()) or DoubleLockStatus(), access to this field is UNKNOWN.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RC.

**R, bit [2]**

PE Reset status bit.
Permitted values are:
- 0b0: The non-debug logic of the PE is not in reset state.
- 0b1: The non-debug logic of the PE is in reset state.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see EDPRSR.{DLK, R} and reset state on page H6-7124.

This field is in the Core power domain.
Accessing this field has the following behavior:
- When (FEAT_DoPD is not implemented and !IsCorePowered()) or DoubleLockStatus(), access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

**SPD, bit [1]**

Sticky core Powerdown status bit.

If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, then:
- If FEAT_Debugv8p2 is implemented, this bit reads as 0.
- If FEAT_Debugv8p2 is not implemented, this bit might read as 0 or 1.

For more information, see EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-7123.

0b0: If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost.
If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.

0b1 The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When FEAT_DoPD is not implemented and the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information, see EDPRSR.SPD when the Core domain is in either retention or powerdown state on page H6-7124.

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-7123.

This field is in the Core power domain and the Cold reset domain.

On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- When FEAT_DoPD is not implemented and !IsCorePowered(), access to this field is RAZ.
- When IsCorePowered() and DoubleLockStatus(), access to this field is UNKNOWN.
- Otherwise, access to this field is RO.

PU, bit [0]

**When FEAT_DoPD is implemented:**

Core powerup status bit.

Access to this field is RAO.

**When FEAT_Debugv8p2 is implemented:**

Core powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

0b0 Either the Core power domain is in a low-power or powerdown state, or FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, meaning the debug registers in the Core power domain cannot be accessed.

0b1 The Core power domain is in a powerup state, and either FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, meaning the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see EDPRSR.{DLK, R} and reset state on page H6-7124

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-7123

Access to this field is RO.

**Otherwise:**

Core powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and DoubleLockStatus() == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.
Otherwise, permitted values are:

0b0  Core power domain is in a low-power or powerdown state where the debug registers in
the Core power domain cannot be accessed.

0b1  Core power domain is in a powerup state where the debug registers in the Core power
domain can be accessed.

If FEAT_DoubleLock is implemented, the Core power domain is powered up, and
DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with
the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more
information see EDPRSR.{DLK, R} and reset state on page H6-7124

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed,
and whether their state has been lost since the last time the register was read. For more information,
see EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-7123.

Access to this field is RO.

Accessing the EDPRSR:

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field
descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, then:
  — EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
  — EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- Otherwise it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If FEAT_DoPD is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered
  up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x314</td>
<td>EDPRSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.41    EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in EDSCR.

Configurations

EDRCR is in the Core power domain.

Attributes

EDRCR is a 32-bit register.

Field descriptions

The EDRCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>30</td>
<td>CSE</td>
</tr>
<tr>
<td>29</td>
<td>CSPA</td>
</tr>
<tr>
<td>28</td>
<td>CBRRQ</td>
</tr>
<tr>
<td>27</td>
<td>CBRRQ, bit [4]</td>
</tr>
<tr>
<td>26</td>
<td>Allow imprecise entry to Debug state</td>
</tr>
<tr>
<td>25</td>
<td>The actions on writing to this bit are:</td>
</tr>
<tr>
<td>24</td>
<td>0b0  No action.</td>
</tr>
<tr>
<td>23</td>
<td>0b1  Allow imprecise entry to Debug state,</td>
</tr>
<tr>
<td></td>
<td>for example by canceling pending bus accesses.</td>
</tr>
</tbody>
</table>

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the EDSCR.PipeAdv bit to 0. The actions on writing to this bit are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>
<td>Clear Sticky Pipeline Advance</td>
</tr>
<tr>
<td>21</td>
<td>No action.</td>
</tr>
<tr>
<td>20</td>
<td>Clear the EDSCR.PipeAdv bit to 0.</td>
</tr>
</tbody>
</table>

CSE, bit [2]

Clear Sticky Error. Used to clear the EDSCR cumulative error bits to 0. The actions on writing to this bit are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>19</td>
<td>Clear Sticky Error.</td>
</tr>
<tr>
<td>18</td>
<td>No action.</td>
</tr>
<tr>
<td>17</td>
<td>Clear the EDSCR.{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the EDSCR.ITO bit, to 0.</td>
</tr>
</tbody>
</table>

Bits [1:0]

Reserved, RES0.
Accessing the EDRCR:

EDRCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x90</td>
<td>EDRCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
H9.2.42   EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

**Purpose**
Main control register for the debug implementation.

**Configurations**
External register EDSCR[30:29] is architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].
EDSCR is in the Core power domain.

**Attributes**
EDSCR is a 32-bit register.

**Field descriptions**
The EDSCR bit assignments are:

```
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 10 | 9 | 8 | 7 | 6 | 5 | 0 |
|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|     | TFO | RXfull | TXfull | ITO | RXO | TXU | PipeAdv | ITE | INTdis | TDA | MA | SC2 | RES0 | SDD |     | RW | EL | A | STATUS |
|     | ERR | HDE | RES0 |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
```

**TFO, bit [31]**

*When FEAT_TRF is implemented:*

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

0b0 Trace Filter controls are not affected.

0b1 Trace Filter controls in TRFCR_EL1, TRFCR_EL2 are ignored.
Trace Filter controls TRFCR and HTRFCR are ignored.

When OLSR_EL1.OSLK == 1, this bit can be indirectly read and written through the MDSCR_EL1 and DBGDSCRext System registers.

This bit is ignored by the PE when ExternalSecureNoninvasiveDebugEnabled() == FALSE and the Effective value of MDCR_EL3.STE == 1.

On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.
**Otherwise:**
Reserved, RES0.

**RXfull, bit [30]**
DTRRX full.
On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.
Access to this field is RO.

**TXfull, bit [29]**
DTRTX full.
On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.
Access to this field is RO.

**ITO, bit [28]**
ITR overrun.
If the PE is in Non-debug state, this bit is UNKNOWN. ITO is set to 0 on entry to Debug state.
Access to this field is RO.

**RXO, bit [27]**
DTRRX overrun.
On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.
Access to this field is RO.

**TXU, bit [26]**
DTRTX underrun.
On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.
Access to this field is RO.

**PipeAdv, bit [25]**
Pipeline advance. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to EDRCR.CSPA.
The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.
Access to this field is RO.

**ITE, bit [24]**
ITR empty.
If the PE is in Non-debug state, this bit is UNKNOWN. It is always valid in Debug state.
Access to this field is RO.
External Debug Register Descriptions

H9.2 External debug registers

INTdis, bits [23:22]

When FEAT_Debugv8p4 is implemented:

Interrupt disable. Disables taking interrupts in Non-Debug state.

- 0b0: Masking of interrupts is controlled by PSTATE and interrupt routing controls.
- 0b1: If ExternalSecureDebugEnabled() == TRUE, then all interrupts, including virtual and SError interrupts, are masked.
  If ExternalSecureDebugEnabled() == FALSE, then all interrupts targeting Non-secure state are masked.

When OSLSR_EL1.OSLK == 1, this field can be indirectly read and written through the MDSCR_EL1 and DBGDSCRext System registers.

This field is ignored by the PE and treated as zero when ExternalDebugEnabled() == FALSE.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Otherwise:

Interrupt disable.

When OSLSR_EL1.OSLK == 1, this field can be indirectly read and written through the MDSCR_EL1 and DBGDSCRext System registers.

- 0b00: Do not disable interrupts.
- 0b01: Disable interrupts taken to Non-secure EL1.
- 0b10: Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If ExternalSecureInvasiveDebugEnabled() == TRUE, also disable interrupts taken to Secure EL1.
- 0b11: Disable interrupts taken only to Non-secure EL1 and Non-secure EL2. If ExternalSecureInvasiveDebugEnabled() == TRUE, also disable all other interrupts.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1.
- AArch32: DBGBCR<n>, DBGBVR<n>, DBGXVR<n>, DBGWCR<n>, DBGWVR<n>.

The possible values of this field are:

- 0b0: Accesses to debug System registers do not generate a Software Access Debug event.
- 0b1: Accesses to debug System registers generate a Software Access Debug event, if OSLSR_EL1.OSLK is 0 and if halting is allowed.

On a Cold reset, this field resets to 0.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC.

This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

- 0b0: Normal access mode.
- 0b1: Memory access mode.
On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and FEAT_PCSRv8p2 is not implemented:

Sample CONTEXTIDR_EL2. Controls whether the PC Sample-based Profiling Extension samples CONTEXTIDR_EL2 or VTTBR_EL2.VMID.

0b0 Sample VTTBR_EL2.VMID.
0b1 Sample CONTEXTIDR_EL2.

On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Otherwise:
Reserved, RES0.

NS, bit [18]
Non-secure status. When in Debug state, gives the current Security state:

0b0 Secure state, IsSecure() == TRUE.
0b1 Non-secure state, IsSecure() == FALSE.

In Non-debug state, this bit is UNKNOWN.

Access to this field is RO.

Bit [17]
Reserved, RES0.

SDD, bit [16]
Secure debug disabled.
On entry to Debug state:

• If entering in Secure state, SDD is set to 0.
• If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

• SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
• This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.
Access to this field is RO.

Bit [15]
Reserved, RES0.

HDE, bit [14]
Halting debug enable. The possible values of this field are:

0b0 Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1 Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.
On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

**RW, bits [13:10]**

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

- **0b1111** All Exception levels are using AArch64 or the PE is in Non-debug state.
- **0b1110** When **AArch32 is supported at any Exception level** The PE is in Debug state. EL0 is using AArch32. All other Exception levels are using AArch64. Only permitted if the PE is executing at EL0.
- **0b110x** When **AArch32 is supported at any Exception level** The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 and EL3 are using AArch64. Only permitted if EL2 is implemented and enabled in the current Security state.
- **0b10xx** When **AArch32 is supported at any Exception level, EL3 is implemented, EL3 is using AArch64 and EL2 is implemented** The PE is in Debug state. EL0, EL1, and, if implemented in the current Security state, EL2 are using AArch32. EL3 is using AArch64.
- **0b0xxx** When **AArch32 is supported at any Exception level** The PE is in Debug state. All Exception levels are using AArch32.

In Non-debug state, this field is RAO.
Access to this field is RO.

**EL, bits [9:8]**

Exception level. In Debug state, this gives the current Exception level of the PE.
In Non-debug state, this field is RAZ.
Access to this field is RO.

**A, bit [7]**

SError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:
- If **HCR_EL2.{AMO, TGE} = {1, 0}**, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

- **0b0** No SError interrupt pending.
- **0b1** SError interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.
UNKNOWN in Non-debug state.
Access to this field is RO.

**ERR, bit [6]**

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.
On a Cold reset, this field resets to 0.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.
Access to this field is RO.

**STATUS, bits [5:0]**

Debug status flags.

- **0b000001** PE is restarting, exiting Debug state.
0b000010  PE is in Non-debug state.
0b000111  Breakpoint.
0b010011  External debug request.
0b011011  Halting step, normal.
0b011111  Halting step, exclusive.
0b100011  OS Unlock Catch.
0b100111  Reset Catch.
0b101011  Watchpoint.
0b101111  HLT instruction.
0b110011  Software access to debug register.
0b110111  Exception Catch.
0b111011  Halting step, no syndrome.

All other values of STATUS are reserved.

Access to this field is RO.

**Accessing the EDSCR:**

EDSCR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x088</td>
<td>EDSCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
H9.2.43  EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose
Contains sampled values captured on reading EDPCSR[31:0].

Configurations
EDVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Note
FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes
If FEAT_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Field descriptions
The EDVIDSR bit assignments are:

When FEAT_VHE is not implemented or EDSCR.SC2 == 0:

<table>
<thead>
<tr>
<th>31 30 29 28 27</th>
<th>16 15</th>
<th>8 7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>NS</td>
<td>RES0</td>
<td>VMID[15:8]</td>
<td>VMID</td>
</tr>
</tbody>
</table>

This format applies in all Armv8.0 implementations.

NS, bit [31]
Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

0b0   Sample is from Secure state.
0b1   Sample is from Non-secure state.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.
E2, bit [30]

When EL2 is implemented:

Exception level 2 status sample. Indicates whether the most recent EDPCSR sample was associated with EL2.

0b0 Sample is not from EL2.
0b1 Sample is from EL2.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

E3, bit [29]

When EL3 is implemented and the highest implemented Exception level is using AArch64 state:

Exception level 3 status sample. Indicates whether the most recent EDPCSR sample was associated with EL3 using AArch64.

0b0 Sample is not from EL3 using AArch64.
0b1 Sample is from EL3 using AArch64.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi (EDPCSR[63:32]) valid. Indicates whether bits [63:32] of the most recent EDPCSR sample might be nonzero:

0b0 Bits[63:32] of the most recent EDPCSR sample are zero.
0b1 Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi (EDPCSR[63:32]) does not need to be read.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented and EL2 is implemented:

Extension to VMID[7:0]. See VMID[7:0] for more details.
On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RES0.
VMID, bits [7:0]

**When EL2 is implemented:**
VMID sample. The VMID associated with the most recent EDPCSRlo (EDPCSR[31:0]) sample. When the most recent EDPCSR sample was generated:
- This field is RES0 if any of the following apply:
  - The PE is executing in Secure state.
  - The PE is executing at EL2.
- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBRR.VMID.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

Otherwise:
Reserved, RES0.

**When (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and EDSCR.SC2 == 1:**

CONTEXTIDR_EL2, bits [31:0]
Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent EDPCSR sample. When the most recent EDPCCSR sample was generated:
- If EL2 was using AArch64 and the PE was executing in Non-secure state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- If EL2 was using AArch32 or the PE was executing in Secure state, then this field is set to an UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

**Accessing the EDVIDSR:**
IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-7134.

EDVIDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xA8</td>
<td>EDVIDSR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
H9.2.44 EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configurations

EDWAR is in the Core power domain.

Attributes

EDWAR is a 64-bit register.

Field descriptions

The EDWAR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:32]</th>
<th>Watchpoint address</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 0</td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See Determining the memory location that caused a Watchpoint exception on page D2-2459.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Accessing the EDWAR:

EDWAR[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x070</td>
<td>EDWAR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDWAR[31:0] are RO.
- Otherwise accesses to EDWAR[31:0] generate an error response.
EDWAR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x034</td>
<td>EDWAR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDWAR[63:32] are RO.
- Otherwise accesses to EDWAR[63:32] generate an error response.
H9.2.45 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configurations

External register MIDR_EL1[31:0] is architecturally mapped to AArch64 System register MIDR_EL1[31:0].

External register MIDR_EL1[31:0] is architecturally mapped to AArch32 System register MIDR[31:0].

It is IMPLEMENTATION DEFINED whether MIDR_EL1 is implemented in the Core power domain or in the Debug power domain.

Attributes

MIDR_EL1 is a 32-bit register.

Field descriptions

The MIDR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>24 23</th>
<th>20 19</th>
<th>16 15</th>
<th>4 3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implementer</td>
<td>Variant</td>
<td></td>
<td>PartNum</td>
<td>Revision</td>
<td></td>
</tr>
</tbody>
</table>

Architecture

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>Reserved for software use</td>
</tr>
<tr>
<td>0xC0</td>
<td>Ampere Computing</td>
</tr>
<tr>
<td>0x41</td>
<td>Arm Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x46</td>
<td>Fujitsu Ltd.</td>
</tr>
<tr>
<td>0x49</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x4D</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
</tbody>
</table>
Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

**Variant, bits [23:20]**

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

**Architecture, bits [19:16]**

Architecture version. Defined values are:
- 0b0001      Armv4.
- 0b0010      Armv4T.
- 0b0011      Armv5 (obsolete).
- 0b0100      Armv5T.
- 0b0101      Armv5TE.
- 0b0110      Armv5TEJ.
- 0b0111      Armv6.
- 0b1111      Architectural features are individually identified in the ID_* registers, see Table K15-9 on page K15-8181.

All other values are reserved.

**PartNum, bits [15:4]**

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

**Revision, bits [3:0]**

An IMPLEMENTATION DEFINED revision number for the device.

**Accessing the MIDR_EL1:**

MIDR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x00</td>
<td>MIDR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.
H9.2.46   OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

**Purpose**

Used to lock or unlock the OS lock.

**Configurations**

External register OSLAR_EL1[31:0] is architecturally mapped to AArch64 System register OSLAR_EL1[31:0].

External register OSLAR_EL1[31:0] is architecturally mapped to AArch32 System register DBGOSLAR[31:0].

OSLAR_EL1 is in the Core power domain.

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

If FEAT_Debugv8p2 is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

**Attributes**

OSLAR_EL1 is a 32-bit register.

**Field descriptions**

The OSLAR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0.</td>
</tr>
<tr>

<tr>
<td>2</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>1</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0</td>
<td>OSLK</td>
</tr>
</tbody>
</table>

**Accessing the OSLAR_EL1:**

--- Note ---
SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

OSLAR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x300</td>
<td>OSLAR_EL1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are WO.
- When IsCorePowered(), !DoubleLockStatus(), !AllowExternalDebugAccess() and FEAT_Debugv8p2 is not implemented accesses to this register are IMPDEF.
- Otherwise accesses to this register generate an error response.
H9.3  Cross-Trigger Interface registers

This section lists the Cross-Trigger Interface registers.
H9.3.1 ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

Purpose

Can be used to provide implementation defined controls for the CTI. For example, the register might be used to control multiplexors for additional implementation defined triggers. The implementation defined controls provided by this register might modify the architecturally defined behavior of the CTI.

--- Note ---
The architecturally-defined triggers must not be multiplexed.

Configurations

It is implementation defined whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is implementation defined whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes implementation defined behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are implementation defined.

Attributes

ASICCTL is a 32-bit register.

Field descriptions

The ASICCTL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the ASICCTL:

ASICCTL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x244</td>
<td>ASICCTL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.
H9.3.2  CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

**Purpose**
Cleans bits of the Application Trigger register.

**Configurations**
CTIAPPCLEAR is in the Debug power domain.

**Attributes**
CTIAPPCLEAR is a 32-bit register.

**Field descriptions**
The CTIAPPCLEAR bit assignments are:

<table>
<thead>
<tr>
<th>Field description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPCLEAR&lt;x&gt;, bit [x]</td>
<td>for x = 0 to 31</td>
</tr>
</tbody>
</table>

**APPCLEAR<x>, bit [x]**, for x = 0 to 31
Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:
- 0b0   No effect.
- 0b1   Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPULSE.

**Accessing the CTIAPPCLEAR:**

CTIAPPCLEAR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x018</td>
<td>CTIAPPCLEAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.
H9.3.3 CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

**Purpose**
Causes event pulses to be generated on ECT channels.

**Configurations**
CTIAPPPULSE is in the Debug power domain.

**Attributes**
CTIAPPPULSE is a 32-bit register.

**Field descriptions**
The CTIAPPPULSE bit assignments are:

<table>
<thead>
<tr>
<th>APPPULSE&lt;x&gt;, bit [x]</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
</table>

**APPPULSE<x>, bit [x], for x = 0 to 31**
Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

- **0b0** No effect.
- **0b1** Channel <x> event pulse generated.

**Note**
- The CTIAPPPULSE operation does not affect the state of the Application Trigger register, CTIAPPTRIG. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

**Accessing the CTIAPPPULSE:**
It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBNEN is 0.

CTIAPPPULSE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x10</td>
<td>CTIAPPPULSE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.
H9.3.4 CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

**Purpose**
Sets bits of the Application Trigger register.

**Configurations**
CTIAPPSET is in the Debug power domain.

**Attributes**
CTIAPPSET is a 32-bit register.

**Field descriptions**
The CTIAPPSET bit assignments are:

<table>
<thead>
<tr>
<th>31-0</th>
<th>APPSET&lt;x&gt;, bit [x]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

APPSET<x>, bit [x], for x = 0 to 31
Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

0b0  Reading this means the application trigger is inactive. Writing this has no effect.
0b1  Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPULSE.

On a Cold reset, the value of this field is unchanged.
On an External debug reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

**Accessing the CTIAPPSET:**
CTIAPPSET can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x014</td>
<td>CTIAPPSET</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.3.5 CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

**Configurations**

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

**Attributes**

CTIAUTHSTATUS is a 32-bit register.

**Field descriptions**

The CTIAUTHSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit 31</th>
<th>Bit 8</th>
<th>Bit 7</th>
<th>Bit 4</th>
<th>Bit 3</th>
<th>Bit 2</th>
<th>Bit 1</th>
<th>Bit 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RAZ</td>
<td>NSNID</td>
<td>NSID</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**Bits [7:4]**

Reserved, RAZ.

**NSNID, bits [3:2]**

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSNID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SNID.

**NSID, bits [1:0]**

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SID.

**Accessing the CTIAUTHSTATUS:**

CTIAUTHSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB8</td>
<td>CTIAUTHSTATUS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.6  CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

**Purpose**
Provides the raw status of the ECT channel inputs to the CTI.

**Configurations**
CTICHINSTATUS is in the Debug power domain.

**Attributes**
CTICHINSTATUS is a 32-bit register.

**Field descriptions**
The CTICHINSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIN&lt;n&gt;, bit [n], for n = 0 to 31</td>
<td></td>
</tr>
<tr>
<td>31</td>
<td>CHIN&lt;n&gt;, bit [n]</td>
</tr>
<tr>
<td>0</td>
<td>CHIN&lt;n&gt;, bit [n]</td>
</tr>
</tbody>
</table>

CTICHINSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x138</td>
<td>CTICHINSTATUS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.7 CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

**Purpose**

Provides the status of the ECT channel outputs from the CTI.

**Configurations**

CTICHOUTSTATUS is in the Debug power domain.

**Attributes**

CTICHOUTSTATUS is a 32-bit register.

**Field descriptions**

The CTICHOUTSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>CHOUT&lt;(n)&gt;, bit [(n)]</th>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output channel &lt;(n)&gt; status.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits \([31:N]\) are RAZ. \(N\) is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

- \(0b0\): Output channel <\(n\)> is inactive.
- \(0b1\): Output channel <\(n\)> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

**Note**

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see CTIGATE.

**Accessing the CTICHOUTSTATUS:**

CTICHOUTSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x13C</td>
<td>CTICHOUTSTATUS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.8 CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see *About the Component Identification scheme* on page K2-8002.

**Configurations**

CTICIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR0 is a 32-bit register.

**Field descriptions**

The CTICIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7-0</td>
<td>PRMBL_0, bits [7:0]</td>
</tr>
</tbody>
</table>

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble.

Reads as 0x0D.

**Accessing the CTICIDR0:**

CTICIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF0</td>
<td>CTICIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.9 CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see *About the Component Identification scheme* on page K2-8002.

**Configurations**

CTICIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR1 is a 32-bit register.

**Field descriptions**

The CTICIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8</td>
<td>CLASS</td>
</tr>
<tr>
<td>7</td>
<td>Component class.</td>
</tr>
<tr>
<td>6</td>
<td>0b1001 CoreSight component.</td>
</tr>
<tr>
<td>5</td>
<td>Other values are defined by the CoreSight Architecture.</td>
</tr>
<tr>
<td>4</td>
<td>This field reads as 0x9.</td>
</tr>
<tr>
<td>3</td>
<td>PRMBL_1, bits [3:0]</td>
</tr>
<tr>
<td>2</td>
<td>Preamble. RAZ.</td>
</tr>
<tr>
<td>1</td>
<td>Reads as 0b0000.</td>
</tr>
</tbody>
</table>

**Accessing the CTICIDR1:**

CTICIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF4</td>
<td>CTICIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.10 CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component. For more information, see *About the Component Identification scheme* on page K2-8002.

**Configurations**

CTICIDR2 is in the Debug power domain. Implementation of this register is OPTIONAL. This register is required for CoreSight compliance.

**Attributes**

CTICIDR2 is a 32-bit register.

**Field descriptions**

The CTICIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8</td>
<td>7</td>
<td>PRMBL_2</td>
</tr>
<tr>
<td>7</td>
<td>6</td>
<td>Preamble.</td>
</tr>
<tr>
<td>0</td>
<td></td>
<td>Reads as 0x05.</td>
</tr>
</tbody>
</table>

**Accessing the CTICIDR2:**

CTICIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF8</td>
<td>CTICIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.11 CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see About the Component Identification scheme on page K2-8002.

Configurations

CTICIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR3 is a 32-bit register.

Field descriptions

The CTICIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7-0</td>
<td>PRMBL_3, Preamble</td>
</tr>
</tbody>
</table>

Accessing the CTICIDR3:

CTICIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFFC</td>
<td>CTICIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• Accesses to this register are RO.
H9.3.12 CTCLAIMCLR, CTI CLAIM Tag Clear register

The CTCLAIMCLR characteristics are:

**Purpose**

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

**Configurations**

CTCLAIMCLR is in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

CTCLAIMCLR is a 32-bit register.

**Field descriptions**

The CTCLAIMCLR bit assignments are:

<table>
<thead>
<tr>
<th>Component Offset Instance</th>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA4</td>
<td>CTCLAIMCLR</td>
<td></td>
</tr>
</tbody>
</table>

CLAIM<\(x\)>, bit \([x]\), for \(x = 0\) to \(31\)

CLAIM tag clear bit.

For values of \(x\) greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of \(x\), reads return the value of CLAIM\([x]\) and the behavior on writes is:

- **0b0** No action.
- **0b1** Indirectly clear CLAIM\([x]\) to 0.

A single write to CTCLAIMCLR can clear multiple tags to 0.

An External Debug reset clears the CLAIM tag bits to 0.

**Accessing the CTCLAIMCLR:**

CTCLAIMCLR can be accessed through the external debug interface:

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.3.13 CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

**Purpose**

Used by software to set CLAIM bits to 1.

**Configurations**

CTICLAIMSET is in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

CTICLAIMSET is a 32-bit register.

**Field descriptions**

The CTICLAIMSET bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLAIM&lt;x&gt;, bit [x]</td>
<td></td>
</tr>
</tbody>
</table>

CLAIM<x>, bit [x], for x = 0 to 31

CLAIM tag set bit.

For values of x greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a Should-Be-Zero policy on writes. Implementations must ignore writes.

For other values of x, the bit is RAO and the behavior on writes is:

0b0 No action.
0b1 Indirectly set CLAIM[x] tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

An External Debug reset clears the CLAIM tag bits to 0.

**Accessing the CTICLAIMSET:**

CTICLAIMSET can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA0</td>
<td>CTICLAIMSET</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.3.14 CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose
 Controls whether the CTI is enabled.

Configurations
 CTICONTROL is in the Debug power domain.

Attributes
 CTICONTROL is a 32-bit register.

Field descriptions
The CTICONTROL bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:1</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0</td>
<td>GLBEN, bit [0]</td>
</tr>
</tbody>
</table>

GLBEN, bit [0]
Enables or disables the CTI mapping functions. Possible values of this field are:

- 0b0: CTI mapping functions and application trigger disabled.
- 0b1: CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it remains asserted after the mapping functions are disabled. All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

On a Cold reset, the value of this field is unchanged.
On an External debug reset, this field resets to 0.
On a Warm reset, the value of this field is unchanged.

Accessing the CTICONTROL:

CTICONTROL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x000</td>
<td>CTICONTROL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.3.15  CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configurations

CTIDEVAFF0 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF1 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions

The CTIDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>MPIDR_EL1lo</td>
</tr>
</tbody>
</table>

MPIDR_EL1lo, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the CTIDEVAFF0:

CTIDEVAFF0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA8</td>
<td>CTIDEVAFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.16 CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

**Configurations**

CTIDEVAFF1 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF0 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

**Attributes**

CTIDEVAFF1 is a 32-bit register.

**Field descriptions**

The CTIDEVAFF1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>MPIDR_EL1hi</td>
</tr>
</tbody>
</table>

**MPIDR_EL1hi, bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the CTIDEVAFF1:**

CTIDEVAFF1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA0</td>
<td>CTIDEVAFF1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.17 CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers’ model architecture of the CTI component.

Configurations

CTIDEVARCH is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is not implemented, CTIDEVAFF0 and CTIDEVAFF1 are also not implemented.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

The CTIDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ARCHITECT</td>
<td>Defines the architecture of the component. For CTI, this is Arm Limited.</td>
</tr>
<tr>
<td>28</td>
<td>Bits [31:28]</td>
<td>JEP106 continuation code, 0x4.</td>
</tr>
<tr>
<td>27</td>
<td>Bits [27:21]</td>
<td>JEP106 ID code, 0x3B.</td>
</tr>
<tr>
<td>20</td>
<td>PRESENT</td>
<td>When set to 1, indicates that the DEVARCH is present.</td>
</tr>
<tr>
<td>19</td>
<td>REVISION</td>
<td>Revision.</td>
</tr>
<tr>
<td>0</td>
<td>ARCHID</td>
<td>Defines this part to be an Armv8 debug component. For architectures defined</td>
</tr>
<tr>
<td></td>
<td></td>
<td>by Arm this is further subdivided.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For CTI:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Bits [15:12] are the architecture version, 0x1.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Bits [11:0] are the architecture part number, 0xA14.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This corresponds to CTI architecture version CTIv2.</td>
</tr>
</tbody>
</table>
Accessing the CTIDEVARCH:

CTIDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFBC</td>
<td>CTIDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.18 CTDEVCTL, CTI Device Control register

The CTDEVCTL characteristics are:

**Purpose**

Provides target-specific device controls

**Configurations**

CTDEVCTL is in the Debug power domain.
This register is present only when FEAT_DoPD is implemented. Otherwise, direct accesses to CTDEVCTL are RES0.

**Attributes**

CTDEVCTL is a 32-bit register.

**Field descriptions**

The CTDEVCTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
<td>0x0</td>
</tr>
<tr>
<td>2</td>
<td>RCE, bit [1]</td>
<td>0b0, 0b1</td>
</tr>
<tr>
<td></td>
<td>Reset Catch Enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Reset Catch debug event disabled.</td>
<td>0b0</td>
</tr>
<tr>
<td></td>
<td>Reset Catch debug event enabled.</td>
<td>0b1</td>
</tr>
<tr>
<td>1</td>
<td>OSUCE, bit [0]</td>
<td>0b0, 0b1</td>
</tr>
<tr>
<td></td>
<td>OS Unlock Catch Enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>OS Unlock Catch debug event disabled.</td>
<td>0b0</td>
</tr>
<tr>
<td></td>
<td>OS Unlock Catch debug event enabled.</td>
<td>0b1</td>
</tr>
</tbody>
</table>

On a Cold reset, the value of this field is unchanged.
On an External debug reset, this field resets to 0.
On a Warm reset, the value of this field is unchanged.
Accessing the CTIDEVCTL:

CTIDEVCTL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x150</td>
<td>CTIDEVCTL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.3.19  CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

Configurations

CTIDEVID is in the Debug power domain.

Attributes

CTIDEVID is a 32-bit register.

Field descriptions

The CTIDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>26-24</td>
<td>NUMCHAN</td>
</tr>
<tr>
<td>15-14</td>
<td>NUMTRIG</td>
</tr>
<tr>
<td>8-7</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**InOut, bits [25:24]**

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

0b00  CTIGATE does not mask propagation of input events from external channels.
0b01  CTIGATE masks propagation of input events from external channels.

All other values are reserved.

**Bits [23:22]**

Reserved, RES0.

**NUMCHAN, bits [21:16]**

Number of ECT channels implemented. IMPLEMENTATION DEFINED. For Armv8, valid values are:

0b000011  3 channels (0..2) implemented.
0b000100  4 channels (0..3) implemented.
0b000101  5 channels (0..4) implemented.
0b000110  6 channels (0..5) implemented.
... and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

**Bits [15:14]**

Reserved, RES0.

**NUMTRIG, bits [13:8]**

Number of triggers implemented. IMPLEMENTATION DEFINED. This is one more than the index of the largest trigger, rather than the actual number of triggers.
For Armv8, valid values are:
- \(0b000011\) Up to 3 triggers (0..2) implemented.
- \(0b001000\) Up to 8 triggers (0..7) implemented.
- \(0b001001\) Up to 9 triggers (0..8) implemented.
- \(0b001010\) Up to 10 triggers (0..9) implemented.
and so on up to \(0b100000\), 32 triggers (0..31) implemented.

All other values are reserved. If the PE contains a Trace extension, this field must be at least \(0b001000\). There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

**Bits [7:5]**

Reserved, RES0.

**EXTMUXNUM, bits [4:0]**

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, ASICCTL.

### Accessing the CTIDEVID:

CTIDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC8</td>
<td>CTIDEVID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.20  CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

**Purpose**
Reserved for future information about the CTI component to the debugger.

**Configurations**
CTIDEVID1 is in the Debug power domain.

**Attributes**
CTIDEVID1 is a 32-bit register.

**Field descriptions**
The CTIDEVID1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the CTIDEVID1:**
CTIDEVID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC4</td>
<td>CTIDEVID1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to this register are RO.
H9.3.21 CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

**Purpose**
Reserved for future information about the CTI component to the debugger.

**Configurations**
CTIDEVID2 is in the Debug power domain.

**Attributes**
CTIDEVID2 is a 32-bit register.

**Field descriptions**
The CTIDEVID2 bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:0]</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

**Accessing the CTIDEVID2:**
CTIDEVID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF0</td>
<td>CTIDEVID2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.22  CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PEs cross-trigger interface.

**Configurations**

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is **OPTIONAL**.

**Attributes**

CTIDEVTYPE is a 32-bit register.

**Field descriptions**

The CTIDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:8]</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>SUB, bits [7:4]</td>
<td>Subtype. Must read as 0x1 to indicate this is a component within a PE.</td>
</tr>
<tr>
<td>MAJOR, bits [3:0]</td>
<td>Major type. Must read as 0x4 to indicate this is a cross-trigger component.</td>
</tr>
</tbody>
</table>

**Accessing the CTIDEVTYPE:**

CTIDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFCC</td>
<td>CTIDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.23  CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

**Purpose**

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

**Configurations**

CTIGATE is in the Debug power domain.

**Attributes**

CTIGATE is a 32-bit register.

**Field descriptions**

The CTIGATE bit assignments are:

<table>
<thead>
<tr>
<th>GATE&lt;x&gt;, bit [x]</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
</tr>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

GATE<x>, bit [x], for x = 0 to 31

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

- 0b0  Disable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.
- 0b1  Enable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.

If GATE[x] is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

On a Cold reset, the value of this field is unchanged.

On an External debug reset, this field resets to an architecturally UNKNOWN value.

On a Warm reset, the value of this field is unchanged.

**Accessing the CTIGATE:**

CTIGATE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x140</td>
<td>CTIGATE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
CTIINEN<\(n\)>, CTI Input Trigger to Output Channel Enable registers, \(n = 0 - 31\)

The CTIINEN<\(n\)> characteristics are:

**Purpose**

Enables the signaling of an event on output channels when input trigger event \(n\) is received by the CTI.

**Configurations**

CTIINEN<\(n\)> is in the Debug power domain.

If input trigger \(n\) is not connected, the behavior of CTIINEN<\(n\)> is IMPLEMENTATION DEFINED.

**Attributes**

CTIINEN<\(n\)> is a 32-bit register.

**Field descriptions**

The CTIINEN<\(n\)> bit assignments are:

<table>
<thead>
<tr>
<th>Field Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INEN&lt;(x)&gt;, bit [(x)]</td>
<td>Input trigger (n) to output channel (x) enable.</td>
</tr>
</tbody>
</table>

- **INEN<\(x\)>, bit [\(x\)], for \(x = 0\) to 31**
  - Input trigger \(n\) to output channel \(x\) enable.
  - Bits [31:N] are RAZ/WI. \(N\) is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.
  - 0b0: Input trigger \(n\) will not generate an event on output channel \(<x>\).
  - 0b1: Input trigger \(n\) will generate an event on output channel \(<x>\).

  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to an architecturally UNKNOWN value.
  - On a Warm reset, the value of this field is unchanged.

**Accessing the CTIINEN<\(n\)>:**

CTIINEN<\(n\)> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x020 + (4 * (n))</td>
<td>CTIINEN&lt;(n)&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.3.25 CTINTACK, CTI Output Trigger Acknowledge register

The CTINTACK characteristics are:

**Purpose**
Can be used to deactivate the output triggers.

**Configurations**
CTINTACK is in the Debug power domain.

**Attributes**
CTINTACK is a 32-bit register.

**Field descriptions**
The CTINTACK bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACK&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

**ACK<n>, bit [n], for n = 0 to 31**

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

If any of the following is true, writes to ACK<n> are ignored:
- n ≥ CTIDEVID.NUMTRIG, the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by CTIOUTEN<n>, is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:
- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:
- 0b0 No effect
- 0b1 Deactivate the trigger.

**Accessing the CTINTACK:**

A debugger must read CTITRIGOUTSTATUS to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTINTACK, such as a write to CTIAPPPULSE to activate another trigger.

CTINTACK can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x010</td>
<td>CTINTACK</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.
H9.3.26 CTITCTRL, CTI Integration mode Control register

The CTITCTRL characteristics are:

**Purpose**

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configurations**

It is IMPLEMENTATION DEFINED whether CTITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

CTITCTRL is a 32-bit register.

**Field descriptions**

The CTITCTRL bit assignments are:

- **Bits [31:1]**
  - Reserved, RES0.

- **IME, bit [0]**
  - Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.
  - 0b0 Normal operation.
  - 0b1 Integration mode enabled.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to 0.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.

- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to 0.
  - On a Warm reset, the value of this field is unchanged.
Accessing the CTIITCTRL:

CTIITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF00</td>
<td>CTIITCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.
H9.3.27 CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

**Purpose**

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configurations**

CTILAR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

**Attributes**

CTILAR is a 32-bit register.

**Field descriptions**

The CTILAR bit assignments are:

*When the Software Lock is implemented:*

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY</td>
<td></td>
</tr>
</tbody>
</table>

**KEY, bits [31:0]**

Lock Access control. Writing the key value 0xC5ACE5 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory-mapped interface.

**Otherwise:**

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

**Otherwise**

**Bits [31:0]**

Reserved, RES0.
Accessing the CTILAR:

CTILAR can be accessed through a memory-mapped interface access to the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB0</td>
<td>CTILAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are WO.
H9.3.28 CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

**Purpose**

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configurations**

CTILSR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

**Attributes**

CTILSR is a 32-bit register.

**Field descriptions**

The CTILSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Bit Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>30</td>
<td>SLI</td>
<td></td>
</tr>
<tr>
<td>29</td>
<td>SLK</td>
<td></td>
</tr>
<tr>
<td>28</td>
<td>nTT</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

*When the Software Lock is implemented:*

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

- **0b0**  
  Lock clear. Writes are permitted to this component's registers.

- **0b1**  
  Lock set. Writes to this component's registers are ignored, and reads have no side effects.

On a Cold reset, the value of this field is unchanged.

On an External debug reset, this field resets to 1.

On a Warm reset, the value of this field is unchanged.

*Otherwise:*

Reserved, RAZ.
SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

- **0b0**  
  Software Lock not implemented or not memory-mapped access.
- **0b1**  
  Software Lock implemented and memory-mapped access.

Accessing the CTILSR:

CTILSR can be accessed through a memory-mapped interface access to the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB4</td>
<td>CTILSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.29 CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

**Purpose**
Defines which input channels generate output trigger n.

**Configurations**
CTIOUTEN<n> is in the Debug power domain.
If output trigger n is not connected, the behavior of CTIOUTEN<n> is IMPLEMENTATION DEFINED.

**Attributes**
CTIOUTEN<n> is a 32-bit register.

**Field descriptions**
The CTIOUTEN<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>…</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>OUTEN&lt;x&gt;, bit [x]</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**OUTEN<x>, bit [x], for x = 0 to 31**
Input channel <x> to output trigger <n> enable.
Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.
Possible values of this bit are:
- 0b0: An event on input channel <x> will not cause output trigger <n> to be asserted.
- 0b1: An event on input channel <x> will cause output trigger <n> to be asserted.

On a Cold reset, the value of this field is unchanged.
On an External debug reset, this field resets to an architecturally UNKNOWN value.
On a Warm reset, the value of this field is unchanged.

**Accessing the CTIOUTEN<n>:**
CTIOUTEN<n> can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x0A0 + (4 * n)</td>
<td>CTIOUTEN&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.
H9.3.30  CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see About the Peripheral identification scheme on page K2-7999.

**Configurations**

CTIPIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR0 is a 32-bit register.

**Field descriptions**

The CTIPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>8</td>
<td>PART_0</td>
</tr>
<tr>
<td>7</td>
<td></td>
</tr>
<tr>
<td>6</td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

**Accessing the CTIPIDR0:**

CTIPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE0</td>
<td>CTIPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.31  CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

CTIPIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR1 is a 32-bit register.

**Field descriptions**

The CTIPIDR1 bit assignments are:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| RES0 | DES_0 | PART_1 |

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

PART_1, bits [3:0]

Part number, most significant nibble.

**Accessing the CTIPIDR1:**

CTIPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE4</td>
<td>CTIPIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.32  CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.
For more information, see About the Peripheral identification scheme on page K2-7999.

Configurations

CTIPIDR2 is in the Debug power domain.
Implementation of this register is OPTIONAL.
This register is required for CoreSight compliance.

Attributes

CTIPIDR2 is a 32-bit register.

Field descriptions

The CTIPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7:4</td>
<td>REVISION, Part major revision. Parts can also use this field to extend Part number to 16-bits.</td>
</tr>
<tr>
<td>3</td>
<td>JEDEC, RAO. Indicates a JEP106 identity code is used.</td>
</tr>
<tr>
<td>2:0</td>
<td>DES_1, Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.</td>
</tr>
</tbody>
</table>

Accessing the CTIPIDR2:

CTIPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE8</td>
<td>CTIPIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.33 CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

CTIPIDR3 is in the Debug power domain.
Implementation of this register is OPTIONAL.
This register is required for CoreSight compliance.

**Attributes**

CTIPIDR3 is a 32-bit register.

**Field descriptions**

The CTIPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8-7</td>
<td>REV AND, Part minor revision. Parts using CTIPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.</td>
</tr>
<tr>
<td>4-0</td>
<td>CMOD, Customer modified. Indicates someone other than the Designer has modified the component.</td>
</tr>
</tbody>
</table>

**Accessing the CTIPIDR3:**

CTIPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE</td>
<td>CTIPIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.34  CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

**Purpose**

Provides information to identify a CTI component.

For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

CTIPIDR4 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR4 is a 32-bit register.

**Field descriptions**

The CTIPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SIZE</td>
<td>DES_2</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. \( \log_2 \) of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is \( 0b0100 \).

**Accessing the CTIPIDR4:**

CTIPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF00</td>
<td>CTIPIDR4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.35 CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

**Purpose**

Provides the status of the trigger inputs.

**Configurations**

CTITRIGINSTATUS is in the Debug power domain.

**Attributes**

CTITRIGINSTATUS is a 32-bit register.

**Field descriptions**

The CTITRIGINSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRIN&lt;n&gt;, bit [n]</td>
<td>Trigger input &lt;n&gt; status.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>0b0 Input trigger n is inactive.</td>
<td>0</td>
</tr>
<tr>
<td></td>
<td>0b1 Input trigger n is active.</td>
<td>1</td>
</tr>
</tbody>
</table>

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

**Accessing the CTITRIGINSTATUS:**

CTITRIGINSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x130</td>
<td>CTITRIGINSTATUS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
H9.3.36  **CTITRIGOUTSTATUS, CTI Trigger Out Status register**

The CTITRIGOUTSTATUS characteristics are:

**Purpose**

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

**Configurations**

CTITRIGOUTSTATUS is in the Debug power domain.

**Attributes**

CTITRIGOUTSTATUS is a 32-bit register.

**Field descriptions**

The CTITRIGOUTSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TROUT&lt;n&gt;, bit [n], for n = 0 to 31</td>
<td>Trigger output &lt;n&gt; status.</td>
</tr>
<tr>
<td>Bits [31:N]</td>
<td>are RAZ. N is the value in CTIDEVID.NUMTRIG.</td>
</tr>
<tr>
<td>If n &lt; N, and output trigger &lt;n&gt; is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT&lt;n&gt; are:</td>
<td></td>
</tr>
<tr>
<td>0b0</td>
<td>Output trigger n is inactive.</td>
</tr>
<tr>
<td>0b1</td>
<td>Output trigger n is active.</td>
</tr>
<tr>
<td>Otherwise when n &lt; N it is IMPLEMENTATION DEFINED whether TROUT&lt;n&gt; behaves as described here or is RAZ.</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the CTITRIGOUTSTATUS:**

CTITRIGOUTSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x134</td>
<td>CTITRIGOUTSTATUS</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
Part I

Memory-mapped Components of the Armv8 Architecture
Chapter I1
Requirements for Memory-mapped Components

This chapter provides some additional information about memory-mapped components. It contains the following sections:

- Supported access sizes on page 11-7320.
- Synchronization of memory-mapped registers on page 11-7322.
- Access requirements for reserved and unallocated registers on page 11-7324.
I1.1 Supported access sizes

The information in this section applies to all accesses to memory-mapped components of the Armv8 architecture, unless a register or component description explicitly states otherwise.

The memory access sizes that are supported by any peripheral are IMPLEMENTATION DEFINED by the peripheral.

When `HaveSecureExtDebugView()` == TRUE, each debug component has a Secure and Non-secure view. The Secure view of a debug component is mapped into Secure physical memory and the Non-secure view of a debug component is mapped into Non-secure memory. Apart from access conditions, the Non-secure and Secure views of the debug components are identical.

An implementation of a memory-mapped component that is compatible with the Armv8 architecture must support the following:

- Word-aligned 32-bit accesses to access 32-bit registers.
- If any PE in the system implements AArch32, word-aligned 32-bit accesses to either half of a 64-bit register that is mapped to a doubleword-aligned pair of adjacent 32-bit locations.

Note

Some memory-mapped components of the Armv8 architecture require support for word-aligned 32-bit accesses to either half of a 64-bit memory mapped register regardless of whether any PE in the system implements AArch32. These include:

- The memory-mapped interface to the external debug and CTI registers that are described in Chapter H9 External Debug Register Descriptions.
- The memory-mapped interfaces to the Generic Timer registers that are described in Chapter I2 System Level Implementation of the Generic Timer.
- The memory-mapped interfaces to the Performance Monitors registers that are described in Chapter I3 Recommended External Interface to the Performance Monitors.
- The memory-mapped interfaces to the Activity Monitors registers that are described in Chapter I4 Recommended External Interface to the Activity Monitors.

- Doubleword-aligned 64-bit accesses to access 64-bit registers that are mapped to a doubleword-aligned pair of adjacent 32-bit locations.

All registers are only single-copy atomic at word granularity. This means that for 64-bit accesses to a 64-bit register, the system might generate a pair of 32-bit accesses. The order in which the two halves are accessed is not specified.

The following accesses are not supported:

- Byte accesses.
- Halfword accesses.
- Unaligned word accesses. These accesses are not word single-copy atomic.
- Unaligned doubleword accesses. These accesses are not doubleword single-copy atomic.
- Doubleword accesses to a pair of 32-bit locations that are not a doubleword-aligned pair that forms a 64-bit register.
- Quadword accesses or higher accesses.
- Exclusive accesses.

For unsupported accesses, it is CONSTRAINED UNPREDICTABLE whether:

- The access generates an External abort or not.
- The defined side-effects of a read occur or not. A read returns UNKNOWN values.
- A write is ignored or sets the accessed register or registers to UNKNOWN.
- The access generates a fault handling interrupt or not. A read returns UNKNOWN data.
For memory-mapped accesses from a PE that complies with an Arm architecture, the single-copy atomicity rules for the instruction, the type of instruction, and the type of memory that is accessed, determine the size of the access that is made by an instruction. Example I1-1 shows this.

Example I1-1 Access sizes for memory-mapped accesses

Two Load Doubleword instructions that are made to consecutive doubleword-aligned locations generate a pair of single-copy atomic doubleword reads. However, if the accesses are made to Normal memory or Device-GRE memory they might appear as a single quadword access that is not supported by the peripheral.

The Armv8 architecture does not require the size of each element that is accessed by a multi-register load or store instruction to be identifiable by the memory system beyond the PE. Unless otherwise specified by the component, any access to a memory-mapped component of the Armv8 architecture is defined to be beyond the PE.

Software must use a Device-nGRE or stronger memory type, and only single register load and store instructions, to create memory accesses that are supported by the peripheral. For more information, see Memory types and attributes on page B2-153.
I1.2 Synchronization of memory-mapped registers

This section describes the synchronization requirements for the memory-mapped accesses to System registers.

This section refers to accesses to external system control registers as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads and indirect writes.

--- Note ---

Synchronization requirements for AArch64 System registers on page D13-2863 and Synchronization of changes to AArch32 System registers on page G8-6138 define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads and external writes as indirect writes.

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. Unless otherwise stated, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

Explicit synchronization is not required for an external read or an external write by an external agent to be observable to a following external read or external write by that agent to the same register using the same address, and so is never required for registers that are accessible as external system control registers.

Unless required to be observable to all observers in finite time, without explicit synchronization, explicit synchronization is normally required following an external write to any register for that write to be observable by:

- A direct access.
- An indirect read by an instruction.
- An external read of the register using a different address.

This means that an external write by an external agent is guaranteed to have an effect on subsequent instructions executed by the PE only if all of the following are true:

- The write has completed.
- The PE has executed a Context synchronization event.
- The Context synchronization event was executed after the write completed.

The order and synchronization of direct reads and direct writes of System registers is defined by:

- Synchronization requirements for AArch64 System registers on page D13-2863
- Synchronization of changes to AArch32 System registers on page G8-6138

The external agent must be able to guarantee completion of a write. For example, the agent can:

- Mark the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- If the register is read/write and reads are not destructive, read back the value written.
- Use some guaranteed property of the connection between the PE and the external agent.

The external agent and PE can guarantee ordering by, for example, passing messages in an ordered way with respect to the external write and the Context synchronization event, and relying on the memory ordering rules provided by the memory model.

External reads and external write complete in the order in which they arrive at the PE. For accesses to different register locations the external agent must create this order. The agent can:

- Mark the memory as Device-nGnRnE or Device-nGnRE.
- Use the appropriate memory barriers.
- Rely on some guaranteed property of the connection between the PE and the external agent.

However, the external agent cannot force the synchronization of completed writes.

In a simple sequential execution, an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

Without explicit synchronization to guarantee the order of the accesses, where the same register is accessed by two or more of a System register access instruction, and external agent, and autonomous asynchronous event, or as a result of a memory-mapped access, the behavior must be as if the accesses occurred atomically and in any order. This applies even if the accesses occur simultaneously.
For example, some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means the simultaneous writes must be merged.
I1.3  Access requirements for reserved and unallocated registers

This section describes the access requirements for reserved and unallocated memory-mapped components.

The following information relates to certain types of reserved accesses:

• Reads and writes of unallocated locations. These accesses are reserved for the architecture.

• Reads and writes of locations for features that are not implemented, including:
  — OPTIONAL features that are not implemented.
  — Breakpoints and watchpoints that are not implemented.
  — Performance Monitors counters that are not implemented.
  — CTI triggers that are not implemented.
  — Error records that are not implemented.

  These accesses are reserved.

• Reads of WO locations. These accesses are reserved for the architecture.

• Writes to RO locations. These accesses are reserved for the architecture.

Reserved accesses are normally RAZ/WI. However, software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture. Software must treat reserved accesses as RES0.
Chapter I2
System Level Implementation of the Generic Timer

This chapter defines the system level implementation of the Generic Timer. It contains the following sections:

- *About the Generic Timer specification* on page I2-7326.
- *Memory-mapped counter module* on page I2-7328.
- *Memory-mapped timer components* on page I2-7332.

**Note**

- *Generic Timer memory-mapped register descriptions* on page I5-7464 describes the System level Generic Timer registers. These registers are memory-mapped.
- Appendix K5 *Additional Information for Implementations of the Generic Timer* gives additional information, that does not form part of the architectural definition of a system level implementation of the Generic Timer,
- Chapter D11 *The Generic Timer in AArch64 state* gives a general description of the AArch64 state view of the Generic Timer, and describes the AArch64 System register interface to the Generic Timer.
- Chapter G6 *The Generic Timer in AArch32 state* gives a general description of the AArch32 state view of the Generic Timer, and describes the AArch32 System register interface to the Generic Timer.
I2.1 About the Generic Timer specification

Chapter D11 The Generic Timer in AArch64 state describes the Arm Generic Timer and its implementation as seen from AArch64 state. Chapter G6 The Generic Timer in AArch32 state describes the Arm Generic Timer and its implementation as seen from AArch32 state. These chapters include the definition of the low-latency System register interface to the Generic Timer. However, the Arm Generic Timer architecture also defines a memory-mapped component, that comprises:

- A memory-mapped counter module, that controls the generation of the Count value used by the Generic Timer.
  This memory-mapped counter module is required in any Arm Generic Timer implementation that requires software control of the Count value of the Generic Timer.
- Optional memory-mapped timer modules. These give a standardized way of providing timers for programmable system components other than PEs that implement the Arm architecture.

The full set of Generic Timer components on page D11-2833 summarizes these components as seen from AArch64 state, and The full set of Generic Timer components on page G6-6101 summarizes them as seen from AArch32 state. The system level components of the Generic Timer on page I2-7327 summarizes the system level components.

I2.1.1 Registers in the system level implementation of the Generic Timer

Registers that control components of the system level implementation of the Generic Timer are grouped into frames. This specification defines the registers in each frame, and their offsets within the frame. The system defines the position of each frame in the memory map. This means the base addresses for each frame is IMPLEMENTATION DEFINED.

Note
The final 12 words of the first or only 4KB block of a register memory frame is an ID block.

Each frame must be in its own memory page, or memory protection region, and must be aligned to the size of the translation granule or protection granule.

Note
When a system level implementation of the Generic Timer is accessed by a PE:

- Using a VMSA, each frame is in its own memory page, aligned to the size of the translation granule.
- Using a PMSA, each frame is in its own memory protection region, aligned to the size of the memory protection granule.

The following sections give more information about the requirements for the system level Generic Timer component:

- Endianness and supported access sizes.
- Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.

Endianness and supported access sizes

All memory-mapped peripherals defined in the Arm architecture must be little-endian. This means the system-level Generic Timer registers, and the register frames, are little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the memory-mapped Generic Timer registers implementations must:

- Comply with the requirements of Supported access sizes on page I1-7320.
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.
Power and reset domains for the system level implementation of the Generic Timer

The power and reset domains of the system level implementation of the Generic Timer are IMPLEMENTATION DEFINED as part of the system implementation. These domains can be outside the PE power and reset domains defined by the remainder of this manual.

The Arm architecture requires that the CNTCR.{FCREQ, EN} and CNTSR.FCACK fields reset to 0. These reset values apply only on powerup of the power domain in which the registers are implemented or a reset of the reset domain in which they are implemented.

Every other register, or register field, of a system level implementation of the Generic Timer resets to a value that is architecturally UNKNOWN if it has a meaningful reset value. This applies on powerup of the power domain in which the register is implemented, and on a reset of the reset domain in which it is implemented.

I2.1.2 The system level components of the Generic Timer

Each system level component has one or two register frames. The possible system level components are:

The memory-mapped counter module, required

This module controls the system counter. It has two frames:
- A control frame, CNTControlBase.
- A status frame, CNTReadBase.

Memory-mapped counter module on page I2-7328 describes this component.

The memory-mapped timer control module, required

The system level implementation of the Generic Timer can provide up to eight timers, and the memory-mapped timer control module identifies:
- Which timers are implemented.
- The features of each implemented timer.

This module has a single frame, CNTCTLBase.

The CNTCTLBase frame on page I2-7333 describes this frame.

Memory-mapped timers, optional

An implemented memory-mapped timer:
- Must provide a privileged view of the timer, in the CNTBaseN frame.
- Optionally provides an unprivileged view of the timer in the CNTEL0BaseN frame.

N is the timer number, and the corresponding frame number, in the range 0-7.

The CNTBaseN and CNTEL0BaseN frames on page I2-7334 describes these frames.
I2.2 Memory-mapped counter module

The memory-mapped counter module provides top-level control of the system counter. The CNTControlBase frame holds the registers for the memory-mapped counter, and provides:

- An RW control register CNTCR, that provides:
  - An enable bit for the system counter.
  - An enable bit for Halt-on-debug. For more information, see Halt-on-debug on page I2-7330.
  - A field that can be written to request a change to the update frequency of the system counter, with a corresponding change to the increment made at each update. This mechanism means that, for example, if the update frequency is halved, the increment at each update is doubled.
  For more information, see Control of counter operating frequency and increment on page I2-7329.
  Writes to this register are rare. In a system that supports two Security states, this register is writable only by Secure writes.

- A RO status register, CNTSR, that provides:
  - A bit that indicates whether the system counter is halted because of an asserted Halt-on-debug signal.
  - A field that indicates the current update frequency of the system counter. This field can be polled to determine when a requested change to the update frequency has been made.

- Two contiguous 32-bit RW registers that hold the current system counter value, CNTCV. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.
  The system counter must be disabled before writing to these registers, otherwise the effect of the write is UNPREDICTABLE.
  Writes to these registers are rare. In a system that supports two Security states, these registers are writable only by Secure writes.

- A Frequency modes table of one or more 32-bit entries, where:
  - The first entry in the table defines the base frequency of the system counter. This is the maximum frequency at which the counter updates.
  - Each subsequent entry in the table defines an alternative frequency of the system counter, that must be an exact divisor of the base frequency.
  A 32-bit zero entry immediately follows the last table entry.
  This table can be RO or RW. For more information, see The Frequency modes table on page I2-7329.
  In addition, the CNTReadBase frame includes a read-only copy of the system counter value, CNTCV, as two contiguous 32-bit RO registers. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

Counter module control and status register summary on page I2-7330 describes CNTReadBase and CNTControlBase memory maps, and the registers in each frame.
### I2.2.1 Control of counter operating frequency and increment

The system counter has a fixed base frequency, and must maintain the required counter accuracy, meaning Arm recommends that it does not gain or lose more than ten seconds in a 24-hour period, see The system counter on page D11-2834. However, the counter can increment at a lower frequency than the base frequency, using a correspondingly larger increment. For example, it can increment by four at a quarter of the base frequency. Any lower-frequency operation, and any switching between operating frequencies, must not reduce the accuracy of the counter.

Control of the system counter frequency and increment is provided only through the memory-mapped counter module. The following sections describe this control:

- The Frequency modes table.
- Changing the system counter and increment.

#### The Frequency modes table

The Frequency modes table starts at offset 0x20 in the CNTControlBase frame.

Table entries are 32-bits, and each entry specifies a system counter update frequency, in Hz.

The first entry in the table specifies the base frequency of the system counter.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

\[
\text{increment} = \frac{\text{base frequency}}{\text{selected frequency}}
\]

A 32-bit word of zero value marks the end of the table. That is, the word of memory immediately after the last entry in the table must be zero.

The only required entry in the table is the entry for the base frequency.

Typically, the Frequency modes table is in RO memory. However, a system implementation might use RW memory for the table, and initialize the table entries as part of its startup sequence. Therefore, the CNTControlBase memory map shows the table region as RO or RW.

Arm strongly recommends that the Frequency modes table is not updated once the system is running.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED, up to this limit.

---

**Note**

- Arm considers it likely that implementations will require significantly fewer entries than the architectural limit.

- In the CNTControlBase frame, the offset range 0x0C0-0x0FC can be used for IMPLEMENTATION DEFINED registers. If any registers are defined in this space, then the Frequency modes table cannot extend beyond offset 0x088, with a zero word at offset 0x08C. This means that if any IMPLEMENTATION DEFINED registers are defined the maximum number of entries in the table is 40, including the zero-word end marker.

---

#### Changing the system counter and increment

The value of the CNTCR.FREQ field specifies which entry in the Frequency modes table specifies the system counter update frequency.

Changing the value of CNTCR.FREQ requests a change to the system counter update frequency. To ensure the frequency change does not affect the overall accuracy of the counter, a change is made as follows:

- When changing from a higher frequency to a lower frequency, the counter:
  1. Continues running at the higher frequency until the count reaches an integer multiple of the required lower frequency.
  2. Switches to operating at the lower frequency.
When changing from a lower frequency to a higher frequency, the counter:
1. Waits until the end of the current lower-frequency cycle.
2. Makes the counter increment required for operation at that lower frequency.
3. Switches to operating at the higher frequency.

When the frequency has changed, CNTSR is updated to indicate the new frequency. Therefore, a system component that is waiting for a frequency change can poll CNTSR to detect the change.

### I2.2.2   Halt-on-debug

The CNTCR register provides an enable bit for an OPTIONAL Halt-on-debug signal.

When the CNTCR.HDBG bit is set to 1, and the Halt-on-debug signal is implemented and asserted, the system counter is halted. Otherwise, the system counter ignores the state of this signal.

Arm recommends that a system counter implements a Halt-on-debug signal that can be controlled by a debugger using the Embedded Cross-Trigger (ECT) using a system-level cross-trigger interface that includes:
- A debug request output trigger event that asserts the Halt-on-debug signal.
- A restart request output trigger event that deasserts the Halt-on-debug signal.

For more information, see About the Embedded Cross-Trigger (ECT) on page H5-7100.

Note
Software must use the Halt-on-debug enable bit to ensure that the timers cannot be halted maliciously in an attempt to prohibit progress.

For more information about Halt-on-debug, contact Arm.

### I2.2.3   Counter module control and status register summary

The Counter module control and status registers are memory-mapped registers in the following register memory frames:
- A control frame, with base address CNTControlBase.
- A status frame, with base address CNTReadBase.

Each of these register memory frames is in its own memory page or memory protection region, and the frame base address points to the start of this region. Each base address must be aligned to the size of the translation granule or protection granule.

Note
Each frame of a memory-mapped Generic Timer takes the name of its base address.

In each register memory frame, the memory at offset 0xF00-0xFFF is reserved for twelve 32-bit IMPLEMENTATION DEFINED ID registers, see the CounterID<n> register descriptions for more information.

Note
The Arm architecture requires memory-mapped peripherals to be little-endian, and therefore the counter is little-endian.

In an implementation that supports Secure and Non-secure memory maps, CNTControlBase is accessible only by Secure accesses.

Table I2-1 on page I2-7331 shows the CNTControlBase control registers, in order of their offsets from the CNTControlBase base address, for an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x000-0x0FC, and also has fewer than 39 CNTFID<n> registers. The Frequency modes table on page I2-7329 describes how this memory map differs if more CNTFID<n> registers are implemented.
Generic Timer memory-mapped register descriptions on page 15-7464 describes each of these registers.

I2.3 Memory-mapped timer components

This part of the Arm Generic Timer specification defines an optional memory-mapped timer component. This can be implemented as part of any programmable system component that does not incorporate a System register mapped Arm Generic Timer, to provide that system component with the timer functionality of an Arm Generic Timer.

The memory map consists of up to eight timer frames. The base address of a frame is CNTBaseN, where N numbers from 0 up to a maximum permitted value of 7.

Each CNTBaseN timer frame:

- Provides its own set of timers and associated interrupts.
- Is implemented in its own memory page or memory protection region.
- Is implemented at a base address, identified as CNTBaseN, that is aligned to the size of the translation granule or memory protection region.

For each implemented CNTBaseN frame the system can optionally provide an unprivileged view of the frame, described as the EL0 view of the frame. The base address of this second view of the CNTBaseN frame is CNTEL0BaseN.

--- Note ---
In the naming of the registers associated with a CNTBaseN or CNTEL0BaseN frame, the value of N is represented as <n>, for example CNTACR<n>.

--- Note ---
If a CNTEL0BaseN frame is implemented:

- Is implemented in its own memory page or memory protection region and is aligned to the size of the translation granule or memory protection region.
- All registers visible in CNTBaseN, except for CNTVOFF and CNTEL0ACR, can be visible in CNTEL0BaseN.
  — Control fields in CNTEL0ACR determine whether each register is visible.
- The offsets of all visible registers are the same as their offsets in the CNTBaseN frame.

In addition to the implemented CNTBaseN and CNTEL0BaseN frames, the system must provide a single control frame at base address CNTCTLBase. CNTCTLBase must be implemented in its own memory page or memory protection region and is aligned to the size of the translation granule or memory protection region.

The system defines the position of each frame in the memory map. This means the values of each of the CNTBaseN, CNTEL0BaseN, and CNTCTLBase base addresses is IMPLEMENTATION DEFINED.

--- Note ---
The Arm architecture requires memory-mapped peripherals to be little-endian, and therefore the memory-mapped timers are little-endian.

The following sections describe the implementation of a memory-mapped view of the counter and timer:

- The CNTCTLBase frame on page I2-7333.
- The CNTBaseN and CNTEL0BaseN frames on page I2-7334.

--- Note ---
Providing a complete set of features in a system level implementation on page K5-8024 gives an implementation example for a system level Generic Timer implementation that provides equivalent features to a System registers Generic Timer implementation in a PE that includes all of the Exception levels.
### I2.3.1 The CNTCTLBase frame

The CNTCTLBase frame contains:

- An identification register for the features of the memory-mapped counter and timer implementation.
- Access controls for each CNTBaseN frame.
- A virtual offset register for frames that implement a virtual timer.

Table I2-3 shows the CNTCTLBase registers, in order of their offsets from the CNTCTLBase base address.

---

**Note**

CNTFRQ and CNTVOFF registers are also implemented in a System register interface to the Generic Timer.

*Generic Timer memory-mapped register descriptions on page I5-7464 describes each of these registers.*

- **a.** Access security requirement in an implementation that supports two Security states. In an implementation that does not support multiple Security states all registers are accessible as shown in the *Type* column.
- **b.** These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in *Generic Timer registers on page D13-3883* and *Generic Timer registers on page G8-6928*. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.
- **c.** Implemented for each value of N from 0 to 7 for which a CNTBaseN frame is implemented.
- **d.** The CNTNSAR determines the Non-secure accessibility of the CNTACR<n>s and the CNTVOFF<n> in the CNTCTLBase frame. For more information, see the register descriptions.
- **e.** Address is reserved, RAZ/WI if register not implemented.

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the CNTVOFF register that defines the virtual offset between the physical count and the virtual count. If a memory-mapped Generic component does not distinguish between real time and virtual time, then it can implement CNTVOFF as RAZ/WI. Otherwise CNTVOFF is an RW register, and Arm strongly recommends that the system only permits access to CNTVOFF from EL2 or higher.
I2.3.2 The CNTBaseN and CNTEL0BaseN frames

Each CNTBaseN frame, or \{CNTBaseN, CNTEL0BaseN\} pair of frames, provides a memory-mapped counter and timer, see:

- *The CNTBaseN frame*.
- *The CNTEL0BaseN frame on page I2-7335*.
- *CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7335*.

**The CNTBaseN frame**

Table I2-4 shows the CNTBaseN registers, in order of their offsets from the CNTBaseN base address. Whether a frame includes a virtual timer is IMPLEMENTATION DEFINED. If it does not, then memory at offsets 0x030-0x03C is RAZ/WI. Except for CNTEL0ACR and the CounterID<\(n\)> registers, equivalent registers are also implemented in a System register interface to the timer component of a Generic Timer.

*Generic Timer memory-mapped register descriptions on page I5-7464* describes each of these registers.

</tbody>
</table>

\(^a\) These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in *Generic Timer registers on page D13-3883* and *Generic Timer registers on page G8-6928*. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.

\(^b\) Address is reserved, RAZ/WI if register not implemented.

\(^c\) The CNTCTLBase frame includes an RW view of this register.
The CNTEL0BaseN frame

For any value of \( N \), the layout of the registers in the CNTEL0BaseN frame is identical to the CNTBaseN frame, except that, in the CNTEL0BaseN frame:

- CNTVOFF is never visible, and the memory at \( 0x018-0x01C \) is RAZ/WI.
- CNTEL0ACR is never visible, and the memory at \( 0x014 \) is RAZ/WI.
- If implemented in the CNTBaseN frame, CNTEL0ACR controls whether CNTPCT, CNTVCT, CNTFRQ, the Physical Timer, and the Virtual Timer registers are visible in the CNTEL0BaseN frame.
  
  If CNTEL0ACR is not implemented then these registers are not visible in the CNTEL0BaseN frame, and their addresses in that frame are RAZ/WI.

If an implementation supports 64-bit atomic accesses, then CNTPCT, CNTVCT, CNTVOFF, CNTP_CVAL, and CNTV_CVAL must be accessible as atomic 64-bit values.

CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames

In the CNTCTLBase frame:

**CNTTIDR controls:**

- Whether each CNTBaseN frame is implemented.
- If a CNTBaseN frame is implemented, whether:
  - That CNTBaseN frame has virtual timer capability.
  - A corresponding CNTEL0BaseN frame is implemented.

**CNTNSAR controls:**

In an implementation that recognizes two Security states, determines whether each implemented CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

This control also determines whether, in the CNTCTLBase frame, the CNTACR\(<n>\) and CNTVOFF\(<n>\) registers are accessible by Non-secure accesses.

The CNTACR\(<n>\) registers control:

For each implemented CNTBaseN frame, the accessibility of the following registers in that frame:

- CNTP_CTL, CNTP_CVAL, and CNTP_TVAL.
- CNTV_CTL, CNTV_CVAL, and CNTV_TVAL.
- CNTVOFF.
- CNTFRQ.
- CNTPCT.
- CNTVCT.

For CNTACR\(<n>\), the value of \(<n>\) corresponds to the value of \( N \) for the controlled CNTBaseN frame.

The CNTVOFF\(<n>\) registers provide:

For each implemented CNTBaseN frame that has virtual capability, the RW copy of the CNTVOFF register for that frame.

--- Note ---

In a CNTBaseN frame that has virtual timer capability the CNTVOFF register is RO.

For CNTVOFF\(<n>\), the value of \(<n>\) corresponds to the value of \( N \) for the controlled CNTBaseN frame.
System Level Implementation of the Generic Timer
I2.3 Memory-mapped timer components
Chapter I3
Recommended External Interface to the Performance Monitors

This chapter describes the recommended external interface to the Performance Monitors. It contains the following section:

• About the external interface to the Performance Monitors registers on page I3-7338.

——— Note ————

Performance Monitors external register descriptions on page I5-7353 describes the external view of the Performance Monitors registers.
### I3.1 About the external interface to the Performance Monitors registers

Arm recommends that:

- An implementation provides the **OPTIONAL** external debug interface to the Performance Monitors registers.

  ______ Note ________
  
  A debugger can use this interface to access counters in the Performance Monitors.

- The implementation includes the **OPTIONAL** support for memory-mapped access to the External debug interface.

  ______ Note ________
  
  — Software running on any PE in a system can use this interface to access counters in the Performance Monitors.
  
  — Privileged software should use the MMU to control access to this interface.

- The external debug interface is implemented as defined in Appendix K2 *Recommended External Debug Interface*.

The following sections describe the memory-mapped views of the Performance Monitors registers:

- Differences in the external views of the Performance Monitors registers
- Synchronization of changes to the memory-mapped views on page I3-7339.
- Access permissions for external views of the Performance Monitors on page I3-7339.

In this section, unless the context explicitly indicates otherwise, any reference to a *memory-mapped view* applies equally to a register view using:

- An access through an external debug interface.
- A memory-mapped access.

#### I3.1.1 Endianness and supported access sizes

When an implementation supports memory-mapped access to the external debug interface the interface is accessed as a little-endian memory-mapped peripheral. *External Performance Monitors registers summary* on page I3-7350 gives the memory map of these registers.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the external interface to the Performance Monitors registers implementations must:

- Comply with the requirements of *Supported access sizes* on page I1-7320.
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.

#### I3.1.2 Differences in the external views of the Performance Monitors registers

An external view of the Performance Monitors registers accesses the same registers as the System registers interface described in *Performance Monitors Extension registers* on page D7-2766, except that:

1. The **PMSELR** is accessible only in the System registers interface.
2. The following registers are accessible only in external views:
   - **PMCFGR**
   - **PMDEVAFF0**
   - **PMDEVAFF1**
   - **PMLAR**
   - **PMLSR**
   - **PMAUTHSTATUS**
• PMDEVARCH
• PMDEVTYPE
• PMPIDR0
• PMPIDR1
• PMPIDR2
• PMPIDR3
• PMPIDR4
• PMCIDR0
• PMCIDR1
• PMCIDR2
• PMCIDR3

Performance Monitors external register descriptions on page I5-7353 describes these registers.

3. The following controls do not affect the external views:
   • PMSELR.
   • PMUSERENR.
   • HDCR.{TPM, TPMCR, HPMN}.

   Instead, see the register descriptions in Chapter I5 External System Control Register Descriptions.

I3.1.3 Synchronization of changes to the memory-mapped views

Synchronization must comply with Synchronization of memory-mapped registers on page I1-7322.

In particular, if a Performance Monitor is visible in both System register and an external view, and is accessed simultaneously through these two mechanisms, the behavior must be as if the access occurred atomically in any order. For more information, see Synchronization of changes to the external debug registers on page H8-7138.

I3.1.4 Access permissions for external views of the Performance Monitors

For more information, see External debug interface register access permissions on page H8-7145.

Table I3-1 on page I3-7340 shows the access permissions for the Performance Monitors registers in a v8 Debug implementation. This table uses the following terms:

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DLK</td>
<td>When FEAT_DoubleLock is implemented and locked, DoubleLockStatus() == TRUE, accesses to some registers produce an error. Applies to both interfaces.</td>
</tr>
<tr>
<td>EPMAD</td>
<td>When AllowExternalPMUAccess() == FALSE, external debug access is disabled for the access. If FEAT_Debugv8p4 is implemented, this applies only for Non-secure access to the register. See also Behavior of a not permitted memory-mapped access on page H8-7143.</td>
</tr>
<tr>
<td>Error</td>
<td>Indicates that the access gives an error response.</td>
</tr>
<tr>
<td>Default</td>
<td>This shows the default access permissions, if none of the conditions in this list prevent access to the register.</td>
</tr>
<tr>
<td>Off</td>
<td>The Core power domain is completely off, or in a low-power state where the Core power domain registers cannot be accessed, and EDPRSR.PU will read as zero.</td>
</tr>
</tbody>
</table>

Note If debug power is off, then all external debug interface accesses return an error.

| OSLK | When the OS Lock is locked, OSLAR_EL1.OSLK == 1, accesses to some registers produces an error. This column shows the effect of this control on accesses using the external debug interface. |
| SLK  | This indicates the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the optional Software Lock is locked. See Register access permissions for memory-mapped accesses on page H8-7142. |
For all other accesses, this column is ignored.

- Indicates that the control has no effect on the behavior of the access:
  - If no other control affects the behavior, the Default access behavior applies.
  - However, another control might determine the behavior.

I3.5 Power domains and Performance Monitors registers reset

For Armv8-A implementations, Arm recommends that Performance Monitors are implemented as part of the Core power domain, not as part of a separate Debug power domain. There is no interface to access the Performance Monitors registers when the Core power domain is powered down.

A Warm or Cold reset sets the Performance Monitors registers to their reset values. An External Debug reset does not change the values of the Performance Monitors registers.

For more information about the reset scheme recommended for a v8 Debug implementation see Chapter H6 Debug Reset and Powerdown Support.

Table I3-2 on page I3-7342 shows the Performance Monitors register resets for writable register fields. The column headings use the following terms:

- **64**: This is the architectural reset value when resetting into AArch64 state.
- **32**: This is the architectural reset value when resetting into AArch32 state.
- **-**: This indicates an IMPLEMENTATION DEFINED reset value on the specified reset. This might be UNKNOWN.

### Note

This table does not include:

- Read-only identification registers and fields that have a fixed value. In this case, the reset value is that fixed value. An example of this is PMCR_EL0.N.
- Write-only registers and fields that only have an effect on writes. These do not have a reset value. An example of this is PMSWINC_EL0.
- IMPLEMENTATION DEFINED registers. In this case, the reset domains are IMPLEMENTATION DEFINED. The reset values are IMPLEMENTATION DEFINED and might be UNKNOWN.

Chapter I4
Recommended External Interface to the Activity Monitors

This chapter describes the optional external interface to the Activity Monitors Extension registers. It contains the following section:

• About the external interface to the Activity Monitors Extension registers on page I4-7344

Note
Activity Monitors external register descriptions on page I5-7428 describes the external view of the Activity Monitors Extension registers.
I4.1 About the external interface to the Activity Monitors Extension registers

If an implementation supports the Activity Monitors Extension, it may optionally support an external memory-mapped interface to the Activity Monitors Extension, and, if so, may further optionally support CoreSight device registers and ID registers.

The memory access sizes supported by the external interface to the Activity Monitors registers:

- Comply with the requirements of Supported access sizes on page I5-7320.
- Include word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.

The base address of the memory-mapped view is aligned to a 4KB boundary, but is otherwise IMPLEMENTATION DEFINED. The address offsets for the memory-mapped view are given in Table I5-2 on page I5-7426.

I4.1.1 Differences in the external views of the Activity Monitors Extension registers

The external memory-mapped interface view of the Activity Monitors Extension registers accesses the same registers as the System registers interface to the registers, except that:

- The following are accessible only in the System registers interface:
  - AMUSERENR_EL0
  - AMEVNRTVOFF0<\text{n}>_EL2
  - AMEVNRTVOFF1<\text{n}>_EL2
  - AMCG1IDR_EL0

- If implemented, the following registers are accessible only in the memory-mapped view:
  - AMIIDR
  - AMDEVALF0
  - AMDEVALF1
  - AMDEVARCH
  - AMDEVTYPE
  - AMPIDR0
  - AMPIDR1
  - AMPIDR2
  - AMPIDR3
  - AMPIDR4
  - AMCIDR0
  - AMCIDR1
  - AMCIDR2
  - AMCIDR3

Activity Monitors external register descriptions on page I5-7428 describes these registers.

- If FEAT_AMUv1p1 virtualization of the activity monitors is enabled, the memory-mapped view of the registers presents the physical view of the counter without any offset. Virtualization of the Activity Monitors does not affect the memory-mapped view of the registers.

Note

The memory mapped view of the activity monitors is unaffected by AMCR_EL0.CG1RZ and AMCR.CG1RZ.
I4.1.2 Access during reset and power transitions

As described in Power and reset domains on page D8-2769, the power and reset domains of the activity monitoring unit are IMPLEMENTATION DEFINED, and when a Cold reset of the power domain of the activity monitoring unit occurs, the activity monitoring unit is reset and the counters are reset to zero.

If the power domain of the activity monitoring unit is an always-on power domain, while the PE is reset or powered down counter values may be preserved and might be accessible by memory-mapped access.

If the power domain of the activity monitoring unit is the Core power domain, while the PE is reset or powered down and when a memory-mapped access occurs, the access reads as zero and the bus access completes without an error.
Recommended External Interface to the Activity Monitors

4.1 About the external interface to the Activity Monitors Extension registers
Chapter I5
External System Control Register Descriptions

This chapter describes the external system control registers. It excludes the External debug registers that are described in Chapter H9 External Debug Register Descriptions. It contains the following sections:

• About the external system control register descriptions on page I5-7348.
• External Performance Monitors registers summary on page I5-7350.
• Performance Monitors external register descriptions on page I5-7353.
• External Activity Monitors Extension registers summary on page I5-7426.
• Activity Monitors external register descriptions on page I5-7428.
• Generic Timer memory-mapped registers overview on page I5-7463.
• Generic Timer memory-mapped register descriptions on page I5-7464.
• RAS register descriptions on page I5-7508.
I5.1  About the external system control register descriptions

This chapter describes the external system control registers other than the external debug registers. That is, it describes:

An external view of the Performance Monitors registers

Arm recommends that implementations provide access to the Performance Monitors registers through the OPTIONAL External debug interface, and provide the OPTIONAL memory-mapped interface to this interface:

- External Performance Monitors registers summary on page I5-7350 lists the registers that are accessible in this view of the Performance Monitors, and describes their memory map.
- Performance Monitors external register descriptions on page I5-7353 describes each of the memory-mapped registers.

Chapter I3 Recommended External Interface to the Performance Monitors describes the recommended interface to these registers.

Note

Chapter D7 The Performance Monitors Extension describes the Performance Monitors. The following sections describe the System register interfaces to the Performance Monitors:

- Performance Monitors registers on page D13-3678, for accesses from an Exception level that is using AArch64.
- Performance Monitors registers on page G8-6750, for accesses from an Exception level that is using AArch32.

An external view of the Activity Monitors Extension registers

An implementation which supports the Activity Monitors Extension may support an optional external memory-mapped interface to the Activity Monitors Extension registers.

- External Activity Monitors Extension registers summary on page I5-7426 lists the registers that are accessible in this view of the Performance Monitors, and describes their memory map.
- Activity Monitors external register descriptions on page I5-7428 describes each of the memory-mapped registers.

Chapter I3 Recommended External Interface to the Performance Monitors describes the recommended interface to these registers.

Note

Chapter D8 The Activity Monitors Extension describes the Activity Monitors. The following sections describe the System register interfaces to the Activity Monitors:

- Activity Monitors registers on page D13-3745, for accesses from an Exception level that is using AArch64.
- Activity Monitors registers on page G8-6830, for accesses from an Exception level that is using AArch32.

The registers for the system level Generic Timer component

Any implementation that includes the Generic Timer must include the memory-mapped system level component described in Chapter I2 System Level Implementation of the Generic Timer. In this chapter:

- Generic Timer memory-mapped registers overview on page I5-7463 gives an overview of the registers, referring to Chapter I2 for more information.
- Generic Timer memory-mapped register descriptions on page I5-7464 describes each of the memory-mapped registers.
Chapter D11 The Generic Timer in AArch64 state describes the Generic Timer component that is accessible using the System registers. The following sections describe the System register interfaces to that component:

- Generic Timer registers on page D13-3883, for accesses from an Exception level that is using AArch64.
- Generic Timer registers on page G8-6928, for accesses from an Exception level that is using AArch32.

Chapter H9 External Debug Register Descriptions describes the external debug registers.
I5.2  **External Performance Monitors registers summary**

When an implementation provides access to the Performance Monitors registers through the External debug interface, that interface provides access to:

- Performance Monitors System registers.
- A read-only configuration register, PMCFGR.
- The OPTIONAL CoreSight registers for the Performance Monitors, if they are implemented.

The locations of the registers are defined as offsets from a system-defined base address. *Performance Monitors external register views* defines this memory map.

I5.2.1  **Performance Monitors external register views**

Table I5-1 shows the external view of the Performance Monitors registers. All other entries are reserved.

---

**Note**

- Counters that are reserved because HDCR.HPMN has been changed from its reset value remain visible in any external view.
- The registers that relate to an implemented event counter, PMNx, are PMEVCNTR<n> and PMEVTYPE<n>.
- The mapping of the *Performance Monitors Event Counter Registers*, at offsets 0x000-0xF4, has changed compared to the mappings of the equivalent registers in Armv7.

---

Each entry in the Name column links to the register description in *Performance Monitors external register descriptions* on page I5-7353, and:

- If the *System register?* column of the table shows that the register is a System register, the memory-mapped interface provides a view of the System register described in:
  - *Performance Monitors registers* on page D13-3678, for the AArch64 System register.
  - *Performance Monitors registers* on page G8-6750, for the AArch32 System register.
- Otherwise, the register is accessible only using the external interface.

</table>

a. The interface must support at least single-copy atomic 32-bit accesses. If single-copy atomic 64-bit access to the registers is not possible, software must use a high-low-high read access to read the counter value if the counter is enabled.

b. PC Sample-based Profiling Extension registers. Implemented only when FEAT_PCSRv8p2 is implemented, except that from Armv8.2 PMDEVIDt is required regardless of whether FEAT_PCSRv8p2 is implemented. Before Armv8.2, the PC Sample-based Profiling Extension can, instead, be implemented in the memory-mapped debug registers space, see Chapter H7 The PC Sample-based Profiling Extension.

c. CoreSight interface registers, see Management registers and CoreSight compliance on page K2-7991.

d. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.
I5.3 Performance Monitors external register descriptions

This section describes the external view of the Performance Monitors registers. _External Performance Monitors registers summary on page I5-7350_ lists these registers in offset order.
I5.3.1 PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

**Attributes**

PMAUTHSTATUS is a 32-bit register.

**Field descriptions**

The PMAUTHSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>7-6</td>
<td>SNID, holds the same value as DBGAUTHSTATUS_EL1.SNID.</td>
</tr>
<tr>
<td>5-4</td>
<td>SID, secure invasive debug. Possible values: 0b00 Not implemented. All other values are reserved.</td>
</tr>
<tr>
<td>3-2</td>
<td>NSNID, holds the same value as DBGAUTHSTATUS_EL1.NSNID.</td>
</tr>
<tr>
<td>1-0</td>
<td>NSID, non-secure invasive debug. Possible values: 0b00 Not implemented. All other values are reserved.</td>
</tr>
</tbody>
</table>

**Accessing the PMAUTHSTATUS:**

PMAUTHSTATUS can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB8</td>
<td>PMAUTHSTATUS</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.2  PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

**Configurations**

- External register PMCCFILTR_EL0[31:0] is architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].
- External register PMCCFILTR_EL0[31:0] is architecturally mapped to AArch32 System register PMCCFILTR[31:0].
- PMCCFILTR_EL0 is in the Core power domain.
- On a Warm or Cold reset, RW fields in this register reset:
  - To architecturally UNKNOWN values if the reset is to an Exception level that is using AArch64.
  - To 0 if the reset is to an Exception level that is using AArch32.
- The register is not affected by an External debug reset.

**Attributes**

PMCCFILTR_EL0 is a 32-bit register.

**Field descriptions**

The PMCCFILTR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>U</td>
<td>M</td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**P, bit [31]**

- Privileged filtering bit. Controls counting in EL1.
- If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.
- 0b0  Count cycles in EL1.
- 0b1  Do not count cycles in EL1.

**U, bit [30]**

- User filtering bit. Controls counting in EL0.
- If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.
- 0b0  Count cycles in EL0.
- 0b1  Do not count cycles in EL0.
NSK, bit [29]

*When EL3 is implemented:*

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

- If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.
- Otherwise, cycles in Non-secure EL1 are not counted.

*Otherwise:*

Reserved, RES0.

NSU, bit [28]

*When EL3 is implemented:*

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

- If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.
- Otherwise, cycles in Non-secure EL0 are not counted.

*Otherwise:*

Reserved, RES0.

NSH, bit [27]

*When EL2 is implemented:*

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

- If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.
  - 0b0: Do not count cycles in EL2.
  - 0b1: Count cycles in EL2.

*Otherwise:*

Reserved, RES0.

M, bit [26]

*When EL3 is implemented:*

Secure EL3 filtering bit.

- If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.
- Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

**Note**

This field is not visible in the AArch32 PMCCFILTR System register.

*Otherwise:*

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

*When FEAT_SEL2 is implemented:*

Secure EL2 filtering.

- If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.
Otherwise, cycles in Secure EL2 are not counted.
If Secure EL2 is disabled, this field is RES0.

--- Note ---
This field is not visible in the AArch32 PMCCFILTR System register.

**Otherwise:**

Reserved, RES0.

**Bits [23:0]**

Reserved, RES0.

**Accessing the PMCCFILTR_EL0:**

--- Note ---
SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCFILTR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x47C</td>
<td>PMCCFILTR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.3 PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

**Purpose**

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see *Time as measured by the Performance Monitors cycle counter* on page D7-2696. PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

**Configurations**

External register PMCCNTR_EL0[63:0] is architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].
External register PMCCNTR_EL0[63:0] is architecturally mapped to AArch32 System register PMCCNTR[63:0].
PMCCNTR_EL0 is in the Core power domain.

**Attributes**

PMCCNTR_EL0 is a 64-bit register.

**Field descriptions**

The PMCCNTR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
</table>
| CCNT, bits [63:0] | Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:  
  - Every processor clock cycle.  
  - Every 64th processor clock cycle.  
  Writing 1 to PMCR_EL0.C sets this field to 0.  
  On a Warm reset, this field resets to an architecturally UNKNOWN value. |

**Accessing the PMCCNTR_EL0:**

--- **Note** ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCNTR_EL0[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF8</td>
<td>PMCCNTR_EL0</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to PMCCNTR_EL0[31:0] are RO.
• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to PMCCNTR_EL0[31:0] are RW.

• Otherwise accesses to PMCCNTR_EL0[31:0] generate an error response.

PMCCNTR_EL0[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF0FC</td>
<td>PMCCNTR_EL0</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to PMCCNTR_EL0[63:32] are RO.

• When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to PMCCNTR_EL0[63:32] are RW.

• Otherwise accesses to PMCCNTR_EL0[63:32] generate an error response.
I5.3.4 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

For more information about the common events and the use of the PMCEIDn registers, see The PMU event number space and common events on page D7-2715.

Note

• Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.
• This view of the register was previously called PMCEID0_EL0.

Configurations

External register PMCEID0[31:0] is architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

External register PMCEID0[31:0] is architecturally mapped to AArch32 System register PMCEID0[31:0].

PMCEID0 is in the Core power domain.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

The PMCEID0 bit assignments are:
ID<\text{n}>, bit [\text{n}], for n = 0 to 31

ID[\text{n}] corresponds to common event n.

For each bit:

0b0 The common event is not implemented, or not counted.
0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

--- Note ---

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<\text{n}> registers of that earlier version of the PMU architecture.

--- Accessing the PMCEID0: ---

--- Note ---

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE20</td>
<td>PMCEID0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
## I5.3.5 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

### Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

For more information about the common events and the use of the PMCEIDn registers, see The PMU event number space and common events on page D7-2715.

### Note

- Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.
- This view of the register was previously called PMCEID1_EL0.

### Configurations

External register PMCEID1[31:0] is architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

External register PMCEID1[31:0] is architecturally mapped to AArch32 System register PMCEID1[31:0].

PMCEID1 is in the Core power domain.

### Attributes

PMCEID1 is a 32-bit register.

### Field descriptions

The PMCEID1 bit assignments are:

```

</tbody>
</table>
```

---
ID<n>, bit [n], for n = 0 to 31

ID[n] corresponds to common event (0x0020 + n).

For each bit:

0b0 The common event is not implemented, or not counted.
0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

--- Note ---

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID1:

--- Note ---

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE24</td>
<td>PMCEID1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.6 PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

Note

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers, see The PMU event number space and common events on page D7-2715.

Configurations

External register PMCEID2[31:0] is architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

External register PMCEID2[63:32] is architecturally mapped to AArch32 System register PMCEID2[31:0].

PMCEID2 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions

The PMCEID2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDhi&lt;n&gt;, bit[n], for n = 0 to 31</td>
<td></td>
</tr>
</tbody>
</table>

IDhi<n>, bit [n], for n = 0 to 31

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.
Accessing the PMCEID2:

--- Note ---
AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE28</td>
<td>PMCEID2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.7 PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

**Purpose**

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

When the value of a bit in the register is 1 the corresponding common event is implemented and counted.

--- Note ---

Arm recommends that, if a common event is never counted, the value of the corresponding register bit is 0.

For more information about the common events and the use of the PMCEIDn registers, see *The PMU event number space and common events on page D7-2715*.

**Configurations**

External register PMCEID3[31:0] is architecturally mapped to AArch64 System register PMCEID1_EL0[63:32].

External register PMCEID3[63:32] is architecturally mapped to AArch32 System register PMCEID3[31:0].

PMCEID3 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are RES0.

**Attributes**

PMCEID3 is a 32-bit register.

**Field descriptions**

The PMCEID3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>IDhi&lt;n&gt;, bit[n], for n = 0 to 31</td>
</tr>
</tbody>
</table>

**IDhi<n>, bit [n], for n = 0 to 31**

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

- **0b0**: The common event is not implemented, or not counted.
- **0b1**: The common event is implemented.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

--- Note ---

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.
Accessing the PMCEID3:

--- Note ---
AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE2C</td>
<td>PMCEID3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.8 PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

**Purpose**
Contains PMU-specific configuration data.

**Configurations**
PMCFGR is in the Core power domain.

**Attributes**
PMCFGR is a 32-bit register.

**Field descriptions**
The PMCFGR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>20</th>
<th>19</th>
<th>18</th>
<th>17</th>
<th>16</th>
<th>15</th>
<th>14</th>
<th>13</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>NCG</td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>SIZE</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NCG, bits [31:28]**
This feature is not supported, so this field is RAZ.

**Bits [27:20]**
Reserved, RES0.

**UEN, bit [19]**
User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ.

**WT, bit [18]**
This feature is not supported, so this bit is RAZ.

**NA, bit [17]**
This feature is not supported, so this bit is RAZ.

**EX, bit [16]**
Export supported. Value is IMPLEMENTATION DEFINED.
0b0 PMCR_EL0.X is RES0.
0b1 PMCR_EL0.X is read/write.

**CCD, bit [15]**
Cycle counter has prescale.
This is RES1 if AArch32 is supported at any Exception level, and RAZ otherwise.
0b0 PMCR_EL0.D is RES0.
0b1 PMCR_EL0.D is read/write.
CC, bit [14]
Dedicated cycle counter (counter 31) supported. This bit is RAO.

SIZE, bits [13:8]
Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.
From Armv8, the largest counter is 64-bits, so the value of this field is \(0b111111\).
This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

N, bits [7:0]
Number of counters implemented in addition to the cycle counter, PMCCNTR_EL0. The maximum number of event counters is 31.

- \(0x00\) Only PMCCNTR_EL0 implemented.
- \(0x01\) PMCCNTR_EL0 plus one event counter implemented.
and so on up to \(0b00011111\), which indicates PMCCNTR_EL0 and 31 event counters implemented.

### Accessing the PMCFGR:

**Note**
AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCFGR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE00</td>
<td>PMCFGR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.9 PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Component Identification scheme* on page K2-8002.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR0 is a 32-bit register.

**Field descriptions**

The PMCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PRMBL_0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Reads as 0x0D.

**Accessing the PMCIDR0:**

PMCIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF0</td>
<td>PMCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.10  PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Component Identification scheme* on page K2-8002.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR1 is a 32-bit register.

**Field descriptions**

The PMCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:8]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[7:4]</td>
<td>CLASS, Component class.</td>
</tr>
<tr>
<td></td>
<td>0b1001 CoreSight component.</td>
</tr>
<tr>
<td></td>
<td>Other values are defined by the CoreSight Architecture.</td>
</tr>
<tr>
<td></td>
<td>This field reads as 0x9.</td>
</tr>
<tr>
<td>[3:0]</td>
<td>PRMBL_1, Preamble. RAZ.</td>
</tr>
<tr>
<td></td>
<td>Reads as 0b0000.</td>
</tr>
</tbody>
</table>

**Accessing the PMCIDR1:**

PMCIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFF4</td>
<td>PMCIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.11 PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Component Identification scheme* on page K2-8002.

**Configurations**

Implementation of this register is **OPTIONAL**.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR2 is a 32-bit register.

**Field descriptions**

The PMCIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8</td>
<td>PRMBL_2</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble.

Reads as 0x05.

**Accessing the PMCIDR2:**

PMCIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF8</td>
<td>PMCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
### I5.3.12 PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Component Identification scheme* on page K2-8002.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMCIDR3 is a 32-bit register.

**Field descriptions**

The PMCIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td>PRMBL_3</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble.

Reads as 0xB1.

**Accessing the PMCIDR3:**

PMCIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFC</td>
<td>PMCIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.13 PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

**Purpose**

Contains the sampled value of CONTEXTIDR_EL1, captured on reading PMPCSR[31:0].

**Configurations**

PMCID1SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMCID1SR are RES0.

--- Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

**Attributes**

PMCID1SR is a 32-bit register.

**Field descriptions**

The PMCID1SR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTEXTIDR_EL1</td>
<td></td>
</tr>
</tbody>
</table>

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register and PMCID1SR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent PMPCSR sample.

Because the value written to PMCID1SR is an indirect read of CONTEXTIDR, it is constrained unpredictable whether PMCID1SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**Accessing the PMCID1SR:**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-7134.
PMCID1SR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x208</td>
<td>PMCID1SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

PMCID1SR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x228</td>
<td>PMCID1SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.14 PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

Contains the sampled value of CONTEXTIDR_EL2, captured on reading PMPCSR[31:0].

Configurations

PMCID2SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMCID2SR are RES0.

Note

If FEAT_PCSRv8p2 is not implemented, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Attributes

PMCID2SR is a 32-bit register.

Field descriptions

The PMCID2SR bit assignments are:

```
31 0
```

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- If EL2 is using AArch64, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- If EL2 is using AArch32, then this field is set to an UNKNOWN value.

Because the value written to PMCID2SR is an indirect read of CONTEXTIDR_EL2, it is CONSTRAINED UNPREDICTABLE whether PMCID2SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR_EL2.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

Accessing the PMCID2SR:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-7134.
PMCID2SR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x22C</td>
<td>PMCID2SR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.15 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

**Configurations**

External register PMCNTENCLR_EL0[31:0] is architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

External register PMCNTENCLR_EL0[31:0] is architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

PMCNTENCLR_EL0 is in the Core power domain.

**Attributes**

PMCNTENCLR_EL0 is a 32-bit register.

**Field descriptions**

The PMCNTENCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>P&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

**C, bit [31]**

PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

- 0b0: When read, means the cycle counter is disabled. When written, has no effect.
- 0b1: When read, means the cycle counter is enabled. When written, disables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter disable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

- 0b0: When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
- 0b1: When read, means that PMEVCNTR<n>_EL0 is enabled. When written, disables PMEVCNTR<n>_EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCNTENCLR_EL0:**

--- Note ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.
PMCNTENCLR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC20</td>
<td>PMCNTENCLR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.16  PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

**Configurations**

External register PMCNTENSET_EL0[31:0] is architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

External register PMCNTENSET_EL0[31:0] is architecturally mapped to AArch32 System register PMCNTENSET[31:0].

PMCNTENSET_EL0 is in the Core power domain.

**Attributes**

PMCNTENSET_EL0 is a 32-bit register.

**Field descriptions**

The PMCNTENSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td></td>
<td>P&lt;n&gt;</td>
</tr>
</tbody>
</table>

**C, bit [31]**

PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:

- 0b0  When read, means the cycle counter is disabled. When written, has no effect.
- 0b1  When read, means the cycle counter is enabled. When written, enables the cycle counter.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter enable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

- 0b0  When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
- 0b1  When read, means that PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMEVCNTR<n>_EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMCNTENSET_EL0:**

**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.
PMCNTENSET_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC00</td>
<td>PMCNTENSET_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.17 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configurations

External register PMCR_EL0[7:0] is architecturally mapped to AArch32 System register PMCR[7:0].

External register PMCR_EL0[7:0] is architecturally mapped to AArch64 System register PMCR_EL0[7:0].

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal PMCR System register. An external agent must use other means to discover the information held in PMCR[31:11], such as accessing PMCFGR and the ID registers.

Attributes

PMCR_EL0 is a 32-bit register.

Field descriptions

The PMCR_EL0 bit assignments are:

<p>| | | | | | | | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>11</td>
<td>10</td>
<td>8</td>
<td>7</td>
<td>6</td>
<td>5</td>
<td>4</td>
<td>3</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>RAZ/WI</td>
<td>RES0</td>
<td>LPLCDP</td>
<td>X</td>
<td>D</td>
<td>C</td>
<td>P</td>
<td>E</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bits [10:8]

Reserved, RES0.

LP, bit [7]

*When FEAT_PMUv3p5 is implemented:*

Long event counter enable. Determines when unsigned overflow is recorded by a counter overflow bit.

0b0 Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<\textless n\textgreater >_EL0[31:0].

0b1 Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<\textless n\textgreater >_EL0[63:0].

If EL2 is implemented and MDCR_EL2.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [MDCR_EL2.HPMN:(PMCR_EL0.N-1)].

If EL2 is implemented and HDCR.HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [HDCR.HPMN..(PMCR_EL0.N-1)].
Note

The effect of MDCR_EL2.HPMN or HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of MDCR_EL2.HPMN or HDCR.HPMN.

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

Otherwise:
Reserved, RES0.

LC, bit [6]

When AArch32 is supported at any Exception level:
Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

0b0 Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].
0b1 Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].

Arm deprecates use of PMCR_EL0.LC = 0.
On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):
Disable cycle counter when event counting is prohibited. The possible values of this bit are:

0b0 Cycle counting by PMCCNTR_EL0 is not affected by this bit.
0b1 When event counting for counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited, cycle counting by PMCCNTR_EL0 is disabled.

For more information, see Prohibiting event counting on page D7-2703.
When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:
• A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
• 0 if the reset is into an Exception level that is using AArch32.

Otherwise:
Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:
Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

0b0 Do not export events.
0b1 Export events where not prohibited.
This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.
No events are exported when counting is prohibited.
This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.
When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally **UNKNOWN** if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**
Reserved, RAZ/WI.

D, bit [3]

*When AArch32 is supported at any Exception level:*

Clock divider.

- 0b0 When enabled, PMCCNTR_EL0 counts every clock cycle.
- 0b1 When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally **UNKNOWN** if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

**Otherwise:**
Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

- 0b0 No action.
- 0b1 Reset PMCCNTR_EL0 to zero.

This bit is always RAZ.

**Note**
Resetting PMCCNTR_EL0 does not change the cycle counter overflow bit.

Access to this field is WO.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

- 0b0 No action.
- 0b1 Reset all event counters, not including PMCCNTR_EL0, to zero.

This bit is always RAZ.

**Note**
Resetting the event counters does not change the event counter overflow bits.

If FEAT_PMUv3p5 is implemented, the value of MDCR_EL2.HLP, or PMCR_EL0.LP is ignored and bits [63:0] of all event counters are reset.

Access to this field is WO.

E, bit [0]

Enable.

- 0b0 All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0, are disabled.
All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0, are enabled by PMCNTENSET_EL0.

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is HDCR.HPMN.
- If EL2 is using AArch64, PMN is MDCR_EL2.HPMN.
- If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is PMCR_EL0.N.

--- Note ---

The effect of the following fields on the operation of this bit applies if EL2 is implemented regardless of whether EL2 is enabled in the current Security state:

- HDCR.HPMN. See the description of HDCR.HPMN for more information.
- MDCR_EL2.HPMN. See the description of MDCR_EL2.HPMN for more information.

---

On a Warm reset, this field resets to 0.

### Accessing the PMCR_EL0:

--- Note ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE04</td>
<td>PMCR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.18 PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configurations

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF0 is a 32-bit register.

Field descriptions

The PMDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPIDR_EL1lo</td>
<td>MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.</td>
</tr>
</tbody>
</table>

Accessing the PMDEVAFF0:

PMDEVAFF0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFA8</td>
<td>PMDEVAFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.19 PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose
Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configurations
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.
This register is required if the external interface to the PMU is implemented.

Attributes
PMDEVAFF1 is a 32-bit register.

Field descriptions
The PMDEVAFF1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>MPIDR_EL1hi</td>
</tr>
</tbody>
</table>

MPIDR_EL1hi, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the PMDEVAFF1:
PMDEVAFF1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFAC</td>
<td>PMDEVAFF1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.20 PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

**Purpose**

Identifies the programmers’ model architecture of the Performance Monitor component.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

PMDEVARCH is a 32-bit register.

**Field descriptions**

The PMDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>[31:21]</td>
<td>Defines the architecture of the component. For Performance Monitors, this is Arm Limited. Bits [31:28] are the JEP106 continuation code, 0x4. Bits [27:21] are the JEP106 ID code, 0x3B.</td>
</tr>
<tr>
<td>PRESENT</td>
<td>bit [20]</td>
<td>When set to 1, indicates that the DEVARCH is present. This field is 1 in Armv8.</td>
</tr>
<tr>
<td>REVISION</td>
<td>[19:16]</td>
<td>Defines the architecture revision. For architectures defined by Arm this is the minor revision. For Performance Monitors, the revision defined by Armv8 is 0x0. All other values are reserved.</td>
</tr>
<tr>
<td>ARCHID</td>
<td>[15:0]</td>
<td>Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided. For Performance Monitors: Bits [15:12] are the architecture version, 0x2. Bits [11:0] are the architecture part number, 0xA16. This corresponds to Performance Monitors architecture version PMUv3.</td>
</tr>
</tbody>
</table>

**Note**

The PMUv3 memory-mapped programmers' model can be used by devices other than Armv8 processors. Software must determine whether the PMU is attached to an Armv8 processor by using the PMDEVAFF0 and PMDEVAFF1 registers to discover the affinity of the PMU to any Armv8 processors.
Accessing the PMDEVARCH:

PMDEVARCH can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFBC</td>
<td>PMDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.21 PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

**Purpose**

Provides information about features of the Performance Monitors implementation.

**Configurations**

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required from Armv8.2 and in any implementation that includes FEAT_PCSRv8p2. Otherwise, its location is RES0.

--- Note ---

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

---

**Attributes**

PMDEVID is a 32-bit register.

**Field descriptions**

The PMDEVID bit assignments are:

<table>
<thead>
<tr>
<th>Bitassignments</th>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:4</td>
<td>RES0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0:0</td>
<td>PCSample</td>
<td>PC Sample-based Profiling support using PM registers.</td>
</tr>
</tbody>
</table>

**Bits [31:4]**

Reserved, RES0.

**PCSample, bits [3:0]**

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers.

- 0b0000: PC Sample-based Profiling Extension not implemented in the Performance Monitors register space.
- 0b0001: PC Sample-based Profiling Extension implemented in the Performance Monitors register space.

All other values are reserved.

FEAT_PCSRv8p2 implements the functionality identified by the value 0b0001.

**Accessing the PMDEVID:**

PMDEVID can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFc8</td>
<td>PMDEVID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.22 PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PE's performance monitor interface.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

**Attributes**

PMDEVTYPE is a 32-bit register.

**Field descriptions**

The PMDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SUB</td>
<td>MAJOR</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a component within a PE.

**MAJOR, bits [3:0]**

Major type. Must read as 0x6 to indicate this is a performance monitor component.

**Accessing the PMDEVTYPE:**

PMDEVTYPE can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFCC</td>
<td>PMDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.23 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

**Configurations**

External register PMEVCNTR<n>_EL0[31:0] is architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0[31:0].

External register PMEVCNTR<n>_EL0[31:0] is architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0].

PMEVCNTR<n>_EL0 is in the Core power domain.

**Attributes**

PMEVCNTR<n>_EL0 is a 64-bit register.

**Field descriptions**

The PMEVCNTR<n>_EL0 bit assignments are:

*When FEAT_PMUv3p5 is implemented:*

```
63 0
```

Event counter n

**Bits [63:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the PMCR.LP and HDCR.HLP bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR<n>_EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64 at any Exception level, bits [63:32] of the event counters are not required to be implemented.

This field resets to an architecturally UNKNOWN value.

*Otherwise:*

```
31 0
```

Event counter n

**Bits [31:0]**

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

This field resets to an architecturally UNKNOWN value.
Accessing the PMEVCNTR<n>_EL0:

External accesses to the performance monitors ignore PMUSERENR_EL0 and, if implemented, MDCR_EL2.TPM, TPMCR, HPMN} and MDCR_EL3.TPM. This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If FEAT_PMUv3p5 is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to 0x004+8×n have a CONSTRAINED UNPREDICTABLE behavior.

--- Note ---
SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVCNTR<n>_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x000+(8*n)</td>
<td>PMEVCNTR&lt;n&gt;_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.24 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configurations

External register PMEVTYPER<n>_EL0[31:0] is architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[31:0].

External register PMEVTYPER<n>_EL0[31:0] is architecturally mapped to AArch32 System register PMEVTYPER<n>_EL0[31:0].

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess().
- A CONstrained UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

PMEVTYPER<n>_EL0 is a 32-bit register.

Field descriptions

The PMEVTYPER<n>_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>26</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>16</th>
<th>15</th>
<th>10</th>
<th>9</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>U</td>
<td>M</td>
<td>RES0</td>
<td>evtCount[15:10]</td>
<td>evtCount[9:0]</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

P, bit [31]

Privileged filtering bit. Controls counting in EL1.
If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

0b0  Count events in EL1.
0b1  Do not count events in EL1.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.
If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

0b0  Count events in EL0.
0b1  Do not count events in EL0.

On a Warm reset, this field resets to an architecturally UNKNOWN value.
NSK, bit [29]

*When EL3 is implemented:*

- Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.
- If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.
- Otherwise, events in Non-secure EL1 are not counted.
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

NSU, bit [28]

*When EL3 is implemented:*

- Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.
- If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.
- Otherwise, events in Non-secure EL0 are not counted.
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

NSH, bit [27]

*When EL2 is implemented:*

- EL2 (Hypervisor) filtering bit. Controls counting in EL2.
- If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.
  - 0b0: Do not count events in EL2.
  - 0b1: Count events in EL2.
- On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.

M, bit [26]

*When EL3 is implemented:*

- Secure EL3 filtering bit.
- If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Secure EL3 are counted.
- Otherwise, events in Secure EL3 are not counted.
- Most applications can ignore this field and set its value to 0b0.

**Note**

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally **UNKNOWN** value.

*Otherwise:*

Reserved, RES0.
MT, bit [25]

*When (FEAT_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:*

Multithreading.

- **0b0** Count events only on controlling PE.
- **0b1** Count events from any PE with the same affinity at level 1 and above as this PE.

--- **Note** ---

- When the lowest level of *affinity* consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

SH, bit [24]

*When FEAT_SEL2 is implemented:*

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

--- **Note** ---

This field is not visible in the AArch32 PMEVTYPER<n> System register.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

*When FEAT_PMUv3p1 is implemented:*

Extension to evtCount[9:0]. See evtCount[9:0] for more details.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in **Table D7-7 on page D7-2715**.
If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

--- Note ---

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

### Accessing the PMEVTYPER<n>_EL0:

--- Note ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVTYPER<n>_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x400 + (4 * n)</td>
<td>PMEVTYPER&lt;n&gt;_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.25 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**
Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configurations**
- External register PMINTENCLR_EL1[31:0] is architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].
- External register PMINTENCLR_EL1[31:0] is architecturally mapped to AArch32 System register PMINTENCLR[31:0].
- PMINTENCLR_EL1 is in the Core power domain.

**Attributes**
PMINTENCLR_EL1 is a 32-bit register.

**Field descriptions**
The PMINTENCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

- **C, bit [31]**
  - PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:
    - 0b0: When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
    - 0b1: When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.
  - On a Warm reset, this field resets to an architecturally UNKNOWN value.

- **P<n>, bit [n], for n = 0 to 30**
  - Event counter overflow interrupt request disable bit for PMEVCNTR<n>_EL0.
    - If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.
    - 0b0: When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
    - 0b1: When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<n>_EL0 interrupt request.
  - On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMINTENCLR_EL1:**

--- **Note** ---
SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.
PMINTENCLR_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC60</td>
<td>PMINTENCLR_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.26 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

**Configurations**

External register PMINTENSET_EL1[31:0] is architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0].

External register PMINTENSET_EL1[31:0] is architecturally mapped to AArch32 System register PMINTENSET[31:0].

PMINTENSET_EL1 is in the Core power domain.

**Attributes**

PMINTENSET_EL1 is a 32-bit register.

**Field descriptions**

The PMINTENSET_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:

- **0b0** When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- **0b1** When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**P<n>, bit [n], for n = 0 to 30**

Event counter overflow interrupt request enable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

- **0b0** When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
- **0b1** When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<n>_EL0 interrupt request.

On a Warm reset, this field resets to an architecturally UNKNOWN value.

**Accessing the PMINTENSET_EL1:**

--- **Note** ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.
PMINTENSEL_EL1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC40</td>
<td>PMINTENSEL_EL1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.27 PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

**Purpose**

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

**Configurations**

It is IMPLEMENTATION DEFINED whether PMITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

**Attributes**

PMITCTRL is a 32-bit register.

**Field descriptions**

The PMITCTRL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td>Integration mode enable (IME)</td>
</tr>
</tbody>
</table>

Bits [31:1]  
Reserved, RES0.

IME, bit [0]  
Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

- **Normal operation.**  
- **Integration mode enabled.**

The following resets apply:

- **If the register is implemented in the Core power domain:**
  - On a Cold reset, this field resets to 0.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.

- **If the register is implemented in the External debug power domain:**
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to 0.
  - On a Warm reset, the value of this field is unchanged.
**Accessing the PMITCTRL:**

PMITCTRL can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF00</td>
<td>PMITCTRL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.
I5.3.28 PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

**Purpose**

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configurations**

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

**Attributes**

PMLAR is a 32-bit register.

**Field descriptions**

The PMLAR bit assignments are:

*When Software Lock is implemented:*

```
<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY</td>
<td></td>
</tr>
</tbody>
</table>
```

**KEY, bits [31:0]**

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

*Otherwise:*

```
<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>
```

**Otherwise**

**Bits [31:0]**

Reserved, RES0.
**Accessing the PMLAR:**

PMLAR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB0</td>
<td>PMLAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
I5.3.29  PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

**Purpose**

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

**Configurations**

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

**Attributes**

PMLSR is a 32-bit register.

**Field descriptions**

The PMLSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>3</td>
<td>nTT, bit [2]</td>
</tr>
<tr>
<td>2</td>
<td>Not thirty-two bit access required. RAZ.</td>
</tr>
<tr>
<td>1</td>
<td>SLK, bit [1]</td>
</tr>
<tr>
<td>0</td>
<td>SLI</td>
</tr>
</tbody>
</table>

When Software Lock is implemented and FEAT_DoPD is not implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

- **0b0**: Lock clear. Writes are permitted to this component's registers.
- **0b1**: Lock set. Writes to this component's registers are ignored, and reads have no side effects.

On a Cold reset, the value of this field is unchanged.

On an External debug reset, this field resets to 1.

On a Warm reset, the value of this field is unchanged.

Otherwise:

Reserved, RAZ.
SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

- **0b0** Software Lock not implemented or not memory-mapped access.
- **0b1** Software Lock implemented and memory-mapped access.

**Accessing the PMLSR:**

PMLSR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFB4</td>
<td>PMLSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.30 PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

**Purpose**

Describes Performance Monitors parameters specific to the implementation.

**Configurations**

PMMIR is in the Core power domain.

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

**Attributes**

PMMIR is a 32-bit register.

**Field descriptions**

The PMMIR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Location</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31–8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7–0</td>
<td>SLOTS</td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

**SLOTS, bits [7:0]**

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is implemented, this field must not be zero.

**Accessing the PMMIR:**

If the Core power domain is off or in a low-power state, access on this interface returns an Error.

PMMIR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE40</td>
<td>PMMIR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or !AllowExternalPMUAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.
I5.3.31 PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSCLR_EL0 characteristics are:

Purpose
Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<\(n\)>. Writing to this register clears these bits.

Configurations
External register PMOVSCLR_EL0[31:0] is architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].
External register PMOVSCLR_EL0[31:0] is architecturally mapped to AArch32 System register PMOVSR[31:0].
PMOVSCLR_EL0 is in the Core power domain.

Attributes
PMOVSCLR_EL0 is a 32-bit register.

Field descriptions
The PMOVSCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>C, bit [31]</th>
<th>P&lt;(n)&gt;, bit [n]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Cycle counter overflow clear bit.</td>
<td>Event counter overflow clear bit for PMEVCNTR&lt;(n)&gt;_EL0.</td>
</tr>
<tr>
<td>00</td>
<td>When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.</td>
<td>If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.</td>
</tr>
<tr>
<td>01</td>
<td>When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.</td>
<td>When read, means that PMEVCNTR&lt;(n)&gt;_EL0 has not overflowed since this bit was last cleared. When written, has no effect.</td>
</tr>
<tr>
<td>10</td>
<td>When read, means that PMEVCNTR&lt;(n)&gt;_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR&lt;(n)&gt;_EL0 overflow bit to 0.</td>
<td>When read, means that PMEVCNTR&lt;(n)&gt;_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR&lt;(n)&gt;_EL0 overflow bit to 0.</td>
</tr>
<tr>
<td>11</td>
<td>If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR&lt;(n)&gt;_EL0[31:0] or unsigned overflow of PMEVCNTR&lt;(n)&gt;_EL0[63:0]. On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
<td>If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR&lt;(n)&gt;_EL0[31:0] or unsigned overflow of PMEVCNTR&lt;(n)&gt;_EL0[63:0]. On a Warm reset, this field resets to an architecturally UNKNOWN value.</td>
</tr>
</tbody>
</table>
Accessing the PMOVSCLR_EL0:

--- Note ---
SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSCLR_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC80</td>
<td>PMOVSCLR_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
I5.3.32 PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>.

**Configurations**

External register PMOVSSET_EL0[31:0] is architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].
External register PMOVSSET_EL0[31:0] is architecturally mapped to AArch32 System register PMOVSSET[31:0].
PMOVSSET_EL0 is in the Core power domain.

**Attributes**

PMOVSSET_EL0 is a 32-bit register.

**Field descriptions**

The PMOVSSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>C, bit [31]</td>
<td></td>
<td>Cycle counter overflow set bit.</td>
</tr>
<tr>
<td>30</td>
<td>P&lt;n&gt;, bit [n]</td>
<td></td>
<td>Event counter overflow set bit for PMEVCNTR&lt;n&gt;_EL0.</td>
</tr>
</tbody>
</table>

- **C, bit [31]**
  - 0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
  - 0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.

- **P<n>, bit [n]**, for n = 0 to 30
  - When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
  - When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, sets the PMEVCNTR<n>_EL0 overflow bit to 1.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

On a Warm reset, this field resets to an architecturally UNKNOWN value.
Accessing the PMOVSET_EL0:

Note
SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSET_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCC0</td>
<td>PMOVSET_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.
### I5.3.33 PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

**Purpose**

Holds a sampled instruction address value.

**Configurations**

PMPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

--- **Note** ---

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

**Attributes**

PMPCSR is a 64-bit register.

**Field descriptions**

The PMPCSR bit assignments are:

<table>
<thead>
<tr>
<th>NS</th>
<th>EL</th>
<th>RES0</th>
<th>PCSample[55:32]</th>
<th>PCSample[31:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>62</td>
<td>61</td>
<td>60</td>
<td>56 55</td>
</tr>
<tr>
<td>32</td>
<td>31</td>
<td>30</td>
<td>29</td>
<td>28 27</td>
</tr>
<tr>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NS, bit [63]**

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

- **0b0** Sample is from Secure state.
- **0b1** Sample is from Non-secure state.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**EL, bits [62:61]**

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

- **0b00** Sample is from EL0.
- **0b01** Sample is from EL1.
- **0b10** Sample is from EL2.
- **0b11** Sample is from EL3.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.
On a Warm reset, the value of this field is unchanged.

**Bits [60:56]**

Reserved, RES0.

**PCSample[55:32], bits [55:32]**

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**PCSample[31:0], bits [31:0]**

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of PMPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

PMPCSR[31:0] reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR to UNKNOWN values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR are unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

### Accessing the PMPCSR:

IMPLEMETATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-7134.

PMPCSR[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x200</td>
<td>PMPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[31:0] are RO.
• Otherwise accesses to PMPCSR[31:0] generate an error response.

PMPCSR[31:0] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x220</td>
<td>PMPCSR</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[31:0] are RO.
• Otherwise accesses to PMPCSR[31:0] generate an error response.

PMPCSR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x204</td>
<td>PMPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[63:32] are RO.
• Otherwise accesses to PMPCSR[63:32] generate an error response.

PMPCSR[63:32] can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x224</td>
<td>PMPCSR</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[63:32] are RO.
• Otherwise accesses to PMPCSR[63:32] generate an error response.
I5.3.34 PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.
For more information, see *About the Peripheral identification scheme* on page K2-7999.

Configurations

Implementation of this register is OPTIONAL.
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.
This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.

Field descriptions

The PMPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PART_0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

Accessing the PMPIDR0:

PMPIDR0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE0</td>
<td>PMPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
### 5.3.35 PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR1 is a 32-bit register.

**Field descriptions**

The PMPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>DES_0</td>
<td>PART_1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

**PART_1, bits [3:0]**

Part number, most significant nibble.

**Accessing the PMPIDR1:**

PMPIDR1 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE4</td>
<td>PMPIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.36 PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR2 is a 32-bit register.

**Field descriptions**

The PMPIDR2 bit assignments are:

![Diagram of PMPIDR2 bit assignments]

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

**Accessing the PMPIDR2:**

PMPIDR2 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE8</td>
<td>PMPIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.37 PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR3 is a 32-bit register.

**Field descriptions**

The PMPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>REVAND</td>
<td>CMOD</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

**Accessing the PMPIDR3:**

PMPIDR3 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFEC</td>
<td>PMPIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.38 PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR4 is a 32-bit register.

**Field descriptions**

The PMPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>8</td>
<td>SIZE</td>
</tr>
<tr>
<td>4</td>
<td>DES_2</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. \( \log_2 \) of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

**Accessing the PMPIDR4:**

PMPIDR4 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFD0</td>
<td>PMPIDR4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.3.39 PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see SW_INCR.

**Configurations**

External register PMSWINC_EL0[31:0] is architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

External register PMSWINC_EL0[31:0] is architecturally mapped to AArch32 System register PMSWINC[31:0].

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

**Attributes**

PMSWINC_EL0 is a 32-bit register.

**Field descriptions**

The PMSWINC_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th></th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>P&lt;n&gt;, bit [n]</td>
<td></td>
</tr>
</tbody>
</table>

**RES0**

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 0 to 30

Event counter software increment bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are WI.

0b0 No action. The write to this bit is ignored.

0b1 It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter n.

**Accessing the PMSWINC_EL0:**

--- **Note** ---

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.
PMSWINC_EL0 can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCA0</td>
<td>PMSWINC_EL0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.
I5.3.40 PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

**Purpose**

Contains the sampled VMID value that is captured on reading PMPCSR[31:0].

**Configurations**

PMVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMVIDSR are RES0.

--- Note ---

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

---

**Attributes**

PMVIDSR is a 32-bit register.

**Field descriptions**

The PMVIDSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>VMID[15:8]</th>
<th>VMID</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>16</td>
<td></td>
<td></td>
</tr>
<tr>
<td>15</td>
<td></td>
<td></td>
</tr>
<tr>
<td>14</td>
<td></td>
<td></td>
</tr>
<tr>
<td>13</td>
<td></td>
<td></td>
</tr>
<tr>
<td>12</td>
<td></td>
<td></td>
</tr>
<tr>
<td>11</td>
<td></td>
<td></td>
</tr>
<tr>
<td>10</td>
<td></td>
<td></td>
</tr>
<tr>
<td>9</td>
<td></td>
<td></td>
</tr>
<tr>
<td>8</td>
<td></td>
<td></td>
</tr>
<tr>
<td>7</td>
<td></td>
<td></td>
</tr>
<tr>
<td>6</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**VMID[15:8], bits [15:8]**

*When FEAT_VMID16 is implemented:*

Extension to VMID[7:0]. See VMID[7:0] for more details.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

*Otherwise:*

Reserved, RES0.

**VMID, bits [7:0]**

VMID sample. The VMID associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
  - EL2 is disabled in the current Security state.
  - The PE is executing at EL2.
  - EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.
- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
— If EL2 is using AArch64, `FEAT_VMID16` is implemented, and `VTCR_EL2.VS` is 0, `PMVIDSR.VMID[7:0]` is set to `VTTBR_EL2.VMID[7:0]` and `PMVIDSR.VMID[15:8]` is RES0.

— If EL2 is using AArch32, this field is set to `VTTBR.VMID`.

Because the value written to PMVIDR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if PMPCSR samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

On an External debug reset, the value of this field is unchanged.

On a Warm reset, the value of this field is unchanged.

**Accessing the PMVIDSR:**

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-7134.

PMVIDSR can be accessed through the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x20C</td>
<td>PMVIDSR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.
I5.4 External Activity Monitors Extension registers summary

The memory-mapped interface to the Activity Monitors Extension registers provides read-only access to:

- Read-only copies of the Activity Monitors Extension System registers, with the exception of AMUSERENR.
- An implementation identification register, AMIIDR.
- If they are implemented, the OPTIONAL Activity Monitors CoreSight and ID registers.

The locations of the registers are defined as offsets from a base address. The base address of the memory-mapped view must be aligned to a 4KB boundary, but is otherwise IMPLEMENTATION DEFINED. Activity Monitors external register views defines this memory map.

I5.4.1 Activity Monitors external register views

Table I5-2 shows the external view of the Activity Monitors registers. All implemented registers are RO. Offsets within the 4KB region not defined in this table are RAZ/WI.

Each entry in the Name column links to the register description in Activity Monitors external register descriptions on page I5-7428, and:

- If the System register? on page I5-7350 column of the table shows that the register is a System register, the memory-mapped interface provides a view of the System register described in:
  - Activity Monitors registers on page D13-3745, for the AArch64 System register.
  - Activity Monitors registers on page G8-6830, for the AArch32 System register.
- Otherwise, the register is accessible only using the external memory-mapped interface.

a. CoreSight interface registers, see Management registers and CoreSight compliance on page K2-7991.
I5.5 Activity Monitors external register descriptions

This section lists the external Activity Monitors registers.
I5.5.1 AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.
Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both thearchitected and the auxiliary counter groups.

Configurations

External register AMCFGR[31:0] is architecturally mapped to AArch64 System register AMCFGR_EL0[31:0].

External register AMCFGR[31:0] is architecturally mapped to AArch32 System register AMCFGR[31:0].
The power domain of AMCFGR is IMPLEMENTATION DEFINED.
This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are RES0.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

The AMCFGR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>25</th>
<th>24</th>
<th>23</th>
<th>14</th>
<th>13</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>NCG</td>
<td>RES0</td>
<td>RAZ</td>
<td>SIZE</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

HDBG

NCG, bits [31:28]

Defines the number of counter groups.
The number of implemented counter groups is defined as [AMCFGR.NCG + 1].
If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.
From Armv8, this feature must be supported, and so this bit is 0b1.
0b0 AMCR.HDBG is RES0.
0b1 AMCR.HDBG is read/write.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.
The size of the activity monitor event counters implemented by the Activity Monitors Extension is defined as \([\text{AMCFGR.SIZE} + 1]\).

From Armv8, the counters are 64-bit, and so this field is 0b111111.

**Note**

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

\[ \text{N, bits [7:0]} \]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is defined as \([\text{AMCFGR.N} + 1]\).

**Accessing the AMCFGR:**

AMCFGR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE00</td>
<td>AMCFGR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.2 AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

**Purpose**

Provides information on the number of activity monitor event counters implemented within each counter group.

**Configurations**

External register AMCGCR[31:0] is architecturally mapped to AArch64 System register AMCGCR_EL0[31:0].

External register AMCGCR[31:0] is architecturally mapped to AArch32 System register AMCGCR[31:0].

The power domain of AMCGCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are RES0.

**Attributes**

AMCGCR is a 32-bit register.

**Field descriptions**

The AMCGCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>16 - 15</td>
<td>CG1NC Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group. In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.</td>
</tr>
<tr>
<td>8 - 7</td>
<td>CG0NC Counter Group 0 Number of Counters. The number of counters in the architected counter group. In an implementation that includes FEAT_AMUv1, the value of this field is 4.</td>
</tr>
</tbody>
</table>

**Accessing the AMCGCR:**

AMCGCR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xCE0</td>
<td>AMCGCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.3 AMCIDR0, Activity Monitors Component Identification Register 0

The AMCIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see About the Component Identification scheme on page K2-8002.

Configurations

The power domain of AMCIDR0 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR0 is a 32-bit register.

Field descriptions

The AMCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PRMBL_0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.
Reads as 0x0D.

Accessing the AMCIDR0:

AMCIDR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFFF0</td>
<td>AMCIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• Accesses to this register are RO.
5.5.4 AMCIDR1, Activity Monitors Component Identification Register 1

The AMCIDR1 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.
For more information, see About the Component Identification scheme on page K2-8002.

**Configurations**

The power domain of AMCIDR1 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMCIDR1 is a 32-bit register.

**Field descriptions**

The AMCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8-7</td>
<td>CLASS, Component class.</td>
</tr>
<tr>
<td>3-0</td>
<td>PRMBL_1, Preamble.</td>
</tr>
</tbody>
</table>

- **CLASS**, bits [7:4]
  
  Component class.
  0b1001 CoreSight component.
  Other values are defined by the CoreSight Architecture.
  This field reads as 0x9.

- **PRMBL_1**, bits [3:0]
  
  Preamble.
  Reads as 0b0000.

**Accessing the AMCIDR1:**

AMCIDR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF4</td>
<td>AMCIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.5  AMCIDR2, Activity Monitors Component Identification Register 2

The AMCIDR2 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see About the Component Identification scheme on page K2-8002.

**Configurations**

The power domain of AMCIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMCIDR2 is a 32-bit register.

**Field descriptions**

The AMCIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PRMBL_2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble.

Reads as 0x05.

**Accessing the AMCIDR2:**

AMCIDR2 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFF8</td>
<td>AMCIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.6 AMCIDR3, Activity Monitors Component Identification Register 3

The AMCIDR3 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see *About the Component Identification scheme* on page K2-8002.

**Configurations**

The power domain of AMCIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMCIDR3 is a 32-bit register.

**Field descriptions**

The AMCIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td>PRMBL_3</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble.

Reads as 0xB1.

**Accessing the AMCIDR3:**

AMCIDR3 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFFC</td>
<td>AMCIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.7 AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

**Purpose**

Disable control bits for the architected event counters, AMEVCNTR0<n>.

**Configurations**

External register AMCNTENCLR0[31:0] is architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

External register AMCNTENCLR0[31:0] is architecturally mapped to AArch32 System register AMCNTENCLR0[31:0].

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

**Attributes**

AMCNTENCLR0 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR0 bit assignments are:

<table>
<thead>
<tr>
<th>P&lt;n&gt;, bit [n], for n = 0 to 31</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Bit Assignments" /></td>
</tr>
</tbody>
</table>

P<n>, bit [n], for n = 0 to 31

Activity monitor event counter disable bit for AMEVCNTR0<n>.

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

- **0b0**  When read, means that AMEVCNTR0<n> is disabled. When written, has no effect.
- **0b1**  When read, means that AMEVCNTR0<n> is enabled. When written, disables AMEVCNTR0<n>.

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENCLR0:**

AMCNTENCLR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC20</td>
<td>AMCNTENCLR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.8 AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

**Purpose**

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1\(<n>\).

**Configurations**

External register AMCNTENCLR1[31:0] is architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

External register AMCNTENCLR1[31:0] is architecturally mapped to AArch32 System register AMCNTENCLR1[31:0].

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

**Attributes**

AMCNTENCLR1 is a 32-bit register.

**Field descriptions**

The AMCNTENCLR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>P(&lt;n&gt;), bit ([n])</td>
<td></td>
</tr>
</tbody>
</table>

**P\(<n>\), bit \([n]\), for \(n = 0 \text{ to } 31**

Activity monitor event counter disable bit for AMEVCNTR1\(<n>\).

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

- 0b0 When read, means that AMEVCNTR1\(<n>\) is disabled. When written, has no effect.
- 0b1 When read, means that AMEVCNTR1\(<n>\) is enabled. When written, disables AMEVCNTR1\(<n>\).

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENCLR1:**

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENCLR1 are RAZ/WI. Software must treat reserved accesses as RES0. See Access requirements for reserved and unallocated registers on page I1-7324.

**Note**

The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR.NCG == 0b0000.

AMCNTENCLR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x024</td>
<td>AMCNTENCLR1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.9 AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

**Purpose**

Enable control bits for the architected activity monitors event counters, AMEVCNTR0\<n>.

**Configurations**

External register AMCNTENSET0[31:0] is architecturally mapped to AArch64 System register AMCNTENSET0_EL0[31:0].

External register AMCNTENSET0[31:0] is architecturally mapped to AArch32 System register AMCNTENSET0[31:0].

The power domain of AMCNTENSET0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are RES0.

**Attributes**

AMCNTENSET0 is a 32-bit register.

**Field descriptions**

The AMCNTENSET0 bit assignments are:

<table>
<thead>
<tr>
<th>P(\langle n\rangle), bit ([n])</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
</tr>
</tbody>
</table>

P\(\langle n\rangle\), bit \([n]\), for \(n = 0\) to \(31\)

Activity monitor event counter enable bit for AMEVCNTR0\(<n>\).

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG0NC.

Possible values of each bit are:

- 0b0 When read, means that AMEVCNTR0\(<n>\) is disabled. When written, has no effect.
- 0b1 When read, means that AMEVCNTR0\(<n>\) is enabled. When written, enables AMEVCNTR0\(<n>\).

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENSET0:**

AMCNTENSET0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC00</td>
<td>AMCNTENSET0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

**Purpose**

Enable control bits for the auxiliary activity monitors event counters, AMEVCNTR1\(<n>\).

**Configurations**

External register AMCNTENSET1[31:0] is architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

External register AMCNTENSET1[31:0] is architecturally mapped to AArch32 System register AMCNTENSET1[31:0].

The power domain of AMCNTENSET1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are RES0.

**Attributes**

AMCNTENSET1 is a 32-bit register.

**Field descriptions**

The AMCNTENSET1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P(&lt;n&gt;), bit [n]</td>
<td>for n = 0 to 31</td>
</tr>
<tr>
<td>31</td>
<td>0</td>
</tr>
</tbody>
</table>

P\(<n>\), bit [n], for n = 0 to 31

Activity monitor event counter enable bit for AMEVCNTR1\(<n>\).

Bits [31:N] are RAZ/WI. N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

- 0b0: When read, means that AMEVCNTR1\(<n>\) is disabled. When written, has no effect.
- 0b1: When read, means that AMEVCNTR1\(<n>\) is enabled. When written, enables AMEVCNTR1\(<n>\).

On a Cold reset, this field resets to 0.

**Accessing the AMCNTENSET1:**

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENSET1 are RAZ/WI. Software must treat reserved accesses as RES0. See Access requirements for reserved and unallocated registers on page I1-7324.

---

**Note**

The number of auxiliary activity monitor counters implemented is zero exactly when AMCFGR.NCG == 0b0000.

AMCNTENSET1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xC04</td>
<td>AMCNTENSET1</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.11 AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the
architected and the auxiliary counter groups.

Configurations

External register AMCR[31:0] is architecturally mapped to AArch64 System register
AMCR_EL0[31:0].

External register AMCR[31:0] is architecturally mapped to AArch32 System register AMCR[31:0].

The power domain of AMCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to
AMCR are RES0.

Attributes

AMCR is a 32-bit register.

Field descriptions

The AMCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>HDBG, bit [10]</td>
</tr>
<tr>
<td>29</td>
<td>Reserved, RAZ/WI</td>
</tr>
</tbody>
</table>

Bits [31:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

0b0 Activity monitors do not halt counting when the PE is halted in Debug state.

0b1 Activity monitors halt counting when the PE is halted in Debug state.

Bits [9:0]

Reserved, RAZ/WI.

Accessing the AMCR:

AMCR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE04</td>
<td>AMCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
### I5.5.12 AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

**Configurations**

The power domain of AMDEVAFF0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMDEVAFF0 is a 32-bit register.

**Field descriptions**

The AMDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>MPIDR_EL1lo</td>
</tr>
</tbody>
</table>

**MPIDR_EL1lo, bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

**Accessing the AMDEVAFF0:**

AMDEVAFF0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFA8</td>
<td>AMDEVAFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.13 AMDEVAFF1, Activity Monitors Device Affinity Register 1

The AMDEVAFF1 characteristics are:

Purpose
Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configurations
The power domain of AMDEVAFF1 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes
AMDEVAFF1 is a 32-bit register.

Field descriptions
The AMDEVAFF1 bit assignments are:

<table>
<thead>
<tr>
<th>MPIDR_EL1hi</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
</tr>
</tbody>
</table>

MPIDR_EL1hi, bits [31:0]
MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing the AMDEVAFF1:
AMDEVAFF1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFAC</td>
<td>AMDEVAFF1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.14 AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH characteristics are:

**Purpose**

 Identifies the programmers’ model architecture of the AMU component.

**Configurations**

The power domain of AMDEVARCH is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMDEVARCH is a 32-bit register.

**Field descriptions**

The AMDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ARCHITECT</td>
<td>Defines the architecture of the component. For AMU, this is Arm Limited.</td>
</tr>
<tr>
<td>28</td>
<td></td>
<td>Bits [31:28] are the JEP106 continuation code, 0x4.</td>
</tr>
<tr>
<td>21</td>
<td>REVISION</td>
<td>Defines the architecture revision. For architectures defined by Arm this is the minor revision.</td>
</tr>
<tr>
<td>19</td>
<td></td>
<td>0b0000 Architecture revision is AMUv1.</td>
</tr>
<tr>
<td>15</td>
<td>ARCHID</td>
<td>Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided.</td>
</tr>
<tr>
<td>12</td>
<td></td>
<td>Bits [15:12] are the architecture version, 0x0.</td>
</tr>
<tr>
<td>0</td>
<td>PRESENT</td>
<td>When set to 1, indicates that the DEVARCH is present.</td>
</tr>
</tbody>
</table>

This field is 1 in Armv8.

For AMU:

• Bits [15:12] are the architecture version, 0x0.
• Bits [11:0] are the architecture part number, 0xA66.

This corresponds to AMU architecture version AMUv1.
Accessing the AMDEVARCH:

AMDEVARCH can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xF8C</td>
<td>AMDEVARCH</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.15   AMDEVTYPE, Activity Monitors Device Type Register

The AMDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a PE's performance monitor interface.

**Configurations**

The power domain of AMDEVTYPE is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMDEVTYPE is a 32-bit register.

**Field descriptions**

The AMDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>Bit Position</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>[31:8]</td>
<td>Reserved, RES0</td>
<td></td>
</tr>
<tr>
<td>[7:4]</td>
<td>SUB, Subtype</td>
<td>0x1</td>
</tr>
<tr>
<td>[3:0]</td>
<td>MAJOR, Major Type</td>
<td>0x6</td>
</tr>
</tbody>
</table>

**Accessing the AMDEVTYPE:**

AMDEVTYPE can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFCC</td>
<td>AMDEVTYPE</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
### I5.5.16 AMEVCNTR0\(<n>\), Activity Monitors Event Counter Registers 0, \(n = 0 - 15\)

The AMEVCNTR0\(<n>\) characteristics are:

**Purpose**

Provides access to the architected activity monitor event counters.

**Configurations**

External register AMEVCNTR0\(<n>\)[63:0] is architecturally mapped to AArch64 System register AMEVCNTR0\(<n>\)_EL0[63:0].

External register AMEVCNTR0\(<n>\)[63:0] is architecturally mapped to AArch32 System register AMEVCNTR0\(<n>\)[63:0].

The power domain of AMEVCNTR0\(<n>\) is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0\(<n>\) are RES0.

**Attributes**

AMEVCNTR0\(<n>\) is a 64-bit register.

**Field descriptions**

The AMEVCNTR0\(<n>\) bit assignments are:

```
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**ACNT, bits [63:0]**

Architected activity monitor event counter \(n\).

Value of architected activity monitor event counter \(n\), where \(n\) is the number of this register and is a number from 0 to 15.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

On a Cold reset, this field resets to 0.

**Accessing the AMEVCNTR0\(<n>\):**

If \(<n>\) is greater than or equal to the number of architected activity monitor event counters, reads of AMEVCNTR0\(<n>\) are RAZ/WI. Software must treat reserved accesses as RES0. See *Access requirements for reserved and unallocated registers* on page I1-7324.

---

**Note**

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

AMEVCNTR0\(<n>\>[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x000 + (8 * (n))</td>
<td>AMEVCNTR0(&lt;n&gt;)</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to AMEVCNTR0\(<n>\>[31:0] are RO.
AMEVCNTR0<n>[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x004 + (8 * n)</td>
<td>AMEVCNTR0&lt;n&gt;</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to AMEVCNTR0<n>[63:32] are RO.
5.17 AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

**Purpose**
Provides access to the auxiliary activity monitor event counters.

**Configurations**
- External register AMEVCNTR1<n>[63:0] is architecturally mapped to AArch64 System register AMEVCNTR1<n>_EL0[63:0].
- External register AMEVCNTR1<n>[63:0] is architecturally mapped to AArch32 System register AMEVCNTR1<n>[63:0].
- The power domain of AMEVCNTR1<n> is IMPLEMENTATION DEFINED.
- This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are RES0.

**Attributes**
AMEVCNTR1<n> is a 64-bit register.

**Field descriptions**
The AMEVCNTR1<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACNT [63:0]</td>
<td>Auxiliary activity monitor event counter n. Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15. If the counter is enabled, writes to this register have UNPREDICTABLE results. On a Cold reset, this field resets to 0.</td>
</tr>
</tbody>
</table>

**Accessing the AMEVCNTR1<n>**
If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVCNTR1<n> are RAZ/WI. Software must treat reserved accesses as RES0. See Access requirements for reserved and unallocated registers on page I1-7324.

--- Note ---
AMECGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

AMEVCNTR1<n>[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x108 + (8 * n)</td>
<td>AMEVCNTR1&lt;n&gt;</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to AMEVCNTR1<n>[31:0] are RO.
AMEVCNTR1<\text{n}>[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x104 + (8 * n)</td>
<td>AMEVCNTR1&lt;\text{n}&gt;</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to AMEVCNTR1<\text{n}>[63:32] are RO.
I5.5.18 AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 15

The AMEVTYPER0<n> characteristics are:

**Purpose**

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n> counts.

**Configurations**

External register AMEVTYPER0<n>[31:0] is architecturally mapped to AArch64 System register AMEVTYPER0<n>_EL0[31:0].
External register AMEVTYPER0<n>[31:0] is architecturally mapped to AArch32 System register AMEVTYPER0<n>[31:0].
The power domain of AMEVTYPER0<n> is IMPLEMENTATION DEFINED.
This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are RES0.

**Attributes**

AMEVTYPER0<n> is a 32-bit register.

**Field descriptions**

The AMEVTYPER0<n> bit assignments are:

<table>
<thead>
<tr>
<th>31  25  24</th>
<th>16  15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ</td>
<td>RES0</td>
<td>evtCount</td>
</tr>
</tbody>
</table>

**Bits [31:25]**

Reserved, RAZ.

**Bits [24:16]**

Reserved, RES0.

**evtCount, bits [15:0]**

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

- 0x0011 When n == 0 Processor frequency cycles
- 0x4004 When n == 1 Constant frequency cycles
- 0x0008 When n == 2 Instructions retired
- 0x4005 When n == 3 Memory stall cycles

**Accessing the AMEVTYPER0<n>:**

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVTYPER0<n> are RAZ/WI. Software must treat reserved accesses as RES0. See Access requirements for reserved and unallocated registers on page I1-7324.
Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

AMEVTYPER0<n> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x400 + (4 * n)</td>
<td>AMEVTYPER0&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.19 AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter AMEVCNTR1<n> counts.

Configurations

External register AMEVTYPER1<n>[31:0] is architecturally mapped to AArch64 System register AMEVTYPER1<n>_EL0[31:0].
External register AMEVTYPER1<n>[31:0] is architecturally mapped to AArch32 System register AMEVTYPER1<n>[31:0].
The power domain of AMEVTYPER1<n> is IMPLEMENTATION DEFINED.
This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are RES0.

Attributes

AMEVTYPER1<n> is a 32-bit register.

Field descriptions

The AMEVTYPER1<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>25 24</th>
<th>16 15</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ</td>
<td>RES0</td>
<td>evtCount</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:25]

Reserved, RAZ.

Bits [24:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>.
It is IMPLEMENTATION DEFINED what values are supported by each counter.
If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1<n>, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

Note

The event counted by AMEVCNTR1<n> might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter AMEVCNTR1<n> is enabled, writes to this register have UNPREDICTABLE results.
Accessing the AMEVTYPER1<n>:

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVTYPER1<n> are RAZ/WI. Software must treat reserved accesses as RES0. See Access requirements for reserved and unallocated registers on page I1-7324.

Note

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

AMEVTYPER1<n> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0x480 + (4 * n)</td>
<td>AMEVTYPER1&lt;n&gt;</td>
</tr>
</tbody>
</table>
I5.5.20 AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

**Purpose**

Defines the implementer and revisions of the AMU.

**Configurations**

The power domain of AMIIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMIIDR are RES0.

**Attributes**

AMIIDR is a 32-bit register.

**Field descriptions**

The AMIIDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-20</td>
<td>ProductID</td>
</tr>
<tr>
<td>19-16</td>
<td>Variant</td>
</tr>
<tr>
<td>15-12</td>
<td>Revision</td>
</tr>
<tr>
<td>11-0</td>
<td>Implementer</td>
</tr>
</tbody>
</table>

**ProductID, bits [31:20]**

This field is an AMU part identifier.

The value of this field is IMPLEMENTATION DEFINED.

If AMPIDR0 is implemented, AMPIDR0.PART_0 matches bits [27:20] of this field.

If AMPIDR1 is implemented, AMPIDR1.PART_1 matches bits [31:28] of this field.

**Variant, bits [19:16]**

This field distinguishes product variants or major revisions of the product.

The value of this field is IMPLEMENTATION DEFINED.

If AMPIDR2 is implemented, AMPIDR2.REVISION matches AMIIDR.Variant.

**Revision, bits [15:12]**

This field distinguishes minor revisions of the product.

The value of this field is IMPLEMENTATION DEFINED.

If AMPIDR3 is implemented, AMPIDR3.REVAND matches AMIIDR.Revision.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the AMU.

For an Arm implementation, this field reads as 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer.

Bit 7 is RES0

Bits [6:0] contain the JEP106 identity code of the implementer.

If AMPIDR4 is implemented, AMPIDR4.DES_2 matches bits [11:8] of this field.

If AMPIDR2 is implemented, AMPIDR2.DES_1 matches bits [6:4] of this field.

If AMPIDR1 is implemented, AMPIDR1.DES_0 matches bits [3:0] of this field.
Accessing the AMIIDR:
AMIIDR can be accessed through its memory-mapped interface:

This interface is accessible as follows:
- Accesses to this register are RO.

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xE08</td>
<td>AMIIDR</td>
</tr>
</tbody>
</table>
I5.5.21 AMPIDR0, Activity Monitors Peripheral Identification Register 0

The AMPIDR0 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

The power domain of AMPIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR0 is a 32-bit register.

**Field descriptions**

The AMPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>8</td>
<td>PART_0, bits [7:0]</td>
<td>Part number</td>
</tr>
<tr>
<td>7</td>
<td></td>
<td>least significant byte.</td>
</tr>
<tr>
<td>0</td>
<td></td>
<td>The value of this field is IMPLEMENTATION DEFINED.</td>
</tr>
</tbody>
</table>

**Accessing the AMPIDR0:**

AMPIDR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE0</td>
<td>AMPIDR0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.22 AMPIDR1, Activity Monitors Peripheral Identification Register 1

The AMPIDR1 characteristics are:

**Purpose**
Provides information to identify an activity monitors component.
For more information, see About the Peripheral identification scheme on page K2-7999.

**Configurations**
The power domain of AMPIDR1 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

**Attributes**
AMPIDR1 is a 32-bit register.

**Field descriptions**
The AMPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>DES_0</td>
<td>PART_1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**
Reserved, RES0.

**DES_0, bits [7:4]**
Designer, least significant nibble of JEP106 ID code.
The value of this field is IMPLEMENTATION DEFINED. For Arm Limited, this field is 0b1011.

**PART_1, bits [3:0]**
Part number, most significant nibble.
The value of this field is IMPLEMENTATION DEFINED.

**Accessing the AMPIDR1:**
AMPIDR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE4</td>
<td>AMPIDR1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

* Accesses to this register are RO.
I5.5.23  AMPIDR2, Activity Monitors Peripheral Identification Register 2

The AMPIDR2 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.
For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

The power domain of AMPIDR2 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR2 is a 32-bit register.

**Field descriptions**

The AMPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8</td>
<td>REVISION</td>
<td>Part major revision. Parts can also use this field to extend Part number to 16-bits.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The value of this field is IMPLEMENTATION DEFINED.</td>
</tr>
<tr>
<td>3</td>
<td>JEDEC</td>
<td>RA0. Indicates a JEP106 identity code is used.</td>
</tr>
<tr>
<td>2:0</td>
<td>DES_1</td>
<td>Designer, most significant bits of JEP106 ID code.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The value of this field is IMPLEMENTATION DEFINED. For Arm Limited, this field is 0b011.</td>
</tr>
</tbody>
</table>

Accessing the AMPIDR2:

AMPIDR2 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFE8</td>
<td>AMPIDR2</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.24  **AMPIDR3, Activity Monitors Peripheral Identification Register 3**

The AMPIDR3 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.

For more information, see *About the Peripheral identification scheme* on page K2-7999.

**Configurations**

The power domain of AMPIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR3 is a 32-bit register.

**Field descriptions**

The AMPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:8</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>7:4</td>
<td>REV AND</td>
</tr>
<tr>
<td>3:0</td>
<td>CMOD</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REV AND, bits [7:4]**

Part minor revision. Parts using AMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

The value of this field is IMPLEMENTATION DEFINED.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

The value of this field is IMPLEMENTATION DEFINED.

**Accessing the AMPIDR3:**

AMPIDR3 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFEC</td>
<td>AMPIDR3</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.5.25 AMPIDR4, Activity Monitors Peripheral Identification Register 4

The AMPIDR4 characteristics are:

**Purpose**

Provides information to identify an activity monitors component.
For more information, see About the Peripheral identification scheme on page K2-7999.

**Configurations**

The power domain of AMPIDR4 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

**Attributes**

AMPIDR4 is a 32-bit register.

**Field descriptions**

The AMPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8-0</td>
<td>SIZE, bits [7:4]</td>
</tr>
<tr>
<td></td>
<td>DES_2, bits [3:0]</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.
This field reads as \(0b0000\).

**DES_2, bits [3:0]**

Designer. JEP106 continuation code, least significant nibble.
The value of this field is IMPLEMENTATION DEFINED. For Arm Limited, this field is \(0b0100\).

**Accessing the AMPIDR4:**

AMPIDR4 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMU</td>
<td>0xFD0</td>
<td>AMPIDR4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.6 Generic Timer memory-mapped registers overview

The Generic Timer memory-mapped registers are implemented as multiple register frames, with each register frame having its own base address, as follows:

- A single CNTCTLBase register frame, at base address CNTCTLBase.
- Between one and seven CNTBaseN register frames, each with its own base address CNTBaseN.
- For each CNTBaseN register frame, if required, a CNTEL0BaseN register frame, at base address CNTEL0BaseN, that provides an EL0 view of the CNTBaseN register frame.

For more information, see:

- Memory-mapped timer components on page I2-7332.
- The CNTBaseN and CNTEL0BaseN frames on page I2-7334. This section includes the memory map of the CNTBaseN and CNTBaseN register frames.
- The CNTCTLBase frame on page I2-7333. This section includes the memory map of the CNTCTLBase register frame.

--- Note ---

Providing a complete set of features in a system level implementation on page K5-8024 gives an implementation example for a system level implementation of the Generic Timer.
I5.7  Generic Timer memory-mapped register descriptions

This section describes the Generic Timer registers. *Generic Timer memory-mapped registers overview on page I5-7463* gives an overview of these registers, and includes links to their memory maps.
### I5.7.1 CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

**Purpose**

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

**Configurations**

The power domain of CNTACR<n> is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-7327.

Implemented only if the value of CNTTIDR.Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

**Attributes**

CNTACR<n> is a 32-bit register.

**Field descriptions**

The CNTACR<n> bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>6</td>
<td>RWPT, bit [5]</td>
</tr>
<tr>
<td>5</td>
<td>Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL, in frame &lt;n&gt;. The possible values of this bit are:</td>
</tr>
<tr>
<td>0</td>
<td>No access to the EL1 Physical Timer registers in frame &lt;n&gt;. The registers are RES0.</td>
</tr>
<tr>
<td>1</td>
<td>Read/write access to the EL1 Physical Timer registers in frame &lt;n&gt;.</td>
</tr>
</tbody>
</table>

This field resets to an architecturally UNKNOWN value.
RWVT, bit [4]
Read/write access to the Virtual Timer register CNTV_CVAL, CNTV_TVAL, and CNTV_CTL, in frame <n>. The possible values of this bit are:
0b0    No access to the Virtual Timer registers in frame <n>. The registers are RES0.
0b1    Read/write access to the Virtual Timer registers in frame <n>.
This field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]
Read-only access to CNTVOFF, in frame <n>. The possible values of this bit are:
0b0    No access to CNTVOFF in frame <n>. The register is RES0.
0b1    Read-only access to CNTVOFF in frame <n>.
This field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]
Read-only access to CNTFRQ, in frame <n>. The possible values of this bit are:
0b0    No access to CNTFRQ in frame <n>. The register is RES0.
0b1    Read-only access to CNTFRQ in frame <n>.
This field resets to an architecturally UNKNOWN value.

RVCT, bit [1]
Read-only access to CNTVCT, in frame <n>. The possible values of this bit are:
0b0    No access to CNTVCT in frame <n>. The register is RES0.
0b1    Read-only access to CNTVCT in frame <n>.
This field resets to an architecturally UNKNOWN value.

RPCT, bit [0]
Read-only access to CNTPCT, in frame <n>. The possible values of this bit are:
0b0    No access to CNTPCT in frame <n>. The register is RES0.
0b1    Read-only access to CNTPCT in frame <n>.
This field resets to an architecturally UNKNOWN value.

**Accessing the CNTACR<n>:**

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

CNTACR<n> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x040 + (4 * n)</td>
<td>CNTACR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
## I5.7.2 CNTCR, Counter Control Register

The CNTCR characteristics are:

### Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

### Configurations

The power domain of CNTCR is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7327.

### Attributes

CNTCR is a 32-bit register.

### Field descriptions

The CNTCR bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit(s)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31:18</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>17:8</td>
<td>FCREQ</td>
</tr>
<tr>
<td>7:3</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>2</td>
<td>SCEN</td>
</tr>
</tbody>
</table>
```

**Bits [31:18]**

Reserved, RES0.

**FCREQ, bits [17:8]**

Frequency change request. Indicates the number of the entry in the Frequency modes table to select. Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see [The Frequency modes table](#) on page I2-7329. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

This field resets to 0.

**Bits [7:3]**

Reserved, RES0.

**SCEN, bit [2]**

When **FEAT_CNTSC** is implemented:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Scaling is not enabled. The counter value is incremented by 0x1.0000000 for each counter tick.</td>
</tr>
<tr>
<td>1</td>
<td>Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick.</td>
</tr>
</tbody>
</table>

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.
If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the CNTCV register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

This field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**HDBG, bit [1]**

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

- 0b0 System counter ignores Halt-on-debug.
- 0b1 Asserted Halt-on-debug signal halts system counter update.

This field resets to an architecturally UNKNOWN value.

**EN, bit [0]**

Enables the counter:

- 0b0 System counter disabled.
- 0b1 System counter enabled.

This field resets to 0.

**Accessing the CNTCR:**

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTCR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x000</td>
<td>CNTCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.7.3 CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Configurations

The power domain of CNTCV is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.

Attributes

CNTCV is a 64-bit register.

Field descriptions

The CNTCV bit assignments are:

63 0

CountValue

CountValue, bits [63:0]

Indicates the counter value.

This field resets to an architecturally UNKNOWN value.

Accessing the CNTCV:

<table>
<thead>
<tr>
<th>Frame</th>
<th>Accessibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTControlBase</td>
<td>RW</td>
</tr>
<tr>
<td>CNTReadBase</td>
<td>RO</td>
</tr>
</tbody>
</table>

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.

- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV[63:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x008</td>
<td>CNTCV</td>
<td>63:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to CNTCV[63:0] are RW.
CNTCV[63:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTReadBase</td>
<td>0x000</td>
<td>CNTCV</td>
<td>63:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to CNTCV[63:0] are RO.
5.7.4 CNTELOACR, Counter-timer EL0 Access Control Register

The CNTELOACR characteristics are:

**Purpose**

An implementation of CNTELOACR in the frame at CNTBaseN controls whether the CNTPCT, CNTVCT, CNTFRQ, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTELOBaseN.

**Configurations**

The power domain of CNTELOACR is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-7327.

**Attributes**

CNTELOACR is a 32-bit register.

**Field descriptions**

The CNTELOACR bit assignments are:

```
|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  9 |  8 |  7 |  2 |  1 |  0 |
| RES0 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | RES0 |
|   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | EL0PCTEN |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | EL0VCTEN |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | EL0VTEN |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  | EL0PTEN |
```

**Bits [31:10]**

Reserved, RES0.

**EL0PTEN, bit [9]**

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the CNTP_CVAL, CNTP_TVAL, and CNTP_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTELOBaseN frame. The possible values of this bit are:

- 0b0: No access. Registers are RES0 in the second view.
- 0b1: Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

This field resets to an architecturally UNKNOWN value.

**EL0VTEN, bit [8]**

Second view read/write access control for the Virtual Timer registers. This bit controls whether the CNTV_CVAL, CNTV_TVAL, and CNTV_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTELOBaseN frame. The possible values of this bit are:

- 0b0: No access. Registers are RES0 in the second view.
- 0b1: Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.
The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

This field resets to an architecturally UNKNOWN value.

**Bits [7:2]**

Reserved, RES0.

**EL0VCTEN, bit [1]**

Second view read access control for CNTVCT and CNTFRQ. The possible values of this bit are:

- **0b0**: CNTVCT is not visible in the second view.
  
  If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.

- **0b1**: Access permitted. If CNTVCT and CNTFRQ are visible in the current frame then they are visible in the second view.

This field resets to an architecturally UNKNOWN value.

**EL0PCTEN, bit [0]**

Second view read access control for CNTPCT and CNTFRQ. The possible values of this bit are:

- **0b0**: CNTPCT is not visible in the second view.
  
  If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.

- **0b1**: Access permitted. If CNTPCT and CNTFRQ are visible in the current frame then they are visible in the second view.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTEL0ACR:**

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

*CNTCTRLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7335* describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.

  If the corresponding CNTEL0BaseN frame is implemented, the registers CNTFRQ, CNTP_CTL, CNTP_CVAL, CNTP_TVAL, CNTPCT, CNTV_CTL, CNTV_CVAL, CNTV_TVAL, and CNTVCT are not visible in that frame.

CNTEL0ACR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x014</td>
<td>CNTEL0ACR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.7.5 CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

**Purpose**
Indicates the base frequency of the system counter.

**Configurations**
The power domain of CNTFID0 is IMPLEMENTATION DEFINED.
For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.
The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see The Frequency modes table on page I2-7329.
The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.
Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.
If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

**Attributes**
CNTFID0 is a 32-bit register.

**Field descriptions**
The CNTFID0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td></td>
</tr>
</tbody>
</table>

**Frequency, bits [31:0]**
The base frequency of the system counter, in Hz.
This field resets to an architecturally UNKNOWN value.

**Accessing the CNTFID0:**
It is IMPLEMENTATION DEFINED whether this register is RO or RW
In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.
CNTFID0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020</td>
<td>CNTFID0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to this register are RO or RW.
I5.7.6 CNTFID<n>, Counter Frequency IDs, n > 0, n = 1 - 1003

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter update frequencies.

Configurations

The power domain of CNTFID<n> is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see The Frequency modes table on page I2-7329.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x0C0-0x0FC, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions

The CNTFID<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Frequency</td>
</tr>
</tbody>
</table>

Frequency, bits [31:0]

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

\[
\text{increment} = \left(\frac{\text{base frequency}}{\text{selected frequency}}\right)
\]

This field resets to an architecturally UNKNOWN value.

Accessing the CNTFID<n>:

It is IMPLEMENTATION DEFINED whether this register is RO or RW
In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

CNTFID<n> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020 + (4 * n)</td>
<td>CNTFID&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO or RW.
I5.7.7 CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

**Purpose**

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLB frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

**Configurations**

The power domain of CNTFRQ is IMPLEMENTATION DEFINED.

For more information see Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.

**Attributes**

CNTFRQ is a 32-bit register.

**Field descriptions**

The CNTFRQ bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:0]</th>
<th>Clock frequency</th>
</tr>
</thead>
</table>

Clock frequency. Indicates the system counter clock frequency, in Hz.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTFRQ:**

CNTFRQ must be implemented as an RW register in the CNTCTLB frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLB frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

CNTCTLB status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7335 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of CNTACR<n>.RFRQ is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
  - CNTFRQ is accessible in the corresponding CNTBaseN frame.
Either the value of `CNTEL0ACR.EL0VCTEN` is 1 or the value of `CNTEL0ACR.EL0PCTEN` is 1.

- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x010</td>
<td>CNTFRQ</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.

CNTFRQ can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x010</td>
<td>CNTFRQ</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.

CNTFRQ can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x000</td>
<td>CNTFRQ</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.7.8  CNTID, Counter Identification Register

The CNTID characteristics are:

Purpose

Indicates whether counter scaling is implemented.

Configurations

The power domain of CNTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

Attributes

CNTID is a 32-bit register.

Field descriptions

The CNTID bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>4</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>CNTSC</td>
</tr>
<tr>
<td>2</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>1</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RES0</td>
</tr>
</tbody>
</table>

Bits [31:4]

Reserved, RES0.

CNTSC, bits [3:0]

Indicates whether Counter Scaling is implemented

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0000</td>
<td>Counter scaling is not implemented.</td>
</tr>
<tr>
<td>0b0001</td>
<td>Counter scaling is implemented.</td>
</tr>
</tbody>
</table>

All other values are reserved.

Accessing the CNTID:

In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTID can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x1C</td>
<td>CNTID</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

* Accesses to this register are RO.
I5.7.9 CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

**Purpose**

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

**Configurations**

The power domain of CNTNSAR is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.

**Attributes**

CNTNSAR is a 32-bit register.

**Field descriptions**

The CNTNSAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:8]</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

**NS<n>, bit [n], for n = 0 to 7**

Non-secure access to frame n. The possible values of this bit are:

- 0b0 Secure access only. Behaves as RES0 to Non-secure accesses.
- 0b1 Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTNSAR:**

In a system that recognizes two Security states, this register is only accessible by Secure accesses.
CNTNSAR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x004</td>
<td>CNTNSAR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.7.10  CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose
Control register for the EL1 physical timer.

Configurations
The power domain of CNTP_CTL is IMPLEMENTATION DEFINED.
For more information, see Power and reset domains for the system level implementation of the
Generic Timer on page I2-7327.

Attributes
CNTP_CTL is a 32-bit register.

Field descriptions
The CNTP_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>3</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>2</td>
<td>IMASK</td>
</tr>
<tr>
<td>1</td>
<td>ENABLE</td>
</tr>
<tr>
<td>0</td>
<td>ENABLE</td>
</tr>
</tbody>
</table>

Bits [31:3]
Reserved, RES0.

ISTATUS, bit [2]
The status of the timer. This bit indicates whether the timer condition is met:
0b0 Timer condition is not met.
0b1 Timer condition is met.
When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met.
ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the
value of IMASK is 0 then the timer interrupt is asserted.
When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.
This bit is read-only.

IMASK, bit [1]
Timer interrupt mask bit. Permitted values are:
0b0 Timer interrupt is not masked by the IMASK bit.
0b1 Timer interrupt is masked by the IMASK bit.
For more information, see the description of the ISTATUS bit.
This field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]
Enables the timer. Permitted values are:
0b0 Timer disabled.
0b1 Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from 
CNTP_TV AL continues to count down.

--- Note ---
Disabling the output signal might be a power-saving option.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_CTL:**

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN 
frame.

**CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames**
on page I2-7335 describes 
the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

• Whether the CNTBaseN frame has virtual timer capability.
• Whether the corresponding CNTEL0BaseN frame is implemented.
• For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any 
corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

• CNTP_CTL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
• Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

• CNTP_CTL is accessible in that frame if both:
  — CNTP_CTL is accessible in the corresponding CNTBaseN frame:
  — The value of CNTEL0ACR.EL0PTEN is 1.
• Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x02C</td>
<td>CNTP_CTL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• Accesses to this register are RW.

CNTP_CTL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x02C</td>
<td>CNTP_CTL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• Accesses to this register are RW.
I5.7.11 CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

**Purpose**
Holds the 64-bit compare value for the EL1 physical timer.

**Configurations**
The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED.
For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I5-7327.

**Attributes**
CNTP_CVAL is a 64-bit register.

**Field descriptions**
The CNTP_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63:0</td>
<td>CompareValue</td>
</tr>
</tbody>
</table>

**CompareValue, bits [63:0]**
Holds the EL1 physical timer CompareValue.
When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.
When the timer condition is met:
• CNTP_CTL.ISTATUS is set to 1.
• An interrupt is generated if CNTP_CTL.IMASK is 0.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count. This field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_CVAL:**
CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I5-7335 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:
• Whether the CNTBaseN frame has virtual timer capability.
• Whether the corresponding CNTEL0BaseN frame is implemented.
• For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:
• CNTP_CVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
• Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.
For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
  - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.

- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x020</td>
<td>CNTP_CVAL</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to CNTP_CVAL[31:0] are RW.

CNTP_CVAL[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x020</td>
<td>CNTP_CVAL</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to CNTP_CVAL[31:0] are RW.

CNTP_CVAL[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x024</td>
<td>CNTP_CVAL</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to CNTP_CVAL[63:32] are RW.

CNTP_CVAL[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x024</td>
<td>CNTP_CVAL</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to CNTP_CVAL[63:32] are RW.
I5.7.12  CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer.

**Configurations**

The power domain of CNTP_TVAL is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.

**Attributes**

CNTP_TVAL is a 32-bit register.

**Field descriptions**

The CNTP_TVAL bit assignments are:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the EL1 physical timer.

On a read of this register:
- If **CNTP_CTL.ENABLE** is 0, the value returned is UNKNOWN.
- If **CNTP_CTL.ENABLE** is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When **CNTP_CTL.ENABLE** is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:
- **CNTP_CTL.ISTATUS** is set to 1.
- If **CNTP_CTL.IMASK** is 0, an interrupt is generated.

When **CNTP_CTL.ENABLE** is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTP_TVAL:**

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

*CNTCTLB* status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7335 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of CNTACR<\n>.RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
  - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

CNTP_TVAL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x828</td>
<td>CNTP_TVAL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.

CNTP_TVAL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x828</td>
<td>CNTP_TVAL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.7.13 CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

**Purpose**

Holds the 64-bit physical count value.

**Configurations**

The power domain of CNTPCT is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I5-7327.

**Attributes**

CNTPCT is a 64-bit register.

**Field descriptions**

The CNTPCT bit assignments are:

- **Bits [63:0]**
  
  Physical count value

**Accessing the CNTPCT:**

CNTPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I5-7335 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTPCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RPCT is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTPCT is accessible in that frame if both:
  - CNTPCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.
CNTPCT[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x000</td>
<td>CNTPCT</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to CNTPCT[31:0] are RO.

CNTPCT[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x000</td>
<td>CNTPCT</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to CNTPCT[31:0] are RO.

CNTPCT[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x004</td>
<td>CNTPCT</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to CNTPCT[63:32] are RO.
I5.7.14  CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

**Purpose**

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

**Configurations**

The power domain of CNTSCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-7327.

**Attributes**

CNTSCR is a 32-bit register.

**Field descriptions**

The CNTSCR bit assignments are:

```
  31 0
```

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScaleVal</td>
<td></td>
</tr>
</tbody>
</table>

**ScaleVal, bits [31:0]**

Scale Value

When counter scaling is enabled, ScaleVal is the amount added to the counter value for every counter tick.

Counter tick is defined as one period of the current operating frequency of the Generic counter.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTSCR:**

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSCR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x10</td>
<td>CNTSCR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.7.15 CNTSR, Counter Status Register

The CNTSR characteristics are:

Purpose

Provides counter frequency status information.

Configurations

The power domain of CNTSR is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.

Attributes

CNTSR is a 32-bit register.

Field descriptions

The CNTSR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>FCACK, Frequency change acknowledge. Indicates the currently selected entry in the Frequency modes table, see The Frequency modes table on page I2-7329. This field resets to 0.</td>
</tr>
<tr>
<td>8:7</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>2</td>
<td>DBGH, Indicates whether the counter is halted because the Hall-on-debug signal is asserted: 0: Counter is not halted. 1: Counter is halted. This field resets to an architecturally UNKNOWN value.</td>
</tr>
<tr>
<td>1</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>0</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

Accessing the CNTSR:

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x004</td>
<td>CNTSR</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

• Accesses to this register are RO.
I5.7.16 CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

**Purpose**

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

**Configurations**

The power domain of CNTTIDR is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-7327.

**Attributes**

CNTTIDR is a 32-bit register.

**Field descriptions**

The CNTTIDR bit assignments are:

Frame<n>, bits [4n+3:4n], for n = 0 to 7

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; does not have a second view. The CNTEL0ACR register in the first view of the frame is RES0</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; has a second view, CNTEL0Base&lt;n&gt;.</td>
</tr>
</tbody>
</table>

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF<n>.

The possible values of bit[1] are:

<table>
<thead>
<tr>
<th>Bit[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; does not have virtual capability. The virtual time and offset registers areRES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; has virtual capability. The virtual time and offset registers are implemented</td>
</tr>
</tbody>
</table>
If bit[0] is 0, bit[1] is RES0.

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Bit[0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b0</td>
<td>Frame&lt;n&gt; is not implemented. All registers associated with the frame are RES0.</td>
</tr>
<tr>
<td>0b1</td>
<td>Frame&lt;n&gt; is implemented</td>
</tr>
</tbody>
</table>

**Accessing the CNTTIDR:**

In a system that recognizes two Security states this register is accessible by both Secure and Non-secure accesses. CNTTIDR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x008</td>
<td>CNTTIDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.7.17 CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

**Purpose**
Control register for the virtual timer.

**Configurations**
The power domain of CNTV_CTL is IMPLEMENTATION DEFINED.
For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.

**Attributes**
CNTV_CTL is a 32-bit register.

**Field descriptions**
The CNTV_CTL bit assignments are:

31 3 2 1 0

RES0

- **Bits [31:3]**
  Reserved, RES0.

- **ISTATUS, bit [2]**
The status of the timer. This bit indicates whether the timer condition is met:
  0b0 Timer condition is not met.
  0b1 Timer condition is met.
When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.
When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.
This bit is read-only.

- **IMASK, bit [1]**
  Timer interrupt mask bit. Permitted values are:
  0b0 Timer interrupt is not masked by the IMASK bit.
  0b1 Timer interrupt is masked by the IMASK bit.
For more information, see the description of the ISTATUS bit.
This field resets to an architecturally UNKNOWN value.

- **ENABLE, bit [0]**
  Enables the timer. Permitted values are:
  0b0 Timer disabled.
  0b1 Timer enabled.
Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TV continues to count down.

**Note**
Disabling the output signal might be a power-saving option.

This field resets to an architecturally **UNKNOWN** value.

**Accessing the CNTV_CTL:**

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

_CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page 12-7335_ describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
  - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

CNTV_CTL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x03C</td>
<td>CNTV_CTL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.

CNTV_CTL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x03C</td>
<td>CNTV_CTL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.7.18 CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the virtual timer.

**Configurations**

The power domain of CNTV_CVAL is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I5-7327.

**Attributes**

CNTV_CVAL is a 64-bit register.

**Field descriptions**

The CNTV_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:0]</td>
<td>CompareValue</td>
</tr>
</tbody>
</table>

*CompareValue, bits [63:0]*

Holds the virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTV_CTL.IMASK is 0.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_CVAL:**

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

*CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames* on page I5-7335 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.
For an implemented CNTEL0BaseN frame:

- CNTV_CV AL is accessible in that frame if both:
  - CNTV_CV AL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.

- Otherwise, the CNTV_CV AL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CV AL register must be accessible as an atomic 64-bit value.

CNTV_CV AL[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN 0x030</td>
<td>CNTV_CVAL</td>
<td>31:0</td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to CNTV_CV AL[31:0] are RW.

CNTV_CV AL[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN 0x030</td>
<td>CNTV_CVAL</td>
<td>31:0</td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to CNTV_CV AL[31:0] are RW.

CNTV_CV AL[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN 0x034</td>
<td>CNTV_CVAL</td>
<td>63:32</td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to CNTV_CV AL[63:32] are RW.

CNTV_CV AL[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN 0x034</td>
<td>CNTV_CVAL</td>
<td>63:32</td>
<td></td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to CNTV_CV AL[63:32] are RW.
### I5.7.19 CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.

**Configurations**

The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED. For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I5-7327.

**Attributes**

CNTV_TVAL is a 32-bit register.

**Field descriptions**

The CNTV_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>TimerValue</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**TimerValue, bits [31:0]**

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CompareValue - CNTVCT).

On a write of this register, CompareValue is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

This field resets to an architecturally UNKNOWN value.

**Accessing the CNTV_TVAL:**

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame. *CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames* on page I5-7335 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TV AL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_TV AL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TV AL is accessible in that frame if both:
  - CNTV_TV AL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_TV AL address in that frame is RAZ/WI.

CNTV_TV AL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x038</td>
<td>CNTV_TV AL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.

CNTV_TV AL can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x038</td>
<td>CNTV_TV AL</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.7.20 CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

**Purpose**

Holds the 64-bit virtual count value.

**Configurations**

The power domain of CNTVCT is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer on page I2-7327*.

**Attributes**

CNTVCT is a 64-bit register.

**Field descriptions**

The CNTVCT bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual count value</th>
</tr>
</thead>
</table>

**Accessing the CNTVCT:**

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

*CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7335* describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVCT is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
  - CNTVCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0VCTEN is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.
CNTVCT[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x008</td>
<td>CNTVCT</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to CNTVCT[31:0] are RO.

CNTVCT[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x008</td>
<td>CNTVCT</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to CNTVCT[31:0] are RO.

CNTVCT[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x00C</td>
<td>CNTVCT</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to CNTVCT[63:32] are RO.
I5.7.21 CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

Purpose
Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

Configurations
The power domain of CNTVOFF is IMPLEMENTATION DEFINED.
For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.

Attributes
CNTVOFF is a 64-bit register.

Field descriptions
The CNTVOFF bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual offset</th>
</tr>
</thead>
</table>

This field resets to an architecturally UNKNOWN value.

Accessing the CNTVOFF:
CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability. CNTCTLBBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7335 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVOFF is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

Note
CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, a CNTVOFF{<n>} register must be accessible as an atomic 64-bit value.
CNTVOFF[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x018</td>
<td>31:0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• Accesses to CNTVOFF[31:0] are RO.

CNTVOFF[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x01C</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• Accesses to CNTVOFF[63:32] are RO.
### 5.7.22 CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

**Purpose**

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

**Configurations**

The power domain of CNTVOFF<n> is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page 12-7327.

**Attributes**

CNTVOFF<n> is a 64-bit register.

**Field descriptions**

The CNTVOFF<n> bit assignments are:

- **Bits [63:0]**
  - Virtual offset.
  - This field resets to an architecturally UNKNOWN value.

**Accessing the CNTVOFF<n>:**

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see *CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames* on page 12-7335.

Note

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using CNTVOFF.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

CNTVOFF<n>[31:0] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x080 + (8 * n)</td>
<td>31:0</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- Accesses to CNTVOFFₙ[31:0] are RW.

CNTVOFFₙ[63:32] can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x084 + (8 * n)</td>
<td>63:32</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to CNTVOFFₙ[63:32] are RW.
I5.7.23 CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

**Purpose**

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

**Configurations**

The power domain of CounterID<n> is IMPLEMENTATION DEFINED.

For more information, see Power and reset domains for the system level implementation of the Generic Timer on page I2-7327.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

**Attributes**

CounterID<n> is a 32-bit register.

**Field descriptions**

The CounterID<n> bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

**Accessing the CounterID<n>:**

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure memory maps the frame is implemented only in the Secure memory map, meaning these registers are implemented only in the Secure memory map.

For the CNTBaseN frames, CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7335 describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.
CounterID<\textit{n}> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0xFD0 + (4 * n)</td>
<td>CounterID&lt;\textit{n}&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to this register are RO.

CounterID<\textit{n}> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTReadBase</td>
<td>0xFD0 + (4 * n)</td>

</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to this register are RO.
I5.8 RAS register descriptions

This section describes the RAS registers.
### I5.8.1 ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see *About the Peripheral identification scheme on page K2-7999*. 

**Configurations**

Implementation of this register is OPTIONAL.

ERRCIDR0 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCIDR0 is a 32-bit register.

**Field descriptions**

The ERRCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>8-7</td>
<td>PRMBL_0</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Component identification preamble, segment 0.

Reads as 0x0D.

**Accessing the ERRCIDR0:**

ERRCIDR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFFF0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.8.2 ERRCIDR1, Component Identification Register 1

The ERRCIDR1 characteristics are:

**Purpose**

Provides discovery information about the component.

For more information, see About the Peripheral identification scheme on page K2-7999.

**Configurations**

Implementation of this register is OPTIONAL.

ERRCIDR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCIDR1 is a 32-bit register.

**Field descriptions**

The ERRCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8-7</td>
<td>CLASS</td>
</tr>
<tr>
<td>4-3</td>
<td>ATTRIBUTES</td>
</tr>
<tr>
<td>0-0</td>
<td>PRMBL_1</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class.

- 0b1111 Generic peripheral with IMPLEMENTATION DEFINED register layout.
- Other values are defined by the CoreSight Architecture.
- This field reads as 0xF.

**PRMBL_1, bits [3:0]**

Component identification preamble, segment 1.

Reads as 0b0000.

**Accessing the ERRCIDR1:**

ERRCIDR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFF4</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.8.3 ERRCIDR2, Component Identification Register 2

The ERRCIDR2 characteristics are:

Purpose
Provides discovery information about the component.
For more information, see About the Peripheral identification scheme on page K2-7999.

Configurations
Implementation of this register is OPTIONAL.
ERRCIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes
ERRCIDR2 is a 32-bit register.

Field descriptions
The ERRCIDR2 bit assignments are:

<p>| | | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>8</td>
<td>7</td>
<td>0</td>

</tr>
<tr>
<td>RES0</td>
<td>PRMBL_2</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]
Reserved, RES0.

PRMBL_2, bits [7:0]
Component identification preamble, segment 2.
Reads as 0x05.

Accessing the ERRCIDR2:
ERRCIDR2 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFF8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.8.4  ERRCIDR3, Component Identification Register 3

The ERRCIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see About the Peripheral identification scheme on page K2-7999.

Configurations

Implementation of this register is OPTIONAL.

ERRCIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR3 is a 32-bit register.

Field descriptions

The ERRCIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>8-7</td>
<td>Component identification preamble, segment 3. Reads as 0xB1.</td>
</tr>
</tbody>
</table>

Accessing the ERRCIDR3:

ERRCIDR3 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFFC</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.8.5  ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

Purpose
Critical Error Interrupt configuration register.

Configurations
This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

ERRCRICR0 is implemented only as part of a memory-mapped group of error records.

Attributes
ERRCRICR0 is a 64-bit register.

Field descriptions
The ERRCRICR0 bit assignments are:

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>63</th>
<th>56-55</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ADDR</td>
<td>RES0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:56]
Reserved, RES0.

ADDR, bits [55:2]
Message Signaled Interrupt address. (ERRCRICR0.ADDR << 2) is the address that the component writes to when signaling the Critical Error Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED.

Unimplemented high-order physical address bits are RES0.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]
Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [63:0]
IMPLEMENTATION DEFINED.
Accessing the ERRCRICR0:

ERRCRICR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEA0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

**Purpose**

Critical Error Interrupt configuration register.

**Configurations**

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<\n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR1 are RES0.

ERRCRICR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRCRICR1 is a 32-bit register.

**Field descriptions**

The ERRCRICR1 bit assignments are:

*When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<\n> registers:*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>DATA</td>
</tr>
</tbody>
</table>

DATA, bits [31:0]

Payload for the message signaled interrupt.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

*When the implementation does not use the recommended layout for the ERRIRQCR<\n> registers:*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

**Accessing the ERRCRICR1:**

ERRCRICR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEA8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
## I5.8.7 ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

### Purpose

Critical Error Interrupt control and configuration register.

### Configurations

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.

ERRCRICR2 is implemented only as part of a memory-mapped group of error records.

### Attributes

ERRCRICR2 is a 32-bit register.

### Field descriptions

The ERRCRICR2 bit assignments are:

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>29</th>
<th>28</th>
<th>27</th>
<th>8</th>
<th>7</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
<td>RES0</td>
<td>RES0</td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Bits [31:8]

Reserved, RES0.

#### Bit [7]

When the component does not support disabling message signaled interrupts:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

Otherwise:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

- 0b0: Disabled.
- 0b1: Enabled.

On an Error recovery reset, this field resets to 0.

On a Cold reset, this field resets to 0.

#### Bit [6]

When the component allows Non-secure writes to ERRCRICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.
When the component does not support configuring the Security attribute for message signaled interrupts:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts. The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Security attribute. Defines the physical address space for message signaled interrupts.

0b0 Secure.

0b1 Non-secure.

On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [5:4]

When the component does not support configuring the Shareability domain:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Shareability. Defines the Shareability domain for message signaled interrupts.

0b00 Not shared.

0b10 Outer Shareable.

0b11 Inner Shareable.

All other values are reserved.

This field is ignored when ERRCRJCR2.MemAttr specifies any of the following memory types:

• Any Device memory type.

• Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

When the component does not support configuring the memory type:

Reserved, RES0.

Memory type.

The component does not support configuring the memory type, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Memory type. Defines the memory type and attributes for message signaled interrupts.

0b0000 Device-nGnRnE memory.

0b0001 Device-nGnRE memory.

0b0010 Device-nGRE memory.

0b0011 Device-GRE memory.

0b0100 Normal memory, Inner Non-cacheable, Outer Non-cacheable.

0b0110 Normal memory, Inner Write-Through, Outer Non-cacheable.

0b0111 Normal memory, Inner Write-Back, Outer Non-cacheable.
I5.8 RAS register descriptions

All other values are reserved.

Note

This is the same format as the VMSA v8-64 stage 2 memory region attributes.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<\text{n}> registers:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xEAC</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
## I5.8.8 ERRDEVAFF, Device Affinity Register

The ERRDEVAFF characteristics are:

### Purpose

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of MPIDR_EL1 or part of MPIDR_EL1:

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as MPIDR_EL1, and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of MPIDR_EL1, and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in MPIDR_EL1.{Aff3,Aff2}, and these values are equal to ERRDEVAFF.{Aff3,Aff2}.
- ERRDEVAFF.Aff1 is nonzero and not 0x80, and ERRDEVAFF.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is 0b100, then the group of error records has affinity with the up-to 8 PEs that have MPIDR_EL1.Aff1[7:3] == ERRDEVAFF.Aff1[7:3].

If RAS System Architecture v1.1 is not implemented, ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

### Configurations

This register is present only when the group of error records has affinity with a PE or cluster of PEs. Otherwise, direct accesses to ERRDEVAFF are RES0.

ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

### Attributes

ERRDEVAFF is a 64-bit register.

### Field descriptions

The ERRDEVAFF bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>63:40</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>Aff3</td>
<td>39:32</td>
<td>PE affinity level 3. The MPIDR_EL1.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.</td>
</tr>
<tr>
<td>F0V</td>
<td>31</td>
<td>Indicates that the ERRDEVAFF.Aff0 field is valid. 0b0 ERRDEVAFF.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.</td>
</tr>
</tbody>
</table>

| Aff0  | 30   | |
| Aff2  | 29   | |
| Aff1  | 28   | |
| Aff0  | 8-7  | |
| MT    |      | |
U, bit [30]

When ERRDEV AFF.F0V == 1:

Uniprocessor. The MPIDR_EL1.U bit, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

When ERRDEV AFF.F0V == 1:

Multithreaded. The MPIDR_EL1.MT bit, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]

When affine with a PE or PEs at affinity level 2 or below:

PE affinity level 2. The MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 2:

PE affinity level 2. Defines part of the MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PEs.

0bxxxxxxx1 ERRDEV AFF.Aff2[7:1] is the value of MPIDR_EL1.Aff2[7:1], viewed from the highest Exception level of the associated PEs.

0bxxxxxx10 ERRDEV AFF.Aff2[7:2] is the value of MPIDR_EL1.Aff2[7:2], viewed from the highest Exception level of the associated PEs.

0bxxxxx100 ERRDEV AFF.Aff2[7:3] is the value of MPIDR_EL1.Aff2[7:3], viewed from the highest Exception level of the associated PEs.

0bxxxx1000 ERRDEV AFF.Aff2[7:4] is the value of MPIDR_EL1.Aff2[7:4], viewed from the highest Exception level of the associated PEs.

0bxxx10000 ERRDEV AFF.Aff2[7:5] is the value of MPIDR_EL1.Aff2[7:5], viewed from the highest Exception level of the associated PEs.

0bxx100000 ERRDEV AFF.Aff2[7:6] is the value of MPIDR_EL1.Aff2[7:6], viewed from the highest Exception level of the associated PEs.

0bx1000000 ERRDEV AFF.Aff2[7] is the value of MPIDR_EL1.Aff2[7], viewed from the highest Exception level of the associated PEs.

Otherwise:

PE affinity level 2. Indicates whether the PE affinity is at level 3.

0x80 PE affinity is at level 3.

All other values are reserved.

Aff1, bits [15:8]

When affine with a PE or PEs at affinity level 1 or below:

PE affinity level 1. The MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PE or PEs.
When affine with a sub-set of PEs at affinity level 1:

PE affinity level 1. Defines part of the MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PEs.

0bxxxxxx01 ERRDEVAFF.Aff1[7:1] is the value of MPIDR_EL1.Aff1[7:1], viewed from the highest Exception level of the associated PEs.

0bxxxxxx10 ERRDEVAFF.Aff1[7:2] is the value of MPIDR_EL1.Aff1[7:2], viewed from the highest Exception level of the associated PEs.

0bxxxx1000 ERRDEVAFF.Aff1[7:3] is the value of MPIDR_EL1.Aff1[7:3], viewed from the highest Exception level of the associated PEs.

0bxx100000 ERRDEVAFF.Aff1[7:4] is the value of MPIDR_EL1.Aff1[7:4], viewed from the highest Exception level of the associated PEs.

0bxx000000 ERRDEVAFF.Aff1[7:5] is the value of MPIDR_EL1.Aff1[7:5], viewed from the highest Exception level of the associated PEs.

0bx1000000 ERRDEVAFF.Aff1[7] is the value of MPIDR_EL1.Aff1[7], viewed from the highest Exception level of the associated PEs.

Otherwise:

PE affinity level 1. Indicates whether the PE affinity is at level 2.

0x0 PE affinity is above level 2 or a subset of level 2.

0x80 PE affinity is at level 2.

Aff0, bits [7:0]

When affine with a PE at affinity level 0:

PE affinity level 0. The MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PE.

When affine with a sub-set of PEs at affinity level 0:

PE affinity level 0. Defines part of the MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PEs.

0bxxxxxx01 ERRDEVAFF.Aff0[7:1] is the value of MPIDR_EL1.Aff0[7:1], viewed from the highest Exception level of the associated PEs.

0bxxxxxx10 ERRDEVAFF.Aff0[7:2] is the value of MPIDR_EL1.Aff0[7:2], viewed from the highest Exception level of the associated PEs.

0bxxxx1000 ERRDEVAFF.Aff0[7:3] is the value of MPIDR_EL1.Aff0[7:3], viewed from the highest Exception level of the associated PEs.

0bxx100000 ERRDEVAFF.Aff0[7:4] is the value of MPIDR_EL1.Aff0[7:4], viewed from the highest Exception level of the associated PEs.

0bxx000000 ERRDEVAFF.Aff0[7:5] is the value of MPIDR_EL1.Aff0[7:5], viewed from the highest Exception level of the associated PEs.

0bx1000000 ERRDEVAFF.Aff0[7] is the value of MPIDR_EL1.Aff0[7], viewed from the highest Exception level of the associated PEs.

Otherwise:

PE affinity level 0. Indicates whether the PE affinity is at level 1.

0x0 PE affinity is above level 1 or a subset of level 1.

0x80 PE affinity is at level 1.
Accessing the ERRDEVAFF:

ERRDEVAFF can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFA8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.8.9 ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

Purpose
Provides discovery information for the component.

Configurations
ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

Attributes
ERRDEVARCH is a 32-bit register.

Field descriptions
The ERRDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Bits</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHITECT</td>
<td>[31:21]</td>
<td>Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code. 0b01000111011 JEP106 continuation code 0x4, ID code 0x3B. Arm Limited. Other values are defined by the JEDEC JEP106 standard. This field reads as 0x23B.</td>
</tr>
<tr>
<td>PRESENT</td>
<td>[20]</td>
<td>DEV ARCH Present. Defines that the DEV ARCH register is present. 0b0 Device Architecture information not present. 0b1 Device Architecture information present. This bit reads as 0b1.</td>
</tr>
<tr>
<td>REVISION</td>
<td>[19:16]</td>
<td>Revision. Defines the architecture revision of the component. 0b0000 RAS System Architecture v1.0. 0b0001 RAS System Architecture v1.1. As 0b0000 and also:  • Simplifies ERR&lt;n&gt;STATUS.  • Adds support for additional ERR&lt;n&gt;MISC&lt;m&gt; registers.  • Adds support for the optional RAS Timestamp Extension.  • Adds support for the optional RAS Common Fault Injection Model Extension. All other values are reserved.</td>
</tr>
<tr>
<td>ARCHVER</td>
<td>[15:12]</td>
<td>Architecture Version. Defines the architecture version of the component. 0b0000 RAS System Architecture v1. All other values are reserved.</td>
</tr>
</tbody>
</table>
ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].
This field reads as 0b0000.

ARCHPART, bits [11:0]
Architecture Part. Defines the architecture of the component.
0xA00 RAS System Architecture.
ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].
This field reads as 0xA00.

Accessing the ERRDEVARCH:
ERRDEVARCH can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFBC</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
• Accesses to this register are RO.
I5.8.10 ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

**Purpose**

Provides discovery information for the component.

**Configurations**

ERRDEVID is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRDEVID is a 32-bit register.

**Field descriptions**

The ERRDEVID bit assignments are:

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>16</td>
<td>15</td>
<td>0</td>
</tr>
<tr>
<td>RES0</td>
<td>NUM</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:16]**

Reserved, RES0.

**NUM, bits [15:0]**

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

This field reads as an IMPLEMENTATION DEFINED value.

**Accessing the ERRDEVID:**

ERRDEVID can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xFC8</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

• Accesses to this register are RO.
I5.8.11 ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configurations

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR0 are RES0.

ERRERICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR0 is a 64-bit register.

Field descriptions

The ERRERICR0 bit assignments are:

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>63</th>
<th>56</th>
<th>55</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ADDR</td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRERICR0.ADDR << 2) is the address that the component writes to when signaling the Error Recovery Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED.

Unimplemented high-order physical address bits are RES0.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

<table>
<thead>
<tr>
<th>63</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPLEMENTATION DEFINED</td>
<td></td>
</tr>
</tbody>
</table>

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.
### Accessing the ERRERICR0:

ERRERICR0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE90</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.8.12 ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

**Purpose**

Error Recovery Interrupt configuration register.

**Configurations**

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

ERRERICR1 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRERICR1 is a 32-bit register.

**Field descriptions**

The ERRERICR1 bit assignments are:

*When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>DATA</td>
</tr>
</tbody>
</table>

*DATA, bits [31:0]*

Payload for the message signaled interrupt.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

*When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-0</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
</tbody>
</table>

*IMPLEMENTATION DEFINED, bits [31:0]*

IMPLEMENTATION DEFINED.

**Accessing the ERRERICR1:**

ERRERICR1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE98</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- Accesses to this register are RW.
I5.8.13 ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

**Purpose**

Error Recovery Interrupt control and configuration register.

**Configurations**

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

ERRERICR2 is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRERICR2 is a 32-bit register.

**Field descriptions**

The ERRERICR2 bit assignments are:

*When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:*

```
+----------+----------+----------+----------+----------+----------+----------+----------+
| 31       | 30       | 29       | 28       | 27       | 26       | 25       | 24       |
|          |          | 7        | 6        | 5        | 4        | 3        | 2        |
| RESERVED | RESERVED | RESERVED | MESSAGE  | MESSAGE  | MESSAGE  | MESSAGE  | MESSAGE  |
|          |          |          | 0        | 1        | 0        | 1        | 0        |
| 0        | 1        | 0        | 1        | 0        | 1        | 0        | 1        |
```

**Bits [31:8]**

Reserved, RES0.

**Bit [7]**

*When the component does not support disabling message signaled interrupts:*

Reserved, RES0.

Message signaled interrupt enable. Message signaled interrupts are always enabled.

**Otherwise:**

Message signaled interrupt enable. Enables generation of message signaled interrupts.

0b0 Disabled.

0b1 Enabled.

On an Error recovery reset, this field resets to 0.

On a Cold reset, this field resets to 0.

**Bit [6]**

*When the component allows Non-secure writes to ERRERICR2:*

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.
When the component does not support configuring the Security attribute for message signaled interrupts:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts. The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Security attribute. Defines the physical address space for message signaled interrupts.

0b0  Secure.

0b1  Non-secure.

On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [5:4]

When the component does not support configuring the Shareability domain:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Shareability. Defines the Shareability domain for message signaled interrupts.

0b00  Not shared.

0b10  Outer Shareable.

0b11  Inner Shareable.

All other values are reserved.

This field is ignored when ERRERICR2.MemAttr specifies any of the following memory types:

• Any Device memory type.

• Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

When the component does not support configuring the memory type:

Reserved, RES0.

Memory type.

The component does not support configuring the memory type, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Memory type. Defines the memory type and attributes for message signaled interrupts.

0b0000  Device-nGnRnE memory.

0b0001  Device-nGnRE memory.

0b0010  Device-GRE memory.

0b0011  Normal memory, Inner Non-cacheable, Outer Non-cacheable.

0b0100  Normal memory, Inner Write-Through, Outer Non-cacheable.

0b0111  Normal memory, Inner Write-Back, Outer Non-cacheable.
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0b1001</td>

</table>

*When the component does not support disabling message signaled interrupts:*

Reserved, RES0.

*Otherwise:*

Reserved, RES0.

*When the component allows Non-secure writes to ERRFHICR2:*

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts. The Security attribute used for message signaled interrupts is Non-secure.
When the component does not support configuring the Security attribute for message signaled interrupts:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts. The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Security attribute. Defines the physical address space for message signaled interrupts.

- **0b0**: Secure.
- **0b1**: Non-secure.

On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.
On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

**Bits [5:4]**

When the component does not support configuring the Shareability domain:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Shareability. Defines the Shareability domain for message signaled interrupts.

- **0b00**: Not shared.
- **0b10**: Outer Shareable.
- **0b11**: Inner Shareable.

All other values are reserved.

This field is ignored when ERRFHICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [3:0]**

When the component does not support configuring the memory type:

Reserved, RES0.

Memory type.

The component does not support configuring the memory type, meaning the memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

Otherwise:

Memory type. Defines the memory type and attributes for message signaled interrupts.

- **0b0000**: Device-nGnRnE memory.
- **0b0001**: Device-nGnRE memory.
- **0b0010**: Device-nGRE memory.
- **0b0011**: Device-GRE memory.
- **0b0101**: Normal memory, Inner Non-cacheable, Outer Non-cacheable.

This interface is accessible as follows:

- Accesses to this register are RW.
I5.8.17 ERRGSR, Error Group Status Register

The ERRGSR characteristics are:

**Purpose**

Shows the status for the records in the group.

**Configurations**

ERRGSR is implemented only as part of a memory-mapped group of error records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

**Attributes**

ERRGSR is a 64-bit register.

**Field descriptions**

The ERRGSR bit assignments are:

| Bits [63:56] | Reserved, RES0. |
| S<m>, bit [m], for m = 0 to 55 |

*When error record <m> is implemented and error record <m> supports this type of reporting:*

The status for error record <m>. A read-only copy of ERR<n>STATUS.V.

- **0b0** No error.
- **0b1** One or more errors.

If the Common Fault Injection Model is implemented, up-to 24 records can be implemented meaning bits [55:24] are RES0.

*Otherwise:*

Reserved, RES0.

**Accessing the ERRGSR:**

ERRGSR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0xE00</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RO.
I5.8.18 ERRIIDR, Implementation Identification Register

The ERRIIDR characteristics are:

**Purpose**

Defines the implementer of the component.

**Configurations**

Implementation of this register is OPTIONAL.

This register is present only when RAS System Architecture v1.1 is implemented.

**Attributes**

ERRIIDR is a 32-bit register.

**Field descriptions**

The ERRIIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>

</table>

**ProductID, bits [31:20]**

Part number, bits [11:0]. The part number is selected by the designer of the component.

If ERRPIDR0 and ERRPIDR1 are implemented, ERRPIDR0.PART_0 matches bits [7:0] of ERRIIDR.ProductID and ERRPIDR1.PART_1 matches bits [11:8] of ERRIIDR.ProductID.

**Variant, bits [19:16]**

Component major revision.

This field distinguishes product variants or major revisions of the product.

If ERRPIDR2 is implemented, ERRPIDR2.REVISION matches ERRIIDR.Variant.

**Revision, bits [15:12]**

Component minor revision.

This field distinguishes minor revisions of the product.

If ERRPIDR3 is implemented, ERRPIDR3.REVAND matches ERRIIDR.Revision.

**Implementer, bits [11:0]**

Contains the JEP106 code of the company that implemented the RAS component. For an Arm implementation, this field has the value 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer, and bits [6:0] contain the JEP106 identity code of the implementer. Bit 7 is RES0.

If ERRPIDR4 is implemented, ERRPIDR2 is implemented, and ERRPIDR1 is implemented, ERRPIDR4.DES_2 matches bits [11:8] of ERRIIDR.Implementer, ERRPIDR2.DES_1 matches bits [6:4] of ERRIIDR.Implementer, and ERRPIDR1.DES_0 matches bits [3:0] of ERRIIDR.Implementer.
Accessing the ERRIIDR:

ERRIIDR can be accessed through its memory-mapped interface:

### I5.8.19 ERRIMPDEF<n>, IMPLEMENTATION DEFINED Register <n>, n = 0 - 191

The ERRIMPDEF<n> characteristics are:

**Purpose**

IMPLEMENTATION DEFINED RAS extensions.

**Configurations**

This register is present only when the RAS Common Fault Injection Model Extension is not implemented, ERRDEVID.NUM <= 32 and an implementation implements ERRIMPDEF<n>. Otherwise, direct accesses to ERRIMPDEF<n> are RES0.

**Attributes**

ERRIMPDEF<n> is a 64-bit register.

**Field descriptions**

The ERRIMPDEF<n> bit assignments are:

```
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED.

</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.8.20 ERRIRQCR<n>, Generic Error Interrupt Configuration Register, n = 0 - 15

The ERRIRQCR<n> characteristics are:

**Purpose**

The ERRIRQCR<n> registers are reserved for IMPLEMENTATION DEFINED interrupt configuration registers. The architecture provides a recommended layout for the ERRIRQCR<n> registers. These registers are named:

- ERRFHICR0, ERRFHICR1, and ERRFHICR2 for the fault handling interrupt controls.
- ERRERICR0, ERRERICR1, and ERRERICR2 for the error recovery interrupt controls.
- ERRCRICR0, ERRCRICR1, and ERRCRICR2 for the critical error interrupt controls.
- ERRIRQSR for the status register.

This section describes the generic, IMPLEMENTATION DEFINED, format.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

This register is present only when the interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQCR<n> are RES0.

ERRIRQCR<n> is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRIRQCR<n> is a 64-bit register.

**Field descriptions**

The ERRIRQCR<n> bit assignments are:

![Bitmap](https://example.com/image)

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED controls. The content of these registers is IMPLEMENTATION DEFINED.

**Accessing the ERRIRQCR<n>**:

ERRIRQCR<n> can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>@xE00 + (8 * n)</td>
<td>ERRIRQCR&lt;n&gt;</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.8.21 ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

**Purpose**

Interrupt status register.

**Configurations**

This register is present only when interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQSR are RES0.

ERRIRQSR is implemented only as part of a memory-mapped group of error records.

**Attributes**

ERRIRQSR is a 64-bit register.

**Field descriptions**

The ERRIRQSR bit assignments are:

*When the implementation uses the recommended layout for the ERRIRQCR<n> registers:*

<table>
<thead>
<tr>
<th>Bit</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>6</td>
<td>FHIERR</td>
</tr>
<tr>
<td>5</td>
<td>ERERR</td>
</tr>
<tr>
<td>4</td>
<td>ERI</td>
</tr>
<tr>
<td>3</td>
<td>CRIERR</td>
</tr>
<tr>
<td>2</td>
<td>CRI</td>
</tr>
<tr>
<td>1</td>
<td>FHI</td>
</tr>
<tr>
<td>0</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [63:6]**

Reserved, RES0.

**CRIERR, bit [5]**

*When the Critical Error Interrupt is implemented:*

Critical Error Interrupt error.

- 0: Critical Error Interrupt write has not returned an error since this bit was last cleared to zero.
- 1: Critical Error Interrupt write has returned an error since this bit was last cleared to zero.

This bit is read/write-one-to-clear.

On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**CRI, bit [4]**

*When the Critical Error Interrupt is implemented:*

Critical Error Interrupt write in progress.

- 0: Critical Error Interrupt write not in progress.
- 1: Critical Error Interrupt write in progress.
Software must not disable an interrupt whilst the write is in progress.

Note
This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.
To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is RO.

Otherwise:
Reserved, RES0.

ERIERR, bit [3]
When the Error Recovery Interrupt is implemented:
Error Recovery Interrupt error.
\[0\]  Error Recovery Interrupt write has not returned an error since this bit was last cleared to zero.
\[1\]  Error Recovery Interrupt write has returned an error since this bit was last cleared to zero.

This bit is read/write-one-to-clear.
On an Error recovery reset, this field resets to an architecturally UNKNOWN value.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

ERI, bit [2]
When the Error Recovery Interrupt is implemented:
Error Recovery Interrupt write in progress.
\[0\]  Error Recovery Interrupt write not in progress.
\[1\]  Error Recovery Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note
This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.
To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is RO.

Otherwise:
Reserved, RES0.

FHIERR, bit [1]
When the Fault Handling Interrupt is implemented:
Fault Handling Interrupt error.
\[0\]  Fault Handling Interrupt write has not returned an error since this bit was last cleared to zero.
\[1\]  Fault Handling Interrupt write has returned an error since this bit was last cleared to zero.

This bit is read/write-one-to-clear.
On an Error recovery reset, this field resets to an architecturally UNKNOWN value.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**FHI, bit [0]**

*When the Fault Handling Interrupt is implemented:*
Fault Handling Interrupt write in progress.

- 0b0 Fault Handling Interrupt write not in progress.
- 0b1 Fault Handling Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

--- **Note**
This bit does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<i>STATUS registers.

---
Access to this field is RO.

**Otherwise:**
Reserved, RES0.

*When the implementation does not use the recommended layout for the ERRIRQCR<i> registers:*

### RAS register descriptions

#### I5.8.22  ERR<\text{n}>ADDR, Error Record Address Register, \text{n} = 0 - 65534

The ERR<\text{n}>ADDR characteristics are:

**Purpose**

If an address is associated with a detected error, then it is written to ERR<\text{n}>ADDR when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

**Configurations**

This register is present only when error record \text{n} is implemented and error record \text{n} includes an address associated with an error. Otherwise, direct accesses to ERR<\text{n}>ADDR are RES0. ERR<\text{n}>FR describes the features implemented by the node that owns error record \text{n}. \text{q} is the index of the first error record owned by the same node as error record \text{n}. If the node owns a single record, then \text{q} = \text{n}.

**Attributes**

ERR<\text{n}>ADDR is a 64-bit register.

**Field descriptions**

The ERR<\text{n}>ADDR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Value</th>
<th>Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Non-secure attribute.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>62</td>
<td>Secure Incorrect. Indicates whether the NS bit is valid.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>61</td>
<td>Address Incorrect. Indicates whether the PADDR field is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>60</td>
<td>RES0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>59</td>
<td>PADDR</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>55</td>
<td>SI, bit [62]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>63  62</td>
<td>NS, bit [63]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>56  55</td>
<td>AI, bit [61]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>0</td>
<td>VA</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**NS, bit [63]**
Non-secure attribute.
- \text{0b0} The address is Secure.
- \text{0b1} The address is Non-secure.
On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**SI, bit [62]**
Secure Incorrect. Indicates whether the NS bit is valid.
- \text{0b0} The NS bit is correct. That is, it matches the programmers' view of the Non-secure attribute for this recorded location.
- \text{0b1} The NS bit might not be correct, and might not match the programmers' view of the Non-secure attribute for the recorded location.
It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.
On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**AI, bit [61]**
Address Incorrect. Indicates whether the PADDR field is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.
- \text{0b0} The PADDR field is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location.
The PADDR field might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location.

It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**VA, bit [60]**

Virtual Address. Indicates whether the PADDR field is a virtual address.

0b0  The PADDR field is not a virtual address.

0b1  The PADDR field is a virtual address.

No context information is provided for the virtual address. When ERR<n>ADDR.VA == 0b1, ERR<n>ADDR.{NS,SLAI} read as \{0,1,1\}.

Support for this bit is optional. If this bit is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS,SLAI} read as \{0,1,1\}.

It is IMPLEMENTATION DEFINED whether this bit is read-only or read/write.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [59:56]**

Reserved, RES0.

**PADDR, bits [55:0]**

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERR<n>ADDR:**

ERR<n>ADDR ignores writes if all of the following are true:

- Any of the following are true:
  - The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and ERR<n>PFGF.AV == 0b0.
  - The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
- ERR<n>STATUS.AV == 0b1.

ERR<n>ADDR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x018 + (64 * n)</td>
<td>ERR&lt;n&gt;ADDR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.8.23 ERR<\text{n}>CTLR, Error Record Control Register, n = 0 - 65534

The ERR<\text{n}>CTLR characteristics are:

**Purpose**

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for Uncorrected errors.

For each bit, if the selected node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

**Configurations**

This register is present only when error record <\text{n}> is implemented and error record <\text{n}> is the first error record owned by a node. Otherwise, direct accesses to ERR<\text{n}>CTLR are RES0. ERR<\text{n}>FR describes the features implemented by the node.

**Attributes**

ERR<\text{n}>CTLR is a 64-bit register.

**Field descriptions**

The ERR<\text{n}>CTLR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>IMPLEMENTATION DEFINED</td>
</tr>
<tr>
<td>32-31</td>
<td>RES0</td>
</tr>
<tr>
<td>14-10</td>
<td>CI</td>
</tr>
<tr>
<td>9-5</td>
<td>ED</td>
</tr>
<tr>
<td>4-0</td>
<td>FI, UI</td>
</tr>
</tbody>
</table>

**IMPLEMENTATION DEFINED, bits [63:32]**

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

**Bits [31:14]**

Reserved, RES0.

**CI, bit [13]**

*When ERR<\text{n}>FR.CI == 0b10:*

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

- 0b0 Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.
- 0b1 Critical error interrupt generated for critical errors.
On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**Bit [12]**
Reserved, RES0.

**WDUI, bit [11]**

*When ERR<n>FR.DUI == 0b11:*

Error recovery interrupt for deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for detected Deferred errors on writes.
0b0  Error recovery interrupt not generated for deferred errors on writes.
0b1  Error recovery interrupt generated for deferred errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.

**DUI, bit [10]**

*When ERR<n>FR.DUI == 0b10:*

Error recovery interrupt for deferred errors enable.

When ERR<n>FR.DUI == 0b10, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all detected Deferred errors.
0b0  Error recovery interrupt not generated for deferred errors.
0b1  Error recovery interrupt generated for deferred errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

*When ERR<n>FR.DUI == 0b11:*

Error recovery interrupt for deferred errors on reads enable.

When ERR<n>FR.DUI == 0b11, this bit is named RDUI.

When enabled, the error recovery interrupt is generated for detected Deferred errors on reads.
0b0  Error recovery interrupt not generated for deferred errors on reads.
0b1  Error recovery interrupt generated for deferred errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**
Reserved, RES0.
WCFI, bit [9]

*When ERR<\(n\)>FR.CFI == 0b11:*

Fault handling interrupt for Corrected errors on writes enable.

When enabled:
- If the node implements Corrected error counters for writes, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 0b1. For more information, see ERR<\(n\)>MISC0.
- Otherwise, the fault handling interrupt is also generated for detected Corrected errors on writes.

0b0 Fault handling interrupt not generated for Corrected errors on writes.
0b1 Fault handling interrupt generated for Corrected errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

*Otherwise:*

Reserved, RES0.

CFI, bit [8]

*When ERR<\(n\)>FR.CFI == 0b10:*

Fault handling interrupt for Corrected errors enable.

When ERR<\(n\)>FR.CFI == 0b10, this control applies to errors arising from both reads and writes.

When enabled:
- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 0b1. For more information, see ERR<\(n\)>MISC0.
- Otherwise, the fault handling interrupt is also generated for all detected Corrected errors.

0b0 Fault handling interrupt not generated for Corrected errors.
0b1 Fault handling interrupt generated for Corrected errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

*When ERR<\(n\)>FR.CFI == 0b11:*

Fault handling interrupt for Corrected errors on reads enable.

When ERR<\(n\)>FR.CFI == 0b11, this bit is named RCFI.

When enabled:
- If the node implements Corrected error counters for reads, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 0b1. For more information, see ERR<\(n\)>MISC0.
- Otherwise, the fault handling interrupt is also generated for detected Corrected errors on reads.

0b0 Fault handling interrupt not generated for Corrected errors on reads.
0b1 Fault handling interrupt generated for Corrected errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**WUE, bit [7]**

When ERR<n>FR.UE == 0b11:

In-band Uncorrected error reporting on writes enable.

- When enabled, responses to writes that detect an Uncorrected error that cannot be deferred are signaled in-band as a detected Uncorrected error (External Abort).
  - 0b0: External Abort response for Uncorrected errors on writes disabled.
  - 0b1: External Abort response for Uncorrected errors on writes enabled.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**WFI, bit [6]**

When ERR<n>FR.FI == 0b11:

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for detected Deferred errors and Uncorrected errors.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters for writes, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 0b1.
  - Otherwise, the fault handling interrupt is also generated for detected Corrected errors on writes.

- 0b0: Fault handling interrupt on writes disabled.
- 0b1: Fault handling interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Otherwise:**

Reserved, RES0.

**WUI, bit [5]**

When ERR<n>FR.UI == 0b11:

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for detected Uncorrected errors on writes that are not deferred.

- 0b0: Error recovery interrupt on writes disabled.
- 0b1: Error recovery interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
External System Control Register Descriptions

I5.8 RAS register descriptions

Otherwise:
Reserved, RES0.

UE, bit [4]

When \( ERR<n>FR.UE == 0b10 \):
In-band Uncorrected error reporting enable.
When \( ERR<n>FR.UE == 0b10 \), this control applies to errors arising from both reads and writes.
When enabled, responses to transactions that detect an Uncorrected error that cannot be deferred are
signaled in-band as a detected Uncorrected error (External Abort).

- \( 0b0 \)  External Abort response for Uncorrected errors disabled.
- \( 0b1 \)  External Abort response for Uncorrected errors enabled.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

When \( ERR<n>FR.UE == 0b11 \):
In-band Uncorrected error reporting on reads enable.
When \( ERR<n>FR.UE == 0b11 \), this bit is named RUE.
When enabled, responses to reads that detect an Uncorrected error that cannot be deferred are
signaled in-band as a detected Uncorrected error (External Abort).

- \( 0b0 \)  External Abort response for Uncorrected errors on reads disabled.
- \( 0b1 \)  External Abort response for Uncorrected errors on reads enabled.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

FI, bit [3]

When \( ERR<n>FR.FI == 0b10 \):
Fault handling interrupt enable.
When \( ERR<n>FR.FI == 0b10 \), this control applies to errors arising from both reads and writes.
When enabled:
- The fault handling interrupt is generated for all detected Deferred errors and Uncorrected
  errors.
- If the fault handling interrupt for Corrected errors control is not implemented:

  — If the node implements Corrected error counters, then the fault handling interrupt is
    also generated when a counter overflows and the overflow bit for the counter is set to
    \( 0b1 \).

  — Otherwise, the fault handling interrupt is also generated for all detected Corrected
    errors.

- \( 0b0 \)  Fault handling interrupt disabled.
- \( 0b1 \)  Fault handling interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already
records a higher priority error.
On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

When \( ERR<n>FR.FI == 0b11 \):
Fault handling interrupt on reads enable.
When \( ERR<n>FR.FI == 0b11 \), this bit is named RFI.
When enabled:
- The fault handling interrupt is generated for detected Deferred errors and Uncorrected errors.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters for reads, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 0b1.
  - Otherwise, the fault handling interrupt is also generated for detected Corrected errors on reads.

<td>0b0</td>
<td>Error recovery interrupt on reads disabled.</td>
</tr>
<tr>
<td>0b1</td>
<td>Error recovery interrupt on reads enabled.</td>
</tr>
</tbody>
</table>

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:
Reserved, RES0.

IMPLEMENTATION DEFINED, bit [1]
Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.
ED, bit [0]

When ERR<n>FR.ED == 0b10:

Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

- 0b0 Error reporting disabled.
- 0b1 Error reporting enabled.

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrectable errors might result in corrupt data being silently propagated by the node.

--- Note ---

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this bit is set to 0b0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 0b1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be UNKNOWN.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Accessing the ERR<n>CTLR:

ERR<n>CTLR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x000 + (64 * n)</td>
<td>ERR&lt;n&gt;CTLR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
### 5.8.24 ERR<n>FR, Error Record Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

#### Purpose

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED != 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED == 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

#### Configurations

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

#### Attributes

ERR<n>FR is a 64-bit register.

#### Field descriptions

The ERR<n>FR bit assignments are:

**IMPLEMENTATION DEFINED, bits [63:55]**

- When ERR<n>FR.FRX != 1:
  - Reserved for identifying IMPLEMENTATION DEFINED controls.
- Otherwise:
  - Reserved, RES0.

**CE, bits [54:53]**

- When ERR<n>FR.FRX == 1:
  - Corrected Error recording. Describes the types of Corrected Error the node can record.
    - 0b00: The node does not record any type of Corrected Error.
    - 0b01: The node can record transient or persistent Corrected Errors (Corrected Errors that are recorded as ERR<n>STATUS.CE == 0b01 and 0b11).
    - 0b10: The node can record of a non-specific Corrected Error (a Corrected Error that is recorded as ERR<n>STATUS.CE == 0b10).
0b11 The node can record any type of Corrected Error.

Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.

DE, bit [52]
When ERR<n>FRX == 1:
Deferred Error recording. Describes whether the node can record this type of error.
0b0 The node does not record this type of error.
0b1 The node can record this type of error.

Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.

UEO, bit [51]
When ERR<n>FRX == 1:
Latent or Restartable Error recording. Describes whether the node can record this type of error.
0b0 The node does not record this type of error.
0b1 The node can record this type of error.

Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.

UER, bit [50]
When ERR<n>FRX == 1:
Signaled or Recoverable Error recording. Describes whether the node can record this type of error.
0b0 The node does not record this type of error.
0b1 The node can record this type of error.

Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.

UEU, bit [49]
When ERR<n>FRX == 1:
Unrecoverable Error recording. Describes whether the node can record this type of error.
0b0 The node does not record this type of error.
0b1 The node can record this type of error.

Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.

UC, bit [48]
When ERR<n>FRX == 1:
Uncontainable Error recording. Describes whether the node can record this type of error.
0b0 The node does not record this type of error.
0b1 The node can record this type of error.

Otherwise:
Reserved for identifying IMPLEMENTATION DEFINED controls.

IMPLEMENTATION DEFINED, bits [47:32]
Reserved for identifying IMPLEMENTATION DEFINED controls.
FRX, bit [31]

*When RAS System Architecture v1.1 is implemented:*

- Feature Register extension. Defines whether ERR<\(\text{n}\)>FR[63:48] are architecturally defined.
  - 0b0: ERR<\(\text{n}\)>FR[63:48] are IMPLEMENTATION DEFINED.
  - 0b1: ERR<\(\text{n}\)>FR[63:48] are defined by the architecture.

*Otherwise:*

Reserved, RES0.

Bits [30:26]

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record <\(\text{m}\)> owned by this node, ERR<\(\text{n}\)>MISC3 is used as the timestamp register, and, if it is, the timebase used by the timestamp.

- 0b00: The node does not support a timestamp register.
- 0b01: The node implements a timestamp register. The timestamp uses the same timebase as the system Generic Timer.

**Note**

For an error record which has an affinity to a PE, this is the same timer that is visible through CNTPCT_EL0 at the highest Exception level on that PE.

- 0b10: The node implements a timestamp register. The timebase for the timestamp is IMPLEMENTATION DEFINED.

All other values are reserved.

CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented.

- 0b00: Does not support the critical error interrupt. ERR<\(\text{n}\)>CTLR.CI is RES0.
- 0b01: Critical error interrupt is supported and always enabled. ERR<\(\text{n}\)>CTLR.CI is RES0.
- 0b10: Critical error interrupt is supported and controllable using ERR<\(\text{n}\)>CTLR.CI.

All other values are reserved.

INJ, bits [21:20]

Fault Injection Extension. Indicates whether the RAS Common Fault Injection Model Extension is implemented.

- 0b00: The node does not support the RAS Common Fault Injection Model Extension.
- 0b01: The node implements the RAS Common Fault Injection Model Extension. See ERR<\(\text{n}\)>PFGF for more information.

All other values are reserved.

CEO, bits [19:18]

*When ERR<\(\text{n}\)>FR.CEC ! = 0b000:*

Corrected Error overwrite. Indicates the behavior when a second Corrected error is detected after a first Corrected error has been recorded by an error record <\(\text{m}\)> owned by the node.

- 0b00: Counts Corrected errors if a counter is implemented. Keeps the previous error syndrome. If the counter overflows, or no counter is implemented, then ERR<\(\text{n}\)>STATUS.OF is set to 0b1.
- 0b01: Counts Corrected errors. If ERR<\(\text{n}\)>STATUS.OF == 0b1 before the Corrected error is counted, then keeps the previous syndrome. Otherwise the previous syndrome is overwritten. If the counter overflows, then ERR<\(\text{n}\)>STATUS.OF is set to 0b1.
All other values are reserved.

Otherwise:
Reserved, RES0.

DUI, bits [17:16]

When ERR<n>FR.UI != 0b00:
Error recovery interrupt for deferred errors control. Indicates whether the control for enabling error recovery interrupts on deferred errors are implemented.
0b00  Does not support the control for enabling error recovery interrupts on deferred errors. ERR<n>CTRLR.DUI is RES0.
0b10  Control for enabling error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTRLR.DUI.
0b11  Control for enabling error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTRLR.WDUI for writes and ERR<n>CTRLR.RDUI for reads.

All other values are reserved.

Otherwise:
Reserved, RES0.

RP, bit [15]

When ERR<n>FR.CEC != 0b000:
Repeat counter. Indicates whether the node implements the repeat Corrected error counter in ERR<n>MISC0 for each error record <m> owned by the node that implements the standard Corrected error counter.
0b0  A single CE counter is implemented.
0b1  A first (repeat) counter and a second (other) counter are implemented. The repeat counter is the same size as the primary error counter.

Otherwise:
Reserved, RES0.

CEC, bits [14:12]
Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter (CE counter) mechanisms in ERR<n>MISC0 for each error record <m> owned by the node that can record countable errors.
0b000  Does not implement the standard Corrected error counter model.
0b010  Implements an 8-bit Corrected error counter in ERR<n>MISC0[39:32].
0b100  Implements a 16-bit Corrected error counter in ERR<n>MISC0[47:32].

All other values are reserved.

Note
Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

CFI, bits [11:10]

When ERR<n>FR.FI != 0b00:
Fault handling interrupt for corrected errors. Indicates whether the control for enabling fault handling interrupts on corrected errors are implemented.
0b00  Does not support the control for enabling fault handling interrupts on corrected errors. ERR<n>CTRLR.CFI is RES0.
0b10  Control for enabling fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTRLR.CFI.
Control for enabling fault handling interrupts on corrected errors is supported and controllable using ERR<\textit{n}>CTRL.RCFI for reads and ERR<\textit{n}>CTRL.WCFI for writes.

All other values are reserved.

\textit{Otherwise:}

Reserved, RES0.

**UE, bits [9:8]**

In-band uncorrected error reporting. Indicates whether the in-band uncorrected error reporting (External Aborts) and associated controls are implemented.

- \texttt{0b00}: Does not support the in-band uncorrected error reporting (External Aborts). ERR<\textit{n}>CTRL.UE is RES0.
- \texttt{0b01}: In-band uncorrected error reporting (External Aborts) is supported and always enabled. ERR<\textit{n}>CTRL.UE is RES0.
- \texttt{0b10}: In-band uncorrected error reporting (External Aborts) is supported and controllable using ERR<\textit{n}>CTRL.UE.
- \texttt{0b11}: In-band uncorrected error reporting (External Aborts) is supported and controllable using ERR<\textit{n}>CTRL.WUE for writes and ERR<\textit{n}>CTRL.RUE for reads.

**FI, bits [7:6]**

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented.

- \texttt{0b00}: Does not support the fault handling interrupt. ERR<\textit{n}>CTRL.FI is RES0.
- \texttt{0b01}: Fault handling interrupt is supported and always enabled. ERR<\textit{n}>CTRL.FI is RES0.
- \texttt{0b10}: Fault handling interrupt is supported and controllable using ERR<\textit{n}>CTRL.FI.
- \texttt{0b11}: Fault handling interrupt is supported and controllable using ERR<\textit{n}>CTRL.WFI for writes and ERR<\textit{n}>CTRL.RFI for reads.

**UI, bits [5:4]**

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented.

- \texttt{0b00}: Does not support the error handling interrupt. ERR<\textit{n}>CTRL.UI is RES0.
- \texttt{0b01}: Error handling interrupt is supported and always enabled. ERR<\textit{n}>CTRL.UI is RES0.
- \texttt{0b10}: Error handling interrupt is supported and controllable using ERR<\textit{n}>CTRL.UI.
- \texttt{0b11}: Error handling interrupt is supported and controllable using ERR<\textit{n}>CTRL.WUI for writes and ERR<\textit{n}>CTRL.RUI for reads.

**IMPLEMENTATION DEFINED, bits [3:2]**

IMPLEMENTATION DEFINED.

**ED, bits [1:0]**

Error reporting and logging. Indicates whether error record <\textit{n}> is the first record owned the node, and, if so, whether it implements the controls for enabling and disabling error reporting and logging.

- \texttt{0b01}: Error reporting and logging always enabled. ERR<\textit{n}>CTRL.ED is RES0.
- \texttt{0b10}: Error reporting and logging is controllable using ERR<\textit{n}>CTRL.ED.

All other values are reserved.
When ERR<n>FR.ED == 0b00:

<table>
<thead>
<tr>
<th>63</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>ED</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:2]
Reserved, RES0.

ED, bits [1:0]
Error reporting and logging. Indicates error record <n> is not the first record owned the node.

- 0b00 Error record <n> is not the first record owned by the node.
- This field reads as 0b00.

Accessing the ERR<n>FR:
ERR<n>FR can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x000 + (64 * n)</td>
<td>ERR&lt;n&gt;FR</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:
- Accesses to this register are RO.
I5.8.25 ERR<n>MISC0, Error Record Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements architecturally-defined error counters (ERR<n>FR.CEC != 0b000), and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined error counter or counters.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

--- **Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

**Attributes**

ERR<n>MISC0 is a 64-bit register.

**Field descriptions**

The ERR<n>MISC0 bit assignments are:

*When ERR<q>FR.CEC == 0b000:*

```
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
```

IMPLEMENTATION DEFINED syndrome.
When ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 0:

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OF, bit [47]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

- 0b0: Counter has not overflowed.
- 0b1: Counter has overflowed.

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [46:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 0:

IMPLEMENTATION DEFINED, bits [63:40]

IMPLEMENTATION DEFINED syndrome.

OF, bit [39]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

- 0b0: Counter has not overflowed.
- 0b1: Counter has overflowed.

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**CEC, bits [38:32]**

Corrected error count. Incremented for each Corrected error. It is **IMPLEMENTATION DEFINED** and might be **UNPREDICTABLE** whether Deferred and Uncorrected errors are counted.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**IMPLEMENTATION DEFINED, bits [31:0]**

**IMPLEMENTATION DEFINED** syndrome.

*When **ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 1:***

**OFO, bit [63]**

Sticky overflow bit, other. Set to 1 when **ERR<n>MISC0.CECO** is incremented and wraps through zero.

- **0b0**: Other counter has not overflowed.
- **0b1**: Other counter has overflowed.

A direct write that modifies this bit might indirectly set **ERR<n>STATUS.OF** to an **UNKNOWN** value and a direct write to **ERR<n>STATUS.OF** that clears it to zero might indirectly set this bit to an **UNKNOWN** value.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**CECO, bits [62:48]**

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing **ERR<n>MISC0.CECR**.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.

**OFR, bit [47]**

Sticky overflow bit, repeat. Set to 1 when **ERR<n>MISC0.CECR** is incremented and wraps through zero.

- **0b0**: Repeat counter has not overflowed.
- **0b1**: Repeat counter has overflowed.

A direct write that modifies this bit might indirectly set **ERR<n>STATUS.OF** to an **UNKNOWN** value and a direct write to **ERR<n>STATUS.OF** that clears it to zero might indirectly set this bit to an **UNKNOWN** value.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally **UNKNOWN** value.
CECR, bits [46:32]
Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note
For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]
IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 1:

OFO, bit [47]
Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.
0b0 Other counter has not overflowed.
0b1 Other counter has overflowed.

A direct write that modifies this bit might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [46:40]
Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [39]
Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.
0b0 Repeat counter has not overflowed.
0b1 Repeat counter has overflowed.
A direct write that modifies this bit might indirectly set ERR<\text{n}>STATUS.OF to an UNKNOWN value and a direct write to ERR<\text{n}>STATUS.OF that clears it to zero might indirectly set this bit to an UNKNOWN value.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**CECR, bits [38:32]**

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

___ Note ___

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<\text{n}>MISC<\text{m}> fields on a first Corrected error. ERR<\text{n}>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**IMPLEMENTATION DEFINED, bits [31:0]**

IMPLEMENTATION DEFINED syndrome.

### Accessing the ERR<\text{n}>MISC0:

Reads from ERR<\text{n}>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<\text{n}>PFGF.MV is 0b1, then some parts of this register are read/write when ERR<\text{n}>STATUS.MV == 0b1. See ERR<\text{n}>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.

- When ERR<\text{n}>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

___ Note ___

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<\text{n}>MISC0 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x020 + (64 * n)</td>
<td>ERR&lt;\text{n}&gt;MISC0</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.8.26   ERR<n>MISC1, Error Record Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configurations

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

Attributes

ERR<n>MISC1 is a 64-bit register.

Field descriptions

The ERR<n>MISC1 bit assignments are:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing the ERR<n>MISC1:

Reads from ERR<n>MISC1 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<n>PFGF.MV is 0b1, then some parts of this register are read/write when ERR<n>STATUS.MV == 0b1. See ERR<n>PFGF.MV for more information.
For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<{} STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

--- Note ---

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<{} MISC1 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>

<tr>
<td>RAS</td>
<td>0x828 + (64 * n)</td>
<td>ERR&lt;{} MISC1</td>
</tr>
</tbody>
</table>

This interface is accessible as follows:

- Accesses to this register are RW.
### 15.8.27 ERR<n>MISC2, Error Record Miscellaneous Register 2, \( n = 0 - 65534 \)

The ERR<n>MISC2 characteristics are:

#### Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

#### Configurations

This register is present only when (an implementation implements ERR<n>MISC2 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. \( q \) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then \( q = n \).

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

---

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

---

#### Attributes

ERR<n>MISC2 is a 64-bit register.

#### Field descriptions

The ERR<n>MISC2 bit assignments are:

```
  63 0  
```

- IMPLEMENTATION DEFINED

#### IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

#### Accessing the ERR<n>MISC2:

Reads from ERR<n>MISC2 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.
If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and 
ERR<\text{n}>PFGF.MV is 0b1, then some parts of this register are read/write when ERR<\text{n}>STATUS.MV == 0b1. See 
ERR<\text{n}>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm 
recommends that:

• Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
• When ERR<\text{n}>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded 
  error ignores writes.

\textbf{Note}

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific 
information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being 
logged.

ERR<\text{n}>MISC2 can be accessed through its memory-mapped interface:

\begin{center}
\begin{tabular}{|l|c|c|}
\hline
Component & Offset & Instance \\
\hline
RAS & 0x030 + (64 * n) & \text{ERR<\text{n}>MISC2} \\
\hline
\end{tabular}
\end{center}

This interface is accessible as follows:

• Accesses to this register are RW.
I5.8.28 ERR<n>MISC3, Error Record Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

**Purpose**

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to identify the FRU in which the error was detected, and might contain enough information to locate the error within that FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record n supports the RAS Timestamp Extension (ERR<n>FR.TS != 0b00), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

This register is present only when (an implementation implements ERR<n>MISC3 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

**Attributes**

ERR<n>MISC3 is a 64-bit register.

**Field descriptions**

The ERR<n>MISC3 bit assignments are:

*When ERR<q>FR.TS != 0b00:*

<table>

</thead>
<tbody>
<tr>
<td>63</td>
<td>TS</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
TS, bits [63:0]

Timestamp. Timestamp value recorded when the error was detected. Valid only if ERR<\(n\)>STATUS.V == 0b1.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO or RW.

**When ERR<\(q\)>FR.TS == 0b00:**

**IMPLEMENTATION DEFINED, bits [63:0]**

IMPLEMENTATION DEFINED syndrome.

**Accessing the ERR<\(n\)>MISC3:**

Reads from ERR<\(n\)>MISC3 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<\(n\)>PFGF.MV is 0b1, then some parts of this register are read/write when ERR<\(n\)>STATUS.MV == 0b1. See ERR<\(n\)>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<\(n\)>STATUS.MV == 0b1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

**Note**

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<\(n\)>MISC3 can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>

This interface is accessible as follows:

- Accesses to this register are RW.
I5.8.29 ERR<n>PFGCDN, Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

**Purpose**

Generates one of the errors enabled in the corresponding ERR<n>PFGCTL register.

For details of this, see the Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile.

**Configurations**

This register is present only when error record <n> is implemented, the node implements the RAS Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.

ERR<n>FR describes the features implemented by the node.

**Attributes**

ERR<n>PFGCDN is a 64-bit register.

**Field descriptions**

The ERR<n>PFGCDN bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>63-32</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>31-0</td>
<td>CDN</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**CDN, bits [31:0]**

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes ERR<n>PFGCTL.CDNEN with 1.
- The Error Generation Counter decrements to zero and ERR<n>PFGCTL.R == 0b1.

While ERR<n>PFGCTL.CDNEN == 0b1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches 0, one of the errors enabled in the ERR<n>PFGCTL register is generated.

**Note**

The current Error Generation Counter value is not visible to software.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Accessing the ERR<n>PFGCDN:**

ERR<n>PFGCDN can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x810 + (64 * n)</td>

</tbody>
</table>
This interface is accessible as follows:

- Accesses to this register are RW.
I5.8.30 ERR<\(n\)>PFGCTL, Pseudo-fault Generation Control Register, \(n = 0 - 65534\)

The ERR<\(n\)>PFGCTL characteristics are:

**Purpose**

Enables controlled fault generation.

**Configurations**

This register is present only when error record \(<n\> is implemented, the node implements the RAS Common Fault Injection Model Extension (ERR<\(n\)>FR.INJ \(!= 0b00\) and error record \(<n\> is the first error record owned by a node. Otherwise, direct accesses to ERR<\(n\)>PFGCTL are RES0.

ERR<\(n\)>FR describes the features implemented by the node.

**Attributes**

ERR<\(n\)>PFGCTL is a 64-bit register.

**Field descriptions**

The ERR<\(n\)>PFGCTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignments</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[63:32]</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>[31] CDNEN</td>
<td>Countdown Enable. Controls transfers from the value that is held in the ERR&lt;(n)&gt;PFGCDN into the Error Generation Counter and enables this counter.</td>
</tr>
<tr>
<td>[30] R</td>
<td>Restart. Controls whether, upon reaching zero, the Error Generation Counter restarts from the ERR&lt;(n)&gt;PFGCDN value or stops.</td>
</tr>
</tbody>
</table>

**Bits [63:32]**

Reserved, RES0.

**CDNEN, bit [31]**

Countdown Enable. Controls transfers from the value that is held in the ERR<\(n\)>PFGCDN into the Error Generation Counter and enables this counter.

- **0b0**: The Error Generation Counter is disabled.
- **0b1**: The Error Generation Counter is enabled. On a write of 0b1 to this bit, the Error Generation Counter is set to ERR<\(n\)>PFGCDN.CDN.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to 0.

**R, bit [30]**

Restart. Controls whether, upon reaching zero, the Error Generation Counter restarts from the ERR<\(n\)>PFGCDN value or stops.

- **0b0**: On reaching 0, the Error Generation Counter will stop.
- **0b1**: On reaching 0, the Error Generation Counter is set to ERR<\(n\)>PFGCDN.CDN.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**Bits [29:13]**

Reserved, RES0.

**MV, bit [12]**

Miscellaneous syndrome. The value that is written to ERR\(^n\)STATUS.MV when an injected error is recorded.

- \(0b0\) ERR\(^n\)STATUS.MV is set to \(0b0\) when an injected error is recorded.
- \(0b1\) ERR\(^n\)STATUS.MV is set to \(0b1\) when an injected error is recorded.

This bit reads-as-one if the node always records some syndrome in ERR\(^n\)MISC\(^m\), setting ERR\(^n\)STATUS.MV to 1, when an injected error is recorded. This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged. On a Cold reset, this field resets to an architecturally UNKNOWN value.

**AV, bit [11]**

Address syndrome. The value that is written to ERR\(^n\)STATUS.AV when an injected error is recorded.

- \(0b0\) ERR\(^n\)STATUS.AV is set to \(0b0\) when an injected error is recorded.
- \(0b1\) ERR\(^n\)STATUS.AV is set to \(0b1\) when an injected error is recorded.

This bit reads-as-one if the node always sets ERR\(^n\)STATUS.AV to \(0b1\) when an injected error is recorded. This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged. On a Cold reset, this field resets to an architecturally UNKNOWN value.

**PN, bit [10]**

Poison flag. The value that is written to ERR\(^n\)STATUS.PN when an injected error is recorded.

- \(0b0\) ERR\(^n\)STATUS.PN is set to \(0b0\) when an injected error is recorded.
- \(0b1\) ERR\(^n\)STATUS.PN is set to \(0b1\) when an injected error is recorded.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged. On a Cold reset, this field resets to an architecturally UNKNOWN value.

**ER, bit [9]**

Error Reported flag. The value that is written to ERR\(^n\)STATUS.ER when an injected error is recorded.

- \(0b0\) ERR\(^n\)STATUS.ER is set to \(0b0\) when an injected error is recorded.
- \(0b1\) ERR\(^n\)STATUS.ER is set to \(0b1\) when an injected error is recorded.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged. On a Cold reset, this field resets to an architecturally UNKNOWN value.

**CI, bit [8]**

Critical Error flag. The value that is written to ERR\(^n\)STATUS.CI when an injected error is recorded.

- \(0b0\) ERR\(^n\)STATUS.CI is set to \(0b0\) when an injected error is recorded.
- \(0b1\) ERR\(^n\)STATUS.CI is set to \(0b1\) when an injected error is recorded.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**CE, bits [7:6]**

Corrected Error generation enable. Controls the type of Corrected Error condition that might be generated.

- **0b00**: No error of this type will be generated.
- **0b01**: A non-specific Corrected Error, that is, a Corrected Error that is recorded as ERR<n>-STATUS.CE == 0b10, might be generated when the Error Generation Counter decrements to zero.
- **0b10**: A transient Corrected Error, that is, a Corrected Error that is recorded as ERR<n>-STATUS.CE == 0b01, might be generated when the Error Generation Counter decrements to zero.
- **0b11**: A persistent Corrected Error, that is, a Corrected Error that is recorded as ERR<n>-STATUS.CE == 0b11, might be generated when the Error Generation Counter decrements to zero.

The set of permitted values for this field is defined by ERR<n>-PFGF.CE.

This field is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**DE, bit [5]**

Deferred Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

- **0b0**: No error of this type will be generated.
- **0b1**: An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**UEO, bit [4]**

Latent or Restartable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

- **0b0**: No error of this type will be generated.
- **0b1**: An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

**UER, bit [3]**

Signaled or Recoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

- **0b0**: No error of this type will be generated.
- **0b1**: An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
UEU, bit [2]

Unrecoverable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

0b0 No error of this type will be generated.
0b1 An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.
On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

UC, bit [1]

Uncontainable Error generation enable. Controls whether this type of error condition might be generated. It is IMPLEMENTATION DEFINED whether the error is generated if the data is not consumed.

0b0 No error of this type will be generated.
0b1 An error of this type might be generated when the Error Generation Counter decrements to zero.

This bit is RES0 if the node does not support this control.
On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

OF, bit [0]

Overflow flag. The value that is written to ERR<n>STATUS.OF when an injected error is recorded.

0b0 ERR<n>STATUS.OF is set to 0b0 when an injected error is recorded.
0b1 ERR<n>STATUS.OF is set to 0b1 when an injected error is recorded.

This bit is RES0 if the node does not support this control.
On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERR<n>PFGCTL:

ERR<n>PFGCTL can be accessed through its memory-mapped interface:

**Bits [63:31]**

Reserved, RES0.

**R, bit [30]**

Restartable. Support for Error Generation Counter restart mode.

- 0b0: The node does not support this feature.
- 0b1: Feature controllable.

**SYN, bit [29]**

Syndrome. Fault syndrome injection.

- 0b0: When an injected error is recorded, the node sets ERR<sub>n</sub>STATUS. {IERR, SERR} to IMPLEMENTATION DEFINED values. ERR<sub>n</sub>STATUS. {IERR, SERR} are UNKNOWN when ERR<sub>n</sub>STATUS.V == 0b0.
- 0b1: When an injected error is recorded, the node does not update the ERR<sub>n</sub>STATUS. {IERR, SERR} fields. ERR<sub>n</sub>STATUS. {IERR, SERR} are writable when ERR<sub>n</sub>STATUS.V == 0b0.
I5.8 RAS register descriptions

---

**Note**

If ERR<\n>PFGF.SYN == 0b1, software can write specific values into the ERR<\n>STATUS.[IERR, SERR] fields when setting up a fault injection event. The sets of values that can be written to these fields is IMPLEMENTATION DEFINED.

---

### Bits [28:13]

Reserved, RES0.

### MV, bit [12]

Miscellaneous syndrome.

Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the ERR<\n>MISC<m> registers when an injected error is recorded.

It is IMPLEMENTATION DEFINED which syndrome fields in ERR<\n>MISC<m> this refers to, as some fields might always be recorded by an error. For example, a Corrected Error counter.

- **0b0** When an injected error is recorded, the node might record IMPLEMENTATION DEFINED additional syndrome in ERR<\n>MISC<m>. If any syndrome is recorded in ERR<\n>MISC<m>, then ERR<\n>STATUS.MV is set to 0b1.
- **0b1** When an injected error is recorded, the node does not update all the syndrome fields in the ERR<\n>MISC<m> and does one of:
  - The node does not update any fields in ERR<\n>MISC<m> and sets ERR<\n>STATUS.MV to ERR<\n>PFGCTL.MV.
  - The node records some syndrome in ERR<\n>MISC<m> and sets ERR<\n>STATUS.MV to 0b1. ERR<\n>PFGCTL.MV is RAO.

The syndrome fields that the node does not update are unchanged and are writable when ERR<\n>STATUS.MV == 0b0.

---

**Note**

If ERR<\n>PFGF.MV == 0b1, software can write specific values into the ERR<\n>MISC<m> registers when setting up a fault injection event. The values that can be written to these registers are IMPLEMENTATION DEFINED.

---

### AV, bit [11]

Address syndrome. Address syndrome injection.

- **0b0** When an injected error is recorded, the node either sets ERR<\n>ADDR and ERR<\n>STATUS.AV for the access, or leaves these unchanged.
- **0b1** When an injected error is recorded, the node does not update ERR<\n>ADDR and does one of:
  - Sets ERR<\n>STATUS.AV to ERR<\n>PFGCTL.AV.
  - Sets ERR<\n>STATUS.AV to 0b1. ERR<\n>PFGCTL.AV is RAO.

ERR<\n>ADDR is writable when ERR<\n>STATUS.AV == 0b0.

---

**Note**

If ERR<\n>PFGF.AV == 0b1, software can write a specific value into ERR<\n>ADDR when setting up a fault injection event.

---

### PN, bit [10]

Poison flag. Describes how the fault generation feature of the node sets the ERR<\n>STATUS.PN status flag.

- **0b0** When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<\n>STATUS.PN to 0b1.
When an injected error is recorded, ERR\textsubscript{n}\textgreater STATUS.PN is set to ERR\textsubscript{n}\textgreater PFGCTL.PN.

This behavior replaces the architecture-defined rules for setting the PN bit.

This bit reads-as-zero if the node does not support this flag.

**ER, bit [9]**

Error Reported flag. Describes how the fault generation feature of the node sets the ERR\textsubscript{n}\textgreater STATUS.ER status flag.

- 0b0 When an injected error is recorded, the node sets ERR\textsubscript{n}\textgreater STATUS.ER according to the architecture-defined rules for setting the ER bit.

- 0b1 When an injected error is recorded, ERR\textsubscript{n}\textgreater STATUS.ER is set to ERR\textsubscript{n}\textgreater PFGCTL.ER. This behavior replaces the architecture-defined rules for setting the ER bit.

This bit reads-as-zero if the node does not support this flag.

**CI, bit [8]**

Critical Error flag. Describes how the fault generation feature of the node sets the ERR\textsubscript{n}\textgreater STATUS.CI status flag.

- 0b0 When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR\textsubscript{n}\textgreater STATUS.CI to 0b1.

- 0b1 When an injected error is recorded, ERR\textsubscript{n}\textgreater STATUS.CI is set to ERR\textsubscript{n}\textgreater PFGCTL.CI. This behavior replaces the architecture-defined rules for setting the CI bit.

This bit reads-as-zero if the node does not support this flag.

**CE, bits [7:6]**

Corrected Error generation. Describes the types of Corrected Error that the fault generation feature of the node can generate.

- 0b00 The fault generation feature of the node cannot generate this type of error.

- 0b01 The fault generation feature of the node allows generation of a non-specific Corrected Error, that is, a Corrected Error that is recorded as ERR\textsubscript{n}\textgreater STATUS.CE == 0b10.

- 0b11 The fault generation feature of the node allows generation of transient or persistent Corrected Errors, that is, Corrected Errors that are recorded as ERR\textsubscript{n}\textgreater STATUS.CE == 0b01 and 0b11.

All other values are reserved.

If ERR\textsubscript{n}\textgreater FR.FRX is 0b1 then ERR\textsubscript{n}\textgreater FR.CE indicates whether the node supports this type of error.

This field reads-as-zeros if the node does not support this type of error.

**DE, bit [5]**

Deferred Error generation. Describes whether the fault generation feature of the node can generate this type of error.

- 0b0 The fault generation feature of the node cannot generate this type of error.

- 0b1 The fault generation feature of the node allows generation of this type of error.

If ERR\textsubscript{n}\textgreater FR.FRX is 0b1 then ERR\textsubscript{n}\textgreater FR.DE indicates whether the node supports this type of error.

This bit reads-as-zero if the node does not support this type of error.

**UEO, bit [4]**

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate this type of error.

- 0b0 The fault generation feature of the node cannot generate this type of error.
The fault generation feature of the node allows generation of this type of error.
If ERR<\text{n}>FR.FR is 0b1 then ERR<\text{n}>FR.UE indicates whether the node supports this type of error.
This bit reads-as-zero if the node does not support this type of error.

**UER, bit [3]**

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate this type of error.
0b0 The fault generation feature of the node cannot generate this type of error.
0b1 The fault generation feature of the node allows generation of this type of error.
If ERR<\text{n}>FR.FR is 0b1 then ERR<\text{n}>FR.UER indicates whether the node supports this type of error.
This bit reads-as-zero if the node does not support this type of error.

**UEU, bit [2]**

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate this type of error.
0b0 The fault generation feature of the node cannot generate this type of error.
0b1 The fault generation feature of the node allows generation of this type of error.
If ERR<\text{n}>FR.FR is 0b1 then ERR<\text{n}>FR.UEU indicates whether the node supports this type of error.
This bit reads-as-zero if the node does not support this type of error.

**UC, bit [1]**

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate this type of error.
0b0 The fault generation feature of the node cannot generate this type of error.
0b1 The fault generation feature of the node allows generation of this type of error.
If ERR<\text{n}>FR.FR is 0b1 then ERR<\text{n}>FR.UC indicates whether the node supports this type of error.
This bit reads-as-zero if the node does not support this type of error.

**OF, bit [0]**

Overflow flag. Describes how the fault generation feature of the node sets the ERR<\text{n}>STATUS.OF status flag.
0b0 When an injected error is recorded, the node sets ERR<\text{n}>STATUS.OF according to the architecture-defined rules for setting the OF bit.
0b1 When an injected error is recorded, ERR<\text{n}>STATUS.OF is set to ERR<\text{n}>PFCTRL.OF. This behavior replaces the architecture-defined rules for setting the OF bit.
This bit reads-as-zero if the node does not support this flag.

**Accessing the ERR<\text{n}>PF:**

ERR<\text{n}>PF can be accessed through its memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
<th>Instance</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAS</td>
<td>0x800 + (64 * n)</td>
<td>ERR&lt;\text{n}&gt;PF</td>
</tr>
</tbody>
</table>
This interface is accessible as follows:

- Accesses to this register are RO.
I5.8.32  **ERR\(<n>\)STATUS, Error Record Primary Status Register, n = 0 - 65534**

The ERR\(<n>\)STATUS characteristics are:

**Purpose**

Contains status information for error record \(<n>\), including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- The \{AV, V, MV\} bits are valid bits that define whether error record \(<n>\) registers are valid.
- The \{UE, OF, CE, DE, UET\} bits encode the types of error or errors recorded.
- The \{CI, ER, PN, IERR, SERR\} fields are syndrome fields.

**Configurations**

This register is present only when error record \(<n>\) is implemented. Otherwise, direct accesses to ERR\(<n>\)STATUS are RES0.

ERR\(<n>\)FR describes the features implemented by the node that owns error record \(<n>\). \(<q>\) is the index of the first error record owned by the same node as error record \(<n>\). If the node owns a single record, then \(q = n\).

For IMPLEMENTATION DEFINED fields in ERR\(<n>\)STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

---

**Note**

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR\(<n>\)CTRL.

---

**Attributes**

ERR\(<n>\)STATUS is a 64-bit register.

**Field descriptions**

The ERR\(<n>\)STATUS bit assignments are:
When RAS System Architecture v1.1 is implemented:

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

0b0  ERR<n>ADDR not valid.

0b1  ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

0b0  ERR<n>STATUS not valid.

0b1  ERR<n>STATUS valid. At least one error has been recorded.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to 0.

UE, bit [29]

Uncorrected Error.

0b0  No errors have been detected, or all detected errors have been either corrected or deferred.

0b1  At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
ER, bit [28]

Error Reported.

0b0  No in-band error (External Abort) reported.
0b1  An External Abort was signaled by the node to the Requester making the access or other transaction. This can be because any of the following are true:

- The applicable one of the $\text{ERR}<n>\text{CTL.R.}{\{\text{WUE},\text{RUE},\text{UE}\}}$ bits is implemented and was set to 0b1 when an Uncorrected error was detected.
- The applicable one of the $\text{ERR}<n>\text{CTL.R.}{\{\text{WUE},\text{RUE},\text{UE}\}}$ bits is not implemented and the node always reports errors.

It is IMPLEMENTATION DEFINED whether this bit can be set to 0b1 by a Deferred error.

When clearing $\text{ERR}<n>\text{STATUS.V}$ to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if any of the following are true:

- $\text{ERR}<n>\text{STATUS.V} == 0b0$.
- $\text{ERR}<n>\text{STATUS.UE} == 0b0$ and this bit is never set to 0b1 by a Deferred error.
- $\text{ERR}<n>\text{STATUS.} \{\text{UE,DE}\} == \{0,0\}$ and this bit can be set to 0b1 by a Deferred error.

This bit is read/write-one-to-clear.

Note

An External Abort signaled by the node might be masked and not generate any exception.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This bit is set to 0b1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- $\text{ERR}<n>\text{STATUS.V}$ was previously set to 0b1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- $\text{ERR}<n>\text{STATUS.V}$ was previously set to 0b1, and a type of error other than a Corrected error is recorded.

Otherwise, this bit is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this bit to an UNKNOWN value.
- A direct write to this bit that clears this bit to zero might indirectly set the counter overflow flag to an UNKNOWN value.

0b0  Since this bit was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.
0b1  Since this bit was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing $\text{ERR}<n>\text{STATUS.V}$ to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if $\text{ERR}<n>\text{STATUS.V} == 0b0$.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
MV, bit [26]

*When error record \(<n>\) includes an additional information for an error:*

Miscellaneous Registers Valid.

- \(0\)   ERR\(<n>\)-MISC\(<m>\) not valid.
- \(1\)   The IMPLEMENTATION DEFINED contents of the ERR\(<n>\)-MISC\(<m>\) registers contains additional information for an error recorded by this record.

This bit is read/write-one-to-clear.

**Note**

If the ERR\(<n>\)-MISC\(<m>\) registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

- \(00\)   No errors were corrected.
- \(01\)   At least one transient error was corrected.
- \(10\)   At least one error was corrected.
- \(11\)   At least one persistent error was corrected.

The mechanism by which a node detects whether a correctable error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to \(10\) when an error is corrected.

When clearing ERR\(<n>\)-STATUS.V to \(0\), if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

This field is not valid and reads UNKNOWN if ERR\(<n>\)-STATUS.V == \(0\).

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

DE, bit [23]

Deferred Error.

- \(0\)   No errors were deferred.
- \(1\)   At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR\(<n>\)-STATUS.V to \(0\), if this bit is nonzero, then Arm recommends that software write \(1\) to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR\(<n>\)-STATUS.V == \(0\).

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.
PN, bit [22]

Poison.
0b0  Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1  Uncorrected error or Deferred error recorded because a poison value was detected.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if any of the following are true:
• ERR<n>STATUS.V == 0b0.
• ERR<n>STATUS.DE,UE == {0,0}.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.
0b00  Uncorrected error, Uncontainable error (UC).
0b01  Uncorrected error, Unrecoverable error (UEU).
0b10  Uncorrected error, Latent or Restartable error (UEO).
0b11  Uncorrected error, Signaled or Recoverable error (UER).

When clearing ERR<n>STATUS.V to 0b0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

This field is not valid and reads UNKNOWN if any of the following are true:
• ERR<n>STATUS.V == 0b0.
• ERR<n>STATUS.UE == 0b0.

This field is read/write-ones-to-clear. Writing a value other than all-zeros or all-ones sets this field to an UNKNOWN value.

--- Note ---
Software might use the information in the error record registers to determine what recovery is necessary.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.
0b0  No critical error condition.
0b1  Critical error condition.

When clearing ERR<n>STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR<n>STATUS.V == 0b0.
This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [18:16]

Reserved, RES0.
### IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<\(n\)>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<\(n\)>MISC<\(m\)> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

---

**Note**

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

This field is not valid and reads UNKNOWN if all of the following are true:

- Any of the following are true:
  - The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and ERR<\(n\)>PFGF.SYN == 0b0.
  - The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
- ERR<\(n\)>STATUS.V == 0b0.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

### SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

<table>

</tr>
</tbody>
</table>
0x12  Error response from Completer of access. For example, error response from cache write-back.
0x13  External timeout. For example, timeout on interaction with another node.
0x14  Internal timeout. For example, timeout on interface within the node.
0x15  Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16  Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17  Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18  Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19  Error recorded by PCIe error logs. Indicates that the node has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

--- Note ---
This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

This field is not valid and reads UNKNOWN if all of the following are true:
• Any of the following are true:
  — The RAS Common Fault Injection Model Extension is implemented by the node that owns this error record and ERR<n>PFGF.SYN == 0b0.
  — The RAS Common Fault Injection Model Extension is not implemented by the node that owns this error record.
• ERR<n>STATUS.V == 0b0.

On an Error recovery reset, the value of this field is unchanged.

On a Cold reset, this field resets to an architecturally UNKNOWN value.

When RAS System Architecture v1.0 is implemented:

Bits [63:32]
Reserved, RES0.
**AV, bit [31]**

*When error record \(<n>\) includes an address associated with an error:*

Address Valid.

- 0b0: ERR\(<n>\)ADDR not valid.
- 0b1: ERR\(<n>\)ADDR contains an address associated with the highest priority error recorded by this record.

This bit ignores writes if ERR\(<n>\)STATUS.{CE,DE,UE} != {0b00,0,0}, and the highest priority of these is not being cleared to zero in the same write.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to 0.

**Otherwise:**

Reserved, RES0.

**V, bit [30]**

Status Register Valid.

- 0b0: ERR\(<n>\)STATUS not valid.
- 0b1: ERR\(<n>\)STATUS valid. At least one error has been recorded.

This bit ignores writes if ERR\(<n>\)STATUS.{CE,DE,UE} != {0b00,0,0}, and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to 0.

**UE, bit [29]**

Uncorrected Error.

- 0b0: No errors have been detected, or all detected errors have been either corrected or deferred.
- 0b1: At least one detected error was not corrected and not deferred.

When clearing ERR\(<n>\)STATUS.V to 0b0, if this bit is nonzero, then Arm recommends that software write 0b1 to this bit to clear this bit to zero.

This bit is not valid and reads UNKNOWN if ERR\(<n>\)STATUS.V == 0b0. This bit ignores writes if ERR\(<n>\)STATUS.OF == 0b1 and is not being cleared to 0b0 in the same write.

This bit is read/write-one-to-clear.

On an Error recovery reset, the value of this field is unchanged.
On a Cold reset, this field resets to an architecturally UNKNOWN value.

**ER, bit [28]**

Error Reported.

- 0b0: No in-band error (External Abort) reported.
- 0b1: An External Abort was signaled by the node to the Requester making the access or other transaction. This can be because any of the following are true:
