**Decode for this encoding**

\[
d = \text{UInt}(R_d); \quad m = \text{UInt}(R_m); \quad n = \text{UInt}(R_n);
\]

\[
\text{if } m != n \text{ } || \text{ } d == 15 \text{ } || \text{ } m == 15 \text{ then UNPREDICTABLE; } \text{// Armv8-A removes UNPREDICTABLE for R13}
\]

**CONSTRAINED UNPREDICTABLE behavior**

If \( m \neq n \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes with the additional decode: \( m = \text{UInt}(R_n) \).
- The value in the destination register is UNKNOWN.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors*.

**Assembler symbols**

- \(<c>\) See *Standard assembler syntax fields* on page F2-4120.
- \(<q>\) See *Standard assembler syntax fields* on page F2-4120.
- \(<R_d>\) Is the general-purpose destination register, encoded in the "Rd" field.
<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field.
For encoding T1: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    result = CountLeadingZeroBits(R[m]);
    R[d] = result<31:0>;

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.32  CMN (immediate)

Compare Negative (immediate) adds a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1

\[
\begin{array}{cccccccccccc}

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.38  CPS, CPSID, CPSIE

Change PE State changes one or more of the PSTATE.\{A, I, F\} interrupt mask bits and, optionally, the PSTATE.M mode field, without changing any other PSTATE bits.

CPS is treated as NOP if executed in User mode unless it is defined as being CONSTRAINED UNPREDICTABLE elsewhere in this section.

The PE checks whether the value being written to PSTATE.M is legal. See Illegal changes to PSTATE.M on page G1-5739.

• The instruction executes as NOOP.
• The instruction behaves as if \texttt{i\textasciimacronmod<1>} == '1'.
• The instruction behaves as if \texttt{A:I:F} == '000'.

Notes for all encodings

Hint instructions: In encoding T2, if the \texttt{i\textasciimacronmod} field is 00 and the M bit is 0, a hint instruction is encoded. To determine which hint instruction, see \textit{Branches and miscellaneous control} on page F3-4192.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 \textit{Architectural Constraints on UNPREDICTABLE Behaviors}.

Assembler symbols

\texttt{<q>} \quad \textit{See Standard assembler syntax fields} on page F2-4120.

\texttt{<iflags>} \quad \textit{Is a sequence of one or more of the following, specifying which interrupt mask bits are affected:}

\begin{itemize}
  \item \texttt{a} \quad \textit{Sets the A bit in the instruction, causing the specified effect on PSTATE.A, the SError interrupt mask bit.}
  \item \texttt{i} \quad \textit{Sets the I bit in the instruction, causing the specified effect on PSTATE.I, the IRQ interrupt mask bit.}
  \item \texttt{f} \quad \textit{Sets the F bit in the instruction, causing the specified effect on PSTATE.F, the FIQ interrupt mask bit.}
\end{itemize}

\texttt{<mode>} \quad \textit{Is the number of the mode to change to, in the range 0 to 31, encoded in the "mode" field.}

Operation for all encodings

\begin{verbatim}
if CurrentInstrSet() == InstrSet_A32 then
  EncodingSpecificOperations();
  if PSTATE.EL != EL0 then
    if enable then
      if affectA then PSTATE.A = '0';

        if changemode then
            // AArch32.WriteModeByInstr() sets PSTATE.IL to 1 if this is an illegal mode change.
            AArch32.WriteModeByInstr(mode);
F5.1.39   CRC32

CRC32 performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x04C11DB7 is used for the CRC calculation.

In Armv8-A, this is an OPTIONAL instruction, and in Armv8.1 it is mandatory for all implementations to implement it.

--- Note ---
ID_ISAR5.CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

--- A1 ---

```plaintext
if InITBlock() then UNPREDICTABLE;
if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
```

**CONSTRAINED UNPREDICTABLE behavior**

If size == 64, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: size = 32.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- `<q>` See Standard assembler syntax fields on page F2-4120. An CRC32 instruction must be unconditional.
- `<Rd>` Is the general-purpose accumulator output register, encoded in the "Rd" field.
- `<Rn>` Is the general-purpose accumulator input register, encoded in the "Rn" field.
- `<Rm>` Is the general-purpose data source register, encoded in the "Rm" field.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();

    acc = R[n];             // accumulator
    val = R[m]<size-1:0>;   // input value
    poly = (if crc32c then 0x1EDC6F41 else 0x04C11DB7)<31:0>;
    tempacc = BitReverse(acc):Zeros(size);
    tempval = BitReverse(val):Zeros(32);
    R[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.40  

**CRC32C**

CRC32C performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x1EDC6F41 is used for the CRC calculation.

In Armv8-A, this is an **OPTIONAL** instruction, and in Armv8.1 it is mandatory for all implementations to implement it.

---

**Note**

ID_ISAR5.CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.41 CSDB

Consumption of Speculative Data Barrier is a memory barrier that controls speculative execution and data value prediction.

No instruction other than branch instructions and instructions that write to the PC appearing in program order after the CSDB can be speculatively executed using the results of any:

- Data value predictions of any instructions.
- PSTATE.\{N,Z,C,V\} predictions of any instructions other than conditional branch instructions and conditional instructions that write to the PC appearing in program order before the CSDB that have not been architecturally resolved.

--- Note ---

For purposes of the definition of CSDB, PSTATE.\{N,Z,C,V\} is not considered a data value. This definition permits:

- Control flow speculation before and after the CSDB.
- Speculative execution of conditional data processing instructions after the CSDB, unless they use the results of data value or PSTATE.\{N,Z,C,V\} predictions of instructions appearing in program order before the CSDB that have not been architecturally resolved.

DBG{<c>}{<q>} #<option>

Decode for this encoding

// DBG executes as a NOP. The 'option' field is ignored

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<option>` Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "option" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
F5.1.43  DCPS1

Debug Change PE State to EL1 allows the debugger to move the PE into EL1 from EL0 or to a specific mode at the current Exception Level.

DCPS1 is UNDEFINED if any of:

- The PE is in Non-debug state.
- EL2 is implemented, EL2 is implemented and enabled in the current Security state, and any of:
  - EL2 is using AArch32 and HCR.TGE is set to 1.
  - EL2 is using AArch64 and HCR_EL2.TGE is set to 1.

When the PE executes DCPS1 at EL0, EL1 or EL3:

- If EL3 or EL1 is using AArch32, the PE enters SVC mode and LR_svc, SPSR_svc, DLR, and DSPSR become UNKNOWN. If DCPS1 is executed in Monitor mode, SCR.NS is cleared to 0.
- If EL1 is using AArch64, the PE enters EL1 using AArch64, selects SP_EL1, and ELR_EL1, ESR_EL1, SPSR_EL1, DLR_EL0 and DSPSR_EL0 become UNKNOWN.

When the PE executes DCPS1 at EL2 the PE does not change mode, and ELR_hyp, HSR, SPSR_hyp, DLR and DSPSR become UNKNOWN.

For more information on the operation of this instruction, see DCPS<n> on page H2-7042.

Assembler symbols

<*> For encoding A1: see Standard assembler syntax fields on page F2-4120. Must be AL or omitted.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

<*> See Standard assembler syntax fields on page F2-4120.

<*> Specifies an optional limitation on the barrier operation. Values are:

SY Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Can be omitted. This option is referred to as the full system barrier. Encoded as option = 0b1111.

ST Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. SYST is a synonym for ST. Encoded as option = 0b1110.

LD Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1101.
ISH  Inner Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b1011.

ISHST Inner Shareable is the required shareability domain, writes are the required access type both before and after the barrier instruction. Encoded as option = 0b1010.

ISHLD Inner Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1001.

NSH Non-shareable is the required shareability domain, reads and writes are the required access, both before and after the barrier instruction. Encoded as option = 0b0111.

NSHST Non-shareable is the required shareability domain, writes are the required access type both before and after the barrier instruction. Encoded as option = 0b0110.

NSHLD Non-shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0101.

OSH Outer Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b0011.

OSHST Outer Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b0010.

OSHLD Outer Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0001.

For more information on whether an access is before or after a barrier instruction, see Data Memory Barrier (DMB) on page E2-4032. All other encodings of option are reserved. All unsupported and reserved options must execute as a full system DMB operation, but software must not rely on this behavior.

---

**Note**

The instruction supports the following alternative <option> values, but Arm recommends that software does not use these alternative values:

- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST as an alias for NSHST.

F5.1.48 EOR, EORS (immediate)

Bitwise Exclusive OR (immediate) performs a bitwise Exclusive OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for \( <Rd> \) identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_{current_mode}.
  - The PE checks SPSR_{current_mode} for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

  \[\text{PSTATE}.N = \text{result}<31>;}\]
  \[\text{PSTATE}.Z = \text{IsZeroBit(result);}\]
  \[\text{PSTATE}.C = \text{carry};\]

  // PSTATE.V unchanged
Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.49  EOR, EORS (register)

Bitwise Exclusive OR (register) performs a bitwise Exclusive OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

• The EOR variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.

• The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
  — The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  — The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  — The instruction is UNDEFINED in Hyp mode.
  — The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

// Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.
Assembler symbols

<
See Standard assembler syntax fields on page F2-4120.

>
See Standard assembler syntax fields on page F2-4120.

<Rdn>
Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd>
For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:
- For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn>
For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm>
For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift>
Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
- LSL when stype = 00
- LSR when stype = 01
- ASR when stype = 10
- ROR when stype = 11

<amount>
For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:
- Outside an IT block, if EORS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EORS <Rd>, <Rn> had been written.
- Inside an IT block, if EOR<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EOR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
  result = R[n] EOR shifted;
  if d == 15 then          // Can only occur for A32 encoding
    if setflags then
      ALUExceptionReturn(result);
    else
      ALUWritePC(result);
  else
    // Handle other encodings here...
else
  \texttt{R[d] = result;}
  \texttt{if setflags then}
    \texttt{PSTATE.N = result<31>};
    \texttt{PSTATE.Z = IsZeroBit(result);}
    \texttt{PSTATE.C = carry;}
    // PSTATE.V unchanged

\textbf{Operational information}

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.50 EOR, EORS (register-shifted register)

Bitwise Exclusive OR (register-shifted register) performs a bitwise Exclusive OR of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

Not flag setting variant

Applies when \( S = 0 \).

\( \text{EOR} \{<c>\} \{<q>\} \{<Rd>,\} <Rn>, <Rm>, <\text{shift}> <\text{Rs}> \)

Decode for all variants of this encoding

\[
d = \text{UInt}(Rd); \quad n = \text{UInt}(Rn); \quad m = \text{UInt}(Rm); \quad s = \text{UInt}(Rs);
setflags = (S == \'1\'); \quad \text{shift} = \text{DecodeRegShift}(	ext{stype});
\text{if } d == 15 || n == 15 || m == 15 || s == 15 \text{ then UNPREDICTABLE;}
\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-4120.
\(<q>\) See Standard assembler syntax fields on page F2-4120.
\(<Rd>\) Is the general-purpose destination register, encoded in the "Rd" field.
\(<Rn>\) Is the first general-purpose source register, encoded in the "Rn" field.
\(<Rm>\) Is the second general-purpose source register, encoded in the "Rm" field.
\(<\text{shift}>\) Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

- LSL when \( \text{stype} = 00 \)
- LSR when \( \text{stype} = 01 \)
- ASR when \( \text{stype} = 10 \)
- ROR when \( \text{stype} = 11 \)
\(<\text{Rs}>\) Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.51   ERET

Exception Return.

The PE branches to the address held in the register holding the preferred return address, and restores PSTATE from SPSR_<current_mode>.

The register holding the preferred return address is:

- ELR_hyp, when executing in Hyp mode.
- LR, when executing in a mode other than Hyp mode, User mode, or System mode.

The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.

Exception Return is CONSTRAINED UNPREDICTABLE in User mode and System mode.

In Debug state, the T1 encoding of ERET executes the DRPS operation.

\text{Assembler symbols}

\text{<q>}

See Standard assembler syntax fields on page F2-4120. An HLT instruction must be unconditional.

\text{<imm>}

For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is for assembly and disassembly only. It is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.
For encoding T1: is a 6-bit unsigned immediate, in the range 0 to 63, encoded in the "imm6" field. This value is for assembly and disassembly only. It is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

**Operation for all encodings**

```
EncodingSpecificOperations();
Halt(DebugHalt_HaltInstruction);
```
F5.1.54   HVC

Hypervisor Call causes a Hypervisor Call exception. For more information see Hypervisor Call (HVC) exception on page G1-5784. Non-secure software executing at EL1 can use this instruction to call the hypervisor to request a service.

The HVC instruction is:

- UNDEFINED in Secure state, and in User mode in Non-secure state.
- When SCR.HCE is set to 0, UNDEFINED in Non-secure EL1 modes and CONSTRAINED UNPREDICTABLE in Hyp mode.

On executing an HVC instruction, the HSR reports the exception as a Hypervisor Call exception, using the EC value 0x12, and captures the value of the immediate argument, see Use of the HSR on page G5-6078.

Decode for this encoding

imm16 = imm4:imm12;
if InITBlock() then UNPREDICTABLE;
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<q> See Standard assembler syntax fields on page F2-4120. An HVC instruction must be unconditional.

<imm16> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is for assembly and disassembly only. It is reported in the HSR but otherwise is ignored by hardware. An HVC handler might interpret imm16, for example to determine the required service.

For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. This value is for assembly and disassembly only. It is reported in the HSR but otherwise is ignored by hardware. An HVC handler might interpret imm16, for example to determine the required service.

Operation for all encodings

EncodingSpecificOperations();

\textbf{Assembler symbols}

{c} For encoding A1: see Standard assembler syntax fields on page F2-4120. Must be AL or omitted.

For encoding T1: see Standard assembler syntax fields on page F2-4120.

{q} See Standard assembler syntax fields on page F2-4120.

<option> Specifies an optional limitation on the barrier operation. Values are:

SY Full system barrier operation, encoded as option = 0b1111. Can be omitted.

All other encodings of option are reserved. The corresponding instructions execute as full system barrier operations, but must not be relied upon by software.

\textbf{Operation for all encodings}

\begin{verbatim}
if ConditionPassed() then
    EncodingSpecificOperations();
    InstructionSynchronizationBarrier();
\end{verbatim}
F5.1.56   IT

If-Then makes up to four following instructions (the IT block) conditional. The conditions for the instructions in the IT block are the same as, or the inverse of, the condition the IT instruction specifies for the first instruction in the block.

The IT instruction itself does not affect the condition flags, but the execution of the instructions in the IT block can change the condition flags.

16-bit instructions in the IT block, other than CMP, CMN and TST, do not set the condition flags. An IT instruction with the AL condition can change the behavior without conditional execution.

The architecture permits exception return to an instruction in the IT block only if the restoration of the CPSR restores PSTATE.IT to a state consistent with the conditions specified by the IT instruction. Any other exception return to an instruction in an IT block is UNPREDICTABLE. Any branch to a target instruction in an IT block is not permitted, and if such a branch is made it is UNPREDICTABLE what condition is used when executing that target instruction and any subsequent instruction in the IT block.

Many uses of the IT instruction are deprecated for performance reasons, and an implementation might include ITD controls that can disable those uses of IT, making them UNDEFINED.

For more information see Conditional execution on page F2-4121 and Conditional instructions on page F1-4077. The first of these sections includes more information about the ITD controls.

T1

|15 14 13 12|11 10 9 8 |7 4 3 0 |
|---|---|---|---|---|---|---|---|
|1 0 1 1 1 1 1 1 | firstcond | l=0000 | mask |

T1 variant

IT{<x>{<y>{<z>}}}{<q>}  <cond>

Decode for this encoding

if mask == '0000' then SEE "Related encodings";
if firstcond == '1111' || (firstcond == '1110' && BitCount(mask) != 1) then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If firstcond == '1111' || (firstcond == '1110' && BitCount(mask) != 1), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The '1111' condition is treated as being the same as the '1110' condition, meaning always, and the ITSTATE state machine is progressed in the same way as for any other cond_base value.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Related encodings: Miscellaneous 16-bit instructions on page F3-4155.
Assembler symbols

<-> The condition for the second instruction in the IT block. If omitted, the "mask" field is set to 0b1000. If present it is encoded in the "mask[3]" field:
    T    firstcond[0]
    E    NOT firstcond[0]

<y> The condition for the third instruction in the IT block. If omitted and <-> is present, the "mask[2:0]" field is set to 0b100. If <y> is present it is encoded in the "mask[2]" field:
    T    firstcond[0]
    E    NOT firstcond[0]

<z> The condition for the fourth instruction in the IT block. If omitted and <y> is present, the "mask[1:0]" field is set to 0b10. If <z> is present, the "mask[0]" field is set to 1, and it is encoded in the "mask[1]" field:
    T    firstcond[0]
    E    NOT firstcond[0]

<q> See Standard assembler syntax fields on page F2-4120.

<cond> The condition for the first instruction in the IT block, encoded in the "firstcond" field. See Table F2-1 on page F2-4121 for the range of conditions available, and the encodings.

The conditions specified in an IT instruction must match those specified in the syntax of the instructions in its IT block. When assembling to A32 code, assemblers check IT instruction syntax for validity but do not generate assembled instructions for them. See Conditional instructions on page F1-4077.

Operation

EncodingSpecificOperations();
AArch32.CheckITEnabled(mask);
PSTATE.IT<7:0> = firstcond:mask;
ShouldAdvanceIT = FALSE;

\(<\text{Rn}>\) Is the general-purpose base register, encoded in the "Rn" field.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    R[t] = ZeroExtend(MemO[address, 2], 32);

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.64   LDC (immediate)

Load data to System register (immediate) calculates an address from a base register value and an immediate offset, loads a word from memory, and writes it to the DBGDTRTXint System register. It can use offset, post-indexed, pre-indexed, or unindexed addressing. For information about memory accesses see Memory accesses on page F2-4125.

In an implementation that includes EL2, the permitted LDC access to DBGDTRTXint can be trapped to Hyp mode, meaning that an attempt to execute an LDC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see Trapping general Non-secure System register accesses to debug registers on page G1-5843.

For simplicity, the LDC pseudocode does not show this possible trap to Hyp mode.

A1

Offset variant
Applies when \( P = 1 && W = 0 \).

\[

imm32 = ZeroExtend(imm8:'00', 32); \( index = (P == '1'); \)
add = (U == '1'); wback = (W == '1');

**Assembler symbols**

\(<c>\) See Standard assembler syntax fields on page F2-4120.
\(<q>\) See Standard assembler syntax fields on page F2-4120.
\(<Rn>\) Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see LDC (literal).
\(<option>\) Is an 8-bit immediate, in the range 0 to 255 enclosed in \{ \}, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.

\(+/-\) Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when \( U == 0 \)
+ when \( U == 1 \)

\(<imm>\) Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as \(<imm>/4\).

**Operation for all encodings**
if ConditionPassed() then
   EncodingSpecificOperations();
   offset_addr = if add then \( R[n] + \)imm32 else \( R[n] - \)imm32;
   address = if index then offset_addr else \( R[n]; \)

   // System register write to DBGDT Rexint.
   DBGDT_EL0[] = Mem(address,4);
   if wback then \( R[n] = offset_addr; \)

**Operational information**
If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.65  LDC (literal)

Load data to System register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to the DBGDTRTXint System register. For information about memory accesses see Memory accesses on page F2-4125.

In an implementation that includes EL2, the permitted LDC access to DBGDTRTXint can be trapped to Hyp mode, meaning that an attempt to execute an LDC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see Trapping general Non-secure System register accesses to debug registers on page G1-5843.

For simplicity, the LDC pseudocode does not show this possible trap to Hyp mode.

LDC{<c>}{<q>} p14, c5, <label>
LDC{<c>}{<q>} p14, c5, [PC, #{+/-}<imm>]
**Decode for this encoding**

if $P == '0' \&\& U == '0' \&\& W == '0'$ then UNDEFINED;
index = ($P == '1$);  add = ($U == '1$);  cp = 14;  imm32 = ZeroExtend(imm8:'00', 32);
if $W == '1' || (P == '0' \& CurrentInstrSet() \neq InstrSet_A32)$ then UNPREDICTABLE;

**CONSTRAINED UNPREDICTABLE behavior**

If $W == '1' || P == '0'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes as LDC (immediate) with writeback to the PC. The instruction is handled as described in *Using R15 on page K1-7941*.

**Assembler symbols**

- See *Standard assembler syntax fields on page F2-4120*.
- See *Standard assembler syntax fields on page F2-4120*.
- Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.
- Is the label of the literal data item that is to be loaded into $<Rt>$. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020.
  - If the offset is zero or positive, imm32 is equal to the offset and add == TRUE (encoded as U == 1).
  - If the offset is negative, imm32 is equal to minus the offset and add == FALSE (encoded as U == 0).
- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
  - - when $U = 0$
  - + when $U = 1$
- Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as $<imm>/4$.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax on page F1-4077*.

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations();
  offset_addr = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
  address = if index then offset_addr else Align(PC,4);
  DBGDTR_EL0[] = MemA[address,4];

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
**F5.1.66 LDM, LDMIA, LDMFD**

Load Multiple (Increment After, Full Descending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the highest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC on page F2-4126.*

Armv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see FEAT_LSMOAC. The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.* Related system instructions are LDM (User registers) and LDM (exception return).

This instruction is used by the alias POP (multiple registers). See *Alias conditions on page F5-4438* for details of when each alias is preferred.

**A1**

| 31 | 28|27 |26 |25 |24 |23 |22 |21 |20 |19 |16|15 | | | | | 0 |
| !=1111 | 1 | 0 | 0 | 1 | 0 | 1 | W | 1 | Rn | | | | | | | | | | | \[register\_list\] |

**A1 variant**

LDM{IA}{<c>}{<q}> <Rn>{!}, <registers> // Preferred syntax
LDMFD{<c>}{<q}> <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

**Decode for this encoding**

\[\text{if wback } \&\& \text{ registers}^{<n} == '1' \text{ then UNPREDICTABLE;}\]

**CONSTRAINED UNPREDICTABLE behavior**

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If wback \& registers^{<n} == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

<tr>
<td>POP (multiple registers)</td>
<td>A1</td>
<td>( W == '1' &amp;&amp; Rn == '1101' &amp;&amp; \text{BitCount}(register_list) &gt; 1 )</td>
</tr>
</tbody>
</table>

Assembler symbols

- \( \text{IA} \): Is an optional suffix for the Increment After form.
- \( <> \): See Standard assembler syntax fields on page F2-4120.
- \( <p> \): See Standard assembler syntax fields on page F2-4120.
- \( <\text{Rn}> \): Is the general-purpose base register, encoded in the "Rn" field.
- !: For encoding A1 and T2: the address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
For encoding T1: the address adjusted by the size of the data loaded is written back to the base register. It is omitted if \(<Rn>\) is included in \(<\text{registers}>\), otherwise it must be present.

\(<\text{registers}>\) For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by \{ and \}. The PC can be in the list.

Arm deprecates using these instructions with both the LR and the PC in the list.

For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by \{ and \}. The registers in the list must be in the range R0-R7, encoded in the "register_list" field.

For encoding T2: is a list of one or more registers to be loaded, separated by commas and surrounded by \{ and \}. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0.

If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations();
    for i = 0 to 14
        if registers\(i\) == '1' then
            \(R[i] = \text{MemA}[\text{address},4]; \) address = address + 4;
        if registers\(15\) == '1' then
            \(\text{LoadWritePC(MemA[address,4])};\)
        if wback && registers\(n\) == '0' then \(R[n] = R[n] + 4\times\text{BitCount(registers)};\)
        if wback && registers\(n\) == '1' then \(R[n] = \text{bits(32)}\) UNKNOWN;

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.67 LDM (exception return)

Load Multiple (exception return) loads multiple registers from consecutive memory locations using an address from a base register. The SPSR of the current mode is copied to the CPSR. An address adjusted by the size of the data loaded can optionally be written back to the base register.

The registers loaded include the PC. The word loaded for the PC is treated as an address and a branch occurs to that address.

Load Multiple (exception return) is:

- UNDEFINED in Hyp mode.
- UNPREDICTABLE in debug state, and in User mode and System mode.

A1

A1 variant

LDM{<amode>}{<c>}{<q>} <Rn>{!}, <registers_with_pc>^  

Decode for this encoding

\[
\begin{align*}

\end{align*}
\]

CONSTRAINED UNPREDICTABLE behavior

If \text{wback} \ \& \ \text{registers}<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all the loads using the specified addressing mode and the content of the register being written back is UNKNOWN. In addition, if an exception occurs during the execution of this instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

\(<\text{amode}>\) is one of:

- DA: Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as \(P = 0, U = 0\).
- FA: Full Ascending. For this instruction, a synonym for DA.
- DB: Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as \(P = 1, U = 0\).
- EA: Empty Ascending. For this instruction, a synonym for DB.
IA     Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as $P = 0, U = 1$.

FD     Full Descending. For this instruction, a synonym for IA.

IB     Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as $P = 1, U = 1$.

ED     Empty Descending. For this instruction, a synonym for IB.

See Standard assembler syntax fields on page F2-4120.

See Standard assembler syntax fields on page F2-4120.

The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers_with_pc> Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must be specified in the register list, and the instruction causes a branch to the address (data) loaded into the PC. See also Encoding of lists of general-purpose registers and the PC on page F2-4126.

Instructions with similar syntax but without the PC included in the registers list are described in LDM (User registers).

Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elsif PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;                          // UNDEFINED or NOP
    else
        length = 4*BitCount(registers) + 4;
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;
        for i = 0 to 14
            if registers<i> == '1' then
                R[i] = MemA[address,4]; address = address + 4;
                new_pc_value = MemA[address,4];
            if wback && registers<n> == '0' then R[n] = if increment then R[n]+length else R[n]-length;
            if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
        AArch32.ExceptionReturn(new_pc_value, SPSR[]);

CONSTRANDED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.68   LDM (User registers)

In an EL1 mode other than System mode, Load Multiple (User registers) loads multiple User mode registers from consecutive memory locations using an address from a base register. The registers loaded cannot include the PC. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Load Multiple (User registers) is undefined in Hyp mode, and unpredictable in User and System modes.

Armv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see FEAT_LSMAOC.

A1

```
A1 variant
LDM{<amode>}{<c>}{<q>} <Rn>, <registers_without_pc>
```

Decode for this encoding

```
n = UInt(Rn); registers = register_list; increment = (U == '1'); wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRANDED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

Notes for all encodings

For more information about the CONSTRANDED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

```
<amode>  is one of:
DA       Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
FA       Full Ascending. For this instruction, a synonym for DA.
DB       Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
EA       Empty Ascending. For this instruction, a synonym for DB.
IA       Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
FD       Full Descending. For this instruction, a synonym for IA.
IB       Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
```
ED Empty Descending. For this instruction, a synonym for IB.

See Standard assembler syntax fields on page F2-4120.

See Standard assembler syntax fields on page F2-4120.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<registers_without_pc> Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded by the LDM instruction. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must not be in the register list. See also Encoding of lists of general-purpose registers and the PC on page F2-4126.

Instructions with similar syntax but with the PC included in <registers_without_pc> are described in LDM (exception return).

Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then UNDEFINED;
    elsif PSTATE.M IN {M32_User,M32_System} then UNPREDICTABLE;

Assembler symbols

- \( \langle c\rangle \): See Standard assembler syntax fields on page F2-4120.
- \( \langle p\rangle \): See Standard assembler syntax fields on page F2-4120.
- \( \langle Rt\rangle \): For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- \( \langle Rn\rangle \): For encoding A1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDR (literal).
- For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
+-

Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
+ when U = 1

+  

Specifies the offset is added to the base register.

<imm>

For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4.

For encoding T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 and encoded in the "imm8" field as <imm>/4.

For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

**Operation for all encodings**

```c
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,4];
    if wback then R[n] = offset_addr;
    if t == 15 then
      if address<1:0> == '00' then
        LoadWritePC(data);
      else
        UNPREDICTABLE;
    else
      R[t] = data;
  else
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,4];

    if t == 15 then
      if address<1:0> == '00' then
        LoadWritePC(data);
      else
        UNPREDICTABLE;
    else
      R[t] = data;
```

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.73  LDR (literal)

Load Register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to a register. For information about memory accesses see Memory accesses on page F2-4125.

A1

![Instruction Format]

A1 variant

Applies when !(P == 0 && W == 1).

LDR{<c>}{<q>} <Rt>, <label> // Normal form
LDR{<c>}{<q>} <Rt>, [PC, #{+/-}imm] // Alternative form

Decode for this encoding

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in LDR (immediate). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in Using R15 on page K1-7941.

T1

![Instruction Format]

T1 variant

LDR{<c>}{<q>} <Rt>, <label> // Normal form

Decode for this encoding

T2

![Instruction Format]
T32 and A32 Base Instruction Set Instruction Descriptions
F5.1 Alphabetical list of T32 and A32 base instruction set instructions

T2 variant

LDR\{<c>}.W <Rt>, <label> // Preferred syntax, and <Rt>, <label> can be represented in T1
LDR\{<c>\{<q>\} <Rt>, <label> // Preferred syntax
LDR\{<c>\{<q>\} <Rt>, [PC, #{+/-}<imm>] // Alternative syntax

Decode for this encoding

t = UInt(Rt);  imm32 = ZeroExtend(imm12, 32);  add = (U == '1');
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-4120.
\(<q>\) See Standard assembler syntax fields on page F2-4120.
\(<Rt>\) For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The SP can be used. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.

\(<label>\) For encoding A1 and T2: the label of the literal data item that is to be loaded into \(<Rt>\). The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are -4095 to 4095.
If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1.
If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.
For encoding T1: the label of the literal data item that is to be loaded into \(<Rt>\). The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are Multiples of four in the range 0 to 1020.

\(+/-\) Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1

\(<imm>\) For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
For encoding T2: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-4077.
Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  base = Align(PC,4);
  address = if add then (base + imm32) else (base - imm32);
  data = MemU[address,4];
  if t == 15 then
    if address<1:0> == '00' then
      LoadWritePC(data);
    else
      UNPREDICTABLE;
  else
    R[t] = data;

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
LDR (register)

Load Register (register) calculates an address from a base register value and an offset register value, loads a word from memory, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses, see Memory accesses on page F2-4125.

The T32 form of LDR (register) does not support register writeback.

A1

```
| 31 | 28|27 26 25 24|23 22 21 20|19 16|15 12|11 | 7 6 5 4 3 0 |

(shift_t, shift_n) = (SRType_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if t == 15 && !InITBlock() && !LastInITBlock() then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<>
See Standard assembler syntax fields on page F2-4120.

<>
See Standard assembler syntax fields on page F2-4120.

<
For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This branch is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.

For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.

<Rn>
For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

+/-
 Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when \( U = 0 \)
+ when \( U = 1 \)
+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-4123.

<imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

if CurrentInstrSet() == InstrSet_A32 then
if ConditionPassed() then
  EncodingSpecificOperations();
  offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
  offset_addr = if add then (R[n] + offset) else (R[n] - offset);

</table>

**A1 variant**

Applies when !(P == 0 && W == 1).

LDRB{<c>}{<q>} <Rt>, <label> // Normal form
LDRB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

**Decode for this encoding**

if P == '0' && W == '1' then SEE "LDRBT";

\[
t = \text{UInt}(Rt); \quad \text{imm32} = \text{ZeroExtend}(\text{imm12}, 32);
\]

\[
\text{add} = (U == '1'); \quad \text{wback} = (P == '0') || (W == '1');
\]

if t == 15 || wback then UNPREDICTABLE;

**CONSTRAINED UNPREDICTABLE behavior**

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in LDRB (immediate). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in Using R15 on page K1-7941.

// Armv8-A removes UNPREDICTABLE for R13
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<
See Standard assembler syntax fields on page F2-4120.

>
See Standard assembler syntax fields on page F2-4120.

<r>
Is the general-purpose register to be transferred, encoded in the "Rt" field.

<label>
The label of the literal data item that is to be loaded into <r>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are -4095 to 4095.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1.
If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

+/−
Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1

<imm>
For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-4077.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC, 4);
    address = if add then (base + imm32) else (base - imm32);
    Rt = ZeroExtend(MemU[address,1], 32);

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.77  LDRB (register)

Load Register Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses see Memory accesses on page F2-4125.

A1

| 31 28|27 26 25 24|23 22 21 20|19 16|15 12|11 7 6 5 4 3 0 |
|---|---|---|---|---|---|---|---|

Assembler symbols

- \(<c>\) See Standard assembler syntax fields on page F2-4120.
- \(<p>\) See Standard assembler syntax fields on page F2-4120.
- \(<Rt>\) Is the general-purpose register to be transferred, encoded in the "Rt" field.
- \(<Rn>\) For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
  For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
  - when \(U = 0\)
  + when \(U = 1\)
- + Specifies the index register is added to the base register.
- \(<Rm>\) Is the general-purpose index register, encoded in the "Rm" field.
- \(<\text{shift}>\) The shift to apply to the value read from \(<Rm>\). If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-4123.
- \(<\text{imm}>\) If present, the size of the left shift to apply to the value from \(<Rm>\), in the range 1-3. \(<\text{imm}>\) is encoded in imm2. If absent, no shift is specified and imm2 is encoded as \(0b00\).
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    R[t] = ZeroExtend(MemU[address,1],32);
    if wback then R[n] = offset_addr;

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.78 LDRBT

Load Register Byte Unprivileged loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-4125.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

- See Standard assembler syntax fields on page F2-4120.
- See Standard assembler syntax fields on page F2-4120.
- For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.
  For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
- Is the general-purpose base register, encoded in the "Rn" field.
- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

  - when \( U = 0 \)
  - when \( U = 1 \)
For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when \( U = 0 \)
+ when \( U = 1 \)

\(<Rm>\) Is the general-purpose index register, encoded in the "Rm" field.

\(<shift>\) The shift to apply to the value read from \(<Rm>\). If absent, no shift is applied. Otherwise, see *Shifts applied to a register* on page F2-4123.

+ Specifies the offset is added to the base register.

\(<imm>\) For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

**Operation for all encodings**

```c
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE; // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    R[t] = ZeroExtend(MemU_unpriv[address,1],32);
    if postindex then R[n] = offset_addr;
```

**CONSTRAINED UNPREDICTABLE behavior**

If \( PSTATE.EL == EL2 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as \textbf{NOP}.
- The instruction executes as \textbf{LDRB} (immediate).

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.79   LDRD (immediate)

Load Register Dual (immediate) calculates an address from a base register value and an immediate offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory accesses on page F2-4125.

A1

```
[31 28|27 26 25 24|23 22 21 20|19 16|15 12|11 8 | 7 6 5 4 | 3 0 |

If wback && (n == t || n == t2), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If t == t2, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The load instruction executes but the destination register takes an UNKNOWN value.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

<
See Standard assembler syntax fields on page F2-4120.

>
See Standard assembler syntax fields on page F2-4120.

Rt
For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

Rt2
For encoding A1: is the second general-purpose register to be transferred. This register must be \(<R(t+1)>\).

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

Rn
Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRD (literal).

\+/-
Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when \(U = 0\)
+ when \(U = 1\)

imm
For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as \(<imm>/4\).

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations();
  offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);

    R[t2] = MemA[address+4,4];
  if wback then R[n] = offset_addr;

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.80   LDRD (literal)

Load Register Dual (literal) calculates an address from the PC value and an immediate offset, loads two words from memory, and writes them to two registers. For information about memory accesses see Memory accesses on page F2-4125.

A1

| 31 28|27 26 25 24|23 22 21 20|19 18 17 16|15 12|11 8 7 6 5 4 3 0 |
|------|-----------|-----------|-----------|------|---------|---------|---------|
| !=1111 0 0 0 |1|U|1|0|0|1|1|1|Rt|imm4H|1|1|0|1|imm4L|

cond

A1 variant

LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form
LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #{+/-}<imm>] // Alternative form

Decode for this encoding

if Rt<0> == '1' then UNPREDICTABLE;

if P == '0' || W == '1', then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction executes with the additional decode: t<0> = '0';
• The instruction executes with the additional decode: t2 = t;
• The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when Rt == '1111'.

T1

| 15 14 13|12|11 10 9 8 7 6 5 4 3 2 1 0 |15 12|11 8 7 |
|---------|------|-----------|---------|
| 1 1 1 0 1 0 0 |P|U|1|W|1|1|1|1|Rt|Rt2|imm8|

T1 variant

Applies when !(P == 0 && W == 0).

LDRD{<c>}{<q>} <Rt>, <Rt2>, <label> // Normal form
LDRD{<c>}{<q>} <Rt>, <Rt2>, [PC, #{+/-}<imm>] // Alternative form
Decode for this encoding

if \( P == '0' \) && \( W == '0' \) then SEE "Related encodings";
\( t = \text{UInt}(Rt); \ t2 = \text{UInt}(Rt2); \)
\( \text{imm32} = \text{ZeroExtend}(\text{imm8(':', '00'), 32}); \ \text{add} = (U == '1'); \)
if \( t == 15 \) || \( t2 == 15 \) || \( t == t2 \) then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if \( W == '1' \) then UNPREDICTABLE;

**CONSTRAINED UNPREDICTABLE behavior**

If \( t == t2 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

If \( W == '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses post-indexed addressing when \( P == '0' \) and uses pre-indexed addressing otherwise. The instruction is handled as described in Using R15 on page K1-7941.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- \(<c>\) See Standard assembler syntax fields on page F2-4120.
- \(<q>\) See Standard assembler syntax fields on page F2-4120.
- \(<Rt>\) For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.
- \(<Rt>\) For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
- \(<Rt2>\) For encoding A1: is the second general-purpose register to be transferred. This register must be \(<R(t+1)>\).
- \(<Rt2>\) For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
- \(<\text{label}>\) For encoding A1: the label of the literal data item that is to be loaded into \(<Rt>\). The assembler calculates the required value of the offset from the \(\text{Align}(\text{PC}, 4)\) value of the instruction to this label. Any value in the range -255 to 255 is permitted.
  - If the offset is zero or positive, \(\text{imm32}\) is equal to the offset and \(\text{add} == \text{TRUE}\), encoded as \(U == 1\). If the offset is negative, \(\text{imm32}\) is equal to minus the offset and \(\text{add} == \text{FALSE}\), encoded as \(U == 0\).
  - For encoding T1: the label of the literal data item that is to be loaded into \(<Rt>\). The assembler calculates the required value of the offset from the \(\text{Align}(\text{PC}, 4)\) value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020.
  - If the offset is zero or positive, \(\text{imm32}\) is equal to the offset and \(\text{add} == \text{TRUE}\), encoded as \(U == 1\).
  - If the offset is negative, \(\text{imm32}\) is equal to minus the offset and \(\text{add} == \text{FALSE}\), encoded as \(U == 0\).
+/− Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when $U = 0$
+ when $U = 1$

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-4077.

**Operation for all encodings**

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian() then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];
```

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
LDRD (register)

Load Register Dual (register) calculates an address from a base register value and a register offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory accesses on page F2-4125.

A1

| 31 28|27 26 25 24|23 22 21 20|19 16|15 12|11 10 9 8 | 7 6 5 4 | 3 0 |
|----------------|
| !=1111 0 0 | P U 0 W 0 | Rn | Rt | 0 |0 |0 |1 | 1 0 1 | Rm |

cond

Offset variant

Applies when \( P == 1 \land W == 0 \).

\[
\text{LDRD}\{<c>\}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]
\]

Post-indexed variant

Applies when \( P == 0 \land W == 0 \).

\[
\text{LDRD}\{<c>\}{<q>} <Rt>, <Rt2>, [<Rn>], {+/-}<Rm>
\]

Pre-indexed variant

Applies when \( P == 1 \land W == 1 \).

\[
\text{LDRD}\{<c>\}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]
\]

Decode for all variants of this encoding

\[
\begin{align*}
\text{if } & \text{ Rt}<0 \text{ } = \text{ '1' then UNPREDICTABLE; } \\
& t = \text{ UInt}(Rt); \quad t_2 = t+1; \quad n = \text{ UInt}(Rn); \quad m = \text{ UInt}(Rm); \quad \\
& \text{index} = (P == \text{ '1'}); \quad \text{add} = (U == \text{ '1'}); \quad wback = (P == \text{ '0'}) \lor (W == \text{ '1'}); \quad \\
& \text{if } P == \text{ '0'} \land W == \text{ '1'} \text{ then UNPREDICTABLE; } \\
& \text{if } t_2 == 15 \lor m == 15 \lor m == t \lor m == t_2 \text{ then UNPREDICTABLE; } \\
& \text{if } wback \land (n == 15 \lor n == t \lor n == t_2) \text{ then UNPREDICTABLE; }
\end{align*}
\]

CONSTRANGED UNPREDICTABLE behavior

If \( \text{wback } \land (n == t \lor n == t_2) \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

If \( P == \text{ '0'} \land W == \text{ '1'} \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

If \( n == t \lor m == t_2 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
• The instruction loads register Rm with an UNKNOWN value.

If Rt<0> == '1', then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction executes with the additional decode: t<0> = '0'.
• The instruction executes with the additional decode: t2 = 1.
• The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when Rt == '1111'.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<c> See Standard assembler syntax fields on page F2-4120.
<q> See Standard assembler syntax fields on page F2-4120.
<Rt> Is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.
<Rt2> Is the second general-purpose register to be transferred. This register must be <R(t+1)>.
<Rn> Is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
<+-> Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1
<Rm> Is the general-purpose index register, encoded in the "Rm" field.

Operation

if ConditionPassed() then
  EncodingSpecificOperations();
  offset_addr = if add then (R[n] + R[m]) else (R[n] - R[m]);
  address = if index then offset_addr else R[n];
  if address == Align(address, 8) then
    data = MemA[address,8];
    if BigEndian() then
      R[t] = data<63:32>;
      R[t2] = data<31:0>;
    else
      R[t] = data<31:0>;
      R[t2] = data<63:32>;
  else
    R[t] = MemA[address,4];
    R[t2] = MemA[address+4,4];
  if wback then R[n] = offset_addr;
Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.82   LDREX

Load Register Exclusive calculates an address from a base register value and an immediate offset, loads a word from memory, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see Synchronization and semaphores on page E2-4063. For information about memory accesses see Memory accesses on page F2-4125.

A1

 LDREX{<c>}{<q>} <Rt>, [, {#}<imm>]

Decode for this encoding

t = UInt(Rt);  n = UInt(Rn);  imm32 = Zeros(32); // Zero offset
if t == 15 || n == 15 then UNPREDICTABLE;

T1

 LDREX{<c>}{<q>} <Rt>, [, #<imm>]

Decode for this encoding

t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
if t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

- <c> See Standard assembler syntax fields on page F2-4120.
- <q> See Standard assembler syntax fields on page F2-4120.
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <imm> For encoding A1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can only be 0 or omitted.
For encoding T1: the immediate offset added to the value of \( <Rn> \) to calculate the address. \( <imm> \) can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    AArch32.SetExclusiveMonitors(address,4);
    R[t] = MemA[address,4];
```

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.83   LDREXB

Load Register Exclusive Byte derives an address from a base register value, loads a byte from memory, zero-extends it to form a 32-bit word, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see Synchronization and semaphores on page E2-4063. For information about memory accesses see Memory accesses on page F2-4125.

// Armv8-A removes UNPREDICTABLE for R13
**CONSTRAINED UNPREDICTABLE behavior**

If wback && n == t, then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is **UNKNOWN**. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

**Notes for all encodings**

For more information about the **CONSTRAINED UNPREDICTABLE behavior** of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE Behaviors*.

**Assembler symbols**

\(<c>\) See Standard assembler syntax fields on page F2-4120.

\(<q>\) See Standard assembler syntax fields on page F2-4120.

\(<Rt>\) Is the general-purpose register to be transferred, encoded in the "Rt" field.

\(<Rn>\) For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRH (literal).

For encoding T1: is the general-purpose base register, encoded in the "Rn" field.

\(<imm>\) For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4Hi:imm4Li" field.

For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as \(<imm>/2\).

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

**Operation for all encodings**

```plaintext
if CurrentInstrSet() == InstrSet_A32 then
    if ConditionPassed() then
        EncodingSpecificOperations();
        offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
        address = if index then offset_addr else R[n];
        data = MemU[address,2];
        if wback then R[n] = offset_addr;
        R[t] = ZeroExtend(data, 32);
    else
        if ConditionPassed() then
            EncodingSpecificOperations();
            offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
            address = if index then offset_addr else R[n];
```

```plaintext
+/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0

+ when U = 1

+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4Hi:imm4Li" field.

For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as \(<imm>/2\).

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.
data = MemU[address,2];
if wback then R[n] = offset_addr;
R[t] = ZeroExtend(data, 32);

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.87  LDRH (literal)
Load Register Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword
from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory
accesses see Memory accesses on page F2-4125.

A1

```

// Armv8-A removes UNPREDICTABLE for R13
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<->
See Standard assembler syntax fields on page F2-4120.

<q>
See Standard assembler syntax fields on page F2-4120.

<Rt>
Is the general-purpose register to be transferred, encoded in the "Rt" field.

<label>
For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Any value in the range -255 to 255 is permitted.
If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.
For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are -4095 to 4095.
If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

+/-
Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1

<imm>
For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.
The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-4077.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,2];
    R[t] = ZeroExtend(data, 32);

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.88 LDRH (register)

Load Register Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see Memory accesses on page F2-4125.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.
- `<Rn>` For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
  For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- `/+` Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
  - when \( U = 0 \)
  - when \( U = 1 \)
- `<imm>` If present, the size of the left shift to apply to the value from \(<Rm>\), in the range 1-3. `<imm>` is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations();
  offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
offset_addr = if add then (R[n] + offset) else (R[n] - offset);
address = if index then offset_addr else R[n];
data = MemU[address,2];
if wback then R[n] = offset_addr;
R[t] = ZeroExtend(data, 32);

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.89   LDRHT

Load Register Halfword Unprivileged loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-4125.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1

\[
\begin{array}{|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|}
| 31 & 28 & 27 & 26 & 25 & 24 & 23 & 22 & 21 & 20 & 19 | 16 & 15 | 12 & 11 | 8 & 7 | 6 | 5 | 4 | 3 | 0 |

Decode for this encoding

\[ t = \text{UInt}(Rt); \ n = \text{UInt}(Rn); \ m = \text{UInt}(Rm); \ \text{postindex} = \text{TRUE}; \ \text{add} = (U == '1'); \text{register\_form} = \text{TRUE}; \]
\[ \text{if} \ t == 15 || n == 15 || n == t || m == 15 \text{ then UNPREDICTABLE;} \]

CONSTRAINED UNPREDICTABLE behavior

If \( n == t \&\& n != 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

LDRHT{<c>}{<q>} <Rt>, [Rn], {{+}<imm>}

Decode for this encoding

\[ \text{if} \ Rn == '1111' \text{ then SEE "LDRH (literal)"; } \]
\[ t = \text{UInt}(Rt); \ n = \text{UInt}(Rn); \ \text{postindex} = \text{FALSE}; \ \text{add} = \text{TRUE}; \text{register\_form} = \text{FALSE}; \ \text{imm32} = \text{ZeroExtend}(\text{imm8}, 32); \]
\[ \text{if} \ t == 15 \text{ then UNPREDICTABLE; } // \text{Arm v8-A removes UNPREDICTABLE for R13} \]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

- See Standard assembler syntax fields on page F2-4120.
- See Standard assembler syntax fields on page F2-4120.
- Is the general-purpose register to be transferred, encoded in the "Rt" field.
- Is the general-purpose base register, encoded in the "Rn" field.
For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when $U = 0$
+ when $U = 1$

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when $U = 0$
+ when $U = 1$

$<Rm>$

Is the general-purpose index register, encoded in the "Rm" field.

$+$

Specifies the offset is added to the base register.

$<imm>$

For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

**Operation for all encodings**

```c
if ConditionPassed() then
  if PSTATE.EL == EL2 then UNPREDICTABLE; // Hyp mode
  EncodingSpecificOperations();
  offset = if register_form then R[m] else imm32;
  offset_addr = if add then (R[n] + offset) else (R[n] - offset);
  address = if postindex then R[n] else offset_addr;
  data = MemU_unpriv(address,2);
  if postindex then R[n] = offset_addr;
  R[t] = ZeroExtend(data, 32);
```

**CONSTRAINED UNPREDICTABLE behavior**

If $PSTATE.EL == EL2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRH (immediate).

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.90  LDRSB (immediate)

Load Register Signed Byte (immediate) calculates an address from a base register value and an immediate offset, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory accesses on page F2-4125.

A1

| [31 28|27 26 25 24|23 22 21 20|19 16|15 12|11 8 7 6 5 4 3 0 |

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

* The instruction is UNDEFINED.
* The instruction executes as NOP.
* The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

See Standard assembler syntax fields on page F2-4120.
See Standard assembler syntax fields on page F2-4120.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRSB (literal).

+/− Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when \( U = 0 \)
+ when \( U = 1 \)

+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

## Operation for all encodings

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then \( R[n] + \text{imm32} \) else \( R[n] - \text{imm32} \);
    address = if index then offset_addr else \( R[n] \);
    R[t] = SignExtend(MemU[address,1], 32);
    if wback then \( R[n] = \text{offset_addr} \);
```

## Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.91 LDRSB (literal)

Load Register Signed Byte (literal) calculates an address from the PC value and an immediate offset, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-4125.

A1

| 31 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 12 | 11 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| !0 | 111 | 0 | 0 | 0 | P | U | W | 1 | 1 | 1 | 1 | Rt | imm4H | 1 | 1 | 0 | 1 | imm4L |

A1 variant

Applies when !(P == 0 && W == 1).

LDRSB{<c>}{<q>} <Rt>, <label> // Normal form
LDRSB{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

Decode for this encoding

// Armv8-A removes UNPREDICTABLE for R13
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<c> See Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<label> For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Any value in the range -255 to 255 is permitted.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are -4095 to 4095.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-4077.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    R[t] = SignExtend(MemU[address,1], 32);

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.92  LDRSB (register)

Load Register Signed Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see Memory accesses on page F2-4125.

A1

address = if index then offset_addr else R[n];
R[t] = SignExtend(MemU[address,1], 32);
if wback then R[n] = offset_addr;

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.93  LDRSBT

Load Register Signed Byte Unprivileged loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see Memory accesses on page F2-4125.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1

```
[31 28|27 26 25 24|23 22 21 20]|19 16|15 12|11 8 7 6 5 4 3 0 |
| !=1111 | 0 0 0 | 0 U 1 1 | 1 | Rn | Rt | imm4H | 1 1 0 | 1 | imm4L |
```

A1 variant

LDRSBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}

Decode for this encoding

```
t = Uint(Rt);  n = Uint(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If \( n = 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in Using R15 on page K1-7941.
- The instruction is treated as if bit[24] == '1' and bit[21] == '0'. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If \( n = t \ & n != 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.
A2

LDRSBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Decode for this encoding

1. \( t = \text{UInt}(Rt); \ n = \text{UInt}(Rn); \ m = \text{UInt}(Rm); \ postindex = \text{TRUE}; \ add = (U == '1'); \)

- \(<Rn>\) Is the general-purpose base register, encoded in the "Rn" field.
+/− For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when \( U = 0 \)
+ when \( U = 1 \)

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when \( U = 0 \)
+ when \( U = 1 \)

\(<Rm>\) Is the general-purpose index register, encoded in the "Rm" field.

+ Specifies the offset is added to the base register.

\(<imm>\) For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

**Operation for all encodings**

```c
if ConditionPassed() then
    if PSTATE_EL == EL2 then UNPREDICTABLE; // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    R[t] = SignExtend(MemU_unpriv[address,1], 32);
    if postindex then R[n] = offset_addr;
```

**CONSTRAINED UNPREDICTABLE behavior**

If \( PSTATE_EL == EL2 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRSB (immediate).

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.94   LDRSH (immediate)

Load Register Signed Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory access on page F2-4125.

// Armv8-A removes UNPREDICTABLE for R13
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Related instructions: Load, signed (literal) on page F3-4209.

Assembler symbols

<
See Standard assembler syntax fields on page F2-4120.

>
See Standard assembler syntax fields on page F2-4120.

<Rt>
Is the general-purpose register to be transferred, encoded in the "Rt" field.

<label>
For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Any value in the range -255 to 255 is permitted.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1. If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values of the offset are -4095 to 4095.

If the offset is zero or positive, imm32 is equal to the offset and add == TRUE, encoded as U == 1.

If the offset is negative, imm32 is equal to minus the offset and add == FALSE, encoded as U == 0.

<imm>
For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-4077.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,2];
    R[t] = SignExtend(data, 32);

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.96   LDRSH (register)

Load Register Signed Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see Memory accesses on page F2-4125.

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.97  **LDRSHT**

Load Register Signed Halfword Unprivileged loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F2-4125](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

**LDRSHT** is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

### A1

    if postindex then R[n] = offset_addr;
    R[t] = SignExtend(data, 32);
```

**CONSTRANDED UNPREDICTABLE behavior**

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRSH (immediate).

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.98 LDRT

Load Register Unprivileged loads a word from memory, and writes it to a register. For information about memory accesses see Memory accesses on page F2-4125.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1

```
<table>
<thead>
<tr>
<th>31 28</th>
<th>27 26 25 24</th>
<th>23 22 21 20</th>
<th>19 16</th>
<th>15 12</th>
<th>11</th>
<th></th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>!=1111 0 1 0</td>
<td>0</td>
<td>U</td>
<td>0</td>
<td>1</td>
<td>1</td>
<td>Rn</td>
<td>Rt</td>
</tr>
</tbody>
</table>
```

cond

A1 variant

LDRT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}

**Decode for this encoding**

```
t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

**CONSTRANGED UNPREDICTABLE behavior**

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in Using R15 on page K1-7941.
- The instruction is treated as if bit[24] == '1' and bit[21] == '0'. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If n == t && n != 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.
A2

Decoded for this encoding

\[
t = \text{UInt}(Rt); \quad n = \text{UInt}(Rn); \quad m = \text{UInt}(Rm); \quad \text{postindex} = \text{TRUE}; \quad \text{add} = (U == '1'); \quad \text{register} \_ \text{form} = \text{TRUE}; \quad \text{postindex} = \text{TRUE}; \quad (\text{shift} \_ t, \text{shift} \_ n) = \text{DecodeImmShift} \_ \text{imm5};
\]

If \( t == 15 \) \&\& \( n == 15 \) \&\& \( m == 15 \) then UNPREDICTABLE;

CONSTRUCTED UNPREDICTABLE behavior

If \( n == t \) \&\& \( n != 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

Decoded for this encoding

\[
t = \text{UInt}(Rt); \quad n = \text{UInt}(Rn); \quad m = \text{UInt}(Rm); \quad \text{postindex} = \text{FALSE}; \quad \text{add} = \text{TRUE}; \quad \text{register} \_ \text{form} = \text{FALSE}; \quad \text{imm32} = \text{ZeroExtend} \_ \text{imm8}, 32;
\]

If \( t == 15 \) then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRUCTED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

- <c> See Standard assembler syntax fields on page F2-4120.
- <p> See Standard assembler syntax fields on page F2-4120.
- <Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

T2 and A32 Base Instruction Set Instruction Descriptions

F5.1 Alphabetical list of T32 and A32 base instruction set instructions

ARM DDI 0487F.c

Copyright © 2013-2020 Arm Limited or its affiliates. All rights reserved.

Non-Confidential
<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/− For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-4123.

+ Specifies the offset is added to the base register.

<imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE; // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    data = MemU_unpriv[address,4];
    if postindex then R[n] = offset_addr;
    R[t] = data;

CONstrained UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

• The instruction is UNDEFINED.

• The instruction executes as NOP.

• The instruction executes as LDR (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
**F5.1.99 LSL (immediate)**

Logical Shift Left (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

- `<Rdm>` Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<Rm>` Is the first general-purpose source register, encoded in the "Rm" field.
- `<Rs>` Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

**Operation for all encodings**
The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.
F5.1.101  **LSLS (immediate)**

Logical Shift Left, setting flags (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-5766.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as \(<\text{imm}>\) modulo 32. For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as \(<\text{imm}>\) modulo 32.

**Operation for all encodings**

The description of MOV, MOV\(S\) (register) gives the operational pseudocode for this instruction.
F5.1.104   LSR (register)

Logical Shift Right (register) shifts a register value right by a variable number of bits, shifting in zeros, and writes the result to the destination register. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the MOV, MOVs (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVs (register-shifted register).
- The description of MOV, MOVs (register-shifted register) gives the operational pseudocode for this instruction.

Assembler symbols

{<c>} See Standard assembler syntax fields on page F2-4120.
{<q>} See Standard assembler syntax fields on page F2-4120.
{Rdm} Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.
{Rd} Is the general-purpose destination register, encoded in the "Rd" field.
{Rm} Is the first general-purpose source register, encoded in the "Rm" field.
<Rs> Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.
F5.1.105  LSRS (immediate)

Logical Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

**Operation for all encodings**

The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.
F5.1.107  MCR

Move to System register from general-purpose register or execute a System instruction. This instruction copies the value of a general-purpose register to a System register, or executes a System instruction.

The System register and System instruction descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see About the AArch32 System register interface on page E1-4011 and General behavior of System registers on page G8-6134.

In an implementation that includes EL2, MCR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see EL2 configurable controls on page G1-5827.

Because of the range of possible traps to Hyp mode, the MCR pseudocode does not show these possible traps.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<

See Standard assembler syntax fields on page F2-4120.

>
<coproc> Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:
   p14 when coproc<0> = 0
   p15 when coproc<0> = 1

<opc1> Is the opc1 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc1" field.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<CRn> Is the CRn parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRn" field.

<CRm> Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

<opc2> Is the opc2 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc2" field.

The possible values of { <coproc>, <opc1>, <CRn>, <CRm>, <opc2> } encode the entire System register and System instruction encoding space. Not all of this space is allocated, and the System register and System instruction descriptions identify the allocated encodings.

**Operation for all encodings**

if ConditionPassed() then
   EncodingSpecificOperations();
   AArch32.SysRegWrite(cp, ThisInstr(), R[t]);
F5.1.108 MCRR

Move to System register from two general-purpose registers. This instruction copies the values of two general-purpose registers to a System register.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see About the AArch32 System register interface on page E1-4011 and General behavior of System registers on page G8-6134.

In an implementation that includes EL2, MCRR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCRR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see EL2 configurable controls on page G1-5827.

Because of the range of possible traps to Hyp mode, the MCRR pseudocode does not show these possible traps.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

\[
<
\]

See Standard assembler syntax fields on page F2-4120.
<coproc> Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:
    p14 when coproc<0> = 0
    p15 when coproc<0> = 1

<opc1> Is the opc1 parameter within the System register encoding space, in the range 0 to 15, encoded in the "opc1" field.

<Rt> Is the first general-purpose register that is transferred into, encoded in the "Rt" field.

<Rt2> Is the second general-purpose register that is transferred into, encoded in the "Rt2" field.

<CRm> Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

The possible values of \{<coproc>, <opc1>, <CRm>\} encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify the allocated encodings.

For the permitted uses of these instructions, as described in this manual, <Rt2> transfers bits[63:32] of the selected System register, while <Rt> transfers bits[31:0].

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    value = R[t2]:R[t];
    AArch32.SysRegWrite64(cp, ThisInstr(), value);
```
F5.1.109 MLA, MLAS

Multiply Accumulate multiplies two register values, and adds a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

In an A32 instruction, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

if $d == 15 || n == 15 || m == 15$ then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

{<c>} See Standard assembler syntax fields on page F2-4120.

{<q>} See Standard assembler syntax fields on page F2-4120.

{<Rd>} Is the general-purpose destination register, encoded in the "Rd" field.
<Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Ra> Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = SInt(R[n]);  // operand1 = UInt(R[n]) produces the same final results
    operand2 = SInt(R[m]);  // operand2 = UInt(R[m]) produces the same final results
    addend = SInt(R[a]);    // addend = UInt(R[a]) produces the same final results
    result = operand1 * operand2 + addend;
    R[d] = result<31:0>;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result<31:0>);
        // PSTATE.C, PSTATE.V unchanged

**Operational information**

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.110 MLS

Multiply and Subtract multiplies two register values, and subtracts the product from a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

- `<Rn>` Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- `<Rm>` Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- `<Ra>` Is the third general-purpose source register holding the minuend, encoded in the "Ra" field.
Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  operand1 = SInt(R[n]);  // operand1 = UInt(R[n]) produces the same final results
  operand2 = SInt(R[m]);  // operand2 = UInt(R[m]) produces the same final results
  addend   = SInt(R[a]);  // addend   = UInt(R[a]) produces the same final results
  result = addend - operand1 * operand2;
  R[d] = result<31:0>;

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.111 MOV, MOVS (immediate)

Move (immediate) writes an immediate value to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The MOV variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<
> See Standard assembler syntax fields on page F2-4120.

<
> See Standard assembler syntax fields on page F2-4120.

<Rd>

For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- For the MOVS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding A2, T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<imm8>

Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.

<imm16>

For encoding A2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.

For encoding T3: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.

<const>

For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-4136 for the range of values.

For encoding T2: an immediate value. See Modified immediate constants in T32 instructions on page F2-4135 for the range of values.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
result = imm32;
if d == 15 then          // Can only occur for encoding A1
    if setflags then
        ALUExceptionReturn(result);
    else
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.112 MOV, MOVS (register)

Move (register) copies a value from a register to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The MOV variant of the instruction is a branch. In the T32 instruction set (encoding T1) this is a simple branch, and in the A32 instruction set it is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.

- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is used by the aliases ASRS (immediate), ASR (immediate), LSLS (immediate), LSL (immediate), LSRS (immediate), LSR (immediate), RORS (immediate), ROR (immediate), RRXS, and RRX. See Alias conditions on page F5-4557 for details of when each alias is preferred.

- **<>**: See Standard assembler syntax fields on page F2-4120.
- **<op>**: See Standard assembler syntax fields on page F2-4120.
- **<Rd>**: For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used:
  - For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993. Arm deprecates use of the instruction if <Rn> is the PC.
  - For the MOV variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. Arm deprecates use of the instruction if <Rn> is not the LR, or if the optional shift or RRX argument is specified.
  - For encoding T1: is the general-purpose destination register, encoded in the "D:Rd" field. If the PC is used:
    - The instruction causes a branch to the address moved to the PC. This is a simple branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
    - The instruction must either be outside an IT block or the last instruction of an IT block.
- **<Rm>**: For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used. Arm deprecates use of the instruction if <Rd> is the PC.
- **<shift>**: For encoding A1 and T3: is the type of shift to be applied to the source register, encoded in the "stype" field. It can have the following values:
  - LSL when stype = 00
  - LSR when stype = 01
  - ASR when stype = 10
  - ROR when stype = 11
For encoding T2: is the type of shift to be applied to the source register, encoded in the "op" field. It can have the following values:

- LSL when op = 00
- LSR when op = 01
- ASR when op = 10

For encoding A1: is the shift amount, in the range 0 to 31 (when <shift> = LSL), 1 to 31 (when <shift> = ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 0 to 31 (when <shift> = LSL) or 1 to 31 (when <shift> = ROR), or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = shifted;
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

**Operational information**

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.113 MOV, MOVS (register-shifted register)

Move (register-shifted register) copies a register-shifted register value to the destination register. It can optionally update the condition flags based on the value.

This instruction is used by the aliases ASRS (register), ASR (register), LSLS (register), LSL (register), LSRS (register), LSR (register), RORS (register), and ROR (register). See Alias conditions on page F5-4562 for details of when each alias is preferred.

## Assembler symbols

\(<c>\)  See Standard assembler syntax fields on page F2-4120.

\(<q>\)  See Standard assembler syntax fields on page F2-4120.

\(<Rdm>\)  Is the general-purpose source register and the destination register, encoded in the "Rdm" field.

\(<Rd>\)  Is the general-purpose destination register, encoded in the "Rd" field.

\(<Rm>\)  Is the general-purpose source register, encoded in the "Rm" field.
<shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
- LSL when stype = 00
- LSR when stype = 01
- ASR when stype = 10
- ROR when stype = 11

<Rs> Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (result, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

**Operational information**

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.114   MOVT

Move Top writes an immediate value to the top halfword of the destination register. It does not affect the contents of the bottom halfword.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<p>` See Standard assembler syntax fields on page F2-4120.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<imm16>` For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.
  For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    R[d]<31:16> = imm16;
    // R[d]<15:0> unchanged

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.115 MRC

Move to general-purpose register from System register. This instruction copies the value of a System register to a
general-purpose register.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For
more information see About the AArch32 System register interface on page E1-4011 and General behavior of
System registers on page G8-6134.

In an implementation that includes EL2, MRC accesses to system control registers can be trapped to Hyp mode,
meaning that an attempt to execute an MRC instruction in a Non-secure mode other than Hyp mode, that would be
permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see EL2
configurable controls on page G1-5827.

Because of the range of possible traps to Hyp mode, the MRC pseudocode does not show these possible traps.

A1

\[
\begin{array}{ccccccccc}
\text{cond} & \begin{array}{c}
\text{=1111}
\end{array} & 1 & 1 & 0 & \text{opc1} & 1 & \text{CRn} & \text{Rt} & 1 & 1 & 1 & \text{opc2} & 1 & \text{CRm} \\
\text{coproc<3:1>} & \text{coproc<0>}
\end{array}
\]

A1 variant

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#<\text{opc2}>\}
\]

Decode for this encoding

\[
t = \text{UInt}(\text{Rt}); \quad cp = \text{if coproc}<0> == '0' \text{ then } 14 \text{ else } 15;
\]

// Armv8-A removes UNPREDICTABLE for R13

T1

\[
\begin{array}{ccccccccc}
\text{coproc<3:1>} & \text{coproc<0>}
\end{array}
\]

T1 variant

\[
\text{MRC}\{<c>\}{<q>} <\text{coproc}>, \{#<\text{opc1}>\}, <\text{Rt}>, <\text{CRn}>, <\text{CRm}>\{, \{#<\text{opc2}>\}
\]

Decode for this encoding

\[
t = \text{UInt}(\text{Rt}); \quad cp = \text{if coproc}<0> == '0' \text{ then } 14 \text{ else } 15;
\]

// Armv8-A removes UNPREDICTABLE for R13

Assembler symbols

\[
<\text{c}> \quad \text{See Standard assembler syntax fields on page F2-4120.}
\]

\[
<\text{q}> \quad \text{See Standard assembler syntax fields on page F2-4120.}
\]

\[
<\text{coproc}> \quad \text{Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following}
\text{values:}
\]

\[
p14 \quad \text{when coproc}<0> = 0
\]

\[
p15 \quad \text{when coproc}<0> = 1
\]
<opc1> Is the opc1 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc1" field.

<Rm> Is the general-purpose register to be transferred or APSR_nzcv (encoded as 0b1111), encoded in the "Rm" field. If APSR_nzcv is used, bits [31:28] of the transferred value are written to the PSTATE condition flags.

<CRn> Is the CRn parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRn" field.

<CRm> Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

<opc2> Is the opc2 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc2" field.

The possible values of {<coproc>, <opc1>, <CRn>, <CRm>, <opc2>} encode the entire System register and System instruction encoding space. Not all of this space is allocated, and the System register and System instruction descriptions identify the allocated encodings.

**Operation for all encodings**

```c
if ConditionPassed() then
  EncodingSpecificOperations();
  bits(32) value = AArch32.SysRegRead(cp, ThisInstr());
  if t != 15 then
    R[t] = value;
  elseif AArch32.SysRegReadCanWriteAPSR(cp, ThisInstr()) then
    PSTATE.<N,Z,C,V> = value<31:28>;
    // value<27:0> are not used.
  else
    UNPREDICTABLE;
```
F5.1.116   MRRC

Move to two general-purpose registers from System register. This instruction copies the value of a System register to two general-purpose registers.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see About the AArch32 System register interface on page E1-4011 and General behavior of System registers on page G8-6134.

In an implementation that includes EL2, MRRC accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MRRC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see EL2 configurable controls on page G1-5827.

Because of the range of possible traps to Hyp mode, the MRRC pseudocode does not show these possible traps.

A1

```plaintext
A1 variant
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

**Decode for this encoding**

```plaintext
t = Uint(Rt);  t2 = Uint(Rt2);  cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

**CONSTRAINED UNPREDICTABLE behavior**

If t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

T1

```plaintext
T1 variant
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

**Decode for this encoding**

```plaintext
t = Uint(Rt);  t2 = Uint(Rt2);  cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```
**CONSTRAINED UNPREDICTABLE behavior**

If \( t = t_2 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<coproc>` Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:
  - p14 when coproc<0> = 0
  - p15 when coproc<0> = 1
- `<opc1>` Is the opc1 parameter within the System register encoding space, in the range 0 to 15, encoded in the "opc1" field.
- `<Rt>` Is the first general-purpose register that is transferred into, encoded in the "Rt" field.
- `<Rt2>` Is the second general-purpose register that is transferred into, encoded in the "Rt2" field.
- `<CRm>` Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

The possible values of \( \{ \text{<coproc>, <opc1>, <CRm> } \} \) encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify the allocated encodings.

For the permitted uses of these instructions, as described in this manual, `<Rt2>` transfers bits[63:32] of the selected System register, while `<Rt>` transfers bits[31:0].

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    value = AArch32.SysRegRead64(cp, ThisInstr());
    R[t] = value<31:0>;
    R[t2] = value<63:32>;
```
MRS

Move Special register to general-purpose register moves the value of the The Application Program Status Register, APSR on page E1-3995, CPSR, or SPSR_<current_mode> into a general-purpose register.

Arm recommends the APSR form when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see The Application Program Status Register, APSR on page E1-3995.

An MRS that accesses the SPSR is UNPREDICTABLE if executed in User mode or System mode.

An MRS that is executed in User mode and accesses the CPSR returns an UNKNOWN value for the CPSR.{E, A, I, F, M} fields.

            mask<22> = '1';
        if HaveDITExt() then
            mask<21> = '1';
        psr_val = GetPSRFromPSTATE() AND mask;
        if PSTATE.EL == EL0 then
            // If accessed from User mode return UNKNOWN values for E, A, I, F bits, bits<9:6>,
            // and for the M field, bits<4:0>
            psr_val<22> = bits(1) UNKNOWN;
            psr_val<9:6> = bits(4) UNKNOWN;
            psr_val<4:0> = bits(5) UNKNOWN;
            R[d] = psr_val;

CONSTRANIED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User, M32_System} && read_spsr, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
MRS (Banked register)

Move to Register from Banked or Special register moves the value from the Banked general-purpose register or SPSR of the specified mode, or the value of ELR_hyp on page G1-5734, to a general-purpose register.

MRS (Banked register) is UNPREDICTABLE if executed in User mode.

When EL3 is using AArch64, if an MRS (Banked register) instruction that is executed in a Secure EL1 mode would access SPSR_mon, SP_mon, or LR_mon, it is trapped to EL3.

The effect of using an MRS (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see Usage restrictions on the banked register transfer instructions on page F5-4990.

A1

MRS{<c>}{<q>} <Rd>, <banked_reg>

Decode for this encoding

d = UInt(Rd); read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE;
SYSm = M:M1;

T1

MRS{<c>}{<q>} <Rd>, <banked_reg>

Decode for this encoding

d = UInt(Rd); read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
SYSm = M:M1;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

See Standard assembler syntax fields on page F2-4120.
<banked_reg> Is the name of the banked register to be transferred to or from, encoded in the "R:M:M1" field. It can have the following values:

- R8_usr when \( R = 0 \), \( M = 0 \), \( M1 = 0000 \)
- R9_usr when \( R = 0 \), \( M = 0 \), \( M1 = 0001 \)
- R10_usr when \( R = 0 \), \( M = 0 \), \( M1 = 0010 \)
- R11_usr when \( R = 0 \), \( M = 0 \), \( M1 = 0011 \)
- R12_usr when \( R = 0 \), \( M = 0 \), \( M1 = 0100 \)
- SP_usr when \( R = 0 \), \( M = 0 \), \( M1 = 0101 \)
- LR_usr when \( R = 0 \), \( M = 0 \), \( M1 = 0110 \)
- R8_fiq when \( R = 0 \), \( M = 0 \), \( M1 = 1000 \)
- R9_fiq when \( R = 0 \), \( M = 0 \), \( M1 = 1001 \)
- R10_fiq when \( R = 0 \), \( M = 0 \), \( M1 = 1010 \)
- R11_fiq when \( R = 0 \), \( M = 0 \), \( M1 = 1011 \)
- R12_fiq when \( R = 0 \), \( M = 0 \), \( M1 = 1100 \)
- SP_fiq when \( R = 0 \), \( M = 0 \), \( M1 = 1101 \)
- LR_fiq when \( R = 0 \), \( M = 0 \), \( M1 = 1110 \)
- LR_irq when \( R = 0 \), \( M = 1 \), \( M1 = 0000 \)
- SP_irq when \( R = 0 \), \( M = 1 \), \( M1 = 0001 \)
- LR_svc when \( R = 0 \), \( M = 1 \), \( M1 = 0010 \)
- SP_svc when \( R = 0 \), \( M = 1 \), \( M1 = 0011 \)
- LR_abt when \( R = 0 \), \( M = 1 \), \( M1 = 0100 \)
- SP_abt when \( R = 0 \), \( M = 1 \), \( M1 = 0101 \)
- LR_und when \( R = 0 \), \( M = 1 \), \( M1 = 0110 \)
- SP_und when \( R = 0 \), \( M = 1 \), \( M1 = 0111 \)
- LR_mon when \( R = 0 \), \( M = 1 \), \( M1 = 1100 \)
- SP_mon when \( R = 0 \), \( M = 1 \), \( M1 = 1101 \)
- ELR_hyp when \( R = 0 \), \( M = 1 \), \( M1 = 1110 \)
- SP_hyp when \( R = 0 \), \( M = 1 \), \( M1 = 1111 \)
- SPSR_fiq when \( R = 1 \), \( M = 0 \), \( M1 = 1110 \)
- SPSR_irq when \( R = 1 \), \( M = 0 \), \( M1 = 1111 \)
- SPSR_svc when \( R = 1 \), \( M = 0 \), \( M1 = 0000 \)
- SPSR_abt when \( R = 1 \), \( M = 0 \), \( M1 = 0001 \)
- SPSR_und when \( R = 1 \), \( M = 0 \), \( M1 = 0010 \)
- SPSR_mon when \( R = 1 \), \( M = 0 \), \( M1 = 0100 \)
- SPSR_hyp when \( R = 1 \), \( M = 0 \), \( M1 = 1111 \)

The following encodings are UNPREDICTABLE:

- \( R = 0 \), \( M = 0 \), \( M1 = 0111 \)
- \( R = 0 \), \( M = 0 \), \( M1 = 1111 \)
- \( R = 0 \), \( M = 1 \), \( M1 = 10xx \)
- \( R = 1 \), \( M = 0 \), \( M1 = 0xxx \)
- \( R = 1 \), \( M = 0 \), \( M1 = 10xx \)
- \( R = 1 \), \( M = 0 \), \( M1 = 110x \)
- \( R = 1 \), \( M = 1 \), \( M1 = 0011 \)
- \( R = 1 \), \( M = 1 \), \( M1 = 0001 \)
Operation for all encodings

```c
if ConditionPassed() then
    EncodingSpecificOperations();
else
    mode = PSTATE.M;
    if read_spsr then

            R[d] = ELR_hyp;
        when '11111' // Access SP_hyp register
            R[d] = Rmode[13,M32_Hyp];
```
The instruction executes as NOP.
F5.1.119   MSR (Banked register)

Move to Banked or Special register from general-purpose register moves the value of a general-purpose register to
the Banked general-purpose register or SPSR of the specified mode, or to ELR_hyp on page G1-5734.

MSR (Banked register) is UNPREDICTABLE if executed in User mode.

When EL3 is using AArch64, if an MSR (Banked register) instruction that is executed in a Secure EL1 mode would
access SPSR_mon, SP_mon, or LR_mon, it is trapped to EL3.

The effect of using an MSR (Banked register) instruction with a register argument that is not valid for the current mode
is UNPREDICTABLE. For more information see Usage restrictions on the banked register transfer instructions on
page F5-4990.

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
F5.1.120 MSR (immediate)

Move immediate value to Special register moves selected bits of an immediate value to the corresponding bits in the *The Application Program Status Register, APSR on page E1-3995, CPSR, or SPSR_<current_mode>*.

Because of the Do-Not-Modify nature of its reserved bits, the immediate form of MSR is normally only useful at the Application level for writing to APSR_nzcvq(CPSR_f).

If an MSR (immediate) moves selected bits of an immediate value to the CPSR, the PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M on page G1-5739*.

An MSR (immediate) executed in User mode:

- Is CONSTRAINED UNPREDICTABLE if it attempts to update the SPSR.
- Otherwise, does not update any CPSR field that is accessible only at EL1 or higher.

An MSR (immediate) executed in System mode is CONSTRAINED UNPREDICTABLE if it attempts to update the SPSR.

The CPSR.E bit is writable from any mode using an MSR instruction. Arm deprecates using this to change its value.

### A1

| Address: | 31 28|27 26 25 24|23 22 21 20|19 18 17 16|15 14 13 12|11 | 10 9 8 7 6 5 4 3 2 1 | 0 |
|----------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|
| Cond:    | !=1111 | 0 0 1 1 0 | R | 1 0 | mask | (1) (1) (1) | imm12 |

### A1 variant

Applies when !(R == 0 & mask == 0000).

 MSR{<c>}{<q>} <spec_reg>, #<imm>

**Decode for this encoding**

if mask == '0000' & R == '0' then SEE "Related encodings";
imm32 = A32ExpandImm(imm12); write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;

**CONSTRAINED UNPREDICTABLE behavior**

If mask == '0000' & R == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Related encodings: *Move Special Register and Hints (immediate) on page F4-4233*.

### Assembler symbols

- <c> See *Standard assembler syntax fields on page F2-4120*.
- <q> See *Standard assembler syntax fields on page F2-4120*.
- <spec_reg> Is one of:
  - APSR<bits>.
For CPSR and SPSR, `<fields>` is a sequence of one or more of the following:

- `c`: mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.
- `x`: mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.
- `s`: mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.
- `f`: mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, `<bits>` is one of nzcvq_g, or nzcvqg. These map to the following CPSR_<fields> values:

- APSR_nzcvq is the same as CPSR_f (mask == '1000').
- APSR_g is the same as CPSR_s (mask == '0100').
- APSR_nzcvqg is the same as CPSR_fs (mask == '1100').

Arm recommends the APSR_<bits> forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see The Application Program Status Register, APSR on page E1-3995.

<imm> is an immediate value. See Modified immediate constants in A32 instructions on page F2-4136 for the range of values.

**Operation**

```c
if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User, M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriByInstr(imm32, mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriByInstr(imm32, mask);
```

**CONSTRAINED UNPREDICTABLE behavior**

If PSTATE.M IN {M32_User, M32_System} && write_spsr, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
F5.1.121  MSR (register)

Move general-purpose register to Special register moves selected bits of a general-purpose register to the *The Application Program Status Register, APSR* on page E1-3995, CPSR or SPSR_{<current_mode>}.

Because of the Do-Not-Modify nature of its reserved bits, a read-modify-write sequence is normally required when the MSR instruction is being used at Application level and its destination is not APSR_nzcvq (CPSR_f).

If an MSR (register) moves selected bits of an immediate value to the CPSR, the PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M* on page G1-5739.

An MSR (register) executed in User mode:

- Is UNPREDICTABLE if it attempts to update the SPSR.
- Otherwise, does not update any CPSR field that is accessible only at EL1 or higher.

An MSR (register) executed in System mode is UNPREDICTABLE if it attempts to update the SPSR.

The CPSR.E bit is writable from any mode using an MSR instruction. Arm deprecates using this to change its value.

MSR{<c>}{<q>} <spec_reg>, <Rn>

**Decode for this encoding**

```java
n = UInt(Rn); write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
if n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```
**CONSTRAINED UNPREDICTABLE behavior**

If \( \text{mask} = '0000' \), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as \texttt{NOP}.

**Notes for all encodings**

For more information about the **CONSTRAINED UNPREDICTABLE behavior** of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE Behaviors*.

**Assembler symbols**

- \(<c>\) See *Standard assembler syntax fields on page F2-4120*.
- \(<op>\) See *Standard assembler syntax fields on page F2-4120*.
- \(<\text{spec}_\text{reg}>\) Is one of:
  - \(\text{APSR}_{\text{bits}}\).
  - \(\text{CPSR}_{\text{fields}}\).
  - \(\text{SPSR}_{\text{fields}}\).

  For \(\text{CPSR} \) and \(\text{SPSR} \), \(<\text{fields}>\) is a sequence of one or more of the following:
  - \(c\) mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.
  - \(x\) mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.
  - \(s\) mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.
  - \(f\) mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

  For \(\text{APSR} \), \(<\text{bits}>\) is one of \(\text{nzcvq} \), \(\text{g} \), or \(\text{nzcvqg} \). These map to the following \(\text{CPSR}_{\text{fields}}\) values:
  - \(\text{APSR}_{\text{nzcvq}}\) is the same as \(\text{CPSR}_{\text{f}}\) (mask == '1000').
  - \(\text{APSR}_{\text{g}}\) is the same as \(\text{CPSR}_{\text{s}}\) (mask == '0100').
  - \(\text{APSR}_{\text{nzcvqg}}\) is the same as \(\text{CPSR}_{\text{fs}}\) (mask == '1100').

  Arm recommends the \(\text{APSR}_{\text{bits}}\) forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see *The Application Program Status Register, APSR on page E1-3995*.

- \(<\text{Rn}>\) Is the general-purpose source register, encoded in the "Rn" field.

**Operation for all encodings**

if \(\text{ConditionPassed}()\) then
  \(\text{EncodingSpecificOperations();}\)
  if \(\text{write}_\text{spsr}\) then
    if \(\text{PSTATE.M IN \{M32_User,M32_System\}}\) then
      \(\text{UNPREDICTABLE;}\)
    else
      \(\text{SPSRWriteByInstr(R[n], mask);}\)
  else
    // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
    \(\text{CPSRWriteByInstr(R[n], mask);}\)

**CONSTRAINED UNPREDICTABLE behavior**

If \(\text{write}_\text{spsr} \&\& \text{PSTATE.M IN \{M32_User,M32_System\}}\), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
The instruction executes as NOP.
F5.1.122 MUL, MULS

Multiply multiplies two register values. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

Optionally, it can update the condition flags based on the result. In the T32 instruction set, this option is limited to only a few forms of the instruction. Use of this option adversely affects performance on many implementations.

A1

Flag setting variant

Applies when S == 1.

MULS{<c>}{<q>} <Rd>, <Rn>{, <Rm>}

Assembler symbols

<
> See Standard assembler syntax fields on page F2-4120.

<
> See Standard assembler syntax fields on page F2-4120.

<Rdm>
Is the second general-purpose source register holding the multiplier and the destination register, encoded in the "Rdm" field.

<Rd>
Is the general-purpose destination register, encoded in the "Rd" field.

<Rn>
Is the first general-purpose destination register holding the multiplicand, encoded in the "Rn" field.

<Rm>
Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field. If omitted, <Rd> is used.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = SInt(R[n]);  // operand1 = UInt(R[n]) produces the same final results
    operand2 = SInt(R[m]);  // operand2 = UInt(R[m]) produces the same final results
    result = operand1 * operand2;
    R[d] = result<31:0>;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result<31:0>);
        // PSTATE.C, PSTATE.V unchanged

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.123 MVN, MVNS (immediate)

Bitwise NOT (immediate) writes the bitwise inverse of an immediate value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for $<Rd>$ identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_&lt;current_mode&gt;.
  - The PE checks SPSR_&lt;current_mode&gt; for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
F5.1.125 MVN, MVNS (register-shifted register)

Bitwise NOT (register-shifted register) writes the bitwise inverse of a register-shifted register value to the destination register. It can optionally update the condition flags based on the result.

A1

### Flag setting variant

Applies when $S == 1$.

MVNS{$c$}{$q$} <Rd>, <Rm>, <shift> <Rs>

### Not flag setting variant

Applies when $S == 0$.

MVN{$c$}{$q$} <Rd>, <Rm>, <shift> <Rs>

#### Decode for all variants of this encoding

\[
\begin{align*}
&d = \text{UInt}(Rd); \\
&m = \text{UInt}(Rm); \\
&s = \text{UInt}(Rs); \\
&\text{setflags} = (S == '1'); \\
&\text{shift}_t = \text{DecodeRegShift}(stype); \\
&\text{if } d == 15 \text{ || } m == 15 \text{ || } s == 15 \text{ then UNPREDICTABLE;}
\end{align*}
\]

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

#### Assembler symbols

- $<c>$: See [Standard assembler syntax fields](#).
- $<q>$: See [Standard assembler syntax fields](#).
- $<Rd>$: Is the general-purpose destination register, encoded in the "Rd" field.
- $<Rm>$: Is the general-purpose source register, encoded in the "Rm" field.
- $<shift>$: Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
  - LSL when stype = 00
  - LSR when stype = 01
  - ASR when stype = 10
  - ROR when stype = 11
- $<Rs>$: Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

#### Operation

if ConditionPassed() then

EncodingSpecificOperations();

\[
\begin{align*}
&\text{shift}_n = \text{UInt}(Rs[7:0]); \\
&(\text{shifted, carry}) = \text{Shift_C}(R[m], \text{shift}_t, \text{shift}_n, \text{PSTATE.C});
\end{align*}
\]
result = NOT(shifted);
R[d] = result;
if setflags then
    PSTATE.N = result<31>;
PSTATE.Z = IsZeroBit(result);
PSTATE.C = carry;
    // PSTATE.V unchanged
F5.1.126   NOP

No Operation does nothing. This instruction can be used for instruction alignment purposes.

——— Note ————

The timing effects of including a NOP instruction in a program are not guaranteed. It can increase execution time, leave it unchanged, or even reduce it. Therefore, NOP instructions are not suitable for timing loops.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    // Do nothing

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.127   ORN, ORNS (immediate)

Bitwise OR NOT (immediate) performs a bitwise (inclusive) OR of a register value and the complement of an immediate value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

**T1**

Assembler symbols

<
See Standard assembler syntax fields on page F2-4120.

>
See Standard assembler syntax fields on page F2-4120.

<Rd>
Is the general-purpose destination register, encoded in the "Rd" field.

<Rn>
Is the first general-purpose source register, encoded in the "Rn" field.

<Rm>
Is the second general-purpose source register, encoded in the "Rm" field.
<shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
- LSL when stype = 00
- LSR when stype = 01
- ASR when stype = 10
- ROR when stype = 11

<amount> Is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

**Operation**

```c
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

**Operational information**

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
### F5.1.129 ORR, ORRS (immediate)

Bitwise OR (immediate) performs a bitwise (inclusive) OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for `<Rd>` identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3993.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
  - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

See Standard assembler syntax fields on page F2-4120.

<Rdn>
Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd>
For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn>
For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm>
For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift>
Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

- LSL when stype = 00
- LSR when stype = 01
- ASR when stype = 10
- ROR when stype = 11

<amount>
For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

In T32 assembly:

- Outside an IT block, if ORRS <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORRS <Rd>, <Rn> had been written.
- Inside an IT block, if ORR<>> <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORR<>> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
```
else
  R[d] = result;
  if setflags then
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged

**Operational information**

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.131 ORR, ORRS (register-shifted register)

Bitwise OR (register-shifted register) performs a bitwise (inclusive) OR of a register value and a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

```
| 31  | 28|27 26 25 24|23 22 21 20|19 16|15 12|11 8 | 7 6 5 4 | 3 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|
| !=1111 | 0 | 0 | 0 | 1 | 0 | S | Rn | Rd | Rs | 0 | stype | 1 | Rm |
```

Flag setting variant

Applies when \( S = 1 \).

\[
\text{ORRS}[^{<\text{c}>}\{<\text{q}>\}[^{<\text{Rd}>}\{<\text{Rn}>\},<\text{Rm}>\{<\text{shift}>\}<\text{Rs}>]
\]

Not flag setting variant

Applies when \( S = 0 \).

\[
\text{ORR}[^{<\text{c}>}\{<\text{q}>\}[^{<\text{Rd}>}\{<\text{Rn}>\},<\text{Rm}>\{<\text{shift}>\}<\text{Rs}>]
\]

Decode for all variants of this encoding

\[
\begin{align*}
d &= \text{UInt}(\text{Rd}); & n &= \text{UInt}(\text{Rn}); & m &= \text{UInt}(\text{Rm}); & s &= \text{UInt}(\text{Rs}); \\
\text{setflags} &= (S == '1'); & \text{shift}_t &= \text{DecodeRegShift}(\text{stype}); \\
\text{if } d == 15 | | n == 15 | | m == 15 | | s == 15 \text{ then UNPREDICTABLE;}
\end{align*}
\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

- **<c>** See [Standard assembler syntax fields on page F2-4120](#).
- **<q>** See [Standard assembler syntax fields on page F2-4120](#).
- **<Rd>** Is the general-purpose destination register, encoded in the "Rd" field.
- **<Rn>** Is the first general-purpose source register, encoded in the "Rn" field.
- **<Rm>** Is the second general-purpose source register, encoded in the "Rm" field.
- **<shift>** Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
  - LSL when \( \text{stype} = 00 \)
  - LSR when \( \text{stype} = 01 \)
  - ASR when \( \text{stype} = 10 \)
  - ROR when \( \text{stype} = 11 \)
- **<Rs>** Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if \texttt{ConditionPassed()} then
    \texttt{EncodingSpecificOperations();}
    \texttt{shift\_n = \texttt{UInt}(R[s]\langle7:0\rangle);}
    \texttt{(shifted, carry) = \texttt{Shift\_C}(R[m], shift\_t, shift\_n, PSTATE.C);}
    \texttt{result = R[n] \texttt{OR shifted;}}
    \texttt{R[d] = result;}
    if \texttt{setflags} then
        \texttt{PSTATE.N = result<31>;}
        \texttt{PSTATE.Z = \texttt{IsZeroBit}(result);}
        \texttt{PSTATE.C = carry;}
        // \texttt{PSTATE.V} unchanged

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

\text{if } d = 15 || n = 15 || m = 15 \text{ then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13}
\]

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.
Assembler symbols

\(<c>\)
See Standard assembler syntax fields on page F2-4120.

\(<q>\)
See Standard assembler syntax fields on page F2-4120.

\(<Rd>\)
Is the general-purpose destination register, encoded in the "Rd" field.

\(<Rn>\)
Is the first general-purpose source register, encoded in the "Rn" field.

\(<Rm>\)
Is the second general-purpose source register, encoded in the "Rm" field.

\(<imm>\)
For encoding A1: the shift to apply to the value read from \(<Rm>\), encoded in the "imm5" field.

For PKKBT, it is one of:

- omitted: No shift, encoded as \(0b00000\).
- 1-31: Left shift by specified number of bits, encoded as a binary number.

For PKKHTB, it is one of:

- omitted: Instruction is a pseudo-instruction and is assembled as though PKKHTB\(<c>\){<q>} <Rd>, <Rm>, \(<Rn>\) had been written.
- 1-32: Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as \(0b00000\). Other shift amounts are encoded as binary numbers.

Note
An assembler can permit \(<imm> = 0\) to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

For encoding T1: the shift to apply to the value read from \(<Rm>\), encoded in the "imm3:imm2" field.

For PKKBT, it is one of:

- omitted: No shift, encoded as \(0b00000\).
- 1-31: Left shift by specified number of bits, encoded as a binary number.

For PKKHTB, it is one of:

- omitted: Instruction is a pseudo-instruction and is assembled as though PKKHTB\(<c>\){<q>} <Rd>, <Rm>, \(<Rn>\) had been written.
- 1-32: Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as \(0b00000\). Other shift amounts are encoded as binary numbers.

Note
An assembler can permit \(<imm> = 0\) to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = Shift(R[m], shift_t, shift_n, PSTATE.C); // PSTATE.C ignored
    R[d]<15:0> = if tbform then operand2<15:0> else R[n]<15:0>;
    R[d]<31:16> = if tbform then R[n]<31:16> else operand2<31:16>;

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
— The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.133   PLD, PLDW (immediate)

Preload Data (immediate) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see Preloading caches on page E2-4042.

PLD{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative syntax

**Decode for this encoding**

\[
imm32 = \text{ZeroExtend}(imm12, 32); \quad add = (U == '1');
\]

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- **<c>** For encoding A1: see Standard assembler syntax fields on page F2-4120. Must be AL or omitted.
  For encoding T1: see Standard assembler syntax fields on page F2-4120.
- **<q>** See Standard assembler syntax fields on page F2-4120.
- **<label>** The label of the literal data item that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. The offset must be in the range –4095 to 4095.
  If the offset is zero or positive, imm32 is equal to the offset and add == TRUE.
  If the offset is negative, imm32 is equal to minus the offset and add == FALSE.
+/-

Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when \( U = 0 \)
+ when \( U = 1 \)

\(<imm>\)

For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-4077.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC, 4) + imm32) else (Align(PC, 4) - imm32);
    Hint_PreloadData(address);
**F5.1.135   PLD, PLDW (register)**

Preload Data (register) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see *Preloading caches* on page E2-4042.

\hline
\end{array} \]

\[ \text{imm12} \]

**T3 variant**

PLI{<c>}{<q>} <label> // Preferred syntax
PLI{<c>}{<q>} [PC, #{+/-}<imm>] // Alternative syntax

**Decode for this encoding**

\[ n = 15; \quad \text{imm32} = \text{ZeroExtend}(\text{imm12}, 32); \quad \text{add} = (U == '1'); \]

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

<\> For encoding A1: see Standard assembler syntax fields on page F2-4120. Must be AL or omitted.
For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-4120.

<\> See Standard assembler syntax fields on page F2-4120.

<label> The label of the instruction that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. The offset must be in the range –4095 to 4095.
If the offset is zero or positive, imm32 is equal to the offset and add == TRUE.
If the offset is negative, imm32 is equal to minus the offset and add == FALSE.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

+/− Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when \( U = 0 \)
+ when \( U = 1 \)

<imm> For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.
For encoding T3: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

For the literal forms of the instruction, encoding T3 is used, or Rn is encoded as \( 0b1111 \) in encoding A1, to indicate that the PC is the base register.

The alternative literal syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-4077.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    base = if n == 15 then Align(PC,4) else R[n];
    address = if add then (base + imm32) else (base - imm32);
    Hint_PreloadInstr(address);
F5.1.137 PLI (register)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. F5.1.138 POP

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-4126.

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.

T1

| 15 14 13 12 | 11 10 9 8 7 | 0 |
| 1 0 1 1 1 0 | P | register_list |

T1 variant

POP{<c>}{<q>} <registers> // Preferred syntax
LDM{<c>}{<q>} SP!, <registers> // Alternate syntax

Decode for this encoding

registers = P:'0000000':register_list; UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;

CONstrained UNpRedictable behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

Notes for all encodings

For more information about the CONstrained UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

- {<c>} See Standard assembler syntax fields on page F2-4120.
- {<q>} See Standard assembler syntax fields on page F2-4120.
- {<registers> Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.
  The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the PC. If the PC is in the list, the "P" field is set to 1, otherwise this field defaults to 0.
  If the PC is in the list, the instruction must be either outside any IT block, or the last instruction in an IT block.
Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = if UnalignedAllowed then MemU[address,4] else MemA[address,4];
            address = address + 4;
        if registers<15> == '1' then
            if UnalignedAllowed then
                if address<1:0> == '00' then
                    LoadWritePC(MemU[address,4]);
                else
                    UNPREDICTABLE;
            else
                LoadWritePC(MemA[address,4]);
        if registers<13> == '0' then SP = SP + 4*BitCount(registers);
        if registers<13> == '1' then SP = bits(32) UNKNOWN;
F5.1.139 POP (multiple registers)

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data.

This instruction is an alias of the LDM, LDMIA, LDMFD instruction. This means that:

- The encodings in this description are named to match the encodings of LDM, LDMIA, LDMFD.
- The description of LDM, LDMIA, LDMFD gives the operational pseudocode for this instruction.

A1

```
|31 28 26 24 22 20 19 16 15| |
|1 0 0 0 1 1 1 0 1 | register_list
```

**A1 variant**

POP<\{c\}><\{q\}><registers>

is equivalent to

LDM<\{c\}><\{q\}> SP!, <registers>

and is the preferred disassembly when BitCount(register_list) > 1.

T2

```
|15 14 13 12|11 10 9 8 7 6 5 4 3 0 |15 14 13 | |
|1 1 1 0 1 0 0 0 1 1 1 1 0 1 | register_list
```

**T2 variant**

POP<\{c\}\.W <registers> // All registers in R0-R7, PC

is equivalent to

LDM<\{c\}\.SP!, <registers>

and is the preferred disassembly when BitCount(P:M:register_list) > 1.

POP<\{c\}><\{q\}><registers>

is equivalent to

LDM<\{c\}><\{q\}> SP!, <registers>

and is the preferred disassembly when BitCount(P:M:register_list) > 1.

**Assembler symbols**

- <\{c\}>
  - See Standard assembler syntax fields on page F2-4120.
- <\{q\}>
  - See Standard assembler syntax fields on page F2-4120.
- <registers>
  - For encoding A1: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-4126.
  - If the SP is in the list, the value of the SP after such an instruction is UNKNOWN.
The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3993.

Arm deprecates the use of this instruction with both the LR and the PC in the list.

For encoding T2: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also *Encoding of lists of general-purpose registers and the PC* on page F2-4126.

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0.

The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-3993. If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

**Operation for all encodings**

The description of LDM, LDMIA, LDMFD gives the operational pseudocode for this instruction.
F5.1.140  POP (single register)

Pop Single Register from Stack loads a single general-purpose register from the stack, loading from the address in SP, and updates SP to point just above the loaded data.

This instruction is an alias of the LDR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of LDR (immediate).
- The description of LDR (immediate) gives the operational pseudocode for this instruction.

A1

```
| 31 28 27 26 25 24 23 22 21 20 19 16 15 12 11 |   |   | 0 |
|-----------------------------------------------|--|--|
| some value                                    |   |   | 1 |
```

Post-indexed variant

POP{<c>}{<q>} <single_register_list>

is equivalent to

LDR{<c>}{<q>} <Rt>, [SP], #4

and is always the preferred disassembly.

T4

```
<table>
<thead>
<tr>
<th>15 14 13 12</th>
<th>11 10 9 8</th>
<th>7 6 5 4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>some value</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

Post-indexed variant

POP{<c>}{<q>} <single_register_list>

is equivalent to

LDR{<c>}{<q>} <Rt>, [SP], #4

and is always the preferred disassembly.

Assembler symbols

- `<c>`  See Standard assembler syntax fields on page F2-4120.
- `<q>`  See Standard assembler syntax fields on page F2-4120.
- `<single_register_list>`
  Is the general-purpose register <Rt> to be loaded surrounded by { and }.
- `<Rt>`  For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.

**Operation for all encodings**

The description of LDR (immediate) gives the operational pseudocode for this instruction.
F5.1.141 PSSBB

Physical Speculative Store Bypass Barrier is a memory barrier which prevents speculative loads from bypassing earlier stores to the same physical address.

The semantics of the Physical Speculative Store Bypass Barrier are:

- When a load to a location appears in program order after the PSSBB, then the load does not speculatively read an entry earlier in the coherence order for that location than the entry generated by the latest store satisfying all of the following conditions:
  - The store is to the same location as the load.
  - The store appears in program order before the PSSBB.

- When a load to a location appears in program order before the PSSBB, then the load does not speculatively read data from any store satisfying all of the following conditions:
  - The store is to the same location as the load.
  - The store appears in program order after the PSSBB.

A1

F5.1.143 PUSH (multiple registers)

Push multiple registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data.

This instruction is an alias of the STMDB, STMFD instruction. This means that:

- The encodings in this description are named to match the encodings of STMDB, STMFD.
- The description of STMDB, STMFD gives the operational pseudocode for this instruction.

**A1**

| 31 28|27 26 25 24|23 22 21 20|19 16|15 | | | 0 |
|---|---|---|---|---|---|---|
| !=1111 |1 0 0 1 0 0 1 0 1 1 0 1 | register_list |

**A1 variant**

PUSH{<c>}{<q>} <registers>

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when BitCount(register_list) > 1.

**T1**

| 15 14 13 12|11 10 9 8|7 6 5 4|3 |0 |15 14 13 | | | 0 |
|---|---|---|---|---|---|---|---|
| 1 1 1 0 1 0 0 1 0 0 1 0 1 1 0 1 |0 |M | register_list |
| W | Rn | P |

**T1 variant**

PUSH{<c>}.W <registers> // All registers in R0-R7, LR

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when BitCount(M:register_list) > 1.

PUSH{<c>}{<q>} <registers>

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when BitCount(M:register_list) > 1.

**Assembler symbols**

- <c>
  - See *Standard assembler syntax fields on page F2-4120*.
- <q>
  - See *Standard assembler syntax fields on page F2-4120*.
- <registers>
  - For encoding A1: is a list of two or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also *Encoding of lists of general-purpose registers and the PC on page F2-4126*. 
The SP and PC can be in the list. However:

- Arm deprecates the use of instructions that include the PC in the list.
- If the SP is in the list, and it is not the lowest-numbered register in the list, the instruction stores an UNKNOWN value for the SP.

For encoding T1, is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-4126.

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

**Operation for all encodings**

The description of STMDB, STMFD gives the operational pseudocode for this instruction.
F5.1.144 PUSH (single register)

Push Single Register to Stack stores a single general-purpose register to the stack, storing to the 32-bit word below the address in SP, and updates SP to point to the start of the stored data.

This instruction is an alias of the STR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of STR (immediate).
- The description of STR (immediate) gives the operational pseudocode for this instruction.

### Pre-indexed variant

For T4 encoding:

```
PUSH{<c>}{<q>} <single_register_list> // Standard syntax
```

is equivalent to

```
STR{<c>}{<q>} <Rt>, [SP, #-4]!
```

and is always the preferred disassembly.

### Assembler symbols

- `<>`  See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<single_register_list>`  Is the general-purpose register `<Rt>` to be stored surrounded by `{` and `}`.
- `<Rt>`  For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field.

### Operation for all encodings

The description of STR (immediate) gives the operational pseudocode for this instruction.
F5.1.145 QADD

Saturating Add adds two register values, saturates the result to the 32-bit signed integer range \(-2^{31}\) to \((2^{31} - 1)\), and writes the result to the destination register. If saturation occurs, it sets PSTATE.Q to 1.

A1 variant

QADD{<c>}{<q>} {<Rd>,} <Rm>, <Rn>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;

T1 variant

QADD{<c>}{<q>} {<Rd>,} <Rm>, <Rn>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<Rm>` Is the first general-purpose source register, encoded in the "Rm" field.
- `<Rn>` Is the second general-purpose source register, encoded in the "Rn" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    (R[d], sat) = SignedSatQ(SInt(R[m]) + SInt(R[n]), 32);
    if sat then
        PSTATE.Q = '1';
F5.1.146   QADD16

Saturating Add 16 performs two 16-bit integer additions, saturates the results to the 16-bit signed integer range \(-2^{15} \leq x \leq 2^{15} - 1\), and writes the results to the destination register.

A1

| 31 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 16 | 15 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.159   RFE, RFEDA, RFEDB, RFEIA, RFEIB

Return From Exception loads two consecutive memory locations using an address in a base register:

• The word loaded from the lower address is treated as an instruction address. The PE branches to it.
• The word loaded from the higher address is used to restore PSTATE. This word must be in the format of an SPSR.

An address adjusted by the size of the data loaded can optionally be written back to the base register.

The PE checks the value of the word loaded from the higher address for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.

RFE is UNDEFINED in Hyp mode and CONSTRAINED UNPREDICTABLE in User mode.

\]
if \( n == 15 \) then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

IA For encoding A1: is an optional suffix to indicate the Increment After variant.

For encoding T2: is an optional suffix for the Increment After form.

<c> For encoding A1: see Standard assembler syntax fields on page F2-4120. \(<c>\) must be AL or omitted.

For encoding T1 and T2: see Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

RFEFA, RFEFA, RFED, and RFEED are pseudo-instructions for RFEDA, RFEDB, RFEIA, and RFEIB respectively, referring to their use for popping data from Full Ascending, Empty Ascending, Full Descending, and Empty Descending stacks.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();
  if PSTATE.EL == EL2 then
    UNDEFINED;
  elsif PSTATE.EL == EL0 then
    UNPREDICTABLE; // UNDEFINED or NOP
  else
    address = if increment then R[n] else R[n]-8;
    if wordhigher then address = address+4;
    new_pc_value = MemA[address,4];
    spsr = MemA[address+4,4];
    if wback then R[n] = if increment then R[n]+8 else R[n]-8;
    AArch32.ExceptionReturn(new_pc_value, spsr);
CONSTRANGED UNPREDICTABLE behavior

If PSTATE.EL == EL0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
F5.1.160   ROR (immediate)

Rotate Right (immediate) provides the value of the contents of a register rotated by a constant value. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

This instruction is an alias of the MOV, MOVS (register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register).
- The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.

A1

\[
\begin{array}{cccccccccccc}
<imm> For encoding A1: is the shift amount, in the range 1 to 31, encoded in the "imm5" field. For encoding T3: is the shift amount, in the range 1 to 31, encoded in the "imm3:imm2" field.

Operation for all encodings

The description of MOV, MOVS (register) gives the operational pseudocode for this instruction.
F5.1.161  ROR (register)

Rotate Right (register) provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The variable number of bits is read from the bottom byte of a register.

This instruction is an alias of the MOV, MOVS (register-shifted register) instruction. This means that:

- The encodings in this description are named to match the encodings of MOV, MOVS (register-shifted register).
- The description of MOV, MOVS (register-shifted register) gives the operational pseudocode for this instruction.

### A1

        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.167   RSB, RSBS (register)

Reverse Subtract (register) subtracts a register value from an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for \(<Rd>\) identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_\(<current\_mode>\).
  - The PE checks SPSR_\(<current\_mode>\) for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

\]
\[
\text{if } d == 15 || n == 15 || m == 15 \text{ then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13}
\]

**Notes for all encodings**
For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- `<c>` See *Standard assembler syntax fields on page F2-4120*.

- `<p>` See *Standard assembler syntax fields on page F2-4120*.

- `<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. Arm deprecates using the PC as the destination register, but if the PC is used:
  - For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993*.
  - For the RSBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

  For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`.

- `<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

  For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.
<Rm>  For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
    For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
    LSL  when stype = 00
    LSR  when stype = 01
    ASR  when stype = 10
    ROR  when stype = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.
    For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

•  The execution time of this instruction is independent of:
    —  The values of the data supplied in any of its registers.
    —  The values of the NZCV flags.

•  The response of this instruction to asynchronous exceptions does not vary based on:
    —  The values of the data supplied in any of its registers.
    —  The values of the NZCV flags.
F5.1.168   RSB, RSBS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value from a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

| 31 | 28|27 26 25 24|23 22 21 20|19 |16|15 | 8 | 7 | 6 | 5 | 4 | 3 | 0 |

    shift_t &= \text{DecodeRegShift}(stype); \\
    \text{if } d == 15 || n == 15 || m == 15 || s == 15 \text{ then UNPREDICTABLE;}
\end{align*}
\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

\(<c>\)   See Standard assembler syntax fields on page F2-4120.

\(<q>\)   See Standard assembler syntax fields on page F2-4120.

\(<Rd>\)   Is the general-purpose destination register, encoded in the "Rd" field.

\(<Rn>\)   Is the first general-purpose source register, encoded in the "Rn" field.

\(<Rm>\)   Is the second general-purpose source register, encoded in the "Rm" field.

\(<\text{shift}>\)   Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

- LSL  when stype = 00
- LSR  when stype = 01
- ASR  when stype = 10
- ROR  when stype = 11

\(<Rs>\)   Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if `ConditionPassed()` then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(NOT(R[n]), shifted, '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.169 RSC, RSCS (immediate)

Reverse Subtract with Carry (immediate) subtracts a register value and the value of NOT (Carry flag) from an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the RSCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSC variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- The RSCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

#### Decode for this encoding

```plaintext
d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;  // Armv8-A removes UNPREDICTABLE for R13
```

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

#### Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.
- `<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

#### Operation for all encodings

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    sum1 = SInt(R[n]<7:0>) + SInt(R[m]<7:0>);
    sum2 = SInt(R[n]<15:8>) + SInt(R[m]<15:8>);
    sum3 = SInt(R[n]<23:16>) + SInt(R[m]<23:16>);
```
sum4 = SInt(R[n]<31:24>) + SInt(R[m]<31:24>);
R[d]<7:0> = sum1<7:0>;
R[d]<15:8> = sum2<7:0>;
R[d]<23:16> = sum3<7:0>;
R[d]<31:24> = sum4<7:0>;
PSTATE.GE<0> = if sum1 >= 0 then '1' else '0';
PSTATE.GE<1> = if sum2 >= 0 then '1' else '0';
PSTATE.GE<2> = if sum3 >= 0 then '1' else '0';
PSTATE.GE<3> = if sum4 >= 0 then '1' else '0';

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.174 SASX

Signed Add and Subtract with Exchange exchanges the two halfwords of the second operand, performs one 16-bit integer addition and one 16-bit subtraction, and writes the results to the destination register. It sets PSTATE.GE according to the results.

if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.
- `<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    diff = Sint(R[n]<15:0>) - Sint(R[m]<31:16>);
    sum  = Sint(R[n]<31:16>) + Sint(R[m]<15:0>);
```
R[d]<15:0>  = diff<15:0>;
R[d]<31:16> = sum<15:0>;
PSTATE.GE<1:0> = if diff >= 0 then '11' else '00';
PSTATE.GE<3:2> = if sum >= 0 then '11' else '00';

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.175   SB

Speculation Barrier is a barrier that controls speculation.

The semantics of the Speculation Barrier are that the execution, until the barrier completes, of any instruction that
appears later in the program order than the barrier:

• Cannot be performed speculatively to the extent that such speculation can be observed through side-channels
  as a result of control flow speculation or data value speculation.
• Can be speculatively executed as a result of predicting that a potentially exception generating instruction has
  not generated an exception.

In particular, any instruction that appears later in the program order than the barrier cannot cause a speculative
allocation into any caching structure where the allocation of that entry could be indicative of any data value present
in memory or in the registers.

The SB instruction:

• Cannot be speculatively executed as a result of control flow speculation or data value speculation.
• Can be speculatively executed as a result of predicting that a potentially exception generating instruction has
  not generated an exception. The potentially exception generating instruction can complete once it is known
  not to be speculative, and all data values generated by instructions appearing in program order before the SB
  instruction have their predicted values confirmed.

When the prediction of the instruction stream is not informed by data taken from the register outputs of the
speculative execution of instructions appearing in program order after an uncompleted SB instruction, the SB
instruction has no effect on the use of prediction resources to predict the instruction stream that is being fetched.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<ϕ> See Standard assembler syntax fields on page F2-4120.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    SpeculationBarrier();
SBC, SBCS (immediate)

Subtract with Carry (immediate) subtracts an immediate value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SBCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The SBC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993*.
- The SBCS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state on page G1-5766*.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.
Assembler symbols

<c>
See Standard assembler syntax fields on page F2-4120.

<q>
See Standard assembler syntax fields on page F2-4120.

<Rdn>
Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.

<Rd>
For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:
- For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- For the SBCS variant, the instruction performs an exception return, that restores PSTATE from SPSR.<current_mode>.

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn>
For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.

<Rm>
For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.

<shift>
Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
- LSL when stype = 00
- LSR when stype = 01
- ASR when stype = 10
- ROR when stype = 11

<amount>
For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

if ConditionPassed() then
   EncodingSpecificOperations();
   shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
   (result, nzcv) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
   if d == 15 then // Can only occur for A32 encoding
      if setflags then
         ALUExceptionReturn(result);
      else
         ALUWritePC(result);
   else
      R[d] = result;
      if setflags then
         PSTATE.<N,Z,C,V> = nzcv;
Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
SBC, SBCS (register-shifted register)

Subtract with Carry (register-shifted register) subtracts a register-shifted register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

Flag setting variant

Applies when \( S == 1 \).

\[ \text{SBCS\{<c>\}{<q>} \{<Rd>,} \ <Rn>, \ <Rm>, <\text{shift}> <Rs> } \]

Not flag setting variant

Applies when \( S == 0 \).

\[ \text{SBC\{<c>\}{<q>} \{<Rd>,} \ <Rn>, \ <Rm>, <\text{shift}> <Rs} \]

Decode for all variants of this encoding

\[
d = \text{UInt}(Rd); \ n = \text{UInt}(Rn); \ m = \text{UInt}(Rm); \ s = \text{UInt}(Rs); \\
\text{setflags} = (S == '1'); \ \text{shift}_t = \text{DecodeRegShift}(\text{stype}); \\
\text{if } d == 15 \ || \ n == 15 \ || \ m == 15 \ || \ s == 15 \ \text{then UNPREDICTABLE;}
\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-4120.

\(<q>\) See Standard assembler syntax fields on page F2-4120.

\(<\text{Rd}>\) Is the general-purpose destination register, encoded in the "Rd" field.

\(<\text{Rn}>\) Is the first general-purpose source register, encoded in the "Rn" field.

\(<\text{Rm}>\) Is the second general-purpose source register, encoded in the "Rm" field.

\(<\text{shift}>\) Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

- LSL when \( \text{stype} = 00 \)
- LSR when \( \text{stype} = 01 \)
- ASR when \( \text{stype} = 10 \)
- ROR when \( \text{stype} = 11 \)

\(<\text{Rs}>\) Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
   EncodingSpecificOperations();
   shift_n = UInt(R[s]<7:0>);
   shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
   (result, nzcv) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
   R[d] = result;
   if setflags then
      PSTATE.<N,Z,C,V> = nzcv;

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.179  SBFX

Signed Bit Field Extract extracts any number of adjacent bits at any position from a register, sign-extends them to 32 bits, and writes the result to the destination register.

Decode for this encoding

\[
d = \text{UInt}(Rd); \quad n = \text{UInt}(Rn);
lsbit = \text{UInt}(imm3:imm2); \quad \text{widthminus1} = \text{UInt}(widthm1);
\]

if \( d = 15 \) || \( n = 15 \) then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

\(<c>\)  See Standard assembler syntax fields on page F2-4120.

\(<q>\)  See Standard assembler syntax fields on page F2-4120.

\(<Rd>\)  Is the general-purpose destination register, encoded in the "Rd" field.

\(<Rn>\)  Is the general-purpose source register, encoded in the "Rn" field.

\(<lsb>\)  For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field.

For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field.

\(<width>\)  Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "widthm1" field as <width>-1.
Operation for all encodings

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsbit + widthminus1;
    if msbit <= 31 then
        R[d] = SignExtend(R[n]<msbit:lsbit>, 32);
    else
        UNPREDICTABLE;
```

CONSTRANGED UNPREDICTABLE behavior

If `msbit > 31`, then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The value in the destination register is **UNKNOWN**.

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.180   SDIV

Signed Divide divides a 32-bit signed integer register value by a 32-bit signed integer register value, and writes the
result to the destination register. The condition flags are not affected.

d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

• The instruction is UNDEFINED.

• The instruction executes as NOP.

• The instruction executes as described, with no change to its behavior and no additional side effects.

• The instruction executes as described, and the register specified by Ra becomes UNKNOWN.

T1

| 15 14 13|12|11 10 9 8 7 6 5 4 3 0 | | 12|11 8 7 6 5 4 3 0 0 |
|--------------------------------|--------------------------------|
| 1 1 1 1 0 1 1 1 0 0 0 1 Rn | (1)(1)(1)(1) Rd | 1 1 1 1 Rm |

Ra

T1 variant

SDIV{<c>}{<q>} {<Rd>,} <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd);  n = UInt(Rn);  m = UInt(Rm);  a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

• The instruction is UNDEFINED.

• The instruction executes as NOP.

• The instruction executes as described, with no change to its behavior and no additional side effects.

• The instruction executes as described, and the register specified by Ra becomes UNKNOWN.
Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<
> See Standard assembler syntax fields on page F2-4120.

<
> See Standard assembler syntax fields on page F2-4120.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register holding the dividend, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the divisor, encoded in the "Rm" field.

Overflow

If the signed integer division 0x80000000 / 0xFFFFFFFF is performed, the pseudocode produces the intermediate integer result +2^31, that overflows the 32-bit signed integer range. No indication of this overflow case is produced, and the 32-bit result written to <Rd> must be the bottom 32 bits of the binary representation of +2^31. So the result of the division is 0x80000000.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    if SInt(R[m]) == 0 then
        result = 0;
    else
        result = RoundTowardsZero(Real(SInt(R[n])) / Real(SInt(R[m])));
    R[d] = result<31:0>;

F5.1.181 SEL

Select Bytes selects each byte of its result from either its first operand or its second operand, according to the values of the PSTATE.GE flags.

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.192 SMC

Secure Monitor Call causes a Secure Monitor Call exception. For more information see Secure Monitor Call (SMC) exception on page G1-5783.

SMC is available only for software executing at EL1 or higher. It is UNDEFINED in User mode.

If the values of HCR.TSC and SCR.SCD are both 0, execution of an SMC instruction at EL1 or higher generates a Secure Monitor Call exception that is taken to EL3. When EL3 is using AArch32 this exception is taken to Monitor mode. When EL3 is using AArch64, it is the SCR_EL3.SMD bit, rather than the SCR.SCD bit, that can change the effect of executing an SMC instruction.

If the value of HCR.TSC is 1, execution of an SMC instruction in a Non-secure EL1 mode generates an exception that is taken to EL2, regardless of the value of SCR.SCD. When EL2 is using AArch32, this is a Hyp Trap exception that is taken to Hyp mode. For more information see Traps to Hyp mode of Non-secure EL1 execution of SMC instructions on page G1-5834.

If the value of HCR.TSC is 0 and the value of SCR.SCD is 1, the SMC instruction is:

• UNDEFINED in Non-secure state.
• CONSTRAINED UNPREDICTABLE if executed in Secure state at EL1 or higher.

                if IsSecure() then
                    // Executes either as a NOP or UNALLOCATED.
                    c = ConstrainUnpredictable();
                    assert c IN {Constraint_NOP, Constraint_UNDEF};
                    if c == Constraint_NOP then EndOfInstruction();
                    UNDEFINED;
                else
                    AArch32.TakeSMCException();
            else
                AArch64.CallSecureMonitor(Zeros(16));
            end if
        end if
    end if
else
    if SCR.SCD == '1' then
        // SMC disabled
        if IsSecure() then
            // Executes either as a NOP or UNALLOCATED.
            c = ConstrainUnpredictable();
            assert c IN {Constraint_NOP, Constraint_UNDEF};
            if c == Constraint_NOP then EndOfInstruction();
            UNDEFINED;
        end if
    else
        AArch32.TakeSMCException();
    end if
end if

CONSTRAINED UNPREDICTABLE behavior

If SCR.SCD == '1' & IsSecure(), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
F5.1.193  SMLABB, SMLABT, SMLATB, SMLATT

Signed Multiply Accumulate (halfwords) performs a signed multiply accumulate operation. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is added to a 32-bit accumulate value and the result is written to the destination register.

If overflow occurs during the addition of the accumulate value, the instruction sets PSTATE.Q to 1. It is not possible for overflow to occur during the multiplication.

```c
EncodingSpecificOperations();
operand1 = if n_{\text{high}} then R[n]<31:16> else R[n]<15:0>;
operand2 = if m_{\text{high}} then R[m]<31:16> else R[m]<15:0>;
result = SInt(operand1) * SInt(operand2) + SInt(R[a]);
R[d] = result<31:0>;
if result != SInt(result<31:0>) then // Signed overflow
  PSTATE.Q = '1';
```
F5.1.194  SMLAD, SMLADX

Signed Multiply Accumulate Dual performs two signed 16 x 16-bit multiplications. It adds the products to a 32-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets PSTATE.Q to 1 if the accumulate operation overflows. Overflow cannot occur during the multiplications.

    // PSTATE.C, PSTATE.V unchanged`

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.196   SMLALBB, SMLALBT, SMLALTB, SMLALTT

Signed Multiply Accumulate Long (halfwords) multiplies two signed 16-bit values to produce a 32-bit value, and accumulates this with a 64-bit value. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is sign-extended and accumulated with a 64-bit accumulate value.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo 2^64.

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.198 SMLAWB, SMLAWT

Signed Multiply Accumulate (word by halfword) performs a signed multiply accumulate operation. The multiply acts on a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are added to a 32-bit accumulate value and the result is written to the destination register. The bottom 16 bits of the 48-bit product are ignored.

If overflow occurs during the addition of the accumulate value, the instruction sets PSTATE.Q to 1. No overflow can occur during the multiplication.

A1

SMLAWB variant

Applies when M == 0.

SMLSLDX{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>
Decode for all variants of this encoding

dLo = UInt(RdLo);  dHi = UInt(RdHi);  n = UInt(Rn);  m = UInt(Rm);  m_swap = (M == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;

**CONSTRUANED UNPREDICTABLE behavior**

If dHi == dLo, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

<\> See Standard assembler syntax fields on page F2-4120.

<\> See Standard assembler syntax fields on page F2-4120.

<RdLo> Is the general-purpose source register holding the lower 32 bits of the addend, and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.

<RdHi> Is the general-purpose source register holding the upper 32 bits of the addend, and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.

<Rn> Is the first general-purpose source register, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register, encoded in the "Rm" field.

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations();
  operand2 = if m_swap then ROR(R[m],16) else R[m];
  product1 = SInt(R[n]<15:0>) * SInt(operand2<15:0>);
  product2 = SInt(R[n]<31:16>) * SInt(operand2<31:16>);
  result = product1 - product2 + SInt(R[dHi]:R[dLo]);
  R[dHi] = result<63:32>;
  R[dLo] = result<31:0>;
F5.1.201  SMMLA, SMMLAR

Signed Most Significant Word Multiply Accumulate multiplies two signed 32-bit values, extracts the most significant 32 bits of the result, and adds an accumulate value.

Optionally, the instruction can specify that the result is rounded instead of being truncated. In this case, the constant 0x80000000 is added to the product before the high word is extracted.

        PSTATE.Z = IsZeroBit(result<63:0>);
        // PSTATE.C, PSTATE.V unchanged
```

**Operational information**

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.207 SMULWB, SMULWT

Signed Multiply (word by halfword) multiplies a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are written to the destination register. The bottom 16 bits of the 48-bit product are ignored. No overflow is possible during this instruction.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.
Assembler symbols

<c> See Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Rm> Is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;
    product = SInt(R[n]) * SInt(operand2);
    R[d] = product<47:16>;
    // Signed overflow cannot occur

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
Signed Multiply Subtract Dual performs two signed 16 x 16-bit multiplications. It subtracts one of the products from the other, and writes the result to the destination register.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

Overflow cannot occur.

    R[d] = result<31:0>;
    // Signed overflow cannot occur
F5.1.209 SRS, SRSDA, SRSDB, SRSIA, SRSIB

Store Return State stores the LR_<current_mode> and SPSR_<current_mode> to the stack of a specified mode. For information about memory accesses see Memory accesses on page F2-4125.

SRS is UNDEFINED in Hyp mode.

SRS is CONSTRAINED UNPREDICTABLE if it is executed in User or System mode, or if the specified mode is any of the following:

- Not implemented.
- A mode that Table G1-5 on page G1-5726 does not show.
- Hyp mode.
- Monitor mode, if the SRS instruction is executed in Non-secure state.

If EL3 is using AArch64 and an SRS instruction that is executed in a Secure EL1 mode specifies Monitor mode, it is trapped to EL3.

See Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-2385.

CONSTRANDED UNPREDICTABLE behavior
If PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.

If mode == M32_Hyp, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.

If mode == M32_Monitor && (!HaveEL(EL3) || !IsSecure()), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.

If BadMode(mode), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
- The instruction stores to the stack of the mode in which it is executed.
- The instruction stores to an **UNKNOWN** address, and if the instruction specifies writeback then any general-purpose register that can be accessed from the current Exception level without a privilege violation becomes **UNKNOWN**.
F5.1.210 SSAT

Signed Saturate saturates an optionally-shifted signed value to a selectable signed range.

This instruction sets PSTATE.Q to 1 if the operation saturates.

- `<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations();
  sum = \(\text{SInt}(R[n]<15:0>) + \text{SInt}(R[m]<31:16>)\);
  diff = \(\text{SInt}(R[n]<31:16>) - \text{SInt}(R[m]<15:0>)\);
R[d]<15:0> = sum<15:0>;
R[d]<31:16> = diff<15:0>;
PSTATE.GE<1:0> = if sum >= 0 then '11' else '00';
PSTATE.GE<3:2> = if diff >= 0 then '11' else '00';

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.213   SSBB

Speculative Store Bypass Barrier is a memory barrier which prevents speculative loads from bypassing earlier stores to the same virtual address under certain conditions.

The semantics of the Speculative Store Bypass Barrier are:

- When a load to a location appears in program order after the SSBB, then the load does not speculatively read an entry earlier in the coherence order for that location than the entry generated by the latest store satisfying all of the following conditions:
  - The store is to the same location as the load.
  - The store uses the same virtual address as the load.
  - The store appears in program order before the SSBB.

- When a load to a location appears in program order before the SSBB, then the load does not speculatively read data from any store satisfying all of the following conditions:
  - The store is to the same location as the load.
  - The store uses the same virtual address as the load.
  - The store appears in program order after the SSBB.

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
STC

Store data to System register calculates an address from a base register value and an immediate offset, and stores a word from the DBGDTRRXint System register to memory. It can use offset, post-indexed, pre-indexed, or unindexed addressing. For information about memory accesses see Memory accesses on page F2-4125.

In an implementation that includes EL2, the permitted STC access to DBGDTRRXint can be trapped to Hyp mode, meaning that an attempt to execute an STC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see Trapping general Non-secure System register accesses to debug registers on page G1-5843.

For simplicity, the STC pseudocode does not show this possible trap to Hyp mode.

**CONSTRANDED UNPREDICTABLE behavior**

If \( n == 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in Using R15 on page K1-7941.

**Assembler symbols**

\(<c>\) See Standard assembler syntax fields on page F2-4120.

\(<q>\) See Standard assembler syntax fields on page F2-4120.

\(<Rn>\) For the offset or unindexed variant: is the general-purpose base register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For the offset, post-indexed or pre-indexed variant: is the general-purpose base register, encoded in the "Rn" field.

\(<option>\) Is an 8-bit immediate, in the range 0 to 255 enclosed in \{ \}, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.
+/− Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1

<imm> Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];

    // System register read from DBGDTRXint.
    MemA[address,4] = DBGDTR_EL0[];
    if wback then R[n] = offset_addr;
```

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

### A1 variant

STLEX{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

### Decode for this encoding

\[
d = \text{UInt}(Rd); \quad t = \text{UInt}(Rt); \quad n = \text{UInt}(Rn);
\]

if \(d == 15 \text{ or } t == 15 \text{ or } n == 15\) then UNPREDICTABLE;

if \(d == n \text{ or } d == t\) then UNPREDICTABLE;

### CONSTRAINED UNPREDICTABLE behavior

If \(d == t\), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If \(d == n\), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

T1

![Instruction Format](#)

### T1 variant

STLEX{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

### Decode for this encoding

\[
d = \text{UInt}(Rd); \quad t = \text{UInt}(Rt); \quad n = \text{UInt}(Rn);
\]

if \(d == 15 \text{ or } t == 15 \text{ or } n == 15\) then UNPREDICTABLE;

if \(d == n \text{ or } d == t\) then UNPREDICTABLE;
CONstrained UNpredictable behavior

If \(d = t\), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If \(d = n\), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-4120.

\(<q>\) See Standard assembler syntax fields on page F2-4120.

\(<Rd>\) Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

\(<Rt>\) Is the general-purpose register to be transferred, encoded in the "Rt" field.

\(<Rn>\) Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- \(<Rd>\) is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If \(\text{AArch32.ExclusiveMonitorsPass()}\) returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If \(\text{AArch32.ExclusiveMonitorsPass()}\) returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address, 4) then
        MemO[address, 4] = R[t];
R[d] = ZeroExtend('0');
else
R[d] = ZeroExtend('1');

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.220   STLEXB

Store-Release Exclusive Byte stores a byte from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in Load-Acquire, Store-Release on page E2-4036.

For more information about support for shared memory see Synchronization and semaphores on page E2-4063. For information about memory accesses see Memory accesses on page F2-4125.

```

T1 variant

STLEXB{<c>}{<q>} <Rd>, <Rt>, [Rn]

Decode for this encoding

\[ d = \text{UInt}(Rd); \ t = \text{UInt}(Rt); \ n = \text{UInt}(Rn); \]
\[ \text{if } d = 15 \text{ || } t = 15 \text{ || } n = 15 \text{ then UNPREDICTABLE;} \]
\[ \text{if } d = n \text{ || } d = t \text{ then UNPREDICTABLE;} \]
**CONSTRAINED UNPREDICTABLE behavior**

If \( d = t \), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The store instruction executes but the value stored is **UNKNOWN**.

If \( d = n \), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The instruction performs the store to an **UNKNOWN** address.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 *Architectural Constraints on UNPREDICTABLE Behaviors*.

**Assembler symbols**

\(<c>\) See *Standard assembler syntax fields* on page F2-4120.

\(<q>\) See *Standard assembler syntax fields* on page F2-4120.

\(<Rd>\) Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

\(<Rt>\) Is the general-purpose register to be transferred, encoded in the "Rt" field.

\(<Rn>\) Is the general-purpose base register, encoded in the "Rn" field.

**Aborts**

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- \(<Rd>\) is not updated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,1) then
        MemO[address, 1] = R[t]<7:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.221  STLEXD

Store-Release Exclusive Doubleword stores a doubleword from two registers to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in Load-Acquire, Store-Release on page E2-4036.

For more information about support for shared memory see Synchronization and semaphores on page E2-4063. For information about memory accesses see Memory accesses on page F2-4125.

```
d = UInt(Rd);  t = UInt(Rt);  t2 = UInt(Rt2);  n = UInt(Rn);
if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

**CONSTRAINED UNPREDICTABLE behavior**

If \( d == t \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If \( d == n \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rd>` Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:
  - 0 If the operation updates memory.
  - 1 If the operation fails to update memory.
- `<Rt>` For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. `<Rt>` must be even-numbered and not R14.
  For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
- `<Rt2>` For encoding A1: is the second general-purpose register to be transferred. `<Rt2>` must be \( 8(t+1) \).
  For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
- `<Rn>` Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment
If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- \(<R_d>\) is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

### Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian() then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address, 8) then
        MemO[address, 8] = value;

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.224 STM, STMIA, STMEA

Store Multiple (Increment After, Empty Ascending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also Encodings of lists of general-purpose registers and the PC on page F2-4126.

Armv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see FEAT_LSMAOC. For details of related system instructions see STM (User registers).

A1

```
|31  28|27 26 25 24|23 22 21 20|19  16|15 | 0 |

!1111   1  0  0  1  0  W  0  Rn  register_list
```

A1 variant

STM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMIA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack

Decode for this encoding

\[
n = \text{UInt}(Rn) ; \text{ registers } = \text{register_list} ; \text{ wback } = (W == '1'); \\
\text{ if } n == 15 || \text{ BitCount(registers) } < 1 \text{ then UNPREDICTABLE;}
\]

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If n == 15 && wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in Using R15 on page K1-7941.

T1

```
|15 14 13|12|11 10 8 7 | 0 |

1 1 0 0 0 | Rn | register_list
```

\text{if } &n \gg 15 || \text{BitCount}(\text{registers}) < 2 \text{ then UNPREDICTABLE;}
\end{align*}
\]

CONstrained UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.
If \( \text{BitCount(registers)} = 1 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If \( \text{wback} \&\& \text{registers}<n> = '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored for the base register is UNKNOWN.

If \( \text{registers}<13> = '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

If \( \text{registers}<15> = '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

If \( n = 15 \&\& \text{wback} \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in Using R15 on page K1-7941.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- IA: Is an optional suffix for the Increment After form.
- <>: See Standard assembler syntax fields on page F2-4120.
- <>: See Standard assembler syntax fields on page F2-4120.
- <Rn>: Is the general-purpose base register, encoded in the "Rn" field.
- !: The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.

The PC can be in the list. However, Arm deprecates the use of instructions that include the PC in the list.

If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field. If the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T2: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;  // Only possible for encodings T1 and A1
            else
                MemA[address,4] = R[i];
                address = address + 4;
        if registers<15> == '1' then  // Only possible for encoding A1
            MemA[address,4] = PCStoreValue();
            if wback then R[n] = R[n] + 4*BitCount(registers);

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.225   STM (User registers)

In an EL1 mode other than System mode, Store Multiple (User registers) stores multiple User mode registers to
consecutive memory locations using an address from a base register. The PE reads the base register value normally,
using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to
the base register.

Store Multiple (User registers) is UNDEFINED in Hyp mode, and CONSTRAINED UNPREDICTABLE in User or System
modes.

Armv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information
see FEAT_LSMAOC.

A1 variant

STM{<amode>}{<c>{<q>}}<Rn>, <registers>^ 

Decode for this encoding

\[ n = UInt(Rn);\] \[ \text{registers} = \text{register_list};\] \[ \text{increment} = (U == '1');\] \[ \text{wordhigher} = (P == U);\]

if \[ n == 15 \] \[ \|\] \[ \text{BitCount(registers)} < 1 \] then UNPREDICTABLE;

CONSTRUINED UNPREDICTABLE behavior

If \[ \text{BitCount(registers)} < 1 \] then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers.
  These registers might include R15.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1
Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

\(<\text{amode}>\) is one of:

DA  Decrement After. The consecutive memory addresses end at the address in the base
    register. Encoded as P = 0, U = 0.
ED  Empty Descending. For this instruction, a synonym for DA.
DB  Decrement Before. The consecutive memory addresses end one word below the address
    in the base register. Encoded as P = 1, U = 0.
FD  Full Descending. For this instruction, a synonym for DB.
IA  Increment After. The consecutive memory addresses start at the address in the base
    register. This is the default. Encoded as P = 0, U = 1.
EA  Empty Ascending. For this instruction, a synonym for IA.
IB  Increment Before. The consecutive memory addresses start one word above the address
    in the base register. Encoded as P = 1, U = 1.
FA Full Ascending. For this instruction, a synonym for IB.

See Standard assembler syntax fields on page F2-4120.

See Standard assembler syntax fields on page F2-4120.

Is the general-purpose base register, encoded in the "Rn" field.

Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be stored by the STM instruction. The registers are stored with the lowest-numbered register to the lowest memory address, through to the highest-numbered register to the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-4126.

### Operation

```plaintext
ef ConditionPassed() then
    EncodingSpecificOperations();
ef PSTATE.EL == EL2 then
    UNDEFINED;
ewl PSTATE.M IN {M32_User, M32_System} then
    UNPREDICTABLE;
e else
    length = 4*BitCount(registers);
    address = if increment then R[n] else R[n]-length;
    if wordhigher then address = address+4;
    for i = 0 to 14
        if registers<i> == '1' then // Store User mode register
            MemA[address,4] = Rmode[i, M32_User];
            address = address + 4;
        if registers<15> == '1' then
            MemA[address,4] = PCStoreValue();
```

### CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User, M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

### Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.226 STMDA, STMED

Store Multiple Decrement After (Empty Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end at this address, and the address just below the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-4126.

Armv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see FEAT_LSMAOC. For details of related system instructions see STM (User registers).

Rn register_list

cond

A1 variant

STMDA{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
STMED{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Descending stack

Decode for this encoding

n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If n == 15 && wback, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction executes without writeback of the base address.
• The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<c> See Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.
<Rn> Is the general-purpose base register, encoded in the "Rn" field.

The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

<registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }.

The PC can be in the list. However, Arm deprecates the use of instructions that include the PC in the list.

If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers) + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;
            else
                MemA[address,4] = R[i];
                address = address + 4;
        if registers<15> == '1' then
            MemA[address,4] = PCStoreValue();
            if wback then R[n] = R[n] - 4*BitCount(registers);

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.227  STMDB, STMFD

Store Multiple Decrement Before (Full Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the first of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-4126.

Armv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see FEAT_LSMAOC. For details of related system instructions see STM (User registers).

This instruction is used by the alias PUSH (multiple registers). See Alias conditions on page F5-4813 for details of when each alias is preferred.

Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-4120.

\(<q>\) See Standard assembler syntax fields on page F2-4120.

\(<Rn>\) Is the general-purpose base register, encoded in the "Rn" field.

\(!\) The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

\(<\text{registers}>\) For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by \{ and \}.

The PC can be in the list. However, Arm deprecates the use of instructions that include the PC in the list.

If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by \{ and \}.

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*\text{BitCount}(registers);
    for i = 0 to 14
        if registers <i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemA[address,4] = bits(32) UNKNOWN;  // Only possible for encoding A1
            else
                MemA[address,4] = R[i];
                address = address + 4;
            if registers <15> == '1' then  // Only possible for encoding A1
                MemA[address,4] = PCStoreValue();
            if wback then R[n] = R[n] - 4*\text{BitCount}(registers);

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.228 STMIB, STMFA

Store Multiple Increment Before (Full Ascending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations start just above this address, and the address of the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F2-4126.

Armv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see FEAT_LSMAOC. For details of related system instructions see STM (User registers).

Assembler symbols

<> See Standard assembler syntax fields on page F2-4120.
<q> See Standard assembler syntax fields on page F2-4120.
<rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.
For encoding T1, T2, T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field.
<rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.
For encoding T1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field.
<+/-> Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1
<imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4.
For encoding T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 and encoded in the "imm8" field as <imm>/4.
For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,4] = if t == 15 then PCStoreValue() else R[t];
    if wback then R[n] = offset_addr;
  else
    if ConditionPassed() then
      EncodingSpecificOperations();
      offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
      address = if index then offset_addr else R[n];
      MemU[address,4] = R[t];
      if wback then R[n] = offset_addr;
Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.230   STR (register)

Store Register (register) calculates an address from a base register value and an offset register value, stores a word
from a register to memory. The offset register value can optionally be shifted. For information about memory
accesses see Memory accesses on page F2-4125.

A1

| 31 28 27 26 25 24 23 22 21 20 19 16 15 12 11  7  6  5  4  3  0 |

if t == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

**CONSTRAINED UNPREDICTABLE behavior**

If t == 15, then one of the following behaviors must occur:

• The instruction is UNDEFINED.

• The instruction executes as NOP.

• The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

• `<<>` See `Standard assembler syntax fields` on page F2-4120.

• `<<>` See `Standard assembler syntax fields` on page F2-4120.

• `<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.

For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

+/− Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
+ when U = 1

+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see "Shifts applied to a register on page F2-4123."

<imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

if ConditionPassed() then
   EncodingSpecificOperations();
   offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
   offset_addr = if add then (R[n] + offset) else (R[n] - offset);
   address = if index then offset_addr else R[n];
   MemU[address,1] = R[t]<7:0>;
   if wback then R[n] = offset_addr;

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.233   STRBT

Store Register Byte Unprivileged stores a byte from a register to memory. For information about memory accesses see Memory accesses on page F2-4125.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

STRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}

Decode for this encoding

t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;

CONstrained Unpredictable behavior

If t == 15, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If n == t, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The store instruction executes but the value stored is UNKNOWN.

If n == 15, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction uses post-indexed addressing with the base register as PC. This is handled as described in Using R15 on page K1-7941.
• The instruction is treated as if bit[24] == 1 and bit[21] == 0. The instruction uses immediate offset addressing with the base register as PC, without writeback.
A2

STRBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}

Decode for this encoding

\[
t = \text{UInt}(Rt); \quad n = \text{UInt}(Rn); \quad m = \text{UInt}(Rm); \quad \text{postindex} = \text{TRUE}; \quad \text{add} = (U == '1');
\]

\[
\text{register} = \text{TRUE}; \quad (\text{shift} \_t, \text{shift} \_n) = \text{DecodeImmShift}(\text{stype}, \text{imm}5);
\]

If \( t == 15 \) then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If \( n == t \) then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If \( n == 15 \) then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in Using R15 on page K1-7941.
- The instruction is treated as if bit[24] == 1 and bit[21] == 0. The instruction uses immediate offset addressing with the base register as PC, without writeback.

T1

STRBT{<c>}{<q>} <Rt>, [<Rn>] {, #{+}<imm>}

T1 variant
Decode for this encoding

if Rn == '1111' then UNDEFINED;

\[
t = \text{UInt}(Rt); \quad n = \text{UInt}(Rn); \quad \text{postindex} = \text{FALSE}; \quad \text{add} = \text{TRUE};
\]

\[
\text{register\_form} = \text{FALSE}; \quad \text{imm32} = \text{ZeroExtend}(\text{imm8}, 32);
\]

if \( t = 15 \) then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If \( t = 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-4120.

\(<q>\) See Standard assembler syntax fields on page F2-4120.

\(<Rt>\) For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

\(<Rn>\) Is the general-purpose base register, encoded in the "Rn" field.

\(+/-\) For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

\[
- \quad \text{when } U = 0
\]
\[
+ \quad \text{when } U = 1
\]

For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

\[
- \quad \text{when } U = 0
\]
\[
+ \quad \text{when } U = 1
\]

\(<Rm>\) Is the general-purpose index register, encoded in the "Rm" field.

\(<\text{shift}>\) The shift to apply to the value read from \(<Rm>\). If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-4123.

\(+\) Specifies the offset is added to the base register.

\(<\text{imm}>\) For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

if ConditionPassed() then

if PSTATE.EL == EL2 then UNPREDICTABLE;               // Hyp mode

EncodingSpecificOperations();
offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
offset_addr = if add then (R[n] + offset) else (R[n] - offset);
address = if postindex then R[n] else offset_addr;
MemU_unpriv[address,1] = R[t]<7:0>;
if postindex then R[n] = offset_addr;

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as STRB (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.234  STRD (immediate)

Store Register Dual (immediate) calculates an address from a base register value and an immediate offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see Memory accesses on page F2-4125.

Offset variant

Applies when \( P = 1 \) \&\& \( W = 0 \).

\[ \text{STRD}\{<c>}\{<q>\} \ <Rt>, \ <Rt2>, \ [<Rn> \ {, \ #{+/-}<imm>}] \]

Post-indexed variant

Applies when \( P = 0 \) \&\& \( W = 0 \).

\[ \text{STRD}\{<c>\}{<q>} \ <Rt>, \ <Rt2>, \ [\langle Rn \rangle], \ #{+/-}<imm> \]

Pre-indexed variant

Applies when \( P = 1 \) \&\& \( W = 1 \).

\[ \text{STRD}\{<c>\}{<q>} \ <Rt>, \ <Rt2>, \ [<Rn>, \ #{+/-}<imm>]! \]

Decode for all variants of this encoding

```c
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt);  t2 = t+1;  n = UInt(Rn);  imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1');  add = (U == '1');  wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if wback && (n == t || n == t2) then UNPREDICTABLE;
if t2 == 15 then UNPREDICTABLE;
```

CONstrained UNPREDICTABLE behavior

If \( t = 15 \) \&\& \( t2 = 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If \( wback \) \&\& \( n = t \) \&\& \( n = t2 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If \( wback \) \&\& \( n = 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
The instruction uses the addressing mode described in the equivalent immediate offset instruction. If \( Rt < 0 \) == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: \( t < 0 \) = '0'.
- The instruction executes with the additional decode: \( t2 = 1 \).
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when \( Rt == '1111' \).

If \( P == '0' \) \&\& \( W == '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

|cond|
```

A1 variant

STREX{<c>}{<q>} Rd, Rt, [Rn {, {#}imm}]

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);  imm32 = Zeros(32); // Zero offset
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONstrained UNPREDICtable behavior

If d == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If d == n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

T1

```
|15 14 13 12|11 10 9 8 7 6 5 4 3 0 15 12|11 8 7 |
|----------|----------|--------|----|
|1 1 1 0 1 0 0 0 1 0 0 |Rn |Rt |Rd |imm8|
```

T1 variant

STREX{<c>}{<q>} Rd, Rt, [Rn {, #imm}]

Decode for this encoding

```
d = UInt(Rd);  t = UInt(Rt);  n = UInt(Rn);  imm32 = ZeroExtend(imm8:'00', 32);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```
**CONSTRAINED UNPREDICTABLE behavior**

If \( d = t \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If \( d = n \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors*.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rd>` Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:
  - 0 If the operation updates memory.
  - 1 If the operation fails to update memory.
- `<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.
- `<Rn>` Is the general-purpose base register, encoded in the "Rn" field.
- `<imm>` For encoding A1: the immediate offset added to the value of `<Rn>` to calculate the address. `<imm>` can only be 0 or omitted.
  For encoding T1: the immediate offset added to the value of `<Rn>` to calculate the address. `<imm>` can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

**Aborts and alignment**

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- `<Rd>` is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    if AArch32.ExclusiveMonitorsPass(address,4) then
        MemA[address,4] = R[t];
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.237  STREXB

Store Register Exclusive Byte derives an address from a base register value, stores a byte from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see `Synchronization and semaphores` on page E2-4063. For information about memory accesses see `Memory accesses` on page F2-4125.

STREXB{<c>}{<q>} <Rd>, <Rt>, [Rn]

**Decode for this encoding**

\[
d = \text{UInt}(Rd); \quad t = \text{UInt}(Rt); \quad n = \text{UInt}(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
\]
**CONSTRAINED UNPREDICTABLE behavior**

If \( d = t \), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The store instruction executes but the value stored is **UNKNOWN**.

If \( d = n \), then one of the following behaviors must occur:

- The instruction is **UNDEFINED**.
- The instruction executes as **NOP**.
- The instruction performs the store to an **UNKNOWN** address.

**Notes for all encodings**

For more information about the **CONSTRAINED UNPREDICTABLE behavior** of this instruction, see Appendix K.1 *Architectural Constraints on UNPREDICTABLE Behaviors*.

**Assembler symbols**

- \(<c>\) See *Standard assembler syntax fields* on page F2-4120.
- \(<q>\) See *Standard assembler syntax fields* on page F2-4120.
- \(<Rd>\) Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:
  - 0 If the operation updates memory.
  - 1 If the operation fails to update memory.
- \(<Rt>\) Is the general-purpose register to be transferred, encoded in the "Rt" field.
- \(<Rn>\) Is the general-purpose base register, encoded in the "Rn" field.

**Aborts**

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- \(<Rd>\) is not updated.

If \( \text{AArch32.ExclusiveMonitorsPass()} \) returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,1) then
        MemA[address,1] = R[t]<?:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.238 STREXD

Store Register Exclusive Doubleword derives an address from a base register value, stores a 64-bit doubleword from two registers to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see Synchronization and semaphores on page E2-4063. For information about memory accesses see Memory accesses on page F2-4125.

A1 variant

STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

\[
\begin{align*}
\text{d} &= \text{UInt}(\text{Rd}); \quad \text{t} = \text{UInt}(\text{Rt}); \quad \text{t2} = \text{t}+1; \quad \text{n} = \text{UInt}(\text{Rn}); \\
\text{if } \text{d} &= \text{15} \quad || \quad \text{Rt}<0> = '1' \quad || \quad \text{t}2 = \text{15} \quad || \quad \text{n} = \text{15} \quad \text{then UNPREDICTABLE}; \\
\text{if } \text{d} &= \text{n} \quad || \quad \text{d} = \text{t} \quad || \quad \text{d} = \text{t}2 \quad \text{then UNPREDICTABLE};
\end{align*}
\]

CONSTRANGED UNPREDICTABLE behavior

If \( d = t \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If \( d = n \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

If \( \text{Rt}<0> = '1' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: \( \text{Rt}<0> = '0' \).
- The instruction executes with the additional decode: \( \text{t}2 = \text{t} \).
- The instruction executes as described, with no change to its behavior and no additional side effects.

If \( \text{Rt} = '1110' \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction is handled as described in Using R15 on page K1-7941.

if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t || d == t2 then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If d == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If d == n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<\c> See Standard assembler syntax fields on page F2-4120.

<\q> See Standard assembler syntax fields on page F2-4120.

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Rd> must not be the same as <Rn>, <Rt>, or <Rt2>.

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

<Rt2> For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.
Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- \(<\text{Rd}>\) is not updated.

A non doubleword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch32.ExclusiveMonitorsPass() returns \text{TRUE}, the exception is generated.
- Otherwise, it is \text{IMPLEMENTATION DEFINED} whether the exception is generated.

If AArch32.ExclusiveMonitorsPass() returns \text{FALSE} and the memory address, if accessed, would generate a synchronous Data Abort exception, it is \text{IMPLEMENTATION DEFINED} whether the exception is generated.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian() then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address,8) then
        MemA[address,8] = value;  R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

**Operational information**

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.239  STREXH

Store Register Exclusive Halfword derives an address from a base register value, stores a halfword from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rt>` Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.
For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.

+/-. Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when \( U = 0 \)
+ when \( U = 1 \)

+ Specifies the index register is added to the base register.

<Rm> Is the general-purpose index register, encoded in the "Rm" field.

<imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    MemU[address,2] = R[t]<15:0>;
    if wback then R[n] = offset_addr;

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.242   STRHT

Store Register Halfword Unprivileged stores a halfword from a register to memory. For information about memory accesses see Memory accesses on page F2-4125.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

STRHT{<c>}{<q>} <Rt>, [<Rn>] {, #{+/-}<imm>}

Decode for this encoding

t = UInt(Rt);  n = UInt(Rn);  postindex = TRUE;  add = (U == '1');
register_form = FALSE;  imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in Using R15 on page K1-7941.
- The instruction is treated as if bit[24] == 1 and bit[21] == 0. The instruction uses immediate offset addressing with the base register as PC, without writeback.

register_form = FALSE;  imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<-> See Standard assembler syntax fields on page F2-4120.
<q> See Standard assembler syntax fields on page F2-4120.
<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn> Is the general-purpose base register, encoded in the "Rn" field.
+/- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
  - when U = 0
  + when U = 1
For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
  - when U = 0
  + when U = 1
<Rm> Is the general-purpose index register, encoded in the "Rm" field.
+ Specifies the offset is added to the base register.
<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

if ConditionPassed() then
  if PSTATE_EL == EL2 then UNPREDICTABLE; // Hyp mode
  EncodingSpecificOperations();
  offset = if register_form then R[m] else imm32;
  offset_addr = if add then (R[n] + offset) else (R[n] - offset);
  address = if postindex then R[n] else offset_addr;
  MemU_unpriv[address, 2] = R[t]<15:0>;
  if postindex then R[n] = offset_addr;
CONSTRANGED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction executes as STRH (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.243  STRT

Store Register Unprivileged stores a word from a register to memory. For information about memory accesses see Memory accesses on page F2-4125.

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

**CONSTRAINED UNPREDICTABLE behavior**

If \( t = 15 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors*. 
Assembler symbols

<>  See Standard assembler syntax fields on page F2-4120.

<>  See Standard assembler syntax fields on page F2-4120.

<Rt>  For encoding A1 and A2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.
       For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn>  Is the general-purpose base register, encoded in the "Rn" field.

+/-  For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
       - when U = 0
       + when U = 1
       For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
       - when U = 0
       + when U = 1

<Rm>  Is the general-purpose index register, encoded in the "Rm" field.

<shift>  The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F2-4123.

+  Specifies the offset is added to the base register.

<imm>  For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
       For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

if ConditionPassed() then
  if PSTATE.EL == EL2 then UNPREDICTABLE;       // Hyp mode
  EncodingSpecificOperations();
  offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
  offset_addr = if add then (R[n] + offset) else (R[n] - offset);
  address = if postindex then R[n] else offset_addr;
  if t == 15 then // Only possible for encodings A1 and A2
    data = PCStoreValue();
  else
    data = R[t];
    MemU_unpriv[address,4] = data;
  if postindex then R[n] = offset_addr;

CONSTRANED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

•  The instruction is UNDEFINED.
•  The instruction executes as NOP.
•  The instruction executes as STR (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.
F5.1.244 SUB (immediate, from PC)

Subtract from PC subtracts an immediate value from the Align(PC, 4) value to form a PC-relative address, and writes the result to the destination register. Arm recommends that, where possible, software avoids using this alias.

This instruction is an alias of the ADR instruction. This means that:

- The encodings in this description are named to match the encodings of ADR.
- The description of ADR gives the operational pseudocode for this instruction.

### A2

![Encoding for A2 variant](image)

**A2 variant**

SUB{<c>}{<q>} <Rd>, PC, #<const>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is the preferred disassembly when imm12 == '000000000000'.

### T2

![Encoding for T2 variant](image)

**T2 variant**

SUB{<c>}{<q>} <Rd>, PC, #<imm12>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is the preferred disassembly when i:imm3:imm8 == '000000000000'.

### Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rd>` For encoding A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.

  For encoding T2: is the general-purpose destination register, encoded in the "Rd" field.

- `<label>` For encoding A2: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the Align(PC, 4) value of the ADR instruction to this label.

  If the offset is zero or positive, encoding A1 is used, with imm32 equal to the offset.
If the offset is negative, encoding A2 is used, with imm32 equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of imm32.

Permitted values of the size of the offset are any of the constants described in Modified immediate constants in A32 instructions on page F2-4136.

For encoding T2: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the Align(PC, 4) value of the ADR instruction to this label.

If the offset is zero or positive, encoding T3 is used, with imm32 equal to the offset.

If the offset is negative, encoding T2 is used, with imm32 equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of imm32.

Permitted values of the size of the offset are 0-4095.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> An immediate value. See Modified immediate constants in A32 instructions on page F2-4136 for the range of values.

**Operation for all encodings**

The description of ADR gives the operational pseudocode for this instruction.
F5.1.245   SUB, SUBS (immediate)

Subtract (immediate) subtracts an immediate value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- The SUBS variant of the instruction performs an exception return without the use of the stack. In this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode, except for encoding T5 with <imm8> set to zero, which is the encoding for the ERET instruction, see ERET.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

\end{align*}
\]

if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors, and particularly SUBS PC, LR and related instructions (A32) on page K1-7954 and SUBS PC, LR and related instructions (T32) on page K1-7954.

**Assembler symbols**

- **<c>** See Standard assembler syntax fields on page F2-4120.
- **<p>** See Standard assembler syntax fields on page F2-4120.
- **<Rdn>** Is the general-purpose source and destination register, encoded in the "Rdn" field.
- **<imm8>** For encoding T2: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
  For encoding T5: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
  If <Rn> is the LR, and zero is used, see ERET.
- **<Rd>** For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used:
  - For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
  - For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. Arm deprecates use of this instruction unless <Rn> is the LR.
  For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
- **<Rn>** For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus immediate). If the PC is used, see ADR.
  For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
  For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus immediate).
- **<imm3>** Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.
<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-4136 for the range of values.
For encoding T3: an immediate value. See Modified immediate constants in T32 instructions on page F2-4135 for the range of values.

In the T32 instruction set, MOVs{<c>}{<q>} PC, LR is a pseudo-instruction for SUBs{<c>}{<q>} PC, LR, #0.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(R[n], NOT(imm32), '1');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```

**Operational information**

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F5.1.246   SUB, SUBS (register)

Subtract (register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for \(<Rd>\) identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_\(<current\_mode>\).
  - The PE checks SPSR_\(<current\_mode>\) for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

\[\text{if} \ (d == 15 \land \text{!setflags}) \mid n == 15 \mid m == 15 \text{ then UNPREDICTABLE};\]
// Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1
Architectural Constraints on UNPREDICTABLE Behaviors.
Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rd>` For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as `<Rn>`. Arm deprecates using the PC as the destination register, but if the PC is used:
  - For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
  - For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.
- `<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. If the SP is used, see SUB, SUBS (SP minus register).
- `<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
- `<shift>` Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
  - LSL when stype = 00
  - LSR when stype = 01
  - ASR when stype = 10
  - ROR when stype = 11
- `<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when `<shift> = LSL or ROR) or 1 to 32 (when `<shift> = LSR or ASR) encoded in the "imm5" field as `<amount>` modulo 32.
  - For encoding T2: is the shift amount, in the range 1 to 31 (when `<shift> = LSL or ROR) or 1 to 32 (when `<shift> = LSR or ASR), encoded in the "imm3:imm2" field as `<amount>` modulo 32.

Operation for all encodings

```cpp
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUEXceptionReturn(result);
        else
            ALUWritePC(result);
        else
            R[d] = result;
            if setflags then
                PSTATE.<N,Z,C,V> = nzcv;
```
Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.247   SUB, SUBS (register-shifted register)

Subtract (register-shifted register) subtracts a register-shifted register value from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

| 31 | 28|27|26|25|24|23|22|21|20|19|16|15| 8 | 7 | 6 | 5 | 4 | 3 | 0 |
| !=1111 | 0 | 0 | 0 | 0 | 1 | 0 | S | Rn | Rd | Rs | 0 | stype | 1 | Rm |

Flag setting variant

Applies when S == 1.

SUBS{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

SUB{<c>}{<q>} {<Rd>,} <Rn>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

\[
d = \text{UInt}(Rd); \quad n = \text{UInt}(Rn); \quad m = \text{UInt}(Rm); \quad s = \text{UInt}(Rs);
setflags = (S == '1'); \quad \text{shift}_t = \text{DecodeRegShift}(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

- \(<c>\) See Standard assembler syntax fields on page F2-4120.

- \(<q>\) See Standard assembler syntax fields on page F2-4120.

- \(<Rd>\) Is the general-purpose destination register, encoded in the "Rd" field.

- \(<Rn>\) Is the first general-purpose source register, encoded in the "Rn" field.

- \(<Rm>\) Is the second general-purpose source register, encoded in the "Rm" field.

- \(<\text{shift}>\) Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
  - LSL when stype = 00
  - LSR when stype = 01
  - ASR when stype = 10
  - ROR when stype = 11

- \(<Rs>\) Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.
Operation

if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcv;

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.248  SUB, SUBS (SP minus immediate)

Subtract from SP (immediate) subtracts an immediate value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `SP` Is the stack pointer.
- `<imm7>` Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the “imm7” field as `<imm7>/4`.
For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. If the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_.<current_mode>. Arm deprecates use of this instruction unless <Rn> is the LR.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

<iimm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F2-4136 for the range of values.

For encoding T2: an immediate value. See Modified immediate constants in T32 instructions on page F2-4135 for the range of values.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcv) = AddWithCarry(SP, NOT(imm32), '1');
    if d == 15 then          // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
```
F5.1.249   SUB, SUBS (SP minus register)

Subtract from SP (register) subtracts an optionally-shifted register value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-3993.

- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
  - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
  - The PE checks SPSR_<current_mode> for an illegal return event. See Illegal return events from AArch32 state on page G1-5766.
  - The instruction is UNDEFINED in Hyp mode.
  - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
- LSL when stype = 00
- LSR when stype = 01
- ASR when stype = 10
- ROR when stype = 11

(amount) For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

**Operation for all encodings**

        if setflags then
            PSTATE.<N,Z,C,V> = nzcv;
F5.1.250  SVC

Supervisor Call causes a Supervisor Call exception. For more information, see Supervisor Call (SVC) exception on page G1-5782.

——— Note ————
SVC was previously called SWI, Software Interrupt, and this name is still found in some documentation.

Software can use this instruction as a call to an operating system to provide a service.

In the following cases, the Supervisor Call exception generated by the SVC instruction is taken to Hyp mode:

- If the SVC is executed in Hyp mode.
- If HCR.TGE is set to 1, and the SVC is executed in Non-secure User mode. For more information, see Supervisor Call exception, when the value of HCR.TGE is 1 on page G1-5759.

In these cases, the HSR identifies that the exception entry was caused by a Supervisor Call exception, EC value 0x11, see Use of the HSR on page G5-6078. The immediate field in the HSR:

- If the SVC is unconditional:
  - For the T32 instruction, is the zero-extended value of the \texttt{imm8} field.
  - For the A32 instruction, is the least-significant 16 bits the \texttt{imm24} field.
- If the SVC is conditional, is UNKNOWN.

```

T2 variant

SXTH{<c>}.W {<Rd>,} <Rm> // <Rd>, <Rm> can be represented in T1
SXTH{<c>}{<q>} {<Rd>,} <Rm> {, ROR #<amount>}

Decode for this encoding

```
d = UInt(Rd);  m = UInt(Rm);  rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;  // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.
Assembler symbols

<
> See Standard assembler syntax fields on page F2-4120.

<
> See Standard assembler syntax fields on page F2-4120.

<Rd>
Is the general-purpose destination register, encoded in the "Rd" field.

<Rm>
Is the general-purpose source register, encoded in the "Rm" field.

<amount>
Is the rotate amount, encoded in the "rotate" field. It can have the following values:

<table>
<thead>
<tr>
<th>Amount</th>
<th>When Rotate</th>
</tr>
</thead>
<tbody>
<tr>
<td>omitted</td>
<td>rotation = 00</td>
</tr>
<tr>
<td>8</td>
<td>rotation = 01</td>
</tr>
<tr>
<td>16</td>
<td>rotation = 10</td>
</tr>
<tr>
<td>24</td>
<td>rotation = 11</td>
</tr>
</tbody>
</table>

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d] = SignExtend(rotated<15:0>, 32);

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
### F5.1.257 TBB, TBH

Table Branch Byte or Halfword causes a PC-relative forward branch using a table of single byte or halfword offsets. A base register provides a pointer to the table, and a second register supplies an index into the table. The branch length is twice the value returned from the table.

**T1**

| 15 14 13 12 11 10 9 8 7 6 5 4 3 0 | 1 1 1 0 1 0 0 0 1 1 0 1 | Rn | 1 1 1 1 0 0 0 0 0 0 | H | Rm |

**Byte variant**

Applies when H == 0.

\[
TBB\{\langle c\rangle\}\{\langle q\rangle\} \ [\langle Rn\rangle, \langle Rm\rangle] \ // \text{Outside or last in IT block}
\]

**Halfword variant**

Applies when H == 1.

\[
TBH\{\langle c\rangle\}\{\langle q\rangle\} \ [\langle Rn\rangle, \langle Rm\rangle, \text{LSL #}1] \ // \text{Outside or last in IT block}
\]

**Decode for all variants of this encoding**

\[
n = \text{UInt}(Rn); \quad m = \text{UInt}(Rm); \quad \text{is\_tbh} = (H == '1');
\]

- if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
- if InITBlock() & !LastInITBlock() then UNPREDICTABLE;

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

- \(<c>\) See Standard assembler syntax fields on page F2-4120.
- \(<q>\) See Standard assembler syntax fields on page F2-4120.
- \(<Rn>\) Is the general-purpose base register holding the address of the table of branch lengths, encoded in the "Rn" field. The PC can be used. If it is, the table immediately follows this instruction.
- \(<Rm>\) For the byte variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a single byte in the table. The offset in the table is the value of the index.
- For the halfword variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a halfword in the table. The offset in the table is twice the value of the index.

**Operation**

\[
\text{if ConditionPassed()} \text{ then}
\]

\[
\quad \text{EncodingSpecificOperations();}
\]

\[
\quad \text{if is\_tbh then}
\]

\[
\quad \quad \text{halfwords = UInt(MemU[R[n]+LSL(R[m],1), 2]);}
\]

\[
\quad \text{else}
\]

\[
\quad \quad \text{halfwords = UInt(MemU[R[n]+R[m], 1]);}
\]

\[
\quad \text{BranchWritePC(PC + 2*halfwords, BranchType\_INDIR);}
\]
F5.1.258  TEQ (immediate)

Test Equivalence (immediate) performs a bitwise exclusive OR operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

\text{if } n = 15 \text{ || } m = 15 \text{ then UNPREDICTABLE; } // \text{Armv8-A removes UNPREDICTABLE for R13}
\]

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rn>` For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
  For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.
- `<Rm>` For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
  For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.
- `<shift>` Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
  - LSL when stype = 00
  - LSR when stype = 01
  - ASR when stype = 10
  - ROR when stype = 11
- `<amount>` For encoding A1: is the shift amount, in the range 1 to 31 (when `<shift>` = LSL or ROR) or 1 to 32 (when `<shift>` = LSR or ASR) encoded in the "imm5" field as `<amount>` modulo 32.
  For encoding T2: is the shift amount, in the range 1 to 31 (when `<shift>` = LSL or ROR) or 1 to 32 (when `<shift>` = LSR or ASR), encoded in the "imm3:imm2" field as `<amount>` modulo 32.

Operation for all encodings

\[
\text{if } \text{ConditionPassed}() \text{ then} \quad \text{EncodingSpecificOperations();}
\]
\[
(\text{shifted}, \text{carry}) = \text{Shift.C}(R[m], \text{shift}_t, \text{shift}_n, \text{PSTATE.C});
\]
\[
\text{result} = R[n] \text{ AND shifted;}
\]
\[
\text{PSTATE.N} = \text{result}<31> ;
\]
\[
\text{PSTATE.Z} = \text{IsZeroBit(result)};
\]
\[
\text{PSTATE.C} = \text{carry};
\]
\[
// \text{PSTATE.V} \text{ unchanged}
\]

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.264   TST (register-shifted register)

Test (register-shifted register) performs a bitwise AND operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

TST{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>

Decode for this encoding

n = UInt(Rn);  m = UInt(Rm);  s = UInt(Rs);
shift_t = DecodeRegShift(stype);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<co> See Standard assembler syntax fields on page F2-4120.
<cp> See Standard assembler syntax fields on page F2-4120.
<Rn> Is the first general-purpose source register, encoded in the "Rn" field.
<Rm> Is the second general-purpose source register, encoded in the "Rm" field.
<type> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
  LSL  when stype = 00
  LSR  when stype = 01
  ASR  when stype = 10
  ROR  when stype = 11
<Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

if ConditionPassed() then
  EncodingSpecificOperations();
  shift_n = UInt(Rs[7:0]);
  (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
  result = R[n] AND shifted;
  PSTATE.N = result<31>;
  PSTATE.Z = IsZeroBit(result);
  PSTATE.C = carry;  // PSTATE.V unchanged
Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.265 UADD16

Unsigned Add 16 performs two 16-bit unsigned integer additions, and writes the results to the destination register. It sets PSTATE.GE according to the results of the additions.

Assembler symbols

<>
See Standard assembler syntax fields on page F2-4120.

<q>
See Standard assembler syntax fields on page F2-4120.

<Rd>
Is the general-purpose destination register, encoded in the "Rd" field.

<Rn>
Is the general-purpose source register, encoded in the "Rn" field.

<lsb>
For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field.

For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field.

<width>
Is the width of the field, in the range 1 to 32<lsb>, encoded in the "widthm1" field as <width>-1.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsbit + widthminus1;
    if msbit <= 31 then
        R[d] = ZeroExtend(R[n]<msbit:lsbit>, 32);
    else
        UNPREDICTABLE;

CONSTRANGED UNPREDICTABLE behavior

If msbit > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.269  UDF

Permanently Undefined generates an Undefined Instruction exception.

The encodings for UDF used in this section are defined as permanently UNDEFINED in the Armv8-A architecture. However:

- With the T32 instruction set, Arm deprecates using the UDF instruction in an IT block.
- In the A32 instruction set, UDF is not conditional.

<c> See Standard assembler syntax fields on page F2-4120.
<q> See Standard assembler syntax fields on page F2-4120.
<RdLo> Is the general-purpose source register holding the lower 32 bits of the addend, and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
<RdHi> Is the general-purpose source register holding the upper 32 bits of the addend, and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
<Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation for all encodings

if ConditionPassed() then
   EncodingSpecificOperations();
   result = UInt(R[n]) * UInt(R[m]) + UInt(R[dHi]:R[dLo]);
   R[dHi] = result<63:32>;
   R[dLo] = result<31:0>;
   if setflags then
      PSTATE.N = result<63>;
      PSTATE.Z = IsZeroBit(result<63:0>);
      // PSTATE.C, PSTATE.V unchanged

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.279 UMULL, UMULLS

Unsigned Multiply Long multiplies two 32-bit unsigned values to produce a 64-bit result.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

```
<table>

**T1 variant**

UXTAH{<c>}{<q>} {<Rd>,} <Rn>, <Rm> {, ROR #<amount>}

**Decode for this encoding**

if Rn == '1111' then SEE "UXTH";

\[ d = \text{UInt}(\text{Rd}); n = \text{UInt}(\text{Rn}); m = \text{UInt}(\text{Rm}); \text{ rotation} = \text{UInt}(\text{rotate}:'000'); \]

if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

#### Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

#### Assembler symbols

- `<c>` See Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<Rd>` Is the general-purpose destination register, encoded in the "Rd" field.
- `<Rn>` Is the first general-purpose source register, encoded in the "Rn" field.
- `<Rm>` Is the second general-purpose source register, encoded in the "Rm" field.
- `<amount>` Is the rotate amount, encoded in the "rotate" field. It can have the following values:
  - (omitted) when rotate = 00
  - 8 when rotate = 01
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d] = R[n] + ZeroExtend(rotated<15:0>, 32);

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.296   UXTB

Unsigned Extend Byte extracts an 8-bit value from a register, zero-extends it to 32 bits, and writes the result to the
destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F5.1.299   WFE

Wait For Event is a hint instruction that indicates that the PE can enter a low-power state and remain there until a wakeup event occurs. Wakeup events include the event signaled as a result of executing the SEV instruction on any PE in the multiprocessor system. For more information, see Wait For Event and Send Event on page G1-5804.

As described in Wait For Event and Send Event on page G1-5804, the execution of a WFE instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level, see:

- Traps to Undefined mode of EL0 execution of WFE and WFI instructions on page G1-5821.
- Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions on page G1-5837.
- Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode on page G1-5848.

F5.1.301 YIELD

YIELD is a hint instruction. Software with a multithreading capability can use a YIELD instruction to indicate to the PE that it is performing a task, for example a spin-lock, that could be swapped out to improve overall system performance. The PE can use this hint to suspend and resume multiple software threads if it supports the capability.

For more information about the recommended use of this instruction see The Yield instruction on page F1-4093.

F5.2 Encoding and use of banked register transfer instructions

Software executing at EL1 or higher can use the MRS (banked register) and MSR (banked register) instructions to transfer values between the general-purpose registers and Special-purpose registers. One particular use of these instructions is for a hypervisor to save or restore the register values of a Guest OS. The following sections give more information about these instructions:

- Register arguments in the banked register transfer instructions.
- Usage restrictions on the banked register transfer instructions on page F5-4990.
- Encoding the register argument in the banked register transfer instructions on page F5-4991.
- Pseudocode support for the banked register transfer instructions on page F5-4992.

For descriptions of the instructions see MRS (Banked register) on page F5-4572 and MSR (Banked register) on page F5-4576.

F5.2.1 Register arguments in the banked register transfer instructions

Figure F5-1 shows the banked general-purpose registers and Special-purpose registers:

<table>
<thead>
<tr>
<th>Associated PE mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>User or System</td>
</tr>
<tr>
<td>Hyp</td>
</tr>
<tr>
<td>Supervisor</td>
</tr>
<tr>
<td>Abort</td>
</tr>
<tr>
<td>Undefined</td>
</tr>
<tr>
<td>Monitor</td>
</tr>
<tr>
<td>IRQ</td>
</tr>
<tr>
<td>FIQ</td>
</tr>
</tbody>
</table>

General-purpose registers

- R8_usr
- R9_usr
- R10_usr
- R11_usr
- R12_usr
- SP_usr
- SP_hyp
- SP_svc
- SP_abt
- SPenschaft
- SP_und
- SP_mon
- SP_irq
- SP_fiq
- LR_usr
- LR_svc
- LR_abt
- LR_und
- LR_mon
- LR_irq
- LR_fiq

Special-purpose registers

- SPSR_svc
- SPSR_abt
- SPSR_und
- SPSR_mon
- SPSR_irq
- SPSR_fiq
- ELR_svc
- ELR_abt
- ELR_und
- ELR_mon
- ELR_irq
- ELR_fiq

For the general-purpose registers, if no other register is shown, the current mode register is the _usr register. So, for example, the full set of current mode registers, including the registers that are not banked:

- For Hyp mode, is (R0_usr - R12_usr, SP_hyp, LR_usr, SPSR_hyp, ELR_svc).
- For Abort mode, is (R0_usr - R12_usr, SP_abt, LR_abt, SPSR_abt).

Figure F5-1 Banking of general-purpose and Special-purpose registers

Figure F5-1 is based on Figure G1-2 on page G1-5729, that shows the complete set of general-purpose registers and Special-purpose registers accessible in each mode.

_____ Note _____

- System mode uses the same set of registers as User mode. Neither of these modes can access an SPSR, except that System mode can use the MRS (banked register) and MSR (banked register) instructions to access some SPSRs, as described in Usage restrictions on the banked register transfer instructions on page F5-4990.

- General-purpose registers R0-R7, that are not banked, cannot be accessed using the MRS (banked register) and MSR (banked register) instructions.

- In addition to the registers shown in Figure F5-1, the DLR and DSPSR are AArch32 System registers that map onto the AArch64 Special-purpose registers DLR_EL0 and DSPSR_EL0. However, DLR and DSPSR are not accessible using the MRS (banked register) and MSR (banked register) instructions.

Software using an MRS (banked register) or MSR (banked register) instruction specifies one of these registers using a name shown in Figure F5-1, or an alternative name for SP or LR. These registers can be grouped as follows:

<table>
<thead>
<tr>
<th>Registers</th>
<th>Banked Copies</th>
</tr>
</thead>
<tbody>
<tr>
<td>R8 - R12</td>
<td>_usr and _fiq</td>
</tr>

</table>

For descriptions of the instructions see MRS (Banked register) on page F5-4572 and MSR (Banked register) on page F5-4576.
SP
There is a banked copy of SP for every mode except System mode. For example, SP_svc is the SP for Supervisor mode.

LR
There is a banked copy of LR for every mode except System mode and Hyp mode. For example, LR_svc is the LR for Supervisor mode.

SPSR
There is a banked copy of SPSR for every mode except System mode and User mode.

ELR_hyp
Except for the operations provided by MRS (banked register) and MSR (banked register), ELR_hyp is accessible only from Hyp mode. It is not banked.

F5.2.2 Usage restrictions on the banked register transfer instructions

MRS (banked register) and MSR (banked register) instructions are CONSTRAINED UNPREDICTABLE if any of the following applies:

• The instruction is executed in User mode.
• The instruction accesses a banked register that is not implemented, or that either:
  — Is not accessible from the current Privilege level and Security state.
  — Can be accessed from the current mode by using a different instruction.

MSR (banked register) and MRS (banked register) on page K1-7963 describes the permitted CONSTRAINED UNPREDICTABLE behavior.

An MRS (banked register) instruction or an MSR (banked register) instruction executed:

• At Non-secure EL1 cannot access any Hyp mode banked registers.
• At Non-secure EL1 or EL2 cannot access any Monitor mode banked registers.
• In a Secure mode other than Monitor mode cannot access any Hyp banked registers.

This means that the banked registers that MRS (banked register) and MSR (banked register) instructions cannot access are:

From Monitor mode
• The current mode registers R8_usr-R12_usr, SP_mon, LR_mon, and SPSR_mon.

From Hyp mode
• The Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
• The current mode registers R8_usr-R12_usr, SP_hyp, LR_usr, and SPSR_hyp.

Note
MRS (banked register) and MSR (banked register) instructions can access the current mode register ELR_hyp.

From FIQ mode
• From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
• The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
• The current mode registers R8_fiq-R12_fiq, SP_fiq, LR_fiq, and SPSR_fiq.

From System mode
• From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
• The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
• The current mode registers R8_usr-R12_usr, SP_usr, and LR_usr.

From Supervisor mode, Abort mode, Undefined mode, and IRQ mode
• From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
• The Hyp mode registers SP_hyp, SPSR_hyp, and ELR_hyp.
• The current mode registers R8_usr-R12_usr, SP_<current_mode>, LR_<current_mode>, and SPSR_<current_mode>.
If EL3 is using AArch64, all MRS (banked register) and MSR (banked register) accesses to the Monitor mode registers from Secure EL1 modes are trapped to EL3. See *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-2385*.

For more information, see:

- *Encoding the register argument in the banked register transfer instructions*.
- *Pseudocode support for the banked register transfer instructions on page F5-4992*.
- *MRS (Banked register) on page F5-4572*.
- *MSR (Banked register) on page F5-4576*.

**Note**

CONSTRAINED UNPREDICTABLE behavior must not give access to registers that are not accessible from the current Privilege level and Security state.

### F5.2.3 Encoding the register argument in the banked register transfer instructions

The MRS (banked register) and MSR (banked register) instructions include a 5-bit field, SYSm, and an R bit, that together encode the register argument for the instruction.

When the R bit is set to 0, the argument is a register other than a banked copy of the SPSR, and Table F5-1 shows how the SYSm field defines the required register argument. In this table, CONST. UNPREDICTABLE indicates that behavior is CONSTRAINED UNPREDICTABLE.

<table>
<thead>
<tr>
<th>SYSm&lt;2:0&gt;</th>

</tr>
</tbody>
</table>

When the R bit is set to 1, the argument is a banked copy of the SPSR, and Table F5-2 shows how the SYSm field defines the required register argument. In this table, CONST. UNPREDICTABLE indicates that behavior is CONSTRAINED UNPREDICTABLE.

<table>
<thead>

</tr>
</tbody>
</table>
The pseudocode functions `BankedRegisterAccessValid()` and `SPSRAccessValid()` check the validity of `MRS` (banked register) and `MSR` (banked register) accesses. That is, they filter the accesses that are CONSTRAINED UNPREDICTABLE either because:

- They attempt to access a register that *Usage restrictions on the banked register transfer instructions on page F5-4990* shows is not accessible.
- They use an `SYSm<4:0>` encoding that *Encoding the register argument in the banked register transfer instructions on page F5-4991* shows as CONSTRAINED UNPREDICTABLE.

`BankedRegisterAccessValid()` applies to accesses to the banked general-purpose registers, or to `ELR_hyp`, and `SPSRAccessValid()` applies to accesses to the SPSRs.

Chapter F6
T32 and A32 Advanced SIMD and Floating-point Instruction Descriptions

This chapter describes each instruction. It contains the following sections:
•  *Alphabetical list of Advanced SIMD and floating-point instructions* on page F6-4994.

--- Note ---
Some headings in this chapter use the term *floating-point register*. This is an abbreviated description, and means a register in the Advanced SIMD and floating-point register file.
F6.1  Alphabetical list of Advanced SIMD and floating-point instructions

This section lists every Advanced SIMD and floating-point instruction in the T32 and A32 instruction sets. For details of the format used see *Format of instruction descriptions* on page F2-4116.

This section is formatted so that each instruction description starts on a new page.
F6.1.1 AESD

AES single round decryption.

A1

if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
    d = UInt(D:Vd); m = UInt(M:Vm);

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when size = '0'

The following encodings are reserved:

- size = '01'.
- size = '1x'.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    op1 = Q[d>>1]; op2 = Q[m>>1];
    Q[d>>1] = AESInvSubBytes(AESInvShiftRows(op1 EOR op2));

Operational information

If CPSR.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.2 AESE

AES single round encryption.

```

**T1 variant**

AESE.<dt> <Qd>, <Qm>

**Decode for this encoding**

if InITBlock() then UNPREDICTABLE;
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

**Assembler symbols**

<dt> Is the data type, encoded in the "size" field. It can have the following values:

- 8 when size = 00

The following encodings are reserved:
- size = 01
- size = 1x

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    op1 = Q[d>>1]; op2 = Q[m>>1];
    Q[d>>1] = AESubBytes(AEShiftRows(op1 EOR op2));

Operational information

If CPSR.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.3 AESIMC

AES inverse mix columns.

A1

| 0011 00 01 11 | 0011 | 10 10 12 | 11 14 15 | 10 11 01 01 11 0 1 1 1 1 1 0 | Vd:0 1 1 1 1 1 1 1 1 | M:0 0 0 1 1 1 | Vm:0 |

```

T1 variant

AESMC.<dt> <Qd>, <Qm>

Decode for this encoding

if InITBlock() then UNPREDICTABLE;
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

| 8 | when size = 00 |

The following encodings are reserved:

- size = 0L
- size = 1x

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    Q[(d>>1)] = AESMixColumns(Q[(m>>1)]);

Operational information

If CPSR.DIT is 1:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.5 FLDM*XR (FLDMDBXR, FLDMIAXR)

FLDMDBXR is the Decrement Before variant of this instruction, and FLDMIAXR is the Increment After variant. FLDM*XR loads multiple SIMD&FP registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register.

Arm deprecates use of FLDMDBXR and FLDMIAXR, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

A1

Decrement Before variant

Applies when P = 1 && U = 0 && W = 1.

FLDMDBXR{<c>}{<q>} <Rn>!, <dreglist>

Increment After variant

Applies when P = 0 && U = 1.

FLDMIAXR{<c>}{<q>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VLDR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FLDM*X".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d+regs) > 16 then UNPREDICTABLE;
if imm8<8> == '1' && (d+regs) > 16 then UNPREDICTABLE;

CONstrained UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• The instruction operates as a VLDM with the same addressing mode but loads no registers.

If regs > 16 || (d+regs) > 16, then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as NOP.
• One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.
T1

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 0 | 15 | 12 | 11 | 10 | 9 | 8 | 7 | 1 | 0 |
|----|----|----|----|----|----|---|---|---|---|---|---|---|---|----|----|----|----|----|----|----|---|
| 1  | 1  | 1  | 0  | 1  | 0  | P | U | D | W | 1  | Rn | Vd | 1  | 0 | 1 | 1 | imm8<7:1> | 1 |
| imm8<0> |

Decrement Before variant
Applies when $P = 1$ && $U = 0$ && $W = 1$.
FLDMDX{<c>}{<q>} <Rn>!, <dreglist>

Increment After variant
Applies when $P = 0$ && $U = 1$.
FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

- if $P = '0'$ && $U = '0'$ && $W = '0'$ then SEE "Related encodings";
- if $P = '1'$ && $U = '0'$ then SEE "VLDR";
- if $P = U && W = '1'$ then UNDEFINED;
- Remaining combinations are $PUW = 010$ (IA without !), $011$ (IA with !), $101$ (DB with !)
  - single_regs = FALSE;
  - add = ($U == '1'$);
  - wback = ($W == '1'$);
  - $d = UInt(D:Vd)$;
  - $n = UInt(Rn)$;
  - $imm32 = ZeroExtend(imm8:'00', 32)$;
  - $regs = UInt(imm8) DIV 2$; // If UInt(imm8) is odd, see "FLDM*X".
  - if $n == 15$ && ($wback || CurrentInstrSet() != InstrSet_A32$) then UNPREDICTABLE;
  - if $regs == 0 || (d+regs) > 16$ || ($d+regs) > 32$ then UNPREDICTABLE;
  - if $imm8<0> == '1'$ && ($d+regs) > 16$ then UNPREDICTABLE;

CONSTRANDED UNPREDICTABLE behavior

If $regs = 0$, then one of the following behaviors must occur:
- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If $regs > 16$ || ($d+regs) > 16$, then one of the following behaviors must occur:
- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRANDED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Related encodings: See Advanced SIMD and floating-point 64-bit move on page F3-4175 for the T32 instruction set, or Advanced SIMD and floating-point 64-bit move on page F4-4253 for the A32 instruction set.

Assembler symbols

- <c> See Standard assembler syntax fields on page F2-4120.
- <q> See Standard assembler syntax fields on page F2-4120.
<Rn> Is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.

! Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.

<dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            S[d+r] = MemA[address,4]; address = address+4;
        else
            word1 = MemA[address,4]; word2 = MemA[address+4,4]; address = address+8;
            // Combine the word-aligned words in the correct order for current endianness.
            D[d+r] = if BigEndian() then word1:word2 else word2:word1;
        if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
    
```
F6.1.6  FSTMDBX, FSTMIAX

FSTMX stores multiple SIMD&FP registers from the Advanced SIMD and floating-point register file to consecutive locations in using an address from a general-purpose register.

Arm deprecates use of FSTMDBX and FSTMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, HCPTCR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

A1

Decrement Before variant

Applies when \(P = 1 && U = 0 && W = 1\).

\[\text{FSTMDBX}\{<c>}\{<q>\} <Rn>!, <dreglist>\]

Increment After variant

Applies when \(P = 0 && U = 1\).

\[\text{FSTMIAX}\{<c>\} \{<q>\} <Rn>!, <dreglist>\]

Decode for all variants of this encoding

if \(P = '0' && U = '0' && W = '0'\) then SEE "Related encodings";
if \(P = '1' && W = '0'\) then SEE "VSTR";
if \(P = U && W = '1'\) then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FSTDBMX, FSTMIAX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d>regs) > 16 then UNPREDICTABLE;
if imm8<0> == '1' && (d>regs) > 16 then UNPREDICTABLE;

CONstrained UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VSTM with the same addressing mode but stores no registers.

If regs > 16 || (d>regs) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.
Decrement Before variant

Applies when \( P == 1 \land U == 0 \land W == 1 \).

\[ \text{FSTMDBX} \{c\} \{q\} \langle Rn \rangle!, \langle \text{dreglist} \rangle \]

Increment After variant

Applies when \( P == 0 \land U == 1 \).

\[ \text{FSTMIAX} \{c\} \{q\} \langle Rn \rangle\{!\}, \langle \text{dreglist} \rangle \]

Decode for all variants of this encoding

if \( P == '0' \land U == '0' \land W == '0' \) then SEE "Related encodings";
if \( P == '1' \land U == '0' \) then SEE "VSTR";
if \( P == U \land W == '1' \) then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FSTDBMX, FSTMIAX".
if n == 15 \&\& (wback /// CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 \&\& ((d+regs) > 16 then UNPREDICTABLE;
if imm8<0> == '1' \&\& (d+regs) > 16 then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If \( \text{regs} == 0 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VSTM with the same addressing mode but stores no registers.

If \( \text{regs} > 16 \lor (d+\text{regs}) > 16 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Related encodings: See Advanced SIMD and floating-point 64-bit move on page F3-4175 for the T32 instruction set, or Advanced SIMD and floating-point 64-bit move on page F4-4253 for the A32 instruction set.

Assembler symbols

\(<c>\) See Standard assembler syntax fields on page F2-4120.
\(<q>\) See Standard assembler syntax fields on page F2-4120.
<Rn> Is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used. However, Arm deprecates use of the PC.

! Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.

<dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            MemA[address,4] = S[d+r]; address = address+4;
        else
            // Store as two word-aligned words in the correct order for current endianness.
            MemA[address,4] = if BigEndian() then D[d+r]<63:32> else D[d+r]<31:0>;
            MemA[address+4,4] = if BigEndian() then D[d+r]<31:0> else D[d+r]<63:32>;
            address = address+8;
        if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

**Operational information**  
If CPSR.DIT is 1 and this instruction passes its condition execution check:  

- The execution time of this instruction is independent of:  
  — The values of the data supplied in any of its registers.  
  — The values of the NZCV flags.  
- The response of this instruction to asynchronous exceptions does not vary based on:  
  — The values of the data supplied in any of its registers.  
  — The values of the NZCV flags.
F6.1.20 VABD (integer)

Vector Absolute Difference (integer) subtracts the elements of one vector from the corresponding elements of another vector, and places the absolute values of the results in the elements of the destination vector.

Operand and result elements are all integers of the same length.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.23 VACGE

Vector Absolute Compare Greater Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is greater than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operands and result can be quadword or doubleword vectors. They must all be the same size.

The operand vector elements are floating-point numbers. The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

This instruction is used by the pseudo-instruction VACLE. The pseudo-instruction is never the preferred disassembly.

<\texttt{Dd}> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<\texttt{Dn}> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<\texttt{Dm}> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = FPAbs(Elem[D+n+r],e,esize));  op2 = FPAbs(Elem[D+m+r],e,esize));
      if or_equal then
        test_passed = FPCompareGE(op1, op2, StandardFPSCRValue());
      else
        test_passed = FPCompareGT(op1, op2, StandardFPSCRValue());
        Elem[D+d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.24 VACLE

Vector Absolute Compare Less Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is less than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

This instruction is a pseudo-instruction of the VACGE instruction. This means that:

- The encodings in this description are named to match the encodings of VACGE.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VACGE gives the operational pseudocode for this instruction.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Operation for all encodings

The description of VACGE gives the operational pseudocode for this instruction.
F6.1.25 VACGT

Vector Absolute Compare Greater Than takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is greater than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operands and result can be quadword or doubleword vectors. They must all be the same size.

The operand vector elements are floating-point numbers. The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPRTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

This instruction is used by the pseudo-instruction VACL. The pseudo-instruction is never the preferred disassembly.

- See Standard assembler syntax fields on page F2-4120.

- Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:
  - F32 when sz = 0
  - F16 when sz = 1

- Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

- Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>
Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd>
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn>
Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm>
Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Sd>
Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sn>
Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm>
Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then  // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                Elem[D[d+r],e,esize] = FPAdd(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize], StandardFPSCRValue());
    else             // VFP instruction
        case esize of
            when 16
                S[d] = Zeros(16) : FPAdd(S[n]<15:0>, S[m]<15:0>, FPSCR);
            when 32
                S[d] = FPAdd(S[n], S[m], FPSCR);
            when 64
                D[d] = FPAdd(D[n], D[m], FPSCR);
```
F6.1.28 VADD (integer)

Vector Add (integer) adds corresponding elements in two vectors, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Assembler symbols

<>

For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

<q>
See Standard assembler syntax fields on page F2-4120.

<dt>
Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:

I8 when size = 00
I16 when size = 01
I32 when size = 10
I64 when size = 11

<Qd>
Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn>
Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm>
Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd>
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn>
Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm>
Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = Elem[D[n+r],e,esize] + Elem[D[m+r],e,esize];

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.29  VADDHN

Vector Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are truncated. For rounded results, see VRADDHN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.32  VAND (immediate)

Vector Bitwise AND (immediate) performs a bitwise AND between a register value and an immediate value, and returns the result into the destination vector.

This instruction is a pseudo-instruction of the VBIC (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of VBIC (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VBIC (immediate) gives the operational pseudocode for this instruction.

A1

```

  For encoding T1 and T2: see *Standard assembler syntax fields on page F2-4120*.

- `<q>`: See *Standard assembler syntax fields on page F2-4120*.

- `<Qd>`: Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2.

- `<Dd>`: Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

- `<imm>`: Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of `<imm>`, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F2-4137*.

**Operation for all encodings**

The description of VBIC (immediate) gives the operational pseudocode for this instruction.
F6.1.33  VAND (register)

Vector Bitwise AND (register) performs a bitwise AND operation between two registers, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

**64-bit SIMD vector variant**

Applies when Q == 0.

VAND{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>

**128-bit SIMD vector variant**

Applies when Q == 1.

VAND{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>

**Decode for all variants of this encoding**

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;

d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;

**Assembler symbols**

VAND{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>  

For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-4120.
See *Standard assembler syntax fields* on page F2-4120.

An optional data type. It is ignored by assemblers, and does not affect the encoding.

Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as \(<Qd>\)*2.

Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as \(<Qn>\)*2.

Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as \(<Qm>\)*2.

Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] AND D[m+r];
```

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.34   VBIC (immediate)

Vector Bitwise Bit Clear (immediate) performs a bitwise AND between a register value and the complement of an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

This instruction is used by the pseudo-instruction VAND (immediate). The pseudo-instruction is never the preferred disassembly.

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.39 VCADD

Vector Complex Add.

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with
the more significant element holding the imaginary part of the number and the less significant element holding the
real part of the number. Each element holds a floating-point value. It performs the following computation on the
corresponding complex number element pairs from the two source registers:

• Considering the complex number from the second source register on an Argand diagram, the number is
  rotated counterclockwise by 90 or 270 degrees.
• The rotated complex number is added to the complex number from the first source register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which
the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For
more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.44  VCGT (Immediate #0)

Vector Compare Greater Than Zero takes each element in a vector, and compares it with zero. If it is greater than zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements are the same type, and are signed integers or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

F6.1.47   VCLE (register)

Vector Compare Less Than or Equal takes each element in a vector, and compares it with the corresponding element of a second vector. If the first is less than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

This instruction is a pseudo-instruction of the VCGE (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VCGE (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VCGE (register) gives the operational pseudocode for this instruction.

- `<q>`: See *Standard assembler syntax fields* on page F2-4120.
- `<dt>`: For encoding A1 and T1: is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:
  - `S8` when `U = 0`, `size = 00`
  - `S16` when `U = 0`, `size = 01`
  - `S32` when `U = 0`, `size = 10`
  - `U8` when `U = 1`, `size = 00`
  - `U16` when `U = 1`, `size = 01`
  - `U32` when `U = 1`, `size = 10`
  For encoding A2 and T2: is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:
  - `F32` when `sz = 0`
  - `F16` when `sz = 1`
- `<Qd>`: Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2.`
- `<d>`: Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

**Operation for all encodings**

The description of `VCGE (register)` gives the operational pseudocode for this instruction.
F6.1.48 VCLS

Vector Count Leading Sign Bits counts the number of consecutive bits following the topmost bit, that are the same as the topmost bit, in each element in a vector, and places the results in a second vector. The count does not include the topmost bit itself.

The operand vector elements can be any one of 8-bit, 16-bit, or 32-bit signed integers.

The result vector elements are the same data type as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Assembler symbols

<<>  For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

<<p>  See Standard assembler syntax fields on page F2-4120.

<dt>  Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
S8     when size = 00
S16    when size = 01
S32    when size = 10

The encoding size = 11 is reserved.

<q>  Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<qm>  Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<dt>  Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<dm>  Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
   EncodingSpecificOperations();  CheckAdvSIMDEnabled();
   for r = 0 to regs-1
      for e = 0 to elements-1
         Elem[D+d+r,e,esize] = CountLeadingSignBits(Elem[D+m+r],e,esize)<esize-1:0>;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.49   VCLT (immediate #0)

Vector Compare Less Than Zero takes each element in a vector, and compares it with zero. If it is less than zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements are the same type, and are signed integers or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

        for e = 0 to elements-1
            if floating_point then
                bits(esize) zero = FPZero('0');
                test_passed = FPCompareGT(zero, Elem[D[m+r],e,esize], StandardFPSCRValue());
            else
                test_passed = (SInt(Elem[D[m+r],e,esize]) < 0);
                Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
Operational information
If CPSR.DIT is 1 and this instruction passes its condition execution check:
• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
The response of this instruction to asynchronous exceptions does not vary based on:

— The values of the data supplied in any of its registers.
— The values of the NZCV flags.
F6.1.50  **VCLT (register)**

Vector Compare Less Than takes each element in a vector, and compares it with the corresponding element of a second vector. If the first is less than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

This instruction is a pseudo-instruction of the VCGT (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VCGT (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VCGT (register) gives the operational pseudocode for this instruction.

### 64-bit SIMD vector variant

For encoding T1: see Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.

<dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
I8     when size = 00
I16    when size = 01
I32    when size = 10
The encoding size = 11 is reserved.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      Elem[D[d+r],e,esize] = CountLeadingZeroBits(Elem[D[m+r],e,esize]<esize-1:0>);

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.52 VCMLA

Vector Complex Multiply Accumulate.

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with
the more significant element holding the imaginary part of the number and the less significant element holding the
real part of the number. Each element holds a floating-point value. It performs the following computation on the
corresponding complex number element pairs from the two source registers and the destination register:

- Considering the complex number from the second source register on an Argand diagram, the number is
  rotated counterclockwise by 0, 90, 180, or 270 degrees.

- The two elements of the transformed complex number are multiplied by:
  - The real element of the complex number from the first source register, if the transformation was a
    rotation by 0 or 180 degrees.
  - The imaginary element of the complex number from the first source register, if the transformation was
    a rotation by 90 or 270 degrees.

- The complex number resulting from that multiplication is added to the complex number from the destination
  register.

The multiplication and addition operations are performed as a fused multiply-add, without any intermediate
rounding.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which
the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For
more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

        Elem[D[d+r],e*2+1,esize] = result2;
```

F6.1.54 VCMP

Vector Compare compares two floating-point registers, or one floating-point register and zero. It writes the result to the FPSCR flags. These are normally transferred to the PSTATE.\{N, Z, C, V\} Condition flags by a subsequent VMRS instruction.

This instruction raises an Invalid Operation floating-point exception if either or both of the operands is a signaling NaN.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    bits(4) nzcv;
    case esize of
        when 16
            bits(16) op16 = if with_zero then FPZero(0) else S[m]<15:0>;
            nzcv = FPCompare(S[d]<15:0>, op16, quiet_nan_exc, FPSCR);
        when 32
            bits(32) op32 = if with_zero then FPZero(0) else S[m];
            nzcv = FPCompare(S[d], op32, quiet_nan_exc, FPSCR);
        when 64
            bits(64) op64 = if with_zero then FPZero(0) else D[m];
            nzcv = FPCompare(D[d], op64, quiet_nan_exc, FPSCR);
    FPSCR<31:28> = nzcv; // FPSCR.<N,Z,C,V> set to nzcv

Operational information
The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands is a NaN, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. An unordered comparison sets the

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.55   VCMPE

Vector Compare, raising Invalid Operation on NaN compares two floating-point registers, or one floating-point register and zero. It writes the result to the FPSCR flags. These are normally transferred to the PSTATE.\{N, Z, C, V\} Condition flags by a subsequent VMRS instruction.

This instruction raises an Invalid Operation floating-point exception if either or both of the operands is any type of NaN.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

  endcase;
  FPSCR<31:28> = nzcv; // FPSCR.<N,Z,C,V> set to nzcv

Operational information

The IEEE 754 standard specifies that the result of a comparison is precisely one of $<, ==, >$ or unordered. If either or both of the operands is a NaN, they are unordered, and all three of $(\text{Operand1} < \text{Operand2})$, $(\text{Operand1} == \text{Operand2})$ and $(\text{Operand1} > \text{Operand2})$ are false. An unordered comparison sets the

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.56   VCNT

Vector Count Set Bits counts the number of bits that are one in each element in a vector, and places the results in a second vector.

The operand vector elements must be 8-bit fields.

The result vector elements are 8-bit integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.57 VCVT (from single-precision to BFloat16, Advanced SIMD)

Vector Convert from single-precision to BFloat16 converts each 32-bit element in a vector from single-precision floating-point to BFloat16 format, and writes the result into a second vector. The result vector elements are half the width of the source vector elements.

Unlike the BFloat16 multiplication instructions, this instruction uses the Round to Nearest rounding mode, and can generate a floating-point exception that causes cumulative exception bits in the FPSCR to be set.

          Elem[Q[d],e,16] = FPConvert(Elem[Qin[m>>1],e,32], StandardFPSCRValue());

F6.1.60  VCVT (between floating-point and integer, Advanced SIMD)

Vector Convert between floating-point and integer converts each element in a vector from floating-point to integer, or from integer to floating-point, and places the results in a second vector.

The vector elements are the same type, and are floating-point numbers or integers. Signed and unsigned integers are distinct.

The floating-point to integer operation uses the Round towards Zero rounding mode. The integer to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

end case;
```

**CONSTRAINED UNPREDICTABLE behavior**

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Assembler symbols**

- `<c>` For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
  For encoding T1: see Standard assembler syntax fields on page F2-4120.
- `<q>` See Standard assembler syntax fields on page F2-4120.
- `<dt1>` Is the data type for the elements of the destination vector, encoded in the "size:op" field. It can have the following values:
  - F16 when size = 01, op = 0x
  - S16 when size = 01, op = 10
  - U16 when size = 01, op = 11
  - F32 when size = 10, op = 0x
  - S32 when size = 10, op = 10
  - U32 when size = 10, op = 11
- `<dt2>` Is the data type for the elements of the source vector, encoded in the "size:op" field. It can have the following values:
  - S16 when size = 01, op = 00
  - U16 when size = 01, op = 01
  - F16 when size = 01, op = 1x
  - S32 when size = 10, op = 00
  - U32 when size = 10, op = 01
  - F32 when size = 10, op = 1x
- `<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2.
- `<Qm>` Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as `<Qm>*2.
- `<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- `<Mm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(esize) result;
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[m+r],e,esize];
            if to_integer then
                result = FPtoFixed(op1, 0, unsigned, StandardFPSCRValue(), FPRounding_ZERO);
            else
                result = FixedToFP(op1, 0, unsigned, StandardFPSCRValue(), FPRounding_TIEEVEN);
            Elem[D[d+r],e,esize] = result;
F6.1.61   VCVT (floating-point to integer, floating-point)

Convert floating-point to integer with Round towards Zero converts a value in a register from floating-point to a 32-bit integer, using the Round towards Zero rounding mode, and places the result in a second register.

VCVT (between floating-point and fixed-point, floating-point) describes conversions between floating-point and 16-bit integers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

      endcase
    endcase
F6.1.63  VCVT (between floating-point and fixed-point, Advanced SIMD)

Vector Convert between floating-point and fixed-point converts each element in a vector from floating-point to fixed-point, or from fixed-point to floating-point, and places the results in a second vector.

The vector elements are the same type, and are floating-point numbers or integers. Signed and unsigned integers are distinct.

The floating-point to fixed-point operation uses the Round towards Zero rounding mode. The fixed-point to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

**Notes for all encodings**

Related encodings: See Advanced SIMD one register and modified immediate on page F3-4173 for the T32 instruction set, or Advanced SIMD one register and modified immediate on page F4-4271 for the A32 instruction set.

**Assembler symbols**

- For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
- For encoding T1: see Standard assembler syntax fields on page F2-4120.
- See Standard assembler syntax fields on page F2-4120.

- Is the data type for the elements of the destination vector, encoded in the "op:U" field. It can have the following values:
  - F16 when op = 00, U = x
  - S16 when op = 01, U = 0
  - U16 when op = 01, U = 1
  - F32 when op = 10, U = x
  - S32 when op = 11, U = 0
  - U32 when op = 11, U = 1

- Is the data type for the elements of the source vector, encoded in the "op:U" field. It can have the following values:
  - S16 when op = 00, U = 0
  - U16 when op = 00, U = 1
  - F16 when op = 01, U = x
  - S32 when op = 10, U = 0
  - U32 when op = 10, U = 1
  - F32 when op = 11, U = x

- Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
<fbits> The number of fraction bits in the fixed point number, in the range 1 to 32 for 32-bit elements, or in the range 1 to 16 for 16-bit elements:
• (64 - <fbits>) is encoded in imm6.

An assembler can permit an <fbits> value of 0. This is encoded as floating-point to integer or integer to floating-point instruction, see VCVT (between floating-point and integer, Advanced SIMD).

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(esize) result;
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[m+r],e,esize];
            if to_fixed then
                result = FPToFixed(op1, frac_bits, unsigned, StandardFPSCRValue(),
                                    FPRounding_ZERO);
            else
                result = FixedToFP(op1, frac_bits, unsigned, StandardFPSCRValue(),
                                    FPRounding_TIEEVEN);
            Elem[D[d+r],e,esize] = result;
F6.1.64 VCVT (between floating-point and fixed-point, floating-point)

Convert between floating-point and fixed-point converts a value in a register from floating-point to fixed-point, or from fixed-point to floating-point. Software can specify the fixed-point value as either signed or unsigned.

The fixed-point value can be 16-bit or 32-bit. Conversions from fixed-point values take their operand from the low-order bits of the source register and ignore any remaining bits. Signed conversions to fixed-point values sign-extend the result value to the destination register width. Unsigned conversions to fixed-point values zero-extend the result value to the destination register width.

The floating-point to fixed-point operation uses the Round towards Zero rounding mode. The fixed-point to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

- `<Dm>` Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
- `<Sm>` Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

**Operation for all encodings**

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    bits(16) hp;
    if convert_from_half then
        hp = S[m]<lowbit:IS:lowbit>;
    if uses_double then
```
D[d] = FPConvert(hp, FPSCR);
else
  S[d] = FPConvert(hp, FPSCR);
else
  if uses_double then
    hp = FPConvert(D[m], FPSCR);
  else
    hp = FPConvert(S[m], FPSCR);
  S[d]<lowbit+15:lowbit> = hp;
F6.1.68   VCVTB (BFloat16)

Converts the single-precision value in a single-precision register to BFloat16 format and writes the result into the bottom half of a single precision register, preserving the top 16 bits of the destination register.

Unlike the BFloat16 multiplication instructions, this instruction honors all the control bits in the FPSCR that apply to single-precision arithmetic, including the rounding mode. This instruction can generate a floating-point exception which causes a cumulative exception bit in the FPSCR to be set, or a synchronous exception to be taken, depending on the enable bits in the FPSCR.

F6.1.69  VCVTM (Advanced SIMD)

Vector Convert floating-point to integer with Round towards -Infinity converts each element in a vector from floating-point to integer using the Round towards -Infinity rounding mode, and places the results in a second vector.

The operand vector elements are floating-point numbers.

The result vector elements are integers, and the same size as the operand vector elements. Signed and unsigned integers are distinct.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

  when 64
    S[d] = FPToFixed(D[m], 0, unsigned, FPSCR, rounding);
F6.1.75   VCVTR

Convert floating-point to integer converts a value in a register from floating-point to a 32-bit integer, using the rounding mode specified by the FPSCR and places the result in a second register.

VCVT (between floating-point and fixed-point, floating-point) describes conversions between floating-point and 16-bit integers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

F6.1.77 VCVTT (BFloat16)

Converts the single-precision value in a single-precision register to BFloat16 format and writes the result in the top half of a single-precision register, preserving the bottom 16 bits of the register.

Unlike the BFloat16 multiplication instructions, this instruction honors all the control bits in the FPSCR that apply to single-precision arithmetic, including the rounding mode. This instruction can generate a floating-point exception which causes a cumulative exception bit in the FPSCR to be set, or a synchronous exception to be taken, depending on the enable bits in the FPSCR.

      D[d] = FPDIV(D[n], D[m], FPSCR);
F6.1.79  VDOT (vector)

BFloat16 floating-point (BF16) dot product (vector). This instruction delimits the source vectors into pairs of 16-bit BF16 elements. Within each pair, the elements in the first source vector are multiplied by the corresponding elements in the second source vector. The resulting single-precision products are then summed and added destructively to the single-precision element in the destination vector which aligns with the pair of BF16 values in the first source vector. The instruction does not update the FPSCR exception status.

        Elem[result, e, 32] = BFAdd(Elem[result, e, 32], sum);
    D[d+r] = result;
F6.1.80 VDOT (by element)

BFloat16 floating-point indexed dot product (vector, by element). This instruction delimits the source vectors into pairs of 16-bit BF16 elements. Each pair of elements in the first source vector is multiplied by the indexed pair of elements in the second source vector. The resulting single-precision products are then summed and added destructively to the single-precision element in the destination vector which aligns with the pair of BFloat16 values in the first source vector. The instruction does not update the FPSCR exception status.

        D[d+r] = result;
F6.1.81 VDUP (general-purpose register)

Duplicate general-purpose register to vector duplicates an element from a general-purpose register into every element of the destination vector.

The destination vector elements can be 8-bit, 16-bit, or 32-bit fields. The source element is the least significant 8, 16, or 32 bits of the general-purpose register. There is no distinction between data types.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.
Assembler symbols

\(<c>\)  
See *Standard assembler syntax fields on page* F2-4120. Arm strongly recommends that any VDUP instruction is unconditional, see *Conditional execution on page* F2-4121.

\(<q>\)  
See *Standard assembler syntax fields on page* F2-4120.

\(<\text{size}>\)  
The data size for the elements of the destination vector. It must be one of:  
- 8   Encoded as \([b, e] = 0b10\).
- 16  Encoded as \([b, e] = 0b01\).
- 32  Encoded as \([b, e] = 0b00\).

\(<q_d>\)  
The destination vector for a quadword operation.

\(<d_d>\)  
The destination vector for a doubleword operation.

\(<\text{rt}>\)  
The Arm source register.

Operation for all encodings

if ConditionPassed() then  
   EncodingSpecificOperations();  CheckAdvSIMDEnabled();  
   scalar = R[t]<\text{size}-1:0>;
   for \(r = 0\) to \(\text{regs-1}\)  
      for \(e = 0\) to \(\text{elements-1}\)  
         \(\text{Elem}[\text{d}+r,e,\text{size}] = \text{scalar};\)

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.82 VDUP (scalar)

Duplicate vector element to vector duplicates a single element of a vector into every element of the destination vector.

The scalar, and the destination vector elements, can be any one of 8-bit, 16-bit, or 32-bit fields. There is no distinction between data types.

For more information about scalars see Advanced SIMD scalars on page F2-4146.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Assembler symbols

<q>   For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
     For encoding T1: see Standard assembler syntax fields on page F2-4120.

<size> The data size. It must be one of:
  8   Encoded as imm4<0> = '1'. imm4<3:1> encodes the index[x] of the scalar.
 16   Encoded as imm4<1:0> = '10'. imm4<3:2> encodes the index[x] of the scalar.
 32   Encoded as imm4<2:0> = '100'. imm4<3> encodes the index[x] of the scalar.

<Qd>  Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dd>  Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm[x]> The scalar. For details of how [x] is encoded, see the description of <size>.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();
  scalar = Elem[D[m],index,esize];
  for r = 0 to regs-1
    for e = 0 to elements-1
      Elem[D[d+r],e,esize] = scalar;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.83 VEOR

Vector Bitwise Exclusive OR performs a bitwise Exclusive OR operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Assembler symbols

\(<c>\) For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

<q>
See Standard assembler syntax fields on page F2-4120.

<dt>
An optional data type. It is ignored by assemblers, and does not affect the encoding.

<Qd>
Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn>
Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm>
Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Qd>
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qn>
Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Qm>
Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] EOR D[m+r];
```

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.84  VEXT (byte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector.

The elements of the vectors are treated as being 8-bit fields. There is no distinction between data types.

The following figure shows the operation of VEXT doubleword operation for imm = 3.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

This instruction is used by the pseudo-instruction VEXT (multibyte elements). The pseudo-instruction is never the preferred disassembly.

**Operation for all encodings**

if \( \text{ConditionPassed()} \) then
  EncodingSpecificOperations(); \ CheckAdvSIMDEnabled();
  if quadword_operation then
    \( Q[d>>1] = (Q[m>>1]:Q[n>>1])<\text{position}+127:\text{position}>; \)
  else
    \( D[d] = (D[m]:D[n])<\text{position}+63: \text{position}>; \)

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.85 **VEXT (multibyte elements)**

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector.

This instruction is a pseudo-instruction of the **VEXT (byte elements)** instruction. This means that:

- The encodings in this description are named to match the encodings of **VEXT (byte elements)**.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of **VEXT (byte elements)** gives the operational pseudocode for this instruction.

**64-bit SIMD vector variant**

Applies when \( Q = 0 \).

\[
\text{VEXT}\{<c>\}<\{<q>\}.<\text{size}\} \{<Dd>,\} <Dn>, <Dm>, #<\text{imm}>
\]

is equivalent to

\[
\text{VEXT}\{<c>\}<\{<q>\}.8 \{<Dd>,\} <Dn>, <Dm>, #<\text{imm}>(\text{size}/8)
\]

and is never the preferred disassembly.

**128-bit SIMD vector variant**

Applies when \( Q = 1 \).

\[
\text{VEXT}\{<c>\}<\{<q>\}.<\text{size}\} \{<Qd>,\} <Qn>, <Qm>, #<\text{imm}>
\]

is equivalent to

\[
\text{VEXT}\{<c>\}<\{<q>\}.8 \{<Qd>,\} <Qn>, <Qm>, #<\text{imm}>(\text{size}/8)
\]

and is never the preferred disassembly.

**T1**

\[
\begin{array}{ccccccccccccccccccccc}
15 & 14 & 13 & 12 & 11 & 10 & 9 & 8 & 7 & 6 & 5 & 4 & 3 & 0 \\
11 & 11 & 11 & 11 & 0 & 0 & 0 & 0 & 1 & 1 & 1 & 1 & D & 1 & 1 & Vn & Vd & imm4 & N & Q & M & 0 & Vm
\end{array}
\]

64-bit SIMD vector variant

Applies when \( Q = 0 \).

\[
\text{VEXT}\{<c>\}<\{<q>\}.<\text{size}\} \{<Dd>,\} <Dn>, <Dm>, #<\text{imm}>
\]

is equivalent to

\[
\text{VEXT}\{<c>\}<\{<q>\}.8 \{<Dd>,\} <Dn>, <Dm>, #<\text{imm}>(\text{size}/8)
\]

and is never the preferred disassembly.
128-bit SIMD vector variant

Applies when Q == 1.

VEXT{<c>}{<q>}{<size>} {<Qd>,} <Qn>, <Qm>, #<imm>
is equivalent to

VEXT{<c>}{<q>}.8 {<Qd>,} <Qn>, <Qm>, #imm*(size/8)

and is never the preferred disassembly.

Assembler symbols

<c> For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.

<size> For the 64-bit SIMD vector variant: is the size of the operation, and can be one of 16 or 32.

For the 128-bit SIMD vector variant: is the size of the operation, and can be one of 16, 32 or 64.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<imm> For the 64-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to (128/<size>-1).

For the 128-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to (64/<size>-1).

Operation for all encodings

The description of VEXT (byte elements) gives the operational pseudocode for this instruction.
F6.1.86 VFMA

Vector Fused Multiply Accumulate multiplies corresponding elements of two vectors, and accumulates the results into the elements of the destination vector. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

                op64 = if op1_neg then FPNeg(D[n]) else D[n];
                D[d] = FPMulAdd(D[d], op64, D[m], FPSCR);
```

```c```
F6.1.87  VFMAB, VFMAT (BFloat16, vector)

The BFloat16 floating-point widening multiply-add long instruction widens the even-numbered (bottom) or odd-numbered (top) 16-bit elements in the first and second source vectors from BFloat16 to single-precision format. The instruction then multiplies and adds these values to the overlapping single-precision elements of the destination vector.

Unlike other BFloat16 multiplication instructions, this performs a fused multiply-add, without intermediate rounding that uses the Round to Nearest rounding mode and can generate a floating-point exception that causes cumulative exception bits in the FPSCR to be set.

```
F6.1.89 VFMAL (vector)

Vector Floating-point Multiply-Add Long to accumulator (vector). This instruction multiplies corresponding values in the vectors in the two source SIMD&FP registers, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

Note

ID_ISAR6.FHM indicates whether this instruction is supported.

F6.1.90   VFMAL (by scalar)

Vector Floating-point Multiply-Add Long to accumulator (by scalar). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

In Armv8.2 and Armv8.3, this is an optional instruction. From Armv8.4 it is mandatory for all implementations to support it.

--- Note ---

ID_ISAR6.FHM indicates whether this instruction is supported.

    D[r+d] = result;
F6.1.94 VFNMA

Vector Fused Negate Multiply Accumulate negates one floating-point register value and multiplies it by another floating-point register value, adds the negation of the floating-point value in the destination register to the product, and writes the result back to the destination register. The instruction does not round the result of the multiply before the addition.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

            Elem[D+d+r],e,esize] = result<esize:1>;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
— The values of the NZCV flags.
F6.1.97 VHSUB

Vector Halving Subtract subtracts the elements of the second operand from the corresponding elements of the first operand, shifts each result right one bit, and places the final results in the destination vector. The results of the halving operations are truncated. There is no rounding version.

The operand and result elements are all the same type, and can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

if InITBlock() then UNPREDICTABLE;
if !HaveFP16Ext() then UNDEFINED;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
d = UInt(Vd:D); m = UInt(Vm:M);

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as if it passes the Condition code check.
• The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<q> See Standard assembler syntax fields on page F2-4120.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<m> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    S[d] = S[m]<15:0> : S[d]<15:0>;
```
F6.1.99   VJCVT

Javascript Convert to signed fixed-point, rounding toward Zero. This instruction converts the double-precision floating-point value in the SIMD&FP source register to a 32-bit signed integer using the Round towards Zero rounding mode, and writes the result to the SIMD&FP destination register. If the result is too large to be accommodated as a signed 32-bit integer, then the result is the integer modulo $2^{32}$, as held in a 32-bit signed integer.

This instruction can generate a floating-point exception. Depending on the settings in FPSCR, the exception results in either a flag being set or a synchronous exception being generated. For more information, see Floating-point exceptions and exception traps on page E1-4003.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Assembler symbols
<>
For encoding A1, A2 and A3: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-4120.

<q>
See Standard assembler syntax fields on page F2-4120.

<size>
Is the data size, encoded in the "size" field. It can have the following values:
8 when size = 00
16 when size = 01
32 when size = 10

<list>
Is a list containing the single 64-bit name of the SIMD&FP register holding the element. The list must be { <Dd><index> }.
The register <Dd> is encoded in the "D:Vd" field.
The permitted values and encoding of <index> depend on <size>:
<size> == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
<size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn>
Is the general-purpose base register, encoded in the "Rn" field.

<align>
When <size> == 8, <align> must be omitted, otherwise it is the optional alignment.
Whenever \(<align>\) is omitted, the standard alignment is used, see Unaligned data access on page E2-4044, and the encoding depends on \(<size>\):

\(<size> == 8\)  
Encoded in the "index_align<0>" field as 0.

\(<size> == 16\)  
Encoded in the "index_align<1:0>" field as 0b00.

\(<size> == 32\)  
Encoded in the "index_align<2:0>" field as 0b000.

Whenever \(<align>\) is present, the permitted values and encoding depend on \(<size>\):

\(<size> == 16\)  
\(<align>\) is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as 0b01.

\(<size> == 32\)  
\(<align>\) is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as 0b011.

\(<align>\) is the preferred separator before the \(<align>\) value, but the alignment can be specified as \(@<align>\), see The Advanced SIMD addressing mode on page F2-4141.

\(<Rm>\)  
Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-4141.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d],index] = MemU[address,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
    else
        R[n] = R[n] + ebytes;
F6.1.101   VLD1 (single element to all lanes)

Load single 1-element structure and replicate to all lanes of one register loads one element from memory into every
element of one or two vectors. For details of the addressing mode see The Advanced SIMD addressing mode on
page F2-4141.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which
the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For
more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

\]

**CONSTRAINED UNPREDICTABLE behavior**

If \( d+\text{regs} > 32 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors, and particularly VLD1 (single element to all lanes) on page K1-7956.

**Assembler symbols**

- \(<c>\)
  
  For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
  
  For encoding T1: see Standard assembler syntax fields on page F2-4120.

- \(<\text{op}>\)
  
  See Standard assembler syntax fields on page F2-4120.

- \(<\text{size}>\)
  
  Is the data size, encoded in the "size" field. It can have the following values:
  
  - 8 when size = 00
  - 16 when size = 01
  - 32 when size = 10

  The encoding size = 11 is reserved.

- \(<\text{list}>\)
  
  Is a list containing the 64-bit names of the SIMD&FP registers.
  
  The list must be one of:
  
  \{ <Dd>[] \}  Encoded in the "T" field as 0.
The register <Dd> is encoded in the "D:Vd" field.

\(<Rn>\) is the general-purpose base register, encoded in the "Rn" field.

\(<align>\) When \(<size> == 8\), \(<align>\) must be omitted, otherwise it is the optional alignment. Whenever \(<align>\) is omitted, the standard alignment is used, see Unaligned data access on page E2-4044, and is encoded in the "a" field as 0.

Whenever \(<align>\) is present, the permitted values and encoding depend on \(<size>\):

- \(<size> == 16\langlealign\rangle\) is 16, meaning 16-bit alignment, encoded in the "a" field as 1.
- \(<size> == 32\langlealign\rangle\) is 32, meaning 32-bit alignment, encoded in the "a" field as 1.

: is the preferred separator before the \(<align>\) value, but the alignment can be specified as @\(<align>\), see The Advanced SIMD addressing mode on page F2-4141.

\(<Rm>\) is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-4141.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    address = R[n];  iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    bits(64) replicated_element = Replicate(MemU[address,ebytes]);
    for r = 0 to regs-1
        D[d+r] = replicated_element;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```
F6.1.102   VLD1 (multiple single elements)

Load multiple single 1-element structures to one, two, three, or four registers loads elements from memory into one, two, three, or four registers, without de-interleaving. Every element of each register is loaded. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-4141.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

**CONSTRAINED UNPREDICTABLE behavior**

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is `UNDEFINED`.
- The instruction executes as `NOP`.
- One or more of the SIMD and floating-point registers are `UNKNOWN`. If the instruction specifies writeback, the base register becomes `UNKNOWN`. This behavior does not affect any general-purpose registers.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors, and particularly VLDI (multiple single elements) on page K1-7956.

Related encodings: See Advanced SIMD element or structure load/store on page F3-4198 for the T32 instruction set, or Advanced SIMD element or structure load/store on page F4-4274 for the A32 instruction set.

**Assembler symbols**

`<c>` For encoding A1, A2, A3 and A4: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1, T2, T3 and T4: see Standard assembler syntax fields on page F2-4120.

See Standard assembler syntax fields on page F2-4120.

<size>
Is the data size, encoded in the "size" field. It can have the following values:

8 when size = 00
16 when size = 01
32 when size = 10
64 when size = 11

<list>
Is a list containing the 64-bit names of the SIMD&FP registers.
The list must be one of:

{ <Dd> } Single register. Selects the A1 and T1 encodings of the instruction.
{ <Dd>, <Dd+1> } Two single-spaced registers. Selects the A2 and T2 encodings of the instruction.
{ <Dd>, <Dd+1>, <Dd+2> } Three single-spaced registers. Selects the A3 and T3 encodings of the instruction.
{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> } Four single-spaced registers. Selects the A4 and T4 encodings of the instruction.

The register <Dd> is encoded in the "D:Vd" field.

<Rn>
Is the general-purpose base register, encoded in the "Rn" field.

<align>
Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-4044, and is encoded in the "align" field as 0b00.
Whenever <align> is present, the permitted values are:
64 64-bit alignment, encoded in the "align" field as 0b01.
128 128-bit alignment, encoded in the "align" field as 0b10. Available only if <list> contains two or four registers.
256 256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-4141.

<Rm>
Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-4141.

                data<63:0> = if BigEndian() then MemU[address,4] else MemU[address+4,4];
                Elem[D[r],e] = data;
                address = address + ebytes;
if wback then
  if register_index then
    $R[n] = R[n] + R[m]$;
  else
    $R[n] = R[n] + 8\times\text{regs;}$;
F6.1.103   VLD2 (single 2-element structure to one lane)

Load single 2-element structure to one lane of two registers loads one 2-element structure from memory into corresponding elements of two registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-4141.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

**Notes for all encodings**

For more information about the CONRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors, and particularly VLD2 (single 2-element structure to one lane) on page K1-7956.

**Assembler symbols**

- `<c>` For encoding A1, A2 and A3: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
  
  For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-4120.

- `<q>` See Standard assembler syntax fields on page F2-4120.

- `<size>` Is the data size, encoded in the "size" field. It can have the following values:
  
  8 when size = 00
  
  16 when size = 01
  
  32 when size = 10

- `<list>` Is a list containing the 64-bit names of the two SIMD&FP registers holding the element.
  
  The list must be one of:

  - `{ Dd}[<index>], {Dd+1}[<index>] `Single-spaced registers, encoded as "spacing" = 0.
  
  - `{ Dd}[<index>], {Dd+2}[<index>] `Double-spaced registers, encoded as "spacing" = 1. Not permitted when size == 8.

  The encoding of "spacing" depends on `<size>`:

  - `<size>` == 16"spacing" is encoded in the "index\_align<1>" field.
  
  - `<size>` == 32"spacing" is encoded in the "index\_align<2>" field.

  The register `Dd` is encoded in the "D:Vd" field.

  The permitted values and encoding of `<index>` depend on `<size>`:

  - `<size>` == 8 `<index>` is in the range 0 to 7, encoded in the "index\_align<3:1>" field.
<size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn>
Is the general-purpose base register, encoded in the "Rn" field.

<align>
Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-4044, and the encoding depends on <size>:
<size> == 8Encoded in the "index_align<0>" field as 0.
<size> == 16Encoded in the "index_align<0>" field as 0.
<size> == 32Encoded in the "index_align<1:0>" field as 0b00.
Whenever <align> is present, the permitted values and encoding depend on <size>:
<size> == 8<align> is 16, meaning 16-bit alignment, encoded in the "index_align<0>" field as 1.
<size> == 16<align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.
<size> == 32<align> is 64, meaning 64-bit alignment, encoded in the "index_align<1:0>" field as 0b01.
: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-4141.

<Rm>
Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-4141.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2], index] = MemU[address+ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 2*ebytes;
    else
        R[n] = R[n] + 2*ebytes;
F6.1.104   VLD2 (single 2-element structure to all lanes)

Load single 2-element structure and replicate to all lanes of two registers loads one 2-element structure from memory into all lanes of two registers. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-4141.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

If \( d2+\text{regs} > 32 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRANGED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors, and particularly VLD2 (multiple 2-element structures) on page K1-7956.

Related encodings: See Advanced SIMD element or structure load/store on page F3-4198 for the T32 instruction set, or Advanced SIMD element or structure load/store on page F4-4274 for the A32 instruction set.

Assembler symbols

\(<c>\) For encoding A1 and A2: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1 and T2: see Standard assembler syntax fields on page F2-4120.

\(<q>\) See Standard assembler syntax fields on page F2-4120.

\(<\text{size}>\) Is the data size, encoded in the "size" field. It can have the following values:

- 8 when \( \text{size} = 00 \)
- 16 when \( \text{size} = 01 \)
- 32 when \( \text{size} = 10 \)

The encoding \( \text{size} = 11 \) is reserved.

\(<\text{list}>\) Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

\{ \text{<Dd>}, \text{<Dd+1>} \} Two single-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype" field as \( \text{0b1000} \).

\{ \text{<Dd>}, \text{<Dd+2>} \} Two double-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype" field as \( \text{0b1001} \).

\{ \text{<Dd>}, \text{<Dd+1>}, \text{<Dd+2>}, \text{<Dd+3>} \} Three single-spaced registers. Selects the A2 and T2 encodings of the instruction.

The register \text{<Dd>} is encoded in the "D:Vd" field.

\(<\text{Rn}>\) Is the general-purpose base register, encoded in the "Rn" field.

\(<\text{align}>\) Is the optional alignment.

Whenever \( \text{align} \) is omitted, the standard alignment is used, see Unaligned data access on page E2-4044, and is encoded in the "align" field as \( \text{0b00} \).

Whenever \( \text{align} \) is present, the permitted values are:

- 64 64-bit alignment, encoded in the "align" field as \( \text{0b01} \).
- 128 128-bit alignment, encoded in the "align" field as \( \text{0b10} \).
- 256 256-bit alignment, encoded in the "align" field as \( \text{0b11} \). Available only if \( \text{list} \) contains four registers.

\( : \) is the preferred separator before the \( \text{align} \) value, but the alignment can be specified as \( @\text{align} \), see The Advanced SIMD addressing mode on page F2-4141.
<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *The Advanced SIMD addressing mode on page F2-4141.*

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    -= AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r], e] = MemU[address, ebytes];
            Elem[D[d2+r],e] = MemU[address+ebytes, ebytes];
            address = address + 2*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 16*regs;
```
F6.1.106 VLD3 (single 3-element structure to one lane)

Load single 3-element structure to one lane of three registers loads one 3-element structure from memory into corresponding elements of three registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-4141.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Notes for all encodings

For more information about the CONstrained UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors, and particularly VLD3 (single 3-element structure to one lane) on page K1-7957.

Assembler symbols

<c>
For encoding A1, A2 and A3: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-4120.

<q>
See Standard assembler syntax fields on page F2-4120.

<size>
Is the data size, encoded in the "size" field. It can have the following values:
   8     when size = 00
   16    when size = 01
   32    when size = 10

<list>
Is a list containing the 64-bit names of the three SIMD&FP registers holding the element.
The list must be one of:
   { <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>] } Single-spaced registers, encoded as "spacing" = 0.
   { <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>] } Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.

The encoding of "spacing" depends on <size>:
   <size> = 8"spacing" is encoded in the "index_align<0:5" field.
   <size> = 16"spacing" is encoded in the "index_align<1:9" field, and "index_align<0:5" is set to 0.
   <size> = 32"spacing" is encoded in the "index_align<2:13" field, and "index_align<1:10" is set to 0b00.

The register <Dd> is encoded in the "D:Vd" field.
The permitted values and encoding of `<index>` depend on `<size>`:

- `<size>` == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
- `<size>` == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
- `<size>` == 32<index> is 0 or 1, encoded in the "index_align<3>" field.

- `<Rn>` Is the general-purpose base register, encoded in the "Rn" field.
- `<Rm>` Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-4141.

Alignment

Standard alignment rules apply, see Alignment support on page B2-148.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n];
    Elem[0][d], index] = MemU[address,ebytes];
    Elem[0][d2], index] = MemU[address+ebytes,ebytes];
    Elem[0][d3], index] = MemU[address+2*ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 3*ebytes;
F6.1.107  VLD3 (single 3-element structure to all lanes)

```

**CONSTRAINED UNPREDICTABLE behavior**

If d3 > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors, and particularly VLD3 (multiple 3-element structures) on page K1-7957.

Related encodings: See Advanced SIMD element or structure load/store on page F3-4198 for the T32 instruction set, or Advanced SIMD element or structure load/store on page F4-4274 for the A32 instruction set.
Assembler symbols

\(<c>\)  For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-4120.

\(<q>\)

See Standard assembler syntax fields on page F2-4120.

\(<\text{size}>\)

Is the data size, encoded in the "size" field. It can have the following values:

8  when size = 00
16 when size = 01
32 when size = 10

The encoding size = 11 is reserved.

\(<\text{list}>\)

Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

\{ <Dd>, <Dd+1>, <Dd+2> \} Single-spaced registers, encoded in the "itype" field as 0b0100.

\{ <Dd>, <Dd+2>, <Dd+4> \} Double-spaced registers, encoded in the "itype" field as 0b0101.

The register <Dd> is encoded in the "D:Vd" field.

\(<\text{Rn}>\)

Is the general-purpose base register, encoded in the "Rn" field.

\(<\text{align}>\)

Is the optional alignment.

Whenever \(<align>\) is omitted, the standard alignment is used, see Unaligned data access on page E2-4044, and is encoded in the "align" field as 0b00.

Whenever \(<align>\) is present, the only permitted values is 64, meaning 64-bit alignment, encoded in the "align" field as 0b01.

: is the preferred separator before the \(<align>\) value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-4141.

\(<\text{Rm}>\)

Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about \(<\text{Rn}>\), !, and \(<\text{Rm}>\), see The Advanced SIMD addressing mode on page F2-4141.

Operation for all encodings

if ConditionPassed() then

EncodingSpecificOperations(); CheckAdvSIMDEnabled();

address = R[n]; iswrite = FALSE;

- = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);

for e = 0 to elements-1

Elem[0] = MemU[address,ebytes];
Elem[0] = MemU[address+ebytes,ebytes];
Elem[0] = MemU[address+2*ebytes,ebytes];

address = address + 3*ebytes;

if wback then

if register_index then

R[n] = R[n] + R[m];
else

R[n] = R[n] + 24;
F6.1.109  VLD4 (single 4-element structure to one lane)

Load single 4-element structure to one lane of four registers loads one 4-element structure from memory into corresponding elements of four registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-4141.

Depending on settings in the CPACR, NSACR, and HCPR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Notes for all encodings
For more information about the CONSTRANDED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors, and particularly VLD4 (single 4-element structure to one lane) on page K1-7957.

Assembler symbols

\(<c>\) For encoding A1, A2 and A3: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1, T2 and T3: see Standard assembler syntax fields on page F2-4120.

\(<q>\) See Standard assembler syntax fields on page F2-4120.

\(<\text{size}>\) Is the data size, encoded in the "size" field. It can have the following values:

- 8 when \( \text{size} = 00 \)
- 16 when \( \text{size} = 01 \)
- 32 when \( \text{size} = 10 \)

\(<\text{list}>\) Is a list containing the 64-bit names of the four SIMD&FP registers holding the element.
The list must be one of:

- \{ \text{<Dd}[<\text{index}>], <Dd+1>[<\text{index}>], <Dd+2>[<\text{index}>], <Dd+3>[<\text{index}>] } \text{Single-spaced registers, encoded as "spacing" = 0.} \\
- \{ \text{<Dd}[<\text{index}>], <Dd+2>[<\text{index}>], <Dd+4>[<\text{index}>], <Dd+6>[<\text{index}>] } \text{Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.} \\

The encoding of "spacing" depends on \<\text{size}>:

- \<\text{size}> = 16"spacing" is encoded in the "index_align<1>" field.
- \<\text{size}> = 32"spacing" is encoded in the "index_align<2>" field.

The register \text{<Dd>} is encoded in the "D:Vd" field.
The permitted values and encoding of \(<index>\) depend on \(<size>\):
\(<size> == 8<index>\) is in the range 0 to 7, encoded in the "index_align<3:1>" field.
\(<size> == 16<index>\) is in the range 0 to 3, encoded in the "index_align<3:2>" field.
\(<size> == 32<index>\) is 0 or 1, encoded in the "index_align<3>" field.

\(<Rn>\)

Is the general-purpose base register, encoded in the "Rn" field.

\(<align>\)

Is the optional alignment.
Whenever \(<align>\) is omitted, the standard alignment is used, see Unaligned data access on page E2-4044, and the encoding depends on \(<size>\):
\(<size> == 8\) encoded in the "index_align<0>" field as 0.
\(<size> == 16\) encoded in the "index_align<0>" field as 0.
\(<size> == 32\) encoded in the "index_align<1:0>" field as 0b00.
Whenever \(<align>\) is present, the permitted values and encoding depend on \(<size>\):
\(<size> == 8<align>\) is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.
\(<size> == 16<align>\) is 64, meaning 64-bit alignment, encoded in the "index_align<0>" field as 1.
\(<size> == 32<align>\) can be 64 or 128. 64-bit alignment is encoded in the "index_align<1:0>" field as 0b01, and 128-bit alignment is encoded in the "index_align<1:0>" field as 0b10.

: is the preferred separator before the \(<align>\) value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-4141.

\(<Rm>\)

Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-4141.

<p>See Standard assembler syntax fields on page F2-4120.</p>

<size>
Is the data size, encoded in the "size" field. It can have the following values:

8  when size = 00
16 when size = 01
32 when size = 1x
</size>

<list>
Is a list containing the 64-bit names of four SIMD&FP registers.
The list must be one of:

{ <Dd>[], <Dd+1>[], <Dd+2>[], <Dd+3>[] } Single-spaced registers, encoded in the "T" field as 0.
{ <Dd>[], <Dd+2>[], <Dd+4>[], <Dd+6>[] } Double-spaced registers, encoded in the "T" field as 1.
The register <Dd> is encoded in the "D:Vd" field.
</list>

<Rn>
Is the general-purpose base register, encoded in the "Rn" field.
</Rn>

<align>
Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-4044, and is encoded in the "a" field as 0.
Whenever <align> is present, the permitted values and encoding depend on <size>:

<align> == 8<align> is 32, meaning 32-bit alignment, encoded in the "a" field as 1.
<align> == 16<align> is 64, meaning 64-bit alignment, encoded in the "a" field as 1.
<align> == 32<align> can be 64 or 128. 64-bit alignment is encoded in the "a:size<0>" field as 0b10, and 128-bit alignment is encoded in the "a:size<0>" field as 0b11.
: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-4141.
</align>

<Rm>
Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.
For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-4141.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    D[d] = Replicate(MemU[address,ebytes]);
    D[d2] = Replicate(MemU[address+ebytes,ebytes]);
    D[d3] = Replicate(MemU[address+2*ebytes,ebytes]);
    D[d4] = Replicate(MemU[address+3*ebytes,ebytes]);
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 4*ebytes;
F6.1.111  VLD4 (multiple 4-element structures)

Load multiple 4-element structures to four registers loads multiple 4-element structures from memory into four registers, with de-interleaving. For more information, see Element and structure load/store instructions on page F1-4098. Every element of each register is loaded. For details of the addressing mode see The Advanced SIMD addressing mode on page F2-4141.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

itype

**Offset variant**

Applies when \( Rm = 1111 \).

\[ \text{VLD4}\{<c>\}{<q>}.<size> <list>, [<Rn>{:<align>}] \]

**Post-indexed variant**

Applies when \( Rm = 1101 \).

\[ \text{VLD4}\{<c>\}{<q>}.<size> <list>, [<Rn>{:<align>}]! \]

**Post-indexed variant**

Applies when \( Rm \neq 11x1 \).

\[ \text{VLD4}\{<c>\}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm> \]

**Decode for all variants of this encoding**

```
case itype of
  when '0000'
    inc = 1;
  when '0001'
    inc = 2;
  otherwise
    SEE "Related encodings";
  if size == '11' then UNDEFINED;
  alignment = if align == '00' then 1 else 4 << UInt(align);
  ebytes = 1 << UInt(size); elements = 8 DIV ebytes;
  d = UInt(D:Vd); d2 = d + inc; d3 = d2 + inc; d4 = d3 + inc; n = UInt(Rn); m = UInt(Rm);
  wback = (m != 15); register_index = (m != 15 & m != 11);
  if n == 15 || d4 > 31 then UNPREDICTABLE;
```

**CONSTRAINED UNPREDICTABLE behavior**

If \( d4 > 31 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.
Offset variant
Applies when $Rm == 1111$.

\[ \text{VLD4}\{<c>\}{<q>}.<\text{size}> \text{ <list>, } [<Rn>\{<:align>\}] \]

Post-indexed variant
Applies when $Rm == 1101$.

\[ \text{VLD4}\{<c>\}{<q>}.<\text{size}> \text{ <list>, } [<Rn>\{<:align>\}]! \]

Post-indexed variant
Applies when $Rm != 11x1$.

\[ \text{VLD4}\{<c>\}{<q>}.<\text{size}> \text{ <list>, } [<Rn>\{<:align>\}], Rm \]

Decode for all variants of this encoding

alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size);  elements = 8 DIV ebytes;
d = UInt(D:Vd);  d2 = d + inc;  d3 = d2 + inc;  d4 = d3 + inc;  n = UInt(Rn);  m = UInt(Rm);
wback = (m != 15);  register_index = (m != 15 && m != 13);
if n == 15 || d4 > 31 then UNPREDICTABLE;
```

CONSTRUATED UNPREDICTABLE behavior

If $d4 > 31$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRUATED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors, and particularly VLD4 (multiple 4-element structures) on page K1-7957.

Related encodings: See Advanced SIMD element or structure load/store on page F3-4198 for the T32 instruction set, or Advanced SIMD element or structure load/store on page F4-4274 for the A32 instruction set.
Assembler symbols

<
For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

&q
See Standard assembler syntax fields on page F2-4120.

<size>
Is the data size, encoded in the "size" field. It can have the following values:

<table>
<thead>
<tr>
<th>Size</th>
<th>Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>when size = 00</td>
</tr>
<tr>
<td>16</td>
<td>when size = 01</td>
</tr>
<tr>
<td>32</td>
<td>when size = 10</td>
</tr>
</tbody>
</table>

The encoding size = 11 is reserved.

<list>
Is a list containing the 64-bit names of the SIMD&FP registers.
The list must be one of:

- \{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> \} Single-spaced registers, encoded in the "itype" field as 0b0000.
- \{ <Dd>, <Dd+2>, <Dd+4>, <Dd+6> \} Double-spaced registers, encoded in the "itype" field as 0b0001.
The register <Dd> is encoded in the "D:Vd" field.

<Rn>
Is the general-purpose base register, encoded in the "Rn" field.

<align>
Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see Unaligned data access on page E2-4044, and is encoded in the "align" field as 0b00.
Whenever <align> is present, the permitted values are:

<table>
<thead>
<tr>
<th>Alignment</th>
<th>Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>64</td>
<td>0b01</td>
</tr>
<tr>
<td>128</td>
<td>0b10</td>
</tr>
<tr>
<td>256</td>
<td>0b11</td>
</tr>
</tbody>
</table>

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see The Advanced SIMD addressing mode on page F2-4141.

<Rm>
Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see The Advanced SIMD addressing mode on page F2-4141.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();

Assembler symbols

<
  See Standard assembler syntax fields on page F2-4120.
<
  See Standard assembler syntax fields on page F2-4120.
.
  Is an optional data size specifier for 64-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.
.<
  Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
.
  Is an optional data size specifier for 32-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.
<
  Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<
  Is the general-purpose base register, encoded in the "Rn" field.

+/-

Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- when U = 0
+ when U = 1
A32 Advanced SIMD and Floating-point Instruction Descriptions

F6.1 Alphabetical list of Advanced SIMD and floating-point instructions

<iimm>

For the single-precision scalar or double-precision scalar variants: is the optional unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0, and encoded in the "imm8" field as <iimm>/4.

For the half-precision scalar variant: is the optional unsigned immediate byte offset, a multiple of 2, in the range 0 to 510, defaulting to 0, and encoded in the "imm8" field as <iimm>/2.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    base = if n == 15 then Align(PC,4) else R[n];
    address = if add then (base + imm32) else (base - imm32);
    case esize of
        when 16
            S[d] = Zeros(16) : MemA[address,2];
        when 32
            S[d] = MemA[address,4];
        when 64
            word1 = MemA[address,4];
            word2 = MemA[address+4,4];
            // Combine the word-aligned words in the correct order for current endianness.
            D[d] = if BigEndian() then word1:word2 else word2:word1;
```
F6.1.114   VLDR (literal)

Load SIMD&FP register (literal) loads a single register from the Advanced SIMD and floating-point register file, using an address from the PC value and an immediate offset.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Applies when size == 11.

VLDR{<c>}{<q>}{.64} <Dd>, <label>
VLDR{<c>}{<q>}{.64} <Dd>, [PC, #{+/-}<imm>]

Decode for all variants of this encoding

if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock() then UNPREDICTABLE;
esize = 8 << UInt(size); add = (U == '1');
imm32 = if esize == 16 then ZeroExtend(imm8:'0', 32) else ZeroExtend(imm8:'00', 32);
case size of
when '01' d = UInt(Vd:D);
when '10' d = UInt(Vd:D);
when '11' d = UInt(D:Vd);
n = UInt(Rn);

CONSTRAINED UNPREDICTABLE behavior
If size == '01' && InITBlock(), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as if it passes the Condition code check.
• The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<>
See Standard assembler syntax fields on page F2-4120.

<op>
See Standard assembler syntax fields on page F2-4120.

.64
Is an optional data size specifier for 64-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.

<Dd>
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

.32
Is an optional data size specifier for 32-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.

<Sd>
Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
The label of the literal data item to be loaded.

For the single-precision scalar or double-precision scalar variants: the assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values are multiples of 4 in the range -1020 to 1020.

For the half-precision scalar variant: the assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. Permitted values are multiples of 2 in the range -510 to 510.

If the offset is zero or positive, \( \text{imm32} \) is equal to the offset and \( \text{add} = \text{TRUE} \).

If the offset is negative, \( \text{imm32} \) is equal to minus the offset and \( \text{add} = \text{FALSE} \).

\(+/-\) Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:

- \( \text{add} = \text{TRUE} \) when \( U = 0 \)
- \( \text{add} = \text{FALSE} \) when \( U = 1 \)

\(<\text{imm}>\) For the single-precision scalar or double-precision scalar variants: is the optional unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0, and encoded in the "imm8" field as \(<\text{imm}>/4\).

For the half-precision scalar variant: is the optional unsigned immediate byte offset, a multiple of 2, in the range 0 to 510, defaulting to 0, and encoded in the "imm8" field as \(<\text{imm}>/2\).

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see Use of labels in UAL instruction syntax on page F1-4077.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
  EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
  base = if n == 15 then Align(PC,4) else R[n];
  address = if add then (base + imm32) else (base - imm32);
  case esize of
    when 16
      S[d] = Zeros(16) : MemA[address,2];
    when 32
      S[d] = MemA[address,4];
    when 64
      word1 = MemA[address,4]; word2 = MemA[address+4,4];
      // Combine the word-aligned words in the correct order for currentendianness.
      D[d] = if BigEndian() then word1:word2 else word2:word1;
```
F6.1.115  VMAX (floating-point)

Vector Maximum compares corresponding elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector.

The operand vector elements are floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see "Enabling Advanced SIMD and floating-point support" on page G1-5812.

maximum = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;

**CONSTRANGED UNPREDICTABLE behavior**

If sz == '1' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Assembler symbols**

<op> For encoding A1: see *Standard assembler syntax fields on page F2-4120*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields on page F2-4120*.

<dt> Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

- F32 when sz = 0
- F16 when sz = 1

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Floating-point maximum and minimum

- max(+0.0, -0.0) = +0.0
- If any input is a NaN, the corresponding result element is the default NaN.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r],e,esize];  op2 = Elem[D[m+r],e,esize];
            if maximum then
                Elem[D[d+r],e,esize] = FPMax(op1, op2, StandardFPSCRValue());
            else
                Elem[D[d+r],e,esize] = FPMin(op1, op2, StandardFPSCRValue());

```

F6.1.116   VMAX (integer)

Vector Maximum compares corresponding elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

if size == '11' then UNDEFINED;
maximum = (op == '0'); unsigned = (U == '1');
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

Assembler symbols

<c>
For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

<op>
See Standard assembler syntax fields on page F2-4120.

<dt>
Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:
S8 when U = 0, size = 00
S16 when U = 0, size = 01
S32 when U = 0, size = 10
U8 when U = 1, size = 00
U16 when U = 1, size = 01
U32 when U = 1, size = 10

<Qd>
Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn>
Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm>
Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Db>
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn>
Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm>
Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Int(Elem[D+n+r],e,esize], unsigned);
      op2 = Int(Elem[D+m+r],e,esize], unsigned);
      result = if maximum then Max(op1,op2) else Min(op1,op2);
      Elem[D+d+r],e,esize] = result>e-1:0;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
The values of the NZCV flags.
F6.1.117  VMAXNM

This instruction determines the floating-point maximum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point VMAX.

This instruction is not conditional.

F6.1.118 VMIN (floating-point)

Vector Minimum compares corresponding elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector.

The operand vector elements are floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPtr registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMIN{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
case sz of
  when '0' esize = 32; elements = 2;
  when '1' esize = 16; elements = 4;
  d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;

T1

64-bit SIMD vector variant

Applies when Q == 0.

VMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMIN{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
maximum = (op == '0');
case sz of
  when '0' esize = 32; elements = 2;
  when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

**CONSTRAINED UNPREDICTABLE behavior**

If sz == '1' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Assembler symbols**

<c> For encoding A1: see *Standard assembler syntax fields on page F2-4120*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields on page F2-4120*.

<q> See *Standard assembler syntax fields on page F2-4120*.

<dt> Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

- F32 when sz = 0
- F16 when sz = 1

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Floating-point minimum

- min(+0.0, -0.0) = -0.0
- If any input is a NaN, the corresponding result element is the default NaN.

**Operation for all encodings**

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Elem[D[n+r],e,esize]; op2 = Elem[D[m+r],e,esize];
      if maximum then
        Elem[D[d+r],e,esize] = FPMax(op1, op2, StandardFPSCRValue());
      else
        Elem[D[d+r],e,esize] = FPMin(op1, op2, StandardFPSCRValue());
### F6.1.119  VMIN (integer)

Vector Minimum compares corresponding elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector.

The operand vector elements can be any one of:
- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-5812](#).

Assembler symbols

<>  For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

<>  See Standard assembler syntax fields on page F2-4120.

<dt>  Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:

- S8  when U = 0, size = 00
- S16 when U = 0, size = 01
- S32 when U = 0, size = 10
- U8  when U = 1, size = 00
- U16 when U = 1, size = 01
- U32 when U = 1, size = 10

<Qd>  Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn>  Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm>  Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd>  Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn>  Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm>  Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
for r = 0 to regs-1
    for e = 0 to elements-1
        op1 = Int(Elem[D:n+r],e,esize], unsigned);
        op2 = Int(Elem[D:m+r],e,esize], unsigned);
        result = if maximum then Max(op1,op2) else Min(op1,op2);
        Elem[D:d+r],e,esize] = result<esize-1:0>;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
The values of the NZCV flags.
F6.1.120  VMINNM

This instruction determines the floating point minimum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point VMIN.

This instruction is not conditional.

            else
                addend = if add then op1val*op2val else -op1val*op2val;
                if long_destination then
                    Elem[D[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + addend;
                else
                    Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + addend;
```  

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.126  VMLS (floating-point)

Vector Multiply Subtract multiplies corresponding elements in two vectors, subtracts the products from corresponding elements of the destination vector, and places the results in the destination vector.

Note

Arm recommends that software does not use the VMLS instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPESC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

A1

64-bit SIMD vector variant

Applies when \( Q = 0 \).

\[ \text{VMLS}\{<c>}\{<q>\}.<dt> <Dd>, <Dn>, <Dm> \]

128-bit SIMD vector variant

Applies when \( Q = 1 \).

\[ \text{VMLS}\{<c>\{<q>\}.<dt> <Qd>, <Qn>, <Qm> \]

Decode for all variants of this encoding

if \( Q = '1' \) && \( \text{Vd}<0> \) \( = '1' \) \&\& \( \text{Vn}<0> \) \( = '1' \) \&\& \( \text{Vm}<0> \) \( = '1' \) then UNDEFINED;
if \( \text{sz} = '1' \) && \( \text{HaveFP16Ext}() \) then UNDEFINED;
advsimd = TRUE;  add = (op == '0');
case sz of
  when '0' esize = 32; elements = 2;
  when '1' esize = 16; elements = 4;
  d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);  regs = if Q == '0' then 1 else 2;

A2

Half-precision scalar variant

Applies when \( \text{size} = 01 \).

\[ \text{VMLS}\{<c>\{<q>\}.F16 <Sd>, <Sn>, <Sm> \]

Single-precision scalar variant

Applies when \( \text{size} = 10 \).

\[ \text{VMLS}\{<c>\{<q>\}.F32 <Sd>, <Sn>, <Sm> \]
**Double-precision scalar variant**

Applies when size == 11.

\[
\text{VMLS\{c\}\{q\}\}.F64 <Dd>, <Dn>, <Dm>
\]

**Decode for all variants of this encoding**

- if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
- if size == '01' && cond != '1110' then UNPREDICTABLE;
- if FPSCR.Len != '00' || FPSCR.Stride != '00' then UNDEFINED;
- case size of
  - when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  - when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  - when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);

**CONSTRAINED UNPREDICTABLE behavior**

If size == '01' && cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

64-bit SIMD vector variant

Applies when Q == 0.

\[
\text{VMLS\{c\}\{q\}\}.<dt> <Dd>, <Dn>, <Dm>
\]

128-bit SIMD vector variant

Applies when Q == 1.

\[
\text{VMLS\{c\}\{q\}\}.<dt> <Qd>, <Qn>, <Qm>
\]

**Decode for all variants of this encoding**

- if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
- if sz == '1' && !HaveFP16Ext() then UNDEFINED;
- if sz == '1' && InITBlock() then UNPREDICTABLE;
- case sz of
  - when '0' esize = 32; elements = 2;
  - when '1' esize = 16; elements = 4;
  - d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

**CONSTRAINED UNPREDICTABLE behavior**

If sz == '1' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

CONSTRAINED UNPREDICTABLE behavior
If size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols
<
  For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
  For encoding A2, T1 and T2: see Standard assembler syntax fields on page F2-4120.
<op>
  See Standard assembler syntax fields on page F2-4120.
<dt>
  Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:
  F32 when sz = 0
  F16 when sz = 1
<Qd>
  Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>
  Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then // Advanced SIMD instruction
        for r = 0 to regs-1
            for e = 0 to elements-1
                product = FPMul(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize], StandardFPSCRValue());
                addend = if add then product else FPNeg(product);
                Elem[D[d+r],e,esize] = FPAdd(Elem[D[d+r],e,esize], addend, StandardFPSCRValue());
    else // VFP instruction
        case esize of
            when 16

### Decode for all variants of this encoding

if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' & & size == '01' & & !HaveFP16Ext()) then UNDEFINED;
if F == '1' & & size == '01' & & InITBlock() then UNPREDICTABLE;
if Q == '1' & & (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = FALSE;  // "Don't care" value: TRUE produces same functionality
add = (op == '0');  floating_point = (F == '1');  long_destination = FALSE;
d = UInt(D:Vd);  n = UInt(N:Vn);  regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16;  elements = 4;  m = UInt(Vm<2:0>);  index = UInt(M:Vm<3>);
if size == '10' then esize = 32;  elements = 2;  m = UInt(Vm);  index = UInt(M);

### CONSTRAINED UNPREDICTABLE behavior

If F == '1' & & size == '01' & & InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

### Notes for all encodings

Related encodings: See Advanced SIMD data-processing on page F3-4165 for the T32 instruction set, or Advanced SIMD data-processing on page F4-4262 for the A32 instruction set.

### Assembler symbols

**<c>** For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-4120.

**<op>** See Standard assembler syntax fields on page F2-4120.

**<dt>** Is the data type for the scalar and the elements of the operand vector, encoded in the "F:size" field. It can have the following values:

- I16 when F = 0, size = 01
- I32 when F = 0, size = 10
- F16 when F = 1, size = 01
- F32 when F = 1, size = 10

**<Qd>** Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as <Qd>*2.

**<Qn>** Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

**<Dd>** Is the 64-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field.

**<Dn>** Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

**<Dm[x]>** Is the 64-bit name of the second SIMD&FP source register holding the scalar. If <dt> is I16 or F16, Dm is restricted to D0-D7. Dm is encoded in "Vm<2:0>", and x is encoded in "M:Vm<3>". If <dt> is I32 or F32, Dm is restricted to D0-D15. Dm is encoded in "Vm", and x is encoded in "M".

### Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();
  op2 = Elem[Din[m],index,esize];  op2val = Int(op2, unsigned);
  for r = 0 to regs-1
for e = 0 to elements-1
  op1 = Elem[Din[n+r], e, esize];  op1val = Int(op1, unsigned);
  if floating_point then
    fp_addend = if add then FPMul(op1,op2,StandardFPSCRValue()) else
    FPNeg(FPMul(op1,op2,StandardFPSCRValue()));
    Elem[D[d+r], e, esize] = FPAdd(Elem[Din[d+r], e, esize], fp_addend, StandardFPSCRValue());
  else
    addend = if add then op1val*op2val else -op1val*op2val;
    if long_destination then
      Elem[Q[d>>1], e, 2*esize] = Elem[Qin[d>>1], e, 2*esize] + addend;
    else
      Elem[D[d+r], e, esize] = Elem[Din[d+r], e, esize] + addend;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.129  VMLSL (integer)

Vector Multiply Subtract Long multiplies corresponding elements in two vectors, and subtract the products from the corresponding elements of the destination vector. The destination vector element is twice as long as the elements that are multiplied.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Notes for all encodings

Related encodings: See Advanced SIMD data-processing on page F3-4165 for the T32 instruction set, or Advanced SIMD data-processing on page F4-4262 for the A32 instruction set.

Assembler symbols

<>  For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-4120.

<q>  See Standard assembler syntax fields on page F2-4120.
<type>  The data type for the elements of the operands. It must be one of:
S   Optional in encoding T1/A1. Encoded as U = 0 in encoding T2/A2.
U   Optional in encoding T1/A1. Encoded as U = 1 in encoding T2/A2.
I   Available only in encoding T1/A1.
<size>  The data size for the elements of the operands. It must be one of:
8   Encoded as size = 0b00.
16  Encoded as size = 0b01.
32  Encoded as size = 0b10.
<Qd>  Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Dn>  Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>  Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            product = Int(Elem[Din[n+r],e,esize],unsigned) * Int(Elem[Din[m+r],e,esize],unsigned);
            addend = if add then product else -product;
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + addend;
            else
                Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + addend;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.130  VMLSL (by scalar)
Vector Multiply Subtract Long multiplies elements of a vector by a scalar, and subtracts the products from corresponding elements of the destination vector. The destination vector elements are twice as long as the elements that are multiplied.

For more information about scalars see Advanced SIMD scalars on page F2-4146.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.131   VMMLA

BFLOAT16 floating-point matrix multiply-accumulate. This instruction multiplies the 2x4 matrix of BF16 values in the first 128-bit source vector by the 4x2 BF16 matrix in the second 128-bit source vector. The resulting 2x2 single-precision matrix product is then added destructively to the 2x2 single-precision matrix in the 128-bit destination vector. This is equivalent to performing a 4-way dot product per destination element. The instruction does not update the FPSCR exception status.

Note

Arm expects that the VMMLA instruction will deliver a peak BF16 multiply throughput that is at least as high as can be achieved using two VDOT instructions, with a goal that it should have significantly higher throughput.

VMOV{<c>}{<q>}.F16 <Sd>, #<imm>

Single-precision scalar variant
Applies when size == 10.
VMOV{<c>}{<q>}.F32 <Sd>, #<imm>

Double-precision scalar variant
Applies when size == 11.
VMOV{<c>}{<q>}.F64 <Dd>, #<imm>

Decode for all variants of this encoding

if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock() then UNPREDICTABLE;
single_register = (size != '11'); advsimd = FALSE;
bites(16) imm16;
bites(32) imm32;
bites(64) imm64;
case size of
  when '01' d = UInt(Vd:D);  imm16 = VFPExpandImm(imm4H:imm4L);  imm32 = Zeros(16) : imm16;
  when '10' d = UInt(Vd:D);  imm32 = VFPExpandImm(imm4H:imm4L);
  when '11' d = UInt(D:Vd);  imm64 = VFPExpandImm(imm4H:imm4L);  regs = 1;

CONSTRANDED UNPREDICTABLE behavior
If size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

**Notes for all encodings**

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-4173 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-4271 for the A32 instruction set.

**Assembler symbols**

**<c>**  
For encoding A1, A3, A4 and A5: see *Standard assembler syntax fields* on page F2-4120. This encoding must be unconditional.
For encoding A2, T1, T2, T3, T4 and T5: see *Standard assembler syntax fields* on page F2-4120.

**<q>**  
See *Standard assembler syntax fields* on page F2-4120.

**<dt>**  
The data type, encoded in the "cmode" field. It can have the following values:
I32 when cmode = 110x
I8 when cmode = 1110
F32 when cmode = 1111

**<Qd>**  
Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

**<Dd>**  
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

**<Sd>**  
Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

**<imm>**  
For encoding A1, A3, A4, A5, T1, T3, T4 and T5: is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-4137.
For encoding A2 and T2: is a signed floating-point constant with 3-bit exponent and normalized 4 bits of precision, encoded in "imm4H:imm4L". For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 floating-point instructions* on page F2-4138.

**Operation for all encodings**

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if single_register then
        S[d] = imm32;
    else
        for r = 0 to regs-1
            D[d+r] = imm64;

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
— The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.135   VMOV (register)

Copy between FP registers copies the contents of one FP register to another.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

\]

and is the preferred disassembly when \(N:Vn = M:Vm\).

**Assemble symbols**

- \(<c>\) For encoding A1: see *Standard assembler syntax fields* on page F2-4120. This encoding must be unconditional.
  
  For encoding T1: see *Standard assembler syntax fields* on page F2-4120.

- \(<q>\) See *Standard assembler syntax fields* on page F2-4120.

- \(<dt>\) An optional data type. \(<dt>\) must not be F64, but it is otherwise ignored.

- \(<Qd>\) Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as \(<Qd>^*2\).

- \(<Qm>\) Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as \(<Qm>^*2\).

- \(<Dd>\) Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

- \(<Dm>\) Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

**Operation for all encodings**

The description of **VORR (register)** gives the operational pseudocode for this instruction.
F6.1.137  VMOV (general-purpose register to scalar)

Copy a general-purpose register to a vector element copies a byte, halfword, or word from a general-purpose register into an Advanced SIMD scalar.

On a Floating-point-only system, this instruction transfers one word to the upper or lower half of a double-precision floating-point register from a general-purpose register. This is an identical operation to the Advanced SIMD single word transfer.

For more information about scalars see Advanced SIMD scalars on page F2-4146.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

   if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.
Assembler symbols

<
See Standard assembler syntax fields on page F2-4120.

<q>
See Standard assembler syntax fields on page F2-4120.

<size>
The data size. It must be one of:
8  Encoded as opc1<1> = 1. [x] is encoded in opc1<0>, opc2.
16  Encoded as opc1<1> = 0, opc2<0> = 1. [x] is encoded in opc1<0>, opc2<1>.
32  Encoded as opc1<1> = 0, opc2 = 0b00. [x] is encoded in opc1<0>.
omitted Equivalent to 32.

<Dd[x]>
The scalar. The register <Dd> is encoded in D:Vd. For details of how [x] is encoded, see the description of <size>.

<Rt>
The source general-purpose register.

Operation for all encodings

if ConditionPassed() then
   EncodingSpecificOperations(); CheckAdvSIMDOrVFPM_enabled(TRUE, advsimd);
   Elem[D[d],index,esize] = R[t]<esize-1:0>;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.138 VMOV (between general-purpose register and single-precision)

Copy a general-purpose register to or from a 32-bit SIMD&FP register. This instruction transfers the value held in a 32-bit SIMD&FP register to a general-purpose register, or the value held in a general-purpose register to a 32-bit SIMD&FP register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

<Rt> The destination general-purpose register.

<Dn[x]> The scalar. For details of how [x] is encoded see the description of <dt>.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if unsigned then
        R[t] = ZeroExtend(Elem[D[n],index,esize], 32);
    else
        R[t] = SignExtend(Elem[D[n],index,esize], 32);

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.140  VMOV (between two general-purpose registers and two single-precision registers)

Copy two general-purpose registers to a pair of 32-bit SIMD&FP registers transfers the contents of two consecutively numbered single-precision Floating-point registers to two general-purpose registers, or the contents of two general-purpose registers to a pair of single-precision Floating-point registers. The general-purpose registers do not have to be contiguous.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

A1

From general-purpose registers variant

Applies when `op == 0`.

`VMOV{<c>}{<q>} <Sm>, <Sm1>, <Rt>, <Rt2>`

To general-purpose registers variant

Applies when `op == 1`.

`VMOV{<c>}{<q>} <Rt>, <Rt2>, <Sm>, <Sm1>`

Decode for all variants of this encoding

```plaintext
to_arm_registers = (op == '1');  t = UInt(Rt);  t2 = UInt(Rt2);  m = UInt(Vm:M);
if t == 15 || t2 == 15 || m == 31 then UNPREDICTABLE;
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRANED UNPREDICTABLE behavior

If to_arm_registers && t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

If m == 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.
From general-purpose registers variant
Applies when \( \text{op} == 0 \).
\[ \text{VMOV\{<c>\}{<q>\} \ <Sm>, \ <Sm1>, \ <Rt>, \ <Rt2> \} \]

To general-purpose registers variant
Applies when \( \text{op} == 1 \).
\[ \text{VMOV\{<c>\}{<q>\} \ <Rt>, \ <Rt2>, \ <Sm>, \ <Sm1> \} \]

Decode for all variants of this encoding
\[
\text{to\_arm\_registers} = (\text{op} == '1'); \quad t = \text{UInt}(Rt); \quad t2 = \text{UInt}(Rt2); \quad m = \text{UInt}(Vm:\text{M}); \\
\text{if } t == 15 \text{ || } t2 == 15 \text{ || } m == 31 \text{ then UNPREDICTABLE}; \\
\text{if } \text{to\_arm\_registers} \&\& t == t2 \text{ then UNPREDICTABLE};
\]

CONSTRAINED UNPREDICTABLE behavior
If \( \text{to\_arm\_registers} \&\& t == t2 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

If \( m == 31 \), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.

Notes for all encodings
For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors, and particularly VMOV (between two general-purpose registers and two single-precision registers) on page K1-7958.

Assembler symbols
- \(<Rt2>\) Is the second general-purpose register that \(<Sm1>\) will be transferred to or from, encoded in the "Rt2" field.
- \(<Rt>\) Is the first general-purpose register that \(<Sm>\) will be transferred to or from, encoded in the "Rt" field.
- \(<Sm1>\) Is the 32-bit name of the second SIMD&FP register to be transferred. This is the next SIMD&FP register after \(<Sm>\).
- \(<Sm>\) Is the 32-bit name of the first SIMD&FP register to be transferred, encoded in the "Vm:M" field.
- \(<c>\) See Standard assembler syntax fields on page F2-4120.

For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-4120.

<q>

See Standard assembler syntax fields on page F2-4120.
**Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:**

- **I16** when size = 00
- **I32** when size = 01
- **I64** when size = 10

The encoding size = 11 is reserved.

**Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.**

**Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.**

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        Elem[<D>d],e,esize] = Elem[<Qin>m>>1],e,2*esize]<esize-1:0>;
```

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.143 VMOVX

Vector Move extraction. This instruction copies the upper 16 bits of the 32-bit source SIMD&FP register into the lower 16 bits of the 32-bit destination SIMD&FP register, while clearing the remaining bits to zero.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

A1

ARMv8.2

VMOVX{<q>}.F16 <Sd>, <Sm>

Decode for this encoding

if !HaveFP16Ext() then UNDEFINED;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
d = UInt(Vd:D); m = UInt(Vm:M);

T1

ARMv8.2

VMOVX{<q>}.F16 <Sd>, <Sm>

Decode for this encoding

if InITBlock() then UNPREDICTABLE;
if !HaveFP16Ext() then UNDEFINED;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
d = UInt(Vd:D); m = UInt(Vm:M);

CONSTRANDED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as if it passes the Condition code check.
• The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<q> See Standard assembler syntax fields on page F2-4120.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    S[d] = Zeros(16) : S[m]<31:16>;
```
F6.1.144 VMRS

Move SIMD&FP Special register to general-purpose register moves the value of an Advanced SIMD and floating-point System register to a general-purpose register. When the specified System register is the FPSCR, a form of the instruction transfers the FPSCR. \{N, Z, C, V\} condition flags to the APSR. \{N, Z, C, V\} condition flags.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

When these settings permit the execution of floating-point and Advanced SIMD instructions, if the specified floating-point System register is not the FPSCR, the instruction is UNDEFINED if executed in User mode.

In an implementation that includes EL2, when HCR.TID0 is set to 1, any VMRS access to FPSID from a Non-secure EL1 mode that would be permitted if HCR.TID0 was set to 0 generates a Hyp Trap exception. For more information, see ID group 0, Primary device identification registers on page G1-5835.

For simplicity, the VMRS pseudocode does not show the possible trap to Hyp mode.

A1

```
|31 28|27 26 25 24|23 22 21 20|19 16|15 12|11 10 9 8 |7 6 5 4 |3 2 1 0 |
|---|---|---|---|---|---|---|---|---|---|
| !=1111 | 1 1 1 0 | 1 1 1 | reg | Rt | 1 0 1 0 | 0 0 0 | 1 0 0 0 |
```

A1 variant

VMRS{<c>}{<q>} <Rt>, <spec_reg>

Decode for this encoding

```
t = UInt(Rt);
if !(reg IN {'000x', '0101', '011x', '1000'}) then UNPREDICTABLE;
if t == 15 && reg != '0001' then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONstrained Unpredictable behavior

If !(reg IN {'000x', '0101', '011x', '1000'}), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction transfers an UNKNOWN value to the specified target register. When the Rt field holds the value 0b1111, the specified target register is the APSR. \{N, Z, C, V\} bits, and these bits become UNKNOWN. Otherwise, the specified target register is the register specified by the Rt field, R0 - R14.

T1

```
|15 14 13 12|11 10 9 8 |7 6 5 4 |3 0 |15 12|11 10 9 8 |7 6 5 4 |3 2 1 0 |
|---|---|---|---|---|---|---|---|---|---|
|1 1 1 0 | 1 1 1 0 1 1 1 | reg | Rt | 1 0 1 0 | 0 0 0 | 1 0 0 0 |
```

<spec_reg> Is the destination Advanced SIMD and floating-point System register, encoded in the "reg" field. It can have the following values:
    FPSID  when reg = 0000
    FPSCR  when reg = 0001
    FPEXC  when reg = 1000
The following encodings are UNPREDICTABLE:
    • reg = 001x.
    • reg = 01xx.
    • reg = 1001.
    • reg = 101x.
    • reg = 11xx.
<rt> Is the general-purpose source register, encoded in the "Rt" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();
    if reg == '0001' then // FPSCR
        CheckVFPEnabled(TRUE);
        FPSCR = R[t];
    elsif PSTATE.EL == EL0 then
        UNDEFINED;
    else // Non-FPSCR registers accessible only at PL1 or above
        CheckVFPEnabled(FALSE);
else // Non-FPSCR registers are not affected by FPEXC.EN
case reg of
    when '0000'  // VMSR access to FPSID is ignored
    when '1000'  
        FPEXC = R[t];
    otherwise  
        Unreachable();  // Dealt with above or in encoding-specific pseudocode
F6.1.146 VMUL (floating-point)

Vector Multiply multiplies corresponding elements in two vectors, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

**Notes for all encodings**

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors.

Related encodings: See Advanced SIMD data-processing on page F3-4165 for the T32 instruction set, or Advanced SIMD data-processing on page F4-4262 for the A32 instruction set.

**Assembler symbols**

- `<c>` For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
  
  For encoding T1: see Standard assembler syntax fields on page F2-4120.

- `<q>` See Standard assembler syntax fields on page F2-4120.

- `<dt>` Is the data type for the elements of the operands, encoded in the "op:U:size" field. It can have the following values:
  
  - S8 when `op = 0, U = 0, size = 00`
  - S16 when `op = 0, U = 0, size = 01`
  - S32 when `op = 0, U = 0, size = 10`
  - U8 when `op = 0, U = 1, size = 00`
  - U16 when `op = 0, U = 1, size = 01`
  - U32 when `op = 0, U = 1, size = 10`
  - P8 when `op = 1, U = 0, size = 00`
  - P64 when `op = 1, U = 0, size = 10`

- `<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2`

- `<Dn>` Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

- `<Dm>` Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r],e,esize]; op1val = Int(op1, unsigned);
            op2 = Elem[Din[m+r],e,esize]; op2val = Int(op2, unsigned);
            if polynomial then
                product = PolynomialMult(op1,op2);
            else
                product = (op1val*op2val)<2*esize-1:0>;
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = product;
            else
                Elem[D[d+r],e,esize] = product<esize-1:0>;
```
Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.150 VMULL (by scalar)

Vector Multiply Long multiplies each element in a vector by a scalar, and places the results in a second vector. The destination vector elements are twice as long as the elements that are multiplied.

For more information about scalars see Advanced SIMD scalars on page F2-4146.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

A1

VMULL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>[<index>]

Decode for this encoding
if size == '11' then "Related encodings";
if size == '00' || Vd<0> == '1' then UNDEFINED;
unsigned = (U == '1'); long_destination = TRUE; floating_point = FALSE;
d = UInt(D:Vd); n = UInt(N:Vn); regs = 1;
if size == '01' then esize = 16; elements = 4; m = UInt(Vm<2:0>); index = UInt(M:Vm<3>);
if size == '10' then esize = 32; elements = 2; m = UInt(Vm); index = UInt(M);

T1

VMULL{<c>}{<p>}.<dt> <Qd>, <Dn>, <Dm>[<index>]

Decode for this encoding
if size == '11' then "Related encodings";
if size == '00' || Vd<0> == '1' then UNDEFINED;
unsigned = (U == '1'); long_destination = TRUE; floating_point = FALSE;
d = UInt(D:Vd); n = UInt(N:Vn); regs = 1;
if size == '01' then esize = 16; elements = 4; m = UInt(Vm<2:0>); index = UInt(M:Vm<3>);
if size == '10' then esize = 32; elements = 2; m = UInt(Vm); index = UInt(M);

Notes for all encodings
Related encodings: See Advanced SIMD data-processing on page F3-4165 for the T32 instruction set, or Advanced SIMD data-processing on page F4-4262 for the A32 instruction set.

Assemble symbols
<<c> For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.
See Standard assembler syntax fields on page F2-4120.

Is the data type for the scalar and the elements of the operand vector, encoded in the "U: size" field. It can have the following values:

- S16 when U = 0, size = 01
- S32 when U = 0, size = 10
- U16 when U = 1, size = 01
- U32 when U = 1, size = 10

Is the 128-bit name of the SIMD&FP destination register, encoded in the "D: Vd" field as <Qd>*2.

Is the 64-bit name of the first SIMD&FP source register, encoded in the "N: Vn" field.

Is the 64-bit name of the second SIMD&FP source register, encoded in the "Vm<2:0>" field when <dt> is S16 or U16, otherwise the "Vm" field.

Is the element index in the range 0 to 3, encoded in the "M: Vm<3>" field when <dt> is S16 or U16, otherwise in range 0 to 1, encoded in the "M" field.

### Operation for all encodings

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    op2 = Elem[Din[m], index, esize]; op2val = Int(op2, unsigned);
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[Din[n+r], e, esize]; op1val = Int(op1, unsigned);
            if floating_point then
                Elem[D[d+r], e, esize] = FPMul(op1, op2, StandardFPSCRValue());
            else
                if long_destination then
                    Elem[D[d+r], e, esize] = (op1val*op2val)<2*esize-1:0>;
                else
                    Elem[D[d+r], e, esize] = (op1val*op2val)<esize-1:0>;
```
F6.1.151 VMVN (immediate)

Vector Bitwise NOT (immediate) places the bitwise inverse of an immediate integer constant into every element of the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

**Notes for all encodings**

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-4173 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-4271 for the A32 instruction set.

**Assembler symbols**

- `<c>` For encoding A1, A2 and A3: see *Standard assembler syntax fields* on page F2-4120. This encoding must be unconditional.
  For encoding T1, T2 and T3: see *Standard assembler syntax fields* on page F2-4120.
- `<q>` See *Standard assembler syntax fields* on page F2-4120.
- `<Qd>` Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2.
- `<Dd>` Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- `<imm>` Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of `<imm>`, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F2-4137.
Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = NOT(imm64);

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.152 **VMVN (register)**

Vector Bitwise NOT (register) takes a value from a register, inverts the value of each bit, and places the result in the destination register. The registers can be either doubleword or quadword.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5812.

#### Assembler symbols

- `<c>` For encoding A1: see *Standard assembler syntax fields* on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

<q>
See Standard assembler syntax fields on page F2-4120.
<dt>
An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>
Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qm>
Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Qd>
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Qm>
Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = NOT(D[m+r]);

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.153 VNEG

Vector Negate negates each element in a vector, and places the results in a second vector. The floating-point version only inverts the sign bit.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

```

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.154  VNMLA

Vector Negate Multiply Accumulate multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the negation of the product, and writes the result back to the destination register.

———  Note  ————

Arm recommends that software does not use the VNMLA instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

F6.1.157  VORN (immediate)

Vector Bitwise OR NOT (immediate) performs a bitwise OR between a register value and the complement of an immediate value, and returns the result into the destination vector.

This instruction is a pseudo-instruction of the VORR (immediate) instruction. This means that:

- The encodings in this description are named to match the encodings of VORR (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VORR (immediate) gives the operational pseudocode for this instruction.

\]
and is never the preferred disassembly.

128-bit SIMD vector variant
Applies when \( Q = 1 \).
VORN{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>

is equivalent to

VORR{<c>}{<q>}.I32 <Qd>, #~<imm>

and is never the preferred disassembly.

Assembler symbols

<c> For encoding A1 and A2: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1 and T2: see Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<imm> Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F2-4137.

Operation for all encodings

The description of VORR (immediate) gives the operational pseudocode for this instruction.
F6.1.158   VORN (register)

Vector bitwise OR NOT (register) performs a bitwise OR NOT operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Assembler symbols

<> For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

<q>  
See Standard assembler syntax fields on page F2-4120.

<dt>  
An optional data type. It is ignored by assemblers, and does not affect the encoding.

<qd>  
Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<qn>  
Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<qm>  
Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<dd>  
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<dn>  
Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<dm>  
Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

if ConditionPassed() then  
   EncodingSpecificOperations(); CheckAdvSIMDEnabled();  
   for r = 0 to regs-1  
      D[d+r] = D[n+r] OR NOT(D[m+r]);

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.159  VORR (immediate)

Vector Bitwise OR (immediate) performs a bitwise OR between a register value and an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

This instruction is used by the pseudo-instruction VORN (immediate). The pseudo-instruction is never the preferred disassembly.

    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] OR D[m+r];
```

### Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**F6.1.161 VPADAL**

Vector Pairwise Add and Accumulate Long adds adjacent pairs of elements of a vector, and accumulates the results into the elements of the destination vector.

The vectors can be doubleword or quadword. The operand elements can be 8-bit, 16-bit, or 32-bit integers. The result elements are twice the length of the operand elements.

The following figure shows the operation of VPADAL doubleword operation for data type S16.

![Diagram of VPADAL operation]

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5812.

VPADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

Decode for this encoding

if Q == '1' then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
case sz of
  when '0' esize = 32; elements = 2;
  when '1' esize = 16; elements = 4;
  d = UInt(D:Vd);  n = UInt(N:Vn);  m = UInt(M:Vm);

CONstrained UNPREDICTABLE behavior

If sz == '1' && InITBlock(), then one of the following behaviors must occur:

• The instruction is UNDEFINED.
• The instruction executes as if it passes the Condition code check.
• The instruction executes as NOP. This means it behaves as if it fails the Condition code check.
Assembler symbols

\(<c>\) For encoding A1: see *Standard assembler syntax fields on page F2-4120*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields on page F2-4120*.

\(<q>\) See *Standard assembler syntax fields on page F2-4120*.

\(<dt>\) Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:

- F32 when \(sz = 0\)
- F16 when \(sz = 1\)

\(<Dd>\) Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

\(<Dn>\) Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

\(<Dm>\) Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```c
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(64) dest;
    h = elements DIV 2;
    for e = 0 to h-1
        Elem[dest,e,esize] = FPAdd(Elem[D[n],2*e,esize], Elem[D[n],2*e+1,esize], StandardFPSCRValue());
        Elem[dest,e+h,esize] = FPAdd(Elem[D[m],2*e,esize], Elem[D[m],2*e+1,esize], StandardFPSCRValue());
    D[d] = dest;
```
F6.1.163   VPADD (integer)

Vector Pairwise Add (integer) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The operands and result are doubleword vectors.

The operand and result elements must all be the same type, and can be 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.

The following figure shows the operation of VPADD doubleword operation for data type I16.

![Operation of VPADD doubleword operation for data type I16.](image)

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

For encoding T1: see Standard assembler syntax fields on page F2-4120.

>
See Standard assembler syntax fields on page F2-4120.

<
Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:
\[
\begin{align*}
I8 & \text{ when size } = 00 \\
I16 & \text{ when size } = 01 \\
I32 & \text{ when size } = 10 \\
\end{align*}
\]

>D
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

>N
Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

>M
Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(64) dest;
    h = elements DIV 2;
    for e = 0 to h-1
        Elem[dest,e,esize] = Elem[D[n],2*e,esize] + Elem[D[n],2*e+1,esize];
        Elem[dest,e+h,esize] = Elem[D[m],2*e,esize] + Elem[D[m],2*e+1,esize];
    D[d] = dest;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.164  VPADDL

Vector Pairwise Add Long adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The vectors can be doubleword or quadword. The operand elements can be 8-bit, 16-bit, or 32-bit integers. The result elements are twice the length of the operand elements.

The following figure shows the operation of VPADDL doubleword operation for data type S16.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

**Decode for this encoding**

- if size == '11' then UNDEFINED;
- maximum = (op == '0'); unsigned = (U == '1');
- esize = 8 << UInt(size); elements = 64 DIV esize;
- d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);

**Assembler symbols**

- `<c>`: For encoding A1: see _Standard assembler syntax fields_ on page F2-4120. This encoding must be unconditional.
  - For encoding T1: see _Standard assembler syntax fields_ on page F2-4120.
- `<q>`: See _Standard assembler syntax fields_ on page F2-4120.
- `<dt>`: Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:
  - S8 when U = 0, size = 00
  - S16 when U = 0, size = 01
  - S32 when U = 0, size = 10
  - U8 when U = 1, size = 00
U16 when U = 1, size = 01
U32 when U = 1, size = 10

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(64) dest;
    h = elements DIV 2;
    for e = 0 to h-1
        op1 = Int(Elem[D[n],2*e,esize], unsigned);
        op2 = Int(Elem[D[n],2*e+1,esize], unsigned);
        result = if maximum then Max(op1,op2) else Min(op1,op2);
        Elem[dest,e,esize] = result<esize-1:0>;
        op1 = Int(Elem[D[m],2*e,esize], unsigned);
        op2 = Int(Elem[D[m],2*e+1,esize], unsigned);
        result = if maximum then Max(op1,op2) else Min(op1,op2);
        Elem[dest,e+h,esize] = result<esize-1:0>;
    D[d] = dest;
```

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.169  VPOP

Pop SIMD&FP registers from Stack loads multiple consecutive Advanced SIMD and floating-point register file registers from the stack

This instruction is an alias of the VLDM, VLMDB, VLDMIA instruction. This means that:

- The encodings in this description are named to match the encodings of VLDM, VLMDB, VLDMIA.
- The description of VLDM, VLMDB, VLDMIA gives the operational pseudocode for this instruction.

VPOP{<c>}{<q>}{.<size>} <sreglist>

is equivalent to

VLDM{<c>}{<q>}{.<size>} SP!, <sreglist>

and is always the preferred disassembly.

Assembler symbols

<c> See Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.

<size> An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.

<sreglist> Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.

<dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

The description of VLDM, VLDMDB, VLDMIA gives the operational pseudocode for this instruction.
F6.1.170 VPUSH

Push SIMD&FP registers to Stack stores multiple consecutive registers from the Advanced SIMD and floating-point register file to the stack.

This instruction is an alias of the VSTM, VSTMDB, VSTMIA instruction. This means that:

- The encodings in this description are named to match the encodings of VSTM, VSTMDB, VSTMIA.
- The description of VSTM, VSTMDB, VSTMIA gives the operational pseudocode for this instruction.

A1

Decrement Before variant

Decrement Before variant

VPUSH{<c>}{<q>}{.<size>} <sreglist>

is equivalent to

VSTMDB{<c>}{<q>}{.<size>} SP!, <sreglist>

and is always the preferred disassembly.

T1

Decrement Before variant

VPUSH{<c>}{<q>}{.<size>} <dreglist>

is equivalent to

VSTMDB{<c>}{<q>}{.<size>} SP!, <dreglist>

and is always the preferred disassembly.
Decrement Before variant

VPUSH{<c>}{<q>}{.<size>} <sreglist>

is equivalent to

VSTMDB{<c>}{<q>}{.<size>} SP!, <sreglist>

and is always the preferred disassembly.

Assembler symbols

<c> See Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.

<size> An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.

<sreglist> Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.

<dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

The description of VSTM, VSTMDB, VSTMIA gives the operational pseudocode for this instruction.
F6.1.171   VQABS

Vector Saturating Absolute takes the absolute value of each element in a vector, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-3991.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

A1

64-bit SIMD vector variant

Assembler symbols

<
For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

>
See Standard assembler syntax fields on page F2-4120.

dt
Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
<th>Encoding</th>
</tr>
</thead>
<tbody>
<tr>
<td>S8</td>
<td>when size = 00</td>
<td></td>
</tr>
<tr>
<td>S16</td>
<td>when size = 01</td>
<td></td>
</tr>
<tr>
<td>S32</td>
<td>when size = 10</td>
<td></td>
</tr>
</tbody>
</table>

The encoding size = 11 is reserved.

Qd
Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

Qm
Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Dd
Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Dm
Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            result = Abs(SInt(Elem[D[r]+e,esize]));
            (Elem[D[r]+e,esize], sat) = SignedSatQ(result, esize);
            if sat then FPSCR.QC = '1';
F6.1.172  VQADD

Vector Saturating Add adds the values of corresponding elements of two vectors, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-3991.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

F6.1.174 VQDMLSL

Vector Saturating Doubling Multiply Subtract Long multiplies corresponding elements in two doubleword vectors, subtracts double the products from corresponding elements of a quadword vector, and places the results in the same quadword vector.

The second operand can be a scalar instead of a vector. For more information about scalars see Advanced SIMD scalars on page F2-4146.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-3991.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

**Notes for all encodings**

Related encodings: See *Advanced SIMD data-processing on page F3-4165* for the T32 instruction set, or *Advanced SIMD data-processing on page F4-4262* for the A32 instruction set.

**Assembler symbols**

<c> For encoding A1 and A2: see *Standard assembler syntax fields on page F2-4120*. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields on page F2-4120*.

<α> See *Standard assembler syntax fields on page F2-4120*.

<dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:

S16  when size = 01
S32  when size = 10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> For encoding A1 and T1: is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

For encoding A2 and T2: is the 64-bit name of the second SIMD&FP source register, encoded in the "Vm<2:0>" field when <dt> is S16, otherwise the "Vm" field.

<index> Is the element index in the range 0 to 3, encoded in the "M:Vm<3>" field when <dt> is S16, otherwise in range 0 to 1, encoded in the "M" field.

F6.1.177 VQMOVN, VQMOVUN

Vector Saturating Move and Narrow copies each element of the operand vector to the corresponding element of the destination vector.

The operand is a quadword vector. The elements can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result is a doubleword vector. The elements are half the length of the operand vector elements. If the operand is unsigned, the results are unsigned. If the operand is signed, the results can be signed or unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-3991.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5812.

This instruction is used by the pseudo-instructions VQRSHRN (zero), VQRSHRUN (zero), VQSHRN (zero), and VQSHRUN (zero). The pseudo-instruction is never the preferred disassembly.

  - op<0> = 0, size = 11.
  - op<0> = 1, size = 11.

For the unsigned result variant: is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

- S16 when size = 00
- S32 when size = 01
- S64 when size = 10
- The encoding size = 11 is reserved.

- \(\langle Dd \rangle\) Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- \(\langle Qm \rangle\) Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as \(\langle Qm \rangle\)*2.

Operation for all encodings

\[
\begin{align*}
\text{if } \text{ConditionPassed}() \text{ then } & \\
\text{EncodingSpecificOperations(); CheckAdvSIMDEnabled();} \\
\text{for } e = 0 \text{ to elements-1} & \\
\text{operand} & = \text{Int}(\text{Elem}[Qin[m>>1],e,2*\text{esize}], \text{src}_\text{unsigned}); \\
(\text{Elem}[D[d],e,\text{esize}], \text{sat}) & = \text{SatQ}(\text{operand}, \text{esize}, \text{dest}_\text{unsigned}); \\
\text{if sat then FPSCR.QC} & = '1';
\end{align*}
\]
F6.1.178 VQNEG

Vector Saturating Negate negates each element in a vector, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-3991.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Notes for all encodings

Related encodings: See Advanced SIMD data-processing on page F3-4165 for the T32 instruction set, or Advanced SIMD data-processing on page F4-4262 for the A32 instruction set.

Assembler symbols

<> For encoding A1 and A2: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1 and T2: see Standard assembler syntax fields on page F2-4120.

<> See Standard assembler syntax fields on page F2-4120.

<dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:

S16 when size = 01
S32 when size = 10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm[x]> Is the 64-bit name of the second SIMD&FP source register holding the scalar. If <dt> is S16, Dm is restricted to D0-D7. Dm is encoded in "Vm<2:0>", and x is encoded in "M:Vm<3>". If <dt> is S32, Dm is restricted to D0-D15. Dm is encoded in "Vm", and x is encoded in "M".

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  round_const = 1 << (esize-1);
  if scalar_form then op2 = SInt(Elem[D[m],index,esize]);
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = SInt(Elem[D[n+r],e,esize]);
      if !scalar_form then op2 = SInt(Elem[D[m+r],e,esize]);
      (result, sat) = SignedSatQ((2*op1*op2 + round_const) >> esize, esize);
      Elem[D[d+r],e,esize] = result;
      if sat then FPSCR.QC = '1';
F6.1.182 VQRSHL

Vector Saturating Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

For truncated results see VQSHL (register).

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-3991.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

instruction set, or Advanced SIMD one register and modified immediate on page F4-4271 for the A32 instruction
set.

Assembler symbols

\(<c>\)

For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be
unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.

\(<q>\)

See Standard assembler syntax fields on page F2-4120.

\(<\text{type}>\)

Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following
values:
- \(S\) when \(U = 0\)
- \(U\) when \(U = 1\)
<size> Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:

- 8 when L = 0, imm6<5:3> = 001
- 16 when L = 0, imm6<5:3> = 01x
- 32 when L = 0, imm6<5:3> = 1xx
- 64 when L = 1, imm6<5:3> = xxx

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

**Operation for all encodings**

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            operand = Int(Elem[D[m+r],e,esize], src_unsigned);
            (result, sat) = SatQ(operand << shift_amount, esize, dest_unsigned);
            Elem[D[d+r],e,esize] = result;
            if sat then FPSCR.QC = '1';
```
F6.1.187 VQSHL (register)

Vector Saturating Shift Left (register) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

The results are truncated. For rounded results, see VQRSHL.

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-3991.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

F6.1.188  VQSHRN (zero)

Vector Saturating Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the signed truncated results in a doubleword vector.

This instruction is a pseudo-instruction of the VQMOVN, VQMOVUN instruction. This means that:

- The encodings in this description are named to match the encodings of VQMOVN, VQMOVUN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VQMOVN, VQMOVUN gives the operational pseudocode for this instruction.

**A1**

```
[31 30 29 28][27 26 25 24][23 22 21 20][19 18 17 16][15 12][11 10 9 8][7 6 5 4][3 0]
1 1 1 1 0 0 1 1 | D | 1 1 | size | 1 0 | Vd | 0 | 0 | 1 0 | 1 | x | M | 0 | Vm
```

**Signed result variant**

VQSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0

is equivalent to

VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>

and is never the preferred disassembly.

**T1**

```
[15 14 13 12][11 10 9 8][7 6 5 4][3 2 1 0][15 12][11 10 9 8][7 6 5 4][3 0]
1 1 1 1 1 1 1 1 | D | 1 1 | size | 1 0 | Vd | 0 | 0 | 1 0 | 1 | x | M | 0 | Vm
```

**Signed result variant**

VQSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0

is equivalent to

VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>

and is never the preferred disassembly.

**Assembler symbols**

- `<c>` For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
  For encoding T1: see Standard assembler syntax fields on page F2-4120.

- `<q>` See Standard assembler syntax fields on page F2-4120.

- `<dt>` Is the data type for the elements of the operand, encoded in the "op<0>:size" field. It can have the following values:
  - S16 when op<0> = 0, size = 00
  - S32 when op<0> = 0, size = 01
  - S64 when op<0> = 0, size = 10
  - U16 when op<0> = 1, size = 00
U32 when op<0> = 1, size = 01
U64 when op<0> = 1, size = 10

The following encodings are reserved:
• op<0> = 0, size = 11.
• op<0> = 1, size = 11.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

The description of VQMOVN, VQMOVUN gives the operational pseudocode for this instruction.
Vector Saturating Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the truncated results in a doubleword vector.

For rounded results, see VQSRH, VQSRHNR.

The operand elements must all be the same size, and can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result elements are half the width of the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see Pseudocode description of saturation on page E1-3991.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

<Qd>  Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>  Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>  Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>  Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>  Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>  Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            diff = Int(Elem[D[n+r],e,esize], unsigned) - Int(Elem[D[m+r],e,esize], unsigned);
            (Elem[D[r]+e,esize], sat) = SatQ(diff, esize, unsigned);
            if sat then FPSCR.QC = '1';
F6.1.192 VRADDHN

Vector Rounding Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are rounded. For truncated results, see VADDHN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Assembler symbols

```
<c>
For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.
For encoding T1: see Standard assembler syntax fields on page F2-4120.
```

<q>
See Standard assembler syntax fields on page F2-4120.
<dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
I16 when size = 00
I32 when size = 01
I64 when size = 10

<dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <qn>*2.

<qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <qm>*2.

**Operation for all encodings**

```plaintext
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    round_const = 1 << (esize-1);
    for e = 0 to elements-1
        result = Elem[Qin[n>>1],e,2*esize] + Elem[Qin[m>>1],e,2*esize] + round_const;
        Elem[D[d],e,esize] = result<2*esize-1:esize>;
```

**Operational information**

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
**F6.1.193  VRECPE**

Vector Reciprocal Estimate finds an approximate reciprocal of each element in the operand vector, and places the results in the destination vector.

The operand and result elements are the same type, and can be floating-point numbers or unsigned integers.

For details of the operation performed by this instruction see *Floating-point reciprocal square root estimate and step* on page E1-4009.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-5812.

**Assembler symbols**

<>

For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-4120.

<>

See Standard assembler syntax fields on page F2-4120.

<dt>

Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

8 when size = 00
16 when size = 01
32 when size = 10

The encoding size = 11 is reserved.

<Qd>

Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm>

Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd>

Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm>

Is the 64-bit name of the SIMD&FP source register, encoded in the "D:Vd" field.

<Qm>

Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();

  bits(64) result;
  integer element;
  integer rev_element;
  for r = 0 to regs-1
    element = 0;
    for c = 0 to containers-1
      rev_element = element + elements_per_container - 1;
      for e = 0 to elements_per_container-1

        element = element + 1;
        rev_element = rev_element - 1;
      D[d+r] = result;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.198   VRHADD

Vector Rounding Halving Add adds corresponding elements in two vectors of integers, shifts each result right one bit, and places the final results in the destination vector.

The operand and result elements are all the same type, and can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The results of the halving operations are rounded. For truncated results, see VHADD.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

  when 64
    D[d] = FPRoundInt(D[m], FPSCR, rounding, exact);
F6.1.212   VRSHL

Vector Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see VSHL.

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is always a signed integer of the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Operation for all encodings

if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            shift = SInt(Elem[D[n+r],e,esize]<7:0>);
            round_const = 1 << (-shift-1); // 0 for left shift, 2^(n-1) for right shift
            result = (Int(Elem[D[m+r],e,esize], unsigned) + round_const) << shift;
            Elem[D[d+r],e,esize] = result<esize-1:0>;

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

•  The execution time of this instruction is independent of:
    — the values of the data supplied in any of its registers.
    — the values of the NZCV flags.
• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.213   VRSHR

Vector Rounding Shift Right takes each element in a vector, right shifts them by an immediate value, and places the rounded results in the destination vector. For truncated results, see VSHR.

The operand and result elements must be the same size, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

For encoding T1: see Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.

type> Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:
S when U = 0
U when U = 1

<size> Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:
8 when L = 0, imm6<5:3> = 001
16 when L = 0, imm6<5:3> = 01x
32 when L = 0, imm6<5:3> = 1xx
64 when L = 1, imm6<5:3> = xxx

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 1 to <size>, encoded in the "imm6" field as <size> - <imm>.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();
  round_const = 1 << (shift_amount - 1);
  for r = 0 to regs-1
    for e = 0 to elements-1
      result = (Int(ElemD[m+r],e,esize], unsigned) + round_const) >> shift_amount;
      ElemD[d+r],e,esize] = result-esize-1:0;
Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
F6.1.214  VRSHR (zero)

Vector Rounding Shift Right copies the contents of one SIMD register to another.

This instruction is a pseudo-instruction of the VORR (register) instruction. This means that:

- The encodings in this description are named to match the encodings of VORR (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VORR (register) gives the operational pseudocode for this instruction.

**Assembler symbols**

- `<c>`: For encoding A1: see *Standard assembler syntax fields on page F2-4120*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields on page F2-4120*.
- `<q>`: See *Standard assembler syntax fields on page F2-4120*.
- `<dt>`: Is the data type for the elements of the vectors, and must be one of: S8, S16, S32, S64, U8, U16, U32 or U64.
- `<Qd>`: Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as `<Qd>*2.
- `<Qm>`: Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as `<Qm>*2.
- `<Dd>`: Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- `<Dm>`: Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

**Operation for all encodings**

The description of **VORR (register)** gives the operational pseudocode for this instruction.
F6.1.215  VRSHRN

Vector Rounding Shift Right and Narrow takes each element in a vector, right shifts them by an immediate value, and places the rounded results in the destination vector. For truncated results, see VSHRN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers. The destination elements are half the size of the source elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.

Notes for all encodings

Related encodings: See Advanced SIMD one register and modified immediate on page F3-4173 for the T32 instruction set, or Advanced SIMD one register and modified immediate on page F4-4271 for the A32 instruction set.

Assembler symbols

<q> For encoding A1: see Standard assembler syntax fields on page F2-4120. This encoding must be unconditional.

For encoding T1: see Standard assembler syntax fields on page F2-4120.

<q> See Standard assembler syntax fields on page F2-4120.

<type> Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values:

S  when U = 0
U  when U = 1

<size> Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values:

8  when L = 0, imm6<5:3> = 001
16  when L = 0, imm6<5:3> = 01x
32  when L = 0, imm6<5:3> = 1xx
64  when L = 1, imm6<5:3> = xxx

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 1 to <size>, encoded in the "imm6" field as <size> - <imm>.

Operation for all encodings

if ConditionPassed() then
  EncodingSpecificOperations();  CheckAdvSIMDEnabled();
  round_const = 1 << (shift_amount - 1);
  for r = 0 to regs-1
    for e = 0 to elements-1
      result = (Int(Elem[D[r+],e,esize], unsigned) + round_const) >> shift_amount;
      Elem[D[d+r],e,esize] = Elem[D[d+r],e,esize] + result;
Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

• The execution time of this instruction is independent of:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.

• The response of this instruction to asynchronous exceptions does not vary based on:
  — The values of the data supplied in any of its registers.
  — The values of the NZCV flags.
F6.1.220  VRSUBHN

Vector Rounding Subtract and Narrow, returning High Half subtracts the elements of one quadword vector from the corresponding elements of another quadword vector, takes the most significant half of each result, and places the final results in a doubleword vector. The results are rounded. For truncated results, see VSUBHN.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see Enabling Advanced SIMD and floating-point support on page G1-5812.
