0b0 EL0 access to these instructions is disabled, and these instructions are trapped to EL1.

0b1 EL0 access to these instructions is enabled.

———— Note —————

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

0b0 SETEND instruction execution is enabled at PL0 and PL1.

0b1 SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

0b0 All IT instruction functionality is enabled at PL1 and PL0.

0b1 Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with $hw1[3:0] \neq 1000$.
- All encodings of the subsequent instruction with the following values for $hw1$:
 - 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
 - 1011xxxxxxxxxxxx: All instructions in *Miscellaneous 16-bit instructions on page F3-4423*.
 - 10100xxxxxxxxxxx: ADD Rd, PC, #imm
 - 01001xxxxxxxxxxx: LDR Rd, [PC, #imm]
 - 0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
 - 010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see *Changes to an ITD control by an instruction in an IT block on page E1-4258*.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the [SCTLR_EL1](#), [SCTLR_EL2](#), and [HSCTLR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When an implementation does not implement ITD, access to this field is RAZ/WI.

UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

0b0 PL0 and PL1 execution of the [CP15DMB](#), [CP15DSB](#), and [CP15ISB](#) instructions is UNDEFINED.

0b1 PL0 and PL1 execution of the [CP15DMB](#), [CP15DSB](#), and [CP15ISB](#) instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the [SCTLR_EL1](#), [SCTLR_EL2](#), and [HSCTLR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

When an implementation does not implement CP15BEN, access to this field is RAO/WI.

LSMAOE, bit [4]

When FEAT_LSMAOC is implemented:

LSMAOE

Load Multiple and Store Multiple Atomicity and Ordering Enable.

0b0 For all memory accesses at EL1 or EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.

0b1 The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]

When FEAT_LSMAOC is implemented:

nTLSMD

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

0b0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

0b1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

0b0 All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.

0b1 All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.

The PE ignores SCTLR.C for Non-secure state and data accesses to Normal memory from EL1 and EL0 are Cacheable if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

0b0 Alignment fault checking disabled when executing at PL1 or PL0.
Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1 Alignment fault checking enabled when executing at PL1 or PL0.
All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

0b0 EL1 and EL0 stage 1 address translation disabled.
See the SCTLR.I field for the behavior of instruction accesses to Normal memory.

0b1 EL1 and EL0 stage 1 address translation enabled.

In the Non-secure state the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of HCR.{DC, TGE} is not {0, 0}.
- EL2 is using AArch64 and the value of HCR_EL2.{DC, TGE} is not {0, 0}.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing SCTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then

    elsif SCR.NS == '0' && CP15SDISABLE2 == HIGH then
        UNDEFINED;
    else
        if SCR.NS == '0' then
            SCTL_R_S = R[t];
        else
            SCTL_R_NS = R[t];

```

G8.2.127 SPSR, Saved Program Status Register

The SPSR characteristics are:

Purpose

Holds the saved process state for the current mode.

Configurations

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to SPSR are UNDEFINED.

Attributes

SPSR is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to the current mode, and copied to PSTATE.IT on executing an exception return operation in the current mode.

SPSR.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR[26:25].
- IT[7:2] is SPSR[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to the current mode, and copied to PSTATE.IL on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to the current mode, and copied to PSTATE.GE on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to the current mode, and copied to PSTATE.E on executing an exception return operation in the current mode.

If the implementation does not support big-endian operation, SPSR.E is RES0. If the implementation does not support little-endian operation, SPSR.E is RES1. On executing an exception return operation in the current mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SERror interrupt mask. Set to the value of PSTATE.A on taking an exception to the current mode, and copied to PSTATE.A on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to the current mode, and copied to PSTATE.I on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to the current mode, and copied to PSTATE.F on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to the current mode, and copied to PSTATE.T on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to the current mode, and copied to PSTATE.M[4:0] on executing an exception return operation in the current mode.

0b10000 User.

0b10001 FIQ.

0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in the current mode is an illegal return event, as described in [Illegal return events from AArch32 state](#) on page G1-6066.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

G8.2.128 SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configurations

AArch32 System register SPSR_abt bits [31:0] are architecturally mapped to AArch64 System register [SPSR_abt](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to SPSR_abt are UNDEFINED.

Attributes

SPSR_abt is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Abort mode, and copied to PSTATE.IT on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_abt[26:25].
- IT[7:2] is SPSR_abt[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

ArmV8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

0b10000 User.

0b10001 FIQ.
0b10010 IRQ.
0b10011 Supervisor.
0b10111 Abort.
0b11011 Undefined.
0b11111 System.

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in *Illegal return events from AArch32 state* on page G1-6066.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_abt

SPSR_abt is accessible in all modes other than User mode and Abort mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_abt

R	M	M1
0b1	0b1	0b0100

MSR{<c>}{<q>} SPSR_abt, <Rn>

R	M	M1
0b1	0b1	0b0100

G8.2.129 SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configurations

AArch32 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch64 System register [SPSR_fiq](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to SPSR_fiq are UNDEFINED.

Attributes

SPSR_fiq is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to FIQ mode, and copied to PSTATE.IT on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_fiq[26:25].
- IT[7:2] is SPSR_fiq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

0b10000 User.

0b10001 FIQ.
0b10010 IRQ.
0b10011 Supervisor.
0b10111 Abort.
0b11011 Undefined.
0b11111 System.

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in *Illegal return events from AArch32 state* on page G1-6066.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_fiq

SPSR_fiq is accessible in all modes other than User mode and FIQ mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_fiq

R	M	M1
0b1	0b0	0b1110

MSR{<c>}{<q>} SPSR_fiq, <Rn>

R	M	M1
0b1	0b0	0b1110

G8.2.130 SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

Purpose

Holds the saved process state when an exception is taken to Hyp mode.

Configurations

AArch32 System register SPSR_hyp bits [31:0] are architecturally mapped to AArch64 System register [SPSR_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to SPSR_hyp are UNDEFINED.

Attributes

SPSR_hyp is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Hyp mode, and copied to PSTATE.IT on executing an exception return operation in Hyp mode.

SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_hyp[26:25].
- IT[7:2] is SPSR_hyp[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

ArmV8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Hyp mode, and copied to PSTATE.SSBS on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Hyp mode, and copied to PSTATE.PAN on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Hyp mode, and copied to PSTATE.DIT on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.

If the implementation does not support big-endian operation, SPSR_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_hyp.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.

0b10000 User.

0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in *Illegal return events from AArch32 state* on page G1-6066.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_hyp

SPSR_hyp is accessible only in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_hyp

R	M	M1
0b1	0b1	0b1110

MSR{<c>}{<q>} SPSR_hyp, <Rn>

R	M	M1
0b1	0b1	0b1110

G8.2.131 SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configurations

AArch32 System register SPSR_irq bits [31:0] are architecturally mapped to AArch64 System register [SPSR_irq](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to SPSR_irq are UNDEFINED.

Attributes

SPSR_irq is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to IRQ mode, and copied to PSTATE.IT on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_irq[26:25].
- IT[7:2] is SPSR_irq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

ArmV8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

0b10000 User.

0b10001 FIQ.
 0b10010 IRQ.
 0b10011 Supervisor.
 0b10111 Abort.
 0b11011 Undefined.
 0b11111 System.

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in *Illegal return events from AArch32 state* on page G1-6066.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_irq

SPSR_irq is accessible in all modes other than User mode and IRQ mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_irq

R	M	M1
0b1	0b1	0b0000

MSR{<c>}{<q>} SPSR_irq, <Rn>

R	M	M1
0b1	0b1	0b0000

G8.2.132 SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

Purpose

Holds the saved process state when an exception is taken to Monitor mode.

Configurations

AArch32 System register SPSR_mon bits [31:0] can be mapped to AArch64 System register SPSR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to SPSR_mon are UNDEFINED.

Attributes

SPSR_mon is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Monitor mode, and copied to PSTATE.N on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Monitor mode, and copied to PSTATE.Z on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Monitor mode, and copied to PSTATE.C on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Monitor mode, and copied to PSTATE.V on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Monitor mode, and copied to PSTATE.Q on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Monitor mode, and copied to PSTATE.IT on executing an exception return operation in Monitor mode.

SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_mon[26:25].
- IT[7:2] is SPSR_mon[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Monitor mode, and copied to PSTATE.SSBS on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Monitor mode, and copied to PSTATE.PAN on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Monitor mode, and copied to PSTATE.DIT on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Monitor mode, and copied to PSTATE.IL on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Monitor mode, and copied to PSTATE.GE on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Monitor mode, and copied to PSTATE.E on executing an exception return operation in Monitor mode.

If the implementation does not support big-endian operation, SPSR_mon.E is RES0. If the implementation does not support little-endian operation, SPSR_mon.E is RES1. On executing an exception return operation in Monitor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_mon.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_mon.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Monitor mode, and copied to PSTATE.A on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Monitor mode, and copied to PSTATE.I on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Monitor mode, and copied to PSTATE.F on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Monitor mode, and copied to PSTATE.T on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Monitor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Monitor mode.

0b10000 User.

0b10001 FIQ.
 0b10010 IRQ.
 0b10011 Supervisor.
 0b10110 Monitor.
 0b10111 Abort.
 0b11010 Hyp.
 0b11011 Undefined.
 0b11111 System.

Other values are reserved. If SPSR_mon.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Monitor mode is an illegal return event, as described in *Illegal return events from AArch32 state on page G1-6066*.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_mon

SPSR_mon is only accessible in EL3 modes other than Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_mon

R	M	M1
0b1	0b1	0b1100

MSR{<c>}{<q>} SPSR_mon, <Rn>

R	M	M1
0b1	0b1	0b1100

G8.2.133 SPSR_svc, Saved Program Status Register (Supervisor mode)

The SPSR_svc characteristics are:

Purpose

Holds the saved process state when an exception is taken to Supervisor mode.

Configurations

AArch32 System register SPSR_svc bits [31:0] are architecturally mapped to AArch64 System register [SPSR_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to SPSR_svc are UNDEFINED.

Attributes

SPSR_svc is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Supervisor mode, and copied to PSTATE.IT on executing an exception return operation in Supervisor mode.

SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_svc[26:25].
- IT[7:2] is SPSR_svc[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Supervisor mode, and copied to PSTATE.SSBS on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Supervisor mode, and copied to PSTATE.PAN on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Supervisor mode, and copied to PSTATE.DIT on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode, and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR_svc.E is RES0. If the implementation does not support little-endian operation, SPSR_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_svc.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Supervisor mode, and copied to PSTATE.T on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Supervisor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Supervisor mode.

0b10000 User.

0b10001 FIQ.
 0b10010 IRQ.
 0b10011 Supervisor.
 0b10111 Abort.
 0b11011 Undefined.
 0b11111 System.

Other values are reserved. If SPSR_svc.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Supervisor mode is an illegal return event, as described in *Illegal return events from AArch32 state* on page G1-6066.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_svc

SPSR_svc is accessible in all modes other than User mode and Supervisor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_svc

R	M	M1
0b1	0b1	0b0010

MSR{<c>}{<q>} SPSR_svc, <Rn>

R	M	M1
0b1	0b1	0b0010

G8.2.134 SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configurations

AArch32 System register SPSR_und bits [31:0] are architecturally mapped to AArch64 System register [SPSR_und](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to SPSR_und are UNDEFINED.

Attributes

SPSR_und is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Undefined mode, and copied to PSTATE.IT on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_und[26:25].
- IT[7:2] is SPSR_und[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state. Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

0b10000 User.

0b10001 FIQ.
0b10010 IRQ.
0b10011 Supervisor.
0b10111 Abort.
0b11011 Undefined.
0b11111 System.

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in *Illegal return events from AArch32 state* on page G1-6066.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_und

SPSR_und is accessible in all modes other than User mode and Undefined mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_und

R	M	M1
0b1	0b1	0b0110

MSR{<c>}{<q>} SPSR_und, <Rn>

R	M	M1
0b1	0b1	0b0110

G8.2.135 TCMTR, TCM Type Register

The TCMTR characteristics are:

Purpose

Provides information about the implementation of the TCM.

Configurations

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TCMTR are UNDEFINED.

If EL1 or above can use AArch32 then this register must be implemented.

Attributes

TCMTR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing TCMTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID1 == '1' then

    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return TCMTR;
    elsif PSTATE.EL == EL2 then
        return TCMTR;
    elsif PSTATE.EL == EL3 then
        return TCMTR;

```

G8.2.136 TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIALL are UNDEFINED.

Attributes

TLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TTLB == '1' then
        AArch32.TakeHypTrapException(0x03);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.FB == '1' then
        if IsFeatureImplemented(FEAT_XS) && IsFeatureImplemented(FEAT_HCX) && HCRX_EL2.FnXS == '1' then
            AArch32.TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_ISH,
            TLBI_ExcludeXS);
        else

```

```
        AArch32.TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_ISH,
TLBI_AllAttr);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HCR.FB == '1' then
        AArch32.TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_ISH, TLBI_AllAttr);
    else
        if IsFeatureImplemented(FEAT_XS) && !ELUsingAArch32(EL2) && IsFeatureImplemented(FEAT_HCX) &&
IsHCRXEL2Enabled() && HCRX_EL2.FnXS == '1' then
            AArch32.TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_NSH,
TLBI_ExcludeXS);
        else
            AArch32.TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_NSH,
TLBI_AllAttr);
    elseif PSTATE.EL == EL2 then
        AArch32.TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_NSH, TLBI_AllAttr);
    elseif PSTATE.EL == EL3 then
        AArch32.TLBI_ALL(SecurityStateAtEL(EL3), Regime_EL30, Shareability_NSH, TLBI_ExcludeXS);
```

G8.2.137 TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIALLH are UNDEFINED.

Attributes

TLBIALLH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    AArch32.TLBI_ALL(SecurityStateAtEL(EL2), Regime_EL2, Shareability_NSH, TLBI_AllAttr);
elseif PSTATE.EL == EL3 then
    if !HaveEL(EL2) then
        UNDEFINED;
    else
        AArch32.TLBI_ALL(SS_NonSecure, Regime_EL2, Shareability_NSH, TLBI_AllAttr);

```

G8.2.138 TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIALLHIS are UNDEFINED.

Attributes

TLBIALLHIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLHIS instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    AArch32.TLBI_ALL(SecurityStateAtEL(EL2), Regime_EL2, Shareability_ISH, TLBI_AllAttr);
elseif PSTATE.EL == EL3 then
    if !HaveEL(EL2) then
        UNDEFINED;
    else
        AArch32.TLBI_ALL(SS_NonSecure, Regime_EL2, Shareability_ISH, TLBI_AllAttr);

```

G8.2.139 TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIALLIS are UNDEFINED.

Attributes

TLBIALLIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLIS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR<{c}>{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);

```

G8.2.140 TLBIALLNSNH, TLB Invalidate All, Non-Secure Non-Hyp

The TLBIALLNSNH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIALLNSNH are UNDEFINED.

Attributes

TLBIALLNSNH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLNSNH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    AArch32.TLBI_ALL(SecurityStateAtEL(EL1), Regime_EL10, Shareability_NSH, TLBI_AllAttr);
elseif PSTATE.EL == EL3 then
    if !HaveEL(EL2) then
        UNDEFINED;
    else
        AArch32.TLBI_ALL(SS_NonSecure, Regime_EL10, Shareability_NSH, TLBI_AllAttr);

```

G8.2.141 TLBIALLNSNHIS, TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable

The TLBIALLNSNHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIALLNSNHIS are UNDEFINED.

Attributes

TLBIALLNSNHIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLNSNHIS instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    AArch32.TLBI_ALL(SecurityStateAtEL(EL1), Regime_EL10, Shareability_ISH, TLBI_AllAttr);
elseif PSTATE.EL == EL3 then
    if !HaveEL(EL2) then
        UNDEFINED;
    else
        AArch32.TLBI_ALL(SS_NonSecure, Regime_EL10, Shareability_ISH, TLBI_AllAttr);

```

G8.2.142 TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIASID are UNDEFINED.

Attributes

TLBIASID is a 32-bit System instruction.

Field descriptions

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing TLBIASID instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b010

```

if PSTATE.EL == EL0 then

    elseif PSTATE.EL == EL3 then
        AArch32.TLBI_ASID(SecurityStateAtEL(EL3), Regime_EL30, VMID_NONE, Shareability_NSH, TLBI_AllAttr,
            R[t]);

```

G8.2.143 TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIASIDIS are UNDEFINED.

Attributes

TLBIASIDIS is a 32-bit System instruction.

Field descriptions

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing TLBIASIDIS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

            R[t]);

```

G8.2.144 TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- [SCR.NS](#) is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIIPAS2 are UNDEFINED.

———— Note ————

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2 is a 32-bit System instruction.

Field descriptions

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing TLBIIPAS2 instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.

```

G8.2.148 TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIMVA are UNDEFINED.

Attributes

TLBIMVA is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVA instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b001

```

```

G8.2.153 TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIMVAH are UNDEFINED.

Attributes

TLBIMVAH is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

```
        UNDEFINED;
    elsif PSTATE.EL == EL2 then
        AArch32.TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID_NONE, Shareability_NSH, TLBILevel_Any,
        TLBI_AllAttr, R[t]);
    elsif PSTATE.EL == EL3 then
        if !HaveEL(EL2) then
            UNDEFINED;
        else
            AArch32.TLBI_VA(SS_NonSecure, Regime_EL2, VMID[], Shareability_NSH, TLBILevel_Any, TLBI_AllAttr,
            R[t]);
```

G8.2.154 TLBIMVAHIS, TLB Invalidate by VA, Hyp mode, Inner Shareable

The TLBIMVAHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIMVAHIS are UNDEFINED.

Attributes

TLBIMVAHIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAHIS instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    
```

```
    else
        UNDEFINED;
    elsif PSTATE.EL == EL2 then
        AArch32.TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID_NONE, Shareability_ISH, TLBILevel_Any,
        TLBI_AllAttr, R[t]);
    elsif PSTATE.EL == EL3 then
        if !HaveEL(EL2) then
            UNDEFINED;
        else
            AArch32.TLBI_VA(SS_NonSecure, Regime_EL2, VMID[], Shareability_ISH, TLBILevel_Any, TLBI_AllAttr,
            R[t]);
```

G8.2.155 TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIMVAIS are UNDEFINED.

Attributes

TLBIMVAIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVAIS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b001

```

    elseif PSTATE.EL == EL3 then
        AArch32.TLBI_VA(SecurityStateAtEL(EL3), Regime_EL30, VMID_NONE, Shareability_ISH, TLBIlevel_Any,
            TLBI_A11Attr, R[t]);

```

G8.2.156 TLBIMVAL, TLB Invalidate by VA, Last level

The TLBIMVAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIMVAL are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVAL is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVAL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

G8.2.158 TLBIMVALHIS, TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable

The TLBIMVALHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIMVALHIS are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVALHIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVALHIS instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b101

```

if PSTATE.EL == EL0 then
  UNDEFINED;
elseif PSTATE.EL == EL1 then
  if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
  
```

```

    AArch32.TakeHypTrapException(0x03);
else
    UNDEFINED;
elseif PSTATE.EL == EL2 then
    AArch32.TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID_NONE, Shareability_ISH, TLBILevel_Last,
    TLBI_AllAttr, R[t]);
elseif PSTATE.EL == EL3 then
    if !HaveEL(EL2) then
        UNDEFINED;
    else
        AArch32.TLBI_VA(SS_NonSecure, Regime_EL2, VMID[], Shareability_ISH, TLBILevel_Last, TLBI_AllAttr,
        R[t]);
```

G8.2.159 TLBINVALIS, TLB Invalidate by VA, Last level, Inner Shareable

The TLBINVALIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configurations

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBINVALIS are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBINVALIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVALIS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;

            TLBI_A11Attr, R[t]);

```

G8.2.160 TLBTR, TLB Type Register

The TLBTR characteristics are:

Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

Configurations

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBTR are UNDEFINED.

Attributes

TLBTR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.

nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB:

- 0b0 Unified TLB.
- 0b1 Separate Instruction and Data TLBs.

Accessing TLBTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b011

```

    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return TLBTR;
    elsif PSTATE.EL == EL2 then
        return TLBTR;

```

```
elseif PSTATE.EL == EL3 then  
    return TLBTR;
```

G8.2.161 TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configurations

AArch32 System register TPIDRPRW bits [31:0] are architecturally mapped to AArch64 System register [TPIDR_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TPIDRPRW are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRPRW is a 32-bit register.

Field descriptions

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRPRW

Accesses to this register use the following encodings in the System register encoding space:

G8.2.162 TPIDRURO, PL0 Read-Only Software Thread ID Register

The TPIDRURO characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configurations

AArch32 System register TPIDRURO bits [31:0] are architecturally mapped to AArch64 System register `TPIDRRO_EL0`[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TPIDRURO are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRURO is a 32-bit register.

Field descriptions

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRURO

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b011

```

```

G8.2.164 TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

Purpose

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using [TTBR0](#) and addresses translated using [TTBR1](#).
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with [TTBCR2](#).

Configurations

AArch32 System register TTBCR bits [31:0] are architecturally mapped to AArch64 System register [TCR_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TTBCR are UNDEFINED.

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

Attributes

TTBCR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

EAE, bit [31]

Extended Address Enable.

0b0 Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [30:6]

Reserved, RES0.

PD1, bit [5]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#).

0b0 Perform translation table walks using [TTBR1](#).

0b1 A TLB miss on an address that is translated using [TTBR1](#) generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

PD0, bit [4]

Translation table walk disable for translations using **TTBR0**. This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using **TTBR0**.

0b0 Perform translation table walks using **TTBR0**.

0b1 A TLB miss on an address that is translated using **TTBR0** generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [3]

Reserved, RES0.

N, bits [2:0]

Indicate the width of the base address held in **TTBR0**. In **TTBR0**, the base address field is bits[31:14-N]. The value of N also determines:

- Whether **TTBR0** or **TTBR1** is used as the base address for translation table walks.
- The size of the translation table pointed to by **TTBR0**.

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When **TTBCR.EAE == 1**:

EAE, bit [31]

Extended Address Enable.

0b1 Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using **TTBR1**.

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1](#).

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1](#).

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#).

0b0 Perform translation table walks using [TTBR1](#).

0b1 A TLB miss on an address that is translated using [TTBR1](#) generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

A1, bit [22]

Selects whether [TTBR0](#) or [TTBR1](#) defines the ASID.

0b0 [TTBR0](#).ASID defines the ASID.

0b1 [TTBR1](#).ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [21:19]

Reserved, RES0.

T1SZ, bits [18:16]

See [Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format on page G5-6297](#) for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using [TTBR0](#) and [TTBR1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [15:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0](#).

0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0](#).

0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0](#).

0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0](#).

0b0	Perform translation table walks using TTBR0 .
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

T2E, bit [6]

When FEAT_AA32HPD is implemented:

T2E

TTBCR2 Enable.

0b0	TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register.
0b1	TTBCR2 is enabled.

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

Otherwise:

Reserved, RAZ/WI.

Bits [5:3]

Reserved, RES0.

T0SZ, bits [2:0]

See [Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format on page G5-6297](#) for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TTBCR

```

G8.2.165 TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If `FEAT_AA32HPD` is not implemented then this register is not implemented and its encoding is UNDEFINED. Otherwise:

- When the value of `TTBCR.{EAE, T2E}` is not {1, 1} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of `TTBCR.{EAE, T2E}` is {1, 1} TTBCR2 is used with `TTBCR`.

Configurations

AArch32 System register TTBCR2 bits [31:0] are architecturally mapped to AArch64 System register `TCR_EL1[63:32]`.

This register is present only when AArch32 is supported at EL0 and `FEAT_AA32HPD` is implemented. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

Attributes

TTBCR2 is a 32-bit register.

Field descriptions

Bits [31:19]

Reserved, RES0.

HWU162, bit [18]

When FEAT_HPDS2 is implemented:

HWU162

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using `TTBR1`.

- 0b0 For translations using `TTBR1`, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using `TTBR1`, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of `TTBCR2.HPD1` is 1.

The Effective value of this field is 0 if the value of `TTBCR2.HPD1` is 0 or the value of `TTBCR.T2E` is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU161, bit [17]

When FEAT_HPDS2 is implemented:

HWU161

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

- 0b0 For translations using [TTBR1](#), bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR1](#), bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU160, bit [16]

When FEAT_HPDS2 is implemented:

HWU160

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

- 0b0 For translations using [TTBR1](#), bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR1](#), bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU159, bit [15]

When FEAT_HPDS2 is implemented:

HWU159

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

- 0b0 For translations using [TTBR1](#), bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR1](#), bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU062, bit [14]

When FEAT_HPDS2 is implemented:

HWU062

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

0b0 For translations using [TTBR0](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR0](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU061, bit [13]

When FEAT_HPDS2 is implemented:

HWU061

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

0b0 For translations using [TTBR0](#), bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR0](#), bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU060, bit [12]

When FEAT_HPDS2 is implemented:

HWU060

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

0b0 For translations using [TTBR0](#), bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR0](#), bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of [TTBCR2.HPD0](#) is 1.

The Effective value of this field is 0 if the value of [TTBCR2.HPD0](#) is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU059, bit [11]

When FEAT_HPDS2 is implemented:

HWU059

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

0b0 For translations using [TTBR0](#), bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR0](#), bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of [TTBCR2.HPD0](#) is 1.

The Effective value of this field is 0 if the value of [TTBCR2.HPD0](#) is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR1](#).

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled if [TTBCR.T2E](#) == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPD0, bit [9]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR0](#).

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled if [TTBCR.T2E](#) ==1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of [TTBCR.T2E](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:0]

Reserved, RES0.

Accessing TTBCR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0010	0b0000	0b011

```

            else
                TTBCR2_NS = R[t];
```

G8.2.166 TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

Configurations

AArch32 System register TTBR0 bits [63:0] are architecturally mapped to AArch64 System register `TTBR0_ELI`[63:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TTBR0 are UNDEFINED.

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

`TTBCR.EAE` determines which TTBR0 format is used:

- `TTBCR.EAE == 0b0`: 32-bit format is used. TTBR0[63:32] are ignored.
- `TTBCR.EAE == 0b1`: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Used in conjunction with the `TTBCR`. When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the `TTBCR`, not in TTBR0.

Attributes

TTBR0 is a 64-bit register.

Field descriptions

When `TTBCR.EAE == 0`:

Bits [63:32]

Reserved, RES0.

TTBR0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [0, 6]

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

———— Note ————

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

0b0	Memory is Non-shareable.
-----	--------------------------

0b1 Memory is Shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.TOSZ as follows:

- If TTBCR.TOSZ is 0 or 1, $x = 5 - \text{TTBCR.TOSZ}$.
- If TTBCR.TOSZ is greater than 1, $x = 14 - \text{TTBCR.TOSZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

CnP

Common not Private. When TTBCR.EAE == 1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

0b0 The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by:

- The value of TTBR0.CnP on those other PEs.
- The value of TTBCR.EAE on those other PEs.

- The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.
- 0b1 The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply:
- The translation table entries are pointed to by this instance of TTBR0.
 - The value of the applicable **TTBCR.EAE** field is 1.
 - The ASID is the same as the current ASID.
 - For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

———— **Note** ————

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see *CONSTRAINED UNPREDICTABLE behaviors due to caching of System register control or data values* on page K1-8391.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

```

G8.2.167 TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

Configurations

AArch32 System register TTBR1 bits [63:0] are architecturally mapped to AArch64 System register `TTBR1_ELI`[63:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TTBR1 are UNDEFINED.

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

`TTBCR.EAE` determines which TTBR1 format is used:

- `TTBCR.EAE == 0b0`: 32-bit format is used. TTBR1[63:32] are ignored.
- `TTBCR.EAE == 0b1`: 64-bit format is used.

Used in conjunction with the `TTBCR`. When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the `TTBCR`, not in TTBR1.

Attributes

TTBR1 is a 64-bit register.

Field descriptions

When `TTBCR.EAE == 0`:

Bits [63:32]

Reserved, RES0.

TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [6, 0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

———— Note —————

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

0b0	Memory is Non-shareable.
-----	--------------------------

0b1 Memory is Shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T1SZ as follows:

- If TTBCR.T1SZ is 0 or 1, $x = 5 - \text{TTBCR.T1SZ}$.
- If TTBCR.T1SZ is greater than 1, $x = 14 - \text{TTBCR.T1SZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

CnP

Common not Private. When TTBCR.EAE == 1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

0b0 The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by:

- The value of TTBR1.CnP on those other PEs.
- The value of TTBCR.EAE on those other PEs.

- The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.
- 0b1 The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply:
- The translation table entries are pointed to by this instance of TTBR1.
 - The value of the applicable [TTBCR.EAE](#) field is 1.
 - The ASID is the same as the current ASID.
 - For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

———— **Note** ————

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of System register control or data values](#) on page K1-8391.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

G8.2.168 VBAR, Vector Base Address Register

The VBAR characteristics are:

Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

Configurations

AArch32 System register VBAR bits [31:0] are architecturally mapped to AArch64 System register [VBAR_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to VBAR are UNDEFINED.

Attributes

VBAR is a 32-bit register.

Field descriptions

Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [4:0]

Reserved, RES0.

Accessing VBAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

```

G8.2.169 VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of [MPIDR](#).

Configurations

AArch32 System register VMPIDR bits [31:0] are architecturally mapped to AArch64 System register [VMPIDR_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to VMPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MPIDR](#).

Attributes

VMPIDR is a 32-bit register.

Field descriptions

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

- 0b0 This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
 - 0b1 This implementation includes the ARMv7 Multiprocessing Extensions functionality.
- From Armv8 this bit is RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

- 0b0 Processor is part of a multiprocessor system.
- 0b1 Processor is part of a uniprocessor system.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.U](#).

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of [affinity](#) consists of logical PEs that are implemented using a multithreading type approach. See the description of [Aff0](#) for more information about affinity levels. The possible values of this bit are:

- 0b0 Performance of PEs at the lowest affinity level is largely independent.
- 0b1 Performance of PEs at the lowest affinity level is very interdependent.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.MT](#).

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff2](#).

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff1](#).

Aff0, bits [7:0]

Affinity level 0. This is the [affinity](#) level that is most significant for determining PE behavior. Higher [affinity](#) levels are increasingly less significant in determining PE behavior. The assigned value of the [MPIDR](#).{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff0](#).

Accessing VMPIDR

Accesses to this register use the following encodings in the System register encoding space:

G8.2.170 VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of [MIDR](#).

Configurations

AArch32 System register VPIDR bits [31:0] are architecturally mapped to AArch64 System register [VPIDR_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to VPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MIDR](#).

Attributes

VPIDR is a 32-bit register.

Field descriptions

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR](#).Implementer.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Variant](#).

Architecture, bits [19:16]

Architecture version. Defined values are:

0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Architecture](#).

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.PartNum](#).

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Revision](#).

```

```
elseif PSTATE.EL == EL3 then  
    return MIDR;
```

G8.2.171 VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

Purpose

The control register for stage 2 of the Non-secure PL1&0 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configurations

AArch32 System register VTCR bits [31:0] are architecturally mapped to AArch64 System register [VTCR_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to VTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTCR is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES1.

Bits [30:29]

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

HWU62

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

0b0 Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

HWU61

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

0b0 Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

HWU60

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

0b0 Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

HWU59

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

0b0 Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [24:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTTBR](#).

0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONstrained UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [VTTBR](#).

0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [VTTBR](#).

0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

Starting level for translation table walks using [VTTBR](#).

0b00	Start at level 2
0b01	Start at level 1

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

S, bit [4]

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the stage 2 T0SZ value is treated as an UNKNOWN value

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [3:0]

The size offset of the memory region addressed by [VTTBR](#). The region size is $2^{(32-T0SZ)}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

———— **Note** ————

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0010	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;

elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T2 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T2 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    VTCR = R[t];
elseif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;

```

```
else  
    VTCR = R[t];
```

G8.2.172 VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

Configurations

AArch32 System register VTTBR bits [63:0] are architecturally mapped to AArch64 System register `VTTBR_EL2`[63:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to VTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTTBR is a 64-bit register.

Field descriptions

Bits [63:56]

Reserved, RES0.

VMID, bits [55:48]

The VMID for the translation table.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of `VTCR.SL0` and `VTCR.T0SZ` as follows:

- If `VTCR.SL0` is 0b00, meaning that lookup starts at level 2, then x is 14 - `VTCR.T0SZ`.
- If `VTCR.SL0` is 0b01, meaning that lookup starts at level 1, then x is 5 - `VTCR.T0SZ`.
- If `VTCR.SL0` is either 0b10 or 0b11 then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

CnP

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

0b0 The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.

0b1 The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

———— Note ————

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are *CONSTRAINED UNPREDICTABLE*, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of System register control or data values on page K1-8391](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing VTTBR

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

```

G8.3 Debug registers

This section lists the Debug System registers in AArch32 state, in alphabetic order.

G8.3.1 DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configurations

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register [DBGAUTHSTATUS_EL1](#)[31:0].

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to External register [DBGAUTHSTATUS_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGAUTHSTATUS are UNDEFINED.

This register is required in all implementations.

Attributes

DBGAUTHSTATUS is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

SNID

Secure Non-Invasive Debug.

This field has the same value as DBGAUTHSTATUS.SID.

Otherwise:

SNID

Secure Non-Invasive Debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR.NS](#) is 1.

0b10 Implemented and disabled. `ExternalSecureNoninvasiveDebugEnabled() == FALSE`.

0b11 Implemented and enabled. `ExternalSecureNoninvasiveDebugEnabled() == TRUE`.

All other values are reserved.

SID, bits [5:4]

Secure Invasive Debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1.

0b10 Implemented and disabled. `ExternalSecureInvasiveDebugEnabled() == FALSE`.

0b11 Implemented and enabled. `ExternalSecureInvasiveDebugEnabled() == TRUE`.

All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

NSNID

Non-secure Non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of **SCR.NS** is 0.

0b11 Implemented and enabled. EL3 is implemented or the Effective value of **SCR.NS** is 1.

All other values are reserved.

Otherwise:

NSNID

Non-secure Non-Invasive Debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of **SCR.NS** is 0

0b10 Implemented and disabled. `ExternalNoninvasiveDebugEnabled() == FALSE`.

0b11 Implemented and enabled. `ExternalNoninvasiveDebugEnabled() == TRUE`.

All other values are reserved.

NSID, bits [1:0]

Non-secure Invasive Debug.

0b00 Not implemented. EL3 is not implemented or the Effective value of **SCR_EL3.NS** is 0.

0b10 Implemented and disabled. `ExternalInvasiveDebugEnabled() == FALSE`.

0b11 Implemented and enabled. `ExternalInvasiveDebugEnabled() == TRUE`.

All other values are reserved.

Accessing DBGAUTHSTATUS

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b1110	0b110

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then

```

G8.3.2 DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, [DBGBVR<n>](#) can be associated with a Breakpoint Extended Value Register [DBGBXVR<n>](#) for VMID matching.

Configurations

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGBCR<n>_EL1](#)[31:0].

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to External register [DBGBCR<n>_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGBCR<n> are UNDEFINED.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBCR<n> is a 32-bit register.

Field descriptions

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

- 0b0000 Unlinked instruction address match. [DBGBVR<n>](#) is the address of an instruction.
- 0b0001 As 0b0000 with linking enabled.
- 0b0010 Unlinked Context ID match. When [FEAT_VHE](#) is implemented, EL2 is using AArch64, and the Effective value of [HCR_EL2.E2H](#) is 1, if either the PE is executing at EL0 with [HCR_EL2.TGE](#) set to 1 or the PE is executing at EL2, then [DBGBVR<n>](#).ContextID must match the [CONTEXTIDR_EL2](#) value. Otherwise, [DBGBVR<n>](#).ContextID must match the [CONTEXTIDR](#) value.
- 0b0011 As 0b0010 with linking enabled.
- 0b0100 Unlinked instruction address mismatch. [DBGBVR<n>](#) is the address of an instruction to be stepped.
- 0b0101 As 0b0100 with linking enabled.
- 0b0110 Unlinked [CONTEXTIDR_EL1](#) match. [DBGBVR<n>](#).ContextID is a Context ID compared against [CONTEXTIDR](#).
- 0b0111 As 0b0110 with linking enabled.
- 0b1000 Unlinked VMID match. [DBGBXVR<n>](#).VMID is a VMID compared against [VTTBR](#).VMID.
- 0b1001 As 0b1000 with linking enabled.

0b1010	Unlinked VMID and Context ID match. DBGBVR<n>.ContextID is a Context ID compared against CONTEXTIDR , and DBGBXVR<n>.VMID is a VMID compared against VTTBR.VMID .
0b1011	As 0b1010 with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBXVR<n>.ContextID2 is a Context ID compared against CONTEXTIDR_EL2 .
0b1101	As 0b1100 with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>.ContextID is compared against CONTEXTIDR , and DBGBXVR<n>.ContextID2 is compared against CONTEXTIDR_EL2 .
0b1111	As 0b1110 with linking enabled.

For more information on Breakpoints and their constraints, see [Breakpoint exceptions on page G2-6170](#) and [Reserved DBGBCR<n>.BT values on page G2-6190](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of [DBGBCR<n>.E](#) is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-6179](#) and [Reserved DBGBCR<n>.{SSC, HMC, PMC} values on page G2-6191](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-6179](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>	Use for T32 instructions
0b1100	DBGBVR<n>+2	Use for T32 instructions
0b1111	DBGBVR<n>	Use for A32 instructions

All other values are reserved. For more information, see [Reserved DBGBCR<n>.BAS values on page G2-6191](#).

For more information on using the BAS field in Address Match breakpoints, see [Using the BAS field in Address Match breakpoints on page G2-6183](#).

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Step instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>	Use for T32 instructions
0b1100	DBGBVR<n>+2	Use for T32 instructions
0b1111	DBGBVR<n>	Use for A32 instructions

All other values are reserved. For more information, see [Reserved DBGBCR<n>.BAS values on page G2-6191](#).

For more information on using the BAS field in address mismatch breakpoints, see [Using the BAS field in Address Match breakpoints on page G2-6183](#).

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page G2-6179](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint [DBGBVR<n>](#). Possible values are:

0b0 Breakpoint disabled.
0b1 Breakpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	n[3:0]	0b101

```

G8.3.3 DBGBVR<n>, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n> characteristics are:

Purpose

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint n together with control register [DBGBCR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, DBGBVR<n> can be associated with a Breakpoint Extended Value Register [DBGXVR<n>](#) for VMID matching.

Configurations

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGBVR<n>_EL1](#)[31:0].

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to External register [DBGBVR<n>_EL1](#)[31:0].

————— Note —————

Writes to DBGBVR<n> do not modify [DBGBVR<n>_EL1](#)[63:32].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGBVR<n> are UNDEFINED.

How this register is interpreted depends on the value of [DBGBCR<n>](#).BT.

- When [DBGBCR<n>](#).BT is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>](#).BT is 0bxx1x, this register holds a Context ID.

For other values of [DBGBCR<n>](#).BT, this register is RES0.

Some breakpoints might not support Context ID comparison. For more information, see the description of the [DBGDIDR.CTX_CMPs](#) field.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBVR<n> is a 32-bit register.

Field descriptions

When [DBGBCR<n>](#).BT == 0b0x0x:

VA[31:2], bits [31:2]

Bits[31:2] of the address value for comparison.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When $DBGBCR\langle n \rangle.BT == 0b001x$:

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against `CONTEXTIDR_EL2` when all of the following are true:

- `FEAT_VHE` is implemented or `FEAT_Debugv8p2` is implemented.
- `HCR_EL2`.{E2H, TGE} is {1,1}.
- The PE is executing at EL0.
- EL2 is using AArch64 and is enabled in the current Security state.

Otherwise, the value is compared against `CONTEXTIDR`.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR\langle n \rangle.BT == 0b101x$ and EL2 is implemented:

ContextID, bits [31:0]

Context ID value for comparison against `CONTEXTIDR`.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR\langle n \rangle.BT == 0bx11x$, EL2 is implemented and (`FEAT_VHE` is implemented or `FEAT_Debugv8p2` is implemented):

ContextID, bits [31:0]

Context ID value for comparison against `CONTEXTIDR`.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing $DBGBVR\langle n \rangle$

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	n[3:0]	0b100

```

G8.3.4 DBGBXVR<n>, Debug Breakpoint Extended Value Registers, n = 0 - 15

The DBGBXVR<n> characteristics are:

Purpose

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register [DBGBCR<n>](#) and a value register [DBGBVR<n>](#), where EL2 is implemented and breakpoint n supports Context matching.

Configurations

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGBVR<n>_EL1](#)[63:32].

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to External register [DBGBVR<n>_EL1](#)[63:32].

———— Note ————

Writes to DBGBXVR<n> do not modify [DBGBVR<n>_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGBXVR<n> are UNDEFINED.

How this register is interpreted depends on the value of [DBGBCR<n>.BT](#).

- When [DBGBCR<n>.BT](#) is 0b10xx, this register holds a VMID.
- When [DBGBCR<n>.BT](#) is 0b11xx, this register holds a Context ID.

For other values of [DBGBCR<n>.BT](#), this register is RES0.

Accesses to this register are UNDEFINED in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.
- EL2 is not implemented.

For more information, see the description of the [DBGDIDR.CTX_CMPs](#) field.

Attributes

DBGBXVR<n> is a 32-bit register.

Field descriptions

When [DBGBCR<n>.BT](#) == 0b10xx and EL2 is implemented:

Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When [FEAT_VMID16](#) is implemented and [VTCR_EL2.VS](#) == 1:

VMID[15:8]

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [7:0]

VMID value for comparison. The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCCR_EL2.VS](#) is 0.
- [FEAT_VMID16](#) is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR\langle n \rangle.BT == 0b11xx$ and EL2 is implemented:

ContextID2, bits [31:0]

When $FEAT_VHE$ is implemented or $FEAT_Debug\delta p2$ is implemented:

ContextID2

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

G8.3.5 DBGCLAIMCLR, Debug CLAIM Tag Clear register

The DBGCLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0. The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET](#) register.

Configurations

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMCLR_EL1](#)[31:0].

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to External register [DBGCLAIMCLR_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGCLAIMCLR are UNDEFINED.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing DBGCLAIMCLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0111	0b1001	0b110

```

G8.3.6 DBGCLAIMSET, Debug CLAIM Tag Set register

The DBGCLAIMSET characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR](#) register.

Configurations

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMSET_EL1](#)[31:0].

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to External register [DBGCLAIMSET_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGCLAIMSET are UNDEFINED.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

G8.3.7 DBGDCCINT, DCC Interrupt Enable Register

The DBGDCCINT characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

Configurations

AArch32 System register DBGDCCINT bits [31:0] are architecturally mapped to AArch64 System register `MDCCINT_EL1`[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDCCINT are UNDEFINED.

Attributes

DBGDCCINT is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

0b0 No interrupt request generated by DTRRX.

0b1 Interrupt request will be generated on `RXfull == 1`.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

0b0 No interrupt request generated by DTRTX.

0b1 Interrupt request will be generated on `TXfull == 0`.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [28:0]

Reserved, RES0.

Accessing DBGDCCINT

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.3.8 DBGDEVID, Debug Device ID register 0

The DBGDEVID characteristics are:

Purpose

Adds to the information given by the [DBGDIDR](#) by describing other features of the debug implementation.

Configurations

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDEVID are UNDEFINED.

This register is required in all implementations.

Attributes

DBGDEVID is a 32-bit register.

Field descriptions

CIDMask, bits [31:28]

Indicates the level of support for the Context ID matching breakpoint masking capability. Defined values are:

0b0000 Context ID masking is not implemented.

0b0001 Context ID masking is implemented.

All other values are reserved. The value of this for Armv8 is 0b0000.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Permitted values for this field are:

0b0000 None supported.

0b0001 Support for External Debug Auxiliary Control Register, [EDACR](#).

All other values are reserved.

DoubleLock, bits [23:20]

OS Double Lock implemented. Defined values are:

0b0000 OS Double Lock is not implemented. [DBGOSDLR](#) is RAZ/WI.

0b0001 OS Double Lock is implemented. [DBGOSDLR](#) is RW.

[FEAT_DoubleLock](#) implements the functionality identified by the value 0b0001.

All other values are reserved.

VirtExtns, bits [19:16]

Indicates whether EL2 is implemented. Defined values are:

0b0000 EL2 is not implemented.

0b0001 EL2 is implemented.

All other values are reserved.

VectorCatch, bits [15:12]

Defines the form of Vector Catch exception implemented. Defined values are:

- 0b0000 Address matching Vector Catch exception implemented.
- 0b0001 Exception matching Vector Catch exception implemented.

All other values are reserved.

BPAAddrMask, bits [11:8]

Indicates the level of support for the instruction address matching breakpoint masking capability. Defined values are:

- 0b0000 Breakpoint address masking might be implemented. If not implemented, [DBGBCR<n>](#)[28:24] is RAZ/WI.
- 0b0001 Breakpoint address masking is implemented.
- 0b1111 Breakpoint address masking is not implemented. [DBGBCR<n>](#)[28:24] is RES0.

All other values are reserved. The value of this for Armv8 is 0b1111.

WPAAddrMask, bits [7:4]

Indicates the level of support for the data address matching watchpoint masking capability. Defined values are:

- 0b0000 Watchpoint address masking might be implemented. If not implemented, [DBGWCR<n>](#).MASK (Address mask) is RAZ/WI.
- 0b0001 Watchpoint address masking is implemented.
- 0b1111 Watchpoint address masking is not implemented. [DBGWCR<n>](#).MASK (Address mask) is RES0.

All other values are reserved. The value of this for Armv8 is 0b0001.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

- 0b0000 PC Sample-based Profiling Extension is not implemented in the external debug registers space.
- 0b0010 Only [EDPCSR](#) and [EDCIDSR](#) are implemented. This option is only permitted if EL3 and EL2 are not implemented.
- 0b0011 [EDPCSR](#), [EDCIDSR](#), and [EDVIDSR](#) are implemented.

All other values are reserved.

When [FEAT_PCSRv8p2](#) is implemented, the only permitted value is 0b0000.

Note

[FEAT_PCSRv8p2](#) implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID](#).PCSample.

Accessing DBGDEVID

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

```

G8.3.9 DBGDEVID1, Debug Device ID register 1

The DBGDEVID1 characteristics are:

Purpose

Adds to the information given by the [DBGDIDR](#) by describing other features of the debug implementation.

Configurations

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDEVID1 are UNDEFINED.

This register is required in all implementations.

Attributes

DBGDEVID1 is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of [EDPCSR](#). Permitted values of this field in Armv8 are:

0b0000 [EDPCSR](#) is not implemented.

0b0010 [EDPCSR](#) implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state.

When [FEAT_PCSRv8p2](#) is implemented, the only permitted value is 0b0000.

————— Note —————

[FEAT_PCSRv8p2](#) implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID.PCSample](#).

Accessing DBGDEVID1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

```

G8.3.10 DBGDEVID2, Debug Device ID register 2

The DBGDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Configurations

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDEVID2 are UNDEFINED.

Attributes

DBGDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing DBGDEVID2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

        return DBGDEVID2;
```

G8.3.11 DBGDIDR, Debug ID Register

The DBGDIDR characteristics are:

Purpose

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

Configurations

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDIDR are UNDEFINED.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDIDR is a 32-bit register.

Field descriptions

WRPs, bits [31:28]

The number of watchpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented watchpoints, to 0b1111 for 16 implemented watchpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as [ID_AA64DFR0_EL1.WRPs](#).

BRPs, bits [27:24]

The number of breakpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented breakpoint, to 0b1111 for 16 implemented breakpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as [ID_AA64DFR0_EL1.BRPs](#).

CTX_CMPs, bits [23:20]

The number of breakpoints that can be used for Context matching, minus 1.

Permitted values of this field are from 0b0000 for 1 Context matching breakpoint, to 0b1111 for 16 Context matching breakpoints.

The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.

If AArch64 is implemented, this field has the same value as [ID_AA64DFR0_EL1.CTX_CMPs](#).

Version, bits [19:16]

The Debug architecture version. Defined values are:

0b0001 Armv6, v6 Debug architecture.

0b0010 Armv6, v6.1 Debug architecture.

0b0011 Armv7, v7 Debug architecture, with baseline CP14 registers implemented.

0b0100 Armv7, v7 Debug architecture, with all CP14 registers implemented.
 0b0101 Armv7, v7.1 Debug architecture.
 0b0110 Armv8, v8 Debug architecture.
 0b0111 Armv8.1, v8 Debug architecture, with Virtualization Host Extensions.
 0b1000 Armv8.2, v8.2 Debug architecture.
 0b1001 Armv8.4, v8.4 Debug architecture.

All other values are reserved.

In any Armv8 implementation, the values 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted.

- If FEAT_VHE is not implemented, the only permitted value is 0b0110.
- In an Armv8.0 implementation, the value 0b1000 or higher is not permitted.

Bit [15]

Reserved, RES1.

nSUHD_imp, bit [14]

In Armv7-A, was Secure User Halting Debug not implemented.

The value of this bit must match the value of the SE_imp bit.

Bit [13]

Reserved, RES0.

SE_imp, bit [12]

EL3 implemented. The meanings of the values of this bit are:

0b0 EL3 not implemented.
 0b1 EL3 implemented.

The value of this bit must match the value of the nSUHD_imp bit.

Bits [11:0]

Reserved, RES0.

Accessing DBGDIDR

Arm deprecates any access to this register from EL0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.3.12 DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

Configurations

AArch32 System register DBGDRAR bits [63:0] are architecturally mapped to AArch64 System register `MDRAR_EL1`[63:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDRAR are UNDEFINED.

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDRAR is a 64-bit register.

Field descriptions

Bits [63:48]

Reserved, RES0.

ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

If `DBGDRAR.Valid == 0b00`, then this field is UNKNOWN.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

0b00 ROM Table address is not valid. Software must ignore ROMADDR.

0b11 ROM Table address is valid.

Other values are reserved.

Arm recommends implementations set this field to zero.

Accessing DBGDRAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0000	0b000

```

G8.3.13 DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

Purpose

In earlier versions of the Arm Architecture, this register defines the offset from the base address defined in [DBGDRAR](#) of the physical base address of the debug registers for the PE. Armv8 deprecates any use of this register.

Configurations

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDSAR are UNDEFINED.

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDSAR is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

Bits [1:0]

Reserved, RAZ.

This field indicates whether the debug self address offset is valid. For ARMv8, this field is always 0b00, the offset is not valid.

Accessing DBGDSAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.3.14 DBGDSCRext, Debug Status and Control Register, External View

The DBGDSCRext characteristics are:

Purpose

Main control register for the debug implementation.

Configurations

AArch32 System register DBGDSCRext bits [31:0] are architecturally mapped to AArch64 System register [MDSCR_EL1](#)[31:0].

AArch32 System register DBGDSCRext bit [15] is architecturally mapped to AArch32 System register [DBGDSCRint](#)[15].

AArch32 System register DBGDSCRext bit [12] is architecturally mapped to AArch32 System register [DBGDSCRint](#)[12].

AArch32 System register DBGDSCRext bits [5:2] are architecturally mapped to AArch32 System register [DBGDSCRint](#)[5:2].

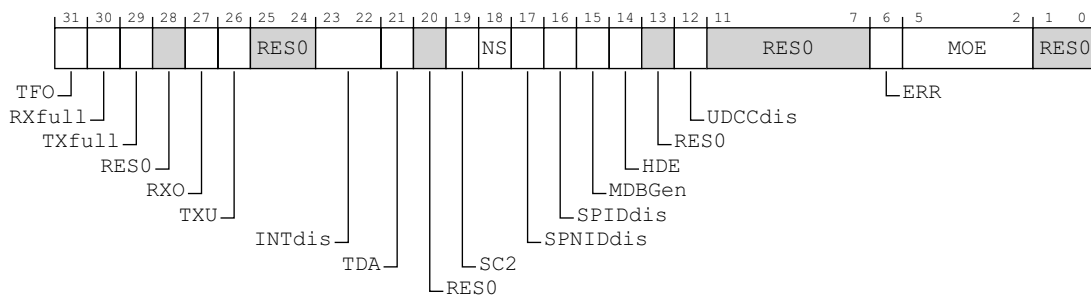

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDSCRext are UNDEFINED.

This register is required in all implementations.

Attributes

DBGDSCRext is a 32-bit register.

Field descriptions

TFO, bit [31]

When *FEAT_TRF* is implemented:

TFO

Trace Filter override. Used for save/restore of [EDSCR.TFO](#).

When the OS Lock is unlocked, [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When the OS Lock is locked, [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.TFO](#). Reads and writes of this bit are indirect accesses to [EDSCR.TFO](#).

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is RW.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is RO.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Used for save/restore of [EDSCR.RXfull](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.RXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXfull](#).

Arm deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRRX full status.

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is RW.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is RO.

TXfull, bit [29]

DTRTX full. Used for save/restore of [EDSCR.TXfull](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.TXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXfull](#).

Arm deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRTX full status.

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is RW.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is RO.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of [EDSCR.RXO](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.RXO](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXO](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is RW.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is RO.

TXU, bit [26]

Used for save/restore of [EDSCR.TXU](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.TXU](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXU](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is RW.

- When `DBGOSLSR.OSLK == 0`, access to this field is RO.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of `EDSCR.INTdis`.

When `DBGOSLSR.OSLK == 0`, this field is RO, and software must treat it as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this field is RW and holds the value of `EDSCR.INTdis`. Reads and writes of this field are indirect accesses to `EDSCR.INTdis`.

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == 1`, access to this field is RW.
- When `DBGOSLSR.OSLK == 0`, access to this field is RO.

TDA, bit [21]

Used for save/restore of `EDSCR.TDA`.

When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.TDA`. Reads and writes of this bit are indirect accesses to `EDSCR.TDA`.

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == 1`, access to this field is RW.
- When `DBGOSLSR.OSLK == 0`, access to this field is RO.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:

SC2

Used for save/restore of `EDSCR.SC2`.

When `DBGOSLSR.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `DBGOSLSR.OSLK == 1`, this bit holds the value of `EDSCR.SC2`. Reads and writes of this bit are indirect accesses to `EDSCR.SC2`.

Accessing this field has the following behavior:

- When `DBGOSLSR.OSLK == 1`, access to this field is RW.
- When `DBGOSLSR.OSLK == 0`, access to this field is RO.

Otherwise:

Reserved, RES0.

NS, bit [18]

Non-secure status.

Arm deprecates use of this field.

0b0 Secure state.

0b1 Non-secure state.

Access to this field is RO.

SPNIDdis, bit [17]

When EL3 is implemented:

SPNIDdis

Secure privileged profiling disabled status bit.

0b0 Profiling allowed in Secure privileged modes.

0b1 Profiling prohibited in Secure privileged modes.

This field reads as 0 if any of the following applies, and reads as 1 otherwise:

- FEAT_Debugv8p2 is not implemented and ExternalSecureNonInvasiveDebugEnabled() returns TRUE.
- EL3 is using AArch32 and the value of SDCR.SPME is 1.
- EL3 is using AArch64 and the value of MDCR_EL3.SPME is 1.

Arm deprecates use of this field.

Access to this field is RO.

Otherwise:

Reserved, RES0.

SPIDdis, bit [16]

When EL3 is implemented:

SPIDdis

Secure privileged AArch32 invasive self-hosted debug disabled status bit. The value of this bit depends on the value of SDCR.SPD and the pseudocode function AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled().

0b0 Self-hosted debug enabled in Secure privileged AArch32 modes.

0b1 Self-hosted debug disabled in Secure privileged AArch32 modes.

This bit reads as 1 if any of the following is true and reads as 0 otherwise:

- EL3 is using AArch32 and SDCR.SPD has the value 0b10.
- EL3 is using AArch64 and MDCR_EL3.SPD32 has the value 0b10.
- EL3 is using AArch32, SDCR.SPD has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.
- EL3 is using AArch64, MDCR_EL3.SPD32 has the value 0b00, and AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled() returns FALSE.

Arm deprecates use of this field.

Access to this field is RO.

Otherwise:

Reserved, RES0.

MDBGGen, bit [15]

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

0b0 Breakpoint, Watchpoint, and Vector Catch exceptions disabled.

0b1 Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

HDE, bit [14]

Used for save/restore of [EDSCR.HDE](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.HDE](#). Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is RW.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is RO.

Bit [13]

Reserved, RES0.

UDCCdis, bit [12]

Traps EL0 accesses to the DCC registers to Undefined mode.

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 accesses to the [DBGDSCRint](#), [DBGDTRRXint](#), [DBGDTRTXint](#), [DBGDIDR](#), [DBGDSAR](#), and [DBGDRAR](#) are trapped to Undefined mode.

———— Note —————

All accesses to these registers are trapped, including LDC and STC accesses to [DBGDTRTXint](#) and [DBGDTRRXint](#), and MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#).

Traps of EL0 accesses to the [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of [EDSCR.ERR](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.ERR](#). Reads and writes of this bit are indirect accesses to [EDSCR.ERR](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is RW.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is RO.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

0b0001 Breakpoint.

0b0011 Software breakpoint (BKPT) instruction.

0b0101 Vector catch.

0b1010 Watchpoint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGDSCRext

Individual fields within this register might have restricted accessibility when the OS Lock is unlocked, [DBGOSLSR.OSLK](#) = 0. See the field descriptions for more detail.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0010	0b010

```

```

G8.3.15 DBGDSCRint, Debug Status and Control Register, Internal View

The DBGDSCRint characteristics are:

Purpose

Main control register for the debug implementation. This is an internal, read-only view.

Configurations

AArch32 System register DBGDSCRint bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

AArch32 System register DBGDSCRint bit [15] is architecturally mapped to AArch64 System register MDSCR_EL1[15].

AArch32 System register DBGDSCRint bit [12] is architecturally mapped to AArch64 System register MDSCR_EL1[12].

AArch32 System register DBGDSCRint bits [5:2] are architecturally mapped to AArch64 System register MDSCR_EL1[5:2].

AArch32 System register DBGDSCRint bit [15] is architecturally mapped to AArch32 System register DBGDSCRExt[15].

AArch32 System register DBGDSCRint bit [12] is architecturally mapped to AArch32 System register DBGDSCRExt[12].

AArch32 System register DBGDSCRint bits [5:2] are architecturally mapped to AArch32 System register DBGDSCRExt[5:2].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDSCRint are UNDEFINED.

This register is required in all implementations.

DBGDSCRint.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} are UNKNOWN when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither UNPREDICTABLE nor return UNKNOWN values, it is permissible for an implementation to return the values of DBGDSCRExt.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)

Attributes

DBGDSCRint is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the [EDSCR](#).

TXfull, bit [29]

DTRTX full. Read-only view of the equivalent bit in the [EDSCR](#).

Bits [28:19]

Reserved, RES0.

NS, bit [18]

Non-secure status.

Read-only view of the equivalent bit in the [DBGDSCRExt](#). Arm deprecates use of this field.

SPNIDdis, bit [17]

Secure privileged non-invasive debug disable.

Read-only view of the equivalent bit in the [DBGDSCRExt](#). Arm deprecates use of this field.

SPIDdis, bit [16]

Secure privileged invasive debug disable.

Read-only view of the equivalent bit in the [DBGDSCRExt](#). Arm deprecates use of this field.

MDBGGen, bit [15]

Monitor debug events enable.

Read-only view of the equivalent bit in the [DBGDSCRExt](#).

Bits [14:13]

Reserved, RES0.

UDCCdis, bit [12]

User mode access to Debug Communications Channel disable.

Read-only view of the equivalent bit in the [DBGDSCRExt](#). Arm deprecates use of this field.

Bits [11:6]

Reserved, RES0.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

- 0b0001 Breakpoint
- 0b0011 Software breakpoint (BKPT) instruction
- 0b0101 Vector catch
- 0b1010 Watchpoint

Read-only view of the equivalent bit in the [DBGDSCRExt](#).

Bits [1:0]

Reserved, RES0.

Accessing DBGDSCRint

G8.3.16 DBGDTRRText, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRText characteristics are:

Purpose

Used for save/restore of [DBGDTRRXint](#). It is a component of the Debug Communications Channel.

Configurations

AArch32 System register DBGDTRRText bits [31:0] are architecturally mapped to AArch64 System register [OSDTRRX_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDTRRText are UNDEFINED.

Attributes

DBGDTRRText is a 32-bit register.

Field descriptions

Bits [31:0]

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRText

Arm deprecates reads and writes of DBGDTRRText through the System register interface when the OS Lock is unlocked, [DBGOSLSR.OSLK](#) == 0.

Accesses to this register use the following encodings in the System register encoding space:

G8.3.17 DBGDTRRXint, Debug Data Transfer Register, Receive

The DBGDTRRXint characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

Configurations

AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRRX_EL0](#)[31:0].

AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to External register [DBGDTRRX_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDTRRXint are UNDEFINED.

Attributes

DBGDTRRXint is a 32-bit register.

Field descriptions

Bits [31:0]

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRXint

Data can be stored to memory from this register using [STC](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0101	0b000

G8.3.18 DBGDTRTXext, Debug OS Lock Data Transfer Register, Transmit

The DBGDTRTXext characteristics are:

Purpose

Used for save/restore of [DBGDTRTXint](#). It is a component of the Debug Communication Channel.

Configurations

AArch32 System register DBGDTRTXext bits [31:0] are architecturally mapped to AArch64 System register [OSDTRTX_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDTRTXext are UNDEFINED.

Attributes

DBGDTRTXext is a 32-bit register.

Field descriptions

Bits [31:0]

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTXext

Arm deprecates reads and writes of DBGDTRTXext through the System register interface when the OS Lock is unlocked, [DBGOSLSR.OSLK](#) == 0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.3.19 DBGDTRTXint, Debug Data Transfer Register, Transmit

The DBGDTRTXint characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

Configurations

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRTX_EL0](#)[31:0].

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to External register [DBGDTRTX_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGDTRTXint are UNDEFINED.

Attributes

DBGDTRTXint is a 32-bit register.

Field descriptions

Bits [31:0]

Return DTRTX.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTXint

Data can be loaded from memory into this register using [LDC \(immediate\)](#) and [LDC \(literal\)](#).

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	0b0101	0b000

G8.3.20 DBGOSDLR, Debug OS Double Lock Register

The DBGOSDLR characteristics are:

Purpose

Locks out the external debug interface.

Configurations

AArch32 System register DBGOSDLR bits [31:0] are architecturally mapped to AArch64 System register [OSDLR_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGOSDLR are UNDEFINED.

Attributes

DBGOSDLR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

DLK, bit [0]

When FEAT_DoubleLock is implemented:

DLK

OS Double Lock control bit.

0b0 OS Double Lock unlocked.

0b1 OS Double Lock locked, if [DBGPRCR.CORENPDRQ](#) (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

Accessing DBGOSDLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.3.21 DBGOSECCR, Debug OS Lock Exception Catch Control Register

The DBGOSECCR characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of [EDECCR](#) that are otherwise invisible to software, so it can save/restore the contents of [EDECCR](#) over powerdown on behalf of the external debugger.

Configurations

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to AArch64 System register [OSECCR_EL1](#)[31:0].

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to External register [EDECCR](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGOSECCR are UNDEFINED.

If [DBGOSLSR.OSLK](#) == 0 then DBGOSECCR returns an UNKNOWN value on reads and ignores writes.

Attributes

DBGOSECCR is a 32-bit register.

Field descriptions

When [DBGOSLSR.OSLK](#) == 1:

EDECCR, bits [31:0]

Used for save/restore to [EDECCR](#) over powerdown.

Reads or writes to this field are indirect accesses to [EDECCR](#).

Accessing DBGOSECCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

```

G8.3.22 DBGOSLAR, Debug OS Lock Access Register

The DBGOSLAR characteristics are:

Purpose

Provides a lock for the debug registers. The OS Lock also disables some debug exceptions and debug events.

Configurations

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DBGOSLAR are UNDEFINED.

The OS Lock can also be locked or unlocked using the AArch64 System register [OSLAR_EL1](#) and External register [OSLAR_EL1](#).

Attributes

DBGOSLAR is a 32-bit register.

Field descriptions

OSLA, bits [31:0]

OS Lock Access. Writing the value 0xC5ACCE55 to the DBGOSLAR sets the OS Lock to 1. Writing any other value sets the OS Lock to 0.

Use [DBGOSLSR.OSLK](#) to check the current status of the lock.

Accessing DBGOSLAR

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0000	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;

elseif PSTATE.EL == EL3 then
    DBGOSLAR = R[t];
```

G8.3.23 DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

Purpose

Provides status information for the OS Lock.

Configurations

AArch32 System register DBGOSLSR bits [31:0] are architecturally mapped to AArch64 System register `OSLSR_EL1`[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGOSLSR are UNDEFINED.

The OS Lock status is also visible in the external debug interface through EDPRSR.

Attributes

DBGOSLSR is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

OSLM, bits [3, 0]

OS Lock model implemented. Identifies the form of OS save and restore mechanism implemented.

0b00 OS Lock not implemented.

0b10 OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is DBGOSLSR[3].
- OSLM[0] is DBGOSLSR[0].

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]

OS Lock Status. The possible values are:

0b0 OS Lock unlocked.

0b1 OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Accessing DBGOSLSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0001	0b0001	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority
when SDD == '1'" && !ELUsingAArch32(EL3) && MDCR_EL3.TDOSA == '1' then
        UNDEFINED;
    elseif EL2Enabled() && !ELUsingAArch32(EL2) && MDCR_EL2.<TDE,TDOSA> != '00' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x05);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HDCR.<TDE,TDOSA> != '00' then
        AArch32.TakeHypTrapException(0x05);
    elseif HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TDOSA == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.AArch32SystemAccessTrap(EL3, 0x05);
        else
            return DBGOSLSR;
elseif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority
when SDD == '1'" && !ELUsingAArch32(EL3) && MDCR_EL3.TDOSA == '1' then
        UNDEFINED;
    elseif HaveEL(EL3) && !ELUsingAArch32(EL3) && MDCR_EL3.TDOSA == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.AArch32SystemAccessTrap(EL3, 0x05);
        else
            return DBGOSLSR;
elseif PSTATE.EL == EL3 then
    return DBGOSLSR;

```

G8.3.24 DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

Purpose

Controls behavior of the PE on powerdown request.

Configurations

AArch32 System register DBGPRCR bits [31:0] are architecturally mapped to AArch64 System register [DBGPRCR_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGPRCR are UNDEFINED.

Bit [0] of this register is mapped to [EDPRCR.CORENPDRQ](#), bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

Attributes

DBGPRCR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

CORENPDRQ, bit [0]

When FEAT_DoPD is implemented:

CORENPDRQ

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.

0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see [Core power domain power states on page H6-7440](#).

———— Note —————

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Otherwise:

CORENPDRQ

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.

0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see [Core power domain power states on page H6-7440](#).

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

Accessing DBGPRCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.3.25 DBGVCR, Debug Vector Catch Register

The DBGVCR characteristics are:

Purpose

Controls Vector Catch debug events.

Configurations

AArch32 System register DBGVCR bits [31:0] are architecturally mapped to AArch64 System register [DBGVCR32_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGVCR are UNDEFINED.

This register is required in all implementations.

Attributes

DBGVCR is a 32-bit register.

Field descriptions

When EL3 is implemented and EL3 is using AArch32:

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is $0x1C$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is $0x18$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort vector catch enable in Non-secure state.

The exception vector offset is $0x10$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is $0x0C$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is $0x08$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is $0x04$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:16]

Reserved, RES0.

MF, bit [15]

FIQ vector catch enable in Monitor mode.

The exception vector offset is $0x1C$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MI, bit [14]

IRQ vector catch enable in Monitor mode.

The exception vector offset is $0x18$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

MD, bit [12]

Data Abort vector catch enable in Monitor mode.

The exception vector offset is $0x10$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MP, bit [11]

Prefetch Abort vector catch enable in Monitor mode.

The exception vector offset is $0x0C$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MS, bit [10]

Secure Monitor Call (SMC) vector catch enable in Monitor mode.

The exception vector offset is $0x08$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is $0x1C$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is $0x18$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.

The exception vector offset is $0x10$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is $0x0C$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is $0x08$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is $0x04$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When EL3 is implemented and EL3 is using AArch64:

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is $0x1C$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is $0x18$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort vector catch enable in Non-secure state.

The exception vector offset is $0x10$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is $0x0C$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is $0x08$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is $0x04$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is 0x1C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.

The exception vector offset is 0x10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When EL3 is not implemented:

Bits [31:8]

Reserved, RES0.

F, bit [7]

FIQ vector catch enable.

The exception vector offset is 0x1C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]

IRQ vector catch enable.

The exception vector offset is 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

D, bit [4]

Data Abort vector catch enable.

The exception vector offset is 0x10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]

Prefetch Abort vector catch enable.

The exception vector offset is 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

G8.3.26 DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>](#).

Configurations

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGWCR<n>_EL1](#)[31:0].

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to External register [DBGWCR<n>_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DBGWCR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWCR<n> is a 32-bit register.

Field descriptions

When the E field is zero, all the other fields in the register are ignored.

Bits [31:29]

Reserved, RES0.

MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

0b00000 No mask.

0b00001 Reserved.

0b00010 Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of [DBGWCRn_EL1](#).
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

- 0b0 Unlinked data address match.
- 0b1 Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint *n* is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page G2-6197](#), and [Reserved DBGWCR<n>.{SSC, HMC, PAC} values on page G2-6204](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint *n* is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page G2-6197](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>](#) is being watched.

BAS	Description
0bxxxxxx1	Match byte at DBGWVR<n>
0bxxxxxx1x	Match byte at DBGWVR<n>+1
0bxxxxxx1xx	Match byte at DBGWVR<n>+2
0bxxxxxx1xxx	Match byte at DBGWVR<n>+3

In cases where [DBGWVR<n>](#) addresses a double-word:

BAS	Description, if DBGWVR<n>[2] == 0
0bxxx1xxxx	Match byte at DBGWVR<n>+4

BAS	Description, if <code>DBGWVR<n>[2] == 0</code>
0bxx1xxxxx	Match byte at <code>DBGWVR<n>+5</code>
0bx1xxxxxx	Match byte at <code>DBGWVR<n>+6</code>
0b1xxxxxxx	Match byte at <code>DBGWVR<n>+7</code>

If `DBGWVR<n>[2] == 1`, only `BAS[3:0]` are used and `BAS[7:4]` are ignored. Arm deprecates setting `DBGWVR<n>[2] == 1`.

The valid values for `BAS` are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See [Reserved `DBGWCR<n>.BAS` values on page G2-6205](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- 0b01 Match instructions that load from a watchpointed address.
- 0b10 Match instructions that store to a watchpointed address.
- 0b11 Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint `n` is generated. This field must be interpreted along with the `SSC` and `HMC` fields.

For more information on the operation of the `SSC`, `HMC`, and `PAC` fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page G2-6197](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint `n`. Possible values are:

- 0b0 Watchpoint disabled.
- 0b1 Watchpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing `DBGWCR<n>`

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1110	0b000	0b0000	n[3:0]	0b111

    else
        DBGWVR[UInt(CRm<3:0>)] = R[t];
```

G8.3.29 DLR, Debug Link Register

The DLR characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configurations

AArch32 System register DLR bits [31:0] are architecturally mapped to AArch64 System register [DLR_ELO](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DLR are UNDEFINED.

Attributes

DLR is a 32-bit register.

Field descriptions

Bits [31:0]

Restart address.

Accessing DLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b001

```

if !Halted() then
    UNDEFINED;
else
    return DLR;
  
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b001

```

if !Halted() then
    UNDEFINED;
else
    DLR = R[t];
  
```

G8.3.30 DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configurations

AArch32 System register DSPSR bits [31:0] are architecturally mapped to AArch64 System register `DSPSR_ELO`[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to DSPSR are UNDEFINED.

Attributes

DSPSR is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on entering Debug state, and copied to PSTATE.Q on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on entering Debug state, and copied to PSTATE.IT on exiting Debug state.

DSPSR.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is DSPSR[26:25].
- IT[7:2] is DSPSR[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on entering Debug state, and copied to PSTATE.GE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on entering Debug state, and copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR.E is RES0. If the implementation does not support little-endian operation, DSPSR.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on entering Debug state, and copied to PSTATE.T on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on entering Debug state, and copied to PSTATE.M[4:0] on exiting Debug state.

0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If DSPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in *Illegal return events from AArch32 state* on page G1-6066.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DSPSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    return DSPSR;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    DSPSR = R[t];
```

G8.3.31 HDCR, Hyp Debug Control Register

The HDCR characteristics are:

Purpose

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

Configurations

AArch32 System register HDCR bits [31:0] are architecturally mapped to AArch64 System register [MDCR_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to HDCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3, and other than for a direct read of the register, the PE behaves as if $\text{HDCR.HPMN} == \text{PMCR.N}$.

Attributes

HDCR is a 32-bit register.

Field descriptions

Bits [31:30]

Reserved, RES0.

HPMFZO, bit [29]

When FEAT_PMUv3p7 is implemented:

HPMFZO

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

0b0 Do not freeze on overflow.

0b1 Event counters do not count when $\text{PMOVSr}[(\text{PMCR.N}-1):\text{HDCR.HPMN}]$ is nonzero.

If HDCR.HPMN is less than PMCR.N , this field affects the operation of event counters in the range $[\text{HDCR.HPMN} .. (\text{PMCR.N}-1)]$.

If HDCR.HPMN is equal to PMCR.N , this field has no effect.

This field does not affect the operation of event counters in the range $[0 .. (\text{HDCR.HPMN}-1)]$ and [PMCCNTR](#).

The operation of this field ignores the values of $\text{PMOVSr}[(\text{HDCR.HPMN}-1):0]$.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented and EL3 is not implemented:

MTPME

Multi-threaded PMU Enable. Enables use of the `PMEVTYPER<n>.MT` bits.

0b0 `FEAT_MTPMU` is disabled. The Effective value of `PMEVTYPER<n>.MT` is zero.

0b1 `PMEVTYPER<n>.MT` bits not affected by this bit.

If `FEAT_MTPMU` is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

The reset behavior of this field is:

- On a Cold reset, in a system where the PE resets into EL2 or EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

TDCC

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

0b0 This control does not cause any register accesses to be trapped.

0b1 If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Hyp Trap exception, unless the access also generates a higher priority exception.

Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- `DBGDTRRXext`, `DBGDTRTXext`, `DBGDSCRint`, `DBGDCCINT`, and, when the PE is in Non-debug state, `DBGDTRRXint` and `DBGDTRTXint`.

The traps are reported with EC syndrome value:

- 0x05 for trapped MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped LDC to `DBGDTRTXint` and STC from `DBGDTRRXint`.

When the PE is in Debug state, HDCR.TDCC does not trap any accesses to:

- `DBGDTRRXint` and `DBGDTRTXint`.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

HLP, bit [26]

When FEAT_PMUv3p5 is implemented:

HLP

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

0b0 Event counter overflow on increment that causes unsigned overflow of `PMEVCNTR<n>[31:0]`.

0b1 Event counter overflow on increment that causes unsigned overflow of `PMEVCNTR<n>[63:0]`.

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is read/write or RAZ/WI.

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range [HDCR.HPMN..(PMCR.N-1)]. Otherwise this bit has no effect on the operation of the event counters.

———— **Note** —————

The effect of HDCR.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HDCR.HPMN field.

———— **Note** —————

[PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [25:24]

Reserved, RES0.

HCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

HCCD

Hypervisor Cycle Counter Disable. Prohibits [PMCCNTR](#) from counting at EL2.

0b0 Cycle counting by [PMCCNTR](#) is not affected by this mechanism.

0b1 Cycle counting by [PMCCNTR](#) is prohibited at EL2.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

When FEAT_TRF is implemented:

TTRF

Traps use of the Trace Filter Control registers at EL1 to EL2.

0b0 Accesses to [TRFCR](#) at EL1 are not affected by this control bit.

0b1 Accesses to [TRFCR](#) at EL1 generate a Hyp Trap exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When FEAT_PMUv3p1 is implemented and FEAT_Debugv8p2 is implemented:

HPMD

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

- 0b0 Event counting and [PMCCNTR](#) are not affected by this mechanism.
- 0b1 Event counting by some event counters is prohibited in Hyp mode. If [PMCR.DP](#) is 1, [PMCCNTR](#) is disabled in Hyp mode. Otherwise, [PMCCNTR](#) is not affected by this mechanism.

This field applies only to:

- The event counters in the range [0 .. (HDCR.HPMN-1)].
- If [PMCR.DP](#) is 1, [PMCCNTR](#).

The other event counters are not affected. When [PMCR.DP](#) is 0, [PMCCNTR](#) is not affected.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

When FEAT_PMUv3p1 is implemented:

HPMD

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

- 0b0 Event counting and [PMCCNTR](#) are not affected by this mechanism.
- 0b1 If `ExternalSecureNoninvasiveDebugEnabled ()` is FALSE, event counting by some event counters is prohibited in Hyp mode, and if [PMCR.DP](#) is 1, [PMCCNTR](#) is disabled in Hyp mode.

If `ExternalSecureNoninvasiveDebugEnabled ()` is TRUE, the event counters and [PMCCNTR](#) are not affected by this field.

Otherwise, this field applies only to:

- The event counters in the range [0 .. (HDCR.HPMN-1)].
- If [PMCR.DP](#) is 1, [PMCCNTR](#).

The other event counters are not affected. When [PMCR.DP](#) is 0, [PMCCNTR](#) is not affected.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:12]

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode.

- 0b0 This control does not cause any instructions to be trapped.
- 0b1 Non-secure EL0 and EL1 System register accesses to the [DBGDRAR](#) or [DBGDSAR](#) are trapped to Hyp mode, unless it is trapped by [DBGDSCRExt.UDCCdis](#).

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

TDOSA

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and [DBGPRCR](#).
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

———— **Note** ————

These registers are not accessible at EL0.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

TDOSA

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- [DBGOSLSR](#), [DBGOSLAR](#), and [DBGPRCR](#).
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [DBGOSDLR](#) are trapped.

———— **Note** ————

These registers are not accessible at EL0.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDA, bit [9]

Trap debug access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers in the (coproc==0b1110) encoding space that are not trapped by either of the following:

- [HDCR.TDRA](#).

- [HDCR.TDOSA](#).

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by [HDCR.TDRA](#) and [HDCR.TDOSA](#), are trapped to Hyp mode, unless it is trapped by [DBGDSCRExt.UDCCdis](#).

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDE, bit [8]

Trap Debug exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D .

0b0 The debug target Exception level is EL1.

0b1 If EL2 is enabled for the current Effective value of [SCR.NS](#), the debug target Exception level is EL2, otherwise the debug target Exception level is EL1.

The [HDCR](#).{[TDRA](#), [TDOSA](#), [TDA](#)} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see [Routing debug exceptions on page G2-6159](#).

When [HCR.TGE](#) == 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

HPME, bit [7]

When FEAT_PMUv3 is implemented:

HPME

[[HDCR.HPMN](#)..([N](#)-1)] event counters enable.

0b0 Event counters in the range [[HDCR.HPMN](#)..([PMCR.N](#)-1)] are disabled.

0b1 Event counters in the range [[HDCR.HPMN](#)..([PMCR.N](#)-1)] are enabled by [PMCNTENSET](#).

If [HDCR.HPMN](#) is less than [PMCR.N](#), the event counters in the range [[HDCR.HPMN](#)..([PMCR.N](#)-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

———— Note ————

The effect of [HDCR.HPMN](#) on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the [HPMN](#) field.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

TPM

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.

———— **Note** ————

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When FEAT_PMUv3 is implemented:

TPMCR

Trap **PMCR** accesses. Traps Non-secure EL0 and EL1 accesses to the **PMCR** to Hyp mode.

0b0 This control does not cause any instructions to be trapped.

0b1 Non-secure EL0 and EL1 accesses to the **PMCR** are trapped to Hyp mode, unless it is trapped by **PMUSERENR.EN**.

———— **Note** ————

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]

When FEAT_PMUv3 is implemented:

HPMN

Defines the number of event counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If HPMN is less than **PMCR.N**, HPMN divides the event counters into two ranges, [0..(HPMN-1)] and [HPMN..(**PMCR.N**-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL1 and EL2, and from EL0 if unprivileged access to the counters is enabled.
- If **FEAT_PMUv3p5** is implemented, **PMCR.LP** determines whether the counter overflows at **PMEVCNTR<n>**[31:0] or **PMEVCNTR<n>**[63:0].
- **PMCR.E** enables the operation of counters in this range.

Note

If HPMN is equal to PMCR.N, this applies to all event counters.

If HPMN is less than PMCR.N, for an event counter in the range [HPMN..(PMCR.N-1)]:

- The counter is accessible only from EL2 and from Secure state.
- If FEAT_PMUv3p5 is implemented, HDCR.HLP determines whether the counter overflows at PMEVCNTR<n>[31:0] or PMEVCNTR<n>[63:0].
- HDCR.HPME enables the operation of counters in this range.

If this field is set to 0, or to a value larger than PMCR.N, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of HDCR.HPMN is UNKNOWN.
- Either:
 - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if HDCR.HPMN is set to an UNKNOWN non-zero value less than or equal to PMCR.N.
 - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in PMCR.N.

Otherwise:

Reserved, RES0.

Accessing HDCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elseif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;

G8.3.32 HTRFCR, Hyp Trace Filter Control Register

The HTRFCR characteristics are:

Purpose

Provides EL2 controls for Trace.

Configurations

AArch32 System register HTRFCR bits [31:0] are architecturally mapped to AArch64 System register [TRFCR_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_TRF is implemented. Otherwise, direct accesses to HTRFCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from Monitor mode when [SCR.NS](#) == 1.

Attributes

HTRFCR is a 32-bit register.

Field descriptions

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

0b00 The timestamp is controlled by [TRFCR.TS](#).

0b01 Virtual timestamp. The traced timestamp is the physical counter value minus the value of [CNTVOFF](#).

0b11 Physical timestamp. The traced timestamp is the physical counter value.

When `SelfHostedTraceEnabled() == FALSE`, this field is ignored.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [4]

Reserved, RES0.

CX, bit [3]

VMID Trace Enable.

0b0 VMID tracing is not allowed.

0b1 VMID tracing is allowed.

When `SelfHostedTraceEnabled() == FALSE`, this field is ignored.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.

0b0 Tracing is prohibited at EL2.

0b1 Tracing is allowed at EL2.

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

E0HTRE, bit [0]

EL0 Trace Enable.

0b0 Tracing is prohibited at EL0 when HCR.TGE == 1.

0b1 Tracing is allowed at EL0 when HCR.TGE == 1.

This field is ignored if any of the following are true:

- The PE is in Secure state.
- SelfHostedTraceEnabled() == FALSE.
- HCR.TGE == 0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing HTRFCR

Accesses to this register use the following encodings in the System register encoding space:

end if

```

G8.3.33 PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configurations

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

Attributes

PMMIR is a 32-bit register.

Field descriptions

Bits [31:20]

Reserved, RES0.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\log_2(\text{number of bytes}) + 1$. Defined values are:

0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might be RAZ.

Accessing PMMIR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b110

```

if PSTATE.EL == EL0 then

                UNDEFINED;
            else
                AArch64.AArch32SystemAccessTrap(EL3, 0x03);
            else
                return PMMIR;
    elsif PSTATE.EL == EL3 then
        return PMMIR;

```

G8.3.34 SDCR, Secure Debug Control Register

The SDCR characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

Configurations

AArch32 System register SDCR bits [31:0] can be mapped to AArch64 System register [MDCR_EL3](#)[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to SDCR are UNDEFINED.

Attributes

SDCR is a 32-bit register.

Field descriptions

Bits [31:29]

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented:

MTPME

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>.MT](#) bits.

0b0 [FEAT_MTPMU](#) is disabled. The Effective value of [PMEVTYPER<n>.MT](#) is 0.

0b1 [PMEVTYPER<n>.MT](#) bits not affected by this bit.

If [FEAT_MTPMU](#) is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

The reset behavior of this field is:

- On a Cold reset, in a system where the PE resets into EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

TDCC

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.

0b0 This control does not cause any register accesses to be trapped.

0b1 Accesses to the DCC registers in modes other than Monitor mode generate a Monitor Trap exception, unless the access also generates a higher priority exception.
Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- [DBGDTRRExt](#), [DBGDTRTExt](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

When the PE is in Debug state, SDCR.TDCC does not trap any accesses to:

- [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [26:24]

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

SCCD

Secure Cycle Counter Disable. Prohibits [PMCCNTR](#) from counting in Secure state.

0b0 Cycle counting by [PMCCNTR](#) is not affected by this mechanism.

0b1 Cycle counting by [PMCCNTR](#) is prohibited in Secure state.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

EPMAD, bit [21]

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:

EPMAD

External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

0b0 Non-secure access to the Performance Monitors registers from an external debugger is permitted.

0b1 Non-secure access to the Performance Monitors registers from an external debugger is not permitted.

If the Performance Monitors Extension does not support external debug interface accesses, this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When FEAT_PMUv3 is implemented:

EPMAD

External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

0b0 Access to Performance Monitors registers from an external debugger is permitted.

0b1 Access to Performance Monitors registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension does not support external debug interface accesses, this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]

When FEAT_Debugv8p4 is implemented:

EDAD

External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

0b0 Non-secure access to debug registers from an external debugger is permitted.

0b1 Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

EDAD

External debug access disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

0b0 Access to debug registers from an external debugger is permitted.

0b1 Access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

EDAD

External debug access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger.

0b0 Access to debug registers from an external debugger is permitted.

0b1 Access to breakpoint registers and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

It is IMPLEMENTATION DEFINED whether access to the [OSLAR_EL1](#) register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

TTRF, bit [19]

When FEAT_TRF is implemented:

TTRF

Trap Trace Filter controls. Controls whether accesses in modes other than Monitor mode to the trace filter control registers generate a Monitor Trap exception.

0b0 Accesses to [HTRFCR](#) and [TRFCR](#) are not affected by this control bit.

0b1 When not in Monitor mode, accesses to [HTRFCR](#) and [TRFCR](#) generate a Monitor Trap exception, unless the access generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

STE, bit [18]

When FEAT_TRF is implemented:

STE

Secure Trace Enable. This bit enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

0b0 Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.

0b1 Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See [Register controls to enable self-hosted trace on page G3-6220](#).

If EL3 is not implemented and the Effective value of [SCR.NS](#) is 0, the PE behaves as if this bit is set to 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

SPME

Secure Performance Monitors Enable. Controls event counting in Secure state.

0b0 Event counting is prohibited in Secure state. If [PMCR.DP](#) is 1, [PMCCNTR](#) is disabled in Secure state. Otherwise, [PMCCNTR](#) is not affected by this mechanism.

0b1 Event counting and [PMCCNTR](#) are not affected by this mechanism.

This field affects the operation of all event counters in Secure state, and if [PMCR.DP](#) is 1, the operation of [PMCCNTR](#) in Secure state. When [PMCR.DP](#) is 0, [PMCCNTR](#) is not affected by this field.

If EL3 is not implemented and the Effective value of `SCR.NS` is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When `FEAT_PMuV3` is implemented:

SPME

Secure Performance Monitors Enable. Controls event counting in Secure state.

0b0 If `ExternalSecureNoninvasiveDebugEnabled()` is FALSE, event counting is prohibited in Secure state, and if `PMCR.DP` is 1, `PMCCNTR` is disabled in Secure state.

0b1 Event counting and `PMCCNTR` are not affected by this mechanism.

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, the event counters and `PMCCNTR` are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if `PMCR.DP` is 1, the operation of `PMCCNTR` in Secure state. When `PMCR.DP` is 0, `PMCCNTR` is not affected by this field.

If EL3 is not implemented and the Effective value of `SCR.NS` is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

SPD, bits [15:14]

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions.

0b00 Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface.

0b10 Secure privileged debug disabled. Debug exceptions from EL3 are disabled.

0b11 Secure privileged debug enabled. Debug exceptions from EL3 are enabled.

Other values are reserved, and have the CONstrained UNpredictable behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of `SDER.SUIDEN` is 1.

If EL3 is not implemented and the Effective value of `SCR.NS` is 0, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Bits [13:0]

Reserved, RES0.

Accessing SDCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.3.35 SDER, Secure Debug Enable Register

The SDER characteristics are:

Purpose

Controls invasive and non-invasive debug in the Secure EL0 mode.

Configurations

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register [SDER32_EL2](#)[31:0] when EL2 is implemented and FEAT_SEL2 is implemented.

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register [SDER32_EL3](#)[31:0] when EL3 is implemented.

This register is present only when (EL3 is implemented and EL3 is capable of using AArch32) or (EL1 is capable of using AArch32 and Secure EL1 is implemented). Otherwise, direct accesses to SDER are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

Attributes

SDER is a 32-bit register.

Field descriptions

Bits [31:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

0b0 This bit does not affect Performance Monitors event counting at Secure EL0

0b1 If EL3 or EL1 is using AArch32, Performance Monitors event counting is allowed in Secure EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SUIDEN, bit [0]

Secure User Invasive Debug Enable.

0b0 This bit does not affect the generation of debug exceptions at Secure EL0.

0b1 If EL3 or EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing SDER

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0001	0b001

```

G8.3.36 TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

Purpose

Provides EL1 controls for Trace.

Configurations

AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register [TRFCR_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

Attributes

TRFCR is a 32-bit register.

Field descriptions

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

0b01 Virtual timestamp. The traced timestamp is the physical counter value minus the value of [CNTVOFF](#).

0b10 *When FEAT_ECV is implemented:*

Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of [CNTPOFF_EL2](#):

- EL3 is implemented and is using AArch32.
- EL3 is implemented, using AArch64, and [SCR_EL3.ECVEn](#) == 0b0.
- EL2 is using AArch32.
- EL2 is using AArch64 and [CNTHCTL_EL2.ECV](#) == 0b0.

0b11 Physical timestamp. The traced timestamp is the physical counter value.

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and [HTRFCR.TS](#) != 0b00.
- `SelfHostedTraceEnabled()` == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

0b0 Tracing is prohibited in PL1 modes.

0b1 Tracing is allowed in PL1 modes.
 This field is ignored if SelfHostedTraceEnabled() == FALSE.
 The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

0b0 Tracing is prohibited at EL0.
 0b1 Tracing is allowed at EL0.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current security state and HCR.TGE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRFCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.4 Performance Monitors registers

This section lists the Performance Monitors registers in AArch32.

G8.4.1 PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR](#), increments.

Configurations

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to AArch64 System register [PMCCFILTR_ELO](#)[31:0].

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to External register [PMCCFILTR_ELO](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR are UNDEFINED.

Attributes

PMCCFILTR is a 32-bit register.

Field descriptions

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR.NSK bit.

0b0 Count cycles in EL1.

0b1 Do not count cycles in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR.NSU bit.

0b0 Count cycles in EL0.

0b1 Do not count cycles in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

NSK, bit [29]

When EL3 is implemented:

NSK

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMCCFILTR.P, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

NSU

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMCCFILTR.U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

NSH

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

0b0 Do not count cycles in EL2.

0b1 Count cycles in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [26:0]

Reserved, RES0.

Accessing PMCCFILTR

PMCCFILTR can also be accessed by using [PMXEVTYPER](#) with [PMSELR](#).SEL set to 0b11111.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.4.2 PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter* on page D7-2852 for more information.

PMCCFILTR determines the modes and states in which the PMCCNTR can increment.

Configurations

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR are UNDEFINED.

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR is a 64-bit register.

Field descriptions

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b000

G8.4.3 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F

For more information about the common events and the use of the PMCEIDn registers see [The PMU event number space and common events on page D7-2875](#).

Configurations

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0_EL0](#)[31:0].

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to External register [PMCEID0](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are UNDEFINED.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event n.

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

————— Note —————

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b110

```

```

G8.4.6 PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

For more information about the common events and the use of the PMCEIDn registers see [The PMU event number space and common events on page D7-2875](#).

Configurations

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1_EL0](#)[63:32].

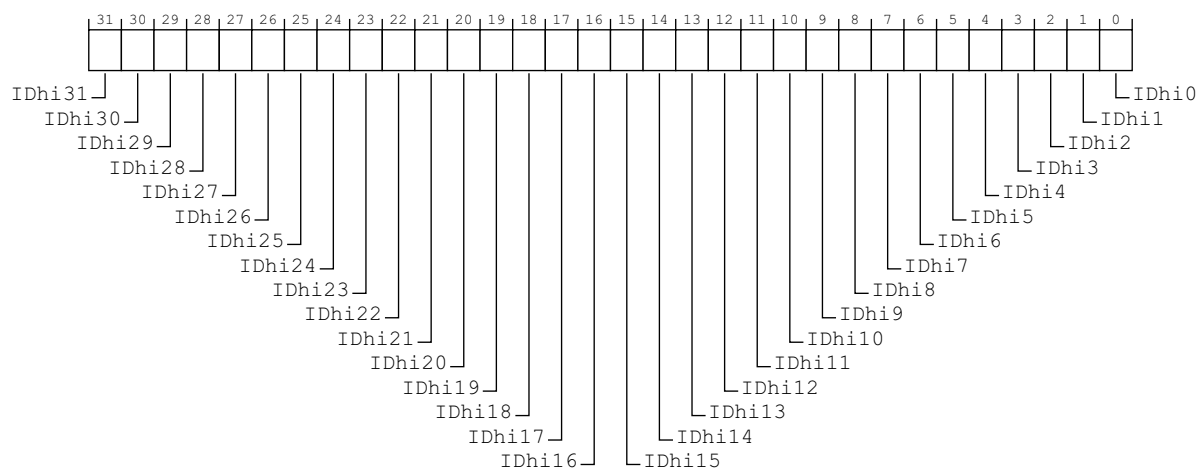

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to External register [PMCEID3](#)[63:32].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUV3p1 is implemented. Otherwise, direct accesses to PMCEID3 are UNDEFINED.

Attributes

PMCEID3 is a 32-bit register.

Field descriptions

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

- 0b0 The common event is not implemented, or not counted.
- 0b1 The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

————— Note —————

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID3

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b101

```

G8.4.7 PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the [PMCNTENSET](#) register.

Configurations

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENCLR_ELO](#)[31:0].

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register [PMCNTENCLR_ELO](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR are UNDEFINED.

Attributes

PMCNTENCLR is a 32-bit register.

Field descriptions

C, bit [31]

[PMCCNTR](#) disable bit. Disables the cycle counter register.

0b0 When read, means the cycle counter is disabled. When written, has no effect.

0b1 When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

0b0 When read, means that [PMEVCNTR<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>](#) is enabled. When written, disables [PMEVCNTR<n>](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

G8.4.8 PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

PMCNTENSET is used in conjunction with the [PMCNTENCLR](#) register.

Configurations

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENSET_EL0](#)[31:0].

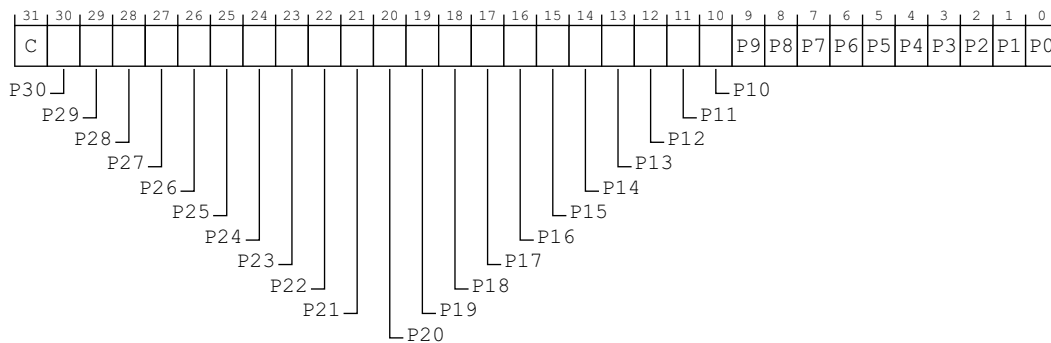

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to External register [PMCNTENSET_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET are UNDEFINED.

Attributes

PMCNTENSET is a 32-bit register.

Field descriptions

C, bit [31]

[PMCCNTR](#) enable bit. Enables the cycle counter register.

0b0 When read, means the cycle counter is disabled. When written, has no effect.

0b1 When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

0b0 When read, means that [PMEVCNTR<n>](#) is disabled. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>](#) event counter is enabled. When written, enables [PMEVCNTR<n>](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENSET

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b001

```

G8.4.9 PMCR, Performance Monitors Control Register

The PMCR characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configurations

AArch32 System register PMCR bits [31:0] are architecturally mapped to AArch64 System register [PMCR_ELO](#)[31:0].

AArch32 System register PMCR bits [7:0] are architecturally mapped to External register [PMCR_ELO](#)[7:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR are UNDEFINED.

Attributes

PMCR is a 32-bit register.

Field descriptions

IMP, bits [31:24]

When FEAT_PMUv3p7 is not implemented:

IMP

Implementer code.

If this field is zero, then PMCR.IDCODE is RES0 and software must use [MIDR](#) to identify the PE.

Otherwise, this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as [MIDR.Implementer](#).

Use of this field is deprecated.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]

When PMCR.IMP != 0x00:

IDCODE

Identification code. Use of this field is deprecated. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is RO.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b00000-0b11111. If the value is 0b00000 then only **PMCCNTR** is implemented. If the value is 0b11111 **PMCCNTR** and 31 event counters are implemented.

In an implementation that includes EL2:

- If EL2 is using AArch32, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of **HDCR.HPMN**.
- If EL2 is using AArch64 and is enabled in the current Security state, reads of this field from EL1 and EL0 return the value of **MDCR_EL2.HPMN**.

Access to this field is RO.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

FZO

Freeze-on-overflow. Stop event counters on overflow.

0b0 Do not freeze on overflow.

0b1 Event counters do not count when **PMOVSr**[(N-1):0] is nonzero, where N is the value of **HDCR.HPMN** if EL2 is implemented, and **PMCR.N** otherwise.

If EL2 is implemented, then:

- This field affects the operation of event counters in the range [0 .. (**HDCR.HPMN**-1)].
- If **HDCR.HPMN** is less than **PMCR.N**:
 - This field does not affect the operation of event counters in the range [**HDCR.HPMN** .. (**PMCR.N**-1)].
 - The operation of this field ignores the values of **PMOVSr**[(**PMCR.N**-1):**HDCR.HPMN**].
- This applies even when EL2 is disabled in the current Security state.

This field does not affect the operation of **PMCCNTR**.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

LP

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

0b0 Event counter overflow on increment that causes unsigned overflow of **PMEVCNTR**<n>[31:0].

0b1 Event counter overflow on increment that causes unsigned overflow of [PMEVCNTR<n>](#)[63:0].

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

If EL2 is implemented and [HDCR.HPMN](#) or [MDCR_EL2.HPMN](#) is less than [PMCR.N](#), this bit does not affect the operation of event counters in the range [[HDCR.HPMN](#)..([PMCR.N](#)-1)] or [[MDCR_EL2.HPMN](#)..([PMCR.N](#)-1)].

[PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

Note

The effect of [HDCR.HPMN](#) or [MDCR_EL2.HPMN](#) on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [HDCR.HPMN](#) or [MDCR_EL2.HPMN](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

0b0 Cycle counter overflow on increment that causes unsigned overflow of [PMCCNTR](#)[31:0].

0b1 Cycle counter overflow on increment that causes unsigned overflow of [PMCCNTR](#)[63:0].

Arm deprecates use of [PMCR.LC](#) = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

DP

Disable cycle counter when event counting is prohibited.

0b0 Cycle counting by [PMCCNTR](#) is not affected by this bit.

0b1 When event counting for counters in the range [0..([HDCR.HPMN](#)-1)] or [0..([MDCR_EL2.HPMN](#)-1)] is prohibited, cycle counting by [PMCCNTR](#) is disabled.

For more information see [Controlling the PMU counters on page D7-2859](#)

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

X

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

- 0b0 Do not export events.
- 0b1 Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

Clock divider. The possible values of this bit are:

- 0b0 When enabled, **PMCCNTR** counts every clock cycle.
- 0b1 When enabled, **PMCCNTR** counts once every 64 clock cycles.

If **PMCR.LC** == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of **PMCR.D** = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

- 0b0 No action.
- 0b1 Reset **PMCCNTR** to zero.

———— **Note** —————

Resetting **PMCCNTR** does not change the cycle counter overflow bit. If **FEAT_PMUv3p5** is implemented, the value of **PMCR.LC** is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

- 0b0 No action.
- 0b1 Reset all event counters accessible in the current Exception level, not including **PMCCNTR**, to zero.

In EL0 and EL1:

- If EL2 is implemented and is enabled in the current Security state, and **HDCR.HPMN** or **MDCR_EL2.HPMN** is less than **PMCR_EL0.N**, a write of 1 to this bit does not reset event counters in the range [**HDCR.HPMN**..(**PMCR.N**-1)] or [**MDCR_EL2.HPMN**..(**PMCR.N**-1)].
- If EL2 is not implemented, EL2 is disabled in the current Security state, or **HDCR.HPMN** or **MDCR_EL2.HPMN** is equal to **PMCR_EL0.N**, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Note

Resetting the event counters does not change the event counter overflow bits. If [FEAT_PMUv3p5](#) is implemented, the values of [HDCR.HLP](#) and [PMCR.LP](#) are ignored and bits [63:0] of all affected event counters are reset.

Access to this field is WO/RAZ.

E, bit [0]

Enable.

0b0 All event counters in the range [0..(PMN-1)] and [PMCCNTR](#), are disabled.

0b1 All event counters in the range [0..(PMN-1)] and [PMCCNTR](#), are enabled by [PMCNTENSET](#).

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is [HDCR.HPMN](#).
- If EL2 is using AArch64, PMN is [MDCR_EL2.HPMN](#).
- If PMN is less than [PMCR.N](#), this bit does not affect the operation of event counters in the range [PMN..(PMCR.N-1)].

If EL2 is not implemented, PMN is [PMCR.N](#).

Note

The effect of [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#) on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.4.10 PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configurations

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to AArch64 System register [PMEVCNTR<n>_EL0](#)[31:0].

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to External register [PMEVCNTR<n>_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n> are UNDEFINED.

Attributes

PMEVCNTR<n> is a 32-bit register.

Field descriptions

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If [FEAT_PMUv3p5](#) is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMEVCNTR<n> return bits [31:0] of the counter.
- Writes to PMEVCNTR<n> update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If [FEAT_PMUv3p5](#) is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>

PMEVCNTR<n> can also be accessed by using [PMXVCNTR](#) with [PMSELR.SEL](#) set to the value of <n>.

If [FEAT_FGT](#) is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVCNTR<n>](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If [FEAT_FGT](#) is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVCNTR<n>](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.

- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

———— **Note** ————

In EL0, an access is permitted if it is enabled by **PMUSERENR**.{ER,EN} or **PMUSERENR_ELO**.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, **HDCR**.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, **MDCR_EL2**.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see **HDCR**.HPMN and **MDCR_EL2**.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b10:n[4:3]	n[2:0]

```

```

G8.4.11 PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configurations

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to AArch64 System register [PMEVTYPER<n>_EL0](#)[31:0].

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to External register [PMEVTYPER<n>_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n> are UNDEFINED.

Attributes

PMEVTYPER<n> is a 32-bit register.

Field descriptions

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>.NSK bit.

0b0 Count events in EL1.

0b1 Do not count events in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>.NSU bit.

0b0 Count events in EL0.

0b1 Do not count events in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

NSK

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMEVTYPER<n>.P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

NSU

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of `PMEVTYPER<n>.U`, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

NSH

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

0b0 Do not count events in EL2.

0b1 Count events in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

MT, bit [25]

When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

MT

Multithreading.

0b0 Count events only on controlling PE.

0b1 Count events from any PE with the same affinity at level 1 and above as this PE.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if `FEAT_MTPMU` is not implemented, this bit is RES0. See [ID_DFR1.MTPMU](#).

This bit is ignored by the PE and treated as zero when `FEAT_MTPMU` is implemented and Disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

evtCount[15:10]

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>](#).

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in [Table D7-6 on page D7-2875](#).

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If 16-bit evtCount is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

———— **Note** —————

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>

PMEVTYPER<n> can also be accessed by using [PMXEVTYPER](#) with [PMSELR.SEL](#) set to n.

If [FEAT_FGT](#) is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVTYPER<n>](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If `FEAT_FGT` is not implemented and `<n>` is greater than or equal to the number of accessible event counters, then reads and writes of `PMEVTYPEPER<n>` are CONstrained UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and `<n>` is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by `PMUSERENR.EN` or `PMUSERENR_EL0.EN`.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, `HDCR.HPMN` identifies the number of accessible event counters.
- If EL2 is using AArch64, `MDCR_EL2.HPMN` identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see `HDCR.HPMN` and `MDCR_EL2.HPMN`.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b11:n[4:3]	n[2:0]

G8.4.12 PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the [PMINTENSET](#) register.

Configurations

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1](#)[31:0].

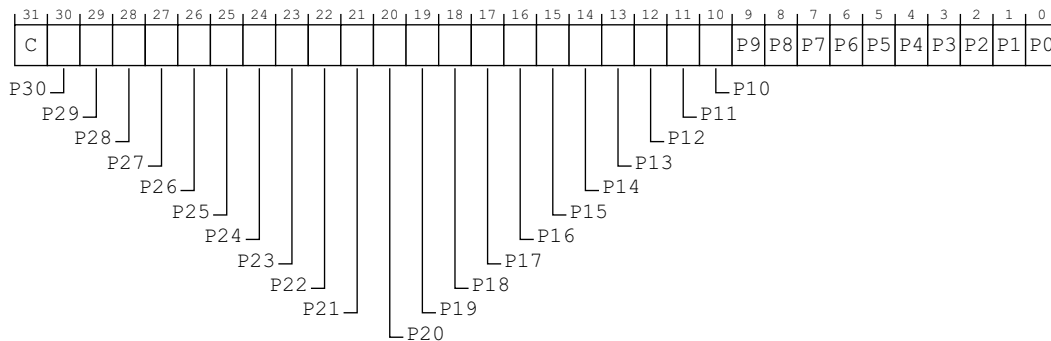

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register [PMINTENCLR_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

Attributes

PMINTENCLR is a 32-bit register.

Field descriptions

C, bit [31]

[PMCCNTR](#) overflow interrupt request disable bit.

0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.

0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

0b0 When read, means that the [PMEVCNTR<n>](#) event counter interrupt request is disabled. When written, has no effect.

0b1 When read, means that the `PMEVCNTR<n>` event counter interrupt request is enabled.
When written, disables the `PMEVCNTR<n>` interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENCLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b010

```

G8.4.13 PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR](#), and the event counters [PMEVCNTR<n>](#). Reading the register shows which overflow interrupt requests are enabled.

PMINTENSET is used in conjunction with the [PMINTENCLR](#) register.

Configurations

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET_EL1](#)[31:0].

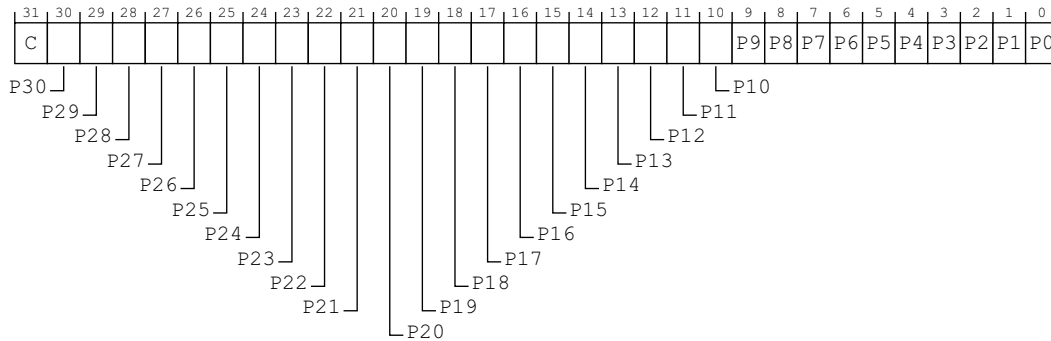

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to External register [PMINTENSET_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET are UNDEFINED.

Attributes

PMINTENSET is a 32-bit register.

Field descriptions

C, bit [31]

[PMCCNTR](#) overflow interrupt request enable bit.

- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

- 0b0 When read, means that the [PMEVCNTR<n>](#) event counter interrupt request is disabled. When written, has no effect.

0b1 When read, means that the `PMEVCNTR<n>` event counter interrupt request is enabled.
When written, enables the `PMEVCNTR<n>` interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENSET

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.4.14 PMOVSR, Performance Monitors Overflow Flag Status Register

The PMOVSR characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Configurations

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch64 System register [PMOVSLR_EL0](#)[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register [PMOVSLR_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMOVSR are UNDEFINED.

Attributes

PMOVSR is a 32-bit register.

Field descriptions

C, bit [31]

Cycle counter overflow clear bit. Possible values are:

- 0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
- 0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR.LC](#) controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

- 0b0 When read, means that [PMEVCNTR<n>](#) has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that `PMEVCNTR<n>` has overflowed since this bit was last cleared. When written, clears the `PMEVCNTR<n>` overflow bit to 0.

If `FEAT_PMUv3p5` is implemented, `MDCR_EL2.HLP`, `HDCR.HLP`, and `PMCR.LP` control whether an overflow is detected from unsigned overflow of `PMEVCNTR<n>`[31:0] or unsigned overflow of `PMEVCNTR<n>`[63:0]. `PMEVCNTR<n>`[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

G8.4.15 PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR](#), and each of the implemented event counters [PMEVCNTR<n>](#).

Configurations

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET_EL0](#)[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register [PMOVSSET_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMOVSSET are UNDEFINED.

Attributes

PMOVSSET is a 32-bit register.

Field descriptions

C, bit [31]

Cycle counter overflow set bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR.LC](#) controls whether an overflow is detected from unsigned overflow of [PMCCNTR](#)[31:0] or unsigned overflow of [PMCCNTR](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

0b0 When read, means that [PMEVCNTR<n>](#) has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that `PMEVCNTR<n>` has overflowed since this bit was last . When written, sets the `PMEVCNTR<n>` overflow bit to 1.

If `FEAT_PMUv3p5` is implemented, `MDCR_EL2.HLP`, `HDCR.HLP`, and `PMCR.LP` control whether an overflow is detected from unsigned overflow of `PMEVCNTR<n>`[31:0] or unsigned overflow of `PMEVCNTR<n>`[63:0]. `PMEVCNTR<n>`[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSSET

Accesses to this register use the following encodings in the System register encoding space:

`MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}`

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b011

    PMOVSSSET = R[t];
```

G8.4.16 PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

Purpose

Selects the current event counter [PMEVCNTR<n>](#) or the cycle counter, CCNT.

PMSELR is used in conjunction with [PMXEVTYPER](#) to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with [PMXEVCNTR](#), to determine the value of a selected event counter.

Configurations

AArch32 System register PMSELR bits [31:0] are architecturally mapped to AArch64 System register [PMSELR_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

Attributes

PMSELR is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, [PMEVCNTR<n>](#), where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to [PMXEVTYPER](#) or [PMXEVCNTR](#) occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR.SEL is 0b11111, it selects the cycle counter and:

- A read of the [PMXEVTYPER](#) returns the value of [PMCCFILTR](#).
- A write of the [PMXEVTYPER](#) writes to [PMCCFILTR](#).
- A read or write of [PMXEVCNTR](#) has CONSTRAINED UNPREDICTABLE effects. For more information, see [PMXEVCNTR](#).

For more information about the results of accesses to event counters, see [PMXEVTYPER](#) and [PMXEVCNTR](#).

For more information about the number of counters accessible at each Exception level, see [HDCR.HPMN](#) and [MDCR_EL2.HPMN](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b101

```

G8.4.17 PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event $0x00$. For more information, see [SW_INCR](#).

Configurations

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to AArch64 System register [PMSWINC_ELO](#)[31:0].

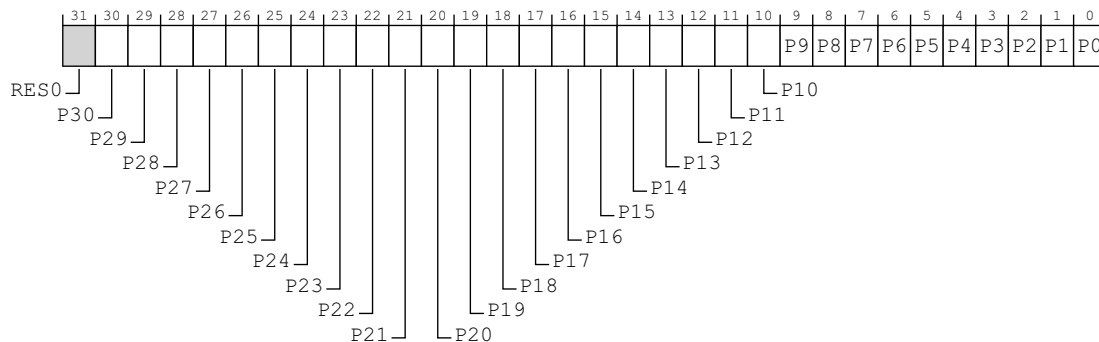

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register [PMSWINC_ELO](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMuV3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

Attributes

PMSWINC is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMEVCNTR<n>](#).

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#) if EL2 is using AArch64, or in [HDCR.HPMN](#) if EL2 is using AArch32. Otherwise, N is the value in [PMCR.N](#).

0b0 No action. The write to this bit is ignored.

0b1 If [PMEVCNTR<n>](#) is enabled and configured to count the software increment event, increments [PMEVCNTR<n>](#) by 1. If [PMEVCNTR<n>](#) is disabled, or not configured to count the software increment event, the write to this bit is ignored.

Accessing PMSWINC

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b100

G8.4.18 PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

Purpose

Enables or disables User mode access to the Performance Monitors.

Configurations

AArch32 System register PMUSERENR bits [31:0] are architecturally mapped to AArch64 System register [PMUSERENR_ELO](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

Attributes

PMUSERENR is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

ER, bit [3]

Event counter read trap control:

- 0b0 EL0 reads of the [PMXVCNTR](#) and [PMEVCNTR<n>](#), and EL0 RW access to the [PMSELR](#), are trapped to Undefined mode if PMUSERENR.EN is also 0.
- 0b1 Overrides PMUSERENR.EN and enables RO access to [PMXVCNTR](#) and [PMEVCNTR<n>](#), and RW access to [PMSELR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

CR, bit [2]

Cycle counter read trap control:

- 0b0 EL0 reads of the [PMCCNTR](#) are trapped to Undefined mode if PMUSERENR.EN is also 0.
- 0b1 Overrides PMUSERENR.EN and enables access to [PMCCNTR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SW, bit [1]

Software increment write trap control:

- 0b0 EL0 writes to the [PMSWINC](#) are trapped to Undefined mode if PMUSERENR.EN is also 0.
- 0b1 Overrides PMUSERENR.EN and enables access to [PMSWINC](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EN, bit [0]

Traps EL0 accesses to the Performance Monitors registers to Undefined mode, as follows:

- **PMCR, PMOVSr, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVCNTR, PMCNTENSET, PMCNTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR, PMSWINC.**
- If **FEAT_PMUv3p1** is implemented, **PMCEID2**, and **PMCEID3**.
- If **FEAT_PMUv3p4** is implemented, **PMMIR**.

0b0 While at EL0, accesses to the specified registers at EL0 are trapped to Undefined mode, unless overridden by one of PMUSERENR.{ER, CR, SW}.

0b1 While at EL0, software can access all of the specified registers.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMUSERENR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b000

```

G8.4.19 PMXEVNTR, Performance Monitors Selected Event Count Register

The PMXEVNTR characteristics are:

Purpose

Reads or writes the value of the selected event counter, [PMXEVNTR<n>](#). [PMSELR.SEL](#) determines which event counter is selected.

Configurations

AArch32 System register PMXEVNTR bits [31:0] are architecturally mapped to AArch64 System register [PMXEVNTR_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVNTR are UNDEFINED.

Attributes

PMXEVNTR is a 32-bit register.

Field descriptions

PMXEVNTR<n>, bits [31:0]

Value of the selected event counter, [PMXEVNTR<n>](#), where n is the value stored in [PMSELR.SEL](#).

If [FEAT_PMUv3p5](#) is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMXEVNTR return bits [31:0] of the counter.
- Writes to PMXEVNTR update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If [FEAT_PMUv3p5](#) is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVNTR

If [FEAT_FGT](#) is implemented and [PMSELR.SEL](#) is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMXEVNTR](#) is as follows:

- If [PMSELR.SEL](#) selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If [FEAT_FGT](#) is not implemented and [PMSELR.SEL](#) is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVNTR](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP

- Accesses to the register behave as if **PMSELR.SEL** has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and **PMSELR.SEL** is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

———— **Note** ————

In EL0, an access is permitted if it is enabled by **PMUSERENR**.{ER,EN} or **PMUSERENR_EL0**.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, **HDCR.HPMN** identifies the number of accessible event counters.
- If EL2 is using AArch64, **MDCR_EL2.HPMN** identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see **HDCR.HPMN** and **MDCR_EL2.HPMN**.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.4.20 PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

Purpose

When [PMSELR.SEL](#) selects an event counter, this accesses a [PMEVTYPER<n>](#) register. When [PMSELR.SEL](#) selects the cycle counter, this accesses [PMCCFILTR](#).

Configurations

AArch32 System register PMXEVTYPER bits [31:0] are architecturally mapped to AArch64 System register [PMXEVTYPER_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER are UNDEFINED.

Attributes

PMXEVTYPER is a 32-bit register.

Field descriptions

Bits [31:0]

Event type register or [PMCCFILTR](#).

When [PMSELR.SEL](#) == 31, this register accesses [PMCCFILTR](#).

Otherwise, this register accesses [PMEVTYPER<n>](#) where n is the value in [PMSELR.SEL](#).

Accessing PMXEVTYPER

If [FEAT_FGT](#) is implemented, and [PMSELR.SEL](#) is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMXEVTYPER](#) is as follows:

- If [PMSELR.SEL](#) selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If [FEAT_FGT](#) is not implemented, and [PMSELR.SEL](#) is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVTYPER](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if [PMSELR.SEL](#) is 31.
- If EL2 is implemented and enabled in the current Security state, and [PMSELR.SEL](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

————— Note —————

In EL0, an access is permitted if it is enabled by [PMUSERENR.EN](#) or [PMUSERENR_EL0.EN](#).

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, [HDCR.HPMN](#) identifies the number of accessible event counters.
- If EL2 is using AArch64, [MDCR_EL2.HPMN](#) identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [HDCR.HPMN](#) and [MDCR_EL2.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b001

G8.5 Activity Monitors registers

This section lists the Activity Monitoring registers in AArch32.

G8.5.1 AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register [AMCFGR_ELO](#)[31:0].

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to External register [AMCFGR](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are UNDEFINED.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is [AMCFGR.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is 0b1.

0b0 [AMCR.HDBG](#) is RES0.

0b1 [AMCR.HDBG](#) is read/write.

Access to this field is RO.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is [AMCFGR.SIZE + 1].

The counters are 64-bit.

Note

Software also uses this field to determine the spacing of counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is RO.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR.N + 1].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMCFGR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b001

```

G8.5.2 AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configurations

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register [AMCGCR_EL0](#)[31:0].

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to External register [AMCGCR](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are UNDEFINED.

Attributes

AMCGCR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes [FEAT_AMUv1](#), the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

Access to this field is RO.

Accessing AMCGCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.5.3 AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configurations

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR0_ELO](#)[31:0].

AArch32 System register AMCNTENCLR0 bits [31:0] are architecturally mapped to External register [AMCNTENCLR0](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are UNDEFINED.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for [AMEVCNTR0<n>](#).

————— Note —————

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes [FEAT_AMUv1](#), the number of architected activity monitor event counters is 4.

Possible values of each bit are:

- 0b0 When read, means that [AMEVCNTR0<n>](#) is disabled. When written, has no effect.
- 0b1 When read, means that [AMEVCNTR0<n>](#) is enabled. When written, disables [AMEVCNTR0<n>](#).

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b100

G8.5.4 AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configurations

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR1_EL0](#)[31:0].

AArch32 System register AMCNTENCLR1 bits [31:0] are architecturally mapped to External register [AMCNTENCLR1](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are UNDEFINED.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for [AMEVCNTR1<n>](#).

When N is less than 16, bits [15:N] are RAZ/WI, where N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

- 0b0 When read, means that [AMEVCNTR1<n>](#) is disabled. When written, has no effect.
- 0b1 When read, means that [AMEVCNTR1<n>](#) is enabled. When written, disables [AMEVCNTR1<n>](#).

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENCLR1 are UNDEFINED.

———— Note ————

The number of auxiliary activity monitor event counters implemented is zero exactly when [AMCFGR.NCG](#) == 0b0000.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0011	0b000

G8.5.5 AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configurations

AArch32 System register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET0_EL0](#)[31:0].

AArch32 System register AMCNTENSET0 bits [31:0] are architecturally mapped to External register [AMCNTENSET0](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are UNDEFINED.

Attributes

AMCNTENSET0 is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter enable bit for [AMEVCNTR0<n>](#).

———— Note ————

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes [FEAT_AMUv1](#), the number of architected activity monitor event counters is 4.

Possible values of each bit are:

- 0b0 When read, means that [AMEVCNTR0<n>](#) is disabled. When written, has no effect.
- 0b1 When read, means that [AMEVCNTR0<n>](#) is enabled. When written, enables [AMEVCNTR0<n>](#).

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENSET0

G8.5.6 AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configurations

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET1_EL0](#)[31:0].

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to External register [AMCNTENSET1](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are UNDEFINED.

Attributes

AMCNTENSET1 is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter enable bit for [AMEVCNTR1<n>](#).

When N is less than 16, bits [15:N] are RAZ/WI, where N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

- 0b0 When read, means that [AMEVCNTR1<n>](#) is disabled. When written, has no effect.
- 0b1 When read, means that [AMEVCNTR1<n>](#) is enabled. When written, enables [AMEVCNTR1<n>](#).

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENSET1

If the number of auxiliary activity monitor event counters implemented is zero, reads and writes of AMCNTENSET1 are UNDEFINED.

———— Note ————

The number of auxiliary activity monitor counters implemented is zero when [AMCFGR.NCG](#) == 0b0000.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0011	0b001

G8.5.7 AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch32 System register AMCR bits [31:0] are architecturally mapped to AArch64 System register [AMCR_EL0](#)[31:0].

AArch32 System register AMCR bits [31:0] are architecturally mapped to External register [AMCR](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are UNDEFINED.

Attributes

AMCR is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

CG1RZ, bit [17]

When FEAT_AMUv1p1 is implemented:

CG1RZ

Counter Group 1 Read Zero.

0b0 System register reads of [AMEVCNTR1](#)<n> return the event count at all implemented and enabled Exception levels.

0b1 If the current Exception level is the highest implemented Exception level, system register reads of [AMEVCNTR1](#)<n> return the event count. Otherwise, reads of [AMEVCNTR1](#)<n> return a zero value.

———— Note —————

Reads from the memory-mapped view are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

0b0 Activity monitors do not halt counting when the PE is halted in Debug state.

0b1 Activity monitors halt counting when the PE is halted in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing AMCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0010	0b000

G8.5.8 AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 3

The AMEVCNTR0<n> characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configurations

AArch32 System register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch64 System register [AMEVCNTR0<n>_EL0](#)[63:0].

AArch32 System register AMEVCNTR0<n> bits [63:0] are architecturally mapped to External register [AMEVCNTR0<n>](#)[63:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are UNDEFINED.

Attributes

AMEVCNTR0<n> is a 64-bit register.

Field descriptions

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

If FEAT_AMUv1p1 is implemented, [HCR_EL2.AMVOFFEN](#) is 1, [SCR_EL3.AMVOFFEN](#) is 1, [HCR_EL2.{E2H, TGE}](#) is not {1,1}, and EL2 is using AArch64 and is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount<63:0> - [AMEVCNTVOFF0<n>_EL2](#)<63:0>).

PCount is the physical count returned when AMEVCNTR0<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMEVCNTR0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n> are UNDEFINED.

———— Note ————

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

G8.5.9 AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configurations

AArch32 System register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register [AMEVCNTR1<n>_EL0](#)[63:0].

AArch32 System register AMEVCNTR1<n> bits [63:0] are architecturally mapped to External register [AMEVCNTR1<n>](#)[63:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are UNDEFINED.

Attributes

AMEVCNTR1<n> is a 64-bit register.

Field descriptions

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

If FEAT_AMUv1p1 is implemented, [HCR_EL2.AMVOFFEN](#) is 1, [SCR_EL3.AMVOFFEN](#) is 1, [HCR_EL2.{E2H, TGE}](#) is not {1,1}, EL2 is using AArch64 and is implemented in the current Security state, and [AMCR_EL0.CG1RZ](#) is 0, reads to these registers at EL0 or EL1 return (PCount<63:0> - [AMEVCNTVOFF1<n>_EL2<63:0>](#)).

PCount is the physical count returned when AMEVCNTR1<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMEVCNTR1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVCNTR1<n> are UNDEFINED.

————— Note —————

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b010:n[3]	0b0:n[2:0]

G8.5.10 AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n> characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>](#) counts.

Configurations

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register [AMEVTYPER0<n>_EL0](#)[31:0].

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to External register [AMEVTYPER0<n>](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are UNDEFINED.

Attributes

AMEVTYPER0<n> is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

0x0011	<i>When n == 0:</i> Processor frequency cycles
0x4004	<i>When n == 1:</i> Constant frequency cycles
0x0008	<i>When n == 2:</i> Instructions retired
0x4005	<i>When n == 3:</i> Memory stall cycles

Accessing AMEVTYPER0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n> are UNDEFINED.

————— Note —————

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.5.11 AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>](#) counts.

Configurations

AArch32 System register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch64 System register [AMEVTYPER1<n>_EL0](#)[31:0].

AArch32 System register AMEVTYPER1<n> bits [31:0] are architecturally mapped to External register [AMEVTYPER1<n>](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are UNDEFINED.

Attributes

AMEVTYPER1<n> is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter [AMEVCNTR1<n>](#), then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by [AMEVCNTR1<n>](#) might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter [AMEVCNTR1<n>](#) is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n> are UNDEFINED.

———— Note —————

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b111:n[3]	n[2:0]

G8.5.12 AMUSERENR, Activity Monitors User Enable Register

The AMUSERENR characteristics are:

Purpose

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch32 System register AMUSERENR bits [31:0] are architecturally mapped to AArch64 System register [AMUSERENR_EL0](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR are UNDEFINED.

Attributes

AMUSERENR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

EN, bit [0]

Traps EL0 accesses to the activity monitors registers to EL1.

0b0 EL0 accesses to the activity monitors registers are trapped to EL1.

0b1 This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

Note

- AMUSERENR can always be read at EL0 and is not governed by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMUSERENR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.6 RAS registers

This section lists [The Reliability, Availability, and Serviceability Extension](#) registers in AArch32.

G8.6.1 DISR, Deferred Interrupt Status Register

The DISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configurations

AArch32 System register DISR bits [31:0] are architecturally mapped to AArch64 System register [DISR_EL1](#)[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to DISR are UNDEFINED.

Attributes

DISR is a 32-bit register.

Field descriptions

When the ESB instruction is executed at EL2:

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:12]

Reserved, RES0.

AET, bits [11:10]

Asynchronous Error Type. See the description of [HSR.AET](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort Type. See the description of [HSR.EA](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

Fault Status Code. See the description of [HSR.DFSC](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 0:

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

Asynchronous Error Type. See the description of [DFSR.AET](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

External abort Type. See the description of [DFSR.ExT](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status Code. See the description of [DFSR.FS](#) for an SError interrupt.

The FS field is split as follows:

- FS[4] is DISR[10].
- FS[3:0] is DISR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

0b0 Using the Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When the ESB instruction is executed at EL0 or EL1 and where *TTBCR.EAE == 1*:

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

Asynchronous Error Type. See the description of [DFSR.AET](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

External abort Type. See the description of [DFSR.ExT](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

0b1 Using the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault Status Code. See the description of [DFSR.FS](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DISR

An indirect write to DISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

DISR is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, and any of the following apply:

- EL3 is using AArch64, `SCR_EL3.EA == 1`, and any of the following apply:
 - The PE is executing at EL2.
 - The PE is executing at EL1 and `((SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0) || HCR_EL2.AMO == 0)`.
- EL3 is using AArch32, `SCR.EA == 1`, and any of the following apply:
 - The PE is executing at EL2.
 - The PE is executing at EL1 and `(SCR.NS == 0 || HCR.AMO == 0)`.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0001	0b001

G8.6.2 ERRIDR, Error Record ID Register

The ERRIDR characteristics are:

Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

Configurations

AArch32 System register ERRIDR bits [31:0] are architecturally mapped to AArch64 System register [ERRIDR_EL1](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR are UNDEFINED.

Attributes

ERRIDR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates that no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

Accessing ERRIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0011	0b000

```

```

G8.6.3 ERRSELR, Error Record Select Register

The ERRSELR characteristics are:

Purpose

Selects an error record to be accessed through the Error Record System registers.

Configurations

AArch32 System register ERRSELR bits [31:0] are architecturally mapped to AArch64 System register [ERRSELR_EL1](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRSELR are UNDEFINED.

If [ERRIDR](#) indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR is UNDEFINED or RES0.

Attributes

ERRSELR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR.SEL is 0x0004, then direct reads and writes of [ERXSTATUS](#) access ERR4STATUS.

If ERRSELR.SEL is greater than or equal to [ERRIDR.NUM](#), then all of the following apply:

- The value read back from ERRSELR.SEL is UNKNOWN.
- One of the following occurs:
 - An UNKNOWN error record is selected.
 - The ERX* registers are RAZ/WI.
 - ERX* register reads and writes are NOPs.
 - ERX* register reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ERRSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0011	0b001

```

G8.6.4 ERXADDR, Selected Error Record Address Register

The ERXADDR characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>ADDR for the error record <n> selected by [ERRSELR.SEL](#).

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

AArch32 System register ERXADDR bits [31:0] are architecturally mapped to AArch64 System register [ERXADDR_EL1](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR are UNDEFINED.

Attributes

ERXADDR is a 32-bit register.

Field descriptions

Bits [31:0]

ERXADDR accesses bits [31:0] of ERR<n>ADDR, where <n> is the value in [ERRSELR.SEL](#).

Accessing ERXADDR

If [ERRIDR.NUM](#) is 0x0000 or [ERRSELR.SEL](#) is greater than or equal to [ERRIDR.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR is RAZ/WI.
- Direct reads and writes of ERXADDR are NOPs.
- Direct reads and writes of ERXADDR are UNDEFINED.

ERR<n>ADDR describes additional constraints that also apply when ERR<n>ADDR is accessed through ERXADDR.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0100	0b011

```

G8.6.5 ERXADDR2, Selected Error Record Address Register 2

The ERXADDR2 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>ADDR for the error record <n> selected by [ERRSEL.RSEL](#). For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

AArch32 System register ERXADDR2 bits [31:0] are architecturally mapped to AArch64 System register [ERXADDR_EL1](#)[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR2 are UNDEFINED.

Attributes

ERXADDR2 is a 32-bit register.

Field descriptions

Bits [31:0]

ERXADDR2 accesses bits [63:32] of ERR<n>ADDR, where <n> is the value in [ERRSEL.RSEL](#).

Accessing ERXADDR2

If [ERRIDR.NUM](#) is 0x0000 or [ERRSEL.RSEL](#) is greater than or equal to [ERRIDR.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR2 is RAZ/WI.
- Direct reads and writes of ERXADDR2 are NOPs.
- Direct reads and writes of ERXADDR2 are UNDEFINED.

ERR<n>ADDR describes additional constraints that also apply when ERR<n>ADDR is accessed through ERXADDR2.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.6.6 ERXCTLR, Selected Error Record Control Register

The ERXCTLR characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>CTLR for the error record <n> selected by [ERRSELR.SEL](#).

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

AArch32 System register ERXCTLR bits [31:0] are architecturally mapped to AArch64 System register [ERXCTLR_EL1](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTLR are UNDEFINED.

Attributes

ERXCTLR is a 32-bit register.

Field descriptions

Bits [31:0]

ERXCTLR accesses bits [31:0] of ERR<n>CTLR, where <n> is the value in [ERRSELR.SEL](#).

Accessing ERXCTLR

If [ERRIDR.NUM](#) is 0x0000 or [ERRSELR.SEL](#) is greater than or equal to [ERRIDR.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR is RAZ/WI.
- Direct reads and writes of ERXCTLR are NOPs.
- Direct reads and writes of ERXCTLR are UNDEFINED.

If [ERRSELR.SEL](#) is not the index of the first error record owned by a node, then ERR<n>CTLR[31:0] is not present, meaning reads and writes of ERXCTLR are RES0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.6.8 ERXFR, Selected Error Record Feature Register

The ERXFR characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>FR for the error record <n> selected by [ERRSEL.RSEL](#).

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

AArch32 System register ERXFR bits [31:0] are architecturally mapped to AArch64 System register [ERXFR_EL1](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXFR are UNDEFINED.

Attributes

ERXFR is a 32-bit register.

Field descriptions

Bits [31:0]

ERXFR accesses bits [31:0] of ERR<n>FR, where <n> is the value in [ERRSEL.RSEL](#).

Accessing ERXFR

If [ERRIDR.NUM](#) is 0x0000 or [ERRSEL.RSEL](#) is greater than or equal to [ERRIDR.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXFR is RAZ.
- Direct reads of ERXFR are NOPs.
- Direct reads of ERXFR are UNDEFINED.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.6.12 ERXMISC2, Selected Error Record Miscellaneous Register 2

The ERXMISC2 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC1 for the error record <n> selected by [ERRSELR.SEL](#).

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC2 bits [31:0] are architecturally mapped to AArch64 System register [ERXMISC1_EL1](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC2 are UNDEFINED.

Attributes

ERXMISC2 is a 32-bit register.

Field descriptions

Bits [31:0]

ERXMISC2 accesses bits [31:0] of ERR<n>MISC1, where <n> is the value in [ERRSELR.SEL](#).

Accessing ERXMISC2

If [ERRIDR.NUM](#) is 0x0000 or [ERRSELR.SEL](#) is greater than or equal to [ERRIDR.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC2 is RAZ/WI.
- Direct reads and writes of ERXMISC2 are NOPs.
- Direct reads and writes of ERXMISC2 are UNDEFINED.

ERR<n>MISC1 describes additional constraints that also apply when ERR<n>MISC1 is accessed through ERXMISC2.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0101	0b100

```

G8.6.14 ERXMISC4, Selected Error Record Miscellaneous Register 4

The ERXMISC4 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC2 for the error record <n> selected by [ERRSELR.SEL](#).

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC4 bits [31:0] are architecturally mapped to AArch64 System register [ERXMISC2_EL1](#)[31:0].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC4 are UNDEFINED.

Attributes

ERXMISC4 is a 32-bit register.

Field descriptions

Bits [31:0]

ERXMISC4 accesses bits [31:0] of ERR<n>MISC2, where <n> is the value in [ERRSELR.SEL](#).

Accessing ERXMISC4

If [ERRIDR.NUM](#) is 0x0000 or [ERRSELR.SEL](#) is greater than or equal to [ERRIDR.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC4 is RAZ/WI.
- Direct reads and writes of ERXMISC4 are NOPs.
- Direct reads and writes of ERXMISC4 are UNDEFINED.

ERR<n>MISC2 describes additional constraints that also apply when ERR<n>MISC2 is accessed through ERXMISC4.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.6.17 ERXMISC7, Selected Error Record Miscellaneous Register 7

The ERXMISC7 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>MISC3 for the error record <n> selected by ERRSELR.SEL.

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

AArch32 System register ERXMISC7 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC3_EL1[63:32].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC7 are UNDEFINED.

Attributes

ERXMISC7 is a 32-bit register.

Field descriptions

Bits [31:0]

ERXMISC7 accesses bits [63:32] of ERR<n>MISC3, where <n> is the value in ERRSELR.SEL.

Accessing ERXMISC7

If ERRIDR.NUM is 0x0000 or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC7 is RAZ/WI.
- Direct reads and writes of ERXMISC7 are NOPs.
- Direct reads and writes of ERXMISC7 are UNDEFINED.

ERR<n>MISC3 describes additional constraints that also apply when ERR<n>MISC3 is accessed through ERXMISC7.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0101	0b111

G8.6.19 VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt injected using [HCR.VA](#) is taken to EL1 using AArch32, then the syndrome value is reported in [DFSR](#). {AET, ExT} and the remainder of [DFSR](#) is set as defined by VMSAv8-32. For more information, see [Chapter G5 The AArch32 Virtual Memory System Architecture](#).

If the virtual SError interrupt injected using [HCR.VA](#) is deferred by an ESB instruction, then the syndrome value is written to [VDISR](#).

Configurations

AArch32 System register VDFSR bits [31:0] are architecturally mapped to AArch64 System register [VSESR_EL2](#)[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when [SCR.NS](#) == 1.

Attributes

VDFSR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[15:4] is set to VDFSR.AET.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR](#)[15:4] is set to VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[12] is set to VDFSR.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR](#)[12] is set to VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing VDFSR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.6.20 VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configurations

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register [VDISR_EL2](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDISR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VDFSR.AET](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VDFSR.ExT](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt.

0b10110 Asynchronous SError interrupt.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to `TTBCR.EAE` when an ESB instruction defers a virtual SError interrupt.

0b0 Using the Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When `TTBCR.EAE == 1`:

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from `VDFSR.AET`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from `VDFSR.ExT`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAAE, bit [9]

Format.

Set to `TTBCR.EAE` when an ESB instruction defers a virtual SError interrupt.

0b1 Using the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

0b010001 Asynchronous SError interrupt.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of `VDISR` occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when `SCR.NS == 1`.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.7 Generic Timer registers

This section lists the Generic Timer registers in AArch32.

G8.7.1 CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configurations

AArch32 System register CNTFRQ bits [31:0] are architecturally mapped to AArch64 System register [CNTFRQ_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTFRQ are UNDEFINED.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0000	0b000

```

if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') &&

```

if IsHighestEL(PSTATE.EL) then
  CNTFRQ = R[t];
else
  UNDEFINED;

```

G8.7.2 CNTHCTL, Counter-timer Hyp Control register

The CNTHCTL characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

Configurations

AArch32 System register CNTHCTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHCTL_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTHCTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHCTL is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

EVNTIS

Controls the scale of the generation of the event stream.

0b0 The CNTHCTL.EVNTI field applies to [CNTPCT](#)[15:0].

0b1 The CNTHCTL.EVNTI field applies to [CNTPCT](#)[23:8].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit of the counter register [CNTPCT](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If [FEAT_ECV](#) is implemented, and CNTHCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTPCT](#) is the trigger.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register `CNTPCT` trigger bit, defined by `EVNTI`, generates an event when the event stream is enabled:

0b0 A 0 to 1 transition of the trigger bit triggers an event.

0b1 A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register `CNTPCT`:

0b0 Disables the event stream.

0b1 Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL1PCEN, bit [1]

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode.

0b0 Non-secure EL0 and EL1 accesses to the `CNTP_CTL`, `CNTP_CVAL`, and `CNTP_TVAL` are trapped to Hyp mode, unless the it is trapped by `CNTKCTL.PL0PTEN`.

0b1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL1PCTEN, bit [0]

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode.

0b0 Non-secure EL0 and EL1 accesses to the `CNTPCT` are trapped to Hyp mode, unless it is trapped by `CNTKCTL.PL0PCTEN`.

0b1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHCTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1110	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    UNDEFINED;
elseif PSTATE.EL == EL2 then
```

```
    return CNTHCTL;  
elseif PSTATE.EL == EL3 then  
    return CNTHCTL;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1110	0b0001	0b000

```
if PSTATE.EL == EL0 then  
    UNDEFINED;  
elseif PSTATE.EL == EL1 then  
    UNDEFINED;  
elseif PSTATE.EL == EL2 then  
    CNTHCTL = R[t];  
elseif PSTATE.EL == EL3 then  
    CNTHCTL = R[t];
```

G8.7.3 CNTHP_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP_CTL characteristics are:

Purpose

Control register for the Hyp mode physical timer.

Configurations

AArch32 System register CNTHP_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHP_CTL_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTHP_CTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP_TVAL](#) continues to count down.

———— **Note** ————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, when the PE resets into EL2 or EL3, On a Warm reset, this field resets to 0.

Accessing CNTHP_CTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.7.4 CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP_CVAL characteristics are:

Purpose

Holds the compare value for the Hyp mode physical timer.

Configurations

AArch32 System register CNTHP_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHP_CVAL_EL2[63:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTHP_CVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTHP_CTL.ISTATUS is set to 1.
- If CNTHP_CTL.IMASK is 0, an interrupt is generated.

When CNTHP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_CVAL

Accesses to this register use the following encodings in the System register encoding space:

```

G8.7.5 CNTHP_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP_TVAL characteristics are:

Purpose

Holds the timer value for the Hyp mode physical timer.

Configurations

AArch32 System register CNTHP_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHP_TVAL_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTHP_TVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHP_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHP_CTL.ENABLE](#) is 1, the value returned is ([CNTHP_CVAL](#) - [CNTPCT](#)).

On a write of this register, [CNTHP_CVAL](#) is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - [CNTHP_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- [CNTHP_CTL.ISTATUS](#) is set to 1.
- If [CNTHP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

G8.7.6 CNTHPS_CTL, Counter-timer Secure Physical Timer Control Register (EL2)

The CNTHPS_CTL characteristics are:

Purpose

Provides AArch32 access from EL0 to the Secure EL2 physical timer.

Configurations

AArch32 System register CNTHPS_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHPS_CTL_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL are UNDEFINED.

Attributes

CNTHPS_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the CNTHPS_CTL.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHPS_TVAL_EL2](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_CTL

This register is accessed using the encoding for [CNTP_CTL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b001

```

G8.7.7 CNTHPS_CVAL, Counter-timer Secure Physical Timer CompareValue Register (EL2)

The CNTHPS_CVAL characteristics are:

Purpose

Provides AArch32 access from EL0 to the compare value for the Secure EL2 physical timer.

Configurations

AArch32 System register CNTHPS_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTHPS_CVAL_EL2](#)[63:0].

This register is present only when AArch32 is supported at EL0 and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL are UNDEFINED.

Attributes

CNTHPS_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHPS_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHPS_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHPS_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHPS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

```

G8.7.8 CNTHPS_TVAL, Counter-timer Secure Physical Timer TimerValue Register (EL2)

The CNTHPS_TVAL characteristics are:

Purpose

Provides AArch32 access from EL0 to the timer value for the Secure EL2 physical timer.

Configurations

AArch32 System register CNTHPS_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHPS_TVAL_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL are UNDEFINED.

Attributes

CNTHPS_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHPS_CTL_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHPS_CTL_EL2.ENABLE](#) is 1, the value returned is ([CNTHPS_CVAL_EL2](#) - [CNTPCT_EL0](#)).

On a write of this register, [CNTHPS_CVAL_EL2](#) is set to ([CNTPCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHPS_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - [CNTHPS_CVAL_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHPS_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHPS_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHPS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_TVAL

This register is accessed using the encoding for [CNTP_TVAL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b000

```

```

G8.7.9 CNTHV_CTL, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL characteristics are:

Purpose

Provides AArch32 access to the control register for the EL2 virtual timer.

Configurations

AArch32 System register CNTHV_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHV_CTL_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CTL are UNDEFINED.

Attributes

CNTHV_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHV_TVAL](#) continues to count down.

———— **Note** ————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_CTL

This register is accessed using the encoding for [CNTV_CTL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

G8.7.10 CNTHV_CVAL, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL characteristics are:

Purpose

Provides AArch32 access to the compare value for the EL2 virtual timer.

Configurations

AArch32 System register CNTHV_CVAL bits [63:0] are architecturally mapped to AArch64 System register CNTHV_CVAL_EL2[63:0].

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CVAL are UNDEFINED.

Attributes

CNTHV_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTHV_CTL.ISTATUS is set to 1.
- If CNTHV_CTL.IMASK is 0, an interrupt is generated.

When CNTHV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

Accessing CNTHV_CVAL

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1

G8.7.11 CNTHV_TVAL, Counter-timer Virtual Timer TimerValue register (EL2)

The CNTHV_TVAL characteristics are:

Purpose

Provides AArch32 access to the timer value for the EL2 virtual timer.

Configurations

AArch32 System register CNTHV_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHV_TVAL_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL are UNDEFINED.

Attributes

CNTHV_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHV_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHV_CTL.ENABLE](#) is 1, the value returned is ([CNTHV_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTHV_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - [CNTHV_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- [CNTHV_CTL.ISTATUS](#) is set to 1.
- If [CNTHV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

Accessing CNTHV_TVAL

This register is accessed using the encoding for [CNTV_TVAL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

```

G8.7.12 CNTHVS_CTL, Counter-timer Secure Virtual Timer Control Register (EL2)

The CNTHVS_CTL characteristics are:

Purpose

Provides AArch32 access from EL0 to the Secure EL2 virtual timer.

Configurations

AArch32 System register CNTHVS_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTHVS_CTL_EL2[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL are UNDEFINED.

Attributes

CNTHVS_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHVS_TVAL](#) continues to count down.

———— **Note** ————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHVS_CTL

This register is accessed using the encoding for [CNTV_CTL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

G8.7.13 CNTHVS_CVAL, Counter-timer Secure Virtual Timer CompareValue Register (EL2)

The CNTHVS_CVAL characteristics are:

Purpose

Provides AArch32 access to the compare value for the Secure EL2 virtual timer.

Configurations

AArch32 System register CNTHVS_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTHVS_CVAL_EL2](#)[63:0].

This register is present only when AArch32 is supported at EL0 and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CVAL are UNDEFINED.

Attributes

CNTHVS_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When [CNTHVS_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- [CNTHVS_CTL.ISTATUS](#) is set to 1.
- If [CNTHVS_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

Accessing CNTHVS_CVAL

This register is accessed using the encoding for [CNTV_CVAL](#).

Accesses to this register use the following encodings in the System register encoding space:

G8.7.14 CNTHVS_TVAL, Counter-timer Secure Virtual Timer TimerValue Register (EL2)

The CNTHVS_TVAL characteristics are:

Purpose

Provides AArch32 access to the timer value for the Secure EL2 virtual timer.

Configurations

AArch32 System register CNTHVS_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHVS_TVAL_EL2](#)[31:0].

This register is present only when AArch32 is supported at EL0 and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL are UNDEFINED.

Attributes

CNTHVS_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHVS_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHVS_CTL.ENABLE](#) is 1, the value returned is ([CNTHVS_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTHVS_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHVS_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - [CNTHVS_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHVS_CTL.ISTATUS](#) is set to 1.
- If [CNTHVS_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

Accessing CNTHVS_TVAL

This register is accessed using the encoding for [CNTV_TVAL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b000

```

```

G8.7.15 CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

Purpose

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

Configurations

AArch32 System register CNTKCTL bits [31:0] are architecturally mapped to AArch64 System register [CNTKCTL_EL1](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTKCTL are UNDEFINED.

Attributes

CNTKCTL is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

EVNTIS

Controls the scale of the generation of the event stream.

0b0 The CNTKCTL.EVNTI field applies to [CNTVCT](#)[15:0].

0b1 The CNTKCTL.EVNTI field applies to [CNTVCT](#)[23:8].

This control applies regardless of the value of the [CNTHCTL_EL2.ECV](#) bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:10]

Reserved, RES0.

PLOPTEN, bit [9]

Traps PL0 accesses to the physical timer registers to Undefined mode.

0b0 PL0 accesses to the [CNTP_CTL](#), [CNTP_CVAL](#), and [CNTP_TVAL](#) registers are trapped to Undefined mode.

0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0VTEN, bit [8]

Traps PL0 accesses to the virtual timer registers to Undefined mode.

0b0 PL0 accesses to the [CNTV_CTL](#), [CNTV_CVAL](#), and [CNTV_TVAL](#) registers are trapped to Undefined mode.

0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of the counter register [CNTVCT](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If [FEAT_ECV](#) is implemented, and [CNTKCTL.EVNTIS](#) is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTVCT](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register [CNTVCT](#) trigger bit, defined by [EVNTI](#), generates an event when the event stream is enabled:

0b0 A 0 to 1 transition of the trigger bit triggers an event.

0b1 A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTVCT](#):

0b0 Disables the event stream.

0b1 Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0VCTEN, bit [1]

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

0b0 PL0 accesses to the [CNTVCT](#) are trapped to Undefined mode.
PL0 accesses to the [CNTFRQ](#) register are trapped to Undefined mode, if [CNTKCTL.PL0PCTEN](#) is also 0.

0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL0PCTEN, bit [0]

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

0b0 PL0 accesses to the [CNTPCT](#) are trapped to Undefined mode.
PL0 accesses to the [CNTFRQ](#) register are trapped to Undefined mode, if [CNTKCTL.PL0VCTEN](#) is also 0.

0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTKCTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    return CNTKCTL;
elseif PSTATE.EL == EL2 then
    return CNTKCTL;
elseif PSTATE.EL == EL3 then
    return CNTKCTL;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    CNTKCTL = R[t];
elseif PSTATE.EL == EL2 then
    CNTKCTL = R[t];
elseif PSTATE.EL == EL3 then
    CNTKCTL = R[t];

```

G8.7.16 CNTP_CTL, Counter-timer Physical Timer Control register

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configurations

AArch32 System register CNTP_CTL bits [31:0] are architecturally mapped to AArch64 System register CNTP_CTL_ELO[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTP_CTL are UNDEFINED.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing CNTP_CTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0010	0b001

```

G8.7.17 CNTP_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configurations

AArch32 System register CNTP_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTP_CVAL_ELO](#)[63:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTP_CVAL are UNDEFINED.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- If [CNTP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

Accesses to this register use the following encodings in the System register encoding space:

G8.7.18 CNTP_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configurations

AArch32 System register CNTP_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTP_TVAL_ELO](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTP_TVAL are UNDEFINED.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP_CTL.ENABLE](#) is 1, the value returned is ([CNTP_CVAL](#) - [CNTPCT](#)).

On a write of this register, [CNTP_CVAL](#) is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - [CNTP_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- If [CNTP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

G8.7.20 CNTPCTSS, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS characteristics are:

Purpose

Holds the 64-bit physical count value.

Configurations

AArch32 System register CNTPCTSS bits [63:0] are architecturally mapped to AArch64 System register `CNTPCTSS_EL0`[63:0].

This register is present only when AArch32 is supported at EL0 and FEAT_ECV is implemented. Otherwise, direct accesses to CNTPCTSS are UNDEFINED.

All reads to the CNTPCTSS occur in program order relative to reads to `CNTPCT` or CNTPCTSS.

This register is a self-synchronised view of the `CNTPCT` counter, and cannot be read speculatively.

Attributes

CNTPCTSS is a 64-bit register.

Field descriptions

Bits [63:0]

Self-Synchronized Physical count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

```

G8.7.21 CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configurations

AArch32 System register CNTV_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTV_CTL_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTV_CTL are UNDEFINED.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV_TVAL](#) continues to count down.

————— Note —————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing CNTV_CTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b0011	0b001

```

G8.7.22 CNTV_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configurations

AArch32 System register CNTV_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTV_CVAL_EL0](#)[63:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTV_CVAL are UNDEFINED.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When [CNTV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- If [CNTV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

        CNTV_CVAL = R[t2]:R[t];
```

G8.7.23 CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configurations

AArch32 System register CNTV_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTV_TVAL_EL0](#)[31:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTV_TVAL are UNDEFINED.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If [CNTV_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV_CTL.ENABLE](#) is 1, the value returned is $(\text{CNTV_CVAL} - \text{CNTVCT})$.

On a write of this register, [CNTV_CVAL](#) is set to $(\text{CNTVCT} + \text{TimerValue})$, where TimerValue is treated as a signed 32-bit integer.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when $(\text{CNTVCT} - \text{CNTP_CVAL})$ is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- If [CNTV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b11110	0b0011	0b000

G8.7.24 CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in [CNTVOFF](#).

Configurations

AArch32 System register CNTVCT bits [63:0] are architecturally mapped to AArch64 System register [CNTVCT_EL0](#)[63:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTVCT are UNDEFINED.

The value of this register is the same as the value of [CNTPCT](#) in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented and is using AArch64, [HCR_EL2](#).{E2H, TGE} is {1, 1}, and this register is read from Non-secure EL0.

All reads to the CNTVCT occur in program order relative to reads to [CNTVCTSS](#) or CNTVCT.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

Bits [63:0]

Virtual count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT

```

G8.7.25 CNTVCTSS, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in [CNTPCT](#) minus the virtual offset visible in [CNTVOFF](#).

Configurations

AArch32 System register CNTVCTSS bits [63:0] are architecturally mapped to AArch64 System register [CNTVCTSS_EL0](#)[63:0].

This register is present only when AArch32 is supported at EL0 and FEAT_ECV is implemented. Otherwise, direct accesses to CNTVCTSS are UNDEFINED.

All reads to the CNTVCTSS occur in program order relative to reads to [CNTVCT](#) or CNTVCTSS.

This register is a self-synchronised view of the [CNTVCT](#) counter, and cannot be read speculatively.

Attributes

CNTVCTSS is a 64-bit register.

Field descriptions

Bits [63:0]

Self-Synchronized Virtual count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCTSS

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b1001

```

            return PhysicalCountInt() - CNTVOFF;
        else
            return PhysicalCountInt();
elseif PSTATE.EL == EL2 then
    return PhysicalCountInt() - CNTVOFF;
elseif PSTATE.EL == EL3 then
    if HaveEL(EL2) then
        return PhysicalCountInt() - CNTVOFF;
    else
        return PhysicalCountInt();
```

G8.7.26 CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in [CNTPCT](#) and the virtual count value visible in [CNTVCT](#).

Configurations

AArch32 System register CNTVOFF bits [63:0] are architecturally mapped to AArch64 System register [CNTVOFF_EL2](#)[63:0].

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to CNTVOFF are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

Note

When EL2 is implemented and is using AArch64, if [HCR_EL2](#).{E2H, TGE} is {1, 1}, the virtual counter uses a fixed virtual offset of zero when [CNTVCT](#) is read from Non-secure EL0.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

Bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
```

```
    UNDEFINED;  
elseif PSTATE.EL == EL2 then  
    return CNTVOFF;  
elseif PSTATE.EL == EL3 then  
    return CNTVOFF;
```

MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1
0b1111	0b1110	0b0100

```
if PSTATE.EL == EL0 then  
    UNDEFINED;  
elseif PSTATE.EL == EL1 then  
    UNDEFINED;  
elseif PSTATE.EL == EL2 then  
    CNTVOFF = R[t2]:R[t];  
elseif PSTATE.EL == EL3 then  
    CNTVOFF = R[t2]:R[t];
```

Part H

External Debug

Chapter H1

About External Debug

This chapter gives an overview of Armv8 external debug and specifies the required debug authentication. It contains the following sections:

- [Introduction to external debug on page H1-7334.](#)
- [External debug on page H1-7335.](#)
- [Required debug authentication on page H1-7336.](#)

———— **Note** —————

For information about self-hosted debug, see [Chapter D2 AArch64 Self-hosted Debug](#) and [Chapter G2 AArch32 Self-hosted Debug](#).

H1.1 Introduction to external debug

Armv8 supports both:

Self-hosted debug

The PE itself hosts a debugger. That is, developers developing software to run on the PE use debugger software running on the same PE.

External debug

The debugger is external to the PE. The debugging might be either on-chip, for example in a second PE, or off-chip, for example a JTAG debugger that accesses the chip through a Debug Access Port.

External debug is particularly useful for:

- Hardware bring-up. That is, debugging during development when a system is first powered up and not all of the software functionality is available.
- PEs that are deeply embedded inside systems.

To support external debug, the Arm architecture defines required features that are called *external debug features*.

————— Note —————

An external debugger has a potentially high level of control over and visibility into the PE. The system sets this level using debug authentication. See [Required debug authentication on page H1-7336](#).

If the debug authentication level is set too low, agents may be able to bypass elements of the security and privilege models. This includes both off-chip agents and on-chip agents such as unprivileged or Non-secure software.

H1.1.1 Definition and constraints of a debugger in the context of external debug

When the description of external debug in this Part of the manual describes a *debugger* as controlling external debug this debugger might be a second on-chip PE or an off-chip device such as a JTAG debugger using a Debug Access Port (DAP).

If a Debug Access Port is implemented:

- When debug is prohibited at the Debug Access Port, the port must not generate accesses to the external debug interface of the PE.
- When Secure debug is prohibited at the Debug Access Port, the port must not generate Secure accesses to the external debug interface of the PE.
- When Secure accesses are allowed at the Debug Access Port, the port must be able to generate Secure accesses.

If `FEAT_Debugv8p4` is not implemented, accesses to the PE are controlled by the external authentication interface functions, `ExternalInvasiveDebugEnabled()`, `ExternalNoninvasiveDebugEnabled()`, `ExternalSecureNoninvasiveDebugEnabled()` and `ExternalSecureInvasiveDebugEnabled()`. The external authentication interface functions override `MDCR_EL3.{EPMAD, EDAD}`.

If `FEAT_TRF` is implemented, the bus Requester, which may be the Debug Access Port, controls the accesses it makes to the PE and `MDCR_EL3.{EPMAD, EDAD}` control Non-secure access to registers.

The Debug Access Port is not required to use the same authentication interface as the PE.

Arm recommends the following authentication interface:

- When `ExternalSecureInvasiveDebugEnabled() == FALSE` at the PE, Secure debug is disabled at the DAP.
- When `ExternalInvasiveDebugEnabled() == FALSE` at the PE, all debug is prohibited at the DAP.

H1.2 External debug

Debug events allow an external debugger to halt the PE. Armv8 provides the following debug events:

- [Halting Step debug events on page H3-7380](#):
 - The debugger can use this resource to make the PE step through code one line at a time.
- [Halt Instruction debug event on page H3-7390](#):
 - This might occur when software executes the Halting breakpoint instruction, HLT.
- [Exception Catch debug event on page H3-7391](#):
 - This can be programmed to occur on all entries to a given Exception level.
- [External Debug Request debug event on page H3-7395](#):
 - An embedded cross-trigger can signal this debug event.
- [OS Unlock Catch debug event on page H3-7396](#):
 - This might occur when the state of the OS Lock changes from locked to unlocked.
- [Reset Catch debug events on page H3-7397](#):
 - This might occur when the PE exits reset state.
- [Software Access debug event on page H3-7398](#):
 - This can be programmed to occur when software tries to access the Breakpoint Value registers, the Breakpoint Control registers, the Watchpoint value registers, or the Watchpoint Control registers. It caused a trap to Debug state.

Breakpoints and watchpoints can also halt the PE.

When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state:
 - The ITR contains a single register, EDITR, and associated flow-control flags.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger:
 - The DCC includes the data transfer registers, DTRRX and DTRTX, and associated flow-control flags.
 - Although the DCC is an essential part of Debug state operation, it can also be used in Non-debug state.
- The PE cannot service any interrupts in Debug state.

[Chapter H2 Debug State](#) describes Debug state in more detail.

H1.3 Required debug authentication

Any implementation must provide the debug authentication defined in this section, that controls:

- Whether the PE can halt.
- Whether some aspects of non-invasive debug are permitted.
- Some legacy aspects of the AArch32 self-hosted debug model.

The pseudocode functions shown in [Table H1-1 on page H1-7336](#), and the conditions that follow that table, define the architectural requirements for debug authentication.

Table H1-1 Debug authentication functions

Pseudocode function	Description
ExternalSecureNoninvasiveDebugEnabled()	Returns TRUE if Secure non-invasive debug is enabled.
AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()	Returns TRUE if Secure invasive self-hosted debug is enabled in AArch32 state.
ExternalSecureInvasiveDebugEnabled()	Returns TRUE if Secure invasive debug is enabled.
ExternalNoninvasiveDebugEnabled()	Returns TRUE if Non-secure non-invasive debug is enabled.
ExternalInvasiveDebugEnabled()	Returns TRUE if Non-secure invasive debug is enabled.

The following conditions always apply:

- If [ExternalInvasiveDebugEnabled\(\)](#) is FALSE then [ExternalSecureInvasiveDebugEnabled\(\)](#) is FALSE.
- If [ExternalNoninvasiveDebugEnabled\(\)](#) is FALSE then [ExternalSecureNoninvasiveDebugEnabled\(\)](#) is FALSE.
- If [ExternalInvasiveDebugEnabled\(\)](#) is TRUE then [ExternalNoninvasiveDebugEnabled\(\)](#) is TRUE.
- If [ExternalSecureInvasiveDebugEnabled\(\)](#) is TRUE then [ExternalSecureNoninvasiveDebugEnabled\(\)](#) is TRUE.

If FEAT_Debugv8p4 is implemented:

- [ExternalNoninvasiveDebugEnabled\(\)](#) always returns TRUE.
- [ExternalSecureNoninvasiveDebugEnabled\(\)](#) returns the same as [ExternalSecureInvasiveDebugEnabled\(\)](#).

Arm recommends the use of the interface described in [Recommended authentication interface on page K2-8431](#) to provide this debug authentication. The pseudocode functions in [Chapter J1 Armv8 Pseudocode](#), that are linked to by the entries in the [Pseudocode function on page H1-7336](#) column of [Table H1-1 on page H1-7336](#), assume that this interface is implemented.

Chapter H2

Debug State

This chapter describes Debug state. It contains the following sections:

- [About Debug state on page H2-7338.](#)
- [Halting the PE on debug events on page H2-7339.](#)
- [Entering Debug state on page H2-7345.](#)
- [Behavior in Debug state on page H2-7348.](#)
- [Exiting Debug state on page H2-7375.](#)

———— **Note** —————

[Table K15-1 on page K15-8602](#) disambiguates the general register references used in this chapter.

H2.1 About Debug state

In external debug, debug events allow an external debugger to halt the PE. The PE then enters Debug state. When the PE is in Debug state:

- It stops executing instructions from the location indicated by the program counter, and is instead controlled through the external debug interface.
- The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state.
- The *Debug Communications Channel*, DCC, passes data between the PE and the debugger.

The PE cannot service any interrupts in Debug state.

H2.2 Halting the PE on debug events

For details of debug events, see [Introduction to Halting debug events on page H3-7378](#) and [Breakpoint and Watchpoint debug events on page H2-7340](#).

On a debug event, the PE must do one of the following:

- Enter Debug state.
- Pend the debug event.
- Generate a debug exception.
- Ignore the debug event.

This behavior depends on both:

- Whether halting is allowed by the current state of the debug authentication interface. See [Halting allowed and halting prohibited on page H2-7339](#).
- The type of debug event and the programming of the debug control registers.
 - See [Halting debug events on page H2-7339](#) for all Halting debug events.
 - See [Breakpoint and Watchpoint debug events on page H2-7340](#) for Breakpoint and Watchpoint debug events.

See also [Other debug exceptions on page H2-7340](#).

This means that behavior can be CONSTRAINED UNPREDICTABLE if the conditions change. See [Synchronization and Halting debug events on page H3-7399](#).

[Summary of debug events and possible outcomes on page H3-7378](#) summarizes the possible outcomes of each type of debug event.

H2.2.1 Halting allowed and halting prohibited

Halting can be either allowed or prohibited:

- Halting is always prohibited in Debug state.
- Halting is always prohibited when `DoubleLockStatus() == TRUE`.
 - This means that `FEAT_DoubleLock` is implemented and OS Double lock is locked.
- Halting is also controlled by the IMPLEMENTATION DEFINED authentication interface, and is prohibited when either:
 - The PE is in Non-secure state and `ExternalInvasiveDebugEnabled() == FALSE`.
 - The PE is in Secure state and `ExternalSecureInvasiveDebugEnabled() == FALSE`.

Note

See [Appendix K2 Recommended External Debug Interface](#) for more information on these functions.

- Otherwise, halting is allowed.

For more information, see:

- [Pseudocode description of Halting on debug events on page H2-7344](#)
- [Required debug authentication on page H1-7336](#).

H2.2.2 Halting debug events

The Halting debug events are described in [Chapter H3 Halting Debug Events](#).

When a Halting debug event is generated, it causes entry to Debug state if all of:

- Halting is allowed. See [Halting allowed and halting prohibited on page H2-7339](#).
- The Halting debug event is one of:
 - A Halt Instruction debug event and `EDSCR.HDE == 1`.
 - A Software Access debug event and `OSLSR_EL1.OSLK == 0`, meaning that the OS Lock is unlocked.
 - Neither a Halt Instruction debug event nor a Software Access debug event.

Note

- A Halt Instruction debug event is the only Halting debug event that relies on `EDSCR.HDE == 1`.
 - Halting on Breakpoint and Watchpoint debug events is also controlled by `EDSCR.HDE`. See [Breakpoint and Watchpoint debug events on page H2-7340](#).
 - `EDSCR.HDE` can be written by software when the OS Lock is locked. Privileged code can use `MDCR_EL3.TDOSA` and `HDCR.TDOSA` to trap writes to these registers.
-

If a Halting debug event does not generate entry to Debug state because the conditions listed in this section do not hold, then:

- If the Halting debug event is a Halt Instruction debug event, the instruction that generated the Halting debug event is treated as `UNDEFINED`.
- If the Halting debug event is an Exception Catch debug event or a Software Access debug event, it is ignored.

In all other cases the Halting debug event is pended, see [Pending Halting debug events on page H3-7399](#).

[Summary of actions from debug events on page H2-7343](#) summarizes the possible outcome for each type of Debug event.

Note

Halting debug events never generate debug exceptions.

H2.2.3 Breakpoint and Watchpoint debug events

A breakpoint or watchpoint generates an entry to Debug state if all of the following conditions hold:

- Halting debug is enabled, that is `EDSCR.HDE == 1`.
- Halting is allowed. See [Halting allowed and halting prohibited on page H2-7339](#).
- The OS Lock is unlocked, that is `OSLSR.OSLK == 0`.

The Address Mismatch breakpoint type is reserved when all of these conditions are met.

`MDCR_EL1.MDE` or `DBGDSCRext.MDBGen` is ignored when determining whether to enter Debug state. A breakpoint or watchpoint that generates entry to Debug state is a Breakpoint or Watchpoint debug event and does not generate a debug exception.

A breakpoint or watchpoint that does not generate an entry to Debug state either:

- Generates a Breakpoint or Watchpoint exception.
- Is ignored.

Note

`EDSCR.HDE` is ignored when determining whether to generate a debug exception. The debug exception is suppressed only if the PE enters Debug state. This means that the use of Halting debug mode in Non-secure state does not affect the Exception model in Secure state.

See [Chapter D2 AArch64 Self-hosted Debug](#), [Chapter G2 AArch32 Self-hosted Debug](#), and the Note in [Other debug exceptions on page H2-7340](#).

H2.2.4 Other debug exceptions

The following events never generate entry to Debug state:

- Breakpoint Instruction exceptions.
- Software Step exceptions.
- Vector Catch exceptions.

The behavior of these events is unchanged when Halting debug mode is enabled, that is when `EDSCR.HDE == 1`. This means that these events can do one of the following:

- They can generate a debug exception.

- They can be ignored.

For additional information, see [Chapter D2 AArch64 Self-hosted Debug](#) and [Chapter G2 AArch32 Self-hosted Debug](#).

H2.2.5 Debug state entry and debug event prioritization

The following are synchronous debug events:

- Breakpoint debug event.
- Watchpoint debug event.
- Halting Step debug event.
- Halt Instruction debug event.
- Exception Catch debug event.
- Software Access debug event.
- Reset Catch debug event.

Each of these synchronous debug events are treated as a synchronous exception generated by an instruction, or by the taking of an exception or reset. That is, if halting is allowed, the synchronous debug event must be taken before any subsequent instructions are executed. Reset Catch debug events must be taken before the PE executes the instruction at the reset vector.

Note

- Reset Catch and Exception Catch debug events might be generated asynchronously, because they can result from an asynchronous exception. However, if halting is allowed after the reset or asynchronous exception has been processed, the Reset Catch or Exception Catch debug event is taken synchronously.
- The Halting Step debug event is generated by the instruction after the stepped instruction. Therefore, if the stepped instruction generates any other synchronous exceptions or debug events these are taken first.

If halting is prohibited then Halting Step debug events and Reset Catch debug events might be pended and taken asynchronously. OS Unlock Catch debug events are always pended and taken asynchronously. See [Pending Halting debug events on page H3-7399](#).

The architecture does not define when asynchronous debug events are taken, and therefore the prioritization of asynchronous debug events is IMPLEMENTATION DEFINED. See [Synchronization and Halting debug events on page H3-7399](#).

The following list shows how the synchronous debug events are prioritized, with 1 being the highest priority.

Note

The priority numbering is the same as the numbering for AArch64 synchronous exception priorities listed in [Synchronous exception types, routing and priorities on page D1-2489](#), and in particular [Prioritization and recognition of interrupts on page D1-2508](#). This numbering correlates with the equivalent AArch32 list in [Exception prioritization for exceptions taken to AArch32 state on page G1-6046](#).

The priority for synchronous debug events is as follows:

- 1 Reset Catch debug event. See [Reset Catch debug events on page H3-7397](#).
This debug event has a higher priority than the synchronous exceptions listed in [Synchronous exception types, routing and priorities on page D1-2489](#).
- 2 Exception Catch debug event. See [Exception Catch debug event on page H3-7391](#).
This debug event can be assigned one of two priorities. When it has a priority of 2, it has a higher priority than the synchronous exceptions listed in the Exception model. See [Exception Catch debug event on page H3-7391](#).
- 3 Halting Step debug event. See [Halting Step debug events on page H3-7380](#).
This debug event has a higher priority than the synchronous exceptions listed in the Exception model.
- 4 This event is not a debug event.

- 5 Exception Catch debug event. See [Exception Catch debug event on page H3-7391](#). This debug event can be assigned one of two priorities, 0 or 5. See [Exception Catch debug event on page H3-7391](#).
- 6 - 7 These events are not debug events.
- 8 Breakpoint exception or debug event or Address Matching Vector Catch exception. See [Breakpoint exceptions on page D2-2579](#), and [Vector Catch exceptions on page G2-6209](#). These two debug events have the same priority.
- 9 This event is not a debug event.
- 10 Halt Instruction debug event. See [Halt Instruction debug event on page H3-7390](#).
- 11 - 26 These events are not debug events.
- 27 Software Access debug event. See [Software Access debug event on page H3-7398](#).
- 28 - 29 These events are not debug events.
- 30 Watchpoint exception or debug event. See [Watchpoint exceptions on page D2-2598](#) for exceptions taken from AArch64 state, or [Watchpoint exceptions on page G2-6195](#) for exceptions taken from AArch32 state.
- 31 This event is not a debug event.

For Reset Catch debug events and Halting Step debug events, the priorities listed in this section apply only when halting is allowed at the time the event is generated. This means that the event is taken synchronously and not pended.

For more information on the prioritization of exceptions, see:

- [Synchronous exception types, routing and priorities on page D1-2489](#).
- [Prioritization and recognition of interrupts on page D1-2508](#).
- [Exception prioritization for exceptions taken to AArch32 state on page G1-6046](#). This section covers synchronous and asynchronous exceptions.

Breakpoint debug events and Vector Catch exception

An Address Matching Vector Catch exception has the same priority as a Breakpoint debug event. See [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2490](#).

The prioritization of these events is unchanged even if the breakpoint generates entry to Debug state instead of a Breakpoint exception. This means that if a single instruction generates both an Address Matching Vector Catch exception and a Breakpoint debug event, there is a CONSTRAINED UNPREDICTABLE choice of:

- The PE entering Debug state due to the Breakpoint debug event.
- A Vector Catch exception.

This applies only if all of the following are true:

- Halting debug is enabled.
- Halting is allowed.
- The OS Lock is unlocked.

An Exception Trapping Vector Catch exception must be generated immediately following the exception that generated it. This means that it does not appear in the priority table.

H2.2.6 Imprecise entry to Debug state

Debug state entry is normally *precise*. This means that the PE cannot enter Debug state if it can neither complete nor abandon all currently executing instructions and leave the PE in a precise state. See [Definition of a precise exception on page D1-2455](#).

A debugger can write a value of 1 to `EDRCR.CBRRQ` to allow imprecise entry to Debug state. An External Debug Request debug event must be pending before writing 1 to this bit. Support for this feature is OPTIONAL and it is IMPLEMENTATION DEFINED when it is effective at forcing entry to Debug state.

The PE ignores writes to this bit if either:

- External debugging is not enabled, meaning `ExternalInvasiveDebugEnabled() == FALSE`.

- Secure external debugging is not enabled, meaning `ExternalSecureInvasiveDebugEnabled() == FALSE`, and either:
 - EL3 is not implemented and the implemented Security state is Secure state.
 - EL3 is implemented.

Example H2-1 on page H2-7343 shows how entry to Debug state can be forced.

Example H2-1 Forcing entry to Debug state

The debugger sends an External Debug Request debug event through the CTI to halt a program that has stopped responding. However, the memory system is not responding and a memory access instruction cannot complete. This means that Debug state cannot be entered precisely. The debugger writes a value of 1 to `EDRCR.CBRRQ`. The PE cancels all outstanding memory accesses and enters Debug state. As some instructions might not have completed correctly, entry to Debug state is imprecise.

When Debug state is entered imprecisely, all memory access instructions executed through the ITR have CONSTRAINED UNPREDICTABLE behavior. The value of all registers is UNKNOWN, but might be useful for diagnostic purposes.

H2.2.7 Summary of actions from debug events

Table H2-1 on page H2-7344 shows the Software and Halting debug events. In Table H2-1 on page H2-7344, the columns have the following meaning:

Debug event type

This means the type of debug event where:

Other software

Means one of:

- [Software Step exceptions on page D2-2613](#).
- [Breakpoint Instruction exceptions on page D2-2577](#).
- [Vector Catch exceptions on page D2-2612](#) for AArch64 state or [Vector Catch exceptions on page G2-6209](#) for AArch32 state.

Other Halting

Means one of the following:

- [Halting Step debug events on page H3-7380](#).
- [External Debug Request debug event on page H3-7395](#).
- [Reset Catch debug events on page H3-7397](#).
- [OS Unlock Catch debug event on page H3-7396](#).

Other debug events are referred to explicitly.

Authentication

This means halting is allowed by the IMPLEMENTATION DEFINED external authentication interface. It is the result of one of the following pseudocode functions:

In Secure state `ExternalSecureInvasiveDebugEnabled()`.

In Non-secure state `ExternalInvasiveDebugEnabled()`.

- DLK** This indicates whether `FEAT_DoubleLock` is implemented and locked, `DoubleLockStatus() == TRUE`.
- OSLK** This is the value of `OSLSR.OSLK`. It indicates whether the OS Lock is locked.
- HDE** This is the value of `EDSCR.HDE`. It indicates whether Halting debug is enabled.

The letter X in [Table H2-1 on page H2-7344](#) indicates that the value can be either 0 or 1.

Table H2-1 Debug authentication for external debug

Debug event type	Authentication	DLK	OSLK	HDE	Behavior
Other software	X	X	X	X	Handled by the Exception model
Breakpoint or Watchpoint debug event	X	TRUE	X	X	Handled by the Exception model (ignored)
	X	FALSE	1	X	Handled by the Exception model (ignored)
	FALSE	FALSE	0	X	Handled by the Exception model
	TRUE	FALSE	0	0	Handled by the Exception model
	TRUE	FALSE	0	1	Entry to Debug state
Halt Instruction debug event	FALSE	X	X	X	undefined
	TRUE	TRUE	X	X	undefined
	TRUE	FALSE	X	0	undefined
	TRUE	FALSE	X	1	Entry to Debug state
Exception Catch debug event	FALSE	X	X	X	Ignored
	TRUE	TRUE	X	X	Ignored
	TRUE	FALSE	X	X	Entry to Debug state
Software Access debug event	FALSE	X	X	X	Ignored
	TRUE	TRUE	X	X	Ignored
	TRUE	FALSE	1	X	Ignored
	TRUE	FALSE	0	X	Entry to Debug state
Other Halting	FALSE	X	X	X	Debug event is pended
	TRUE	TRUE	X	X	Debug event is pended
	TRUE	FALSE	X	X	Entry to Debug state

H2.2.8 Pseudocode description of Halting on debug events

The `Halted()`, `Restarting()`, `HaltingAllowed()`, and `HaltOnBreakpointOrWatchpoint()` functions are described in the Armv8 pseudocode.

H2.3 Entering Debug state

On entry to Debug state, the preferred restart address and `PSTATE` are saved in `DLR` and `DSPSR`. The PE remains in the mode and security state from which it entered Debug state.

If `EDRCR.CBRRQ` has a value of 0, entry to Debug state is precise. If `EDRCR.CBRRQ` has a value of 1, then imprecise entry to Debug state is permitted.

If a Watchpoint debug event causes an entry to Debug state, the address of the access that generated the Watchpoint debug event is recorded in `EDWAR`.

For more information, see:

- [Determining the memory location that caused a Watchpoint exception on page D2-2606](#) for a debug event taken from AArch64 state.
- [Determining the memory location that caused a Watchpoint exception on page G2-6202](#) for a debug event taken from AArch32 state.

Other than the effect on `PSTATE` and `EDSCR`, entry to Debug state is not a *Context synchronization event*. The effects of entry to Debug state on `PSTATE` and `EDSCR` are synchronized.

H2.3.1 Entering Debug state from AArch32 state

When entering Debug state from AArch32 state, the PE remains in AArch32 state. In AArch32 Debug state the PE executes T32 instructions, regardless of the value of `PSTATE.T` before entering Debug state.

To allow the debugger to determine the state of the PE, the current Execution state for all four Exception levels can be read from `EDSCR.RW`, and the current Exception level can be read from `EDSCR.EL`.

The current endianness state, `PSTATE.E`, is unchanged on entry to Debug state.

———— Note —————

- If EL1 is using AArch32 state, the current endianness state can differ from that indicated by `SCTLR.EE`.
- If EL2 is using AArch32 state, the current endianness state can differ from that indicated by `HSCTLR.EE`.
- On entry to Debug state from AArch32 state, `PSTATE.SS` is copied to `DSPSR.SS`, even though the PE remains in AArch32 state.

See also [Effect of entering Debug state on PSTATE on page H2-7346](#).

H2.3.2 Effect of Debug state entry on DLR and DSPSR

`DLR` is set to the preferred restart address for the debug event, that depends on the event type. The value of `PSTATE` is saved in `DSPSR`.

For entry to Debug state from AArch32 state, the values saved in `DSPSR.IT` are always correct for the preferred restart address.

For synchronous Halting debug events, the preferred restart address is the address of the instruction that generated the debug event. It is CONSTRAINED UNPREDICTABLE whether `DSPSR_EL0.BTYPE` is set to the value of `PSTATE.BTYPE` or 0 for synchronous debug events other than the following debug events:

- A Halting Step debug event.
- A Breakpoint debug event.
- A Halt Instruction debug event.

For asynchronous Halting debug events, including pending Halting debug events taken asynchronously, the preferred restart address is the address of the first instruction that must be executed on exit from Debug state.

This means that:

- For Breakpoint and Watchpoint debug events, the preferred restart address is the same as the preferred return address for a debug exception, as described in [Chapter D2 AArch64 Self-hosted Debug](#) and [Chapter G2 AArch32 Self-hosted Debug](#).

- For Halt Instruction debug events, **DLR** is set to the address of the HLT instruction and **DSPSR.IT** is correct for the HLT instruction.
 - For Software Access debug events, **DLR** is set to the address of the accessing instruction and **DSPSR.IT** is correct for this instruction.
 - For Halting Step debug events taken synchronously, **DLR** and **DSPSR** are set as the ELR and SPSR would be set for a Software Step exception. This is usually the address of, and **PSTATE** for, the instruction after the one that was stepped.
 - For Exception Catch debug events:
 - If the debug event is generated on taking an exception to a trapped Exception level, the **DLR** is set to the address of the exception vector the PE would have started fetching from. This is UNKNOWN if the **VBAR** for the Exception level has never been initialized. The **DSPSR** records the value of **PSTATE** after taking the exception. The Exception Catch occurs after the **SPSR** and the Link register are set, and the debugger can use these registers to determine where in the application program the exception occurred.
- **Note** —————
- Depending on the target Exception level and Execution state for the exception, the Link register is one of **ELR_EL1**, **ELR_EL2**, **ELR_EL3**, **ELR_hyp**, or LR (R14).
- If the debug event is generated on an exception return to a trapped Exception level, the **DLR** is set to the target address of the exception return and the **DSPSR** records the value of **PSTATE** after the exception return.
 - Reset Catch debug events taken synchronously behave like Exception Catch debug events.
 - For Reset Catch debug events and Exception Catch debug events generated on reset to a trapped Exception level, the **DLR** is set to is set to the reset address and the **DSPSR** records the reset value of **PSTATE**.
 - For pending Halting debug events and External Debug Request debug events, **DLR** is set to the address of the first instruction that must be executed on exit from Debug state and **DSPSR.IT** is correct for this instruction. See [Pending Halting debug events on page H3-7399](#).

Normally **DLR** is aligned according to the instruction set state indicated in **DSPSR**. However, a debug event might be taken at a point where the PC is not aligned.

H2.3.3 Effect of Debug state entry on System registers, the Event register, and Exclusives monitors

Entering Debug state has no effect on System registers other than **DLR** and **DSPSR**. In particular, ESRs, FARs, and FSRs are not updated on entering Debug state. **SCR** is unchanged, even when entering Debug state from EL3.

Entering Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors.

———— **Note** —————

Entry to Debug state might set the Event Register or clear the Exclusives monitors, or both. However, this is not a requirement, and debuggers must not rely on any implementation specific behavior.

Unless otherwise described in this reference manual, instructions executed in Debug state have their architecturally-defined effects on the System registers, the Event register, and Exclusives monitors.

H2.3.4 Effect of entering Debug state on PSTATE

The effect of an entry to Debug state on **PSTATE** is described in [Entering Debug state on page H2-7345](#) and [Entering Debug state from AArch32 state on page H2-7345](#).

On entry to Debug state after **PSTATE** is saved in **DSPSR**:

- **PSTATE.IL** is cleared to 0.
- **PSTATE.TCO** is set to 1.
- **PSTATE.BTYPE** is set to 0.
- **PSTATE**.{IT, T, SS, D, A, I, F, SSBS} are set to UNKNOWN values

PSTATE.{N, Z, C, V, Q, GE, E, M, nRW, EL, SP, PAN, UAO, DIT} are unchanged.

For more information, see [PSTATE in Debug state on page H2-7348](#).

H2.3.5 Entering Debug state during loads and stores

The PE can enter Debug state during instructions that perform a sequence of memory accesses, as opposed to a single single-copy atomic access, because of a Watchpoint debug event. The effect of entering Debug state on such an instruction is the same as taking a Data Abort exception during such an instruction.

In addition, when executing in AArch64 state, the PE can enter Debug state during instructions that perform a sequence of memory accesses because of an External Debug Request debug event. The effect of entering Debug state on such an instruction is the same as taking an interrupt exception during such an instruction.

This applies to all memory types.

H2.3.6 Entering Debug state and Software Step

When Software Step is active, a debug event that causes entry to Debug state behaves like an exception taken to an Exception level above the debug target Exception level. That is:

- If the instruction that is stepped generates a synchronous debug event that causes entry to Debug state, or an asynchronous debug event is taken before the step completes, the PE enters Debug state with `DSPSR.SS` set to 1.
- A pending Halting debug event or an asynchronous debug event can be taken after the step has completed. In this case the PE enters Debug state with `DSPSR.SS` set to 0.

In addition:

- If the instruction that is stepped generates an exception trapped by an Exception Catch debug event, the PE enters Debug state at the exception vector with `DSPSR.SS` set to 0. This is because `PSTATE.SS` is set to 0 by taking the exception.
- If the PE is reset, `PSTATE.SS` is reset to 0. If the following debug events are enabled, the PE enters Debug state with `DSPSR.SS` set to 0:
 - Reset Catch debug event at the reset Exception level.
 - Exception Catch debug event at the reset Exception level.
 - Halting Step debug event.
- If Halting Step is also active, then Halting Step and Software Step operate in parallel and can both become active-pending. In this case Halting step has a higher priority than Software step. This means that the PE enters Debug state and `DSPSR.SS` is set to 0.

H2.3.7 Pseudocode description of entering Debug state

The `DebugHalt` constants are described in [shared/debug/halting/DebugHalt on page J1-8233](#) in the Armv8 pseudocode. The `UpdateEDSCRFields()` and `Halt()` functions are described in [Chapter J1 Armv8 Pseudocode](#).

H2.4 Behavior in Debug state

Instructions are executed in Debug state from the Instruction Transfer Register, ITR. The debugger controls which instructions are executed in Debug state by writing the instructions to the External Debug Instruction Transfer register, [EDITR](#). The Execution state of the PE determines which instruction set is executed:

- If the PE is in AArch64 state it executes A64 instructions.
- If the PE is in AArch32 state it executes T32 instructions:
 - For a 32-bit T32 instruction, [EDITR\[15:0\]](#) specifies the first halfword and [EDITR\[31:16\]](#) specifies the second halfword.
 - For a 16-bit T32 instruction, [EDITR\[15:0\]](#) contains the instruction and [EDITR\[31:16\]](#) is ignored. All 16-bit T32 instructions are UNPREDICTABLE in Debug state.

The PE does not execute A32 instructions in Debug state.

Some instructions are available only in Debug state. See [Debug state operations, DCPS, DRPS, MRS, MSR](#) on page H2-7366. In Non-debug state these instructions are UNDEFINED.

The following sections describe behavior in Debug state:

- [PSTATE in Debug state](#) on page H2-7348.
- [Executing instructions in Debug state](#) on page H2-7349.
- [Decode tables](#) on page H2-7361.
- [Security in Debug state](#) on page H2-7365.
- [Privilege in Debug state](#) on page H2-7366.
- [Debug state operations, DCPS, DRPS, MRS, MSR](#) on page H2-7366.
- [Exceptions in Debug state](#) on page H2-7369.
- [Accessing registers in Debug state](#) on page H2-7371.
- [Accessing memory in Debug state](#) on page H2-7374.

This section specifies the CONSTRAINED UNPREDICTABLE behaviors that apply in Debug state, but see [Changing the value of EDECR.SS when not in Debug state](#) on page H3-7387 for a change in Non-debug state that causes CONSTRAINED UNPREDICTABLE behavior.

H2.4.1 PSTATE in Debug state

[PSTATE](#).{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F, SSBS} are all ignored in Debug state:

- There are no conditional instructions in Debug state.
- In AArch32 state, the PE executes only T32 instructions and [PSTATE.IT](#) is ignored.
- Asynchronous exceptions and debug events are ignored.
- Software step is inactive.

Instructions executed in Debug state indirectly read [PSTATE](#).{UAO, PAN, IL, E, M, nRW, EL, SP} as they would in Non-debug state.

———— Note —————

[PSTATE.DIT](#) is not guaranteed to have any effect in Debug state.

In Debug state:

- [PSTATE.PAN](#) is set to 1 by:
 - A DCPS instruction to EL1 using AArch64 if [SCTLR_EL1.SPAN](#) == 0.
 - A DCPS instruction to EL2 using AArch64 if [SCTLR_EL2.SPAN](#) == 0.
- [PSTATE.UAO](#) is set to 0 by a DCPS instruction to AArch64 state.
- [PSTATE.TCO](#) is set to 1 by a DCPS instruction to AArch64 state.
- [PSTATE](#) can also be changed by taking exceptions in Debug state, and by the execution of DCPS and DRPS instructions.

When in Debug state, if [FEAT_SSBS](#) is implemented, then hardware is permitted to load or store speculatively, regardless of the value of [PSTATE.SSBS](#).

When `FEAT_MTE` is implemented, if Memory-access mode is enabled and `PSTATE.TCO` is 0, reads and writes to the external debug interface DTR registers are `CONSTRAINED UNPREDICTABLE`, with the following permitted behaviors:

- The PE behaves as if `PSTATE.TCO` is 0. That is, the load or store operation performs the tag check if required.
- The PE behaves as if `PSTATE.TCO` is 1. That is, the load or store operation does not perform the tag check.

For more information, see [Chapter D6 Memory Tagging Extension](#).

H2.4.2 Executing instructions in Debug state

The instructions executed in Debug state must be either A64 instructions or T32 instructions, depending on the current Execution state.

Each instruction falls into one of the following groups:

- Debug state instructions. These are instructions that are changed in Debug state. See [A64 instructions that are changed in Debug state on page H2-7349](#) and [T32 instructions that are changed in Debug state on page H2-7356](#).
- Instructions that are unchanged in Debug state. See [A64 instructions that are unchanged in Debug state on page H2-7349](#) and [T32 instructions that are unchanged in Debug state on page H2-7356](#).
- Instructions that are `UNPREDICTABLE` or `CONSTRAINED UNPREDICTABLE` in Debug state. See [A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-7352](#) and [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-7358](#).

All T32 instructions are treated as unconditional, regardless of `PSTATE.IT`. See [PSTATE in Debug state on page H2-7348](#).

If `EDSCR.SDD` == 1 then an instruction executed in Non-secure state cannot cause entry into Secure state. See [Security in Debug state on page H2-7365](#)

Executing A64 instructions in Debug state

The following sections describe the behavior of the A64 instructions in Debug state:

- [A64 instructions that are changed in Debug state on page H2-7349](#).
- [A64 instructions that are unchanged in Debug state on page H2-7349](#).
- [A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-7352](#).

A64 instructions that are changed in Debug state

The following A64 instructions are defined in Debug state, but are undefined in Non-debug state:

- DCPS.

———— **Note** —————

DCPS can be `UNDEFINED` in certain conditions in Debug state. See [DCPS<n> on page H2-7366](#).

- DRPS.
- MRS (`DLR_EL0`), MRS (`DSPSR_EL0`), MSR (`DLR_EL0`), MSR (`DSPSR_EL0`)

For more information, see [Debug state operations, DCPS, DRPS, MRS, MSR on page H2-7366](#).

A64 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state:

Any instruction that is `UNDEFINED` in Non-debug state

This list of instructions excludes:

- Any instruction listed in [A64 instructions that are changed in Debug state on page H2-7349](#).
- Any instruction listed in [A64 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-7352](#) that is `UNDEFINED` because an enable or disable bit is not `RES0` or `RES1`

Instructions that move System or Special-purpose registers to or from a general-purpose register

This list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes [PSTATE](#) access instructions.

These instructions are:

- MRS <special_reg>, MSR <special_reg>.

———— **Note** —————

This does not include NZCV, DAIF, DAIFSet, DAIFClr, SPSel, CurrentEL, PAN, UAO, DIT, and TCO.

- MRS <system_reg>, MSR <system_reg>.

Floating-point moves between a SIMD&FP register and a general-purpose register

These instructions are:

- FMOV (between a general-purpose register and a half-precision register).
- FMOV (between a general-purpose register and a single-precision register).
- FMOV (between a general-purpose register and a double-precision register).
- FMOV (between a general-purpose register and a SIMD element).

SIMD moves between a SIMD&FP register and a general-purpose register

These instructions are:

- INS (from a general-purpose register to a SIMD element).
- UMOV (from a SIMD element to a general-purpose register).

Barriers

These instructions are:

- DMB.
- DSB.
- ISB.
- CSDB.
- SSBB.
- PSSBB.

When [FEAT_SB](#) is implemented, this instruction is:

- SB.

When [FEAT_SPE](#) is implemented, this instruction is:

- PSB CSYNC.

When [FEAT_TRF](#) is implemented, this instruction is:

- TSB CSYNC.

When [FEAT_RAS](#) is implemented, this instruction is:

- ESB.

Memory access instructions at various access sizes

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
 - Unscaled (9-bit signed) immediate offset.
 - Immediate (9-bit signed) post-indexed.
 - Immediate (9-bit signed) pre-indexed.
 - Unprivileged (9-bit signed).
- Not literal.

- One of the following types:
 - (Single) register.
 - Exclusive.
 - Exclusive pair.
 - Acquire/Release.
 - Acquire/Release Exclusive.
 - Acquire/Release Exclusive pair.
- 32-bit and 64-bit target register variants.

These instructions are:

- LDR, LDRB, LDRH, LDERSB, LDRSH, LDRSW (immediate, not literal).
- LDUR, LDURB, LDURH, LDURSB, LDURSH, LDURSW (immediate).
- LDTR, LDTRB, LDTRH, LDTRSB, LDTRSH, LDTRSW (immediate).
- LDAR, LDARB, LDARH, LDXR, LDXRB, LDXRH, LDAXR, LDAXRB, LDAXRH.
- LDXP, LDAXP.
- STR, STRB, STRH (immediate).
- STUR, STURB, STURH (immediate).
- STTR, STTRB, STTRH (immediate).
- STLR, STLRB, STLRH, STXR, STXRB, STXRH, STLXR, STLXRB, STLXRH.
- STXP, STLXP.

When [FEAT_LOR](#) is implemented, these instructions are:

- LDLAR, LDLARB, LDLARH.
- STLLR, STLLRBB, STLLRH.

When [FEAT_LSE](#) is implemented, these instructions are:

- CAS, CASB, CASH, CASP.
- SWP, SWPB, SWPH.
- LDADD, LDADDB, LDADDH.
- LDCLR, LDCLB, LDCLRH.
- LDEOR, LDEORB, LDEORH.
- LDSET, LDSETB, LDSETH.
- LDSMAX, LDSMAXB, LDSMAXH.
- LDSMIN, LDSMINB, LDSMINH.
- LDUMAX, LDUMAXB, LDUMAXH.
- LDUMIN, LDUMINB, LDUMINH.
- STADD, STADDB, STADDH.
- STCLR, STCLB, STCLRH.
- STEOR, STEORB, STEORH.
- STSET, STSETB, STSETH.
- STSMAX, STSMAXB, STSMAXH.
- STSMIN, STSMINB, STSMINH.
- STUMAX, STUMAXB, STUMAXH.
- STUMIN, STUMINB, STUMINH.

When [FEAT_LRCPC](#) is implemented, these instructions are:

- LDAPR, LDAPRB, LDAPRH.

When [FEAT_LRCPC2](#) is implemented, these instructions are:

- LDAPURH, LDAPURSH, LDAPUR, LDAPURSW, LDAPURSB, LDAPURB.
- STLUR, STLURH, STLURB.

When [FEAT_LS64](#) is implemented, these instructions are:

- LD64B.
- ST64B, ST64BV, ST64BV0.

Move immediate to general-purpose register

These instructions are:

- MOVZ, MOVN, MOVK (immediate).
- MOV (between a general-purpose register and the stack pointer).

System instructions, Send Event, NOP, Clear Exclusive, and Prediction

In this context, the System instructions are the Cache maintenance instructions, TLB maintenance instructions, Address translation instructions, and the prediction restriction instructions.

These instructions are:

- IC.
- DC.
- TLBI.
- AT.
- SEV, SEVL.
- NOP.
- CLREX.
- CFP.
- CPP.
- DVP.

Basic pointer authentication instructions

When [FEAT_PAAuth](#) is implemented, these instructions are:

- AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIZA.
- AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZB.
- AUTDA, AUTDZA.
- AUTDB, AUTDZB.
- PACIA, PACIA1716, PACIASP, PACIAZ, PACIZA.
- PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZB.
- PACDA, PACDZA.
- PACDB, PACDZB.
- PACGA.
- XPACD, XPACI, XPACLR.

Memory Tagging Extension instructions

When [FEAT_MTE](#) is implemented, these instructions are:

- ADDG.
- SUBG.
- STG.
- STZG.
- ST2G.
- STZ2G.
- LDG.
- STGP.

When [FEAT_MTE2](#) is implemented, these instructions are:

- LDGM.
- STGM.
- STZGM.

A64 instructions that are **CONSTRAINED UNPREDICTABLE** in Debug state

This subsection describes all instructions that are not listed in either:

- [A64 instructions that are changed in Debug state on page H2-7349](#).

- [A64 instructions that are unchanged in Debug state on page H2-7349.](#)

These instructions are CONSTRAINED UNPREDICTABLE in Debug state. In general, the permissible behaviors are:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- If the instruction reads the PC or [PSTATE](#), it uses an UNKNOWN value.
- If the instruction modifies the PC or [PSTATE](#), other than by advancing the PC to the sequentially next instruction, it sets [DLR_EL0](#) and [DSPSR_EL0](#) to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.
- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for A64 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed. An example of this is [CCMP](#).

Exception-generating instructions

These instructions are:

- SVC.
- HVC.
- SMC.
- BRK.
- HLT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCPS1.
- HVC behaves as DCPS2.
- SMC behaves as DCPS3.
- They generate the exception that the instruction would generate in Non-debug state. The exception is taken as described in [Exceptions in Debug state on page H2-7369](#).

————— **Note** —————

SMC must not generate a Secure Monitor Call exception from Non-secure state if [EDSCR.SDD](#) is set to 1.

—————

Instructions that explicitly write to the PC (branches)

These instructions are:

- B, B.cond, BL, BLR, BR, CBZ, CBNZ, RET, TBZ, TBNZ.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set [DSPSR_EL0](#) and [DLR_EL0](#) to UNKNOWN values.

Exception return and related instructions

These instructions are:

- ERET.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.

- They execute as in Non-debug state without branching. They set **DSPSR_EL0** and **DLR_EL0** to UNKNOWN values, and either:
 - Execute the DRPS operation instead of performing an exception return, using UNKNOWN SPSR values.
 - Not change the Exception level.

Instructions that request entry to a low-power state

These instructions are:

- WFE, WFI.

When **FEAT_WFxT** or **FEAT_WFxT2** is implemented, these instructions are:

- WFET, WFIT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See *Configurable instruction enables and disables, and trap controls on page D1-2510*.
- A WFE instruction clears the Event register if it is set.

———— **Note** —————

This means that these instructions must not suspend execution.

Instructions that read the PC

These instructions are:

- LDR (literal), LDRSW (literal).
- ADR, ADRP.
- PRFM (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, using an UNKNOWN value for the PC operand.

Instructions that explicitly modify **PSTATE**, other than DCPS and DRPS

These instructions are:

- ADDS, SUBS, ADCS, SBCS, ANDS, BICS, CCMN, CCMP.
- FCMP, FCMPE, FCCMP, FCCMPE.
- MSR DAIFSet (immediate), MSR DAIFClr (immediate), MSR SPSe1 (immediate).
- MSR NZCV (register), MSR DAIF (register), MSR SPSe1 (register).

When **FEAT_PAN** is implemented, these instructions are:

- MSR PAN (immediate).
- MSR PAN (register).

When **FEAT_UAO** is implemented, these instructions are:

- MSR UAO (immediate).
- MSR UAO (register).

When **FEAT_FlagM** is implemented, these instructions are:

- CFINV.
- RMIF.
- SETF8.
- SETF16.

When **FEAT_DIT** is implemented, this instruction is:

- MSR DIT.

When **FEAT_FlagM2** is implemented, these instructions are:

- AXFLAG.
- XAFLAG.

When **FEAT_MTE** is implemented, this instruction is:

- MSR TCO.

When **FEAT_RNG** is implemented, these instructions are:

- MRS RNDR.
- MRS RNDRRS.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting **DSPSR_ELO** and **DLR_ELO** to UNKNOWN values.

Instructions that read **PSTATE**.{N, Z, C, V} or other **PSTATE** fields

These instructions are:

- CSEL, CSINC, CSINV, CSNEG, CCMN, CCMP, FCSEL, FCCMP, FCCMPE.
- ADC, ADCS,SBC, SBCS.
- CFINV.
- MRS NZCV, MRS DAIF, MRS SPSe1, MRS CurrentEL.

When **FEAT_PAN** is implemented, this instruction is:

- MRS PAN.

When **FEAT_UAO** is implemented, this instruction is:

- MRS UAO.

When **FEAT_FlagM** is implemented, this instruction is:

- CFINV.

When **FEAT_DIT** is implemented, this instruction is:

- MRS DIT.

When **FEAT_MTE** is implemented, this instruction is:

- MRS TCO.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
 - For the conditional operations and those using the **PSTATE.C** flag as an input, these instructions use an UNKNOWN value for the Condition flag.
 - For the MRS instruction, they return an UNKNOWN value.

Hint instructions

When **FEAT_DGH** is implemented, this instruction is:

- DGH.

These instructions behave in one of the following ways:

- They execute as a NOP.
- They execute as in Non-debug state.

All other instructions

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state.

———— Note —————

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Debug state.

Executing T32 instructions in Debug state

The following sections describe the behavior of the T32 instructions in Debug state:

- [T32 instructions that are changed in Debug state on page H2-7356.](#)
- [T32 instructions that are unchanged in Debug state on page H2-7356.](#)
- [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-7358.](#)

T32 instructions that are changed in Debug state

The following T32 instructions are defined in Debug state, but are undefined in Non-debug state:

- DCPS

———— Note —————

DCPS can be UNDEFINED in certain conditions in Debug state. See [DCPS<n> on page H2-7366.](#)

- MRC p15, 3, <Rt>, c4, c5, 0 (DSPSR).
- MCR p15, 3, <Rt>, c4, c5, 0 (DSPSR).
- MRC p15, 3, <Rt>, c4, c5, 1 (DLR).
- MCR p15, 3, <Rt>, c4, c5, 1 (DLR).

In addition, ERET executes the DRPS operation in Debug state.

For more information, see [Debug state operations, DCPS, DRPS, MRS, MSR on page H2-7366.](#)

T32 instructions that are unchanged in Debug state

The following list shows the instructions that are unchanged in Debug state. Any T32 instruction that uses the PC or APSR. {N, Z, C, V} as the source or destination register is not included in the list. Moreover, the list includes only the 32-bit T32 encodings.

Any instruction that is UNDEFINED in Non-debug state

The list of instructions:

- Excludes any instruction listed in [T32 instructions that are changed in Debug state on page H2-7356.](#)
- Excludes any instruction listed in [T32 instructions that are CONSTRAINED UNPREDICTABLE in Debug state on page H2-7358](#) that is UNDEFINED because an enable or disable bit is not RES0 or RES1.

Instructions that move System or Special-purpose registers to or from a general-purpose register

The list of instructions:

- Includes the instructions to transfer a general-purpose register to or from the DTR, which can be executed at any Exception level.
- Excludes APSR and CPSR access instructions.
- Excludes instructions for accessing banked registers for the current mode.

These instructions are:

- MRS <banked_reg>, MSR <banked_reg>.

———— **Note** ————

This does not apply to cases which are UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state in the current mode.

- MRC, MCR.

———— **Note** ————

This includes all allocated System registers in the (coproc==0b111x) encoding space other than an MRC move to APSR_nzcv.

- MRS SPSR, MSR SPSR_fsxc (register).
- VMRS <vfp_system_reg>, VMSR <vfp_system_reg>.

———— **Note** ————

This includes all allocated Advanced SIMD and floating-point System registers, other than an a VMRS move to APSR_nzcv.

Floating-point moves between a SIMD&FP register and a general-purpose register

These instructions are:

- VMOV (between a general-purpose register and a single-precision register).
- VMOV (between a general-purpose register and a doubleword floating-point register).

SIMD moves between a SIMD&FP register and a general-purpose register

These instructions are:

- VMOV (between a general-purpose register and a scalar).

Barriers

These instructions are:

- CSDB.
- DMB.
- DSB.
- ISB.
- PSSBB.
- SSBB.

When [FEAT_RAS](#) is implemented, this instruction is:

- ESB.

When [FEAT_SB](#) is implemented, this instruction is:

- SB.

When [FEAT_TRF](#) is implemented, this instruction is:

- TSB CSYNC.

Memory access instructions at various access sizes

The following constraints apply:

- General purpose-registers only.
- One of the following addressing modes:
 - Immediate (8-bit or 12-bit) offset.
 - Immediate (8-bit) post-indexed.
 - Immediate (8-bit) pre-indexed.
 - Unprivileged (8-bit).
- Not literal.

- One of the following types:
 - (Single) register.
 - Dual.
 - Exclusive.
 - Exclusive doubleword.
 - Acquire/Release.
 - Acquire/Release Exclusive.
 - Acquire/Release Exclusive doubleword.

These instructions are:

- LDR.W, LDRB.W, LDRH.W, LDRD, LDRSB.W, LDRSH.W (immediate, not literal).
- LDRT, LDRBT, LDRHT, LDRSBT, LDRSHT (immediate).
- LDREX, LDREXB, LDREXH, LDA, LDAB, LDAH, LDAEX, LDAEXB, LDAEXH.
- LDREXD, LDAEXD.
- STR.W, STRB.W, STRH.W, STRD (immediate).
- STRT, STRBT, STRHT (immediate).
- STREX, STREXB, STREXH, STL, STLB, STLH, STLEX, STLEXB, STLEXH.
- STREXD, STLEXD.

Move to general-purpose register

These instructions are:

- MOVW, MOVT (immediate).

System instructions, Send Event, NOP, and Clear Exclusive

The System instructions are Cache maintenance instructions, TLB maintenance instructions, and Address translation instructions. These are encoded in the (coproc == 0b1111) System register encoding space.

These instructions are:

- [ICIALLU](#), [ICIALLUIS](#), [ICIMVAU](#).
- [DCCIMVAC](#), [DCCISW](#), [DCCMVAC](#), [DCCMVAU](#), [DCCSW](#), [DCIMVAC](#), [DCISW](#).
- [TLBIALL](#), [TLBIALLH](#), [TLBIALLHIS](#), [TLBIALLIS](#), [TLBIALLNSNH](#), [TLBIALLNSNHIS](#), [TLBIASID](#), [TLBIASIDIS](#), [TLBIIPAS2](#), [TLBIIPAS2IS](#), [TLBIIPAS2L](#), [TLBIIPAS2LIS](#), [TLBIMVA](#), [TLBIMVAA](#), [TLBIMVAAIS](#), [TLBIMVAAL](#), [TLBIMVAALIS](#), [TLBIMVAH](#), [TLBIMVAHIS](#), [TLBIMVAIS](#), [TLBIMVAL](#), [TLBIMVALH](#), [TLBIMVALHIS](#), [TLBIMVALIS](#).
- [ATS12NSOPR](#), [ATS12NSOPW](#), [ATS12NSOUR](#), [ATS12NSOUW](#), [ATS1CPR](#), [ATS1CPW](#), [ATS1CUR](#), [ATS1CUW](#), [ATS1HR](#), [ATS1HW](#).
- [BPIALL](#), [BPIALLIS](#), [BPIMVA](#).
- [SEV.W](#), [SEVL.W](#).
- [NOP.W](#).
- [CLREX](#).

T32 instructions that are CONstrained UNpredictable in Debug state

This subsection describes all instruction not listed in either:

- [T32 instructions that are changed in Debug state on page H2-7356](#).
- [T32 instructions that are unchanged in Debug state on page H2-7356](#).

These instructions are CONstrained UNpredictable in Debug state. In general, the permissible behaviors are:

- The instruction generates an Undefined Instruction exception.
- The instruction executes as a NOP.
- If the instruction reads the PC or [PSTATE](#), it uses an UNKNOWN value.
- If the instruction modifies the PC or [PSTATE](#), other than by advancing the PC to the sequentially next instruction, it sets [DLR](#) and [DSPSR](#) to UNKNOWN values.
- If the instruction is similar to a Debug state instruction, it executes as that Debug state instruction.

- The instruction has the same behavior as in Non-debug state.

The following list shows the permissible behaviors for T32 instruction in Debug state. An instruction might appear multiple times in the list, in which case the choice of permissible behaviors is any of those listed.

Exception-generating instructions

These instructions are:

- SVC.
- HVC.
- SMC.
- UDF.
- BKPT.
- HLT.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- SVC behaves as DCPS1.
- HVC behaves as DCPS2.
- SMC behaves as DCPS3.
- They generate the exception the instruction would generate in Non-debug state. The exception is taken as described in [Exceptions in Debug state on page H2-7369](#)

Note

SMC must not generate a Secure Monitor Call exception from Non-secure state if EDSCR.SDD is set to 1.

Instructions that explicitly write to the PC (branches)

These instructions are:

- B, B (conditional), CBZ, CBNZ BL.
- BX, BLX (register or immediate).
- BXJ, TBB, TBH.
- MOV pc and related instructions.
- LDR pc, LDM (with a register list includes the PC), POP (with a register list that includes the PC).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching and set [DPSR](#) and [DLR](#) to UNKNOWN values.

Exception return and related instructions, other than ERET

These instructions are:

- SRS, RFE, SUBS pc, 1r, and related instructions.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state without branching, setting [DLR](#) and [DPSR](#) to UNKNOWN values, and either:
 - Execute the DRPS operation instead of performing an exception return, using UNKNOWN SPSR values.
 - Not changing Exception level or PE mode.

Instructions that request entry to a low-power state

These instructions are:

- WFE, WFI, WFET, WFIT

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They generate a synchronous exception if the corresponding instruction would be trapped in Non-debug state. See [Configurable instruction enables and disables, and trap controls on page G1-6117](#).
- A WFE instruction is permitted to clear the Event register if it is set.

———— Note —————

This means that these instructions must not suspend execution.

Instructions that read the PC

These instructions are:

- LDR (literal), LDRB (literal), LDRH (literal), LDRSB (literal), LDRSH (literal).
- ADR, ADRL, ADRH.
- PLD (literal), PLI (literal).

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state using an UNKNOWN value for the PC operand.

Instructions that explicitly modify **PSTATE**, other than DCPS and ERET

These instructions are:

- CMP, TST, TEQ, CMN.
- <opc>S.
- MRC p14, 0, APSR_nzcv, c0, c1, 0 (accessing DBGDSCRint).
- CPS, SETEND, IT.
- MSR CPSR (immediate), MSR CPSR (register), MSR APSR (immediate), MSR APSR (register).
- VMRS APSR_nzcv, FPSCR.
- QADD, QDADD, QSUB, QDSUB.
- SMLABB, SMLABT, SMLATB, SMLATT, SMLAD, SMLAWB, SMLAWT, SMLSD, SMUAD.
- SSAT, SSAT16, USAT, USAT16.
- SADD, SADD8, SADD16, SASX, SSAX, SSUB, SSUB8, SSUB16.
- UADD, UADD8, UADD16, UASX, USAX, USAUB, USUN8, USUB16.

When **FEAT_PAN** is implemented, this instruction is:

- SETPAN.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state, setting **DSPSR_ELO** and **DLR_ELO** to UNKNOWN values.

Instructions that read **PSTATE**.{N, Z, C, V} or other **PSTATE** fields

These instructions are:

- SEL, VSEL.
- ADC, SBC, all instructions with an RRX shift.
- MRS CPSR.

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They execute as in Non-debug state:
 - For the conditional operations and those using the [PSTATE.C](#) flag as an input, these instructions use an UNKNOWN value for the Condition flag.
 - For the MRS instruction, they return an UNKNOWN value.

All other instructions

These instructions behave in one of the following ways:

- They are UNDEFINED.
- They execute as a NOP.
- They have the same behavior as in Non-debug state.

————— Note —————

This includes instructions defined as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in Non-debug state. These instructions are CONSTRAINED UNPREDICTABLE in Debug state. This includes some T32 instructions that specify R15 as a destination or source register.

[Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#) describes the CONSTRAINED UNPREDICTABLE behavior for these instructions. In Debug state these CONSTRAINED UNPREDICTABLE choices are further restricted:

- Instructions that specify R15 as a destination register:
 - Are not permitted to branch, because the architecture does not define a branch operation in Debug state.
 - Might set [DLR](#) and [DSPSR](#) to UNKNOWN values.
 - Might have any of the other permitted behaviors.
- Instructions that specify R15 as a source operand:
 - Cannot use PC + offset, because there is no architecturally-defined PC in Debug state.
 - Might have any of the other permitted behaviors, including using an UNKNOWN value.

H2.4.3 Decode tables

The syntax in the tables is defined as follows:

- | | |
|-----------|--|
| 1 | The bit has a fixed value of 1. |
| 0 | The bit has a fixed value of 0. |
| != | The field has any value other than the value or values specified. The field might be an encoding field in the instruction whose value is supplied by the debugger. |

————— Note —————

The instruction encodings in [Chapter C6 A64 Base Instruction Descriptions](#) and [Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions](#) might show these bits as (0) or (1). A debugger must set these bits to 0 or 1, as appropriate.

Any other value indicates an encoding field in the instruction whose value is supplied by the debugger. Some values might be reserved or undefined, in which case the instruction is UNDEFINED or CONSTRAINED UNPREDICTABLE in Debug state, as it is in Non-debug state.

For more information about the instruction encodings, see:

- [Chapter C6 A64 Base Instruction Descriptions](#).
- [Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions](#).

For information about the syntax used in [Table H2-2 on page H2-7362](#), [Table H2-3 on page H2-7362](#), [Table H2-4 on page H2-7362](#), and [Table H2-5 on page H2-7364](#), see:

- [Common syntax terms on page C1-195](#).
- [Assembler symbols on page F1-4345](#).

[Table H2-2 on page H2-7362](#) shows the A64 instructions that are modified in Debug state. For details of how these are packed in the [EDITR](#), see the register description.

Table H2-2 Modified A64 instructions in Debug state

H2.4.4 Security in Debug state

If EL3 is implemented or the implemented Security state is Secure state, security in Debug state is governed by the Secure debug disabled flag, [EDSCR.SDD](#).

On entry to Debug state

If entering in Secure state, [EDSCR.SDD](#) is set to 0. Otherwise [EDSCR.SDD](#) is set to the inverse of `ExternalSecureInvasiveDebugEnabled()`. That is:

- If `ExternalSecureInvasiveDebugEnabled() == TRUE`, [EDSCR.SDD](#) is set to 0.
- If `ExternalSecureInvasiveDebugEnabled() == FALSE`, [EDSCR.SDD](#) is set to 1.

Note

Normally, if `ExternalSecureInvasiveDebugEnabled() == FALSE` then halting is prohibited and it is not possible to enter Debug state from Secure state. However, because changes to the authentication signals require a *Context synchronization event* to guarantee their effect, there is a period during which the PE might halt even though the authentication signals prohibit halting.

In Debug state

The value of [EDSCR.SDD](#) does not change, even if `ExternalSecureInvasiveDebugEnabled()` changes.

Note

- [DBGAUTHSTATUS_EL1](#).{SNID, SID, NSNID, NSID} are not frozen in Debug state.
 - If [EDSCR.SDD](#) set to 1 in Debug state, then there is no means to enter Secure state from Non-secure state. In this case it is impossible for the PE to be in Secure state. This is a general principle of behavior in Debug state.
-

In Non-debug state

[EDSCR.SDD](#) returns the inverse of `ExternalSecureInvasiveDebugEnabled()`. If the authentication signals that control `ExternalSecureInvasiveDebugEnabled()` change, a *Context synchronization event* is required to guarantee their effect.

Note

- In Non-debug state, [EDSCR.SDD](#) is unaffected by the Security state of the PE.
 - A *Context synchronization event* is also required to guarantee that changes in the authentication signals are visible in [DBGAUTHSTATUS_EL1](#).{SNID, SID, NSNID, NSID}.
-

If EL3 is not implemented and the implemented Security state is Non-Secure state, [EDSCR.SDD](#) is RES1.

H2.4.5 Privilege in Debug state

The only additional privileges offered to Debug state are:

- The privilege to execute *Debug state operations, DCPS, DRPS, MRS, MSR* on page H2-7366.
- The privilege to execute DTR access instructions regardless of the Exception level and traps.

The DTR access instructions can be executed at any Exception level, including EL0, regardless of any control register settings that might force these instructions to be undefined or trapped in Non-debug state. These instructions are:

- The MRS and MSR instructions that access `DBGDTR_EL0`, `DBGDTRTX_EL0`, and `DBGDTRRX_EL0` in AArch64 state.
- The MRC and MCR instructions that access `DBGDTRTXint` and `DBGDTRRXint` in AArch32 state.

All other instructions operate with the privilege determined by the current Exception level and security state. This applies to all Special-purpose and System registers accesses, memory accesses, and undefined instructions, and includes generating exceptions when the System registers trap or disable an instruction.

H2.4.6 Debug state operations, DCPS, DRPS, MRS, MSR

Armv8 defines operations to change between Exception levels in Debug state. These operations can also change the mode at the current Exception level.

DCPS<n>

Executing a `DCPS<n>` instruction in Debug state moves the PE to a higher Exception level or to a specific mode at the current Exception level.

If the `DCPS<n>` instruction is executed in AArch32 state and the target Exception level is using AArch64:

- The current instruction set switches from T32 to A64.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for system calls in Non-debug state. See *Execution state* on page D1-2457.

Otherwise, the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- In AArch64 state the current endianness is determined by the value of `SCTLR_ELx.EE` for the target Exception level.
- In AArch32 state the current endianness is determined by the value of `SCTLR.EE` or `HSCTLR.EE` for the target Exception level.

The `DCPS<n>` instructions are:

In AArch64 state

- `DCPS1`
- `DCPS2`
- `DCPS3`

In AArch32 state, in the T32 instruction set only

- `DCPS1`
- `DCPS2`
- `DCPS3`

The `DCPS` instructions are undefined in Non-debug state.

[Table H2-6 on page H2-7367](#) shows the target of the instruction. In [Table H2-6 on page H2-7367](#), the entries have the following meaning:

- EL1h/Svc** This means that the target is:
- EL1h if EL1 is using AArch64.

- EL1 and Supervisor mode if EL1 is using AArch32.
- EL2h/Hyp** This means that the target is:
- EL2h if EL2 is using AArch64.
 - EL2 and Hyp mode if EL2 is using AArch32.
- EL3h/Monitor** This means that the target is:
- EL3h if EL3 is using AArch64.
 - EL3 and Monitor mode if EL3 is using AArch32.
- Svc** Secure Supervisor mode, in EL3 using AArch32.
- Monitor** Secure Monitor mode, in EL3 using AArch32.

Table H2-6 Target for DCPS instructions in Debug state

Instruction	Target when DCPS instruction executed at stated Exception level:				
	EL0	EL1	EL2	EL3 (AArch64)	EL3 (AArch32)
DCPS1	EL1h/Svc	EL1h/Svc	EL2h/Hyp	EL3h	Svc, clears SCR.NS to 0
DCPS2	EL2h/Hyp	EL2h/Hyp	EL2h/Hyp	EL3h	UNDEFINED
DCPS3	EL3h/Monitor	EL3h/Monitor	EL3h/Monitor	EL3h	Monitor, clears SCR.NS to 0

In AArch32 Monitor mode, DCPS1 and DCPS3 clear SCR.NS to 0.

Note

In AArch64 state, at EL3, DCPS<n> does not change SCR_EL3.NS.

However:

- DCPS1 is undefined at EL0 if either:
 - EL2 is implemented and enabled in the current Security state, and is using AArch64 and HCR_EL2.TGE == 1.
 - In Non-secure state, EL2 is implemented and using AArch32 and HCR.TGE == 1.
- DCPS2 is undefined at all Exception levels if EL2 is not implemented.
- DCPS2 is undefined at the following Exception levels if EL2 is implemented:
 - At EL0 and EL1 in Secure state if EL2 is disabled in the current Security state.
 - At EL3 if EL3 is using AArch32.
- DCPS3 is undefined at all Exception levels if either:
 - EDSCR.SDD == 1.
 - EL3 is not implemented.

Note

The references to DCPS1, DCPS2, and DCPS3 in this section link to the descriptions of the instructions in the A64 instruction set. The DCPS<n> instructions are also defined in the T32 instruction set, see DCPS1, DCPS2, DCPS3. These instructions are not defined in the A32 instruction set, because A32 instructions cannot be executed in Debug state.

On executing a DCPS instruction:

- If the target Exception level is using AArch64:
 - ELR_ELx of the target Exception level becomes UNKNOWN.
 - SPSR_ELx of the target Exception level becomes UNKNOWN.
 - ESR_ELx of the target Exception level becomes UNKNOWN.

- `DLR_EL0` and `DSPSR_EL0` become UNKNOWN.
- If the target Exception level is using AArch32 `DLR` and `DSPSR` become UNKNOWN and:
 - If the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become UNKNOWN.
 - If the target Exception level is EL2, then `ELR_hyp`, `SPSR_hyp`, and `HSR` become UNKNOWN.

If the target Exception level is using AArch32, and the target Exception level is EL1 or EL3, the LR and SPSR of the target mode become UNKNOWN.

If `FEAT_SSBS` is implemented, the `DCPS<n>` instruction leaves the `PSTATE.SSBS` bit UNKNOWN.

The `DCPSInstruction()` function is described in [Chapter J1 Armv8 Pseudocode](#).

DRPS

Executing the DRPS operation in Debug state moves the PE to a lower Exception level, or to another PE mode at the current Exception level, by copying the current SPSR to `PSTATE`.

If DRPS is executed in AArch64 state and the target Exception level is using AArch32:

- The current instruction set switches from A64 to T32.
- The effect on registers that are not visible or only partially visible in AArch32 state is the same as for exception returns in Non-debug state. See [Execution state on page D1-2457](#).

Otherwise, the instruction set state does not change.

If the target Exception level is the same as the current Exception level, then the PE does not change Exception level. However, the PE might change mode.

The effect on endianness is the same as for exceptions and exception returns in Non-debug state:

- If targeting an Exception level using AArch64, current endianness is set according to `SCTLR_ELx.EE`, or `SCTLR_EL1.E0E` for the target Exception level.
- If targeting an Exception level using AArch32, current endianness is set by `SPSR.E` as appropriate.

The DRPS instructions are:

In AArch64 state

- `DRPS`

In AArch32 state, in the T32 instruction set only

- `ERET`

If the SPSR specifies an illegal exception return, then `PSTATE.{M, nRW, EL, SP}` are unchanged and `PSTATE.IL` is set to 1. For further information on illegal exception returns, see [Illegal return events from AArch64 state on page D1-2486](#).

`PSTATE.{N, Z, C, V, Q, GE, IT, T, SS, D, A, I, F}` are ignored in Debug state. This means that the effect of the DRPS operation on these fields is to set them to an UNKNOWN value that might be the value from the SPSR. For more information, see [PSTATE in Debug state on page H2-7348](#).

All other `PSTATE` fields are copied from SPSR.

`DRPS` is undefined at EL0 and in Non-debug state.

————— Note —————

Unlike an exception return, the DRPS operation has no architecturally-defined effect on the Event Register and Exclusives monitors. DRPS might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

On executing a DRPS instruction:

- If the target Exception level is using AArch64:
 - `DLR_EL0` and `DSPSR_EL0` become UNKNOWN.
- If the target Exception level is using AArch32:
 - `DLR` and `DSPSR` become UNKNOWN.

If `FEAT_SSBS` is implemented, the DRPS instruction leaves the `PSTATE.SSBS` bit UNKNOWN.

The `DRPSInstruction()` function is described in [Chapter J1 Armv8 Pseudocode](#).

MRS and MSR

The other Debug state instructions are used to read or write `DLR_EL0` and `DSPSR_EL0`.

These instructions are:

In AArch64 state

- `MRS`
- `MSR (register)`

In AArch32 state

- `MRC`
- `MCR`

```
MRS <Xt>, DLR_EL0      ; Copy DLR_EL0 to <Xt>
MRS <Xt>, DSPSR_EL0    ; Copy DSPSR_EL0 to <Xt>
MSR DLR_EL0, <Xt>     ; Copy <Xt> to DLR_EL0
MSR DSPSR_EL0, <Xt>   ; Copy <Xt> to DSPSR_EL0
```

These instructions can be executed at any Exception level when in Debug state, including EL0. They are undefined in Non-debug state.

H2.4.7 Exceptions in Debug state

The following sections describe how exceptions are handled in Debug state:

- [Generating exceptions when in Debug state on page H2-7369](#).
- [Taking exceptions when in Debug state on page H2-7370](#).
- [Reset in Debug state on page H2-7371](#).

Generating exceptions when in Debug state

In Debug state:

- Instruction Abort exceptions cannot happen because instructions are not fetched from memory.
- Interrupts, including SError and virtual interrupts are ignored and remain pending:
 - The pending interrupt remains visible in `ISR`.
- Debug exceptions and debug events are ignored.
- `SCR.EA` is treated as if it were set to 0, regardless of its actual state, other than for the purpose of reading the bit.
- Any attempt to execute an instruction bit pattern that is an allocated instruction at the current Exception level, but is listed in [Executing instructions in Debug state on page H2-7349](#) as undefined in Debug state, generates an exception that is taken to the current Exception level, or to EL1 if executing at EL0.

————— Note —————

If the exception is taken to an Exception level that is using AArch32 then it is taken as an Undefined Instruction exception.

The priority and syndrome for these exceptions is the same as for executing an encoding that does not have an allocated instruction.

- Instructions executed at EL2, EL1 and EL0 that are configured by EL3 control registers to trap to EL3:
 - When the value of `EDSCR.SDD` is 0, generate the appropriate trap exception that is taken to EL3.
 - When the value of `EDSCR.SDD` is 1, are treated as UNDEFINED and generate an exception that is taken to the current Exception level, or to EL1 if the instruction is executed at EL0. If the exception is taken to an Exception level that is using AArch32 it is taken as an Undefined Instruction exception.

If the exception is taken to an Exception level using AArch64 or to AArch32 Hyp mode, then it is reported with an EC value of `0x00`.

Otherwise configurable traps, enables, and disables for instructions are unaffected by Debug state, and executing an affected instruction generates the appropriate exception.

Otherwise, synchronous exceptions, including Data Aborts, are generated as they would be in Non-debug state and taken to the appropriate Exception level in Debug state.

———— **Note** ————

If `EDSCR.SDD == 1` then an exception from Non-secure state is never taken to Secure state. See [Security in Debug state on page H2-7365](#).

Taking exceptions when in Debug state

When the PE is in Debug state, all exceptions are synchronous. When an exception is generated, it is taken to Debug state. This means that:

- The target Exception level is as defined for the exception in Non-debug state.
- If the target Exception level is using AArch32 then the target PE mode is as defined for the exception in Non-debug state.
- The exception syndrome is reported as defined for the exception in Non-debug state, except for the case described in [Data Aborts in Memory access mode on page H4-7408](#) for which the reporting requirements are relaxed.

The exception syndrome is reported using the syndrome register or registers for the target Exception level. In AArch64 state, these are `ESR_ELx`, and `FAR_ELx`. In AArch32 state, these are `DFSR`, `DFAR`, `HSR`, `HDFAR`, and `HPFAR`. For example:

- If a Data Abort exception is taken to Abort mode at EL1 or EL3 and the exception is taken from AArch32 state and using the Short-descriptor translation table format, the `DFSR` reports the exception using the Short-descriptor format fault encoding. For exceptions other than Data Abort exceptions taken to Abort mode, `DFSR` is not updated.
- If an instruction is trapped to an Exception level using AArch64 due to a configurable trap, disable, or enable, the exception code reported is the same as it would be in Non-debug state.

The effect on auxiliary syndrome registers, such as `AFSR`, is IMPLEMENTATION DEFINED.

———— **Note** ————

Generally, the AArch32 Fault Address Registers (FARs) and Fault Status Registers (FSRs) are not described as *syndrome registers*, although the term is appropriate to their function.

- The PE remains in Debug state and changes to the target mode.
- If EL3 is using AArch32 and the exception is taken from Monitor mode, `SCR.NS` is cleared to 0.
- If the exception is taken to an Exception level using AArch32, the PE continues to execute T32 instructions, regardless of the TE bit in the System register for the target Exception level.
- The endianness switches to that indicated by the EE bit of the System register for the target Exception level.
- The SPSR for the target Exception level or mode is corrupted and becomes UNKNOWN.
- If the target Exception level is using AArch64, `ELR_ELx` for the target Exception level becomes unknown.
- If the target Exception level is EL2 using AArch32, `ELR_hyp` becomes unknown.
- If the target Exception level is EL1 or EL3 using AArch32, `LR_<mode>` for the target mode becomes unknown.
- `DLR` and `DSPSR` become UNKNOWN.
- The cumulative error flag, `EDSCR.ERR`, is set to 1. See [Cumulative error flag on page H4-7412](#).
- `PSTATE.IL` is cleared to 0.
- `PSTATE.{IT, T, SS, D, A, I, F}` are set to UNKNOWN values, and `PSTATE.{N, Z, C, V, Q, GE}` are unchanged. However, these fields are ignored and are not observable in Debug state. For more information, see [PSTATE in Debug state on page H2-7348](#).

The debugger must save any state that can be corrupted by an exception before executing an instruction that might generate another exception.

Pseudocode description of taking exceptions in Debug state

The pseudocode function `AArch64.TakeException()` shows the behavior when the PE takes an exception to an Exception level using AArch64 in Non-debug state. In Debug state, this is replaced with the function `AArch64.TakeExceptionInDebugState()`.

The pseudocode functions `AArch32.EnterMode()`, `AArch32.EnterHypMode()`, and `AArch32.EnterMonitorMode()` show the behavior when the PE takes an exception to an Exception level using AArch32 in Non-debug state. In Debug state:

- `AArch32.EnterMode()` is replaced with the function `AArch32.EnterModeInDebugState()`.
- `AArch32.EnterHypMode()` is replaced with the function `AArch32.EnterHypModeInDebugState()`.
- `AArch32.EnterMonitorMode()` is replaced with `AArch32.EnterMonitorModeInDebugState()`.

Reset in Debug state

If the PE is reset when in Debug state, it exits Debug state and enters Non-debug reset state. When the PE is in reset state, `EDSCR.STATUS == 0b000010` and writes to `EDITR` are ignored.

———— Note —————

If `EDECR.RCE == 1` or `CTIDEVCTL.RCE == 1`, meaning that a Reset Catch debug event is programmed, and if halting is allowed on exiting reset state, then on exiting reset state the PE halts and re-enters Debug state. See *Reset Catch debug events on page H3-7397*. All PE registers have taken their reset values, which might be UNKNOWN.

H2.4.8 Accessing registers in Debug state

Register accesses are unchanged in Debug state. The view of each register is determined by either the current Exception level or the mode, or both, and accesses might be disabled or trapped by controls at a higher Exception level.

General-purpose register access, other than AArch64 state SP access

A single general-purpose register can be read by issuing an MSR instruction through the ITR to write `DBGDTR_EL0` in AArch64 state, or an MCR instruction through the ITR to write `DBGDTRTXint` in AArch32 state. The debugger can then read the DTR register or registers through the external debug interface. The reverse sequence writes to a general-purpose register.

[Figure H2-1 on page H2-7372](#) shows the reading and writing of general-purpose registers, other than SP, in Debug state in AArch64 state.

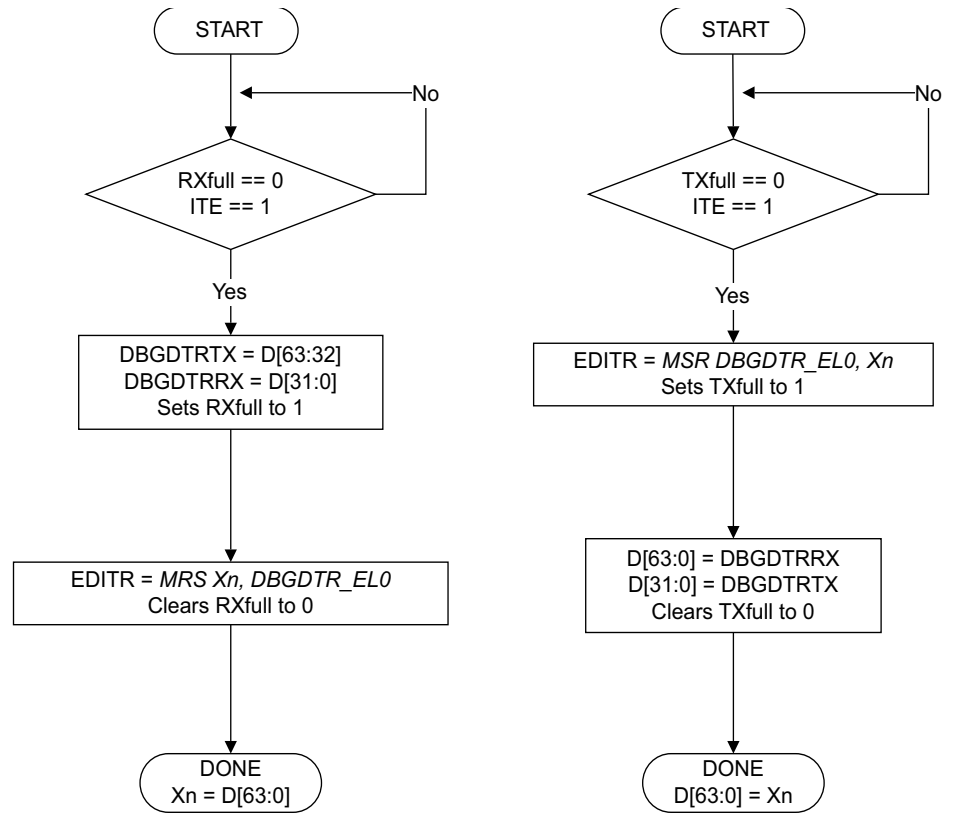

Figure H2-1 Reading and writing general-purpose registers, other than SP, in Debug state in AArch64 state

Figure H2-2 on page H2-7373 shows the reading and writing of general-purpose registers in Debug state in AArch32 state.

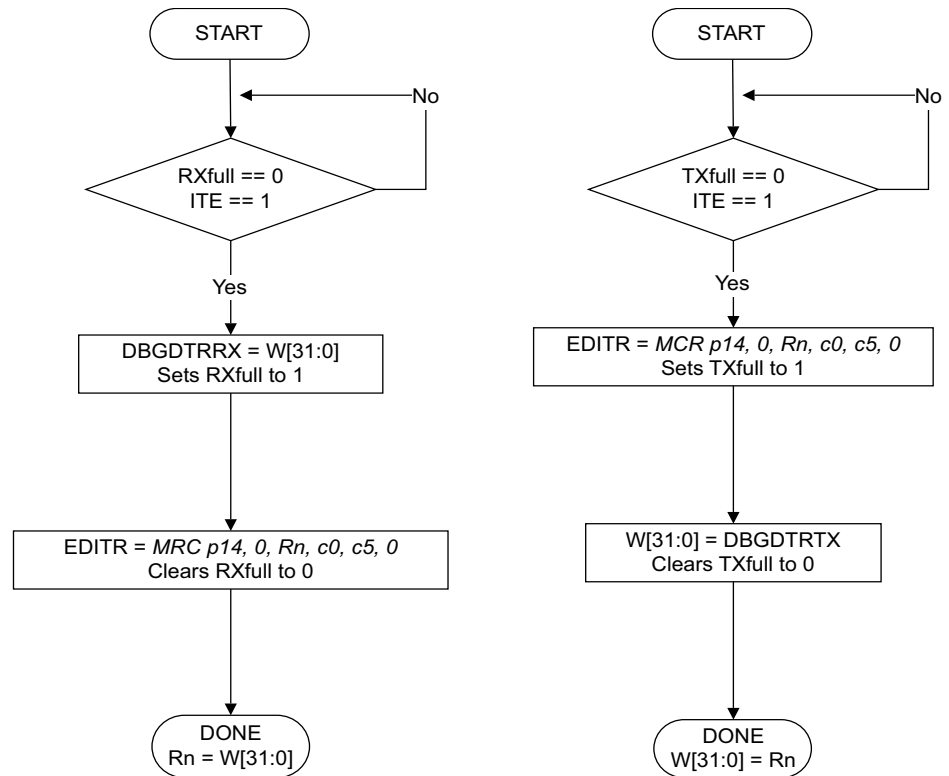

Figure H2-2 Reading and writing general-purpose registers in Debug state in AArch32 state

SIMD and floating-point register, System register, and AArch64 state SP accesses

To read a SIMD and floating-point register or a System register, the debugger must first copy the value into a general-purpose register using:

- An FMOV instruction in AArch64 state or a VMOV instruction in AArch32 state for floating-point transfers to SIMD and FP registers.
- A UMOV instruction in AArch64 state or a VMOV instruction in AArch32 state for SIMD transfers to SIMD and FP registers.
- An MRS instruction in AArch64 state or an MRC instruction in AArch32 state for System registers.
- A MOV Xd, SP instruction for the SP register in AArch64 state.

The debugger can then read out the particular general-purpose register. The reverse sequence writes a register.

PC and PSTATE access

The debugger reads the program counter and **PSTATE** of the process being debugged through the **DLR_EL0** and **DSPSR_EL0** System registers. The actual values of PC and **PSTATE** cannot be directly observed in Debug state:

- Instructions that are used for direct reads and writes of PC and **PSTATE** in Non-debug state are UNDEFINED in Debug state.
- On taking an exception, **ELR_ELx** and **SPSR_ELx** at the target Exception level are UNKNOWN. They do not record the PC and **PSTATE**.

PSTATE. {IL, E, M, nRW, EL, SP} are indirectly read by instructions executed in Debug state, but all other **PSTATE** fields are ignored and cannot be observed. See also:

- [PSTATE in Debug state on page H2-7348.](#)
- [Executing instructions in Debug state on page H2-7349.](#)
- [Exceptions in Debug state on page H2-7369.](#)

H2.4.9 Accessing memory in Debug state

How the PE accesses memory is unchanged in Debug state. This includes:

- The operation of the MMU, including address translation, tagged address handling, access permissions, memory attribute determination, and the operation of any TLBs.
- The operation of any caches and coherency mechanisms.
- Alignment support.
- Endianness support.
- The Memory order model.

Simple memory transfers

Simple memory accesses can be performed in Debug state by issuing memory access instructions through the ITR and passing data through the DTR registers. [Executing instructions in Debug state on page H2-7349](#) lists the memory access instructions that are supported in Debug state.

Bulk memory transfers

Memory access mode can accelerate bulk memory transfers in Debug state. See [DCC and ITR access modes on page H4-7406](#).

H2.5 Exiting Debug state

The PE exits Debug state when it receives a Restart request trigger event. If `EDSCR.ITE == 0` the behavior of any instruction issued through the ITR in Normal access mode or an operation issued by a DTR access in memory access mode that has not completed execution is `CONSTRAINED UNPREDICTABLE`, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state after the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an `UNKNOWN` state.

Note

- Implementations can set `EDSCR.ITE` to 1 to indicate that further instructions can be accepted by ITR before the previous instructions have completed. If any previous instruction has not completed and `EDSCR.ITE == 1`, then the PE must complete these instructions in Debug state before executing the restart sequence. `EDSCR.ITE == 0` indicates that the PE is not ready to restart.
- A debugger must observe that any instructions issued through `EDITR` that might generate a synchronous exception, as complete, before issuing a restart request. It can do this by observing the completion of a later instruction, as synchronous exceptions must occur in program order. For example, a debugger can observe that an instruction that reads or writes a DTR register is complete because of its effect on the `EDSCR.{TXfull, RXfull}` flags.

On exiting Debug state, the PE sets the program counter to the address in `DLR`, where:

- If exiting to AArch32 state:
 - Bits[31:1] of the PC are set to the value of bits[31:1] of `DLR`.
 - Bit[0] of the PC is set to a `CONSTRAINED UNPREDICTABLE` choice of 0 or the value of bit[0] in `DLR`.
- If exiting to AArch64 state:
 - Bits[63:56] of `DLR_EL0` might be ignored as part of tagged address handling. See *Address tagging in AArch64 state* on page D5-2676.
 - Otherwise the PC is set from `DLR_EL0`.

Note

Bits[63:32] of `DLR_EL0` are ignored when exiting to AArch32 state.

Exit from Debug state can give rise to a PC alignment fault exception when the program counter is used. Unlike an exception return, this might also happen when returning to AArch32 state. For more information, see *PC alignment checking* on page D1-2469.

On exiting Debug state, `PSTATE` is set from `DSPSR` in the same way that an exception return sets `PSTATE` from `SPSR_ELx`:

- The same illegal exception return checks that apply to an exception return also apply to exiting Debug state. If the return from Debug state is an illegal exception return then the effect on `PSTATE` and the PC is the same as for any other illegal exception return. See *Exception return* on page D1-2485 and *Exception return to an Exception level using AArch32* on page G1-6065.
- The checks on the `PSTATE.IT` bits that apply to exiting Debug state into AArch32 state are the same as those that apply to an exception return. See *Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors*.
- `PSTATE.SS` is copied from `DSPSR.SS` if all of the following hold:
 - `MDSCR_EL1.SS == 1`.
 - The debug target Exception level is using AArch64.
 - Software step exceptions from the restart Exception level are enabled.
 Otherwise `PSTATE.SS` is set to 0.

Note

Unlike a return using `ERET`, `PSTATE.SS` must be restored from `DSPSR.SS` because otherwise it is `UNKNOWN`.

However, if `OSDLR.DLK == 1` and `DBGPRCR.CORENPDRQ == 0`, meaning `FEAT_DoubleLock` is implemented and locked in Non-debug state and therefore Software Step exceptions are disabled, but otherwise Software Step exceptions would be enabled from the restart Exception level, it is CONstrained UNPREDICTABLE whether `PSTATE.SS` is copied from `DSPSR.SS`.

- If `FEAT_SSBS` is implemented, on exit from Debug state to AArch64 state, `DSPSR_EL0.SSBS` is copied to `PSTATE.SSBS`.
- If `FEAT_SSBS` is implemented, on exit from Debug state to AArch32 state, `DSPSR.SSBS` is copied to `CPSR.SSBS`.
- If `FEAT_PAN` is implemented, `DSPSR_EL0.PAN` is copied to `PSTATE.PAN`.
- If `FEAT_UAO` is implemented, `DSPSR_EL0.UAO` is copied to `PSTATE.UAO`.
- If `FEAT_DIT` is implemented, on exit from Debug state to AArch64 state, `DSPSR_EL0.DIT` is copied to `PSTATE.DIT`.
- If `FEAT_DIT` is implemented, on exit from Debug state to AArch32 state, `DSPSR.DIT` is copied to `CPSR.DIT`.
- If `FEAT_MTE` is implemented, on exit from Debug state to AArch64 state, `DSPSR_EL0.TCO` is copied to `PSTATE.TCO`. On exit from Debug state to AArch32 state, `PSTATE.TCO` is not updated.
- If `FEAT_BTI` is implemented, `DSPSR_EL0.BTYPE` is copied to `PSTATE.BTYPE`.

Note

- One important difference between Debug state exit and an exception return is that the PE can exit Debug state at EL0. Despite this, the behavior of an exit from Debug state is similar to an exception return. For example, `PSTATE.{D, A, I, F}` is updated regardless of the value of `SCTLR_EL1.UMA`.
- Exit from Debug state has no architecturally-defined effect on the Event Register and Exclusives monitors. An exit from Debug state might set the Event Register or clear the Exclusives monitors, or both, but this is not a requirement and debuggers must not rely on any implementation specific behavior.

The `ExitDebugState()` function is described in [Chapter J1 Armv8 Pseudocode](#).

Chapter H3

Halting Debug Events

This chapter describes a particular class of debug events. It contains the following sections:

- *Introduction to Halting debug events* on page H3-7378.
- *Halting Step debug events* on page H3-7380.
- *Halt Instruction debug event* on page H3-7390.
- *Exception Catch debug event* on page H3-7391.
- *External Debug Request debug event* on page H3-7395.
- *OS Unlock Catch debug event* on page H3-7396.
- *Reset Catch debug events* on page H3-7397.
- *Software Access debug event* on page H3-7398.
- *Synchronization and Halting debug events* on page H3-7399.

———— **Note** —————

[Table K15-1 on page K15-8602](#) disambiguates the general register references used in this chapter.

H3.1 Introduction to Halting debug events

External debug defines Halting debug events. The following Halting debug events are available in Armv8:

- [Halting Step debug events on page H3-7380.](#)
- [Halt Instruction debug event on page H3-7390.](#)
- [Exception Catch debug event on page H3-7391.](#)
- [External Debug Request debug event on page H3-7395.](#)
- [OS Unlock Catch debug event on page H3-7396.](#)
- [Reset Catch debug events on page H3-7397.](#)
- [Software Access debug event on page H3-7398.](#)

If halting is allowed, a Halting debug event halts the PE. The PE enters Debug state.

In addition, breakpoints and watchpoints might halt the PE if halting is allowed. See [Breakpoint and Watchpoint debug events on page H2-7340](#). Because breakpoints and watchpoints can generate an exception or halt the PE, Breakpoint and Watchpoint debug events are not classified as Halting debug events.

For a definition of Debug state, see [Chapter H2 Debug State](#). For a definition of halting allowed, see [Halting allowed and halting prohibited on page H2-7339](#).

[Debug state entry and debug event prioritization on page H2-7341](#) describes the behavior when multiple debug events are generated by an instruction.

See also [Synchronization and Halting debug events on page H3-7399](#).

Table H3-1 on page H3-7378 shows the behavior of Breakpoint, Watchpoint, and Halting debug events.

Table H3-1 Summary of debug events and possible outcomes

Debug event type	PE behavior when halting is:	
	Allowed	Prohibited
Breakpoint and Watchpoint debug events on page H2-7340	Halt	See Table D2-1 on page D2-2566 and Table G2-1 on page G2-6157
Halt Instruction debug event on page H3-7390	Halt	UNDEFINED
Software Access debug event on page H3-7398	Halt	Ignored
Exception Catch debug event on page H3-7391	Halt	Ignored
Halting Step debug events on page H3-7380	Halt	Pended
External Debug Request debug event on page H3-7395	Halt	Pended
Reset Catch debug events on page H3-7397	Halt	Pended
OS Unlock Catch debug event on page H3-7396	Pended	Pended

Table H3-2 on page H3-7378 shows where the pseudocode for each Halting debug event type is located.

Table H3-2 Pseudocode description of Halting debug events

Halting debug event type	Pseudocode
Halt Instruction debug event on page H3-7390	HLT on page C6-1034 for AArch64 and HLT on page F5-4696 for AArch32

H3.2 Halting Step debug events

Halting Step is a debug resource that a debugger can use to make the PE step through code one instruction at a time. This section describes the Halting Step debug events. It is divided into the following sections:

- [Overview of a Halting Step debug event on page H3-7380.](#)
- [The Halting Step state machine on page H3-7380.](#)
- [Using Halting Step on page H3-7383.](#)
- [Detailed Halting Step state machine behavior on page H3-7383.](#)
- [Synchronization and the Halting Step state machine on page H3-7386.](#)
- [Stepping T32 IT instructions on page H3-7387.](#)
- [Disabling interrupts while stepping on page H3-7388.](#)
- [Syndrome information on Halting Step on page H3-7388.](#)
- [Pseudocode description of Halting Step debug events on page H3-7389.](#)

The architecture describes the behavior as a simple Halting Step state machine. See [The Halting Step state machine on page H3-7380.](#)

H3.2.1 Overview of a Halting Step debug event

The behavior of Halting Step is defined by a state machine, shown in [Figure H3-1 on page H3-7382.](#) A Halting Step debug event executes a single instruction and then returns control to the debugger. When the debugger software wants to execute a Halting Step:

1. With the PE in Debug state, the debugger activates Halting Step.
2. The debugger signals the PE to exit Debug state and return to the instruction that is to be stepped.
3. The PE executes that single instruction.
4. The PE enters Debug state before executing the next instruction.

However, an exception might be generated while the instruction is being stepped. That is either:

- A synchronous exception generated by the instruction being stepped.
- An asynchronous exception taken before or after the instruction being stepped.

Halting Step has its own enable control bit, [EDEC.R.SS](#) and [EDES.R.SS](#).

———— **Note** ————

Because the Halting Step state machine states occur as a result of normal PE operation, the states can be described as both:

- PE states.
- Halting Step states.

H3.2.2 The Halting Step state machine

The state machine states are:

Inactive Halting Step is inactive. No Halting Step debug events can be generated, therefore execution is not affected by Halting Step. The PE is in this state whenever either of the following is true:

- Halting Step is disabled. That is, [EDEC.R.SS](#) is set to 0 and [EDES.R.SS](#) is set to 0.
- Halting is prohibited. See [Halting the PE on debug events on page H2-7339.](#) In this state, if [EDEC.R.SS](#) is set to 1, then a Halting Step debug event is pending.

In [Figure H3-1 on page H3-7382,](#) this state is shown in red.

Active-not-pending

Halting Step is enabled and active. This is the state in which the PE steps an instruction. [EDEC.R.SS](#) == 1 and [EDES.R.SS](#) == 0. Software must not set [EDEC.R.SS](#) to 1 unless the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE, as described in [Changing the value of EDEC.R.SS when not in Debug state on page H3-7387.](#)

In [Figure H3-1 on page H3-7382](#), this state is shown in green.

Active-pending

Halting Step is enabled and active. The step has completed and the PE enters Debug state.
`EDESR.SS == 1`.

In [Figure H3-1 on page H3-7382](#), this state is shown in green.

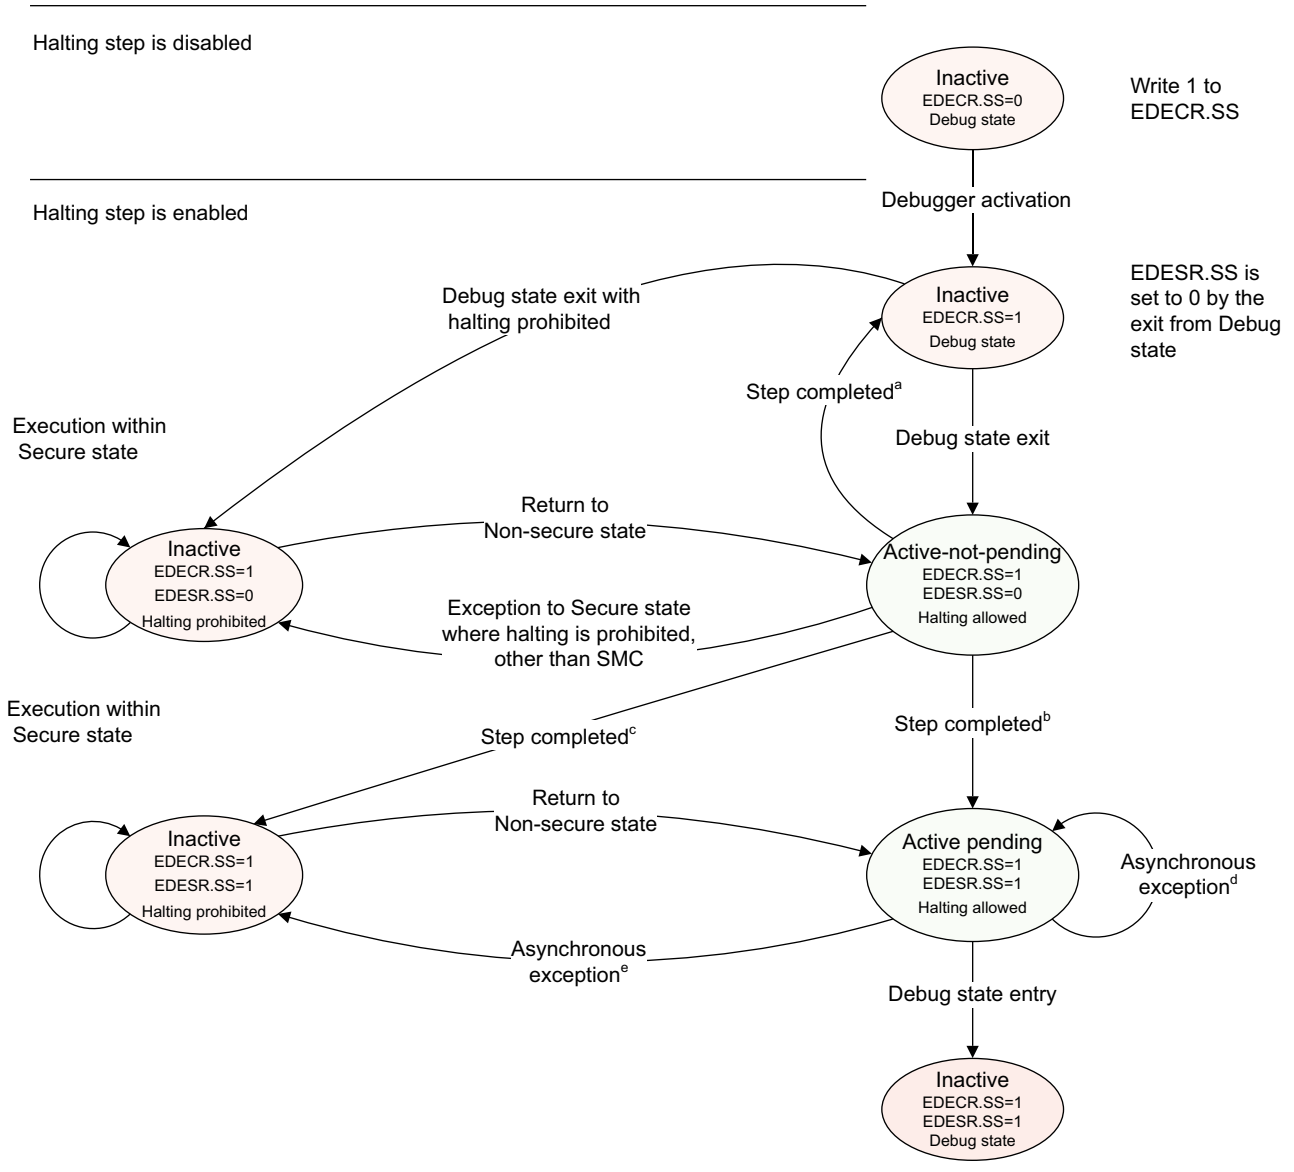

Whenever Halting Step is enabled and active, whether the state machine is in the active-not-pending state or in the active-pending state depends on `EDESR.SS`. [Halting Step state machine states on page H3-7383](#) shows this.

In the simple sequential execution of the program, the PE executes the Halting Step state machine as follows:

1. Initially, Halting Step is inactive.
2. After exiting Debug state, Halting Step is active-not-pending.
3. The PE executes an instruction and Halting Step is active-pending.
4. The pending Debug state entry is taken on the next instruction and the step is complete.

Exceptions and other changes to the PE context can interrupt this sequence.

[Figure H3-1 on page H3-7382](#) shows a Halting Step state machine.

- a. Step completed occurs when:
 - A debug event, other than a Halting Step debug event, causes entry into Debug state.
- b. Step completed occurs when:
 - An instruction is executed without taking an exception.
 - An exception is taken to a state where halting is allowed.
 - A reset.
- c. Step completed occurs when:
 - An SMC exception is taken to Secure state where halting is prohibited.
- d. An asynchronous exception taken to a state where halting is allowed.
- e. An asynchronous exception taken to Secure state where halting is prohibited.

Figure H3-1 Halting Step state machine

———— **Note** ————

Figure H3-1 on page H3-7382 only describes state transitions to and from the inactive state by exit from Debug state, executing an exception return, or taking an exception. Other changes to the PE context, including writes to registers such as [EDEC.R.SS](#) and [EDES.R.SS](#) and changes to the authentication interface can also cause changes to the Halting Step state machine. These can lead to UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior. See [Synchronization and the Halting Step state machine on page H3-7386](#).

The following bits control the state machine, as shown in [Table H3-3 on page H3-7383](#):

- [EDEC.R.SS](#). This is the Halting Step enable bit.
- [EDES.R.SS](#). This is the Halting Step debug event pending bit.

[Table H3-3 on page H3-7383](#) shows the Halting Step state machine states. The letter X in a register column means that the relevant bit can be set to either zero or one.

Table H3-3 Halting Step state machine states

Halting	EDEC.R.SS	EDES.R.SS	Halting Step state
Prohibited	X	X	Inactive (Halting Step debug even not pending)
Prohibited	X	1	Inactive (Halting Step debug event pending)
Allowed	0	0	Inactive
Allowed	1	0	Active-not-pending
Allowed	X	1	Active-pending

H3.2.3 Using Halting Step

To step a single instruction the PE must be in Debug state:

1. The debugger sets [EDEC.R.SS](#) to 1 to enable Halting step.
2. The debugger signals the PE to exit Debug state with [DLR](#) set to the address of the instruction being stepped. The PE clears [EDES.R.SS](#) to 0 and the Halting Step state machine enter the active-not-pending state.
3. The PE executes the instruction being stepped.
If an exception is taken to a state where halting is prohibited, then [EDES.R.SS](#) is always correct for the preferred return address of the exception.
4. The PE enters Debug state before executing the next instruction and the step is complete.

———— **Note** ————

- If [FEAT_DoPD](#) is not implemented, [EDEC.R.SS](#) value is in the Debug power domain, meaning that the state machine is maintained over a powerdown of the Core power domain.
- If [FEAT_DoPD](#) is implemented, the values of [EDEC.R.SS](#) and [EDES.R.SS](#) are set to 0 on a Cold reset, and, if the PE was stepping an instruction, [EDES.R.SS](#) is effectively UNKNOWN after a Warm reset. A debugger must use a Reset Catch debug event to step over a powerdown state.
- A debugger must only change the value of [EDEC.R.SS](#) when the PE is in Debug state, otherwise behavior is CONSTRAINED UNPREDICTABLE as described in [Changing the value of EDEC.R.SS when not in Debug state on page H3-7387](#).

H3.2.4 Detailed Halting Step state machine behavior

The behavior of the Halting Step state machine is described in the following sections:

- [Entering the active-not-pending state on page H3-7384](#).
- [PE behavior in the active-not-pending state on page H3-7384](#).
- [Entering the active-pending state on page H3-7385](#).

- [PE behavior in the active-pending state on page H3-7385.](#)
- [PE behavior in the inactive state when in Non-debug state on page H3-7386.](#)
- [PE behavior in Debug state on page H3-7386.](#)

Entering the active-not-pending state

The PE enters the active-not-pending state:

- By exiting Debug state to a state where halting is allowed with `EDECR.SS == 1`.
- By an exception return from a state where halting is prohibited to a state where halting is allowed with `EDECR.SS == 1` and `EDESR.SS == 0`.
- As described in [Synchronization and the Halting Step state machine on page H3-7386.](#)

PE behavior in the active-not-pending state

When the PE is in the active-not-pending state it does one of the following:

- It executes one instruction and does one of the following:
 - Completes it without taking a synchronous exception.
 - Takes a synchronous exception generated by the instruction.
 - Generates a debug event that causes entry to Debug state.
- It takes an asynchronous exception without executing any instruction.
- It takes an asynchronous debug event into Debug state.

If no exception or debug event is generated

If no exception or debug event is generated the PE sets `EDESR.SS` to 1. This means that the Halting Step state machine advances to the active-pending state.

If an exception or debug event is generated

The PE sets `EDESR.SS` according to all of the following:

- The type of exception.
- The target Exception level of the exception.
- If the exception is taken to Secure state, whether halting is prohibited in Secure state.
 - This is determined by the result of `ExternalSecureInvasiveDebugEnabled()`.

If an exception or debug event is generated, the PE sets `EDESR.SS` to 1 if one of the following applies:

- A synchronous exception is generated by the instruction and one of the following applies:
 - The exception is taken to EL1 or EL2.
 - The exception is taken to EL3, it is not an SMC exception, and `ExternalSecureInvasiveDebugEnabled() == TRUE`.
 - The exception is an SMC exception.
- An asynchronous exception is generated before executing an instruction and this is either:
 - Taken to EL1 or EL2.
 - Taken to EL3 and `ExternalSecureInvasiveDebugEnabled() == TRUE`.
- A PE reset occurs.

Otherwise, `EDESR.SS` is unchanged. This happens when:

- No instruction is executed because either:
 - An asynchronous exception is taken to EL3 and `ExternalSecureInvasiveDebugEnabled() == FALSE`.
 - An asynchronous debug event causes entry to Debug state.
- An instruction is executed and either:
 - Generates a synchronous exception other than an SMC exception which is taken to EL3, and `ExternalSecureInvasiveDebugEnabled() == FALSE`.
 - Generates a synchronous debug event and causes entry to Debug state.

It is UNPREDICTABLE whether EDESR.SS is set to 1 or unchanged when an SError interrupt is taken to EL3 without executing the instruction, and ExternalSecureInvasiveDebugEnabled() == FALSE.

If halting is prohibited after taking the exception or debug event, then the Halting Step state machine advances to the inactive state. Otherwise, the Halting Step state machine advances to the active-pending state.

———— **Note** —————

The underlying criteria for the value of EDESR.SS on an exception are:

- Whether halting is allowed at the target of the exception. If halting is allowed, the PE must step into the exception. If halting is prohibited, the PE must step over the exception.
- Whether the preferred return address of the exception is the instruction itself or the next instruction, if the PE steps over the exception.

Table H3-4 on page H3-7385 shows the behavior of the active-not-pending state. The letter X indicates that ExternalSecureInvasiveDebugEnabled() can be either TRUE or FALSE.

Table H3-4 Summary of active-not-pending state behavior

Event	Target Exception level	ExternalSecureInvasiveDebugEnabled()	Value written to EDESR.SS
No exception or debug event	Not applicable	X	1
SMC exception	EL3	X	1
Reset	Highest	X	1
Exception, other than SMC exception	EL1	X	1
	EL2	X	1
	EL3	TRUE	1
		FALSE	Unchanged
Debug event	Debug state	X	Unchanged

Entering the active-pending state

The PE enters the active-pending state by one of the following:

- From the active-not-pending state by:
 - Executing an instruction without taking an exception.
 - Taking an exception so that the PE remains in a state where halting is allowed.
- An exception return from a state where halting is prohibited when EDESR.SS == 1.

———— **Note** —————

That is, an exception return from Secure state with ExternalSecureInvasiveDebugEnabled() == FALSE to Non-secure state with ExternalInvasiveDebugEnabled() == TRUE.

- A reset when the value of EDECR.SS == 1, regardless of the state the PE was in before the reset occurred.
- From the active-pending state by taking an asynchronous exception to a state where halting is allowed.
- Following the description in *Synchronization and the Halting Step state machine* on page H3-7386.

PE behavior in the active-pending state

When the PE is in the active-pending state, it enters Debug state before executing an instruction.

The entry into Debug state has higher priority than all other types of synchronous debug event and synchronous exception. However, the architecture does not define the prioritization of this Debug state entry with respect to any unmasked pending asynchronous exception. If an asynchronous exception is prioritized over the entry to Debug state, then EDESR.SS is unchanged.

For more information on the prioritization of debug events, see [Debug state entry and debug event prioritization on page H2-7341](#).

PE behavior in the inactive state when in Non-debug state

EDESR.SS is not updated by the execution of an instruction or the taking of an exception when Halting Step is inactive. This means that EDESR.SS is not changed by an exception handled in a state where halting is prohibited.

On return to a state where halting is allowed, the Halting Step state machine is restored either to the active-pending state or the active-not-pending state, depending on the value of EDESR.SS. The return to a state where halting is allowed is normally by an exception return, which in some situations is a [Context synchronization event](#).

See also [Synchronization and the Halting Step state machine on page H3-7386](#).

PE behavior in Debug state

Halting Step is inactive in Debug state because halting is prohibited, see [Halting allowed and halting prohibited on page H2-7339](#).

Entry to Debug state does not change EDESR.SS.

EDESR.SS is cleared to 0 on exiting Debug state as the result of a restart request. If EDECR.SS = 1, Halting Step enters the active-not-pending state.

———— **Note** —————

This means that EDESR.SS is never cleared to 0 by the execution of an instruction in Debug state, or by taking an exception when in Debug state as described in [PE behavior in the active-not-pending state on page H3-7384](#), because the Halting Step state machine is not in the active-not-pending state. EDESR.SS can be cleared by a write to EDESR, see the register description.

However, if the PE exits Debug state as the result of a PE reset and EDECR.SS = 1, then Halting Step immediately enters the active-pending state, as EDESR.SS is set to the value of EDECR.SS.

H3.2.5 Synchronization and the Halting Step state machine

The Halting Step state machine also changes state if:

- Halting becomes allowed or prohibited other than by exit from Debug state, an exception return, or taking an exception. This means that halting becomes allowed or prohibited because:
 - The Security state changes without an exception return. See [State and mode changes without explicit context synchronization events on page G2-6217](#).
 - The external authentication interface changes.
 - FEAT_DoubleLock is implemented and the status, DoubleLockStatus(), changes.
- A write to EDECR when the PE is in Non-debug state changes the value of EDECR.SS.

———— **Note** —————

Behavior is CONSTRAINED UNPREDICTABLE if the value of EDECR.SS is changed when the PE is in Non-debug state, see [Changing the value of EDECR.SS when not in Debug state on page H3-7387](#).

- A write to EDESR when the PE is in Non-debug state clears EDESR.SS to 0.

These operations are guaranteed to take effect only after a [Context synchronization event](#). If the instruction being stepped generates a [Context synchronization event](#), then the PE might use the old or new state.

The PE must perform the required behavior of the new state before or immediately following the next *Context synchronization event*, but it is not required to do so immediately. This means that the PE can perform the required behavior of the old state before the next *Context synchronization event*. This is illustrated in [Example H3-1 on page H3-7387](#) and [Example H3-2 on page H3-7387](#).

Example H3-1 Synchronization requirements 1

EDECR.SS is set to 1 in Debug state, requesting the active-not-pending state on exit from Debug state. On exit from Debug state the PE immediately takes an exception to Secure state. ExternalSecureInvasiveDebugEnabled() == FALSE, meaning that halting is prohibited in Secure state. The PE does not step any instructions but executes the software in Secure state as normal. EDESR.SS remains set to 0. If ExternalSecureInvasiveDebugEnabled() subsequently becomes TRUE, meaning that halting is now allowed, the PE must perform the required behavior of the active-not-pending state before or immediately following the next *Context synchronization event*, but it is not required to do so immediately.

Example H3-2 Synchronization requirements 2

EDECR.SS is set to 1 in Debug state. On exit from Debug the PE executes an MSR instruction that sets OSDLR_EL1.DLK to 1 and DoubleLockStatus() becomes TRUE. This change requires a *Context synchronization event* to guarantee its effect, meaning it is CONSTRAINED UNPREDICTABLE whether:

- Halting is allowed:
 - The PE enters Debug state on the next instruction.
- Halting is prohibited:
 - The PE does not enter Debug state.

The value in EDESR.SS depends on whether halting was allowed or prohibited when the write to OSDLR_EL1.DLK completed, and so it might be 0 or 1. If a second MSR instruction clears OSDLR_EL1.DLK to 0, the PE must perform the required behavior of the state indicated by EDESR.SS before or immediately following the next *Context synchronization event*, but it is not required to do so immediately.

See also [Synchronization and Halting debug events on page H3-7399](#).

Changing the value of EDECR.SS when not in Debug state

If software changes the value of EDECR.SS when the PE is not in Debug state then behavior is CONSTRAINED UNPREDICTABLE, and one or more of the following behaviors occurs:

- The value of EDECR.SS becomes UNKNOWN.
- The state of the Halting Step state machine becomes UNKNOWN.
- On a reset of the PE, the value of EDECR.SS and the state of the Halting Step state machine are UNKNOWN.

H3.2.6 Stepping T32 IT instructions

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and another 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

For the purpose of stepping an item, it is IMPLEMENTATION DEFINED whether:

- The PE considers such a pair of instructions to be one instruction.
- The PE considers such a pair of instructions be two instructions.

It is IMPLEMENTATION DEFINED whether this behavior depends on the value of the applicable ITD bit. For example:

- The debug logic might consider such a pair of instructions as one instruction, regardless of the state of the applicable ITD field.

- The debug logic might consider such a pair of instructions as two instructions, regardless of the state of the applicable ITD field.
- The debug logic might consider such a pair of instructions as one instruction when the value of the applicable ITD field is 1, and as two instructions when the value of the ITD field is 0.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

The ITD control fields are:

HSCTLR.ITD

Applies to execution at EL2 when EL2 is using AArch32.

SCTLR.ITD

Applies to execution at EL0 or EL1 when EL1 is using AArch32.

SCTLR_EL1.ITD

Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

H3.2.7 Disabling interrupts while stepping

When using Halting Step, the sequence of entering Debug state, interacting with the debugger, and then exiting Debug state for each instruction reduces the rate at which the PE executes instructions. However, the rate at which certain interrupts, such as timer interrupts, are generated might be fixed by the system. This means it might be necessary to disable interrupts while using Halting Step by setting [EDSCR.INTdis](#), to allow the code being debugged to make forward progress.

H3.2.8 Syndrome information on Halting Step

Three [EDSCR.STATUS](#) encodings record different scenarios for entering Debug state on a Halting Step debug event:

Halting Step, normal

An instruction other than a Load-Exclusive instruction was stepped.

Halting Step, exclusive

A Load-Exclusive instruction was stepped.

Halting Step, no syndrome

The syndrome data is not available.

If the PE enters Debug state due to a Halting Step debug event immediately after stepping an instruction in the active-not-pending state, [EDSCR.STATUS](#) is set to either:

- Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
- Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.

If the stepped instruction was a conditional Load-Exclusive instruction that failed its Condition code check, [EDSCR.STATUS](#) is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, normal, or Halting Step, exclusive.

Otherwise, the PE enters Debug state without stepping an instruction. This means that the Halting Step state machine enters the active-pending state directly from the inactive state, without going through active-not-pending state. In this case, [EDSCR.STATUS](#) is set to Halting Step, no syndrome. This happens when:

- The PE enters directly into the active-pending state on an exception return to Non-secure state from EL3 when Halting is prohibited in Secure state.
- The active-pending state is entered for other reasons. See [Synchronization and the Halting Step state machine on page H3-7386](#)

In addition, [EDSCR.STATUS](#) is CONSTRAINED UNPREDICTABLE when:

- The instruction being stepped generated a Halting Step debug event before the instruction was executed.

In this case `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of:

- Halting Step, no syndrome, or Halting Step, normal, if the stepped instruction was not a Load-Exclusive instruction.
- Halting Step, no syndrome, or Halting Step, exclusive, if the stepped instruction was a Load-Exclusive instruction.
- The instruction that was stepped was an Exception Return instruction or an ISB. As these instructions are not in the Load-Exclusive instructions, `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.
- The PE enters directly into the active-pending state on a Warm reset because `EDECR.SS` is set to 1. `EDSCR.STATUS` is set to a CONSTRAINED UNPREDICTABLE choice of Halting Step, no syndrome or Halting Step, normal.

In all cases, if `EDSCR.STATUS` is not set to Halting Step, no syndrome, then it must indicate whether the stepped instruction was a Load-Exclusive instruction by setting `EDSCR.STATUS` to Halting Step, normal or Halting Step, exclusive.

———— **Note** —————

In an implementation that always sets `EDSCR.STATUS` to Halting Step, no syndrome is not compliant.

—————

H3.2.9 Pseudocode description of Halting Step debug events

There are two pseudocode functions for Halting Step debug events:

- `RunHaltingStep()`. This is called after an instruction has executed and any exception generated by the instruction is taken. It is also called after taking a reset before executing any instructions. That is, reset is treated like an asynchronous exception, even if `EDECR.RCE == 1` or `CTIDEVCTL.RCE == 1`. `RunHaltingStep()` affects the next instruction.
- `CheckHaltingStep()`. This is called before the next instruction is executed. If a step is pending, it generates the debug event.

H3.3 Halt Instruction debug event

A Halt Instruction debug event is generated when `EDSCR.HDE == 1`, halting is allowed, and the PE executes the Halt instruction, HLT.

The pseudocode for Halt Instruction debug events is described in [HLT on page C6-1034](#) for A64 and [HLT on page F5-4696](#) for A32 and T32.

HLT never generates a debug exception. It is treated as UNDEFINED if `EDSCR.HDE == 0`, or if halting is prohibited.

———— **Note** ————

A debugger can replace a program instruction with a Halt instruction to generate a Halt Instruction debug event. Debuggers that use the HLT instruction must be aware of the Armv8-A rules for concurrent modification of executable code, CMOBX. The rules for concurrent modification and execution of instructions do not allow one thread of execution or an external debugger to replace an instruction with an HLT instruction when these same instructions are being executed by a different thread of execution. See [Concurrent modification and execution of instructions on page B2-130](#).

The T32 HLT instruction is unconditionally executed inside an IT block, even when it is treated as undefined. The A32 HLT instruction is CONSTRAINED UNPREDICTABLE if the Condition code field is not `0b1110`, with the set of behaviors the same as for BKPT. See [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

———— **Note** ————

The HLT instruction is part of the external debug solution for Armv8-A. As such, the presence of the HLT instruction is not indicated in the ID registers. In particular, the AArch32 System register `ID_ISAR0`. Debug does not indicate the presence of the HLT instruction.

H3.3.1 HLT instructions as the first instruction in a T32 IT block

In an implementation that supports the ITD control, the architecture permits a combination of one T32 IT instruction and certain other 16-bit T32 instruction to be treated as a single 32-bit instruction when the value of the ITD field that applies to the current Exception level is 1.

The T32 HLT instruction cannot be combined with an IT instruction in this way. In an implementation that supports the ITD control, if the first instruction in an IT block is an HLT instruction, then the behavior of the instruction depends on the value of the applicable ITD field:

- If the value of the ITD field is 1, then the combination is treated as undefined and an Undefined Instruction exception is generated either by the IT instruction or by the HLT instruction.
- If the value of the ITD field is 0, then the HLT instruction unconditionally executed.

An implementation that does not support the ITD control behaves as if the value of the ITD field is 0.

To set an Halt Instruction debug event on the first instruction of an IT block, debuggers must replace the IT instruction with an HLT instruction to ensure consistent behavior.

The ITD control fields are:

HSCTLR.ITD

Applies to execution at EL2 when EL2 is using AArch32.

SCTLR.ITD

Applies to execution at EL0 or EL1 when EL1 is using AArch32.

SCTLR_EL1.ITD

Applies to execution at EL0 using AArch32 when EL1 is using AArch64.

———— **Note** ————

An HLT instruction is always unconditional, even within an IT block.

H3.4 Exception Catch debug event

Exception Catch debug events:

- Are generated when the corresponding bit in the Exception Catch Control Register, [EDEC](#), is set to 1 on all entries to a given Exception level. This means:
 - Exceptions taken to the Exception level.
 - Exception returns to the Exception level.
 - It is IMPLEMENTATION DEFINED whether a reset into an Exception level generates an Exception Catch debug event.
- Are taken synchronously, after the exception or reset entry or the exception return has been processed by the PE.
- Ignore the Execution state of the target Exception level.
- Are ignored if halting is prohibited.

For exception returns, the final Exception level of the exception return determines whether an Exception Catch debug event is generated. On an illegal exception return, an Exception Catch debug event is generated only if [EDEC](#) is programmed to generate an Exception Catch debug event for an exception return to the current Exception level.

The [EDEC](#) contains two sets of fields to generate Exception Catch debug events:

- NSE, and when [FEAT_Debugv8p2](#) is implemented, NSR for Non-secure state.
- SE, and when [FEAT_Debugv8p2](#) is implemented, SR for Secure state.

Each field within each set contains one bit for each Exception level in that state. Bits corresponding to Exception levels that are not implemented, or that are not implemented in the Security state, are RES0.

———— Note —————

- [EDEC](#) does not replace [DBGVCR](#):
 - [DBGVCR](#) is retained in AArch32 state for backwards compatibility.
 - [DBGVCR](#) is ignored in AArch64 state and never generates entries to Debug state.
 - [DBGVCR](#) cannot be accessed by the external debug interface.
- [EDEC](#) is visible as [OSEC](#) by System register instructions in AArch64 state, and as [DBGOSEC](#) by System register access instructions in AArch32 state, only when the OS Lock is locked to allow software to save and restore it over a powerdown.
- Exception Catch debug events are not disabled when the OS Lock is locked.

When an Exception Catch debug event is generated after exception entry, the PE halts and enters Debug state:

- Before the first instruction at the handler is executed.
- After the exception entry has updated the program counter, [PSTATE](#) and syndrome registers for the exception. This means that on entering Debug state:
 - The current Exception level is the target Exception level of the exception.
 - The ELR, SPSR, ESR, and other syndrome registers contain information about the exception.
 - [DLR](#) contains the exception vector address or the reset address.

When an Exception Catch debug event is generated on exception return, the PE halts and enters Debug state:

- After the exception return has updated the program counter and [PSTATE](#).
- Before the execution of the first instruction at the return address is completed.

The PE does not fetch instructions from the vector address before entering Debug state, if address translation is disabled in the translation regime at the target Exception level.

The following rules define the prioritization of Exception Catch debug events:

- It is IMPLEMENTATION DEFINED whether Exception Catch debug events are higher or lower priority than each of [Software Step exceptions](#) and [Halting Step debug events](#).
- Exception Catch debug events are higher priority than all synchronous exceptions other than [Software Step exceptions](#).

- Exception Catch debug events are lower priority than [Reset Catch debug events](#).
- The prioritization of Exception Catch debug events against pending asynchronous exceptions depends on whether [FEAT_Debugv8p2](#) is implemented and is described in [Exception Catch debug events when FEAT_Debugv8p2 is implemented](#) on page H3-7392 and [Exception Catch debug events when FEAT_Debugv8p2 is not implemented](#) on page H3-7393.

———— **Note** —————

As described in [Synchronous exception prioritization for exceptions taken to AArch64 state](#) on page D1-2490, an exception trapping form of a Vector Catch debug event might generate a second debug exception as part of the exception entry, before the Exception Catch debug event is taken. See [Vector Catch exceptions](#) on page D2-2612 or [Vector Catch exceptions](#) on page G2-6209.

H3.4.1 Exception Catch debug events when FEAT_Debugv8p2 is implemented

When [FEAT_Debugv8p2](#) is implemented, the fields NSR, SR, NSE, and SE in [EDEC](#) control generation of Exception Catch debug events:

- On exception entry but not on exception return.
- On exception return but not on exception entry.
- On exception entry and exception return.

Exception entry, reset and exception return Exception Catch debug events are enabled as shown in [Table H3-5](#) on page H3-7392.

Table H3-5 Summary of Exception Catch debug event control when [FEAT_Debugv8p2](#) is implemented

(N)SR <n>	(N)SE <n>	Behavior on exception return to ELn	Behavior on exception taken to ELn, and if resets are Exception Catch debug events, reset into ELn
0	0	No action.	No action.
0	1	Halt if allowed.	Halt if allowed.
1	0	Halt if allowed.	No action.
1	1	No action.	Halt if allowed.

When an Exception Catch debug event is generated on exception entry, the PE halts and enters Debug state before any asynchronous exception or debug event is taken at the first instruction in the exception handler.

———— **Note** —————

There is no prioritization between asynchronous exceptions, asynchronous debug events, and an Exception Catch debug event generated on an exception return.

See also [Debug state entry and debug event prioritization](#) on page H2-7341.

H3.4.2 Exception Catch debug events when FEAT_Debugv8p2 is not implemented

When [FEAT_Debugv8p2](#) is not implemented, all Exception Catch debug events are enabled by a combination of the fields NSE and SE in [EDECCR](#), as shown in [Table H3-6 on page H3-7393](#).

Table H3-6 Summary of Exception Catch debug event control when [FEAT_Debugv8p2](#) is not implemented

(N)SE<n>	Behavior on exception taken to ELn, return to ELn, and if resets are Exception Catch debug events, reset into ELn
0	No action.
1	Halt if allowed.

A second unmasked asynchronous exception can be taken before the PE enters Debug state. If this second exception does not generate an Exception Catch debug event, the exception handler executed at the higher Exception level later returns to the trapped Exception level, causing the Exception Catch debug event to be generated again.

When the PE is executing code at a given Exception level, and the corresponding [EDECCR](#) bit is 1, it is CONSTRAINED UNPREDICTABLE whether an Exception Catch debug event is generated.

———— **Note** ————

It is possible to generate Exception Catch debug events:

- As a trap on all instruction fetches from the trapped Exception level as part of an instruction fetch.
- On entry to the Exception level, as described in [Detailed Halting Step state machine behavior on page H3-7383](#).

This is similar to the implementation options allowed for Vector Catch debug events. The architecture does not require that the event is generated following an ISB operation executed at the Exception level.

Examples of this are:

- If the debugger writes to [EDECCR](#) so that the current Exception level is trapped.
- If the OS restore code writes to [OSECCR](#) so that the current Exception level is trapped.
- If the code executing in AArch32 state changes the Exception level or Security state other than by an exception return, and the target Exception level is trapped. See [State and mode changes without explicit context synchronization events on page G2-6217](#).

H3.4.3 Examples of Exception Catch debug events

If [EDECCR](#) == 0x0020, meaning that the Exception Catch debug event is enabled for Non-secure EL1, then the following exceptions generate Exception Catch debug events:

- An exception taken from Non-secure EL0 to Non-secure EL1.
- An exception return from EL2 to Non-secure EL1.
- An exception return from EL3 to Non-secure EL1.

For example, on taking a Data Abort exception from Non-secure EL0 to Non-secure EL1, using AArch64:

- [ELR_EL1](#) and [SPSR_EL1](#) are written with the preferred return address and PE state for a return to EL0.
- [ESR_EL1](#) and [FAR_EL1](#) are written with the syndrome information for the exception.
- [DLR_EL0](#) is set to [VBAR_EL1](#) + 0x400, the synchronous exception vector.
- [DSPSR_EL0](#) is written with the PE state for an exit to EL1.

The following do not generate Exception Catch debug events:

- An exception taken from EL0 to EL2, in either Security state, or EL3.
- An exception return from EL2, in either Security state, to EL0.
- An exception taken from Secure EL0 to Secure EL1.
- An exception return from EL3 to Secure EL1.

H3.4.4 Pseudocode description of Exception Catch debug events

The pseudocode function [CheckExceptionCatch\(\)](#) is described in [Chapter J1 Armv8 Pseudocode](#).

H3.5 External Debug Request debug event

External Debug Request debug events are asynchronous debug events.

An External Debug Request debug event is generated when signaled by the embedded cross-trigger. See [Chapter H5 The Embedded Cross-Trigger Interface](#).

———— **Note** —————

Armv8-A requires the implementation of an embedded cross-trigger.

An implementation might also support IMPLEMENTATION DEFINED ways of generating an External Debug Request debug event.

H3.5.1 Synchronization and External Debug Request debug events

An External Debug Request debug event that is asserted before a [Context synchronization event](#) is taken and the PE enters Debug state before the first instruction following the [Context synchronization event](#) completes its execution, provided that halting is allowed after completion of the [Context synchronization event](#).

An External Debug Request debug event that is being asserted when the PE comes out of reset is taken, and the PE enters Debug state before the first instruction after the reset completes its execution, provided that halting is allowed when the PE exits reset state.

If the first instruction after the [Context synchronization event](#) or after coming out of reset generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

Otherwise, when halting is allowed, External Debug Request debug events must be taken in finite time, without requiring the synchronization of any necessary change to the external authentication interface.

———— **Note** —————

These rules are based on the rules that apply when taking asynchronous exceptions. See [Asynchronous exception types, routing, masking and priorities](#) on page D1-2500.

If an unmasked External Debug Request debug event was pending but is changed to not pending before it is taken, then the architecture permits the External Debug Request debug event to be taken, but does not require this to happen. If the External Debug Request debug event is taken then it must be taken before the first [Context synchronization event](#) after the External Debug Request debug event was changed to not pending.

[Example H3-3 on page H3-7395](#) shows an example of the synchronization requirements.

Example H3-3 Synchronization requirements

Secure software locks up in a tight loop, so it executes indefinitely without any synchronization operations. An External debug request must be able to break the PE out of that loop. This is a requirement even if **DBGEN** or **SPIDEN** or both are LOW on entry to the loop, meaning that halting is prohibited, and are only asserted HIGH later.

H3.5.2 Pseudocode description of External Debug Request debug events

The `ExternalDebugRequest()` function is described in [Chapter J1 Armv8 Pseudocode](#).

H3.6 OS Unlock Catch debug event

An OS Unlock Catch debug event is generated when enabled and the state of the OS Lock changes from locked to unlocked. When [FEAT_DoPD](#) is implemented, [CTIDEVCTL.OSUCE](#) enables an OS Unlock Catch debug event, otherwise [EDECR.OSUCE](#) enables an OS Unlock Catch debug event.

When the OS Lock is unlocked, the PE sets [EDES.R.OSUC](#) to 1 if the OS Unlock Catch debug event is enabled, and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. However, this is an indirect write to [EDES.R.OSUC](#), meaning the OS Unlock Catch debug event is not guaranteed to be taken before a subsequent Context synchronization event. If the PE enters Debug state or the OS Unlock Catch debug event is disabled before [EDES.R.OSUC](#) becomes set to 1, then [EDES.R.OSUC](#) might not be set.

OS Unlock Catch debug events are not generated if the OS Lock is unlocked when the PE is in Debug state. See also [Synchronization and Halting debug events on page H3-7399](#).

[EDES.R.OSUC](#) is cleared to 0 on a Warm reset and on exiting Debug state.

H3.6.1 Using the OS Unlock Catch debug event

When the Core power domain is completely off or in a low-power state, a debugger is permitted to access a debug register that is implemented in the External debug power domain. However, if a debugger attempts to access a debug register that is implemented in the Core power domain when the Core power domain registers cannot be accessed, and that access returns an error, the debugger must retry the access.

Regularly powering down the Core power domain can result in unreliable debugger behavior.

The debugger can program a Reset Catch debug event to halt the PE when it has powered up, and can program the debug registers from Debug state. However, if the PE boot software restores the debug registers, as described in [Debug OS Save and Restore sequences on page H6-7446](#), then newly written values are overwritten by the restore sequence.

The debugger can program an OS Unlock Catch debug event to halt the PE after the restore sequence has completed, and program the debug registers from Debug state.

H3.6.2 Pseudocode description of OS Unlock Catch debug event

The [CheckOSUnlockCatch\(\)](#) function is called when the OS Lock is unlocked.

The [CheckPendingOSUnlockCatch\(\)](#) function is called before an instruction is executed. If an OS Unlock Catch is pending, it generates the debug event.

H3.7 Reset Catch debug events

A Reset Catch debug event is generated when enabled, and the PE exits reset state. When the Reset Catch debug event is generated, it is recorded by setting `EDESR.RC` to 1. When `FEAT_DoPD` is implemented, `CTIDEVCTL.RCE` enables a Reset Catch debug event, otherwise `EDECR.RCE` enables a Reset Catch debug event.

If halting is allowed when the event is generated, the Reset Catch debug event is taken immediately and synchronously. On entering Debug state, `DLR` has the address of the reset vector. The PE must not fetch any instructions from memory.

Otherwise, the Reset Catch debug event is pended and taken when halting is allowed. See *Synchronization and Halting debug events on page H3-7399* for more information.

This means that `EDESR.RC` is set to the value of `EDECR.RCE` or `CTIDEVCTL.RCE` on a Warm reset. `EDESR.RC` is cleared to 0 on exiting Debug state.

H3.7.1 Pseudocode description of Reset Catch debug event

The `CheckResetCatch()` function is called after reset before executing any instruction.

The `CheckPendingResetCatch()` function is called before an instruction is executed. If a Reset Catch is pending, it generates the Reset Catch debug event.

H3.8 Software Access debug event

When the value of [EDSCR.TDA](#) is 1, software access to the following AArch64 and AArch32 debug System registers generate a Software Access debug event:

- The Breakpoint Value Registers, [DBGBVR](#).
- The Breakpoint Control Registers, [DBGBCR](#).
- The Watchpoint Value Registers, [DBGWVR](#).
- The Watchpoint Control Registers, [DBGWCR](#).

However, [EDSCR.TDA](#) is ignored if any of the following applies:

- The value of [OSLSR.OSLK](#) == 1, meaning that the OS Lock is locked.
- Halting is prohibited. See [Halting allowed and halting prohibited on page H2-7339](#).
- The register access generates an exception.

Note

- The only accesses to the specified registers that generate a Software Access debug event are:
 - Accesses to System registers in AArch64 state.
 - Accesses to System registers in the (coproc==0b1110) encoding space in AArch32 state.
 - Accesses by a PE using the external debug interface never generate a Software Access debug event.
-

H3.8.1 Pseudocode description of Software Access debug event

The [CheckSoftwareAccessToDebugRegisters\(\)](#) function is described in [Chapter J1 Armv8 Pseudocode](#).

H3.9 Synchronization and Halting debug events

The behavior of external debug depends on:

- Indirect reads of:
 - External debug registers.
 - System registers, including system debug registers.
 - Special-purpose registers.
- The state of the external authentication interface.

For some registers, all read and write accesses that update the register occur in program order, without any additional synchronization, but others require an explicit *Context synchronization event*. For more information on the synchronization of register updates, see:

- *Synchronization requirements for AArch64 System registers* on page D13-3041.
- *Synchronization of changes to the external debug registers* on page H8-7462.
- *State and mode changes without explicit context synchronization events* on page G2-6217.

Changes to the external authentication interface do not require explicit synchronization to affect External Debug Request debug events. See *Synchronization and External Debug Request debug events* on page H3-7395.

For changes that require explicit synchronization, it is CONSTRAINED UNPREDICTABLE whether instructions between the change and the *Context synchronization event* observe the old state or the new state.

This means that any change to these registers or the external authentication interface requires explicit synchronization by a *Context synchronization event* before the change takes effect. This ensures that for instructions appearing in program order after the change, the change affects the following:

- The generation and behavior of Breakpoint and Watchpoint debug events. See *Synchronization and debug exceptions* on page D2-2626 for exceptions taken from AArch64 state, or *Synchronization and debug exceptions* on page G2-6217 for exceptions taken from AArch32 state.
- The generation of all Halting debug events by instructions.
- Taking a pending Halting debug event or other asynchronous debug event. See:
 - *Pending Halting debug events* on page H3-7399.
 - *Synchronization and External Debug Request debug events* on page H3-7395.
- The behavior of the Halting Step state machine. See *Synchronization and the Halting Step state machine* on page H3-7386.

H3.9.1 Pending Halting debug events

A Halting debug event might be pending:

1. If Halting Step of an instruction sets EDESR.SS to 1, and halting is prohibited following the step, then the Halting Step state machine is inactive but a Halting Step debug event is pending.
2. If a Reset Catch debug event sets EDESR.RC to 1, and halting is prohibited following reset, then a Reset Catch debug event is pending.
3. If an OS Unlock Catch debug event sets EDESR.OSUC to 1, then an OS Unlock Catch debug event is pending.

Pending Halting debug events are taken asynchronously when halting is allowed.

Pending Halting debug events are discarded by a Cold reset. The debugger can also force a pending event to be dropped by writing to EDESR.

Any Halting debug event that is observed as pending in the EDESR before a *Context synchronization event* is taken and the PE enters Debug state before the first instruction following the *Context synchronization event* completes its execution. This is possible only if halting is allowed after completion of the *Context synchronization event*.

If the first instruction after the *Context synchronization event* generates a synchronous exception then the architecture does not define the order in which the debug event and the exception or exceptions are taken, unless both:

- A Halting Step debug event is pending. EDESR.SS == 1.

- The *Context synchronization event* is an exception return from a state where halting is prohibited to a state where halting is allowed.

———— **Note** —————

This applies to an exception return from Secure state with `ExternalSecureInvasiveDebugEnabled() == FALSE` to Non-secure state with `ExternalInvasiveDebugEnabled() == TRUE`.

In this case the order in which the debug events are handled is specified to avoid a double-step. See [Entering the active-pending state on page H3-7385](#).

If an asynchronous exception is also pending after the *Context synchronization event* then the architecture does not define the order in which the debug event and the exception or exceptions are taken.

———— **Note** —————

These rules are based on the rules that apply to taking asynchronous exceptions. See [Asynchronous exception types, routing, masking and priorities on page D1-2500](#).

Chapter H4

The Debug Communication Channel and Instruction Transfer Register

This chapter describes communication between a debugger and the implemented debug logic, using the *Debug Communications Channel* (DCC) and the *Instruction Transfer Register* (ITR), and associated control flags. It contains the following sections:

- [Introduction on page H4-7402.](#)
- [DCC and ITR registers on page H4-7403.](#)
- [DCC and ITR access modes on page H4-7406.](#)
- [Flow control of the DCC and ITR registers on page H4-7410.](#)
- [Synchronization of DCC and ITR accesses on page H4-7413.](#)
- [Interrupt-driven use of the DCC on page H4-7418.](#)
- [Pseudocode description of the operation of the DCC and ITR registers on page H4-7419.](#)

———— **Note** —————

Where necessary, [Table K15-1 on page K15-8602](#) disambiguates the general register references used in this chapter.

H4.1 Introduction

The *Debug Communications Channel*, DCC, is a channel for passing data between the PE and an external agent, such as a debugger. The DCC provides a communications channel between:

- An external debugger, described as the *debug host*.
- The debug implementation on the PE, described as the *debug target*.

The DCC can be used:

- As a 32-bit full-duplex channel.
- As a 64-bit half-duplex channel.

The DCC is an essential part of Debug state operation and can also be used in Non-debug state.

The *Instruction Transfer Register*, ITR, passes instructions to the PE to execute in Debug state.

The PE includes flow-control mechanisms for both the DCC and ITR.

H4.2 DCC and ITR registers

The DCC comprises *data transfer registers*, the DTRs, and associated flow-control flags. The data transfer registers are DTRRX and DTRTX.

The ITR comprises a single register, [EDITR](#), and associated flow-control flags.

In AArch64 state, software can access the data transfer registers as:

- A receive and transmit pair for 32-bit full duplex operation:
 - The write-only [DBGDTRTX_EL0](#) register to transmit data.
 - The read-only [DBGDTRRX_EL0](#) register to receive data.
- A single 64-bit read/write register, [DBGDTR_EL0](#), for 64-bit half-duplex operation.
- The read/write [OSDTRTX_EL1](#) and [OSDTRRX_EL1](#) registers for save and restore.

In AArch32 state, software can only access the data transfer registers as:

- A receive and transmit pair, for 32-bit full duplex operation:
 - The write-only [DBGDTRTXint](#) register to transmit data.
 - The read-only [DBGDTRRXint](#) register to receive data.
- The read/write [DBGDTRTXext](#) and [DBGDTRRXext](#) registers for save and restore.

The data transfer registers are also accessible by the external debug interface as a pair of 32-bit registers, [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#). Both registers are read/write, allowing both 32-bit full-duplex and 64-bit half-duplex operation.

The DCC flow-control flags are [EDSCR](#).{RXfull, TXfull, RXO, TXU}:

- The RXfull and TXfull ready flags are used for flow-control and are visible to software in the Debug system registers in [DCCSR](#).
- The RX overrun flag, RXO, and the TX underrun flag, TXU, report flow-control errors.
- The flow-control flags are also accessible by software as simple read/write bits for saving and restoring over a powerdown when the OS Lock is locked in [DSCR](#).
- The flow-control flags are accessible from the external debug interface in [EDSCR](#).

[Figure H4-1 on page H4-7404](#) shows the System register and external debug interface views of the [EDSCR](#) and DTR registers in both AArch64 state and AArch32 state. These figures do not include the save and restore views.

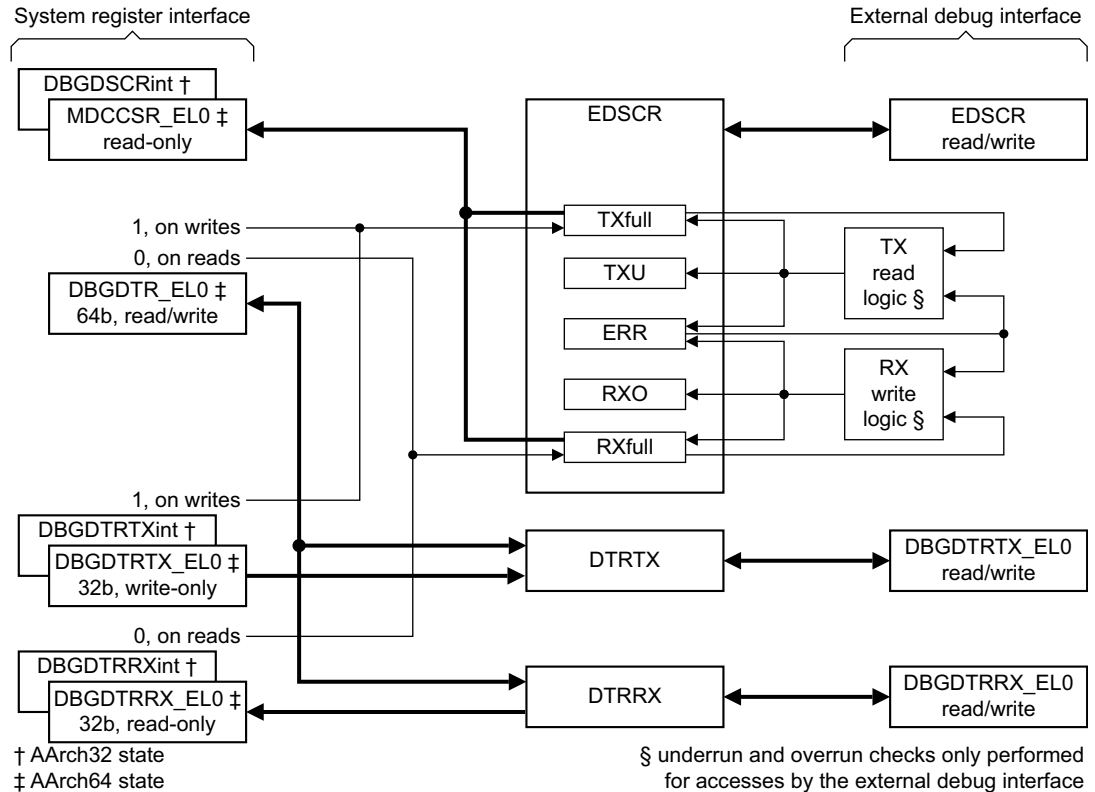

Figure H4-1 System register and external debug interface views of EDSCR and DTR registers, Normal access mode

EDITR and the ITR flow-control flags, EDSCR.{ITE, ITO} are accessible only by the external debug interface:

- The EDITR specifies an instruction to execute in Debug state.
- The ITR empty flag, ITE, is used for flow-control.
- The ITR overrun flag, ITO, reports flow-control errors.

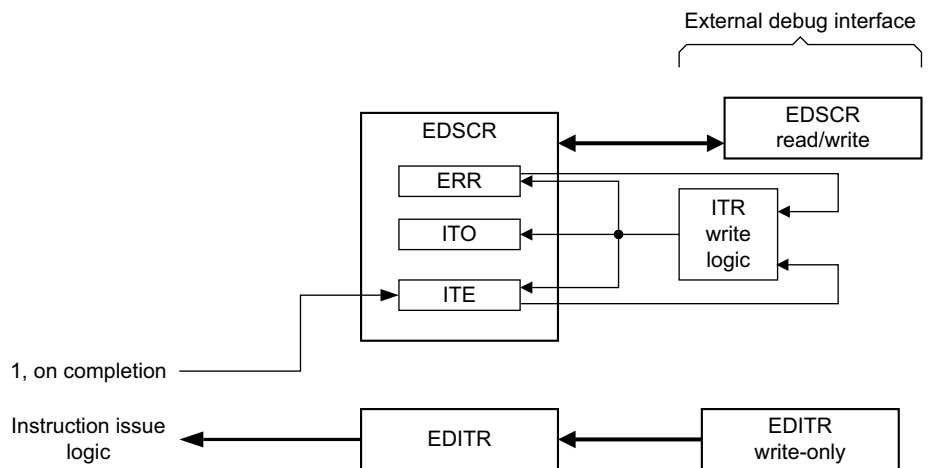

Figure H4-2 External debug interface views of EDSCR and EDITR registers, Normal access mode

The sticky overflow flag, EDSCR.ERR, is used by both the DCC and ITR to report flow-control errors.

To save and restore the DCC registers for an external debugger over powerdown, software uses:

- The MDSCR_EL1, OSDTRTX_EL1, and OSDTRRX_EL1 registers in AArch64 state.

- The `DBGDSCRext`, `DBGDTRTXext`, and `DBGDTRRXext` registers in AArch32 state.

———— **Note** ————

There is no save and restore mechanism for the ITR registers as the ITR is only used in Debug state.

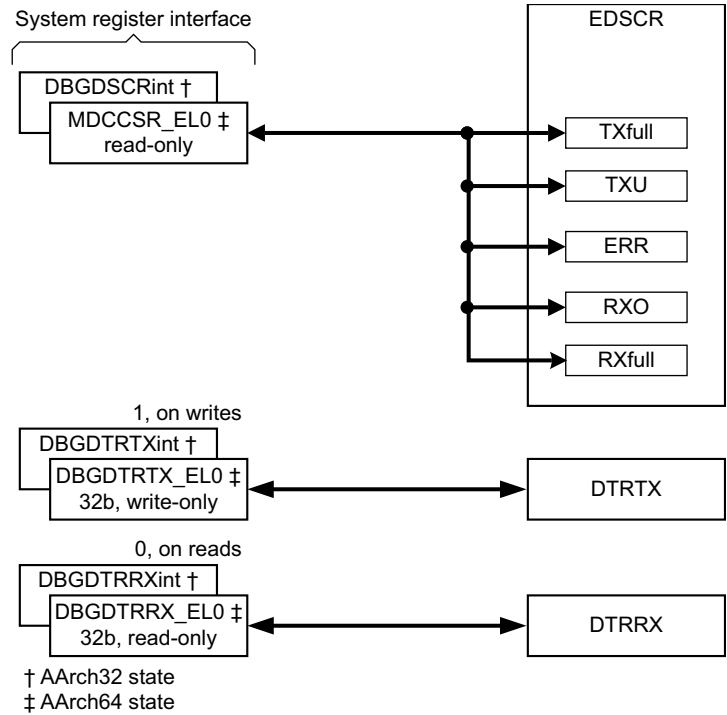

Figure H4-3 System register views of EDSCR and DTR registers for save and restore

H4.3 DCC and ITR access modes

The DCC and ITR support two access modes:

DCC and ITR access mode, links to description	Applies when:
Normal access mode on page H4-7406	EDSCR.MA == 0 or the PE is in Non-debug state
Memory access mode on page H4-7407	EDSCR.MA == 1 and the PE is in Debug state

H4.3.1 Normal access mode

The Normal access mode allows use of the DCC as a communications channel between target and host. It also allows the use of the ITR for issuing instructions to the PE in Debug state.

In Normal access mode, if there is no overrun or underrun, the following occurs:

For accesses by software:

- Direct writes to [DBGDTRTX](#) update the value in DTRTX and indirectly write 1 to TXfull.
- Direct reads from [DBGDTRRX](#) return the value in DTRRX and indirectly write 0 to RXfull.
- In AArch64 state, direct writes to [DBGDTR_EL0](#) update both DTRTX and DTRRX, indirectly write 1 to TXfull, and do not change RXfull:
 - DTRTX is set from bits[31:0] of the transfer register.
 - DTRRX is set from bits[63:32] of the transfer register.
- In AArch64 state, direct reads from [DBGDTR_EL0](#) return the concatenation of DTRRX and DTRTX, indirectly write 0 to RXfull, and do not change TXfull:
 - Bits[31:0] of the transfer register are set from DTRRX.
 - Bits[63:32] of the transfer register are set from DTRTX.

Note

For [DBGDTR_EL0](#), the word order is reversed for reads with respect to writes.

Software reads TXfull and RXfull using [DCCSR](#).

For accesses by the external debug interface:

- Writes to [EDITR](#) trigger the instruction to be executed if the PE is in Debug state:
 - If the PE is in AArch64 state, this is an A64 instruction.
 - If the PE is in AArch32 state, this is a T32 instruction. The T32 instruction is a pair of halfwords where the first halfword is taken from the lower 16-bits, and the second halfword is taken from the upper 16-bits.
- Reads of [DBGDTRTX_EL0](#) return the value in DTRTX and indirectly write 0 to TXfull.
- Writes to [DBGDTRTX_EL0](#) update the value in DTRTX and do not change TXfull.
- Reads of [DBGDTRRX_EL0](#) return the value in DTRRX and do not change RXfull.
- Writes to [DBGDTRRX_EL0](#) update the value in DTRRX and indirectly write 1 to RXfull.

TXfull and RXfull are visible to the external debug interface in [EDSCR](#).

The PE detects overrun and underrun by the external debug interface, and records errors in [EDSCR](#). {TXU, RXO, ITO, ERR}. See [Flow control of the DCC and ITR registers on page H4-7410](#).

See also [Synchronization of DCC and ITR accesses on page H4-7413](#).

H4.3.2 Memory access mode

When the PE is in Debug state, *Memory access mode* can be selected to accelerate word-aligned block reads or writes of memory by an external debugger. Memory access mode can only be enabled in Debug state, and no instructions can be issued directly by the debugger when in Memory access mode.

If there is no overrun or underrun when in Memory access mode, an access by the external debug interface results in the following:

- External reads from [DBGDTRTX_ELO](#) cause:
 1. The existing value in DTRTX to be returned. This clears [EDSCR.TXfull](#) to 0.
 2. The equivalent of `LDR W1, [X0], #4`, if in AArch64 state, or `LDR R1, [R0], #4`, if in AArch32 state, to be executed.
 3. The equivalent of the MSR `DBGDTRTX_ELO, X1` instruction, if in AArch64 state, or the MCR `p14, 0, R1, c0, c5, 0` instruction, if in AArch32 state, to be executed.
 4. [EDSCR.{TXfull, ITE}](#) to be set to {1,1}, and X1 or R1 to be set to an UNKNOWN value.
- External writes to [DBGDTRRX_ELO](#) cause:
 1. The value in DTRRX to be updated. This sets [EDSCR.RXfull](#) to 1.
 2. The equivalent of the instruction `MRS X1, DBGDTRRX_ELO`, if in AArch64 state, or `MRC p14, 0, R1, c0, c5, 0` if in AArch32 state, to be executed.
 3. The equivalent of the instruction `STR W1, [X0], #4`, if in AArch64 state, or `STR R1, [R0], #4`, if in AArch32 state, to be executed.
 4. [EDSCR.{RXfull, ITE}](#) to be set to {0,1}, and X1 or R1 to be set to an UNKNOWN value.
- External reads from [DBGDTRRX_ELO](#) return the last value written to DTRRX.
- External writes to [EDITR](#) generate an overrun error.

During these accesses, [EDSCR.{TXfull, RXfull, ITE}](#) are used for flow control.

———— Note ————

An overrun or underrun might result in [EDSCR.ERR](#) being set to 1 asynchronously to the sequence of operations that are outlined in this section. As this is timing-dependent, it is UNPREDICTABLE when the [EDSCR.ERR](#) flag affects the instructions and therefore whether neither instruction, only the first instruction, or both instructions are executed. If the second instruction is executed, then the first instruction must have been executed. However, in each case X1 or R1 is set to an UNKNOWN value. This means that:

- In both cases, if the memory access instruction is not executed, then the base register X0 or R0 is not updated, meaning the debugger can determine the last accessed location.
- In the list describing External reads from [DBGDTRTX_ELO](#), DTRTX and [EDSCR.TXfull](#) get set to UNKNOWN values. If the load was executed, then the value that was read by the PE is lost. This means the operation might need to be repeated by the debugger, and it is not advisable to use Memory access mode to read from read-sensitive locations using the underrun and overrun detection for flow control.
- In the list describing External writes to [DBGDTRRX_ELO](#), [EDSCR.RXfull](#) is set to an UNKNOWN value.

A Data Abort from the memory access can also set [EDSCR.ERR](#) to 1. See [Data Aborts in Memory access mode on page H4-7408](#).

The architecture does not require precisely when these flags are set or cleared by the sequence of operations outlined in this section. For example, in the case of an external write to [DBGDTRRX_ELO](#), in AArch64 state, [RXfull](#) might be cleared after step 2, or it might not be cleared until after step 3, as an implementation is free to fuse these steps into a single operation. The architecture does require that the flags are set as at step 4 when the PE is ready to accept a further read or write without causing an overrun error or an underrun error.

The process outlined in this section represents a simple sequential execution model of Memory access mode. An implementation is free to pipeline, buffer, and re-order instructions and transactions, as long as the following remain true:

- Data items are transferred into and out of the DTR in order and without loss of data, other than as a result of an overrun or an underrun.
- Data Aborts occur in order.

- The constraints of the memory type are met.
- In the list describing [External reads from DBGDTRTX_ELO on page H4-7407](#):
 - The MSR equivalent operation at step 3 of the sequence reads the value loaded by step 2.
 - If the list is performed in a loop, for all but the first iteration of this list, the value read by step 1 returns the values written by the MSR equivalent operation at the previous iteration of step 3.
- In the list describing [External writes to DBGDTRRX_ELO on page H4-7407](#):
 - The MRS equivalent operation at step 2 of the sequence returns the value written at step 1.
 - The STR equivalent at step 3 of the sequence writes the value read at step 2.
- If the PE cannot accept a read or write, as applicable, during the sequence, then the flags are updated to indicate an overrun or underrun.

See [Flow control of the DCC and ITR registers on page H4-7410](#) for more information on overrun and underrun.

Ordering, access sizes and effect on Exclusives monitors

For the purposes of memory ordering, access sizes, and effect on the Exclusives monitor, accesses in Memory access mode are consistent with load/store word instructions executed by the PE.

The simple sequential access model of Memory-access mode, as stated in [Memory access mode on page H4-7407](#), must also be ordered with respect to instructions executed as a result of explicit writes to EDITR in Normal mode both before and after accesses to the DTR registers in Memory-access mode.

Data Aborts in Memory access mode

If a memory access generates a Data Abort, then:

- The Data Abort exception is taken. See [Exceptions in Debug state on page H2-7369](#):
 - This means EDSCR.ERR is set to 1, see [Cumulative error flag on page H4-7412](#).
 - If the Data Abort occurs on stage 2 of an address translation, then the values returned in the ISV field and in bits[23:14] of the ISS are UNKNOWN.
If this Data Abort is taken to EL2 using AArch64, the ISS is returned by ESR_EL2. [ISS encoding for an exception from a Data Abort on page D13-3172](#) describes the usual encoding of this ISS.
If EL2 is using AArch32 and this Data Abort is taken to Hyp mode, the ISS is returned by HSR. [ISS encoding for exception from a Data Abort on page G8-6650](#) describes the usual encoding of this ISS.
- Register R0 retains the address that generated the abort.
- Register R1 is set to an UNKNOWN value.
- EDSCR.TXfull, for a load, or EDSCR.RXfull, for a store, is set to an UNKNOWN value.
- DTRTX, for a load, or DTRRX, for a store, is set to an UNKNOWN value.
- EDSCR.ITE is set to 1.

Illegal Execution state exception

If PSTATE.IL is set to 1 when EDSCR.MA == 1, then on an external write access to DBGDTRRX_ELO or an external read from DBGDTRTX_ELO, it is CONSTRAINED UNPREDICTABLE whether the PE:

- Takes an Illegal Execution state exception without performing any operations. In this case:
 - EDSCR.ERR is set to 1, see [Cumulative error flag on page H4-7412](#).
 - Register R0 is unchanged.
 - Register R1 is set to an UNKNOWN value.
 - EDSCR.TXfull or EDSCR.RXfull, as applicable, is set to an UNKNOWN value.
 - DTRTX or DTRRX, as applicable, is set an UNKNOWN value.
 - EDSCR.ITE is set to 1.

See also [Exceptions in Debug state on page H2-7369](#).

- Ignores PSTATE.IL.

Note

The typical usage model for Memory access mode involves executing instructions in Normal access mode to set up X0 before setting `EDSCR.MA` to 1. These instructions generate an Illegal state exception if `PSTATE.IL` is set to 1.

Alignment constraints

If the address in R0 is not aligned to a multiple of four, the behavior is as follows:

- For each external DTR access a CONSTRAINED UNPREDICTABLE choice of:
 1. The PE makes an unaligned memory access to R0. If alignment checking is enabled for the memory access, this generates an Alignment fault.
 2. The PE makes a memory access to `Align(X[0], 4)` in AArch64 state, or `Align(R[0], 4)` in AArch32 state.
 3. The PE generates an Alignment fault, regardless of whether alignment checking is enabled.
 4. The PE does nothing.
- Following each memory access, if there is no Data Abort, R0 is updated with an UNKNOWN value.
- For external writes to `DBGDTRRX_ELO`, if the PE writes to memory, an UNKNOWN value is written.
- For external reads of `DBGDTRTX_ELO` an UNKNOWN value is returned.
- The RXfull and TXfull flags are left in an UNKNOWN state, meaning that a `DBGDTRTX_ELO` read can trigger a TX underrun, and a `DBGDTRTX_ELO` write can trigger an RX overrun.

H4.3.3 Memory-mapped accesses to the DCC and ITR

Writes to the flags in `EDSCR` by external debug interface accesses to the DCC and the ITR registers are indirect writes, because they are a side-effect of the access. The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see [Register access permissions for memory-mapped accesses on page H8-7466](#).

H4.4 Flow control of the DCC and ITR registers

- [Ready flags](#) on page H4-7410.
- [Buffering writes to EDITR](#) on page H4-7410.
- [Overflow and underrun flags](#) on page H4-7410.
- [Cumulative error flag](#) on page H4-7412.

H4.4.1 Ready flags

In Normal access mode:

- For the DTR registers there are two ready flags:
 - `EDSCR.RXfull == 1` indicates that `DBGDTRRX_EL0` contains a valid value that has been written by the external debugger and not yet read by software running on the target.
 - `EDSCR.TXfull == 1` indicates that `DBGDTRTX_EL0` contains a valid value that has been written by software running on the target and not yet read by an external debugger.
- For the ITR register there is a single ready flag:
 - `EDSCR.ITE == 1` indicates that the PE is ready to accept an instruction to the ITR.

———— **Note** —————

The architecture permits a PE to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, as long as those instructions are discarded if `EDSCR.ERR` is set, either by an underrun or overrun or by any of the other error conditions described in this architecture, such as an instruction generating an abort.

In Memory access mode:

- `EDSCR.{RXfull, ITE} == {0,1}` indicates that `DBGDTRRX_EL0` is empty and the PE is ready to accept a word external write to `DBGDTRRX_EL0`.
- `EDSCR.{TXfull, ITE} == {1,1}` indicates that `DBGDTRTX_EL0` is full and the PE is ready to accept a word external read from `DBGDTRTX_EL0`.

All other values indicate that the PE is not ready, and result in a DTR overrun or underrun error, an ITR overrun error, or both, as defined in [Overflow and underrun flags](#) on page H4-7410.

`EDSCR.{ITE, RXfull, TXfull}` shows the status of the ITR and DCC registers. It ignores the question of whether a read or write cannot be accepted because, for example, `EDSCR.ERR` is set or the OPTIONAL Software Lock is locked for memory-mapped accesses (`EDLSR.SLK == 1`).

H4.4.2 Buffering writes to EDITR

The architecture permits a processor to continue to accept and buffer instructions when previous instructions have not completed their architecturally defined behavior, provided that:

- Those instructions are discarded if `EDSCR.ERR` is set to 1, either by an underrun or an overrun, or by any other error conditions described in this architecture, such as an instruction generating an abort.
- The PE maintains the simple sequential execution model with the order of instructions determined by the order in which the PE accepts the EDITR writes. In particular, the buffered instructions must be executed in the Execution state consistent with a simple sequential execution of the instructions, even if one of the previous instructions is a state changing operation, such as DCPS or DRPS.

H4.4.3 Overflow and underrun flags

Each of the ready flags has a corresponding overrun or a corresponding underrun flag. These are sticky status flags that are set if the register is accessed using the external debug interface when the corresponding ready flag is not in the ready state.

If the PE is in Debug state and Memory access mode, the corresponding error flag is also set if the PE is not ready to accept an operation because a previous load or store is still in progress. The sticky status flag remains set until cleared by writing 1 to `EDRCR.CSE`.

Note

The architecture permits a PE to continue to accept and buffer data to write to memory in Memory access mode.

Table H4-1 on page H4-7411 shows DCC and ITR ready flags and the overrun and underrun flags associated with them.

Table H4-1 DCC and ITR ready flags and the associated overrun/underrun flags

External debug interface access	Overrun/Underrun condition	EDSCR flag
Write DBGDTRRX_ELO	$\text{EDSCR.RXfull} == '1' \ \ (\text{Halted}() \ \&\& \ \text{EDSCR.MA} == '1' \ \&\& \ \text{EDSCR.ITE} == '0')$	RXO
Read DBGDTRTX_ELO	$\text{EDSCR.TXfull} == '0' \ \ (\text{Halted}() \ \&\& \ \text{EDSCR.MA} == '1' \ \&\& \ \text{EDSCR.ITE} == '0')$	TXU
Write EDITR	$\text{Halted}() \ \&\& \ (\text{EDSCR.ITE} == '0' \ \ \text{EDSCR.MA} == '1')$	ITO

When an overrun or underrun flag is set to 1, the cumulative error flag, [EDSCR.ERR](#), described in *Cumulative error flag* on page H4-7412, is also set to 1.

In the event of an external write to [DBGDTRRX_ELO](#) or [EDITR](#) generating an overrun, or an external read from [DBGDTRTX_ELO](#) generating an underrun:

- For a write, the written value is ignored.
- For a read, an UNKNOWN value is returned.
- [EDSCR.TXfull](#), [EDSCR.RXfull](#) or [EDSCR.ITE](#), as applicable, are not updated.

There is no overrun or underrun detection on external reads of [DBGDTRRX_ELO](#) or external writes of [DBGDTRTX_ELO](#).

There is no overrun or underrun detection of direct reads and direct writes of the DTR System registers by software:

- If $\text{RXfull} == 0$, a direct read of [DBGDTRRX](#) or [DBGDTR_ELO](#) returns UNKNOWN.
- If $\text{TXfull} == 1$, a direct write of:
 - [DBGDTRTX](#) sets [DTRTX](#) to UNKNOWN.
 - [DBGDTR_ELO](#) sets [DTRRX](#) and [DTRTX](#) to UNKNOWN.

See *DCC accesses in Non-debug state* on page H4-7414 for more information.

Accessing 64-bit data

In AArch64 state, a software access to the [DBGDTR_ELO](#) register and an external debugger access to both [DBGDTRRX_ELO](#) and [DBGDTRTX_ELO](#) can perform a 64-bit half-duplex operation.

However, there is only overrun and underrun detection on one of the external debug registers. That is:

- If software directly writes a 64-bit value to [DBGDTR_ELO](#), only TXfull is set to 1, meaning:
 - A subsequent external write to [DBGDTRRX_ELO](#) would not be detected as an overrun.
 - If the external debugger reads [DBGDTRTX_ELO](#) first, software might observe [MDCCSR_ELO.TXfull](#) == 0 and send a second value before the external debugger reads [DBGDTRRX_ELO](#), leading to an undetected overrun.
- On external writes to both [DBGDTRRX_ELO](#) and [DBGDTRTX_ELO](#) only RXfull is set to 1, meaning:
 - A subsequent direct write of [DBGDTRTX_ELO](#) would not be detected as an overrun.
 - If the external debugger writes to [DBGDTRRX_ELO](#) first, software might observe [MDCCSR_ELO.RXfull](#) == 1 and read a full 64-bit value, before the external debugger writes to [DBGDTRTX_ELO](#), leading to an undetected underrun.

To avoid this, debuggers need to be aware of the data size used by software for transfers and ensure that 64-bit data is read or written in the correct order. If the PE is in Non-debug state, this order is as follows:

- The external debugger must check [EDSCR](#).{[RXfull](#), [TXfull](#)} before each transfer.

- To receive a 64-bit value from the target, the external debugger must read [DBGDTRRX_EL0](#) before reading [DBGDTRTX_EL0](#).
- To send a 64-bit value to the target, the external debugger must write to [DBGDTRTX_EL0](#) before writing [DBGDTRRX_EL0](#).

Because three accesses are required to transfer 64 bits of data, 64-bit transfers are not recommended for regular communication between host and target. The use of underrun and overrun detection means that only one access is required for 32 bits of data when using 32-bit transfers.

In Debug state, the debugger controls the instructions executed by the PE, so these limitations do not apply. 64-bit transfers provide a means to transfer a 64-bit general register between the host and the target in Debug state.

H4.4.4 Cumulative error flag

The cumulative error flag, [EDSCR.ERR](#), is set to 1:

- On taking an exception from Debug state.
- On any signaled overrun or underrun in the DCC or ITR.

When [EDSCR.ERR](#) == 1:

- External reads of [DBGDTRTX_EL0](#) do not have any side-effects.
- External writes to [DBGDTRRX_EL0](#) are ignored.
- External writes to [EDITR](#) are ignored.
- No further instructions can be issued in Debug state. This includes any instructions previously accepted as external writes to [EDITR](#) that occur in program order after the instruction or access that caused the error.

This allows a debugger to stream data, or, in Debug state, instructions, to the target without having to:

- Check [EDSCR](#).{RXfull, TXfull, ITE} before each access.
- Check [EDSCR](#).{ITO, RXO, TXU} following each access, for overrun or underrun.
- Check [PSTATE](#) or other syndrome registers, or both, for an exception following each instruction executed in Debug state that might generate a synchronous exception.

The cumulative error flag remains set until cleared to 0 by writing 1 to [EDRCR.CSE](#). However, the effect of writing 1 to [EDRCR.CSE](#) to clear [EDSCR.ERR](#) is CONSTRAINED UNPREDICTABLE when both of the following apply:

- The PE is in Debug state.
- The value of [EDSCR.ITE](#) is 0.

When these conditions apply and a value of 1 is written to [EDRCR.CSE](#), either or both of the following might occur:

- [EDSCR.ERR](#) is not cleared to 0.
- Any instructions in [EDITR](#) that have not been executed might be executed subsequently, rather than being ignored.

———— **Note** —————

This means that a debugger must poll [EDSCR.ITE](#) until it has the value 1, indicating that [EDITR](#) is empty, before writing to [EDRCR.CSE](#) to clear the [EDSCR.ERR](#) flag to 0.

For overruns and underruns, [EDSCR](#).{ITO, RXO, TXU} record the error type.

Pseudocode description of clearing the error flag

The [ClearStickyErrors\(\)](#) pseudocode function is described in [Chapter J1 Armv8 Pseudocode](#).

H4.5 Synchronization of DCC and ITR accesses

In addition to the standard synchronization requirements for register accesses, the following subsections describe additional requirements that apply for the DCC and ITR registers:

- [Summary of System register accesses to the DCC on page H4-7413.](#)
- [DCC accesses in Non-debug state on page H4-7414.](#)
- [Synchronization of DCC interrupt request signals on page H4-7416.](#)
- [DCC and ITR access in Debug state on page H4-7417.](#)

In these sections, accesses by the external debug interface are referred to as external reads and external writes. Accesses to System registers are referred to as direct reads, direct writes, indirect reads, and indirect writes.

———— **Note** ————

In [Synchronization requirements for AArch64 System registers on page D13-3041](#) external reads and external writes are described as forms of indirect access. This whole section uses more explicit terminology.

The DTR registers and the DCC flags, TXfull and RXfull, form a communication channel, with one end operating asynchronously to the other. Implementations must respect the ordering of accesses to these registers in order to maintain the correct behavior of the channel.

External reads of, and external writes to [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#) are asynchronous to direct reads of, and direct writes to, [DBGDTRRX](#), [DBGDTRTX](#), and in AArch64 state [DBGDTR_EL0](#), made by software using System register access instructions. The direct reads and direct writes indirectly write to the DCC flags. The external reads and external writes indirectly read the DCC flags to check for underrun and overrun.

Throughout this section:

- DCC flags** Means any or all of the following:
- The [EDSCR](#).{RXfull.TXfull} ready flags.
 - The [EDSCR](#).RXO overrun flag.
 - The [EDSCR](#).TXU underrun flag.
 - The [EDSCR](#).ERR cumulative error flag.
- ITR flags** Means any or all of the following:
- The [EDSCR](#).ITE ready flag.
 - The [EDSCR](#).ITO overrun flag.
 - The [EDSCR](#).ERR cumulative error flag.

H4.5.1 Summary of System register accesses to the DCC

System register accesses to the DTR registers are direct reads and writes of those registers, as shown in [Table H4-2 on page H4-7414](#). Several of these instructions access the same registers using different encodings.

[DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#) are encoded as MRS and MSR accesses respectively to the same System register, even though they access different underlying register values. [DBGDTRRX](#) and [DBGDTRTX](#) are similarly encoded as MRC and MCR accesses respectively to the same System register. The encoding means that direct reads and writes using these encodings must be ordered with respect to each other. For more information, see [Synchronization requirements for AArch64 System registers on page D13-3041](#) and [Synchronization of changes to AArch32 System registers on page G8-6443](#).

Table H4-2 on page H4-7414 shows a summary of System register accesses to the DCC.

Table H4-2 Summary of System register accesses to the DCC

Operation	OS Lock	AArch64 (MRS/MSR)	AArch32 (MRC/MCR)	Description
Read	-	DBGDTRRX_EL0	DBGDTRRXint	Direct read of DTRRX Indirect write to the DCC flags An STC instruction that reads DBGDTRRXint makes an indirect write to DBGDSCRint.RXfull
Write	-	DBGDTRTX_EL0	DBGDTRTXint	Direct read of DTRTX Indirect write to the DCC flags An LDC instruction that writes to DBGDTRTXint using a value read from memory is a direct write to DBGDTRTXint
Read/write	-	DBGDTR_EL0	-	Direct read/write of both DTRRX and DTRTX Indirect write to the DCC flags
Read	-	MDCCSR_EL0	DBGDSCRint	Direct read of the DCC flags
Read/write	-	OSDTRRX_EL1	DBGDTRRXext	Direct read/write of DTRRX
Read/write	-	OSDTRTX_EL1	DBGDTRTXext	Direct read/write of DTRTX
Read	Unlocked	MDSCR_EL1	DBGDSCRext	Direct read of DCC flags
Read/write	Locked	MDSCR_EL1	DBGDSCRext	Direct read/write of DCC flags

H4.5.2 DCC accesses in Non-debug state

In Non-debug state DCC accesses are as described in [Normal access mode](#) on page H4-7406:

- If a direct read of [DCCSR](#) returns [RXfull](#) == 1, then a following direct read of [DBGDTRRX](#), or in AArch64 state of [DBGDTR_EL0](#), returns valid data and indirectly writes 0 to [DCCSR.RXfull](#) as a side-effect.
- If a direct read of [DCCSR](#) returns [TXfull](#) == 0, then a following direct write to [DBGDTRTX](#), or in AArch64 state to [DBGDTR_EL0](#), writes the intended value, and indirectly writes 1 to [DCCSR.TXfull](#) as a side-effect.

No [Context synchronization event](#) is required between these two instructions. Overrun and underrun detection prevents intervening external reads and external writes affecting the outcome of the second instruction.

The indirect write to the [DCC flags](#) as part of the DTR access instruction is made atomically with the DTR access.

Because a direct read of [DBGDTRRX](#) is an indirect write to [DCCSR.RXfull](#), it must occur in program order with respect to the direct read of [DCCSR](#), meaning it must not return a speculative value for [DTRTX](#) that predates the [RXfull](#) flag returned by the read of [DCCSR](#). The direct write to [DBGDTRTX](#) must not be executed speculatively.

Direct reads of [DBGDTRRX](#), or in AArch64 state [DBGDTR_EL0](#), and [DCCSR](#), must occur in program order with respect to other direct reads of the same register using the same encoding.

The following accesses have an implied order within the atomic access:

- In the simple sequential execution of the program the indirect write of the [DCC flags](#) occurs immediately after the direct DTR access.

————— **Note** —————

For an access to [DBGDTR_EL0](#), this means the indirect write happens after both [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#) have been accessed.
- In the simple sequential execution model, for an external read of [DBGDTRTX_EL0](#) or an external write of [DBGDTRRX_EL0](#):

— The check of the [DCC flags](#) for overrun or underrun occurs immediately before the access.

- If there is no underrun or overrun, the update of the [DCC flags](#) occurs immediately after the access.
- If there is underrun or overrun, the update of the DCC underrun or overrun flags occurs immediately after the access.

All observers must observe the same order for accesses.

———— **Note** —————

These requirements do not create order where order does not otherwise exist. It applies only for ordered accesses.

Without explicit synchronization following external writes and external reads:

- The value written by the external write to [DBGDTRRX_EL0](#) that does not overrun, must be observable to direct reads of [DBGDTRRX](#) and [DBGDTR_EL0](#) in finite time.
- The [DCC flags](#) that are updated as a side-effect of the external write or external read must be observable:
 - To subsequent external reads of [EDSCR](#).
 - To subsequent external reads of [DBGDTRRX_EL0](#) when checking for underrun.
 - To subsequent external writes to [DBGDTRTX_EL0](#) when checking for overrun.
 - To direct reads of [DCCSR](#) in finite time.

However, explicit synchronization is required to guarantee that a direct read of [DCCSR](#) returns up-to-date [DCC flags](#). This means that if a signal is received from another agent that indicates that [DCCSR](#) must be read, an ISB is required to ensure that the direct read of [DCCSR](#) occurs after the signal has been received. This also synchronizes the value in [DBGDTRRX](#), if applicable. However, if that signal is an interrupt exception triggered by [COMMIRQ](#), [COMMTX](#), or [COMMRX](#), the exception entry is sufficient synchronization. See [Synchronization of DCC interrupt request signals on page H4-7416](#).

Explicit synchronization is required following a direct read or direct write:

- To ensure that a value directly written to [DBGDTRTX](#) is observable to external reads of [DBGDTRTX_EL0](#).
- To ensure that a value directly written to [DBGDTR_EL0](#) is observable to external reads of [DBGDTRTX_EL0](#) and [DBGDTRRX_EL0](#).
- To guarantee that the indirect writes to the [DCC flags](#) that were a side-effect of the direct read or direct write have occurred, and therefore that the updated values are:
 - Observable to external reads of [EDSCR](#).
 - Observable to external reads of [DBGDTRRX_EL0](#) when checking for underrun.
 - Observable to external writes of [DBGDTRTX_EL0](#) when checking for overrun.
 - Returned by a following direct read of [DCCSR](#).

See also [Memory-mapped accesses to the DCC and ITR on page H4-7409](#) and [Synchronization of changes to the external debug registers on page H8-7462](#).

———— **Note** —————

These ordering rules mean that software:

- Must not read [DBGDTRRX](#) without first checking [DCCSR.RXfull](#) or if the previously-read value of [DCCSR.RXfull](#) is 0.
It is not sufficient to read both registers and then later decide whether to discard the read value, as there might be an intervening write from the external debug interface.
- Must not write [DBGDTRTX](#) without first checking [DCCSR.TXfull](#) or if the previously-read value of [DCCSR.TXfull](#) is 1.
The write to [DBGDTRTX](#) overwrites the value in [DTRTX](#), and the external debugger might or might not have read this value.
- Must ensure there is an explicit [Context synchronization event](#) following a DTR access, even if not immediately returning to read [DCCSR](#) again. This synchronization operation can be an exception return.

Derived requirements

The rules for DCC accesses in Non-debug state are as follows:

- Following a direct read of **DBGDTRRX** when **RXfull** is 1:
 - If an external write to **DBGDTRRX** checks the **RXfull** flag for overrun and observes that the value of **RXfull** is 0, the value returned by the previous direct read must not be affected by the external write.
 - If an external read of **EDSCR** returns a **RXfull** value of 0, then the value returned by the previous direct read must not be affected by a following external write to **DBGDTRRX**, and the following external write does not overrun.
- Following a direct read of **DBGDTR_EL0**, when **RXfull** is 1:
 - If an external write to **DBGDTRRX** checks the **RXfull** flag for overrun and observes that the value of **RXfull** is 0, the value returned by the previous direct read must not be affected by the external write nor by a following direct write to **DBGDTRTX**.
 - If an external read of **EDSCR** returns a **RXfull** value of 0, then the value returned by the previous direct read must not be affected by subsequent external writes to **DBGDTRRX** and **DBGDTRTX** in any order, and the following external write of **DBGDTRRX** will not overrun.
- Following a direct write to **DBGDTRTX**, when **TXfull** is 0:
 - If an external read of **DBGDTRTX** checks the **TXfull** flag for underrun and observes that the value of **TXfull** is 1, the value returned by the external read must be the value written by the previous direct write.
 - If an external read of **EDSCR** returns a **TXfull** value of 1, then the value returned by a following external read of **DBGDTRRX** must be the value written by the previous direct read, and the subsequent external read will not underrun.
- Following a direct write to **DBGDTR_EL0**, when **TXfull** is 0:
 - If an external read of **DBGDTRTX** checks the **TXfull** flag for underrun and observes that the value of **TXfull** is 1, the values returned by the external read and by a subsequent external read of **DBGDTRRX** must be the value written by the previous direct write.
 - If an external read of **EDSCR** returns a **TXfull** value of 1, then the value returned by subsequent external reads of **DBGDTRRX** and **DBGDTRTX**, in any order, must be the value written by the previous direct read, and the subsequent external read of **DBGDTRTX** does not underrun.
- Following an external read of **DBGDTRTX** that does not underrun, if a direct read of **DCCSR** returns a **TXfull** value of 0, then the value returned by the external read must not be affected by a following direct write to **DBGDTRTX**.
- Following a first external read **DBGDTRRX** and a following second external read of **DBGDTRTX** that does not underrun, if a direct read of **DCCSR** returns a **TXfull** value of 0, then the values returned by the external reads must not be affected by a following direct write to **DBGDTR_EL0**.
- Following an external write to **DBGDTRRX** that does not overrun, if a direct read of **DCCSR** returns an **RXfull** value of 1, then the value returned by a following direct read of **DBGDTRRX** or **DBGDTR_EL0** must be the value written by the previous external write.
- Following a first external write to **DBGDTRTX** and a following second external write to **DBGDTRRX** that does not overrun, if a direct read of **DCCSR** returns an **RXfull** value of 1, then the value returned by a subsequent direct read of **DBGDTR_EL0** must return the values written by the previous external writes.

H4.5.3 Synchronization of DCC interrupt request signals

Following an external read or external write access to the DTR registers, the interrupt request signals, **COMMIRQ**, **COMMTX**, and **COMMRX**, must be updated in finite time without explicit synchronization.

The updated values must be observable to a direct read of **DCCSR** or **DBGDTRRX**, or a direct write of **DBGDTRTX** executed after taking an interrupt exception generated by the interrupt request. The updated values must also be observable to a direct write of **DBGDTRTX** executed after taking an interrupt exception generated by the interrupt request.

———— **Note** —————

The requirement that indirect writes to registers are observable to direct reads in finite time does not imply that all observers will observe the indirect write at the same time. For more information, see [Synchronization requirements for AArch64 System registers](#) on page D13-3041 and [Synchronization of changes to AArch32 System registers](#) on page G8-6443.

Following a direct read of [DBGDTRRX](#) or a direct write to [DBGDTRRX](#), software must execute a [Context synchronization event](#) to guarantee the interrupt request signals have been updated in finite time. This synchronization operation can be an exception return.

H4.5.4 DCC and ITR access in Debug state

In Debug state, stricter observability rules apply for instructions issued through the ITR, to maintain communication between a debugger and the PE, without requiring excessive explicit synchronization.

In Normal access mode, without explicit synchronization:

- A direct read or direct write of the DTR registers by an instruction written to [EDITR](#) must be observable to an external write or an external read in finite time:
 - A direct read of [DBGDTRRX](#) must be observable to an external write of [DBGDTRRX_EL0](#).
 - A direct read of [DBGDTR_EL0](#) must be observable to an external write of [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#).
 - A direct write of [DBGDTRTX](#) must be observable to an external read of [DBGDTRTX_EL0](#).
 - A direct write of [DBGDTR_EL0](#) must be observable to an external read of [DBGDTRRX_EL0](#) and [DBGDTRTX_EL0](#).

This includes the indirect write to the [DCC flags](#) that occurs atomically with the access as described in [DCC accesses in Non-debug state](#) on page H4-7414.

The subsequent external write or external read must observe either the old or the new values of both the DTR contents and [DCC flags](#). If the old values are observed, this typically results in overrun or underrun, assuming the old values of the [DCC flags](#) indicate an overrun or underrun condition, as would normally be the case.

This means the debugger can observe the direct read or direct write without explicit synchronization and without explicitly testing the [DCC flags](#) in [EDSCR](#), because it can rely on overrun and underrun tests.

- External reads of [DBGDTRTX_EL0](#) that do not underrun and external writes to [DBGDTRRX_EL0](#) that do not overrun must be observable to an instruction subsequently written to [EDITR](#) on completion of the first external access. This includes the indirect write to the [DCC flags](#).

This means that without explicit synchronization and without the need to first check the [DCC flags](#) in [DCCSR](#):

- If the instruction is a direct read of [DBGDTRRX](#), it observes the external write.
- If the instruction is a direct write of [DBGDTRTX](#), it observes the external read.
- Writes to [EDITR](#) that do not overrun commit an instruction for execution immediately. The instruction must complete execution in finite time without requiring any further operation by the debugger.
- After an external write to the [EDITR](#), the [ITR flags](#) that are updated as a side effect of that write must be observable by:
 - An external read of the [EDSCR](#) that follows the external write to the [EDITR](#).
 - When checking for overrun, another external write to the [EDITR](#) that follows the original external write to the [EDITR](#).

In Memory access mode, these requirements shift to the instructions implicitly executed by external reads and external writes of the DTR registers, as described in [Memory access mode](#) on page H4-7407.

H4.6 Interrupt-driven use of the DCC

Arm recommends implementations provide a level-sensitive DCC interrupt request through the IMPLEMENTATION DEFINED interrupt controller as a private peripheral interrupt for the originating PE.

———— **Note** —————

- In addition to connection to the interrupt controller Arm also recommends **COMMIRQ**, **COMMTX**, and **COMMRX** signals that might be implemented for use by any legacy system peripherals.
- GICv3 reserves a private peripheral interrupt number for the **COMMIRQ** interrupt.

The **DCCINT** register provides a first level of interrupt masking within the PE, meaning only a single interrupt source, **COMMIRQ**, is needed at the interrupt controller.

See also [Synchronization of DCC interrupt request signals on page H4-7416](#).

H4.7 Pseudocode description of the operation of the DCC and ITR registers

The basic operation of the DCC and ITR registers is shown by the following pseudocode functions. These functions do not cover the behavior when `OSLSR.OSLK == 1`, meaning that the OS Lock is locked:

- `DBGDTR_EL0[]`.
- `DBGDTRRX_EL0[]`.
- `DBGDTRTX_EL0[]`.
- `EDITR[]`.
- `CheckForDCCInterrupts()`.

For the definition of the DTR Registers, see [shared/debug/dccanditr/DTR](#) on page J1-8231.

Chapter H5

The Embedded Cross-Trigger Interface

This chapter describes the embedded cross-trigger interface. It contains the following sections:

- *About the Embedded Cross-Trigger (ECT) on page H5-7422.*
- *Basic operation on the ECT on page H5-7424.*
- *Cross-triggers on a PE in an Armv8 implementation on page H5-7428.*
- *Description and allocation of CTI triggers on page H5-7429.*
- *CTI registers programmers' model on page H5-7433.*
- *Examples on page H5-7434.*

H5.1 About the Embedded Cross-Trigger (ECT)

The *Embedded Cross-Trigger*, ECT, allows a debugger to:

- Send trigger events to a PE. For example, this might be done to halt the PE.
- Send a trigger event to one or more PEs, or other system components, when a trigger event occurs on another PE or system component. For example, this might be done to halt all PEs when one individual PE halts.

Figure H5-1 on page H5-7422 shows the logical structure of an ECT.

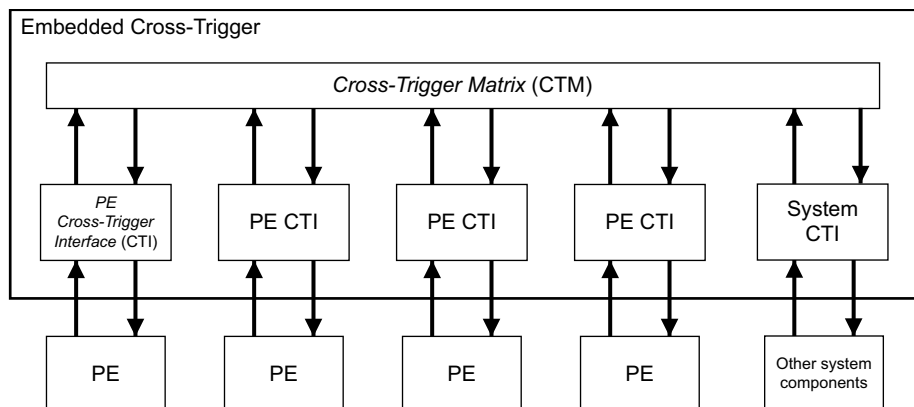

Figure H5-1 Structure of an embedded cross-trigger

The ECT can deliver many types of trigger events, which are described in the following sections:

- [Debug request trigger event on page H5-7430.](#)
- [Restart request trigger event on page H5-7430.](#)
- [Cross-halt trigger event on page H5-7430.](#)
- [Performance Monitors overflow trigger event on page H5-7430.](#)
- [Generic trace external input trigger events on page H5-7431.](#)
- [Generic trace external output trigger events on page H5-7431.](#)
- [Generic CTI interrupt trigger event on page H5-7431.](#)

An Armv8-A implementation must:

- Include a cross-trigger interface, CTI.
- Implement at least the input and output triggers defined in this architecture.

In addition, see [Cross-triggers on a PE in an Armv8 implementation on page H5-7428.](#)

Arm recommends that this cross-trigger interface includes:

- The ability to route trigger events between Trace Units, which typically have advanced event triggering logic.
- An output trigger to the interrupt controller.

Also, Arm recommends that the Embedded Cross-Trigger includes the capability to send and receive IMPLEMENTATION DEFINED system trigger events to and from other system components, including a system counter, using a system CTI. See [Halt-on-debug on page I2-7666.](#)

———— Note ————

The ECT and CTI must only signal trigger events for external debugging. They must not route software events, such as interrupts. For example, the Performance Monitors overflow input trigger is provided to allow entry to Debug state on a counter overflow, and the output trigger to the interrupt controller is provided to generally allow events from the external debug sub-system to be routed to a software agent. However, the combination of the two must not be used as a mechanism to route Performance Monitors overflows to an interrupt controller.

Note

CTI version 1 (CTIv1) is defined by the *CoreSight™ SoC Technical Reference Manual*. CTIv2 extends CTIv1 with the addition of the input channel gate. See [Implementation with CTIv2 on page H5-7423](#)

H5.1.1 Implementation with a CoreSight CTI

For details of the recommended connections in an Armv8-A implementation, see [Appendix K2 Recommended External Debug Interface](#). See also *CoreSight™ SoC Technical Reference Manual*.

H5.1.2 Implementation with CTIv2

If the CTI implemented is CTIv2 then:

- The [CTIDEVARCH](#), [CTIDEVAFF0](#), and [CTIDEVAFF1](#) registers must be implemented.
- If the channel gate function is implemented, it applies to both input and output channels.
- The input channel gate function must be implemented if either of the following is true:
 - The CTM is implemented and the architecture variant is Armv8.5 or higher.
 - The [CTIDEVARCH.REVISION](#) field reads as 0b0001 or higher.

Implementation of CTIv2 features in architecture variants below Armv8.5 is OPTIONAL, but Arm recommends that CTIv2 is implemented, CTIv2 must be implemented from Armv8.5.

H5.2 Basic operation on the ECT

The ECT comprises a Cross-Trigger Matrix, CTM, and one Cross-Trigger Interface, CTI, for each PE. The ECT might also include other CTIs for other system components. The CTM passes events between the CTI blocks over channels. The CTM can have a maximum of 32 channels.

The main interfaces of the cross-trigger interface, CTI, are:

- The input triggers:
 - These are trigger event inputs from the PE to the CTI.
- The output triggers:
 - These are trigger event outputs from the CTI to the PE.
- The input channels:
 - These are channel event inputs from the cross-trigger matrix, CTM, to the CTI.
- The output channels:
 - These are channel event outputs from the CTI to the CTM.

Each CTI block has:

- Up to 32 input triggers that come from the PE:
 - The input triggers are numbered 0-31.
- Up to 32 output triggers that go to the PE:
 - The output triggers are numbered 0-31.

If the CTI is not powered up when the Core power domain is powered up, the CTI ignores all input triggers and input channel events, and does not generate any output triggers or output channel events.

[Figure H5-2 on page H5-7425](#) shows the logical internal structure of a CTI.

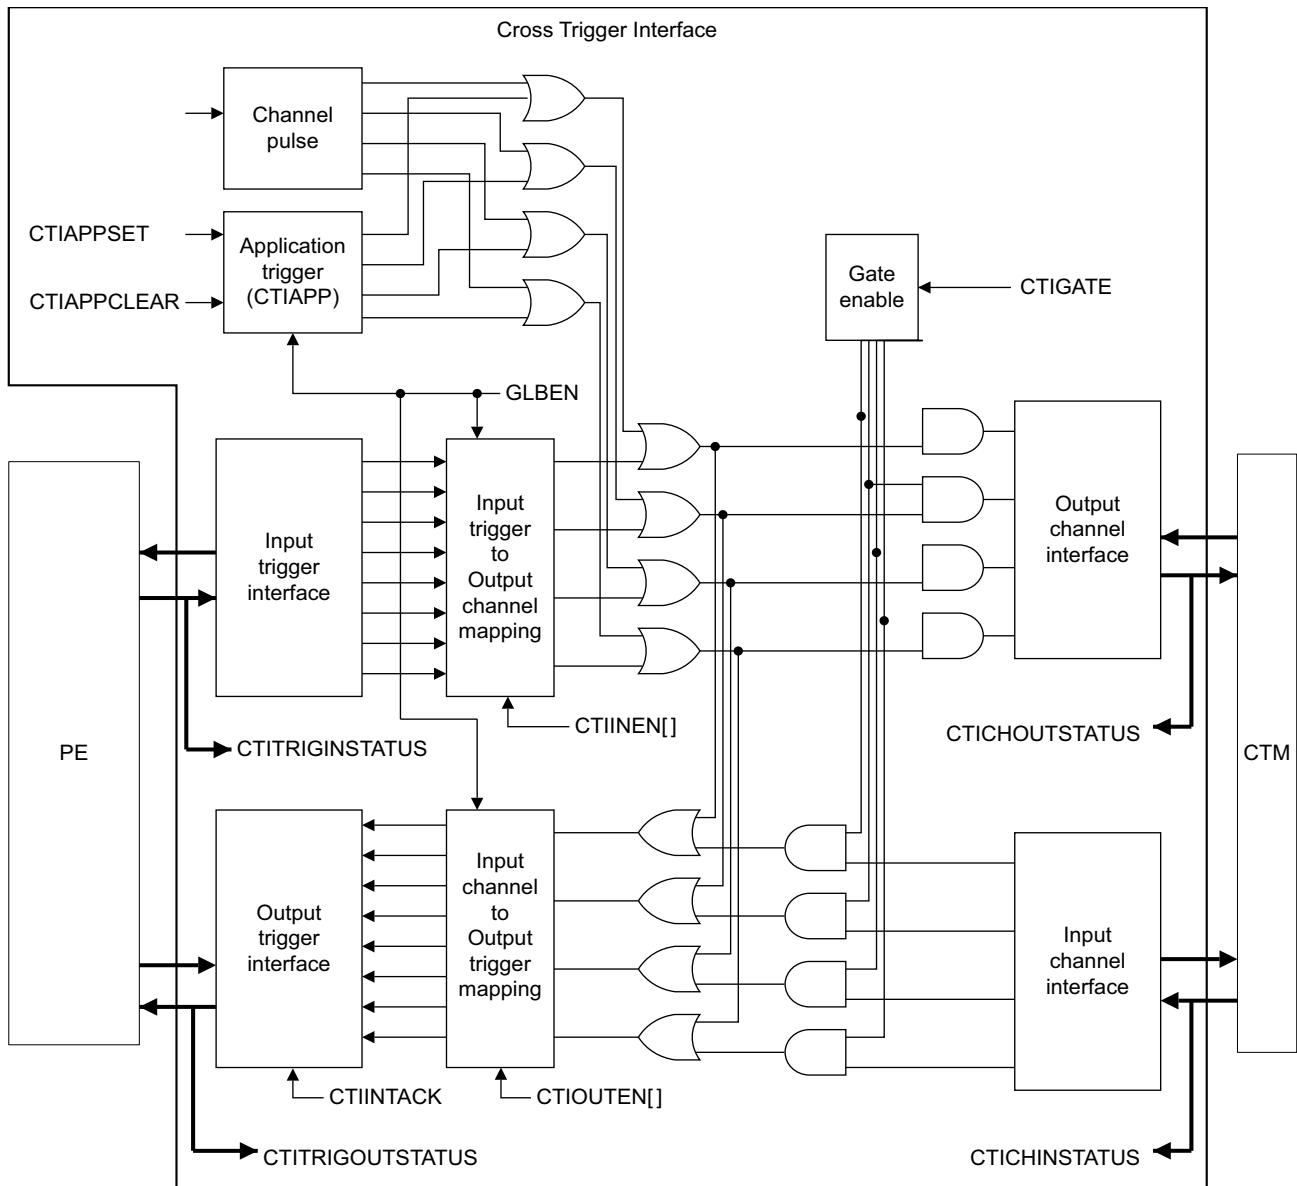

Figure H5-2 Structure of a cross-trigger interface

Note

- The number of triggers is IMPLEMENTATION DEFINED. [Figure H5-2 on page H5-7425](#) shows eight input and eight output triggers.
- The number of channels is IMPLEMENTATION DEFINED. [Figure H5-2 on page H5-7425](#) shows four channels.
- In [Figure H5-2 on page H5-7425](#) the input channel gate function is a CTIv2 feature.

When the CTI receives an input trigger event, this generates channel events on one or more internal channels, according to the *mapping function* defined by the *Input trigger→output channel mapping registers*, [CTIINEN<n>](#).

The CTI also contains an *application trigger* and *channel pulse* to allow a debugger to create channel events directly on internal channels by writing to the CTI control registers.

Channel events on each internal channel are passed to a corresponding output channel that is controlled by a *channel gate*. The channel gate can block propagation of channel events from an internal channel to an output channel.

———— **Note** —————

If the CTM is implemented:

- The gate function must be implemented.
- If the CTI is CTIv1, the gate function applies to output triggers only.

The output channels from a CTI are combined, using a logical OR function, with the output channels from all other CTIs to form the input channels on other CTIs. The input channels of this CTI are the logical OR of the output channels on all other CTIs. This is the *cross-trigger matrix*, CTM. Therefore, the number of input channels must equal the number of output channels.

———— **Note** —————

The number of input triggers and output triggers is not required to be the same.

The internal channels form an internal cross-trigger matrix within the CTI. This delivers events directly from the input triggers to the output triggers. Therefore the number of internal channels is the same as the number of input and output channels on the external CTM, and there is a direct mapping between the two.

Channel events received on each input channel are passed to the corresponding internal channel. It is IMPLEMENTATION DEFINED whether the cross-trigger gate also blocks propagation of channel events from input channels to internal channels.

———— **Note** —————

If CTIv2 is implemented, the cross-trigger gate also blocks propagation of channel events from input channels to internal channels.

When the CTI receives a channel event on an internal channel this generates trigger events on one or more output triggers, according to the mapping function defined by the *Input channel* → *output trigger mapping registers*, CTIOUTEN<n>.

The CTI contains the input and output trigger interfaces to the PE and the interface of the cross-trigger matrix. The architecture does not define the signal protocol used on the trigger interfaces, and:

- It is IMPLEMENTATION DEFINED whether the CTI supports multicycle input trigger events.
- It is IMPLEMENTATION DEFINED whether the CTM supports multicycle channel events.

See [Multicycle events on page H5-7426](#).

However, an output trigger is asserted until acknowledged. The output trigger can be:

- Self-acknowledging. This means that no further action is required from the debugger.
- Acknowledged by the debugger writing 1 to the corresponding bit of CTIINTACK.

The time taken to propagate a trigger event from the first PE, through its CTI, across the CTM to another CTI, and thereby to a second PE is IMPLEMENTATION DEFINED.

———— **Note** —————

Arm recommends that this path is not longer than the shortest software communication path between those PEs. This is because if the first PE halts, the Cross-halt trigger event can propagate through the ECT and halt the second PE without causing software on the second PE to malfunction because the first PE is in Debug state and is not responding.

H5.2.1 Multicycle events

A multicycle event is one with a continuous state that might persist over many cycles, as opposed to a discrete event. A typical implementation of a multicycle event is a level-based signal interface, whereas a discrete event might be implemented as a pulse signal or message.

CTI support for multicycle trigger events is IMPLEMENTATION DEFINED. Use of multicycle trigger events is deprecated. Of the architecturally defined input trigger events, the Performance Monitors overflow trigger event and Generic trace external output trigger events can be multicycle input triggers.

CTM support for multicycle channel events is IMPLEMENTATION DEFINED. A CTM that does not support multicycle channel events cannot propagate a multicycle trigger event between CTIs.

Note

A full ECT might comprise a mix of CTIs, some of which can support multicycle trigger events. In bridging these components, multicycle channel events become single channel events at the boundary between the CTIs.

An ECT that supports multicycle trigger events

When an ECT supports multicycle trigger events, an input trigger event to the CTI continuously asserts channel events on all output channels mapped to it until either:

- The input trigger event is removed.
- The channel mapping function is disabled.

This means that an input trigger that is asserted for multiple cycles causes any channels that are mapped to it to become active for multiple cycles. Consequently, any output triggers mapped from that channel are asserted for multiple cycles.

Note

The output trigger remains asserted for at least as long as the channel remains active. This means that even if the output trigger is acknowledged, it remains asserted until the channel deactivates.

The CTI does not guarantee that these events have precisely the same duration, as the triggers and channels can cross between clock domains.

[CTIAPPSET](#) and [CTIAPPCLEAR](#) can set a channel active for multiple cycles. [CTIAPPULSE](#) generates a single channel event. [CTICHINSTATUS](#) and [CTICHOUTSTATUS](#) can report whether a channel is active.

An ECT that does not support multicycle trigger events

When an ECT does not support multicycle trigger events, an input trigger event to the CTI generates a single channel event on all output channels mapped to it, regardless of how long the input trigger event is asserted.

This means that an input trigger event that is asserted for multiple cycles generates a single channel event on any channels mapped to it. Consequently any self-acknowledging output triggers mapped from those channels are single trigger events.

Note

A single event is typically a single cycle, but there is no guarantee that this is always the case.

[CTIAPPSET](#) and [CTIAPPCLEAR](#) can only generate a single channel event. [CTIAPPULSE](#) generates a single channel event. If the ECT does not support multicycle channel events, use of [CTIAPPSET](#) and [CTIAPPCLEAR](#) is deprecated, and the debugger must only use [CTIAPPULSE](#). [CTICHINSTATUS](#) and [CTICHOUTSTATUS](#) must be treated as UNKNOWN.

H5.3 Cross-triggers on a PE in an Armv8 implementation

An Armv8 PE must include a cross-trigger interface, and the implementation must include at least the input and output triggers defined in this architecture. The number of channels in the cross-trigger matrix is IMPLEMENTATION DEFINED, but there must be a minimum of three. Software can read CTIDEVID.NUMCHAN to discover the number of implemented channels.

The CTM must connect to all PEs in the same Inner Shareability domain as the Armv8-A PE, but can also connect to additional PEs. Arm strongly recommends that the CTM connects all PEs implementing a CTI in the system. This includes Armv7-A PEs and other PEs that can be connected using a CoreSight CTI module.

———— **Note** —————

In a uniprocessor system the CTM is OPTIONAL. In a multiprocessor system the CTM is required. The CTM might be connected other CTI modules for non-PEs, such as triggers for system visibility components. Arm recommends that the CTM is implemented.

Any CTI connected to a PE that is not an Armv8-A PE must implement at least:

- The Debug request trigger event.
- The Restart trigger event.
- The Cross-halt trigger event.

For more information about the CTI, see the *CoreSight™ SoC Technical Reference Manual*. Armv8-A refines the generic CTI by defining roles for each of the implemented input and output triggers.

H5.4 Description and allocation of CTI triggers

Table H5-1 on page H5-7429 shows the output trigger events defined by the architecture and the related trigger numbers.

Table H5-1 Allocation of CTI output trigger events

Number	Source	Destination	Event description
0	CTI	PE	<i>Debug request trigger event on page H5-7430</i>
1	CTI	PE	<i>Restart request trigger event on page H5-7430</i>
2	CTI	IRQ controller	<i>Generic CTI interrupt trigger event on page H5-7431</i>
3	-	-	Reserved
4 - 7	CTI	PE Trace Unit	OPTIONAL <i>Generic trace external input trigger events on page H5-7431</i>

———— **Note** —————

Output triggers from the CTI are inputs to other blocks.

Table H5-2 on page H5-7429 shows the input trigger events defined by the architecture and the related trigger numbers.

Table H5-2 Allocation of CTI input trigger events

Number	Source	Destination	Event description
0	PE	CTI	<i>Cross-halt trigger event on page H5-7430</i>
1	PE	CTI	<i>Performance Monitors overflow trigger event on page H5-7430</i>
2	PE	CTI	<i>Statistical Profiling Extension sample trigger event on page H5-7431</i>
3	-	-	Reserved
4 - 7	PE Trace Unit	CTI	OPTIONAL <i>Generic trace external output trigger events on page H5-7431</i>

———— **Note** —————

Input triggers to the CTI are outputs from other blocks.

Table H5-1 on page H5-7429 and Table H5-2 on page H5-7429 show the minimum set of trigger events defined by the architecture. However:

- The Generic trace external input and output trigger events are required only if the OPTIONAL PE Trace Unit is implemented. If the OPTIONAL PE Trace Unit is not implemented, these trigger events are reserved.
- Support for the generic CTI interrupt trigger event is IMPLEMENTATION DEFINED because details of interrupt handling in the system, including any interrupt controllers, are IMPLEMENTATION DEFINED. Details regarding how the CTI interrupt is connected to an interrupt controller and its allocated interrupt number lie outside the scope of the architecture. Arm strongly recommends that implementations provide a means to generate interrupts based on external debug events.
- The other trigger events are required by the architecture.

An Armv8-A implementation can extend the CTI with additional triggers. These start with the number eight.

H5.4.1 Debug request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to force the PE into Debug state. The trigger event is asserted until acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to [CTIINTACK](#)[0].

———— **Note** —————

A debugger must poll [CTITRIGOUTSTATUS](#)[0] until it reads as 0, to confirm that the output trigger has been deasserted before generating any event that must be ordered after the write to [CTIINTACK](#), such as a write to [CTIAPPULSE](#) to activate another trigger.

If the PE is already in Debug state, the PE ignores the trigger event, but the CTI continues to assert it until it is removed by the debugger. See also [External Debug Request debug event on page H3-7395](#).

H5.4.2 Restart request trigger event

This is an output trigger event from the CTI, and an input trigger event to the PE, asserted by the CTI to request the PE to exit Debug state. If the PE is in Non-debug state, the request is ignored by the PE.

If a Restart request trigger event is received at or about the same time as the PE enters Debug state, it is CONstrained UNPREDICTABLE whether:

- The request is ignored by the PE. In this case the PE enters Debug state and remains in Debug state.
- The PE enters Debug state and then immediately restarts.

Debuggers must program the CTI to send Restart request trigger events only to PEs that are halted. To enable the PE to disambiguate discrete Restart request trigger events, after sending a Restart request trigger event, the debugger must confirm that the PE has restarted and halted before sending another Restart request trigger event. Debuggers can use [EDPRSR](#).{SDR, HALTED} to determine the Execution state of the PE.

———— **Note** —————

Before generating a Restart request trigger event for a PE, a debugger must ensure any Debug request trigger event targeting that PE is cleared. [Debug request trigger event on page H5-7430](#) describes how to do this.

The trigger event is self-acknowledging, meaning that the debugger requires no further action to remove the trigger event. The trigger event is acknowledged even if the request is ignored by the PE. See also [Exiting Debug state on page H2-7375](#).

H5.4.3 Cross-halt trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted by a PE when it is entering Debug state.

———— **Note** —————

To reduce the latency of halting, Arm recommends that an implementation issues the Cross-halt trigger event early in the committed process of entering Debug state. This means that there is no requirement to wait until all aspects of entry to Debug state have completed before issuing the trigger event. Speculative emission of Cross-halt trigger events is not allowed. The Cross-halt trigger event must not be issued early enough for a subsequent Debug request trigger event, which might be derived from the Cross-halt trigger event, to be recorded in the [EDSCR](#).STATUS field. This applies to Debug request trigger events that are acting as inputs to the PE.

H5.4.4 Performance Monitors overflow trigger event

This is an input trigger event to the CTI, and an output trigger event from the PE, asserted each time the PE asserts a new Performance Monitors counter overflow interrupt request. See [Chapter D7 The Performance Monitors Extension](#).

If the CTI supports multicycle trigger events, then the trigger event remains asserted until the overflow is cleared by a write to `PMOVSCLR_EL0`. Otherwise, the trigger event is asserted when the value of `PMOVSCLR_EL0` changes from zero to a non-zero value.

———— **Note** ————

- This does not replace the recommended connection of Performance Monitors overflow trigger event to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI.
- Events can be counted when `ExternalNoninvasiveDebugEnabled()==FALSE`, and, in Secure state, when `ExternalSecureNoninvasiveDebugEnabled()==FALSE`. Secure software must be aware that overflow trigger events are nevertheless visible to the CTI.

H5.4.5 Statistical Profiling Extension sample trigger event

If the Statistical Profiling Extension is implemented, and a sample record is written to memory, CTI input trigger 2 is asserted. This trigger might also be directly connected to other IMPLEMENTATION DEFINED debug features.

For more information, see [Chapter D9 The Statistical Profiling Extension](#).

H5.4.6 Generic trace external input trigger events

These are output trigger events from the CTI, and input trigger events to the OPTIONAL PE Trace Unit, that are used in conjunction with the Generic trace external output trigger events to pass trigger events between:

- The PE and the OPTIONAL PE Trace Unit.
- The OPTIONAL PE Trace Unit and any other component attached to the CTM, including other Trace Units.

There are four Generic trace external input trigger events.

The trigger events are self-acknowledging. This means that the debugger does not have to take any further action to remove the events.

H5.4.7 Generic trace external output trigger events

These are input trigger events to the CTI, and output trigger events from the OPTIONAL PE Trace Unit, used in conjunction with the Generic trace external input trigger events to pass trigger events between:

- The PE and the OPTIONAL PE Trace Unit.
- The OPTIONAL PE Trace Unit and any other component attached to the CTM, including other Trace Units.

There are four Generic trace external output trigger events.

H5.4.8 Generic CTI interrupt trigger event

This is an output trigger event from the CTI, and an input to an IMPLEMENTATION DEFINED interrupt controller, and can transfer trigger events from the PE, PE Trace Units, or any other component attached to the CTI and CTM to software as an interrupt. The Generic CTI interrupt trigger event must be connected to the interrupt controller as an interrupt that can target the originating PE.

———— **Note** ————

- Arm recommends that the Generic CTI interrupt trigger event is a private peripheral interrupt, but implementations might instead make this trigger event available as a shared peripheral interrupt or a local peripheral interrupt.
- GICv3 reserves a private peripheral interrupt number for this interrupt.

It is IMPLEMENTATION DEFINED whether this trigger event is:

- Self-acknowledging. This means that the debugger is not required to take any further action, and that the interrupt controller must treat the trigger event as a pulse or edge-sensitive interrupt.

- Acknowledged by the debugger. The debugger acknowledges the trigger event by writing 1 to [CTIINTACK\[2\]](#). This means that the interrupt controller must treat the trigger event as a level-sensitive interrupt.

Arm recommends that the Generic CTI interrupt trigger event is a self-acknowledging trigger event.

H5.5 CTI registers programmers' model

The CTI registers programmers' model is described in [Chapter H8 About the External Debug Registers](#). The following sections contain information specific to the CTI:

- [External debug register resets](#) on page H8-7481.
- [External debug interface register access permissions](#) on page H8-7468.
- [Cross-trigger interface registers](#) on page H8-7479.
- The individual register descriptions in [Cross-Trigger Interface registers](#) on page H9-7599.

See also [Memory-mapped accesses to the external debug interface](#) on page H8-7466.

H5.5.1 CTI reset

An External Debug reset resets the CTI. See [External debug register resets](#) on page H8-7481 for details of CTI register resets. All CTI output triggers and output channels are deasserted on an External Debug reset.

———— **Note** —————

An indirect read of an output trigger might not observe the deasserted state until the processor is Cold reset. For more information, see [Synchronization of changes to the external debug registers](#) on page H8-7462.

H5.5.2 CTI authentication

The CTI ignores the state of the IMPLEMENTATION DEFINED authentication interface. This means that:

- [CTITRIGINSTATUS](#) shows the status of the input triggers and [CTICHINSTATUS](#) shows the status of the input channels, regardless of the value of `ExternalNoninvasiveDebugEnabled()`.

———— **Note** —————

The PE does not generate the Cross-halt trigger event and the PE Trace Unit does not generate Generic trace external output trigger events when `ExternalNoninvasiveDebugEnabled()==FALSE`. However, the PE can generate Performance Monitors overflow trigger events.

- The CTI can generate external triggers regardless of the value of `ExternalInvasiveDebugEnabled()`.

———— **Note** —————

The PE ignores Debug request and Restart request trigger events when `ExternalInvasiveDebugEnabled()==FALSE`. The PE Trace Unit ignores Generic trace external input trigger events when `ExternalNoninvasiveDebugEnabled()==FALSE`. The behavior of Generic CTI interrupt requests is part of the IMPLEMENTATION DEFINED handling of these interrupts, but it is permissible for an interrupt controller to receive these requests even when `ExternalInvasiveDebugEnabled()==FALSE`.

H5.6 Examples

The CTI is fully programmable and allows for flexible cross-triggering of events within a PE and between PEs in a multiprocessor system. For example:

- The Cross-halt trigger event and the Debug request trigger event can be used for cross-triggering in a multiprocessor system.
- The Cross-halt trigger event and the Generic interrupt trigger event can be used for event-driven debugging in a multiprocessor system.
- The Performance Monitors overflow trigger event and the Debug request trigger event can force entry to Debug state on overflow of a Performance Monitors event counter, for event-driven profiling.

Note

This does not replace the recommended connection of Performance Monitors overflow trigger events to an interrupt controller. Software must be able to program an interrupt on Performance Monitors overflow without programming the CTI. Arm recommends that the Performance Monitors overflow signal is directly available as a local interrupt source.

- The Generic trace external input and Generic trace external output trigger events can pass trace events into and out of the event logic of the PE Trace Unit. They can do this:
 - To pass trace events between Trace Units.
 - In conjunction with the Performance Monitors overflow trigger event, to couple the Performance Monitors to the PE Trace Unit.
 - In conjunction with the Debug request trigger event, to trigger entry to Debug state on a trace event.
 - In conjunction with other CTIs, to signal a trace trigger event onto a CoreSight trace interconnect.

The following sections describe some examples in more detail:

- [Halting a single PE on page H5-7434.](#)
- [Halting all PEs in a group when any one PE halts on page H5-7434.](#)
- [Synchronously restarting a group of PEs on page H5-7435.](#)
- [Halting a single PE on Performance Monitors overflow on page H5-7435.](#)

Example H5-1 Halting a single PE

To halt a single PE, set:

1. `CTIGATE[0]` to 0, so that the CTI does not pass channel events on internal channel 0 to the CTM.
2. `CTIOUTEN0[0]` to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 0.

Note

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instance of `CTIOUTEN<n>` for which `<n>` is 0.

3. `CTIAPPULSE[0]` to 1, to generate a channel event on channel 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to `CTIINTACK[0]`, before restarting the PE.

Example H5-2 Halting all PEs in a group when any one PE halts

To program a group of PEs so that when one PE in the group halts, all of the PEs in that group halt, set the following registers for each PE in the group:

1. `CTIGATE[2]` to 1, so that each CTI passes channel events on internal channel 2 to the CTM.
2. `CTIINEN0[2]` to 1, so that each CTI generates a channel event on channel 2 in response to a Cross-halt trigger event.

3. CTIOUTEN0[2] to 1, so that each CTI generates a Debug request trigger event in response to a channel event on channel 2.

———— **Note** —————

The Cross-halt trigger event is input trigger 0, meaning it is controlled by the instances of CTIINEN<n> and CTIOUTEN<n> for which <n> is 0.

When a PE has halted, clear the Debug request trigger event by writing a value of 1 to CTIINTACK[0], before restarting the PE.

Example H5-3 Synchronously restarting a group of PEs

To restart a group of PEs, for each PE in the group:

1. If the PE was halted because of a Debug request trigger event, the debugger must ensure the trigger event is deasserted. It can do this by:
 - a. Writing 1 to CTIINTACK[0] to clear the Debug request trigger event.
 - b. Polling CTITRIGOUTSTATUS[0], until it reads as 0, to confirm that the trigger event has been deasserted.
2. Set CTIGATE[1] to 1, so that each CTI passes channel events on internal channel 1 to the CTM.
3. Set CTIOUTEN1[1] to 1, so that each CTI generates a Restart request trigger event in response to a channel event on channel 1.

———— **Note** —————

This example must use the instance of CTIOUTEN<n> for which <n> is 1.

4. Set CTIAPPULSE[1] to 1 on any one PE in the group, to generate a channel event on channel 1.

Example H5-4 Halting a single PE on Performance Monitors overflow

To halt a single PE on a Performance Monitors overflow set:

1. CTIGATE[3] to 0, so that the CTI does not pass channel events on internal channel 3 to the CTM.
2. CTIINEN1[3] to 1, so that the CTI generates a channel event on channel 3 in response to a Performance Monitors overflow trigger event.

———— **Note** —————

This step of this example must use the instance of CTIINEN<n> for which <n> is 1.

3. CTIOUTEN0[3] to 1, so that the CTI generates a Debug request trigger event in response to a channel event on channel 3.

———— **Note** —————

This step of this example must use the instance of CTIOUTEN<n> for which <n> is 0.

When the PE has entered Debug state, clear the Debug request trigger event by writing 1 to CTIINTACK[0], before restarting the PE. Clear the overflow status by writing to PMOVSLR_EL0.

Chapter H6

Debug Reset and Powerdown Support

This chapter describes the reset and powerdown support in the Debug architecture. It contains the following sections:

- *About Debug over powerdown* on page H6-7438.
- *Power domains and debug* on page H6-7439.
- *Core power domain power states* on page H6-7440.
- *Emulating low-power states* on page H6-7444.
- *Powerup request mechanism* on page H6-7442.
- *Debug OS Save and Restore sequences* on page H6-7446.
- *Reset and debug* on page H6-7452.

Note

Where necessary, [Table K15-1 on page K15-8602](#) disambiguates the general register references used in this chapter.

H6.1 About Debug over powerdown

Armv8 external debug defines a logical model for the hardware on which a PE executes. This hardware is logically split into the *Core power domain* and the *Debug power domain*, and the model contains descriptions of the states of those domains. See:

- [Power domains and debug on page H6-7439](#).
- [Core power domain power states on page H6-7440](#).

An implementation may allow power domains to be powered up and down independently. Debug over powerdown provides:

- A facility for software executing on the PE to save and restore the PE state on behalf of a self-hosted or external debugger or both. See [Debug OS Save and Restore sequences on page H6-7446](#).
- A facility for an external debugger to request power up of the Core power domain. See [Powerup request mechanism on page H6-7442](#).
- A facility for an external debugger, or software executing on the PE, to request emulation of powerdown of the Core power domain. See [Emulating low-power states on page H6-7444](#).

H6.2 Power domains and debug

Armv8 external debug has two logical power domains, each with its own reset:

- The Debug power domain contains the interface between the PE and the external debugger, and is powered up whenever an external debugger is connected to the SoC. It remains powered up while the external debugger is connected. When the Core power domain is completely off or in a low-power state, a debugger is permitted to access a register that is implemented in the Debug power domain. Registers in this domain are reset by an External Debug reset.
- The Core power domain contains the rest of the PE, and might be allowed to power up and power down independently of the Debug power domain.

Note

- The model of two logical power domains has an impact on the reset and access permission requirements of the debug programmers' model.
- The power domains are described as logical because the architecture defines the requirements but does not require two physical power domains. Any power domain split that meets the requirements of the programmers' model is a valid implementation.

The Core power domain contains several types of registers:

- Non-debug logic refers to all registers and logic that are not associated with debug.
- Self-hosted debug logic refers to registers and logic associated solely with the self-hosted debug aspects of the architecture.
- Shared debug logic refers to registers and logic associated with both the self-hosted and external debug aspects of the architecture.
- External debug logic refers to registers and logic associated solely with the external debug aspects of the architecture.

For information about which groups of registers and components are in each power domain, and which registers change power domain if FEAT_DoPD is implemented, see:

- [Access permissions for the External debug interface registers on page H8-7474.](#)
- [Cross-trigger interface registers on page H8-7479.](#)
- [Management register access permissions on page K2-8433.](#)
- [Access permissions for external views of the Performance Monitors on page I3-7675.](#)

H6.3 Core power domain power states

The Arm architecture does not define the power states of the PE as these are not normally visible to software. However, they are visible to the external debugger. Armv8 external debug uses a four logical power states model for the Core power domain. The four logical power states are as follows:

- Normal** The Core power domain is fully powered up and the debug registers are accessible.
- Standby** The Core power domain is on, but there are measures to reduce energy consumption. In a typical implementation, the PE enters standby by executing a WFI or WFE instruction, and exits on a wake-up event. There can be other IMPLEMENTATION DEFINED measures the OS can take to enter standby. The PE preserves the PE state, including the debug logic state. Changing from standby to normal operation does not involve a reset of the PE. Standby is the least invasive OS energy saving state. Standby implies only that the PE is unavailable and does not clear any debug settings. For standby, the Debug architecture requires only the following:
- An External Debug Request debug event is a wake-up event when halting is allowed. This means that the PE must exit standby to handle the debug event. If the PE executed a WFE or a WFI instruction to enter standby, then it retires that instruction.
 - If the external debug interface is accessed, the PE must respond to that access. Arm recommends that, if the PE executed a WFI or WFE instruction to enter standby, then it does not retire that instruction.

Note

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, this also applies to the WFET and WFIT instructions.

Standby is transparent, meaning that to software and to an external debugger it is indistinguishable from normal operation.

- Retention** The OS takes some measures, including IMPLEMENTATION DEFINED code sequences and registers, to reduce energy consumption. The PE state, including debug settings, is preserved in low-power structures, allowing the Core power domain to be at least partially turned off. Changing from low-power retention to normal operation does not involve a reset of the PE. The saved PE state is restored on changing from low-power retention state to normal operation. If software has to use an IMPLEMENTATION DEFINED code sequence before entering, or after leaving, a retention state, this is referred to as a *software-visible retention state*. It is IMPLEMENTATION DEFINED whether the value of [DBGPRCR.CORENPDRQ](#) is set to its Cold reset value on leaving the software-visible retention state. See the description of [DBGPRCR.CORENPDRQ](#) for more information. External Debug Request debug events stay pending and registers in the Core power domain cannot be accessed.

Note

- This model of retention does not include implementations where the PE exits the state in response to a debug register access. From the Debug architecture perspective, implementations like this are forms of standby.

- Powerdown** The OS takes some measures to reduce energy consumption by turning the Core power domain off. These measures must include the OS saving any PE state, including the debug settings, that must be preserved over powerdown.

If [FEAT_DoubleLock](#) is implemented, it is used during powerdown.

Changing from powerdown to normal operation must include:

- A Cold reset of the PE after the power level has been restored.
- The OS restoring the saved PE state.

External Debug Request debug events stay pending and debug registers in the Core power domain cannot be accessed.

An implementation might support enabling and disabling threads, either dynamically or once at reset time. Threads that are disabled in this way must appear to the external debugger as either:

- Powered off, meaning they are either:
 - In a powerdown state.
 - In a retention state.
- Held in reset state.

Armv8 external debug uses a simpler two states model for the Debug power domain. The two states are:

Off The Debug power domain is turned off.

On The Debug power domain is turned on.

The available power states, including the cross-product of Core power domain and Debug power domain power states is IMPLEMENTATION DEFINED. Implementations are not required to implement all of these states and might include additional states. These additional states must appear to the debugger as one of the logical power states defined by this model. The control of power states is IMPLEMENTATION DEFINED.

———— **Note** —————

As a result, it is IMPLEMENTATION DEFINED whether it is possible for the Debug power domain to be on when the Core power domain is off.

If the Debug power domain is implemented but is not powered up when the Core power domain is powered up, the Reset Catch debug event and the OS Unlock Catch debug event are disabled.

H6.4 Powerup request mechanism

If a powerup request mechanism is implemented, asserting the powerup request requests the power controller to power up the Core power domain, and to emulate any subsequent powerdown requests, until the powerup request mechanism is deasserted.

H6.4.1 Powerup request mechanism if FEAT_DoPD is implemented

If [FEAT_DoPD](#) is implemented, the external debug component implements an OPTIONAL powerup request mechanism.

If the powerup request mechanism is implemented, the powerup request must be a CoreSight Class 0x9 ROM table block that contains both:

- A parent entry for the debug registers of the PE.
- A parent entry for the PMU registers of the PE, if the OPTIONAL PMU with an external debug interface is implemented.

A parent entry of a component is an entry in a ROM table that either locates the component, or locates another ROM table that contains the parent entry for the component.

———— **Note** —————

The ROM table and any descendants might describe other debug components, including debug components for other PEs.

The ROM table might have a parent entry in a second ROM table and that parent entry might also have a powerup request mechanism in the second ROM table. This applies recursively.

The parent entries for the debug components have the following properties:

For the debug registers and Performance Monitors registers:

These components are in the Core power domain.

The POWERIDVALID bit is 1.

All parent entries must have the same IMPLEMENTATION DEFINED POWERID value.

———— **Note** —————

The IMPLEMENTATION DEFINED POWERID value does not need to be unique for each PE.

For the CTI registers:

This component is in the Debug power domain.

The POWERIDVALID bit is IMPLEMENTATION DEFINED.

If the POWERIDVALID bit is 1, the entries must have a valid POWERID value.

———— **Note** —————

If the Core power domain can be powered down independently of the Debug power domain, Arm recommends the system implements an external debug component with a powerup request mechanism which can request the Core power domain to be powered up.

For more information about Coresight Class 0x9 ROM Tables, see *ARM® CoreSight™ Architecture Specification*.

On reset, if [FEAT_DoPD](#) is implemented, [DBGPRCR.CORENPDRQ](#) is set to an IMPLEMENTATION DEFINED choice between 0 and 1 if the powerup request is implemented and asserted, and 0 otherwise

H6.4.2 Powerup request mechanism if FEAT_DoPD is not implemented

If [FEAT_DoPD](#) is not implemented, the bit [EDPRCR.COREPURQ](#) is the powerup request mechanism.

The control registers [DBGPRCR.CORENPDRQ](#) and [EDPRCR.COREPURQ](#) provide an interface between the power controller and the PE. They typically map directly to signals in the recommended external debug interface.

On reset, if [FEAT_DoPD](#) is not implemented, [DBGPRCR.CORENPDRQ](#) is set to the value of [EDPRCR.COREPURQ](#).

H6.5 Emulating low-power states

[DBGPRCR.CORENPDRQ](#) and the powerup request mechanism can request the power controller to emulate states where the Core power domain is completely off or in a low-power state where the Core power domain registers cannot be accessed. This simplifies the requirements on software by sacrificing entirely realistic behavior.

If [FEAT_DoPD](#) is not implemented, [EDPRSR](#).{SPD, PU} indicates the Core power domain power state. For more information, see:

- The [DBGPRCR_EL1](#) and [DBGPRCR](#) System register descriptions.
- The [EDPRCR](#) and [EDPRSR](#) external debug register descriptions.
- [Appendix K2 Recommended External Debug Interface](#).

The measures to emulate powerdown are IMPLEMENTATION DEFINED. The ability of the debugger to access the state of the PE and the system might be limited as a result of the measures adopted.

In an emulated powerdown state, the debugger must be able to access all debug, PMU, CTI, and trace unit registers that are accessible on the external debug interface and are in one of:

- The Debug power domain.
- The Core power domain.
- When a trace unit with a separate trace unit Core power domain is implemented, and the trace unit Core power domain is powered on, the trace unit Core power domain.

That is, the debugger must be able to read and write to such registers without receiving errors. This allows an external debugger to debug the powerup sequence.

Arm recommends that any IMPLEMENTATION DEFINED registers that are on the external debug interface and in either the Core power domain or the Debug power domain are also accessible in an emulated powerdown state.

If [FEAT_DoubleLock](#) is implemented, `DoubleLockStatus() == FALSE` when [DBGPRCR.CORENPDRQ](#) == 1.

Otherwise, the behavior of the PE in emulated powerdown must be similar to that in a real powerdown state. In particular, the PE must not respond to other system stimuli, such as interrupts.

[Example H6-1 on page H6-7444](#) and [Example H6-2 on page H6-7444](#) are examples of two approaches to emulating powerdown.

Example H6-1 An example of emulating powerdown

The PE is held in Standby state, isolated from any system stimuli. It is IMPLEMENTATION DEFINED whether the PE can respond to debug stimuli such as an External Debug Request debug event.

If the PE can enter Debug state, then the external debugger is able to use the ITR to execute instructions, such as loads and stores. This causes the external debugger to interact with the system. If the external debugger restarts the PE, the PE leaves Standby state and restarts fetching instructions from memory.

Example H6-2 Another example of emulating powerdown

The PE is held in Warm reset. This limits the ability of an external debugger to access the resources of the PE. For example, the PE cannot be put into Debug state.

On exit from emulated powerdown the PE is reset. However, the debug registers that are only reset by a Cold reset must not be reset. Typically this means that a Warm reset is substituted for the Cold reset. As such, the effect of accessing any register that is reset by a Warm reset while the PE is in the emulated powerdown state will have an IMPLEMENTATION DEFINED effect on that register.

Note

- Warm reset and Cold reset have different effects apart from resetting the debug registers. In particular, [RMR_ELx](#) is reset by a Cold reset and controls the reset state on a Warm reset. This means that if a Cold reset is substituted by a Warm reset, the behavior of the reset code might be different.
 - The timing effects of powering down are typically not factored in the powerdown emulation. Examples of these timing effects are clock and voltage stabilization.
 - Emulation does not model the state lost during powerdown, meaning that it might mask errors in the state storage and recovery routines.
-

H6.6 Debug OS Save and Restore sequences

In Armv8-A, the following registers provide the OS Save and Restore mechanism:

- The *OS Lock Access Register*, [OSLAR](#), locks the OS Lock to restrict access to debug registers before starting an OS Save sequence, and unlocks the OS Lock after an OS Restore sequence.
- The *OS Lock Status Register*, [OSLSR](#), shows the status of the OS Lock.
- The PE can be configured to generate an *OS Unlock Catch debug event* on [page H3-7396](#) when the OS Lock is unlocked.
- If [FEAT_DoubleLock](#) is implemented, the OS Double Lock locks out an external debug interface entirely. This is only used immediately before a powerdown sequence.

See also:

- [FEAT_DoubleLock](#) on [page A2-70](#)
- [Reset and debug](#) on [page H6-7452](#)
- [Appendix K8 Example OS Save and Restore Sequences](#)

H6.6.1 EDPRSR.{DLK, SPD, PU} and the Core power domain

If [FEAT_DoPD](#) is not implemented, a debugger uses [EDPRSR](#).{DLK, SPD, PU} to determine whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read.

Table H6-1 Interpretation of the EDPRSR.{DLK, SPD, PU} bits

EDPRSR			Core power domain			Notes
DLK	SPD	PU	Power	Accesses	State lost	
0	0	1	On	OK	No	-
0	1	1	On	OK	Yes	SPD is cleared to 0 following the read.
1	X	1	On	Error	Not known	FEAT_DoubleLock is implemented and <code>DoubleLockStatus() == TRUE</code> . Software locks the OS Double Lock before removing power.
X	1	0	Off	Error	Yes	A Cold reset will be asserted on exiting powerdown state, but not on exiting low-power retention state.
X	0	0	Not known	Error	Not known	

If [FEAT_DoPD](#) is implemented, accesses to [EDPRSR](#) return an error when the Core power domain is off or in a retention state, meaning successful reads of [EDPRSR](#) always return 1 for [EDPRSR](#).PU.

When [FEAT_Debugv8p4](#) is implemented, and whenever [FEAT_DoubleLock](#) is not implemented, [EDPRSR](#).DLK is always 0.

If [FEAT_DoubleLock](#) is not implemented, `DoubleLockStatus()` always returns FALSE.

If the Core power domain is powered up and `DoubleLockStatus() == TRUE`, then:

- When [FEAT_Debugv8p2](#) is not implemented, [EDPRSR](#).{DLK, SPD, PU} can read either {1, UNKNOWN, 1} or {UNKNOWN, 0, 0}.
- When [FEAT_Debugv8p2](#) is implemented, and [FEAT_Debugv8p4](#) is not implemented, [EDPRSR](#).{DLK, SPD, PU} can only read {UNKNOWN, 0, 0}.

H6.6.2 EDPRSR.SPD when the Core domain is in either retention or powerdown state

If `FEAT_DoPD` is not implemented, when the Core power domain is in either the retention or powerdown state, `EDPRSR.SPD` is not cleared following a read of `EDPRSR` and it is IMPLEMENTATION DEFINED whether:

- `EDPRSR.SPD` shows whether the state of the debug registers in the Core power domain has been lost since the last time that `EDPRSR` was read. This means that:
 - When the Core power domain is in the powerdown state, `EDPRSR.SPD` is RAO, this indicates that the state of the debug registers has been lost.
 - When the Core power domain is in the retention state, `EDPRSR.SPD` indicates whether the state of the debug registers was lost before the Core power domain entered retention state.
- `EDPRSR.SPD` is RAZ, and:
 - On leaving the powerdown state, `EDPRSR.SPD` is set to 1 which indicates that the state of the debug registers has been lost.
 - On leaving the retention state, `EDPRSR.SPD` reverts the value it had on entering the retention state.

———— **Note** —————

If `FEAT_DoPD` is implemented, accesses to `EDPRSR` return an error when the Core power domain is off or in a retention state.

H6.6.3 EDPRSR.{DLK, R} and reset state

If `FEAT_DoPD` is implemented, accesses to `EDPRSR` return an error when the Core power domain is off or in a retention state, meaning successful reads of `EDPRSR` always return 1 for `EDPRSR.PU`.

When `FEAT_Debugv8p4` is implemented, and whenever `FEAT_DoubleLock` is not implemented, `EDPRSR.DLK` is always 0.

If `FEAT_DoubleLock` is not implemented, `DoubleLockStatus()` always returns FALSE.

If `FEAT_DoubleLock` is implemented and enabled, the behavior of all registers and fields except `EDPRSR.DLK` is the same as their behavior if `FEAT_Debugv8p4` is not implemented.

If `FEAT_Debugv8p4` is implemented `EDPRSR.DLK` is always 0 and does not give any information about the OS Double Lock.

`EDPRSR.R` is UNKNOWN when `DoubleLockStatus() == TRUE`. `OSDLR_EL1.DLK` is cleared to 0 by a reset. If the Core power domain is powered up and entered reset state with the OS Double Lock locked, it is CONSTRAINED UNPREDICTABLE whether a read of `EDPRSR` while the PE is in reset state returns:

- `EDPRSR.{DLK, R, PU} == {1, UNKNOWN, 1}` indicating that the OS Double Lock is locked. This is not permitted from Armv8.2.
- `EDPRSR.{DLK, R, PU} == {0, 1, 1}` indicating that the PE is in reset state.
- `EDPRSR.{DLK, R, PU} == {UNKNOWN, UNKNOWN, 0}` indicating that the registers in the Core power domain cannot be accessed because the OS Double Lock is locked.

If the PE was powered up and the OS Double Lock was unlocked when the PE was reset, then `EDPRSR.{DLK, R, PU}` reads as `{0, 1, 1}` while the PE is in reset state.

On leaving reset state, `EDPRSR.{DLK, R}` reads as `{0, 0}`.

H6.6.4 Debug registers to save over powerdown

Table H6-2 on page H6-7448 shows the different requirements for self-hosted debug over powerdown and external debug over powerdown:

- The column labeled Self-hosted lists registers that software must preserve over powerdown so that it can support self-hosted debug over powerdown. This does not require use of the OS Save and Restore mechanism.

- The column labeled External lists registers that software must preserve over powerdown so that it can support external debug over powerdown. This requires use of the OS Save and Restore mechanism:
 - Some external debug registers are not normally accessible to software executing on the PE. Additional debug registers are provided that give software the required access to save and restore these external debug registers when OSLSR.OSLK is locked. These registers include OSECCR, OSDTRRX, and OSDTRTX.
- Some registers might only present in some implementations, or might not be accessible at all Exception levels or in Non-secure state. DBGVCR32_EL2 and SDER32_EL3 are only required to support AArch32.

Table H6-2 on page H6-7448 does not include registers for the OPTIONAL Trace and Performance Monitor extensions.

Table H6-2 Debug registers to save over powerdown

Register in AArch64 state	Register in AArch32 state	Self-hosted	External
MDSCR_EL1	DBGDSCRExt	Yes	Yes ^a
DBGBVR<n>_EL1	DBGBVR<n>	Yes	Yes
DBGBCR<n>_EL1	DBGBCR<n>	Yes	Yes
DBGWVR<n>_EL1	DBGWVR<n>	Yes	Yes
DBGWCR<n>_EL1	DBGWCR<n>	Yes	Yes
DBGVCR32_EL2	DBGVCR	Yes	-
MDCR_EL2	HDCR	Yes	-
SDER32_EL3	SDER	Yes	-
MDCR_EL3	SDCR	Yes ^b	-
MDCCINT_EL1	DBGDCCINT	-	Yes ^b
DBGCLAIMSET_EL1 DBGCLAIMCLR_EL1	DBGCLAIMSET, DBGCLAIMCLR	-	Yes ^c
OSECCR_EL1	DBGOSECCR	-	Yes ^{ab}
OSDTRRX_EL1 OSDTRTX_EL1	DBGDTRRXext DBGDTRTXext	-	Yes

- The OS Lock must be locked to save and restore for external debug. When the OS Lock is locked, DSCR is part of the software save and restore mechanism for external debug. It provides a mechanism for an operating system to access some fields of EDSCR that are otherwise read-only or not visible to software. This allows the operating system to save and restore these settings over a powerdown for the external debugger.
- This register is new in Armv8-A. Sequences written for Armv7 do not preserve the register over powerdown.
- Read DBGCLAIMCLR to save, write DBGCLAIMSET to restore.

H6.6.5 OS Save sequence

To preserve the debug logic state over a powerdown, the state must be saved to nonvolatile storage. This means the OS Save sequence must:

- Lock the OS Lock by:
 - Writing the key value 0xC5ACCE55 to the DBGOSLAR in AArch32 state.
 - Writing 1 to OSLAR_EL1.OSLK in AArch64 state.

2. Execute an ISB instruction.
3. Walk through the debug registers listed in [Debug registers to save over powerdown on page H6-7447](#) and save the values to the nonvolatile storage.

If the [FEAT_DoubleLock](#) is implemented, before removing power from the Core power domain, software must:

1. Lock the OS Double Lock by:
 - Writing 1 to [DBGOSDLR.DLK](#) in AArch32 state.
 - Writing 1 to [OSDLR_EL1.DLK](#) in AArch64 state.If [FEAT_DoubleLock](#) is not implemented, [OSDLR_EL1](#) and [DBGOSDLR](#) ignore writes.
2. Execute a [Context synchronization event](#).

H6.6.6 OS Restore sequence

After a powerdown, the OS Restore sequence must perform the following steps to restore the debug logic state from the non-volatile storage:

1. Lock the OS Lock, as described in [OS Save sequence on page H6-7448](#). The OS Lock is generally locked by the Cold reset, but this step ensures that it is locked.
2. Execute an ISB instruction.
3. To ensure that, if an external debugger clears the OS Lock before the end of this sequence, no debug exceptions are generated:
 - Write 0 to [MDSR_EL1](#) if executing in AArch64 state.
 - Write 0 to [DBGDSCRext](#) if executing in AArch32 state.
4. Walk through the debug registers listed in [Debug registers to save over powerdown on page H6-7447](#), and restore the values from the nonvolatile storage. The last register to be restored must be:
 - [MDSR_EL1](#) if executing in AArch64 state.
 - [DBGDSCRext](#) if executing in AArch32 state.
5. Execute an ISB instruction.
6. Unlock the OS Lock by:
 - Writing any non-key value to [DBGOSLAR](#) if executing in AArch32 state.
 - Writing 0 to [OSLAR_EL1.OSLK](#) if executing in AArch64 state.
7. Execute a [Context synchronization event](#).

———— Note ————

The OS Restore sequence overwrites the debug registers with the values that were saved. If there are valid values in these registers immediately before the restore sequence, then those values are lost.

H6.6.7 Debug behavior when the OS Lock is locked

The main purpose of the OS Lock is to prevent updates to debug registers during an OS Save or OS Restore operation. The OS Lock is locked on a Cold reset.

When the OS Lock is locked:

- Access to debug registers through the System register interface is mainly unchanged except that:
 - Certain registers are read and written without side-effects.
 - Fields in [DSCR](#) and [OSECCR](#) that are normally read-only become read/write.This allows the state to be saved or restored. For more information, see the relevant register description in [Chapter H9 External Debug Register Descriptions](#).
- Access to debug registers by the external debug interface is restricted to prevent an external debugger modifying the registers that are being saved or restored. For more information, see [External debug interface register access permissions summary on page H8-7469](#).

- Debug exceptions, other than Breakpoint Instruction exceptions are not generated.
- Breakpoint and Watchpoint debug events are not generated. The OS Lock has no effect on Breakpoint Instruction exceptions and other debug events.

H6.6.8 Debug behavior when the OS Lock is unlocked

When the OS Lock is unlocked, the PE sets `EDES.R.OSUC` to 1 if the OS Unlock Catch debug event is enabled and the PE is in Non-debug state, meaning the OS Unlock Catch debug event becomes pending. See [OS Unlock Catch debug event on page H3-7396](#).

H6.6.9 Debug behavior when the OS Double Lock is locked

If the `FEAT_DoubleLock` is implemented, software locks the OS Double Lock immediately before a powerdown sequence.

The OS Double Lock ensures that it is safe to remove core power by forcing the debug interfaces to be quiescent.

When `DoubleLockStatus() == TRUE`:

- The external debug interface has only restricted access to the debug registers, so that it is quiescent before removing power. See [External debug interface register access permissions summary on page H8-7469](#).
- Debug exceptions, other than Breakpoint Instruction exceptions, are not generated.
- Halting is prohibited. See [Halting allowed and halting prohibited on page H2-7339](#).

———— **Note** —————

Pending Halting debug events might be lost when core power is removed.

- No asynchronous debug events are `WF*` wake-up events.

If the `FEAT_DoubleLock` is not implemented, the PE ensures these conditions are met before allowing power to be removed.

Software must synchronize the update to `OSDLR` before it indicates to the system that core power can be removed. The interface between the PE and its power controller is IMPLEMENTATION DEFINED.

Typically software indicates that core power can be removed by entering the Wait For Interrupt state. This means that software must explicitly synchronize the `OSDLR` update before issuing the `WFI` instruction.

`OSDLR.DLK` is ignored and `DoubleLockStatus() == FALSE` if either:

- The PE is in Debug state.
- `DBGPRCR.CORENPDRQ` is set to 1.

———— **Note** —————

It is possible to enter Debug state with `OSDLR.DLK` set to 1. This is because a [Context synchronization event](#) is required to ensure the OS Double Lock is locked, meaning that Debug state might be entered before the `OSDLR` update is synchronized.

Because `OSDLR.DLK` is ignored when `DBGPRCR.CORENPDRQ` is set to 1, an external debugger can write to `DBGPRCR.CORENPDRQ`, and the `FEAT_DoubleLock` is not always implemented, software must not rely on using the OS Double Lock to disable debug exceptions or to prohibit halting, or both. Arm deprecates use of the OS Double Lock for these purposes, and instead recommends that software:

- Uses the OS Lock to disable debug exceptions during save or restore sequences.
- Uses the debug authentication interface to prohibit halting and external debug access to debug registers at times other than immediately prior to removing power.

As the purpose of the OS Double Lock is to ensure that it is safe to remove core power, if the [FEAT_DoubleLock](#) is implemented, it is important to avoid race conditions that defeat this purpose. Arm recommends that:

- Once the write to [OSDLR.DLK](#) has been synchronized by a [Context synchronization event](#) and `DoubleLockStatus() == TRUE`, a PE must:
 - Not allow a debug event generated before the [Context synchronization event](#) to cause an entry to Debug state or act as a wake-up event for a WFI or WFE instruction after the [Context synchronization event](#) has completed.

———— **Note** —————

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, this also applies to the WFET and WFIT instructions.
 - Complete any external debug access started before the [Context synchronization event](#) by the time the [Context synchronization event](#) completes.

———— **Note** —————

A debug register access might be in progress when software sets [OSDLR.DLK](#) to 1. An implementation must not permit the synchronization of locking the OS Double Lock to stall indefinitely while waiting for that access to complete. This means that any debug register access that is in progress when software sets [OSDLR.DLK](#) to 1 must complete or return an error in finite time.
- If a write to [DBGPRCR](#) or [EDPRCR](#) made when `OSDLR.DLK == 1` changes [DBGPRCR.CORENPDRQ](#) or [EDPRCR.CORENPDRQ](#) from 1 to 0, meaning `DoubleLockStatus()` changes from FALSE to TRUE, then before signaling to the system that the CORENPDRQ field has been cleared and emulation of powerdown is no longer requested, meaning the system can remove core power, the PE must ensure that all the requirements for `DoubleLockStatus() == TRUE` listed in this section are met.

In a standard OS Save sequence, the OS Lock is locked before the OS Double Lock is locked. This means that writes to CORENPDRQ are ignored by the time the OS Double Lock is locked. However, if `DoubleLockStatus() == FALSE`, an external debugger can clear the OS Lock at any time, and then write to [EDPRCR](#).

H6.7 Reset and debug

All registers in the Core power domain are either:

- Reset by both a Cold and a Warm reset.
- Reset only by a Cold reset and are not changed by a Warm reset.

For more information, see [Reset on page D1-2471](#).

All registers in the Debug power domain are reset by an External Debug reset.

[Figure H6-1 on page H6-7452](#) shows this reset scheme. The following three reset signals are an example implementation of the reset scheme:

- **CORERESET**, which must be asserted for a Warm reset.
- **CPUPORESET**, which must be asserted for a Cold reset.
- **PRESETDBG**, which must be asserted for an External Debug reset.

As shown in the figure, the external debug logic is split between the Debug power domain and the Core power domain.

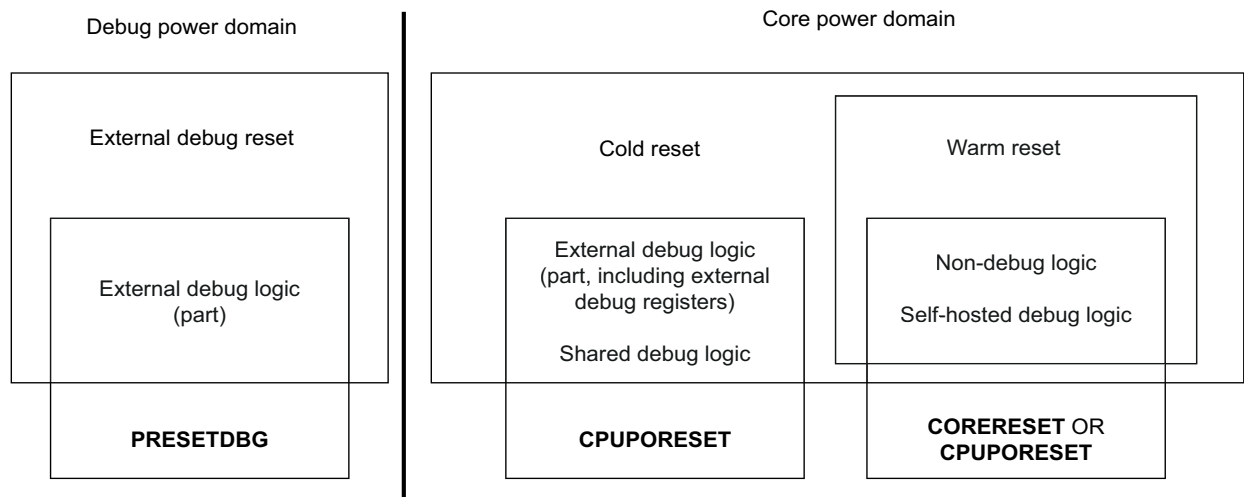

Figure H6-1 Power and reset domains

For more information about power domains and power states, see [Power domains and debug on page H6-7439](#).

When power is first applied to the Debug power domain, **PRESETDBG** must be asserted.

When power is first applied to the Core power domain, **CPUPORESET** must be asserted.

———— **Note** ————

In this scheme, logic in the Warm reset domain is reset by asserting either **CORERESET** or **CPUPORESET**. This implies a particular implementation style that permits these approaches.

CPUPORESET is not normally asserted on moving from a low-power state, where power has not been removed, to a full-power state. This can occur, for example, on exiting a low-power retention state. See also [Emulating low-power states on page H6-7444](#) and the [EDPRSR](#) register description.

H6.7.1 External debug interface accesses to registers in reset

If a reset signal is asserted and the external debug interface:

- Writes a register, or indirectly writes a register or register field as a side-effect of an access:
 - Then, if the register or register field is reset by that reset signal, it is **CONSTRAINED UNPREDICTABLE** whether the register or register field takes the reset value or the value written. The reset value might be **UNKNOWN**.

- Otherwise, the register or register field takes the value that is written.
- Reads a register, or indirectly reads a register or register field, as part of an access:
 - Then, if the register or register field is reset by that reset signal, the value returned is UNKNOWN.
 - Otherwise, the value of the register or register field is returned.

It is IMPLEMENTATION DEFINED whether any register can be accessed when External Debug reset is being asserted. The result of these accesses is IMPLEMENTATION DEFINED.

Chapter H7

The PC Sample-based Profiling Extension

This chapter describes the OPTIONAL PC Sample-based Profiling Extension that provides a non-invasive external debug component.

It contains the following section:

- [About the PC Sample-based Profiling Extension on page H7-7456.](#)

H7.1 About the PC Sample-based Profiling Extension

The PC Sample-based Profiling Extension is an OPTIONAL extension that provides coarse-grained, non-invasive profiling by an external debugger. See also [Non-invasive behavior on page D7-2853](#).

PC Sample-based Profiling creates samples so that tools can populate a statistical model of the performance of software executing on the PE.

———— Note —————

Data returned by periodic sampling of PC Sample-based Profiling registers is sufficient to allow tools to estimate the distribution of time spent executing software on the PE.

The delay between an instruction being executed by the PE and its address appearing in the PC Sample Register is not defined, and Armv8 does not require that the sampled instruction was recently executed. For example, if a piece of software executes a load instruction that reads the PC Sample Register of the PE it is running on, there is no guaranteed relationship between the address of the load instruction and the value read. The PC Sample Register is intended only for use by an external agent to provide statistical information for software profiling.

It must be possible to sample references to branch targets. It is IMPLEMENTATION DEFINED whether references to other instructions can be sampled. The branch target for a conditional branch instruction that fails its condition check is the instruction that follows the conditional branch instruction. The branch target for an exception is the exception vector address.

To keep the implementation and validation cost low, a reasonable degree of inaccuracy in the sampled data is acceptable. Arm does not define *a reasonable degree of inaccuracy* but recommends the following guidelines:

- In exceptional circumstances, such as a change in Security state or other boundary condition, it is acceptable for the sample to represent an instruction that was not committed for execution.
- Under unusual non-repeating pathological cases, the sample can represent an instruction that was not committed for execution. These cases are likely to occur as a result of asynchronous exceptions, such as interrupts, where the chance of a systematic error in sampling is very unlikely.
- Under normal operating conditions, the sample must reference an instruction that was committed for execution, including its context, and must not reference instructions that are fetched but not committed for execution.

———— Note —————

In the Armv7 PC Sample-based Profiling Extension, an offset was applied to the sampled program counter value and this offset and the instruction set state indicated in bits [1:0] of the sampled value. In the Armv8 PC Sample-based Profiling Extension, the sampled value is the address of an instruction that has executed, with no offset and no indication of the instruction set state.

- [Controlling the PC Sample-based Profiling Extension on page H7-7456](#).
- [Registers implemented by the PC Sample-based Profiling Extension on page H7-7457](#).
- [Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-7458](#).
- [Pseudocode description of PC Sample-based Profiling on page H7-7458](#).

H7.1.1 Controlling the PC Sample-based Profiling Extension

PC Sample-based Profiling is controlled by the IMPLEMENTATION DEFINED authentication interface `ExternalNoninvasiveDebugEnabled()`.

PC Sample-based Profiling is prohibited unless both:

- It is allowed by the IMPLEMENTATION DEFINED authentication interface `ExternalNoninvasiveDebugEnabled()`.
- At least one of the following applies:
 - The PE is executing in Non-secure state.
 - EL3 is not implemented.
 - EL3 is implemented, the PE is executing in Secure state, and non-invasive debug is allowed by the IMPLEMENTATION DEFINED authentication interface `ExternalSecureNoninvasiveDebugEnabled()`.

- EL3 is implemented, EL3 or EL1 is using AArch32, the PE is executing at EL0 in Secure state, and the value of `SDER.SUNIDEN` is 1.

The state of the IMPLEMENTATION DEFINED authentication interface is visible through `DBGAUTHSTATUS_EL1`. See *Recommended authentication interface* on page K2-8431.

H7.1.2 Registers implemented by the PC Sample-based Profiling Extension

The options for implementing the PC Sample-based Profiling extension are:

- The extension is implemented in the external debug register space. `EDDEVID.PCSample` identifies the implemented level of profiling, and `EDDEVID1.PCSROffset` also indicates that this option is implemented. From Armv8.2 this option is not permitted.
- `FEAT_PCSRv8p2` is implemented, meaning the PC Sample-based Profiling extension is implemented in the Performance Monitors memory-mapped register space. `PMDEVID.PCSample` identifies the implemented level of profiling.

If PC Sample-based Profiling is implemented in the external debug register space:

- The following external debug registers can be implemented:
 - `EDCIDSR`.
 - `EDPCSR`.
 - `EDVIDSR`.

See *External debug interface register map* on page H8-7472.

- If `FEAT_VHE` is implemented, `EDSCR.SC2` controls what PC Sample-based Profiling samples.

If `FEAT_PCSRv8p2` is implemented, the following registers can be implemented in the Performance Monitors memory-mapped register space:

- `PMCID1SR` and `PMCID2SR`.
- `PMPCSR`.
- `PMVIDSR`.

See *Performance Monitors external register views* on page I5-7686.

If the PC Sample-based Profiling Extension is implemented with `FEAT_PCSRv8p2` but the Performance Monitors Extension is not implemented, then the PC Sample-based Profiling Extension is implemented in its own memory-mapped register space, within the area that is reserved for the Performance Monitors, see [Table H7-1 on page H7-7457](#). If CoreSight compliance is required:

- The management registers are defined as in [Table K2-3 on page K2-8432](#).
- The support for PC Sample-based profiling is defined in the following registers:
 - `PMDEVTYPE.MAJOR` has the value `0x0`.
 - `PMDEVARCH.ARCHID` has the value `0x0A10`.

Table H7-1 PC Sample-based Profiling register map without the Performance Monitors Extension

Offset	Description
0x200	<code>PMPCSR[31:0]</code>
0x204	<code>PMPCSR[63:32]</code>
0x208	<code>PMCID1SR</code>
0x20C	<code>PMVIDSR</code>
0x220	<code>PMPCSR[31:0]</code> (alias)
0x224	<code>PMPCSR[63:32]</code> (alias)
0x228	<code>PMCID1SR</code> (alias)
0x22C	<code>PMCID2SR</code>

Table H7-1 PC Sample-based Profiling register map without the Performance Monitors Extension

Offset	Description
0x600-0x6FC	IMPLEMENTATION DEFINED
0xE80-0xEFC	IMPLEMENTATION DEFINED for CoreSight compliance
0xFF0-0xFFc	Management and CoreSight compliance registers

H7.1.3 Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN

The architecture permits IMPLEMENTATION DEFINED extensions to external debug to define mechanisms that make the values of the PC Sample-based profiling registers UNKNOWN. However, it requires that any such mechanism is disabled by default. This means that powerup or a hard reset of the PE must leave the PE in a state where the PC Sample-based Profiling Extension, if implemented, exhibits its architecturally-defined behavior.

———— **Note** —————

A mechanism that, when enabled, makes the PC Sample-based profiling registers UNKNOWN might use other sample-based profiling events that are appropriate for a use that is independent of PC Sample-based Profiling.

If no instruction has been retired since the PE left Debug state, Reset state, or a state where PC Sample-based profiling is prohibited, the sampled value is UNKNOWN. If an instruction has been retired but this is the first time the [PMPCSR](#) or [EDPCSR](#) is read since the PE left Reset state, the sampled value is permitted but not required to return the value 0xFFFFFFFF.

H7.1.4 Pseudocode description of PC Sample-based Profiling

When PC Sample-based Profiling is implemented but not with [FEAT_PCSRv8p2](#), the functionality is described by the pseudocode functions:

- [CreatePCSample\(\)](#), which populates a variable of type [PCSample](#).
- [EDPCSRto\[\]](#), which writes a PC sample to the [EDPCSR](#) and associated registers.

When [FEAT_PCSRv8p2](#) is implemented, the functionality is described by the pseudocode functions:

- [CreatePCSample\(\)](#), which populates a variable of type [PCSample](#).
- [PMPCSR\[\]](#), which writes a PC Sample to the [PMPCSR](#) and associated registers.

Chapter H8

About the External Debug Registers

This chapter provides some additional information about the external debug registers. It contains the following sections:

- *Relationship between external debug and System registers* on page H8-7460.
- *Endianness and supported access sizes* on page H8-7461.
- *Synchronization of changes to the external debug registers* on page H8-7462.
- *Memory-mapped accesses to the external debug interface* on page H8-7466.
- *External debug interface register access permissions* on page H8-7468.
- *External debug interface registers* on page H8-7472.
- *Cross-trigger interface registers* on page H8-7479.
- *External debug register resets* on page H8-7481.

Note

Where necessary, [Table K15-1 on page K15-8602](#) disambiguates the general register references used in this chapter.

H8.1 Relationship between external debug and System registers

Table H8-1 on page H8-7460 shows the relationship between external debug registers and System registers. Where no relationship exists, the registers are not listed.

Table H8-1 Equivalence between external debug and System registers

External debug register	System register		Notes
	AArch64	AArch32	
DBGDTRRX_EL0	DBGDTRRX_EL0	DBGDTRRXint	See also <i>Summary of System register accesses to the DCC</i> on page H4-7413
DBGDTRTX_EL0	DBGDTRTX_EL0	DBGDTRTXint	
OSLAR_EL1	OSLAR_EL1	DBGOSLAR	-
DBGBVR<n>_EL1[31:0]	DBGBVR<n>_EL1[31:0]	DBGBVR<n>	-
DBGBVR<n>_EL1[63:32]	DBGBVR<n>_EL1[63:32]	DBGBXVR<n>	
DBGBCR<n>_EL1	DBGBCR<n>_EL1	DBGBCR<n>	-
DBGWVR<n>_EL1[31:0]	DBGWVR<n>_EL1[31:0]	DBGWVR<n>	-
DBGWVR<n>_EL1[63:32]	DBGWVR<n>_EL1[63:32]		
DBGWCR<n>_EL1	DBGWCR<n>_EL1	DBGWCR<n>	-
DBGCLAIMSET_EL1	DBGCLAIMSET_EL1	DBGCLAIMSET	-
DBGCLAIMCLR_EL1	DBGCLAIMCLR_EL1	DBGCLAIMCLR	-
DBGAUTHSTATUS_EL1	DBGAUTHSTATUS_EL1	DBGAUTHSTATUS	Read-only
EDSCR	MDSR_EL1	DBGDSCRext	Only some fields map
EDECCR	OSECCR_EL1	DBGOSECCR	Applies when the OS Lock is locked.
MIDR_EL1	MIDR_EL1	MIDR	Read-only copies of Processor ID Registers
EDDEVAFF0	MPIDR_EL1[31:0] ^a	MPIDR	Read-only copies of system ID registers
EDDEVAFF1	MPIDR_EL1[63:32] ^a		

a. This is a word of a 64-bit register.

In addition:

- **EDSCR**.{TXfull, RXfull} are read-only aliases for **DCCSR**.{TXfull, RXfull}.
- **EDPRCR**.CORENPDRQ is a read/write alias for **DBGPRCR**.CORENPDRQ.
- **EDPRSR**.OSLK is a read-only alias for **OSLSR**.OSLK.
- If the **FEAT_DoubleLock** is implemented, **EDPRSR**.DLK is a read-only function of **OSDLR**.DLK.

H8.2 Endianness and supported access sizes

The debug registers, Performance Monitors registers, and CTI registers are implemented as memory-mapped peripherals. The Arm architecture requires memory-mapped peripherals to be little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the debug registers, Performance Monitors registers, and CTI registers, implementations must:

- Comply with the requirements of [Supported access sizes on page I1-7656](#).
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.

———— **Note** —————

These requirements mean that a system implementing the debug registers using a 32-bit bus, such as a AMBA APB3, with a wider system interconnect must implement a bridge between the system and the debug bus that can split 64-bit accesses.

For accesses from the external debug interface, the size of an access is determined by the interface. For an access from an ADIv5-compliant Memory Access Port, MEM-AP, this is specified by the MEM-AP CSW register.

H8.3 Synchronization of changes to the external debug registers

This section describes the synchronization requirements for the external debug interface.

For more information on how these requirements affect debug, see:

- [Synchronization and debug exceptions on page D2-2626](#) for exceptions taken from AArch64 state.
- [Synchronization and debug exceptions on page G2-6217](#) for exceptions taken from AArch32 state.
- [Synchronization and Halting debug events on page H3-7399](#).
- [Synchronization of DCC and ITR accesses on page H4-7413](#).

This section refers to accesses from the external debug interface as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

Note

[Synchronization requirements for AArch64 System registers on page D13-3041](#) and [Synchronization of changes to AArch32 System registers on page G8-6443](#) define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads, and external writes as indirect writes.

For general information about synchronization, access completion, ordering, and observability, see [Synchronization of memory-mapped registers on page I1-7658](#).

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. With the exception of `DBGBCR<n>_EL1`, `DBGBVR<n>_EL1`, `DBGWCR<n>_EL1`, and `DBGWVR<n>_EL1`, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

[Synchronization of DCC and ITR accesses on page H4-7413](#) describes the synchronization requirements for the DCC and ITR.

Changes to the IMPLEMENTATION DEFINED authentication interface are external writes to the authentication status registers by the Requester of the authentication interface. See [Synchronization and the authentication interface on page H8-7463](#).

The external agent must be able to guarantee completion of a write. For example by:

- Marking the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- Reading back the value written.
- Some guaranteed property of the connection between the PE and the external agent.

Note

For an external Debug Access Port, access completion is an IMPLEMENTATION DEFINED property. For a CoreSight system using APB-AP to access a debug APB, accesses complete in order.

However, the external agent cannot force synchronization of completed writes without halting the PE. Executing an ISB instruction, either in Debug state or in Non-debug state, and exiting from Debug state forces synchronization. If the PE is in Debug state, executing an ISB instruction is guaranteed to explicitly synchronize any external reads, external writes, and changes to the authentication interface that are ordered before the external write to `EDITR`.

For any given observer, external writes to the following register groups are guaranteed to be observable in the same order in which they complete:

- The breakpoint registers, `DBGBCR<n>_EL1` and `DBGBVR<n>_EL1`.
- The watchpoint registers, `DBGWCR<n>_EL1` and `DBGWVR<n>_EL1`.

This guarantee applies only to external writes to registers within one of these groups. There is no guarantee regarding the ordering of the observability of external writes within these groups with respect to external writes to registers, for example `EDSCR`, or between breakpoints and watchpoints, including watchpoints linked to context matching breakpoints.

Note

This means that a debugger can rely on the external writes to be observed in the same order in which they complete. It does not mean that a debugger can rely on the external writes being observed in finite time.

In a simple sequential execution an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

If two or more interfaces simultaneously access a register, the behavior must be as if the accesses occurred atomically and in any order. This is described in [Examples of the synchronization of changes to the external debug registers on page H8-7463](#).

Some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means that simultaneous writes must be merged. Registers that have this property and support both external debug and System register access include [DBGCLAIMSET_EL1](#), [DBGCLAIMCLR_EL1](#), [PMCR_EL0](#).{C,P}, [PMOVSSET_EL0](#), [PMOVSLR_EL0](#), [PMCNTENSET_EL0](#), [PMCNTENCLR_EL0](#), [PMINTENSET_EL1](#), [PMINTENCLR_EL1](#), and [PMSWINC_EL0](#). This last register is OPTIONAL and deprecated in the external debug interface.

H8.3.1 Synchronization and the authentication interface

Changes to the authentication interface are indirect writes to the state of the PE by the Requester of the authentication interface.

For an external debug interface read of any Authentication Status register, or an indirect read of the authentication interface made in determining the response to a subsequent external debug interface access, a change on the authentication interface must be observable following a subsequent explicit [Context synchronization event](#), and:

- It is IMPLEMENTATION DEFINED whether a change is guaranteed to be observable in finite time.
- It is IMPLEMENTATION DEFINED whether a change is guaranteed to be observable following an entry to Debug state.

For a System register read of [DBGAUTHSTATUS_EL1](#), a change on the authentication interface is guaranteed to be observable only after a [Context synchronization event](#).

Note

- In some systems, the authentication interface is fixed by configuration or is changed under the control of software. These systems can require explicit synchronization for any change to the authentication interface.
- In other systems, the authentication interface is controlled dynamically by an external agent. In these systems, it is desirable that changes to the authentication interface do not require explicit synchronization by software executing on the PE to be observable by subsequent external debug interface accesses, and are either observable in finite time or are synchronized by entry to Debug state. Otherwise, there are scenarios where a debugger is not able to halt and debug the system.

H8.3.2 Examples of the synchronization of changes to the external debug registers

[Example H8-1 on page H8-7463](#), [Example H8-2 on page H8-7464](#), and [Example H8-3 on page H8-7464](#) show the synchronization of changes to the external debug registers.

Example H8-1 Order of synchronization of Breakpoint and Watchpoint register writes

Initially [DBGBVR<n>_EL1](#) is 0x8000 and [DBGBCR<n>_EL1](#) is 0x0181. This means that a breakpoint is enabled on the halfword T32 instruction at address 0x8000.

A sequence of external writes occurs in the following order:

1. 0x0000 is written to [DBGBCR<n>_EL1](#), disabling the breakpoint.
2. 0x9000 is written to [DBGBVR<n>_EL1](#)[31:0].
3. 0x0061 is written to [DBGBCR<n>_EL1](#), enabling a breakpoint on the halfword at address 0x9002.

The external writes must be observable to indirect reads in the same order as the external writes complete. This means that at no point is there a breakpoint enabled on either of the halfwords at address 0x8002 and 0x9000.

Similarly a breakpoint or watchpoint must be disabled:

- If both halves of a 64-bit address have to be updated.
- If any of the `DBGBCR<n>_EL1` or `DBGWCR<n>_EL1` fields are modified at the same time as updating the address.

Example H8-2 Simultaneous accesses to DTR registers

Initially `EDSCR.{TXfull, TXU, ERR}` are 0. Then:

- `0x0DCCDA7A` is directly written to `DBGDTRTX_EL0` by an MSR instruction.
- `DBGDTRTX_EL0` is indirectly read by the external debug interface.

These accesses might happen at the same time and in any order.

If the direct write of `0x0DCCDA7A` to `DBGDTRTX_EL0` is handled first, then:

- The external debug interface read of `DBGDTRTX_EL0` clears `EDSCR.TXfull` to 0.
- `EDSCR.{TXU, ERR}` are unchanged.
- The external debug interface read returns `0x0DCCDA7A`.

If the indirect read of `DBGDTRTX_EL0` by the external debug interface is handled first, then:

- The external debug interface read of `DBGDTRTX_EL0` causes an underrun and as a result `EDSCR.{TXU, ERR}` are both set to 1.
- The external debug interface returns an UNKNOWN value.
- Writing `0x0DCCDA7A` to `DBGDTRTX_EL0` sets `DTRTX` to `0x0DCCDA7A` and `EDSCR.TXfull` to 1.

Example H8-3 Simultaneous writes to CLAIM registers

Initially all CLAIM tag bits are 0. Then:

- `0x01` is written to `DBGCLAIMSET_EL1` by a direct write, followed by an explicit *Context synchronization event*.
- `0x02` is written to `DBGCLAIMSET_EL1` by an external write.

These events might happen at the same time and in either order.

After this:

- `DBGCLAIMCLR_EL1` is read by a direct read.
- `DBGCLAIMCLR_EL1` is read by an external read.

In this case, a direct read can return either `0x01` or `0x03`, and the external read can return either `0x02` or `0x03`.

The only permitted final result for the CLAIM tags is the value `0x03`, because this would be the result regardless of whether `0x01` or `0x02` is written first. This is because the external write is guaranteed to be observable to a direct read in finite time. See *Synchronization requirements for AArch64 System registers* on page D13-3041.

It is not possible for a direct read to return `0x01` and the external read to return `0x02`, because the writes to `DBGCLAIMCLR_EL1` are serialized.

In the following scenario, there is only one permitted result. Both observers observe the value `0x03`, and then, at the same time, two writes occur:

- `0x04` is written to `DBGCLAIMSET_EL1` by a direct write, followed by an explicit *Context synchronization event*.
- `0x01` is written to `DBGCLAIMCLR_EL1` by an external write.

In this case, the only permitted final result for the CLAIM tags is the value 0x06.

H8.4 Memory-mapped accesses to the external debug interface

Support for memory-mapped access to the external debug interface is OPTIONAL. When memory-mapped access to the external debug interface is supported, the external debug interface is accessed as a little-endian memory-mapped peripheral.

If the external debug interface is CoreSight compliant, then an OPTIONAL Software Lock can be implemented for memory-mapped accesses to each component.

The Software Lock is OPTIONAL and deprecated. If [FEAT_Debugv8p4](#) is implemented, the Software Lock is not implemented. If it is not implemented, the behavior is as if it is unlocked. The Software Locks are controlled by [EDLSR](#) and [EDLAR](#), [PMLSR](#) and [PMLAR](#), and [CTILSR](#) and [CTILAR](#). See *Management registers and CoreSight compliance* on page K2-8432.

If [FEAT_DoPD](#) is implemented, Software Lock is not implemented by the architecturally-defined debug components in the Core power domain.

With the exception of these registers and the effect of the Software Lock, the behavior of the memory-mapped accesses is the same as for other accesses to the external debug interface.

———— Note ————

The recommended memory-mapped accesses to the external debug interface are not compatible with the memory-mapped interface defined in Armv7. In particular:

- The memory map is different.
- Memory-mapped accesses do not behave differently to Debug Access Port accesses when [OSLSR.OSLK == 1](#), meaning that the OS Lock is locked.

The following sections give more information about these memory-mapped accesses:

- [Register access permissions for memory-mapped accesses](#) on page H8-7466.
- [Synchronization of memory-mapped accesses to external debug registers](#) on page H8-7467.

See also [Supported access sizes](#) on page I1-7656.

H8.4.1 Register access permissions for memory-mapped accesses

It is IMPLEMENTATION DEFINED whether unprivileged memory-mapped accesses are allowed. Privileged software is responsible for controlling memory-mapped accesses using the MMU.

If [FEAT_Debugv8p4](#) is implemented, the Secure view of a debug component is mapped into Secure physical memory and the Non-secure view is mapped into Non-secure physical memory.

If [FEAT_Debugv8p4](#) is implemented, the access permissions are different in each Security state, but Secure and Non-secure views of the debug components are identical. Arm recommends the views are located at the same address in the Secure and Non-secure physical address maps.

If memory-mapped accesses are made through an ADIV5 interface, the Debug Access Port can block the access using [DBGSWENABLE](#). This is outside the scope of the Armv8-A architecture. See *Arm® Debug Interface Architecture Specification ADIV5.0 to ADIV5.2*.

Effect of the OPTIONAL Software Lock on memory-mapped access

For memory-mapped accesses, if other controls permit access to a register, the OPTIONAL Software Lock is implemented, and [EDLSR.SLK](#), [PMLSR.SLK](#), or [CTILSR.SLK](#) is set to 1, meaning the Software Lock is locked, then with the exception of the LAR itself:

- If other controls permit access to a register, then writes are ignored. That is:
 - Read/write (RW) registers become read-only, writes ignored (RO/WI).
 - Write-only (WO) registers become writes ignored (WI).
- Reads and writes have no side-effects. A side-effect is where a direct read or a direct write of a register creates an indirect write of the same or another register. When the Software Lock is locked, the indirect write does not occur.

- Writes to [EDLAR](#), [PMLAR](#), and [CTILAR](#) are unaffected.

This behavior must also apply to all IMPLEMENTATION DEFINED registers.

For example, if [EDLSR.SLK](#) is set to 1:

- [EDSCR](#).{TXfull, TXU, ERR} are unchanged by a memory-mapped read from [DBGDTRTX_ELO](#).
- [EDSCR](#).{RXfull, RXO, ERR} are unchanged by a memory-mapped write to [DBGDTRRX_ELO](#) that is ignored.
- [EDSCR](#).{ITE, ITO, ERR} are unchanged by a memory-mapped write to [EDITR](#) that is ignored.
- [OSLSR.OSLK](#) is unchanged by a memory-mapped write to [OSLAR_EL1](#) that is ignored.
- [EDPCSR](#)[63:32], [EDCIDSR](#), and [EDVIDSR](#) are unchanged by a memory-mapped read from [EDPCSR](#)[31:0].

———— **Note** ————

Updating [EDVIDSR](#), [EDCIDSR](#), and [EDPCSR](#)hi are side-effects of reading [EDPCSR](#)lo, such that these registers contain the matching context for [EDPCSR](#)lo. The process that updates [EDPCSR](#)lo with PC samples is not a side-effect of the access. Reads of [EDPCSR](#)lo made when the Software Lock is locked can be used to profile software.

- [PMPCSR](#)[63:32], [PMCID1SR/PMCID2SR](#), and [PMVIDSR](#) are unchanged by a memory-mapped read from [PMPCSR](#)[31:0].

———— **Note** ————

Updating [PMVIDSR](#), [PMCID1SR/PMCID2SR](#), and [PMPCSR](#)[31:0] are side-effects of reading [PMPCSR](#)[63:32], such that these registers contain the matching context for [PMPCSR](#)[63:32]. The process that updates [PMPCSR](#)[63:32] with PC samples is not a side-effect of the access. Reads of [PMPCSR](#)[63:32] made when the Software Lock is locked can be used to profile software.

- [EDPRSR](#).{SDR, SPMAD, SDAD, SR, SPD} are unchanged by a memory-mapped read from [EDPRSR](#).
- [EDPRSR.SDAD](#) is not set if an error response is returned due to a memory-mapped read or write of any debug register as the result of the value of the [EDAD](#) field.
- The CLAIM tags are unchanged by memory-mapped writes to [DBGCLAIMSET_EL1](#) and [DBGCLAIMCLR_EL1](#) which are ignored.

Similarly, if [PMLSR.SLK](#) is set to 1, then [EDPRSR.SPMAD](#) is not set if an error response is returned to a memory-mapped read or write of any Performance Monitors register due to the value of the [EPMAD](#) field.

Behavior of a not permitted memory-mapped access

Where the architecture requires that an external debug interface access generates an error response, a memory-mapped access must also generate an error response. However, it is IMPLEMENTATION DEFINED how the error response is handled, as this depends on the system.

Arm recommends that the error is returned as either:

- A synchronous external Data Abort.
- An SError interrupt.

H8.4.2 Synchronization of memory-mapped accesses to external debug registers

The synchronization requirements for memory-mapped accesses to the external debug interface is described in [Synchronization of changes to the external debug registers on page H8-7462](#) and [Synchronization of memory-mapped registers on page I1-7658](#).

The synchronization requirements between different routes to the external debug interface, that is, between Debug Access Port accesses and memory-mapped accesses are IMPLEMENTATION DEFINED.

H8.5 External debug interface register access permissions

Some external accesses to debug registers and Performance Monitor registers are not permitted and return an error response if:

- The Core power domain is powered down or is in low-power state where the registers cannot be accessed.
- `OSLSR.OSLK == 1`. The OS Lock is locked.
- `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`. The OS Double Lock is locked.
- The access is disabled by either the authentication interface or secure monitor.

Not all registers are affected in all of these cases. For more information, see [External debug interface register access permissions summary](#) on page H8-7469.

H8.5.1 External debug over powerdown and locks

Accessing registers using the external debug interface is not possible when the Debug power domain is off. In this case, all accesses return an error.

External accesses to debug and Performance Monitors registers in the Core power domain are not permitted and return an error response if:

- The Core power domain is off or in low-power state where the registers cannot be accessed.
- `OSLSR.OSLK == 1`, meaning that the OS Lock is locked. This allows software to prevent external debugger modification of the registers while it saves and restores them over powerdown.
- `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`. This means that the OS Double Lock is locked. The OS Double Lock ensures that it is safe to remove Core power by forcing the debug interface to be quiescent.

If `FEAT_DoubleLock` is not implemented, the hardware must provide another method to safely remove Core power.

The OS Lock condition does not apply to the following debug registers:

- `OSLAR_EL1`. This means that an external debugger can override this lock.
- `EDESR`. This means that an external debugger can program a debug event for when software unlocks the OS Lock. See [OS Unlock Catch debug event](#) on page H3-7396.
- The ID registers that describe the PE to the debugger.

See also [Debug registers to save over powerdown](#) on page H6-7447.

H8.5.2 External access disabled

Accesses are further controlled by the external authentication interface. An untrusted external debugger cannot program the breakpoint and watchpoint registers to generate spurious debug exceptions. If external invasive debugging is not enabled, these external accesses to the registers are disabled. If EL3 is implemented, then `SDCR` provides additional external access controls for those registers.

The disable applies to:

- The `DBGBVR<n>_EL1`, `DBGBCR<n>_EL1`, `DBGWVR<n>_EL1`, and `DBGWCR<n>_EL1` registers.
- From Armv8.2, the `OSLAR_EL1` register.

If `FEAT_Debugv8p2` is not implemented, it is IMPLEMENTATION DEFINED whether the disable applies to `OSLAR_EL1`.

If `FEAT_Debugv8p4` is not implemented, the external debug interface cannot access these registers if any of the following are true:

- `ExternalInvasiveDebugEnabled() == FALSE`.
- `ExternalSecureInvasiveDebugEnabled() == FALSE`, EL3 is not implemented, and the PE behaves as if the Security state is Secure.
- `ExternalSecureInvasiveDebugEnabled() == FALSE`, EL3 is implemented and `SDCR.EDAD == 1`.

If `FEAT_Debugv8p4` is implemented, Non-secure accesses from the external debug interface to these registers are not permitted if any of the following are true:

- EL3 is not implemented and the PE behaves as if the Security state is Secure.

- EL3 is implemented and `SDCR.EDAD == 1`.

The `AllowExternalDebugAccess()` pseudocode function describes these accessibility rules.

PEs might also provide an OPTIONAL external debug interface to the Performance Monitor registers. The authentication interface and `SDCR` provide similar external access disable controls for those registers.

If `FEAT_Debugv8p4` is not implemented, the external debug interface cannot access the Performance Monitor registers if any of the following are true:

- `ExternalNoninvasiveDebugEnabled() == FALSE`.
- `ExternalSecureNoninvasiveDebugEnabled() == FALSE`, EL3 is not implemented and the PE behaves as if the Security state is Secure.
- `ExternalSecureNoninvasiveDebugEnabled() == FALSE`, EL3 is implemented and `SDCR.EPMAD == 1`.

———— **Note** ————

- Arm recommends that Secure software that is not making use of debug hardware does not lock out the external debug interface.
- Armv8-A does not provide the equivalent control over access to Trace extension registers, which means if `FEAT_Debugv8p4` is implemented, the Non-secure and Secure views are identical.

If `FEAT_Debugv8p4` is implemented, Non-secure accesses from the external debug interface to these registers are not permitted if any of the following are true:

- EL3 is not implemented and the PE behaves as if the Security state is Secure.
- EL3 is implemented and `SDCR.EPMAD == 1`.

The `AllowExternalPMUAccess()` pseudocode function describes these accessibility rules.

H8.5.3 Behavior of a not permitted access

For an external debug interface access by a Debug Access Port, the Debug Access Port receives the error response and must signal this to the external debugger. For an ADIV5 implementation of a Debug Access Port, the error sets a sticky error flag in the Debug Access Port that the debugger can poll, and that suppresses further accesses until it is explicitly cleared.

When an error is returned because external access is disabled, and this is the highest priority error condition, a sticky error flag in `EDPRSR` is indirectly written to 1 as a side-effect of the access:

- For a debug register access when `AllowExternalDebugAccess() == FALSE`, `EDPRSR.SDAD` is indirectly written to 1.
- For Performance Monitor register access when `AllowExternalPMUAccess() == FALSE`, `EDPRSR.SPMAD` is indirectly written to 1.

The indirect write might not occur for a memory-mapped access to the external debug interface. For more information, see [Register access permissions for memory-mapped accesses on page H8-7466](#).

If no error is returned, or the error is returned because of a higher priority error condition, the flag in `EDPRSR` is unchanged.

See also [Behavior of a not permitted memory-mapped access on page H8-7467](#).

For more information, see *Arm® Debug Interface Architecture Specification*.

H8.5.4 External debug interface register access permissions summary

For accesses to:

- IMPLEMENTATION DEFINED registers, see [IMPLEMENTATION DEFINED registers on page H8-7470](#).
- OPTIONAL registers for CoreSight compliance, see [Management registers and CoreSight compliance on page K2-8432](#).
- Reserved, unallocated, or unimplemented registers, writes to read-only registers, and reads of write-only registers, see [Reserved and unallocated registers on page H8-7470](#).

For all other external debug interface, CTI, and Performance Monitor registers, [Table H8-3 on page H8-7475](#), [Table H8-4 on page H8-7476](#), [Table H8-6 on page H8-7480](#) and [Table I3-1 on page I3-7676](#), show the response of the PE to accesses by the external debug interface.

H8.5.5 IMPLEMENTATION DEFINED registers

For debug registers, Performance Monitors registers, CTI registers, register access permissions for IMPLEMENTATION DEFINED registers are IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there are additional constraints on memory-mapped accesses to registers. These constraints must also apply to IMPLEMENTATION DEFINED registers. For more information, see [Register access permissions for memory-mapped accesses on page H8-7466](#).

If FEAT_DoPD is not implemented, the power domain of these registers in which these registers are implemented is also IMPLEMENTATION DEFINED. The registers must apply the constraint that if the OPTIONAL Software Lock is locked, writes are ignored and accesses have no side-effects.

If FEAT_DoPD is implemented, then:

- For debug registers and Performance Monitors registers, IMPLEMENTATION DEFINED registers are implemented in the Core power domain. Accesses return an error when the Core power domain is off or in a low-power state.
- For CTI registers, IMPLEMENTATION DEFINED registers are implemented in the Debug power domain.

H8.5.6 Reserved and unallocated registers

The default access requirements for reserved and unallocated registers are described in [Access requirements for reserved and unallocated registers on page I1-7660](#).

———— Note ————

Reads of WO and writes to RO refers to the default access permissions for a register. For example, when the SLK field is set, meaning that the relevant registers become RO, a memory-mapped write to a RW register is ignored, and not treated as a reserved access.

The following reserved registers are RES0 in all conditions, other than when debug power is off:

- All reserved CTI registers.
- For the debug registers, and Performance Monitors registers, if the implementation is CoreSight architecture compliant, and either FEAT_DoPD is not implemented or the Core power domain is on, all reserved registers in the range 0xF00 - 0xFFC. See [Management register access permissions on page K2-8433](#).

Otherwise, the architecture defines that:

1. If debug power is off, all register accesses, including reserved accesses, return an error.
2. For reserved debug registers and Performance Monitors registers, if FEAT_DoPD is implemented, and the Core power domain is off or in a low-power state, the response is an error. Otherwise, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0, when any of the following hold:
 - Off** The Core power domain is either completely off or in a low-power state in which the Core power domain registers cannot be accessed.
 - DLK** FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE. The OS Double Lock is locked.
 - OSLK** OSLSR.OSLK == 1. The OS Lock is locked.
3. In addition, for reserved debug registers in the address ranges 0x400 - 0x4FC and 0x800 - 0x8FC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:
 - EDAD** AllowExternalDebugAccess() == FALSE. External debug is disabled.

———— Note ————

See also [Behavior of a not permitted access on page H8-7469](#).

4. In addition, for reserved Performance Monitors registers in the address ranges 0x000 - 0xEFC, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when conditions 1 or 2 do not apply and:
EPMAD AllowExternalPMUAccess() == FALSE. External Performance Monitor access is disabled.

———— **Note** —————

See also [Behavior of a not permitted access on page H8-7469](#).

5. For reads of WO locations, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires a write to the location to return an error.
6. For writes of RO locations, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires a read to the location to return an error.
7. For reads and writes of locations for features that are not implemented, the response is a CONSTRAINED UNPREDICTABLE choice of error or RES0 when the architecture permits or requires an access to the location to return an error if the feature is implemented.

H8.6 External debug interface registers

The external debug interface register map is described by:

- [Performance Monitors external register views](#) on page 15-7686.
- [Cross-trigger interface registers](#) on page H8-7479.
- [External debug interface register map](#) on page H8-7472.

- a. Supported only if the OPTIONAL PC Sample-Based Profiling is implemented but [FEAT_PCSRv8p2](#) is not implemented. See [Chapter H7 The PC Sample-based Profiling Extension](#).
Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented.
- b. A 64-bit register mapped to a pair of 32-bit locations. Doubleword accesses to this register are not guaranteed to be 64-bit single copy atomic. See [Endianness and supported access sizes on page H8-7461](#). Software must ensure a breakpoint or watchpoint is disabled before altering the value register.
- c. Implemented breakpoints and watchpoints only. *n* is the breakpoint or the watchpoint number.

———— Note ————

All other locations are reserved.

H8.6.1 Access permissions for the External debug interface registers

Table H8-3 on page H8-7475 and Table H8-4 on page H8-7476 show the access permissions for the external debug interface registers in an Armv8-A Debug implementation. The terms are defined as follows:

Domain	<p>This describes the power domain in which the register is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.</p> <p>If FEAT_DoPD is implemented, most External debug interface registers are in the Core power domain, as shown in Table H8-3 on page H8-7475.</p> <p>If FEAT_DoPD is not implemented, most of the registers are in the Debug Power Domain, as shown in Table H8-4 on page H8-7476.</p>
Conditions	<p>This lists the conditions under which the access is attempted.</p> <p>To determine the access permissions for a register, read these columns from left to right, and stop at first column that lists the condition as being true.</p> <p>The conditions are:</p> <p>Off The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed, and if FEAT_DoPD is not implemented, EDPRSR.PU will read as 0.</p> <p style="text-align: center;">———— Note —————</p> <p>When the Core power domain is off, or in a low-power state, a debugger is permitted to access a debug register that is implemented in the external Debug power domain.</p> <p>When the Debug power domain is off, all accesses to the registers in the external Debug power domain return an error.</p> <p>DLK FEAT_DoubleLock is implemented and <code>DoubleLockStatus() == TRUE</code>. The OS Double Lock is locked. If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented and so Table H8-3 on page H8-7475 does not include this column.</p> <p>OSLK OSLSR.OSLK == 1. The OS Lock is locked.</p> <p>EDAD <code>AllowExternalDebugAccess() == FALSE</code>. External debug access is disabled for the access. If FEAT_Debugv8p4 is implemented, this applies only for Non-secure accesses to the register. See also <i>Behavior of a not permitted access</i> on page H8-7469.</p> <p>EPMAD <code>AllowExternalPMUAccess() == FALSE</code>. Access to the external Performance Monitors is disabled for the access. If FEAT_Debugv8p4 is implemented, this applies only for Non-secure accesses to the register. See also <i>Behavior of a not permitted access</i> on page H8-7469.</p> <p>SLK The Software Lock is implemented and <code>SoftwareLockStatus() == TRUE</code>. This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked. See <i>Register access permissions for memory-mapped accesses</i> on page H8-7466. If FEAT_DoPD is implemented, the Software Lock is not locked or not implemented, this column is ignored.</p> <p>Default This provides the default access permissions, if there are no conditions that prevent access to the register.</p>

The access permissions are:

- This means that the default access permission applies. See the Default column, or the SLK column, if applicable.
- RO** This means that the register or field is read-only, and:
 - Unless the register description states otherwise, a RO field in an RW register ignores writes.
 - Where the **SLK** control makes a RW register RO, the register ignores writes.

- RW** This means that the register or field is read/write. Individual fields within the register might be RO or WO. See the relevant register description for details.
- RC** This means that a read of the register bit clears the field to 0.
- WO** This means that the register or field is write-only. Unless the register description states otherwise, a WO field in a RW register returns an UNKNOWN value on a read of the register.
- WI** This means that the register or field ignores writes.
- IMP DEF** This means that the access permissions are IMPLEMENTATION DEFINED.

If OPTIONAL memory-mapped access to the external debug interface is supported, there might be additional constraints on memory-mapped accesses. See [Register access permissions for memory-mapped accesses on page H8-7466](#).

For the reset values for the external debug interface registers, see [Table H8-7 on page H8-7481](#).

- a. Implemented only if the PC Sample-based Profiling Extension is implemented.
- b. If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether an error is returned. See [External access disabled on page H8-7468](#). If no error is returned, the access is permitted.
- c. Some bits are in the Debug power domain and some bits are in the Core power domain. See register field descriptions for information.
- d. Implemented breakpoints and watchpoints only. *n* is the breakpoint or watchpoint number.
- e. It is IMPLEMENTATION DEFINED whether an error is returned. See [External debug over powerdown and locks on page H8-7468](#). If no error is returned, the access is permitted.

H8.7 Cross-trigger interface registers

The Embedded Cross-Trigger Interface, CTI, is located within its own block of the external debug memory map. There must be one such block for each PE.

If the CTI of a PE does not implement the [CTIDEVAFF0](#) or [CTIDEVAFF1](#) registers it must be located 64KB above the debug registers in the external debug interface.

When [FEAT_Debugv8p4](#) is implemented, each debug component has a Secure and Non-secure view. The Secure view of a debug component is mapped into Secure physical memory and the Non-secure view of a debug component is mapped into Non-secure memory. Apart from access conditions, the Non-secure and Secure views of the debug components are identical.

[Table H8-5 on page H8-7479](#) shows the CTI register map.

Table H8-5 Cross-trigger interface map

Offset	Mnemonic	Location of further details
0x000	CTICONTROL	CTICONTROL , CTI Control register on page H9-7619

0xFC8	CTIDEVID	Debug	-	-	-	-	RO	RO

a. Implemented triggers only (including triggers that are not connected). *n* is the trigger number.

For the reset values of the CTI registers, see Table H8-8 on page H8-7483.

H8.8 External debug register resets

Each register or field has a defined reset domain:

- Registers and fields in the Warm reset domain are also reset by a Cold reset and unchanged by an External Debug reset that is not coincident with a Cold reset or a Warm reset.
- Registers and fields in the Cold reset domain are unchanged by a Warm reset or an External Debug reset that is not coincident with a Cold reset.
- Registers and fields in the External Debug reset domain are unchanged by a Cold reset or a Warm reset that is not coincident with an External Debug reset.

A reset might change the value of a register. Specific rules apply to the observability of registers in the External Debug reset domain by indirect reads from the Core power domain when an External Debug reset is asserted without a coincident Cold reset. For more information, see *Synchronization of changes to the external debug registers* on page H8-7462.

Table H8-7 on page H8-7481 and Table H8-8 on page H8-7483 show the external debug register and CTI register resets. For other debug registers and Performance Monitors registers, see *Management register resets* on page K2-8439 and *Power domains and Performance Monitors registers reset* on page I3-7677.

———— Note —————

By reference to Figure H6-1 on page H6-7452 the power domain can be deduced from the reset domain. Table K2-9 on page K2-8439 also shows reset power domains.

Table H8-7 on page H8-7481 and Table H8-8 on page H8-7483 do not include:

- Read-only identification registers, such as Processor ID Registers and `PMCFGR`, that have a fixed value from reset.
- Read-only status registers, such as `EDSCR.RW`, that are evaluated each time the register is read and that have no meaningful reset value.
- Write-only registers, such as `EDRCR`, that only have an effect on writes, and have no meaningful reset value.
- Read/write registers, such as breakpoint and watchpoint registers, and `EDPRCR.CORENPDRQ`, that alias other registers. The reset values are described by the descriptions of those other registers.
- IMPLEMENTATION DEFINED registers. The reset values and reset domains of these registers are also IMPLEMENTATION DEFINED and might be UNKNOWN.

All other fields in the registers are set to an IMPLEMENTATION DEFINED value that can be UNKNOWN. The register is in the specified reset domain.

———— Note —————

An IMPLEMENTATION DEFINED reset value, which can be UNKNOWN, means that hardware is not required to reset the register on the specified reset, but software must not rely on the register being preserved over reset.

Table H8-7 Summary of external debug register resets, debug registers

Register	Reset domain	Field	Value	Description
<code>DBGPRCR_EL1</code>	Cold into AArch64 state	<code>CORENPDRQ</code>	The value of the powerup request ^a	Debug Power Control Register.
<code>DBGPRCR</code>	Cold into AArch32 state	<code>CORENPDRQ</code>	The value of the powerup request ^a	Debug Power Control Register.
<code>EDESR</code>	Warm	<code>SS</code>	<code>EDECR.SS</code>	Halting Step debug event pending
		<code>RC</code>	<code>EDECR.RCE</code>	Reset Catch debug event pending
		<code>OSUC</code>	0	OS Unlock Catch debug event pending

Table H8-7 Summary of external debug register resets, debug registers (continued)

Register	Reset domain	Field	Value	Description
EDES _R if FEAT_DoPD is implemented	Cold	SS	0	Halting Step debug event pending
	Warm	RC	CTIDEVCTL.RCE	Reset Catch debug event pending
EDECR if FEAT_DoPD is implemented	Cold	SS	0	Halting Step debug event enable
EDECR if FEAT_DoPD is not implemented	External debug	SS	0	Halting Step debug event enable
		RCE	0	Reset Catch debug event enable
		OSUCE	0	OS Unlock Catch debug event enable
EDWAR	Cold	-	-	All fields
EDSCR	Cold	RXfull	0	DTRRX register full
		TXfull	0	DTRTX register full
		RXO	0	DTRRX overrun
		TXU	0	DTRTX underrun
		INTdis	0	Interrupt disable
		TDA	0	Trap debug register accesses to Debug state
		MA	0	Memory access mode in Debug state
		HDE	0	Halting debug mode enable
EDECCR	Cold	NSE[2:1]	0b00	Coarse-grained Non-secure Exception Catch
		SE[3,1]	0b00	Coarse-grained Secure Exception Catch
EDPCSR	Cold	-	-	All fields
EDCIDS _R	Cold	-	-	All fields
EDVID _S _R	Cold	-	-	All fields
EDPRCR if FEAT_DoPD is implemented	Cold	-	-	-
EDPRCR if FEAT_DoPD is not implemented	External debug	COREPURQ ^b	-	Core powerup request
EDPRSR	Warm	SDR	-	Sticky debug restart
	Cold	SPMAD	0	Sticky EPMAD error
		SDAD	0	Sticky EDAD error
	Warm	SR	1	Sticky reset status
	Cold	SPD	1	Sticky powerdown status

a. If FEAT_DoPD is not implemented, the powerup request is the EDPRCR.COREPURQ control bit.

- b. If `FEAT_DoPD` is not implemented, on a Cold reset into AArch64 state, `DBGPRCR_EL1.CORENPDRQ` resets to the value of `EDPRCR.COREPURQ`. On a Cold reset into AArch32 state, `DBGPRCR.CORENPDRQ` resets to the value of `EDPRCR.COREPURQ`. If an External Debug reset and a Cold reset coincide, both `EDPRCR.COREPURQ` and the `CORENPDRQ` field of the appropriate System register are reset to 0.

Table H8-8 on page H8-7483 shows the reset values for the CTI registers

Table H8-8 Summary of external debug register resets, CTI registers

Register	Reset domain	Field	Value	Description
<code>CTICONTROL</code>	External debug	GLBEN	0	CTI global enable
<code>CTIDEVCTL</code>	External debug	RCE	0	If <code>FEAT_DoPD</code> is implemented, Reset Catch debug event enable
		OSUCE	0	If <code>FEAT_DoPD</code> is implemented, OS Unlock Catch debug event enable
<code>CTIAPPSET</code>	External debug	-	-	All fields
<code>CTIINEN<n></code>	External debug	-	-	All fields

<code>ASICCTL</code>	IMPLEMENTATION DEFINED	-	IMPLEMENTATION DEFINED	All of register

Chapter H9

External Debug Register Descriptions

This chapter provides a description of the external debug registers. It contains the following sections:

- *About the debug registers on page H9-7486.*
- *External debug registers on page H9-7487.*
- *Cross-Trigger Interface registers on page H9-7599.*

H9.1 About the debug registers

The following sections describe the registers that are accessible through the external debug interface:

- [External debug registers on page H9-7487.](#)
- [Cross-Trigger Interface registers on page H9-7599.](#)

H9.2 External debug registers

This section describes the debug registers that are accessible through the external debug interface and are used for external debug.

H9.2.1 DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configurations

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGAUTHSTATUS_EL1](#)[31:0].

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGAUTHSTATUS](#)[31:0].

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Attributes

DBGAUTHSTATUS_EL1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

SNID

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

SNID

Secure non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3](#).NS is 1.

0b10 Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3](#).NS is 1.

0b10 Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

NSNID

Non-secure non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.

0b11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

If the Effective value of SCR_EL3.NS is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.

All other values are reserved.

Otherwise:

NSNID

Non-secure non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.

0b10 Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.

0b10 Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing the DBGAUTHSTATUS_EL1:

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFB8	DBGAUTHSTATUS_EL1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.2 DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>_EL1](#).

Configurations

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGBCR<n>_EL1](#)[31:0].

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>](#)[31:0].

DBGBCR<n>_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when `IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess()`.
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBCR<n>_EL1 is a 32-bit register.

Field descriptions

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

- | | |
|--------|---|
| 0b0000 | Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction. |
| 0b0001 | As 0b0000 but linked to a Context matching breakpoint. |
| 0b0010 | Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value. |
| 0b0011 | As 0b0010, with linking enabled. |
| 0b0100 | Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction to be stepped. |
| 0b0101 | As 0b0100, with linking enabled. |
| 0b0110 | Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 . |
| 0b0111 | As 0b0110, with linking enabled. |
| 0b1000 | Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID . |

0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1 .ContextID is a Context ID compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1 .VMID is a VMID compared against VTTBR_EL2 .VMID.
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1 .ContextID2 is a Context ID compared against CONTEXTIDR_EL2 .
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1 .ContextID is compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1 .ContextID2 is compared against CONTEXTIDR_EL2 .
0b1111	As 0b1110, with linking enabled.

Constraints on breakpoint programming mean some values are reserved under certain conditions. For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2589 and [Reserved DBGBCR<n>_EL1.BT values](#) on page D2-2594.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of [DBGBCR<n>_EL1.E](#) is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see [Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values](#) on page D2-2594.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2589.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see [DBGBCR<n>_EL1.SSC](#) description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2589.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported at EL0:

BAS

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved.

For more information, see [Using the BAS field in Address Match breakpoints on page G2-6183](#).

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>_EL1	Use for stepping T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for stepping T32 instructions
0b1111	DBGBVR<n>_EL1	Use for stepping A64 and A32 instructions

For more information, see [Using the BAS field in Address Match breakpoints on page G2-6183](#).

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the [DBGBCR<n>_EL1.SSC](#) description.

For more information on the operation of the SSC, HMC, and PMC fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-2589](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint `DBGBVR<n>_EL1`. Possible values are:

0b0 Breakpoint disabled.

0b1 Breakpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the `DBGBCR<n>_EL1`:

———— Note ————

`SoftwareLockStatus()` depends on the type of access attempted and `AllowExternalDebugAccess()` has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

`DBGBCR<n>_EL1` can be accessed through the external debug interface:

Component	Offset	Instance
Debug	$0x408 + (16 * n)$	<code>DBGBCR<n>_EL1</code>

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalDebugAccess()` and `SoftwareLockStatus()` accesses to this register are RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalDebugAccess()` and `!SoftwareLockStatus()` accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.3 DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>_EL1](#).

Configurations

External register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register [DBGBVR<n>_EL1](#)[63:0].

External register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBVR<n>](#)[31:0].

If the breakpoint is context-aware and EL2 is implemented then External register DBGBVR<n>_EL1[63:32] is architecturally mapped to AArch32 System register [DBGXVR<n>](#). Otherwise there is no External register access to DBGBVR<n>_EL1[63:32] from AArch32 state.

External register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register [DBGXVR<n>](#)[31:0].

DBGBVR<n>_EL1 is in the Core power domain.

How this register is interpreted depends on the value of [DBGBCR<n>_EL1.BT](#).

- When [DBGBCR<n>_EL1.BT](#) is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>_EL1.BT](#) is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>_EL1.BT](#) is 0b100x, this register holds a VMID.
- When [DBGBCR<n>_EL1.BT](#) is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>_EL1.BT](#) is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>_EL1.BT](#), this register is RES0.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When [DBGBCR<n>_EL1.BT](#) == 0b0x0x:

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.

- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

Bits[52:49]

When FEAT_LVA is implemented:

VA[52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0]

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When [FEAT_LVA](#) is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR_EL2](#) when ([FEAT_VHE](#) is implemented or [FEAT_Debugv8p2](#) is implemented), EL2 is using AArch64, [HCR_EL2.E2H](#) is 1, and either:

- The PE is executing at EL2.
- [HCR_EL2.TGE](#) is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against the following:

- [CONTEXTIDR](#) when the PE is executing at AArch32.
- [CONTEXTIDR_EL1](#) when the PE is executing at AArch64.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR<n>_{EL1.BT} == 0b011x$, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR<n>_{EL1.BT} == 0b100x$ and EL2 is implemented:

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VHE is implemented and $VTCR_{EL2.VS} == 1$:

VMID[15:8]

Extension to VMID[7:0]. For more information, see [DBGBVR<n>_{EL1.VMID\[7:0\]}](#).

If EL2 is using AArch32, this field is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR_{EL2.VS}](#) is 0.
- [FEAT_VMID16](#) is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When $DBGBCR\langle n\rangle_EL1.BT == 0b101x$ and EL2 is implemented:

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When $FEAT_VMID16$ is implemented and $VTCR_EL2.VS == 1$:

VMID[15:8]

Extension to VMID[7:0]. For more information, see $DBGBVR\langle n\rangle_EL1.VMID[7:0]$.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- $VTCR_EL2.VS$ is 0.
- $FEAT_VMID16$ is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against $CONTEXTIDR_EL1$.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR\langle n\rangle_EL1.BT == 0b110x$, EL2 is implemented and ($FEAT_VHE$ is implemented or $FEAT_Debugv8p2$ is implemented):

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When $DBGBCR\langle n \rangle_EL1.BT == 0b111x$, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the $DBGBVR\langle n \rangle_EL1$:

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

$DBGBVR\langle n \rangle_EL1[63:0]$ can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	$0x400 + (16 * n)$	$DBGBVR\langle n \rangle_EL1$	63:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.4 DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0. The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET_EL1](#) register.

Configurations

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMCLR_EL1](#)[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMCLR](#)[31:0].

DBGCLAIMCLR_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing the DBGCLAIMCLR_EL1:

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA4	DBGCLAIMCLR_EL1

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` accesses to this register are RO.

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.5 DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR_EL1](#) register.

Configurations

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMSET_EL1](#)[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMSET](#)[31:0].

DBGCLAIMSET_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET_EL1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

Accessing the DBGCLAIMSET_EL1:

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA0	DBGCLAIMSET_EL1

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` accesses to this register are RO.

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.6 DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

Configurations

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRRX_EL0](#)[31:0].

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXint](#)[31:0].

DBGDTRRX_EL0 is in the Core power domain.

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions

Bits [31:0]

Update DTRRX.

Writes to this register:

- If RXfull is set to 1, set DTRRX to UNKNOWN.
- If RXfull is set to 0, update the value in DTRRX.

After the write, RXfull is set to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRRX_EL0:

If [EDSCR.ITE](#) == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONstrained UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x080	DBGDTRRX_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.7 DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

Configurations

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRTX_EL0](#)[31:0].

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRTXint](#)[31:0].

DBGDTRTX_EL0 is in the Core power domain.

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions

Bits [31:0]

Return DTRTX.

Reads of this register:

- If TXfull is set to 1, return the last value written to DTRTX.
- If TXfull is set to 0, return an UNKNOWN value.

After the read, TXfull is cleared to 0.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the DBGDTRTX_EL0:

If [EDSCR.ITE](#) == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONstrained UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRTX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x08C	DBGDTRTX_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.8 DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>_EL1](#).

Configurations

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGWCR<n>_EL1](#)[31:0].

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWCR<n>](#)[31:0].

DBGWCR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When `IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess()`, RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWCR<n>_EL1 is a 32-bit register.

Field descriptions

When the E field is zero, all the other fields in the register are ignored.

Bits [31:29]

Reserved, RES0.

MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

0b00000 No mask.

0b00001 Reserved.

0b00010 Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of [DBGWCRn_EL1](#).
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

- 0b0 Unlinked data address match.
- 0b1 Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint *n* is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions](#) on page D2-2600.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint *n* is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions](#) on page D2-2600.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by `DBGWVR<n>_EL1` is being watched.

BAS	Description
xxxxxxx1	Match byte at <code>DBGWVR<n>_EL1</code>
xxxxxx1x	Match byte at <code>DBGWVR<n>_EL1 + 1</code>
xxxxx1xx	Match byte at <code>DBGWVR<n>_EL1 + 2</code>
xxxx1xxx	Match byte at <code>DBGWVR<n>_EL1 + 3</code>

In cases where `DBGWVR<n>_EL1` addresses a double-word:

BAS	Description, if <code>DBGWVR<n>_EL1[2] == 0</code>
xxx1xxxx	Match byte at <code>DBGWVR<n>_EL1 + 4</code>

BAS	Description, if <code>DBGWVR<n>_EL1[2] == 0</code>
xx1xxxxx	Match byte at <code>DBGWVR<n>_EL1 + 5</code>
x1xxxxxx	Match byte at <code>DBGWVR<n>_EL1 + 6</code>
1xxxxxxx	Match byte at <code>DBGWVR<n>_EL1 + 7</code>

If `DBGWVR<n>_EL1[2] == 1`, only `BAS[3:0]` is used. Arm deprecates setting `DBGWVR<n>_EL1[2] == 1`.

The valid values for `BAS` are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See [Reserved `DBGWCR<n>_BAS` values on page G2-6205](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- `0b01` Match instructions that load from a watchpointed address.
- `0b10` Match instructions that store to a watchpointed address.
- `0b11` Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint `n` is generated. This field must be interpreted along with the `SSC` and `HMC` fields.

For more information on the operation of the `SSC`, `HMC`, and `PAC` fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2600](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint `n`. Possible values are:

- `0b0` Watchpoint disabled.
- `0b1` Watchpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the `DBGWCR<n>_EL1`:

———— Note ————

`SoftwareLockStatus()` depends on the type of access attempted and `AllowExternalDebugAccess()` has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	$0x808 + (16 * n)$	DBGWCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.9 DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>_EL1](#).

Configurations

External register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register [DBGWVR<n>_EL1](#)[63:0].

External register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWVR<n>](#)[31:0].

DBGWVR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When `IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess()`, RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

RESS[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

VA[52:49]

Extension to VA[48:2]. For more information, see [VA\[48:2\]](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0]

Extension to RESS[14:4]. For more information, see [RESS\[14:4\]](#).

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When **FEAT_LVA** is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

Arm deprecates setting **DBGWVR<n>_EL1[2] == 1**.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing the **DBGWVR<n>_EL1**:

———— Note —————

SoftwareLockStatus() depends on the type of access attempted and **AllowExternalDebugAccess()** has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWVR<n>_EL1[63:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	$0x800 + (16 * n)$	DBGWVR<n>_EL1	63:0

This interface is accessible as follows:

- When **IsCorePowered()**, **!DoubleLockStatus()**, **!OSLockStatus()**, **AllowExternalDebugAccess()** and **SoftwareLockStatus()** accesses to this register are RO.
- When **IsCorePowered()**, **!DoubleLockStatus()**, **!OSLockStatus()**, **AllowExternalDebugAccess()** and **!SoftwareLockStatus()** accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.10 EDAA32PFR, External Debug Auxiliary Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.

Note

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers](#) on page D13-3045.

Configurations

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions

Bits [63:20]

Reserved, RES0.

MSA_frac, bits [19:16]

When $EDAA32PFR.PMSA == 0b0000$ and $EDAA32PFR.VMSA == 0b1111$:

MSA_frac

Memory System Architecture fractional field. This holds the information on additional Memory System Architectures supported. Defined values are:

0b0001 PMSAv8-64 supported in all translation regimes. VMSAv8-64 not supported.

0b0010 PMSAv8-64 supported in all translation regimes. In addition to PMSAv8-64, stage 1 EL1&0 translation regime also supports VMSAv8-64.

All other values are reserved.

Otherwise:

Reserved, RES0.

EL3, bits [15:12]

When $EDPFR.EL3 == 0b0000$:

EL3

AArch32 EL3 Exception level handling. Defined values are:

0b0000 EL3 is not implemented or can be executed in AArch64 state.

0b0001 EL3 can be executed in AArch32 state only.

All other values are reserved.

———— **Note** ————

[EDPFR](#).{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

EL2, bits [11:8]

When *EDPFR.EL2* == 0b0000:

EL2

AArch32 EL2 Exception level handling. Defined values are:

0b0000 EL2 is not implemented or can be executed in AArch64 state.

0b0001 EL2 can be executed in AArch32 state only.

All other values are reserved.

———— **Note** ————

[EDPFR](#).{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

PMSA, bits [7:4]

Indicates support for a 32-bit PMSA. Defined values are:

0b0000 PMSA-32 not supported.

0b0100 PMSAv8-32 supported.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

VMSA, bits [3:0]

When *EDAA32PFR.PMSA* != 0b0000:

VMSA

Indicates support for a VMSA in addition to a 32-bit PMSA. Defined values are:

0b0000 VMSA not supported.

All other values are reserved.

When *EDAA32PFR.PMSA* == 0b0000:

VMSA

Defined values are:

0b0000 VMSAv8-64 supported.

0b1111 Memory system architecture described by *EDAA32PFR.MSA_frac*.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

Reserved, RAZ.

Accessing the EDAA32PFR:

EDAA32PFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD60	EDAA32PFR

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.

H9.2.11 EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

Configurations

It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain.

If [FEAT_DoPD](#) is implemented, this register is implemented in the Core power domain.

If [FEAT_DoPD](#) is not implemented, the power domain that this register is implemented in is IMPLEMENTATION DEFINED.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, [OSLSR_EL1.OSLK](#) == 1, and when the Core is powered off.

Attributes

EDACR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- The following resets apply:
 - If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to an architecturally UNKNOWN value.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
 - If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to an architecturally UNKNOWN value.
 - On a Warm reset, the value of this field is unchanged.

Accessing the EDACR:

EDACR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x094	EDACR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.

H9.2.12 EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see [About the Component Identification scheme on page K2-8443](#).

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is RO.

Accessing the EDCIDR0:

EDCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF0	EDCIDR0

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.13 EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see [About the Component Identification scheme on page K2-8443](#).

Configurations

Implementation of this register is OPTIONAL.

If **FEAT_DoPD** is implemented, this register is in the Core power domain. If **FEAT_DoPD** is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

0b1001 CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is RO.

Accessing the EDCIDR1:

EDCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF4	EDCIDR1

This interface is accessible as follows:

- When **FEAT_DoPD** is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.14 EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see [About the Component Identification scheme](#) on page K2-8443.

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is RO.

Accessing the EDCIDR2:

EDCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF8	EDCIDR2

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.15 EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see [About the Component Identification scheme](#) on page K2-8443.

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is RO.

Accessing the EDCIDR3:

EDCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFFC	EDCIDR3

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.16 EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

Purpose

Contains the sampled value of the Context ID, captured on reading [EDPCSR\[31:0\]](#).

Configurations

EDCIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDCIDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

[FEAT_PCSRv8p2](#) implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDCIDSR is a 32-bit register.

Field descriptions

CONTEXTIDR, bits [31:0]

Context ID. The value of [FEAT_PCSRv8p2](#) that is associated with the most recent [EDPCSR](#) sample. When the most recent [EDPCSR](#) sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register, and EDCIDSR samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent [EDPCSR](#) sample.

Because the value written to EDCIDSR is an indirect read of [FEAT_PCSRv8p2](#), it is CONstrained UNPREDICTABLE whether EDCIDSR is set to the original or new value if [EDPCSR](#) samples:

- An instruction that writes to [FEAT_PCSRv8p2](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDCIDSR:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-7458.

EDCIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A4	EDCIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.17 EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configurations

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the EDDEVAFF0:

EDDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA8	EDDEVAFF0

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.18 EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configurations

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF1 is a 32-bit register.

Field descriptions

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the EDDEVAFF1:

EDDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFAC	EDDEVAFF1

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.19 EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Configurations

Implementation of this register is OPTIONAL.

If **FEAT_DoPD** is implemented, this register is in the Core power domain.

If **FEAT_DoPD** is not implemented, this register is in the Debug power domain.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8-A is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is RO.

ARCHVER, bits [15:12]

Defines the architecture version of the component. This is the same value as [ID_AA64DFR0_EL1.DebugVer](#) and [DBGDIDR.Version](#). The defined values of this field are:

- 0b0110 Armv8.0 Debug architecture.
- 0b0111 Armv8.0 Debug architecture with Virtualization Host Extensions.
- 0b1000 Armv8.2 Debug architecture.
- 0b1001 Armv8.4 Debug architecture.

[FEAT_Debugv8p4](#) adds the functionality indicated by the value 0b1001. [FEAT_Debugv8p2](#) adds the functionality indicated by the value 0b1000. If [FEAT_VHE](#) is not implemented, the only permitted value is 0b0110.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHVER is ARCHID[15:12].

ARCHPART, bits [11:0]

The part number of the Armv8-A debug component.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHPART is ARCHID[11:0].

Reads as 0xA15.

Access to this field is RO.

Accessing the EDDEVARCH:

EDDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFBC	EDDEVARCH

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.20 EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configurations

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain.

If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Defined values are:

0b0000 None supported.

0b0001 Support for External Debug Auxiliary Control Register, [EDACR](#).

All other values are reserved.

Bits [23:8]

Reserved, RES0.

DebugPower, bits [7:4]

Indicates support for the [FEAT_DoPD](#) feature. Defined values are:

0b0000 [FEAT_DoPD](#) not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.

0b0001 [FEAT_DoPD](#) implemented. All registers in the external debug interface register map are implemented in the Core power domain.

[FEAT_DoPD](#) implements the functionality added by the value 0b0001.

All other values are reserved.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

0b0000 PC Sample-based Profiling Extension is not implemented in the external debug registers space.

0b0010 Only [EDPCSR](#) and [EDCIDSR](#) are implemented. This option is only permitted if EL3 and EL2 are not implemented.

0b0011 [EDPCSR](#), [EDCIDSR](#), and [EDVIDSR](#) are implemented.

All other values are reserved.

When [FEAT_PCSRv8p2](#) is implemented, the only permitted value is 0b0000.

———— **Note** —————

[FEAT_PCSRv8p2](#) implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID.PCSample](#).

Accessing the EDDEVID:

EDDEVID can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC8	EDDEVID

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.21 EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configurations

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain.

If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID1 is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

PCSRoffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of [EDPCSR](#). Permitted values of this field in Armv8 are:

0b0000 [EDPCSR](#) not implemented.

0b0010 [EDPCSR](#) implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

When [FEAT_PCSRv8p2](#) is implemented, the only permitted value is 0b0000.

———— Note —————

[FEAT_PCSRv8p2](#) implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID](#).PCSample.

Accessing the EDDEVID1:

EDDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC4	EDDEVID1

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.22 EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Configurations

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing the EDDEVID2:

EDDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC0	EDDEVID2

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.23 EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's debug logic.

Configurations

Implementation of this register is OPTIONAL.

If `FEAT_DoPD` is implemented, this register is in the Core power domain. If `FEAT_DoPD` is not implemented, this register is in the Debug power domain.

Attributes

EDDEVTYPE is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as `0b0001`.

Access to this field is RO.

MAJOR, bits [3:0]

Major type. Indicates this is a debug logic component.

Reads as `0b0101`.

Access to this field is RO.

Accessing the EDDEVTYPE:

EDDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFCC	EDDEVTYPE

This interface is accessible as follows:

- When `FEAT_DoPD` is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.24 EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top level information about the debug system.

Note

Debuggers must use [EDDEVARCH](#) to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers on page D13-3045](#).

Configurations

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDDFR is a 64-bit register.

Field descriptions

Bits [63:44]

Reserved, RES0.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

0b0000 Armv8.4 Self-hosted Trace Extension is not implemented.

0b0001 Armv8.4 Self-hosted Trace Extension is implemented.

All other values are reserved.

[FEAT_TRF](#) implements the functionality added by 0b0001.

From Armv8.4, the permitted values are 0b0000 and 0b0001.

Bits [39:32]

Reserved, UNKNOWN.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1.CTX_CMPs](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1.WRPs](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1.BRPs](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in [Alternative ID scheme used for the Performance Monitors Extension version on page D13-3047](#)

Defined values are:

0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and also includes support for: <ul style="list-style-type: none">Extended 16-bit PMEVTYPER<n>_EL0.evtCount field.If EL2 is implemented, the MDCR_EL2.HPMD control bit.
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none">64-bit event counters.If EL2 is implemented, the MDCR_EL2.HCCD control bit.If EL3 is implemented, the MDCR_EL3.SCCD control bit.
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none">The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO control bits.If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} control bits.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

[FEAT_PMUv3](#) implements the functionality identified by the value 0b0001.

[FEAT_PMUv3p1](#) implements the functionality identified by the value 0b0100.

[FEAT_PMUv3p4](#) implements the functionality identified by the value 0b0101.

[FEAT_PMUv3p5](#) implements the functionality identified by the value 0b0110.

[FEAT_PMUv3p7](#) implements the functionality identified by the value 0b0111.

From Armv8.1, if [FEAT_PMUv3](#) is implemented, the value 0b0001 is not permitted.

From Armv8.4, if [FEAT_PMUv3](#) is implemented, the value 0b0100 is not permitted.

From Armv8.5, if [FEAT_PMUv3](#) is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented.

Defined values are:

0b0000 PE trace unit System registers not implemented.

0b0001 PE trace unit System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented.

A PE trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.TraceVer.

Bits [3:0]

Reserved, UNKNOWN.

Accessing the EDDFR:

EDDFR[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD28	EDDFR	31:0

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to EDDFR[31:0] are RO.
- Otherwise accesses to EDDFR[31:0] are IMPDEF.

EDDFR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD2C	EDDFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to EDDFR[63:32] are RO.
- Otherwise accesses to EDDFR[63:32] are IMPDEF.

H9.2.25 EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

Purpose

Controls Exception Catch debug events. For more information, see [Table H3-5 on page H3-7392](#).

Configurations

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register [OSECCR_EL1\[31:0\]](#).

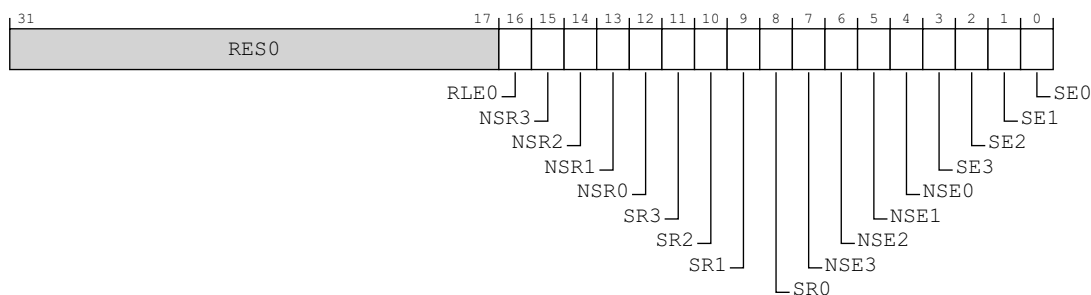

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register [DBGOSECCR\[31:0\]](#).

EDECCR is in the Core power domain.

Attributes

EDECCR is a 32-bit register.

Field descriptions

Bits [31:17]

Reserved, RES0.

RLE0, bit [16]

Access to this field is RES0.

NSR3, bit [15]

Access to this field is RES0.

NSR2, bit [14]

When FEAT_Debug8p2 is implemented and Non-secure EL2 is implemented:

NSR2

Controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSE2.

0b0 If EDECCR.NSE2 is 0, then Exception Catch debug events are disabled for Non-secure EL2.

If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2.

0b1 If EDECCR.NSE2 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL2.

If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSR1, bit [13]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

NSR1

Controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSE1.

0b0 If EDECCR.NSE1 is 0, then Exception Catch debug events are disabled for Non-secure EL1.

If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1.

0b1 If EDECCR.NSE1 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL1.

If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSR0, bit [12]

When FEAT_Debugv8p2 is implemented and Non-secure EL0 is implemented:

NSR0

Controls exception catch on exception return to Non-secure EL0.

0b0 Exception Catch debug events are disabled for Non-secure EL0.

0b1 Exception Catch debug events are enabled for exception returns to Non-secure EL0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR3, bit [11]

When FEAT_Debugv8p2 is implemented and EL3 is implemented:

SR3

Controls exception catch on exception return to EL3 in conjunction with EDECCR.SE3.

0b0 If EDECCR.SE3 is 0, then Exception Catch debug events are disabled for EL3.

If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3.

0b1 If EDECCR.SE3 is 0, then Exception Catch debug events are enabled for exception returns to EL3.

If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR2, bit [10]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

SR2

Controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SE2.

0b0 If EDECCR.SE2 is 0, then Exception Catch debug events are disabled for Secure EL2.
If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2.

0b1 If EDECCR.SE2 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL2.
If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR1, bit [9]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

SR1

Controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SE1.

0b0 If EDECCR.SE1 is 0, then Exception Catch debug events are disabled for Secure EL1.
If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1.

0b1 If EDECCR.SE1 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL1.
If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR0, bit [8]

When FEAT_Debugv8p2 is implemented and Secure EL0 is implemented:

SR0

Controls exception catch on exception return to Secure EL0.

0b0 Exception Catch debug events are disabled for Secure EL0.

0b1 Exception Catch debug events are enabled for exception returns to Secure EL0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE3, bit [7]

Access to this field is RES0.

NSE2, bit [6]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

NSE2

Controls exception catch on exception entry to Non-secure EL2. Also controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSR2.

0b0 If EDECCR.NSR2 is 0, then Exception Catch debug events are disabled for Non-secure EL2.

If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL2.

0b1 If EDECCR.NSR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2.

If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

When Non-secure EL2 is implemented:

NSE2

Coarse-grained exception catch for Non-secure EL2. Controls Exception Catch debug events for Non-secure EL2.

0b0 Exception Catch debug events are disabled for Non-secure EL2.

0b1 Exception Catch debug events are enabled for Non-secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE1, bit [5]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

NSE1

Controls exception catch on exception entry to Non-secure EL1. Also controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSR1.

0b0 If EDECCR.NSR1 is 0, then Exception Catch debug events are disabled for Non-secure EL1.

If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL1.

0b1 If EDECCR.NSR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1.

If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

———— **Note** ————

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

When Non-secure EL1 is implemented:

NSE1

Coarse-grained exception catch for Non-secure EL1. Controls Exception Catch debug events for Non-secure EL1.

0b0 Exception Catch debug events are disabled for Non-secure EL1.

0b1 Exception Catch debug events are enabled for Non-secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE0, bit [4]

Access to this field is RES0.

SE3, bit [3]

When FEAT_Debug8p2 is implemented and EL3 is implemented:

SE3

Controls exception catch on exception entry to EL3. Also controls exception catch on exception return to EL3 in conjunction with EDECCR.SR3.

0b0 If EDECCR.SR3 is 0, then Exception Catch debug events are disabled for EL3.
If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception returns to EL3.

0b1 If EDECCR.SR3 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3.
If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

———— **Note** ————

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

When FEAT_Debug8p2 is not implemented and EL3 is implemented:

SE3

Coarse-grained exception catch for EL3. Controls Exception Catch debug events for EL3.

0b0 Exception Catch debug events are disabled for EL3.

0b1 Exception Catch debug events are enabled for EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE2, bit [2]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

SE2

Controls exception catch on exception entry to Secure EL2. Also controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SR2.

- 0b0 If EDECCR.SR2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL2.
- 0b1 If EDECCR.SR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

———— **Note** ————

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE1, bit [1]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

SE1

Controls exception catch on exception entry to Secure EL1. Also controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SR1.

- 0b0 If EDECCR.SR1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL1.
- 0b1 If EDECCR.SR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

———— **Note** ————

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

When Secure EL1 is implemented:

SE1

Coarse-grained exception catch for Secure EL1. Controls Exception Catch debug events for Secure EL1.

- 0b0 Exception Catch debug events are disabled for Secure EL1.

0b1 Exception Catch debug events are enabled for Secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE0, bit [0]

Access to this field is RES0.

Accessing the EDECCR:

EDECCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x098	EDECCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.26 EDECRCR, External Debug Execution Control Register

The EDECRCR characteristics are:

Purpose

Controls Halting debug events.

Configurations

If `FEAT_DoPD` is implemented, this register is in the Core power domain.

If `FEAT_DoPD` is not implemented, this register is in the Debug power domain.

Attributes

EDECRCR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

0b0 Halting step debug event disabled.

0b1 Halting step debug event enabled.

If the value of EDECRCR.SS is changed when the PE is in Non-debug state, behavior is CONstrained UNPREDICTABLE as described in [Changing the value of EDECRCR.SS when not in Debug state on page H3-7387](#).

The reset behavior of this field is:

- On a Cold reset, when `FEAT_DoPD` is implemented, this field resets to 0.
- On an External debug reset, when `FEAT_DoPD` is not implemented, this field resets to 0.

RCE, bit [1]

When `FEAT_DoPD` is not implemented:

RCE

Reset Catch Enable.

0b0 Reset Catch debug event disabled.

0b1 Reset Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

OSUCE, bit [0]

When `FEAT_DoPD` is not implemented:

OSUCE

OS Unlock Catch Enable.

0b0 OS Unlock Catch debug event disabled.

0b1 OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing the EDECR:

EDECR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x024	EDECR

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are RO.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.27 EDESR, External Debug Event Status Register

The EDESR characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Configurations

EDESR is in the Core power domain.

Attributes

EDESR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

SS, bit [2]

When FEAT_DoPD is implemented:

SS

Halting step debug event pending. Possible values of this field are:

- 0b0 Reading this means that a Halting step debug event is not pending. Writing this means no action.
- 0b1 Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

SS

Halting step debug event pending. Possible values of this field are:

- 0b0 Reading this means that a Halting step debug event is not pending. Writing this means no action.
- 0b1 Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [EDEC.RC.SS](#).

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

- 0b0 Reading this means that a Reset Catch debug event is not pending. Writing this means no action.
- 0b1 Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

The reset behavior of this field is:

- On a Warm reset:
 - When FEAT_DoPD is implemented, this field resets to the value in [CTIDEVCTL.RCE](#).
 - When FEAT_DoPD is not implemented, this field resets to the value in [EDECR.RCE](#).

OSUC, bit [0]

OS Unlock Catch debug event pending. Possible values of this field are:

- 0b0 Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.
- 0b1 Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing the EDESR:

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is **CONSTRAINED UNPREDICTABLE** whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

EDESR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x020	EDESR

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()` and `SoftwareLockStatus()` accesses to this register are RO.
- When `IsCorePowered()`, `!DoubleLockStatus()` and `!SoftwareLockStatus()` accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.28 EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

Purpose

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configurations

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When $IME == 1$, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0b0 Normal operation.

0b1 Integration mode enabled.

The reset behavior of this field is:

- The following resets apply:
 - Whichever power domain the register is implemented in, this field resets to 0.
 - Otherwise, the value of this field is unchanged.

Accessing the EDITCTRL:

EDITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xF00	EDITCTRL

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `SoftwareLockStatus()` accesses to this register are RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `!SoftwareLockStatus()` accesses to this register are RW.

- Otherwise accesses to this register are IMPDEF.

H9.2.29 EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

Purpose

Used in Debug state for passing instructions to the PE for execution.

Configurations

EDITR is in the Core power domain.

Attributes

EDITR is a 32-bit register.

Field descriptions

When AArch32 is supported at EL0 and in AArch32 state:

T32Second, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see [Behavior in Debug state on page H2-7348](#).

T32First, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

When AArch64 is supported at the highest implemented Exception level and in AArch64 state:

Bits [31:0]

A64 instruction to be executed on the PE.

Accessing the EDITR:

If `EDSCR.ITE == 0` when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONstrained UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.

EDITR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x084	EDITR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.

H9.2.30 EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface. The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configurations

If [FEAT_DoPD](#) is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and [EDLSR](#) to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing the EDLAR:

EDLAR can be accessed through its memory-mapped interface:

Component	Offset	Instance
Debug	0xFB0	EDLAR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.

H9.2.31 EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

Purpose

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configurations

If [FEAT_DoPD](#) is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Software uses [EDLAR](#) to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLSR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented:

SLK

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

- 0b0 Lock clear. Writes are permitted to this component's registers.
- 0b1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On a Cold reset, when [FEAT_DoPD](#) is implemented, this field resets to 1.
- On an External debug reset, when [FEAT_DoPD](#) is not implemented, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED.

Permitted values are:

- 0b0 Software Lock not implemented or not memory-mapped access.
- 0b1 Software Lock implemented and memory-mapped access.

Accessing the EDLSR:

EDLSR can be accessed through its memory-mapped interface:

Component	Offset	Instance
Debug	0xFB4	EDLSR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.32 EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configurations

EDPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

EDPCSR[63:32] and EDPCSR[31:0] are accessed at 32-bit memory mapped addresses that are not contiguous.

If FEAT_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

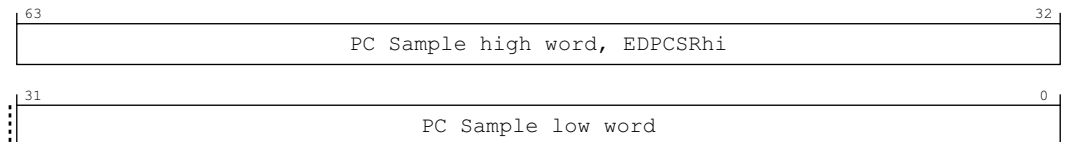

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDPCSR is a 64-bit register.

Field descriptions

When FEAT_VHE is not implemented or EDSCR.SC2 == 0:

Bits [63:32]

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.

- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and EDSCR.SC2 == 1:

NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

0b0 Sample is from Secure state.

0b1 Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

0b00 Sample is from EL0.

0b01 Sample is from EL1.

0b10 Sample is from EL2.

0b11 Sample is from EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

Bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDPCSR:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see [Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-7458](#)

EDPCSR[31:0] can be accessed through its memory-mapped interface:

Component	Offset	Instance	Range
Debug	0x0A0	EDPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDPCSR[31:0] are RO.
- Otherwise accesses to EDPCSR[31:0] generate an error response.

EDPCSR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x0AC	EDPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDPCSR[63:32] are RO.
- Otherwise accesses to EDPCSR[63:32] generate an error response.

H9.2.33 EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers on page D13-3045](#).

Configurations

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDPFR is a 64-bit register.

Field descriptions

63	60	59	56	55	52	51	48	47	44	43	40	39	36	35	32
UNKNOWN	UNKNOWN	UNKNOWN	RES0	UNKNOWN	AMU	UNKNOWN	SEL2	SVE							
31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
UNKNOWN	GIC	AdvSIMD	FP	EL3	EL2	EL1	EL0								

Bits [63:60]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [59:56]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [55:52]

Reserved, RES0.

Bits [51:48]

From Armv8.4:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

0b0000 Activity Monitors Extension is not implemented.

0b0001 FEAT_AMUv1 is implemented.

0b0010 FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Bits [43:40]

From Armv8.2:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

SEL2, bits [39:36]

Secure EL2. Defined values are:

0b0000 Secure EL2 is not implemented.

0b0001 Secure EL2 is implemented.

All other values are reserved.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

0b0000 SVE is not implemented.

0b0001 SVE is implemented.

All other values are reserved.

Bits [31:28]

From Armv8.2:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

GIC, bits [27:24]

System register GIC interface support. Defined values are:

0b0000 GIC CPU interface system registers not implemented.

0b0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.

0b0011 System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1.GIC](#).

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

- 0b0000 Advanced SIMD is implemented, including support for the following SIMD and SIMD operations:
- Integer byte, halfword, word and doubleword element operations.
 - Single-precision and double-precision floating-point arithmetic.
 - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
- 0b0001 As for 0b0000, and also includes support for half-precision floating-point arithmetic.
- 0b1111 Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support, that does not include the [FEAT_FP16](#) extension.
- 0b0001 in an implementation with Advanced SIMD support, that includes the [FEAT_FP16](#) extension.
- 0b1111 in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1.AdvSIMD](#).

FP, bits [19:16]

Floating-point. Defined values are:

- 0b0000 Floating-point is implemented, and includes support for:
- Single-precision and double-precision floating-point types.
 - Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
- 0b0001 As for 0b0000, and also includes support for half-precision floating-point arithmetic.
- 0b1111 Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support, that does not include the [FEAT_FP16](#) extension.
- 0b0001 in an implementation with floating-point support, that includes the [FEAT_FP16](#) extension.
- 0b1111 in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1.FP](#).

EL3, bits [15:12]

AArch64 EL3 Exception level handling. Defined values are:

- 0b0000 EL3 is not implemented or cannot be executed in AArch64 state.
- 0b0001 EL3 can be executed in AArch64 state only.
- 0b0010 EL3 can be executed in both Execution states.

When the value of [EDAA32PFR.EL3](#) is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1.EL3](#).

EL2, bits [11:8]

AArch64 EL2 Exception level handling. Defined values are:

- 0b0000 EL2 is not implemented or cannot be executed in AArch64 state.
- 0b0001 EL2 can be executed in AArch64 state only.
- 0b0010 EL2 can be executed in both Execution states.

When the value of [EDAA32PFR.EL2](#) is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1.EL2](#).

EL1, bits [7:4]

AArch64 EL1 Exception level handling. Defined values are:

- 0b0000 EL1 cannot be executed in AArch64 state.
EL1 can be executed in AArch32 state only.
- 0b0001 EL1 can be executed in AArch64 state only.
- 0b0010 EL1 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1.EL1](#).

EL0, bits [3:0]

AArch64 EL0 Exception level handling. Defined values are:

- 0b0000 EL0 cannot be executed in AArch64 state.
EL0 can be executed in AArch32 state only.
- 0b0001 EL0 can be executed in AArch64 state only.
- 0b0010 EL0 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1.EL0](#).

Accessing the EDPFR:

EDPFR[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD20	EDPFR	31:0

This interface is accessible as follows:

- When `IsCorePowered()` and `!DoubleLockStatus()` accesses to EDPFR[31:0] are RO.
- Otherwise accesses to EDPFR[31:0] are IMPDEF.

EDPFR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x024	EDPFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to EDPFR[63:32] are RO.
- Otherwise accesses to EDPFR[63:32] are IMPDEF.

H9.2.34 EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

If **FEAT_DoPD** is implemented, this register is in the Core power domain. If **FEAT_DoPD** is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the EDPIDR0:

EDPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE0	EDPIDR0

This interface is accessible as follows:

- When **FEAT_DoPD** is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.35 EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the EDPIDR1:

EDPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE4	EDPIDR1

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.36 EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

If **FEAT_DoPD** is implemented, this register is in the Core power domain. If **FEAT_DoPD** is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the EDPIDR2:

EDPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE8	EDPIDR2

This interface is accessible as follows:

- When **FEAT_DoPD** is not implemented or `IsCorePowered()` accesses to this register are RO.

- Otherwise accesses to this register generate an error response.

H9.2.37 EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

If **FEAT_DoPD** is implemented, this register is in the Core power domain. If **FEAT_DoPD** is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using **EDPIDR2.REVISION** as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the EDPIDR3:

EDPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFEC	EDPIDR3

This interface is accessible as follows:

- When **FEAT_DoPD** is not implemented or **IsCorePowered()** accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.38 EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

If **FEAT_DoPD** is implemented, this register is in the Core power domain. If **FEAT_DoPD** is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the EDPIDR4:

EDPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFD0	EDPIDR4

This interface is accessible as follows:

- When **FEAT_DoPD** is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.39 EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

Purpose

Controls the PE functionality related to powerup, reset, and powerdown.

Configurations

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If **FEAT_DoPD** is implemented then all fields in this register are in the Core power domain.

CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR_EL1.

Attributes

EDPRCR is a 32-bit register.

Field descriptions

When FEAT_DoPD is implemented:

Bits [31:2]

Reserved, RES0.

CWRR, bit [1]

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

0b0 No action.

0b1 Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- RAZ/WI if any of the following are true:
 - OSLockStatus().
 - SoftwareLockStatus().
- Otherwise, access to this field is WO/RAZ.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.

0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the [DBGPRCR.CORENPDRQ](#) and [DBGPRCR_EL1.CORENPDRQ](#) fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see [Core power domain power states on page H6-7440](#).

———— Note —————

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Accessing this field has the following behavior:

- When OSLockStatus(), access to this field is UNKNOWN/WI.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Bits [31:4]

Reserved, RES0.

COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 Do not request power up of the Core power domain.

0b1 Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

———— **Note** —————

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RW.

Bit [2]

Reserved, RES0.

CWRR, bit [1]

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

0b0 No action.

0b1 Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGIRSTREQ signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- RAZ/WI if any of the following are true:
 - !IsCorePowered().
 - DoubleLockStatus().
 - OSLockStatus().
 - SoftwareLockStatus().

- Otherwise, access to this field is WO/RAZ.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.

0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the [DBGPRCR.CORENPDRQ](#) and [DBGPRCR_EL1.CORENPDRQ](#) fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see [Core power domain power states on page H6-7440](#).

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - !IsCorePowered().
 - DoubleLockStatus().
 - OSLockStatus().
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RW.

Accessing the EDPRCR:

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x310	EDPRCR

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are RO.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.40 EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Configurations

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If `FEAT_DoPD` is implemented then all fields in this register are in the Core power domain.

Attributes

EDPRSR is a 32-bit register.

Field descriptions

Bits [31:12]

Reserved, RES0.

SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

Permitted values are:

- 0b0 The PE has not restarted since EDPRSR was last read.
- 0b1 The PE has restarted since EDPRSR was last read.

Note

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRSR:

- If `FEAT_DoubleLock` is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - `(FEAT_DoPD is not implemented and !IsCorePowered())`.
 - `DoubleLockStatus()`.
 - `EDPRSR.R == 1`.
- When `SoftwareLockStatus()`, access to this field is RO.

- Otherwise, access to this field is RC/WI.

SPMAD, bit [10]

When FEAT_Debugv8p4 is implemented:

SPMAD

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because `AllowExternalPMUAccess() == FALSE`.

Permitted values are:

- 0b0 No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because `AllowExternalPMUAccess() == FALSE` for the access since EDPRSR was last read.
- 0b1 At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because `AllowExternalPMUAccess() == FALSE` for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If `FEAT_DoubleLock` is not implemented or `DoubleLockStatus() == FALSE`, this bit clears to 0.
- If `FEAT_DoubleLock` is implemented, and `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - `(FEAT_DoPD is not implemented and !IsCorePowered())`.
 - `DoubleLockStatus()`.
 - `EDPRSR.R == 1`.
- When `SoftwareLockStatus()`, access to this field is RO.
- Otherwise, access to this field is RC/WI.

Otherwise:

SPMAD

Sticky EPMAD error.

- 0b0 No external debug interface accesses to the Performance Monitors registers have failed because `AllowExternalPMUAccess() == FALSE` since EDPRSR was last read.
- 0b1 At least one external debug interface access to the Performance Monitors registers has failed and returned an error because `AllowExternalPMUAccess() == FALSE` since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If `FEAT_DoubleLock` is not implemented or `DoubleLockStatus() == FALSE`, this bit clears to 0.
- If `FEAT_DoubleLock` is implemented, and `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - `(FEAT_DoPD is not implemented and !IsCorePowered())`.
 - `OSLockStatus()`.

- DoubleLockStatus().
- EDPRSR.R == 1.
- When SoftwareLockStatus(), access to this field is RO.
- Otherwise, access to this field is RC/WI.

EPMAD, bit [9]

When FEAT_Debug8p4 is implemented and FEAT_PMUv3 is implemented:

EPMAD

External Performance Monitors Non-secure Access Disable status.

- 0b0 External Non-secure Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE for a Non-secure access.
- 0b1 External Non-secure Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered()).
 - DoubleLockStatus().
 - EDPRSR.R == 1.
- Otherwise, access to this field is RO.

When FEAT_PMUv3 is implemented:

EPMAD

External Performance Monitors access disable status.

- 0b0 External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.
- 0b1 External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered()).
 - OSLockStatus().
 - DoubleLockStatus().
 - EDPRSR.R == 1.
- Otherwise, access to this field is RO.

Otherwise:

Reserved, RES0.

SDAD, bit [8]

When FEAT_Debug8p4 is implemented:

SDAD

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

- 0b0 No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.
- 0b1 At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If `FEAT_DoubleLock` is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`, it is CONstrained UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - `(FEAT_DoPD is not implemented and !IsCorePowered())`.
 - `DoubleLockStatus()`.
 - `EDPRSR.R == 1`.
- Otherwise, access to this field is RO.

Otherwise:

SDAD

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because `AllowExternalDebugAccess() == FALSE`.

0b0 No external debug interface accesses to the debug registers have failed because `AllowExternalDebugAccess() == FALSE` since EDPRSR was last read.

0b1 At least one external debug interface access to the debug registers has failed and returned an error because `AllowExternalDebugAccess() == FALSE` since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If `FEAT_DoubleLock` is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`, it is CONstrained UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is UNKNOWN on reads if `OSLockStatus() == TRUE` and external debug writes to `OSLAR_ELI` do not return an error when `AllowExternalDebugAccess() == FALSE`.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - `(FEAT_DoPD is not implemented and !IsCorePowered())`.
 - `DoubleLockStatus()`.
 - `EDPRSR.R == 1`.
- Otherwise, access to this field is RO.

EDAD, bit [7]

When `FEAT_Debugv8p4` is implemented:

EDAD

External Debug Access Disable status.

0b0 External Non-secure access to breakpoint registers, watchpoint registers, and `OSLAR_ELI` enabled. `AllowExternalDebugAccess() == TRUE` for a Non-secure access.

0b1 External Non-secure access to breakpoint registers, watchpoint registers, and `OSLAR_ELI` disabled. `AllowExternalDebugAccess() == FALSE` for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered()).
 - DoubleLockStatus().
 - EDPRSR.R == 1.
- Otherwise, access to this field is RO.

When FEAT_Debug8p2 is implemented:

EDAD

External Debug Access Disable status.

- 0b0 External access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) enabled. AllowExternalDebugAccess() == TRUE.
- 0b1 External access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) disabled. AllowExternalDebugAccess() == FALSE.

This bit is not valid and reads UNKNOWN if OSLockStatus() == TRUE and external debug writes to [OSLAR_EL1](#) do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered()).
 - DoubleLockStatus().
 - EDPRSR.R == 1.
- Otherwise, access to this field is RO.

Otherwise:

EDAD

External Debug Access Disable status.

- 0b0 External access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) enabled. AllowExternalDebugAccess() == TRUE.
- 0b1 External access to breakpoint registers, watchpoint registers disabled. It is IMPLEMENTATION DEFINED whether accesses to [OSLAR_EL1](#) are enabled or disabled. AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered()).
 - DoubleLockStatus().
 - EDPRSR.R == 1.
- Otherwise, access to this field is RO.

DLK, bit [6]

When FEAT_Debug8p4 is implemented:

DLK

This field is RES0.

When FEAT_Debug8p2 is implemented and FEAT_DoubleLock is implemented:

DLK

Double Lock.

From Armv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- RAZ/WI if all of the following are true:
 - IsCorePowered().
 - !DoubleLockStatus().
- Otherwise, access to this field is UNKNOWN/WI.

When FEAT_DoubleLock is implemented:

DLK

Double Lock.

This field returns the result of the pseudocode function DoubleLockStatus().

If the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
- EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

This field is in the Core power domain.

0b0 DoubleLockStatus() returns FALSE.

0b1 DoubleLockStatus() returns TRUE and the Core power domain is powered up.

Accessing this field has the following behavior:

- UNKNOWN/WI if all of the following are true:
 - FEAT_DoPD is not implemented.
 - !IsCorePowered().
- Otherwise, access to this field is RO.

Otherwise:

Reserved, RES0.

OSLK, bit [5]

OS Lock status bit.

A read of this bit returns the value of [OSLSR_EL1.OSLK](#).

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if all of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered()).
 - DoubleLockStatus().
 - EDPRSR.R == 1.
- Otherwise, access to this field is RO.

HALTED, bit [4]

Halted status bit.

0b0 PE is in Non-debug state.

0b1 PE is in Debug state.

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if all of the following are true:
 - FEAT_DoPD is not implemented.
 - !IsCorePowered().
- Otherwise, access to this field is RO.

SR, bit [3]

Sticky core Reset status bit.

Permitted values are:

- 0b0 The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.
- 0b1 The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If [FEAT_DoubleLock](#) is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If [FEAT_DoubleLock](#) is implemented and `DoubleLockStatus() == TRUE`, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - ([FEAT_DoPD](#) is not implemented and `!IsCorePowered()`).
 - `DoubleLockStatus()`.
- When `SoftwareLockStatus()`, access to this field is RO.
- Otherwise, access to this field is RC/WI.

R, bit [2]

PE Reset status bit.

Permitted values are:

- 0b0 The non-debug logic of the PE is not in reset state.
- 0b1 The non-debug logic of the PE is in reset state.

If [FEAT_DoubleLock](#) is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see [EDPRSR.{DLK, R} and reset state on page H6-7447](#).

This field is in the Core power domain.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - ([FEAT_DoPD](#) is not implemented and `!IsCorePowered()`).
 - `DoubleLockStatus()`.
- Otherwise, access to this field is RO.

SPD, bit [1]

Sticky core Powerdown status bit.

If [FEAT_DoubleLock](#) is implemented and `DoubleLockStatus() == TRUE`, then:

- If [FEAT_Debugv8p2](#) is implemented, this bit reads as 0.
- If [FEAT_Debugv8p2](#) is not implemented, this bit might read as 0 or 1.

For more information, see [EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-7446](#).

- 0b0 If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost.

If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.

0b1 The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If [FEAT_DoubleLock](#) is not implemented or `DoubleLockStatus() == FALSE` this bit clears to 0.
- If [FEAT_DoubleLock](#) is implemented and `DoubleLockStatus() == TRUE`, it is CONstrained UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When [FEAT_DoPD](#) is not implemented and the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information, see [EDPRSR.SPD when the Core domain is in either retention or powerdown state on page H6-7447](#).

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see [EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-7446](#).

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- RAZ/WI if all of the following are true:
 - [FEAT_DoPD](#) is not implemented.
 - `!IsCorePowered()`.
- UNKNOWN/WI if all of the following are true:
 - `IsCorePowered()`.
 - `DoubleLockStatus()`.
- Otherwise, access to this field is RO.

PU, bit [0]

When [FEAT_DoPD](#) is implemented:

PU

Core powerup status bit.

Access to this field is RAO/WI.

When [FEAT_Debugv8p2](#) is implemented:

PU

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

0b0 Either the Core power domain is in a low-power or powerdown state, or [FEAT_DoubleLock](#) is implemented and `DoubleLockStatus() == TRUE`, meaning the debug registers in the Core power domain cannot be accessed.

0b1 The Core power domain is in a powerup state, and either [FEAT_DoubleLock](#) is not implemented or `DoubleLockStatus() == FALSE`, meaning the debug registers in the Core power domain can be accessed.

If [FEAT_DoubleLock](#) is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONstrained UNPREDICTABLE value. For more information, see [EDPRSR.{DLK, R} and reset state on page H6-7447](#)

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see [EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-7446](#)

Access to this field is RO.

Otherwise:

PU

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and `DoubleLockStatus() == TRUE`, then the value of `EDPRSR.PU` is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

0b0 Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.

0b1 Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If `FEAT_DoubleLock` is implemented, the Core power domain is powered up, and `DoubleLockStatus() == TRUE`, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If `FEAT_DoubleLock` is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see [EDPRSR.{DLK, R} and reset state on page H6-7447](#)

`EDPRSR.{DLK, SPD, PU}` describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see [EDPRSR.{DLK, SPD, PU} and the Core power domain on page H6-7446](#).

Access to this field is RO.

Accessing the EDPRSR:

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (`EDPRSR.PU == 1`), then following a read of EDPRSR:

- If `FEAT_DoubleLock` is not implemented or `DoubleLockStatus() == FALSE`, then:
 - `EDPRSR.{SDR, SPMAD, SDAD, SPD}` are cleared to 0.
 - `EDPRSR.SR` is cleared to 0 if the non-debug logic of the PE is not in reset state (`EDPRSR.R == 0`).
- If `FEAT_DoubleLock` is implemented and `DoubleLockStatus() == TRUE`, it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If `FEAT_DoPD` is not implemented and the Core power domain is powered down (`EDPRSR.PU == 0`), then:

- `EDPRSR.{SDR, SPMAD, SDAD, SR}` are all UNKNOWN, and are either reset or restored on being powered up.
- `EDPRSR.SPD` is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x314	EDPRSR

This interface is accessible as follows:

- When `FEAT_DoPD` is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.41 EDRCCR, External Debug Reserve Control Register

The EDRCCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in [EDSCR](#).

Configurations

EDRCCR is in the Core power domain.

Attributes

EDRCCR is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

CBRRQ, bit [4]

Allow imprecise entry to Debug state. The actions on writing to this bit are:

0b0 No action.

0b1 Allow imprecise entry to Debug state, for example by canceling pending bus accesses.

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the [EDSCR.PipeAdv](#) bit to 0. The actions on writing to this bit are:

0b0 No action.

0b1 Clear the [EDSCR.PipeAdv](#) bit to 0.

CSE, bit [2]

Clear Sticky Error. Used to clear the [EDSCR](#) cumulative error bits to 0. The actions on writing to this bit are:

0b0 No action.

0b1 Clear the [EDSCR](#).{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the [EDSCR.ITO](#) bit, to 0.

Bits [1:0]

Reserved, RES0.

Accessing the EDRCR:

EDRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x090	EDRCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.

H9.2.42 EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Configurations

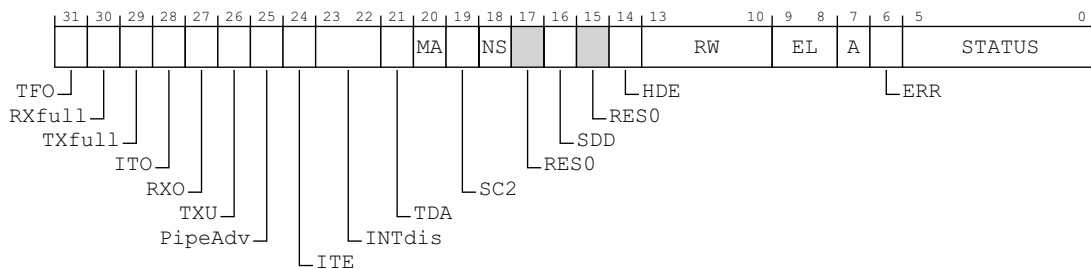

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register [MDCCSR_ELO](#)[30:29].

EDSCR is in the Core power domain.

Attributes

EDSCR is a 32-bit register.

Field descriptions

TFO, bit [31]

When *FEAT_TRF* is implemented:

TFO

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

0b0 Trace Filter controls are not affected.

0b1 Trace Filter controls in [TRFCR_EL1](#) and [TRFCR_EL2](#) are ignored.

Trace Filter controls [TRFCR](#) and [HTRFCR](#) are ignored.

When [OSLSR_EL1.OSLK](#) == 1, this bit can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

This bit is ignored by the PE when `ExternalSecureNoninvasiveDebugEnabled() == FALSE` and the Effective value of [MDCR_EL3.STE](#) == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is RO.

TXfull, bit [29]

DTRTX full.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is RO.

ITO, bit [28]

ITR overrun.

If the PE is in Non-debug state, this bit is UNKNOWN. ITO is set to 0 on entry to Debug state.

Access to this field is RO.

RXO, bit [27]

DTRRX overrun.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is RO.

TXU, bit [26]

DTRTX underrun.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is RO.

PipeAdv, bit [25]

Pipeline advance. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to [EDRCR.CSPA](#).

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

Access to this field is RO.

ITE, bit [24]

ITR empty.

If the PE is in Non-debug state, this bit is UNKNOWN. It is always valid in Debug state.

Access to this field is RO.

INTdis, bits [23:22]

When FEAT_Debugv8p4 is implemented:

INTdis

Interrupt disable. Disables taking interrupts in Non-debug state.

0b00 Masking of interrupts is controlled by PSTATE and interrupt routing controls.

0b01 If `ExternalInvasiveDebugEnabled()` is TRUE, then all interrupts taken to Non-secure state are masked.

If `ExternalSecureInvasiveDebugEnabled()` is TRUE, then all interrupts taken to Secure state are masked.

———— **Note** —————

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1.OSLK](#) is 1, this field can be indirectly read and written through the [MDSR_EL1](#) and [DBGDSCRext](#) System registers.

The Effective value of this field is 0b00 when `ExternalInvasiveDebugEnabled()` is FALSE.

When FEAT_Debugv8p4 is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

INTdis

Interrupt disable. Disables taking interrupts in Non-debug state.

0b00 Masking of interrupts is controlled by PSTATE and interrupt routing controls.

0b01 If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure EL1 are masked.

0b10 If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked.

If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure EL1 are masked.

0b11 If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked.

If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1.OSLK](#) is 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

Support for the values 0b01 and 0b10 is IMPLEMENTATION DEFINED. If these values are not supported, they are reserved. If programmed with a reserved value, the PE behaves as if INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: [DBGBCR<n>_EL1](#), [DBGBVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGWVR<n>_EL1](#).
- AArch32: [DBGBCR<n>](#), [DBGBVR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).

The possible values of this field are:

0b0 Accesses to debug System registers do not generate a Software Access Debug event.

0b1 Accesses to debug System registers generate a Software Access Debug event, if [OSLSR_EL1.OSLK](#) is 0 and if halting is allowed.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

0b0 Normal access mode.

0b1 Memory access mode.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and FEAT_PCSRv8p2 is not implemented:

SC2

Sample CONTEXTIDR_EL2. Controls whether the PC Sample-based Profiling Extension samples CONTEXTIDR_EL2 or VTTBR_EL2.VMID.

0b0 Sample VTTBR_EL2.VMID.

0b1 Sample CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NS, bit [18]

Non-secure status. When in Debug state, gives the current Security state:

0b0 Secure state.

0b1 Non-secure state.

In Non-debug state, this bit is UNKNOWN.

Access to this field is RO.

Bit [17]

Reserved, RES0.

SDD, bit [16]

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled ().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled () changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled (). If the authentication signals that control ExternalSecureInvasiveDebugEnabled () change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is RO.

Bit [15]

Reserved, RES0.

HDE, bit [14]

Halting debug enable. The possible values of this field are:

0b0 Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.

0b1 Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

0b1111 Any of the following:

- The PE is in Non-debug state.
- The PE is at EL0 using AArch64.
- The PE is not at EL0, and EL1, EL2, and EL3 are using AArch64.

0b1110 *When AArch32 is supported at EL0:*

The PE is in Debug state at EL0. EL0 is using AArch32. EL1, EL2, and EL3 are using AArch64.

0b110x *When AArch32 is supported at EL0 and EL2 is implemented:*

The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is enabled in the current Security state and is using AArch64. If implemented, EL3 is using AArch64.

0b10xx *When AArch32 is supported at EL0 and EL3 is implemented:*

The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is not implemented, disabled in the current Security state, or using AArch32. EL3 is using AArch64.

0b0xxx *When AArch32 is supported at EL0:*

The PE is in Debug state. All Exception levels are using AArch32.

In Non-debug state, this field is RAO.

Access to this field is RO.

EL, bits [9:8]

Exception level. In Debug state, this gives the current Exception level of the PE.

In Non-debug state, this field is RAZ.

Access to this field is RO.

A, bit [7]

SError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If $HCR_EL2.\{AMO, TGE\} = \{1, 0\}$, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

0b0 No SError interrupt pending.

0b1 SError interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

UNKNOWN in Non-debug state.

Access to this field is RO.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is RO.

STATUS, bits [5:0]

Debug status flags.

- 0b000001 PE is restarting, exiting Debug state.
- 0b000010 PE is in Non-debug state.
- 0b000111 Breakpoint.
- 0b010011 External debug request.
- 0b011011 Halting step, normal.
- 0b011111 Halting step, exclusive.
- 0b100011 OS Unlock Catch.
- 0b100111 Reset Catch.
- 0b101011 Watchpoint.
- 0b101111 HLT instruction.
- 0b110011 Software access to debug register.
- 0b110111 Exception Catch.
- 0b111011 Halting step, no syndrome.

All other values of STATUS are reserved.

Access to this field is RO.

Accessing the EDSCR:

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x088	EDSCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

H9.2.43 EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading [EDPCSR](#)[31:0].

Configurations

EDVIDSR is in the Core power domain.

This register is present only when [FEAT_PCSRv8](#) is implemented and [FEAT_PCSRv8p2](#) is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

If [FEAT_VHE](#) is implemented, the format of this register differs depending on the value of [EDSCR.SC2](#).

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Note

[FEAT_PCSRv8p2](#) implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDVIDSR is a 32-bit register.

Field descriptions

When [FEAT_VHE](#) is not implemented or [EDSCR.SC2](#) == 0:

This format applies in all Armv8.0 implementations.

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent [EDPCSR](#) sample.

If EL3 is not implemented, this bit indicates the Effective value of [SCR.NS](#).

0b0 Sample is from Secure state.

0b1 Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E2, bit [30]

When [EL2](#) is implemented:

E2

Exception level 2 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL2.

0b0 Sample is not from EL2.

0b1 Sample is from EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [29]

When EL3 is implemented and AArch64 is supported at the highest implemented Exception level:

E3

Exception level 3 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL3 using AArch64.

0b0 Sample is not from EL3 using AArch64.

0b1 Sample is from EL3 using AArch64.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi ([EDPCSR](#)[63:32]) valid. Indicates whether bits [63:32] of the most recent [EDPCSR](#) sample might be nonzero:

0b0 Bits[63:32] of the most recent EDPCSR sample are zero.

0b1 Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi ([EDPCSR](#)[63:32]) does not need to be read.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented and EL2 is implemented:

VMID[15:8]

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

When EL2 is implemented:

VMID

VMID sample. The VMID associated with the most recent EDPCSRlo (EDPCSR[31:0]) sample. When the most recent EDPCSR sample was generated:

- This field is RES0 if any of the following apply:
 - The PE is executing in Secure state.
 - The PE is executing at EL2.
- Otherwise:
 - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
 - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
 - If EL2 is using AArch32, this field is set to VTTBR.VMID.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and EDSCR.SC2 == 1:

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample was generated:

- If EL2 was using AArch64 and the PE was executing in Non-secure state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- If EL2 was using AArch32 or the PE was executing in Secure state, then this field is set to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDVIDSR:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-7458*.

EDVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A8	EDVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

H9.2.44 EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configurations

EDWAR is in the Core power domain.

Attributes

EDWAR is a 64-bit register.

Field descriptions

Bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the [DC ZVA](#) block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See [Determining the memory location that caused a Watchpoint exception on page D2-2606](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the EDWAR:

EDWAR[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x030	EDWAR	31:0

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()` and `!OSLockStatus()` accesses to EDWAR[31:0] are RO.
- Otherwise accesses to EDWAR[31:0] generate an error response.

EDWAR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x034	EDWAR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to EDWAR[63:32] are RO.
- Otherwise accesses to EDWAR[63:32] generate an error response.

H9.2.45 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configurations

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [MIDR_EL1](#)[31:0].

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MIDR](#)[31:0].

It is IMPLEMENTATION DEFINED whether MIDR_EL1 is implemented in the Core power domain or in the Debug power domain.

Attributes

MIDR_EL1 is a 32-bit register.

Field descriptions

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is RO.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.
Access to this field is RO.

Architecture, bits [19:16]

Architecture version. Defined values are:

0b0001 Armv4.
0b0010 Armv4T.
0b0011 Armv5 (obsolete).
0b0100 Armv5T.
0b0101 Armv5TE.
0b0110 Armv5TEJ.
0b0111 Armv6.
0b1111 Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is RO.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the MIDR_EL1:

MIDR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD00	MIDR_EL1

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.

H9.2.46 OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configurations

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [OSLAR_EL1](#)[31:0].

OSLAR_EL1 is in the Core power domain.

The OS Lock can also be locked or unlocked using [DBGOSLAR](#).

If [FEAT_Debugv8p2](#) is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when `AllowExternalDebugAccess()` returns FALSE for the access.

If [FEAT_Debugv8p2](#) is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when `AllowExternalDebugAccess()` returns FALSE for the access.

Attributes

OSLAR_EL1 is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use [EDPRSR.OSLK](#) to check the current status of the lock.

Accessing the OSLAR_EL1:

———— Note ————

`SoftwareLockStatus()` depends on the type of access attempted and `AllowExternalDebugAccess()` has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

OSLAR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x300	OSLAR_EL1

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `AllowExternalDebugAccess()` and `SoftwareLockStatus()` accesses to this register are WI.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `AllowExternalDebugAccess()` and `!SoftwareLockStatus()` accesses to this register are WO.

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!AllowExternalDebugAccess()` and `FEAT_Debugv8p2` is not implemented accesses to this register are IMPDEF.
- Otherwise accesses to this register generate an error response.

H9.3 Cross-Trigger Interface registers

This section lists the Cross-Trigger Interface registers.

H9.3.1 ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

Purpose

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

———— **Note** —————

The architecturally-defined triggers must not be multiplexed.

Configurations

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

Attributes

ASICCTL is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the ASICCTL:

ASICCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x144	ASICCTL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are RO.
- Otherwise accesses to this register are IMPDEF.

H9.3.2 CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

Purpose

Clears bits of the Application Trigger register.

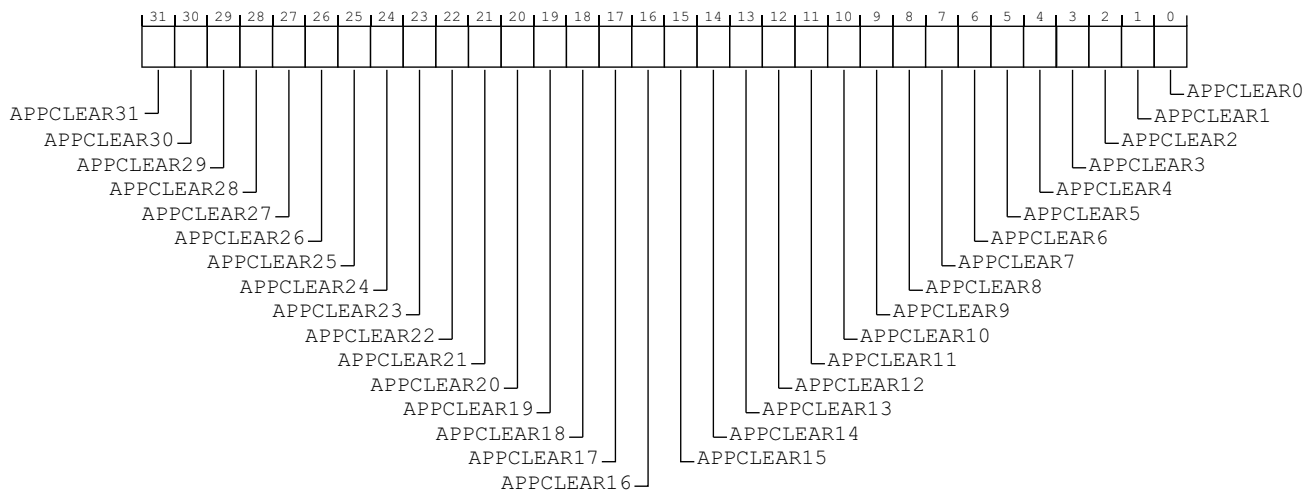

Configurations

CTIAPPCLEAR is in the Debug power domain.

Attributes

CTIAPPCLEAR is a 32-bit register.

Field descriptions

APPCLEAR<x>, bit [x], for x = 31 to 0

Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Writing to this bit has the following effect:

0b0 No effect.

0b1 Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use [CTIAPPULSE](#).

Accessing the CTIAPPCLEAR:

CTIAPPCLEAR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x018	CTIAPPCLEAR

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.

H9.3.3 CTIAPPULSE, CTI Application Pulse register

The CTIAPPULSE characteristics are:

Purpose

Causes event pulses to be generated on ECT channels.

Configurations

CTIAPPULSE is in the Debug power domain.

Attributes

CTIAPPULSE is a 32-bit register.

Field descriptions

APPULSE<x>, bit [x], for x = 31 to 0

Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Writing to this bit has the following effect:

- | | |
|-----|------------------------------------|
| 0b0 | No effect. |
| 0b1 | Channel <x> event pulse generated. |

Note

- The CTIAPPULSE operation does not affect the state of the Application Trigger register, CTIAPPTRIG. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

Accessing the CTIAPPULSE:

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPULSE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x01C	CTIAPPULSE

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.

H9.3.4 CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets bits of the Application Trigger register.

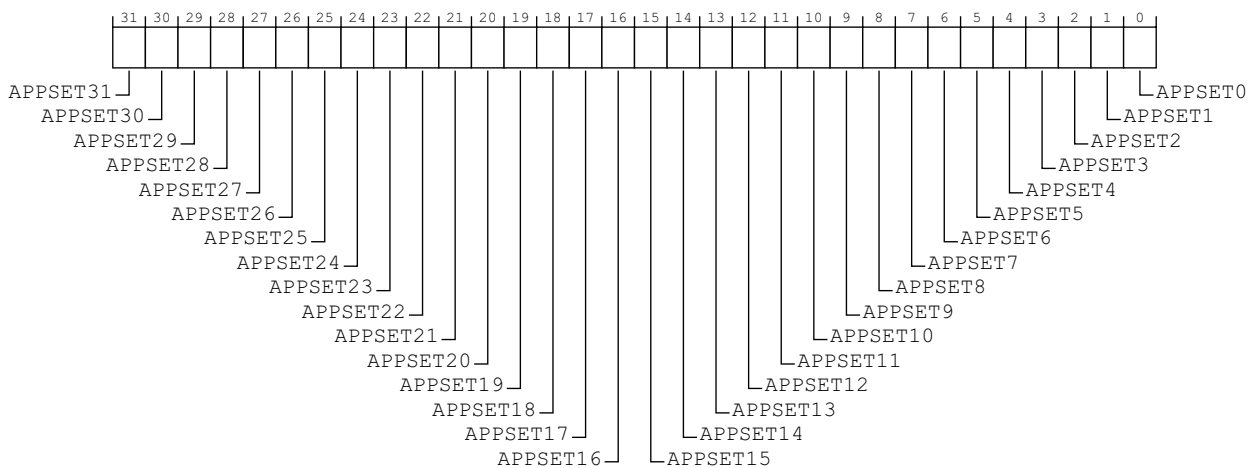

Configurations

CTIAPPSET is in the Debug power domain.

Attributes

CTIAPPSET is a 32-bit register.

Field descriptions

APPSET<x>, bit [x], for x = 31 to 0

Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

0b0 Reading this means the application trigger is inactive. Writing this has no effect.

0b1 Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use [CTIAPPULSE](#).

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIAPPSET:

CTIAPPSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x014	CTIAPPSET

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.

H9.3.5 CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configurations

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is implemented, this field holds the same value as [DBGAUTHSTATUS_EL1.NSNID](#).

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as [DBGAUTHSTATUS_EL1.SNID](#).

NSID, bits [1:0]

If EL3 is implemented, this field holds the same value as [DBGAUTHSTATUS_EL1.NSID](#).

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as [DBGAUTHSTATUS_EL1.SID](#).

Accessing the CTIAUTHSTATUS:

CTIAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFB8	CTIAUTHSTATUS

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.6 CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

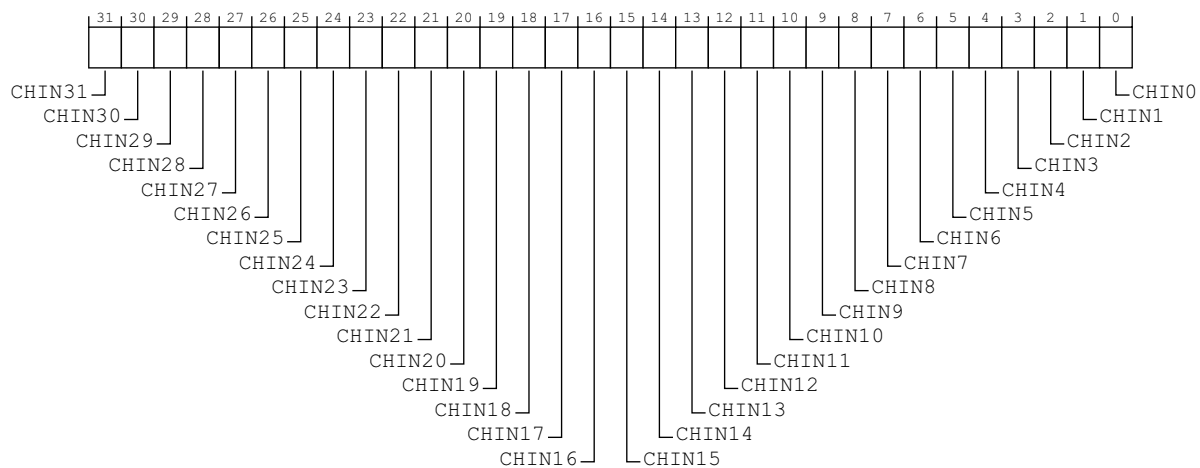

Configurations

CTICHINSTATUS is in the Debug power domain.

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions

CHIN<n>, bit [n], for n = 31 to 0

Input channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

0b0 Input channel <n> is inactive.

0b1 Input channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

Accessing the CTICHINSTATUS:

CTICHINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x138	CTICHINSTATUS

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.7 CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

Purpose

Provides the status of the ECT channel outputs from the CTI.

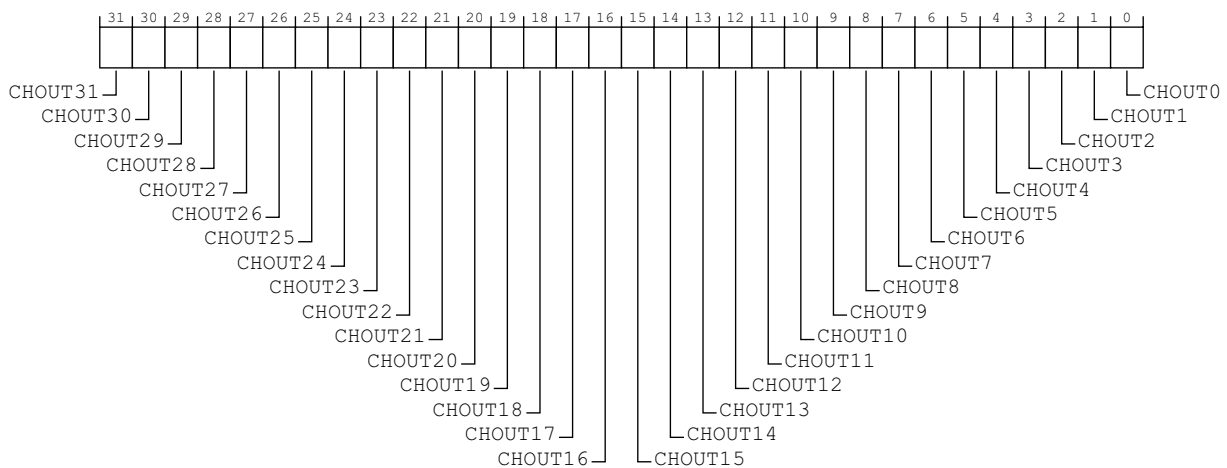

Configurations

CTICHOUTSTATUS is in the Debug power domain.

Attributes

CTICHOUTSTATUS is a 32-bit register.

Field descriptions

CHOUT<n>, bit [n], for n = 31 to 0

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

- 0b0 Output channel <n> is inactive.
- 0b1 Output channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

———— Note ————

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see [CTIGATE](#).

Accessing the CTICHOUTSTATUS:

CTICHOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x13C	CTICHOUTSTATUS

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.8 CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see [About the Component Identification scheme on page K2-8443](#).

Configurations

CTICIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is RO.

Accessing the CTICIDR0:

CTICIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF0	CTICIDR0

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.9 CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see [About the Component Identification scheme on page K2-8443](#).

Configurations

CTICIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

0b1001 CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Reads as 0b0000.

Access to this field is RO.

Accessing the CTICIDR1:

CTICIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF4	CTICIDR1

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.10 CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see [About the Component Identification scheme on page K2-8443](#).

Configurations

CTICIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is RO.

Accessing the CTICIDR2:

CTICIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF8	CTICIDR2

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.11 CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see [About the Component Identification scheme](#) on page K2-8443.

Configurations

CTICIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is RO.

Accessing the CTICIDR3:

CTICIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFFC	CTICIDR3

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.12 CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

Configurations

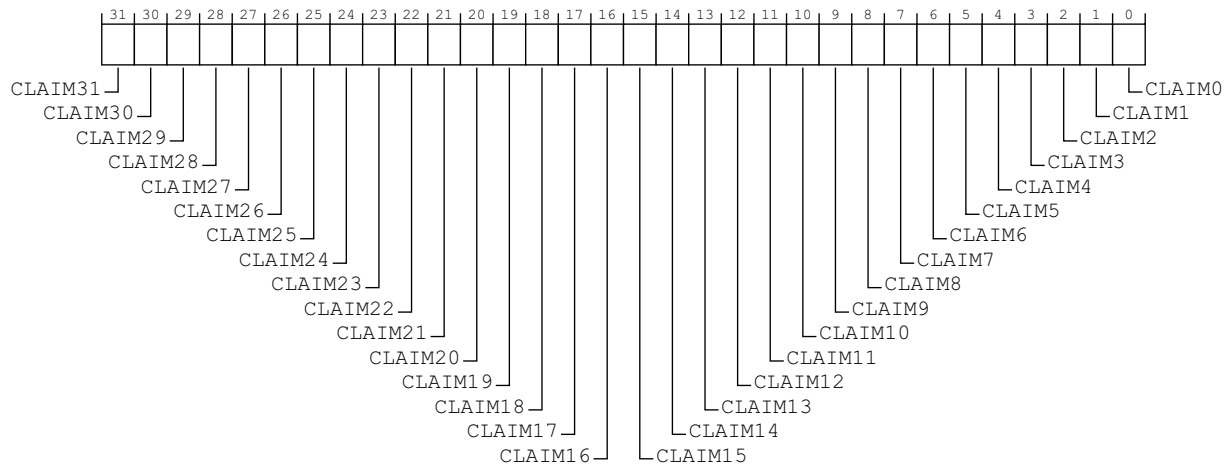

CTICLAIMCLR is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag clear bit.

Reads return the value of CLAIM<x>, writes have the following behavior:

- 0b0 No action.
- 0b1 Indirectly clear CLAIM<x> to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/WI.

The reset behavior of this field is:

- An External Debug reset clears the CLAIM tag bits to 0.

Accessing the CTICLAIMCLR:

CTICLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA4	CTICLAIMCLR

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.

H9.3.13 CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

Configurations

CTICLAIMSET is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMSET is a 32-bit register.

Field descriptions

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag set bit.

If x is less than the IMPLEMENTATION DEFINED number of CLAIM tags, this field is RAO and the behavior on writes is:

0b0 No action.

0b1 Indirectly set CLAIM<x> tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/WI.

The reset behavior of this field is:

- An External Debug reset clears the CLAIM tag bits to 0.

Accessing the CTICLAIMSET:

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA0	CTICLAIMSET

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.

H9.3.14 CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

Configurations

CTICONTROL is in the Debug power domain.

Attributes

CTICONTROL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

- 0b0 CTI mapping functions and application trigger disabled.
- 0b1 CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it is CONstrained UNPREDICTABLE which of the following occurs:

- The output trigger remains asserted after the mapping functions are disabled.
- The output trigger is deasserted after the mapping functions are disabled.

All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Accessing the CTICONTROL:

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x000	CTICONTROL

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.

H9.3.15 CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configurations

CTIDEVAFF0 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then [CTIDEVAFF1](#) must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the CTIDEVAFF0:

CTIDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA8	CTIDEVAFF0

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.16 CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configurations

CTIDEVAFF1 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then [CTIDEVAFF0](#) must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the CTIDEVAFF1:

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFAC	CTIDEVAFF1

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.17 CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

Configurations

CTIDEVARCH is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is not implemented, [CTIDEVAFF0](#) and [CTIDEVAFF1](#) are also not implemented.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architecture of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

When FEAT_DoPD is implemented:

REVISION

Revision.

Defines the architecture revision of the component.

0b0000 First revision.

0b0001 As 0b0000, and also adds support for [CTIDEVCTL](#).

All other values are reserved.

Access to this field is RO.

Otherwise:

REVISION

Revision.

Defines the architecture revision of the component.

All other values are reserved.

Reads as 0b0000.

Access to this field is RO.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.

Reads as 0x1A14.

Access to this field is RO.

Accessing the CTIDEVARCH:

CTIDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFBC	CTIDEVARCH

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.18 CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

Purpose

Provides target-specific device controls

Configurations

CTIDEVCTL is in the Debug power domain.

This register is present only when FEAT_DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

Attributes

CTIDEVCTL is a 32-bit register.

Field descriptions

Bits [31:2]

Reserved, RES0.

RCE, bit [1]

Reset Catch Enable.

0b0 Reset Catch debug event disabled.

0b1 Reset Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

OSUCE, bit [0]

OS Unlock Catch Enable

0b0 OS Unlock Catch debug event disabled.

0b1 OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Accessing the CTIDEVCTL:

CTIDEVCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x150	CTIDEVCTL

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.

H9.3.19 CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

Configurations

CTIDEVID is in the Debug power domain.

Attributes

CTIDEVID is a 32-bit register.

Field descriptions

Bits [31:26]

Reserved, RES0.

INOUT, bits [25:24]

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

- 0b00 **CTIGATE** does not mask propagation of input events from external channels.
- 0b01 **CTIGATE** masks propagation of input events from external channels.

All other values are reserved.

Bits [23:22]

Reserved, RES0.

NUMCHAN, bits [21:16]

Number of ECT channels implemented. For Armv8, valid values are:

- 0b000011 3 channels (0..2) implemented.
- 0b000100 4 channels (0..3) implemented.
- 0b000101 5 channels (0..4) implemented.
- 0b000110 6 channels (0..5) implemented.

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Number of triggers implemented. This is one more than the index of the largest trigger, rather than the actual number of triggers. For Armv8, valid values are:

- 0b000011 Up to 3 triggers (0..2) implemented.
- 0b001000 Up to 8 triggers (0..7) implemented.

- 0b001001 Up to 9 triggers (0..8) implemented.
- 0b001010 Up to 10 triggers (0..9) implemented.

and so on up to 0b100000, 32 triggers (0..31) implemented.

All other values are reserved. If the PE contains a Trace extension, this field must be at least 0b001000. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, [ASICCTL](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the CTIDEVID:

CTIDEVID can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC8	CTIDEVID

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.20 CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configurations

CTIDEVID1 is in the Debug power domain.

Attributes

CTIDEVID1 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing the CTIDEVID1:

CTIDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC4	CTIDEVID1

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.21 CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configurations

CTIDEVID2 is in the Debug power domain.

Attributes

CTIDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing the CTIDEVID2:

CTIDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC0	CTIDEVID2

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.22 CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's cross-trigger interface.

Configurations

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVTYPE is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001.

Access to this field is RO.

MAJOR, bits [3:0]

Major type. Indicates this is a cross-trigger component.

Reads as 0b0100.

Access to this field is RO.

Accessing the CTIDEVTYPE:

CTIDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFCC	CTIDEVTYPE

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.23 CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

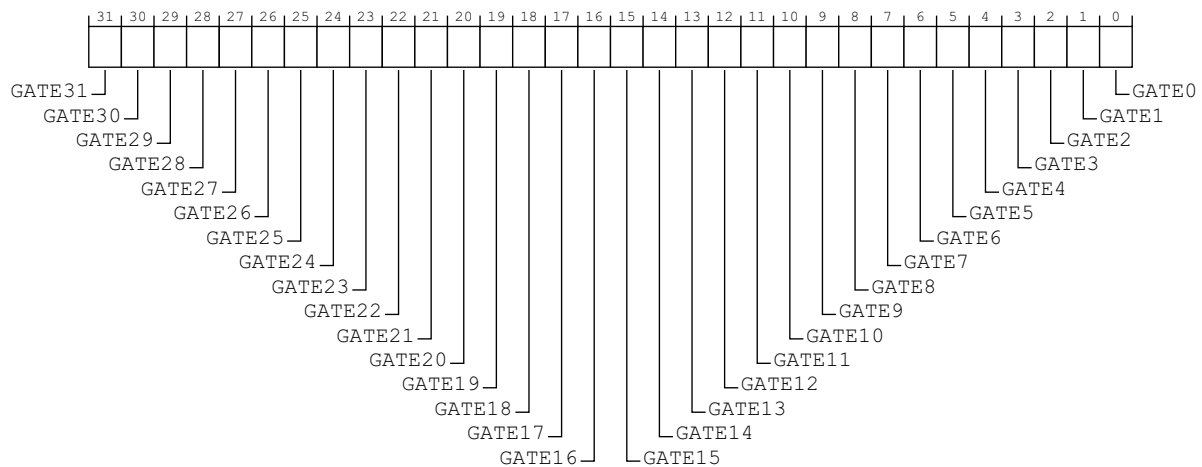

Configurations

CTIGATE is in the Debug power domain.

Attributes

CTIGATE is a 32-bit register.

Field descriptions

GATE<x>, bit [x], for x = 31 to 0

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

0b0 Disable output and, if [CTIDEVID.INOUT](#) == 0b01, input channel <x> propagation.

0b1 Enable output and, if [CTIDEVID.INOUT](#) == 0b01, input channel <x> propagation.

If GATE<x> is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIGATE:

CTIGATE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x140	CTIGATE

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.

H9.3.24 CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

Configurations

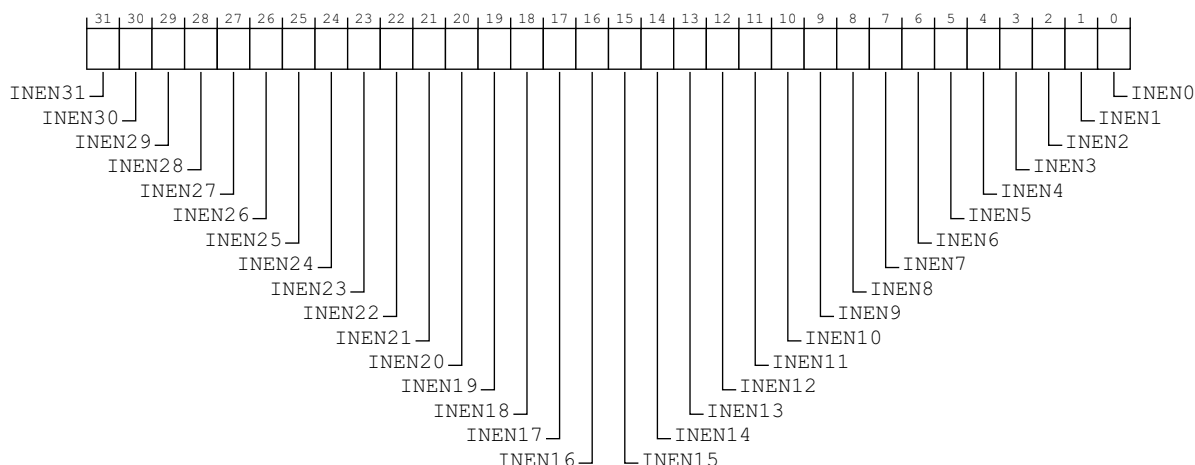

CTIINEN<n> is in the Debug power domain.

If input trigger n is not connected, the behavior of CTIINEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIINEN<n> is a 32-bit register.

Field descriptions

INEN<x>, bit [x], for x = 31 to 0

Input trigger <n> to output channel <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

0b0 Input trigger <n> will not generate an event on output channel <x>.

0b1 Input trigger <n> will generate an event on output channel <x>.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIINEN<n>:

CTIINEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x020 + (4 * n)	CTIINEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.

- When !SoftwareLockStatus() accesses to this register are RW.

H9.3.25 CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

Purpose

Can be used to deactivate the output triggers.

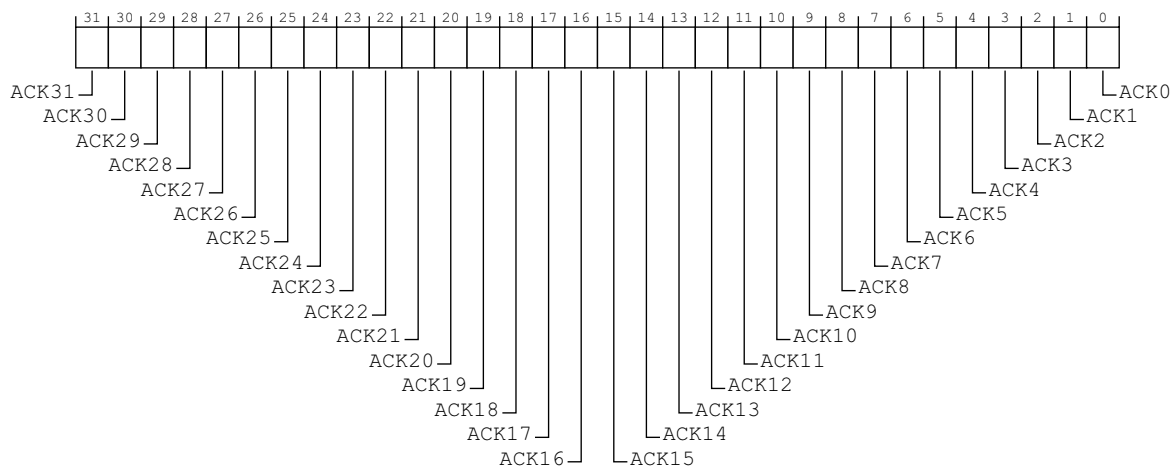

Configurations

CTIINTACK is in the Debug power domain.

Attributes

CTIINTACK is a 32-bit register.

Field descriptions

ACK<n>, bit [n], for n = 31 to 0

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the [CTIDEVID.NUMTRIG](#) field.

If any of the following is true, writes to ACK<n> are ignored:

- n >= [CTIDEVID.NUMTRIG](#), the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by [CTIOUTEN<n>](#), is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

- 0b0 No effect
- 0b1 Deactivate the trigger.

Accessing the CTIINTACK:

A debugger must read [CTITRIGOUTSTATUS](#) to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPULSE to activate another trigger.

CTIINTACK can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x010	CTIINTACK

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are WI.
- When !SoftwareLockStatus() accesses to this register are WO.

H9.3.26 CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configurations

It is IMPLEMENTATION DEFINED whether CTIITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0b0 Normal operation.

0b1 Integration mode enabled.

The reset behavior of this field is:

- The following resets apply:
 - If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to 0.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
 - If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to 0.
 - On a Warm reset, the value of this field is unchanged.

Accessing the CTIITCTRL:

CTIITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xF00	CTIITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.

H9.3.27 CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configurations

CTILAR is in the Debug power domain.

If [FEAT_Debugv8p4](#) is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and [CTILSR](#) to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing the CTILAR:

CTILAR can be accessed through a memory-mapped interface access to the external debug interface:

Component	Offset	Instance
CTI	0xFB0	CTILAR

This interface is accessible as follows:

- Accesses to this register are WO.

H9.3.28 CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configurations

CTILSR is in the Debug power domain.

If `FEAT_Debugv8p4` is implemented, the Software Lock is not implemented.

Software uses [CTILAR](#) to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented:

SLK

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

- 0b0 Lock clear. Writes are permitted to this component's registers.
- 0b1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On an External debug reset, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED.

Permitted values are:

- 0b0 Software Lock not implemented or not memory-mapped access.
- 0b1 Software Lock implemented and memory-mapped access.

Accessing the CTILSR:

CTILSR can be accessed through a memory-mapped interface access to the external debug interface:

Component	Offset	Instance
CTI	0xFB4	CTILSR

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.29 CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

Purpose

Defines which input channels generate output trigger n.

Configurations

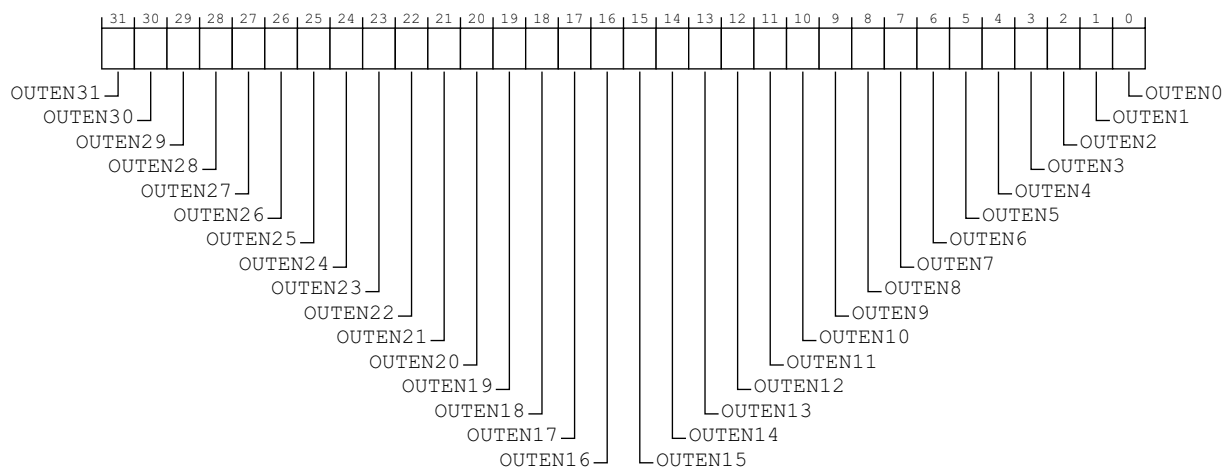

CTIOUTEN<n> is in the Debug power domain.

If output trigger n is not connected, the behavior of CTIOUTEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIOUTEN<n> is a 32-bit register.

Field descriptions

OUTEN<x>, bit [x], for x = 31 to 0

Input channel <x> to output trigger <n> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID.NUMCHAN](#) field.

Possible values of this bit are:

- 0b0 An event on input channel <x> will not cause output trigger <n> to be asserted.
- 0b1 An event on input channel <x> will cause output trigger <n> to be asserted.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing the CTIOUTEN<n>:

CTIOUTEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x0A0 + (4 * n)	CTIOUTEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are RO.
- When !SoftwareLockStatus() accesses to this register are RW.

H9.3.30 CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

CTIPIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the CTIPIDR0:

CTIPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE0	CTIPIDR0

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.31 CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

CTIPIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the CTIPIDR1:

CTIPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE4	CTIPIDR1

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.32 CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

CTIPIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the CTIPIDR2:

CTIPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE8	CTIPIDR2

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.33 CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

CTIPIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using CTIPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the CTIPIDR3:

CTIPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFEC	CTIPIDR3

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.34 CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

CTIPIDR4 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the CTIPIDR4:

CTIPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFD0	CTIPIDR4

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.35 CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

Configurations

CTITRIGINSTATUS is in the Debug power domain.

Attributes

CTITRIGINSTATUS is a 32-bit register.

Field descriptions

TRIN<n>, bit [n], for n = 31 to 0

Trigger input <n> status.

Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the [CTIDEVID.NUMTRIG](#) field.

0b0 Input trigger n is inactive.

0b1 Input trigger n is active.

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicyle events can be observed as active.

Accessing the CTITRIGINSTATUS:

CTITRIGINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x130	CTITRIGINSTATUS

This interface is accessible as follows:

- Accesses to this register are RO.

H9.3.36 CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

Purpose

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

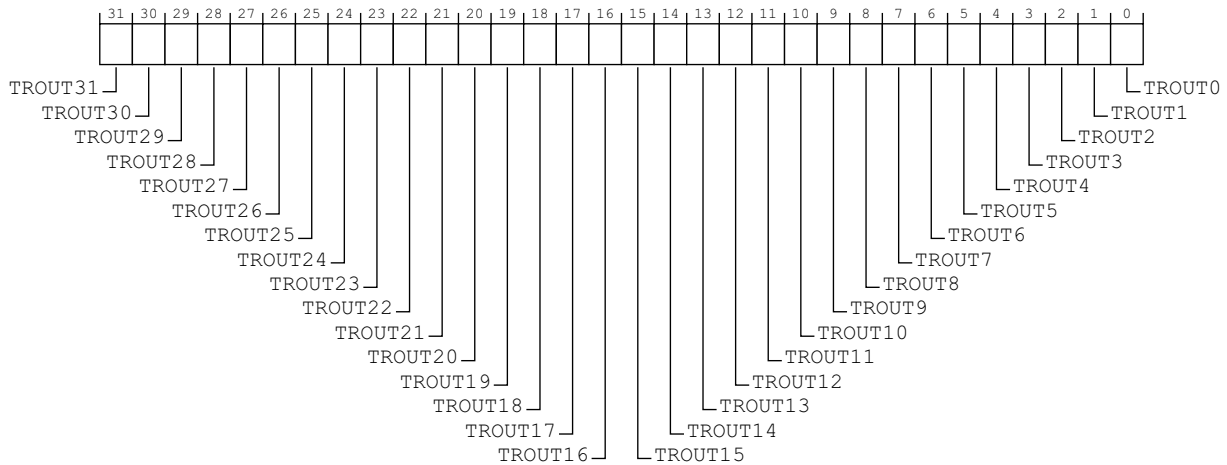

Configurations

CTITRIGOUTSTATUS is in the Debug power domain.

Attributes

CTITRIGOUTSTATUS is a 32-bit register.

Field descriptions

TROUT<n>, bit [n], for n = 31 to 0

Trigger output <n> status.

Bits [31:N] are RAZ. N is the value in [CTIDEVID.NUMTRIG](#).

If $n < N$, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

0b0 Output trigger n is inactive.

0b1 Output trigger n is active.

Otherwise when $n < N$ it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

Accessing the CTITRIGOUTSTATUS:

CTITRIGOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x134	CTITRIGOUTSTATUS

This interface is accessible as follows:

- Accesses to this register are RO.

Part I

Memory-mapped Components of the Armv8 Architecture

Chapter I1

Requirements for Memory-mapped Components

This chapter provides some additional information about memory-mapped components. It contains the following sections:

- *Supported access sizes on page I1-7656.*
- *Synchronization of memory-mapped registers on page I1-7658.*
- *Access requirements for reserved and unallocated registers on page I1-7660.*

11.1 Supported access sizes

The information in this section applies to all accesses to memory-mapped components of the Armv8 architecture, unless a register or component description explicitly states otherwise.

The memory access sizes that are supported by any peripheral are IMPLEMENTATION DEFINED by the peripheral.

When `HaveSecureExtDebugView() == TRUE`, each debug component has a Secure and Non-secure view. The Secure view of a debug component is mapped into Secure physical memory and the Non-secure view of a debug component is mapped into Non-secure memory. Apart from access conditions, the Non-secure and Secure views of the debug components are identical.

An implementation of a memory-mapped component that is compatible with the Armv8 architecture must support the following:

- Word-aligned 32-bit accesses to access 32-bit registers.
- If any PE in the system implements AArch32, word-aligned 32-bit accesses to either half of a 64-bit register that is mapped to a doubleword-aligned pair of adjacent 32-bit locations.

———— **Note** —————

Some memory-mapped components of the Armv8 architecture require support for word-aligned 32-bit accesses to either half of a 64-bit memory mapped register regardless of whether any PE in the system implements AArch32. These include:

- The memory-mapped interface to the external debug and CTI registers that are described in [Chapter H9 External Debug Register Descriptions](#).
 - The memory-mapped interfaces to the Generic Timer registers that are described in [Chapter I2 System Level Implementation of the Generic Timer](#).
 - The memory-mapped interfaces to the Performance Monitors registers that are described in [Chapter I3 Recommended External Interface to the Performance Monitors](#).
 - The memory-mapped interfaces to the Activity Monitors registers that are described in [Chapter I4 Recommended External Interface to the Activity Monitors](#).
- Doubleword-aligned 64-bit accesses to access 64-bit registers that are mapped to a doubleword-aligned pair of adjacent 32-bit locations.

All registers are only single-copy atomic at word granularity. This means that for 64-bit accesses to a 64-bit register, the system might generate a pair of 32-bit accesses. The order in which the two halves are accessed is not specified.

The following accesses are not supported:

- Byte accesses.
- Halfword accesses.
- Unaligned word accesses. These accesses are not word single-copy atomic.
- Unaligned doubleword accesses. These accesses are not doubleword single-copy atomic.
- Doubleword accesses to a pair of 32-bit locations that are not a doubleword-aligned pair that forms a 64-bit register.
- Quadword accesses or higher accesses.
- Exclusive accesses.

For unsupported accesses, it is CONSTRAINED UNPREDICTABLE whether:

- The access generates an External abort or not.
- The defined side-effects of a read occur or not. A read returns UNKNOWN values.
- A write is ignored or sets the accessed register or registers to UNKNOWN.
- The access generates a fault handling interrupt or not. A read returns UNKNOWN data.

For memory-mapped accesses from a PE that complies with an Arm architecture, the single-copy atomicity rules for the instruction, the type of instruction, and the type of memory that is accessed, determine the size of the access that is made by an instruction. [Example 11-1 on page 11-7657](#) shows this.

Example I1-1 Access sizes for memory-mapped accesses

Two Load Doubleword instructions that are made to consecutive doubleword-aligned locations generate a pair of single-copy atomic doubleword reads. However, if the accesses are made to Normal memory or Device-GRE memory they might appear as a single quadword access that is not supported by the peripheral.

The Armv8 architecture does not require the size of each element that is accessed by a multi-register load or store instruction to be identifiable by the memory system beyond the PE. Unless otherwise specified by the component, any access to a memory-mapped component of the Armv8 architecture is defined to be beyond the PE.

Software must use a Device-nGRE or stronger memory type, and only single register load and store instructions, to create memory accesses that are supported by the peripheral. For more information, see [Memory types and attributes on page B2-165](#).

11.2 Synchronization of memory-mapped registers

This section describes the synchronization requirements for the memory-mapped accesses to System registers.

This section refers to accesses to external system control registers as external reads and external writes. It refers to accesses to System registers as direct reads, direct writes, indirect reads, and indirect writes.

———— **Note** —————

[Synchronization requirements for AArch64 System registers on page D13-3041](#) and [Synchronization of changes to AArch32 System registers on page G8-6443](#) define direct read, direct write, indirect read, and indirect write, and classifies external reads as indirect reads and external writes as indirect writes.

Writes to the same register are serialized, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes. Unless otherwise stated, external writes to different registers are not necessarily observed in the same order by all observers as the order in which they complete.

Explicit synchronization is not required for an external read or an external write by an external agent to be observable to a following external read or external write by that agent to the same register using the same address, and so is never required for registers that are accessible as external system control registers.

Unless required to be observable to all observers in finite time, without explicit synchronization, explicit synchronization is normally required following an external write to any register for that write to be observable by:

- A direct access.
- An indirect read by an instruction.
- An external read of the register using a different address.

This means that an external write by an external agent is guaranteed to have an effect on subsequent instructions executed by the PE only if all of the following are true:

- The write has completed.
- The PE has executed a Context synchronization event.
- The Context synchronization event was executed after the write completed.

The order and synchronization of direct reads and direct writes of System registers is defined by:

- [Synchronization requirements for AArch64 System registers on page D13-3041](#)
- [Synchronization of changes to AArch32 System registers on page G8-6443](#)

The external agent must be able to guarantee completion of a write. For example, the agent can:

- Mark the memory as Device-nGnRnE and executing a DSB barrier, if the system supports this property.
- If the register is read/write and reads are not destructive, read back the value written.
- Use some guaranteed property of the connection between the PE and the external agent.

The external agent and PE can guarantee ordering by, for example, passing messages in an ordered way with respect to the external write and the Context synchronization event, and relying on the memory ordering rules provided by the memory model.

External reads and external write complete in the order in which they arrive at the PE. For accesses to different register locations, the external agent must create this order. The agent can:

- Mark the memory as Device-nGnRnE or Device-nGnRE.
- Use the appropriate memory barriers.
- Rely on some guaranteed property of the connection between the PE and the external agent.

However, the external agent cannot force the synchronization of completed writes.

In a simple sequential execution, an indirect write that occurs as a side-effect of an access happens atomically with the access, meaning no other accesses are allowed between the register access and its side-effect.

Without explicit synchronization to guarantee the order of the accesses, where the same register is accessed by two or more of a System register access instruction, and external agent, and autonomous asynchronous event, or as a result of a memory-mapped access, the behavior must be as if the accesses occurred atomically and in any order. This applies even if the accesses occur simultaneously.

For example, some registers have the property that for certain bits a write of 0 is ignored and a write of 1 has an effect. This means the simultaneous writes must be merged.

I1.3 Access requirements for reserved and unallocated registers

This section describes the access requirements for reserved and unallocated memory-mapped components.

The following information relates to certain types of reserved accesses:

- Reads and writes of unallocated locations. These accesses are reserved for the architecture.
- Reads and writes of locations for features that are not implemented, including:
 - OPTIONAL features that are not implemented.
 - Breakpoints and watchpoints that are not implemented.
 - Performance Monitors counters that are not implemented.
 - CTI triggers that are not implemented.
 - Error records that are not implemented.

These accesses are reserved.

- Reads of WO locations. These accesses are reserved for the architecture.
- Writes to RO locations. These accesses are reserved for the architecture.

Reserved accesses are normally RAZ/WI. However, software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture. Software must treat reserved accesses as RES0.

Chapter I2

System Level Implementation of the Generic Timer

This chapter defines the system level implementation of the Generic Timer. It contains the following sections:

- [About the Generic Timer specification on page I2-7662.](#)
- [Memory-mapped counter module on page I2-7664.](#)
- [Memory-mapped timer components on page I2-7668.](#)

Note

- [Generic Timer memory-mapped register descriptions on page I5-7805](#) describes the System level Generic Timer registers. These registers are memory-mapped.
 - [Appendix K5 Additional Information for Implementations of the Generic Timer](#) gives additional information, that does not form part of the architectural definition of a system level implementation of the Generic Timer.
 - [Chapter D11 The Generic Timer in AArch64 state](#) gives a general description of the AArch64 state view of the Generic Timer, and describes the AArch64 System register interface to the Generic Timer.
 - [Chapter G6 The Generic Timer in AArch32 state](#) gives a general description of the AArch32 state view of the Generic Timer, and describes the AArch32 System register interface to the Generic Timer.
-

I2.1 About the Generic Timer specification

[Chapter D11 *The Generic Timer in AArch64 state*](#) describes the Arm Generic Timer and its implementation as seen from AArch64 state. [Chapter G6 *The Generic Timer in AArch32 state*](#) describes the Arm Generic Timer and its implementation as seen from AArch32 state. These chapters include the definition of the low-latency System register interface to the Generic Timer. However, the Arm Generic Timer architecture also defines a memory-mapped component, that comprises:

- A memory-mapped counter module, that controls the generation of the Count value used by the Generic Timer.
This memory-mapped counter module is required in any Arm Generic Timer implementation that requires software control of the Count value of the Generic Timer.
- Optional memory-mapped timer modules. These give a standardized way of providing timers for programmable system components other than PEs that implement the Arm architecture.

[The full set of Generic Timer components on page D11-3009](#) summarizes these components as seen from AArch64 state, and [The full set of Generic Timer components on page G6-6405](#) summarizes them as seen from AArch32 state. [The system level components of the Generic Timer on page I2-7663](#) summarizes the system level components.

I2.1.1 Registers in the system level implementation of the Generic Timer

Registers that control components of the system level implementation of the Generic Timer are grouped into *frames*. This specification defines the registers in each frame, and their offsets within the frame. The system defines the position of each frame in the memory map. This means the base addresses for each frame are IMPLEMENTATION DEFINED.

———— **Note** —————

The final 12 words of the first or only 4KB block of a register memory frame is an ID block.

Each frame must be in its own memory page, or memory protection region, and must be aligned to the size of the translation granule or protection granule.

———— **Note** —————

When a system level implementation of the Generic Timer is accessed by a PE:

- Using a VMSA, each frame is in its own memory page, aligned to the size of the translation granule.
- Using a PMSA, each frame is in its own memory protection region, aligned to the size of the memory protection granule.

The following sections give more information about the requirements for the system level Generic Timer component:

- [Endianness and supported access sizes on page I2-7662](#).
- [Power and reset domains for the system level implementation of the Generic Timer on page I2-7663](#).

Endianness and supported access sizes

All memory-mapped peripherals defined in the Arm architecture must be little-endian. This means the system-level Generic Timer registers, and the register frames, are little-endian.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the memory-mapped Generic Timer registers implementations must:

- Comply with the requirements of [Supported access sizes on page I1-7656](#).
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.

Power and reset domains for the system level implementation of the Generic Timer

The power and reset domains of the system level implementation of the Generic Timer are IMPLEMENTATION DEFINED as part of the system implementation. In register descriptions, they are called Timer resets to indicate they can be outside the PE power and reset domains defined by the remainder of this manual.

The Arm architecture requires that the `CNTCR`.{FCREQ, EN} and `CNTRSR`.FACK fields reset to 0. These Timer reset values apply only on powerup of the power domain in which the registers are implemented or a reset of the reset domain in which they are implemented.

Every other register, or register field, of a system level implementation of the Generic Timer resets to a value that is architecturally UNKNOWN if it has a meaningful reset value. These Timer resets apply on powerup of the power domain in which the register is implemented, and on a reset of the reset domain in which it is implemented.

I2.1.2 The system level components of the Generic Timer

Each system level component has one or two register frames. The possible system level components are:

The memory-mapped counter module, required

This module controls the system counter. It has two frames:

- A control frame, `CNTControlBase`.
- A status frame, `CNTReadBase`.

Memory-mapped counter module on page I2-7664 describes this component.

The memory-mapped timer control module, required

The system level implementation of the Generic Timer can provide up to eight timers, and the memory-mapped timer control module identifies:

- Which timers are implemented.
- The features of each implemented timer.

This module has a single frame, `CNTCTLBase`.

The CNTCTLBase frame on page I2-7668 describes this frame.

Memory-mapped timers, optional

An implemented memory-mapped timer:

- Must provide a privileged view of the timer, in the `CNTBaseN` frame.
- Optionally provides an unprivileged view of the timer in the `CNTELOBaseN` frame.

N is the timer number, and the corresponding frame number, in the range 0-7.

The CNTBaseN and CNTELOBaseN frames on page I2-7669 describes these frames.

I2.2 Memory-mapped counter module

The memory-mapped counter module provides top-level control of the system counter. The `CNTControlBase` frame holds the registers for the memory-mapped counter, and provides:

- An RW control register, `CNTCR`, that provides:
 - An enable bit for the system counter.
 - An enable bit for Halt-on-debug. For more information, see [Halt-on-debug on page I2-7666](#).
 - A field that can be written to request a change to the update frequency of the system counter, with a corresponding change to the increment made at each update. This mechanism means that, for example, if the update frequency is halved, the increment at each update is doubled.
For more information, see [Control of counter operating frequency and increment on page I2-7665](#).Writes to this register are rare. In a system that supports two Security states, this register is writable only by Secure writes.
- A RO status register, `CNTSR`, that provides:
 - A bit that indicates whether the system counter is halted because of an asserted Halt-on-debug signal.
 - A field that indicates the current update frequency of the system counter. This field can be polled to determine when a requested change to the update frequency has been made.
- Two contiguous 32-bit RW registers that hold the current system counter value, `CNTCV`. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.
The system counter must be disabled before writing to these registers, otherwise the effect of the write is UNPREDICTABLE.
Writes to these registers are rare. In a system that supports two Security states, these registers are writable only by Secure writes.
- A *Frequency modes table* of one or more 32-bit entries, where:
 - The first entry in the table defines the *base frequency* of the system counter. This is the maximum frequency at which the counter updates.
 - Each subsequent entry in the table defines an alternative frequency of the system counter, that must be an exact divisor of the base frequency.A 32-bit zero entry immediately follows the last table entry.
This table can be RO or RW. For more information, see [The Frequency modes table on page I2-7665](#).

In addition, the `CNTReadBase` frame includes a read-only copy of the system counter value, `CNTCV`, as two contiguous 32-bit RO registers. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

[Counter module control and status register summary on page I2-7666](#) describes `CNTReadBase` and `CNTControlBase` memory maps, and the registers in each frame.

I2.2.1 Control of counter operating frequency and increment

The system counter has a fixed *base frequency*, and must maintain the required counter accuracy, meaning Arm recommends that it does not gain or lose more than ten seconds in a 24-hour period, see *The system counter on page D11-3010*. However, the counter can increment at a lower frequency than the base frequency, using a correspondingly larger increment. For example, it can increment by four at a quarter of the base frequency. Any lower-frequency operation, and any switching between operating frequencies, must not reduce the accuracy of the counter.

Control of the system counter frequency and increment is provided only through the memory-mapped counter module. The following sections describe this control:

- *The Frequency modes table on page I2-7665.*
- *Changing the system counter and increment on page I2-7665.*

The Frequency modes table

The Frequency modes table starts at offset 0x20 in the `CNTControlBase` frame.

Table entries are 32-bits, and each entry specifies a system counter update frequency, in Hz.

The first entry in the table specifies the base frequency of the system counter.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

$$\text{increment} = (\text{base_frequency}) / (\text{selected_frequency})$$

A 32-bit word of zero value marks the end of the table. That is, the word of memory immediately after the last entry in the table must be zero.

The only required entry in the table is the entry for the base frequency.

Typically, the Frequency modes table is in RO memory. However, a system implementation might use RW memory for the table, and initialize the table entries as part of its startup sequence. Therefore, the `CNTControlBase` memory map shows the table region as RO or RW.

Arm strongly recommends that the Frequency modes table is not updated once the system is running.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED, up to this limit.

———— Note —————

- Arm considers it likely that implementations will require significantly fewer entries than the architectural limit.
- In the `CNTControlBase` frame, the offset range 0x0C0-0x0FC can be used for IMPLEMENTATION DEFINED registers. If any registers are defined in this space, then the Frequency modes table cannot extend beyond offset 0x0B8, with a zero word at offset 0x0BC. This means that if any IMPLEMENTATION DEFINED registers are defined the maximum number of entries in the table is 40, including the zero-word end marker.

Changing the system counter and increment

The value of the `CNTCR.FCREQ` field specifies which entry in the Frequency modes table specifies the system counter update frequency.

Changing the value of `CNTCR.FCREQ` requests a change to the system counter update frequency. To ensure the frequency change does not affect the overall accuracy of the counter, a change is made as follows:

- When changing from a higher frequency to a lower frequency, the counter:
 1. Continues running at the higher frequency until the count reaches an integer multiple of the required lower frequency.
 2. Switches to operating at the lower frequency.

- When changing from a lower frequency to a higher frequency, the counter:
 1. Waits until the end of the current lower-frequency cycle.
 2. Makes the counter increment required for operation at that lower frequency.
 3. Switches to operating at the higher frequency.

When the frequency has changed, [CNTSR](#) is updated to indicate the new frequency. Therefore, a system component that is waiting for a frequency change can poll [CNTSR](#) to detect the change.

I2.2.2 Halt-on-debug

The [CNTCR](#) register provides an enable bit for an OPTIONAL Halt-on-debug signal.

When the [CNTCR.HDBG](#) bit is set to 1, and the Halt-on-debug signal is implemented and asserted, the system counter is halted. Otherwise, the system counter ignores the state of this signal.

Arm recommends that a system counter implements a Halt-on-debug signal that can be controlled by a debugger using the Embedded Cross-Trigger (ECT) using a system-level cross-trigger interface that includes:

- A debug request output trigger event that asserts the Halt-on-debug signal.
- A restart request output trigger event that deasserts the Halt-on-debug signal.

For more information, see [About the Embedded Cross-Trigger \(ECT\) on page H5-7422](#).

———— Note —————

Software must use the Halt-on-debug enable bit to ensure that the timers cannot be halted maliciously in an attempt to prohibit progress.

For more information about Halt-on-debug, contact Arm.

I2.2.3 Counter module control and status register summary

The Counter module control and status registers are memory-mapped registers in the following register memory frames:

- A control frame, with base address [CNTControlBase](#).
- A status frame, with base address [CNTReadBase](#).

Each of these register memory frames is in its own [memory page](#) or [memory protection region](#), and the frame base address points to the start of this region. Each base address must be aligned to the size of the translation granule or protection granule.

———— Note —————

Each frame of a memory-mapped Generic Timer takes the name of its base address.

In each register memory frame, the memory at offset [0xFD0-0xFFF](#) is reserved for twelve 32-bit IMPLEMENTATION DEFINED ID registers, see the [CounterID<n>](#) register descriptions for more information.

———— Note —————

The Arm architecture requires memory-mapped peripherals to be little-endian, and therefore the counter is little-endian.

In an implementation that supports Secure and Non-secure memory maps, [CNTControlBase](#) is accessible only by Secure accesses.

[Table I2-1 on page I2-7667](#) shows the [CNTControlBase](#) control registers, in order of their offsets from the [CNTControlBase](#) base address, for an implementation that includes registers in the IMPLEMENTATION DEFINED register space [0x0C0-0x0FC](#), and also has fewer than 39 [CNTFID<n>](#) registers. [The Frequency modes table on page I2-7665](#) describes how this memory map differs if more [CNTFID<n>](#) registers are implemented.

Generic Timer memory-mapped register descriptions on page I5-7805 describes each of these registers.

Table I2-1 CNTControlBase memory map

Offset	Name	Type	Description
0x000	CNTCR	RW	Counter Control Register.
0x004	CNTSR	RO	Counter Status Register.
0x008	CNTCV[31:0]	RW	Counter Count Value register.
0x00C	CNTCV[63:32]	RW	
0x010	CNTSCR ^a	RW	Counter Scale Register.
0x014-0x018	-	RES0	Reserved.
0x01C	CNTID ^a	RO	Counter Identification Register.
0x020	CNTFID0	RO or RW	Frequency modes table, and end marker.
0x020+4n	CNTFID<n>	RO or RW	For more information, see <i>The Frequency modes table on page I2-7665</i> .
0x024+4n	-	RO or RW, RAZ	
(0x028+4n)-0x0BC	-	RO, RES0	Reserved.
0x0C0-0x0FC	-	IMPLEMENTATION DEFINED	Reserved for IMPLEMENTATION DEFINED registers.
0x100-0xFCC	-	RO, RES0	Reserved.
0xFD0-0xFFC	CounterID<n>	RO	Counter ID registers 0-11.

a. Implemented only if FEAT_CNTSC is implemented.

Table I2-2 on page I2-7667 shows the CNTReadBase control registers, in order of their offsets from the CNTReadBase base address. *Generic Timer memory-mapped register descriptions on page I5-7805* describes each of these registers.

Table I2-2 CNTReadBase memory map

Offset	Name	Type	Description
0x000	CNTCV[31:0]	RO	Counter Count Value register
0x004	CNTCV[63:32]	RO	
0x008-0xFCC	-	RES0	Reserved
0xFD0-0xFFC	CounterID<n>	RO	Counter ID registers 0-11

I2.3 Memory-mapped timer components

This part of the Arm Generic Timer specification defines an optional memory-mapped timer component. This can be implemented as part of any programmable system component that does not incorporate a System register mapped Arm Generic Timer, to provide that system component with the timer functionality of an Arm Generic Timer.

The memory map consists of up to eight timer *frames*. The base address of a frame is `CNTBaseN`, where *N* numbers from 0 up to a maximum permitted value of 7.

Each `CNTBaseN` timer frame:

- Provides its own set of timers and associated interrupts.
- Is implemented in its own [memory page](#) or [memory protection region](#).
- Is implemented at a base address, identified as `CNTBaseN`, that is aligned to the size of the [translation granule](#) or [memory protection region](#).

For each implemented `CNTBaseN` frame the system can optionally provide an unprivileged view of the frame, described as the EL0 view of the frame. The base address of this second view of the `CNTBaseN` frame is `CNTELOBaseN`.

Note

In the naming of the registers associated with a `CNTBaseN` or `CNTELOBaseN` frame, the value of *N* is represented as `<n>`, for example `CNTACR<n>`.

If a `CNTELOBaseN` frame is implemented:

- Is implemented in its own [memory page](#) or [memory protection region](#) and is aligned to the size of the [translation granule](#) or [memory protection region](#).
- All registers visible in `CNTBaseN`, except for `CNTVOFF` and `CNTELOACR`, can be visible in `CNTELOBaseN`.
 - Control fields in `CNTELOACR` determine whether each register is visible.
- The offsets of all visible registers are the same as their offsets in the `CNTBaseN` frame.

In addition to the implemented `CNTBaseN` and `CNTELOBaseN` frames, the system must provide a single control frame at base address `CNTCTLBase`. `CNTCTLBase` must be implemented in its own [memory page](#) or [memory protection region](#) and is aligned to the size of the [translation granule](#) or [memory protection region](#).

The system defines the position of each frame in the memory map. This means the values of each of the `CNTBaseN`, `CNTELOBaseN`, and `CNTCTLBase` base addresses is IMPLEMENTATION DEFINED.

Note

The Arm architecture requires memory-mapped peripherals to be little-endian, and therefore the memory-mapped timers are little-endian.

The following sections describe the implementation of a memory-mapped view of the counter and timer:

- [The `CNTCTLBase` frame on page I2-7668.](#)
- [The `CNTBaseN` and `CNTELOBaseN` frames on page I2-7669.](#)

Note

[Providing a complete set of features in a system level implementation on page K5-8468](#) gives an implementation example for a system level Generic Timer implementation that provides equivalent features to a System registers Generic Timer implementation in a PE that includes all of the Exception levels.

I2.3.1 The `CNTCTLBase` frame

The `CNTCTLBase` frame contains:

- An identification register for the features of the memory-mapped counter and timer implementation.
- Access controls for each `CNTBaseN` frame.
- A virtual offset register for frames that implement a virtual timer.

Table I2-3 on page I2-7669 shows the CNTCTLBase registers, in order of their offsets from the CNTCTLBase base address.

———— **Note** ————

CNTFRQ and CNTVOFF registers are also implemented in a System register interface to the Generic Timer.

Generic Timer memory-mapped register descriptions on page I5-7805 describes each of these registers.

Table I2-3 CNTCTLBase memory map

Offset	Register	Type	Security ^a	Description
0x000	CNTFRQ ^b	RW	Secure only	Counter Frequency register.
0x004	CNTNSAR	RW	Secure only	Counter Non-Secure Access register.
0x008	CNTTIDR	RO	Both	Counter Timer ID register.
0x00C- 0x03F	-	RES0	-	Reserved.
0x040+4N ^c	CNTACR<n>	RW	Configurable ^d	Counter Access Control register <i>N</i> .
0x060- 0x07F	-	RES0	-	Reserved.
0x080+8N ^c	CNTVOFF<n>[31:0] ^b	RW ^e	Configurable ^d	Virtual Offset register <i>N</i> . If the CNTBaseN frame has virtual timer capability then CNTVOFF is implemented as an RW register, otherwise its location is RAZ/WI.
0x084+8N ^c	CNTVOFF<n>[63:32] ^b	RW ^e		
0x0C0-0x0FC	-	RES0	-	Reserved.
0x100-0x7FC	-	-	-	IMPLEMENTATION DEFINED.
0x800-0xFBC	-	RES0	-	Reserved.
0xFC0-0xFCF	-	-	-	IMPLEMENTATION DEFINED.
0xFD0- 0xFFC	CounterID<n>	RO	Both	Counter ID registers 0-11.

- Access security requirement in an implementation that supports two Security states. In an implementation that does not support multiple Security states all registers are accessible as shown in the *Type* column.
- These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in *Generic Timer registers on page D13-4139* and *Generic Timer registers on page G8-7253*. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.
- Implemented for each value of *N* from 0 to 7 for which a CNTBaseN frame is implemented.
- The CNTNSAR determines the Non-secure accessibility of the CNTACR<n>s and the CNTVOFF<n> in the CNTCTLBase frame. For more information, see the register descriptions.
- Address is reserved, RAZ/WI if register not implemented.

All implementations of the Generic Timer include the virtual counter. Therefore, conceptually, all implementations include the CNTVOFF register that defines the virtual offset between the physical count and the virtual count. If a memory-mapped Generic Timer component does not distinguish between real time and virtual time, then it can implement CNTVOFF as RAZ/WI. Otherwise CNTVOFF is an RW register, and Arm strongly recommends that the system only permits access to CNTVOFF from EL2 or higher.

I2.3.2 The CNTBaseN and CNTEL0BaseN frames

Each CNTBaseN frame, or {CNTBaseN, CNTEL0BaseN} pair of frames, provides a memory-mapped counter and timer, see:

- The CNTBaseN frame on page I2-7670.*
- The CNTEL0BaseN frame on page I2-7670.*
- CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7671.*

The CNTBaseN frame

Table I2-4 on page I2-7670 shows the CNTBaseN registers, in order of their offsets from the CNTBaseN base address. Whether a frame includes a virtual timer is IMPLEMENTATION DEFINED. If it does not, then memory at offsets 0x030-0x03C is RAZ/WI. Except for CNTEL0ACR and the CounterID<n> registers, equivalent registers are also implemented in a System register interface to the timer component of a Generic Timer.

Generic Timer memory-mapped register descriptions on page I5-7805 describes each of these registers.

Table I2-4 CNTBaseN memory map

Offset	Register	Type	Description
0x000	CNTPCT[31:0] ^a	RO	Physical Count register.
0x004	CNTPCT[63:32] ^a	RO	
0x008	CNTVCT[31:0] ^a	RO	Virtual Count register.
0x00C	CNTVCT[63:32] ^a	RO	
0x010	CNTFRQ ^a	RO ^c	Counter Frequency register.
0x014	CNTEL0ACR	RW ^b	Counter EL0 Access Control Register, optional in the CNTBaseN memory map.
0x018	CNTVOFF[31:0] ^a	RO ^c	Virtual Offset register. If CNTVOFF in the CNTCTLBase frame is an RW register, a read of this register returns the value of that register. Otherwise is RAZ.
0x01C	CNTVOFF[63:32] ^a	RO ^c	
0x020	CNTP_CVAL[31:0] ^a	RW	Physical Timer CompareValue register.
0x024	CNTP_CVAL[63:32] ^a	RW	
0x028	CNTP_TVAL ^a	RW	Physical TimerValue register.
0x02C	CNTP_CTL ^a	RW	Physical Timer Control register.
0x030	CNTV_CVAL[31:0] ^a	RW ^b	Virtual Timer CompareValue register, optional in the CNTBaseN memory map.
0x034	CNTV_CVAL[63:32] ^a	RW ^b	
0x038	CNTV_TVAL ^a	RW ^b	Virtual TimerValue register, optional in the CNTBaseN memory map.
0x03C	CNTV_CTL ^a	RW ^b	Virtual Timer Control register, optional in the CNTBaseN memory map.
0x040-0xFCF	-	RES0	Reserved.
0xFD0-0xFFC	CounterID<n>	RO	Counter ID registers 0-11.

- a. These registers are also defined in the System register interface to the Generic Timer, and therefore are also described in *Generic Timer registers on page D13-4139* and *Generic Timer registers on page G8-7253*. The bit assignments of the registers are identical in the System register interface and in the memory-mapped system level interface.
- b. Address is reserved, RAZ/WI if register not implemented.
- c. The CNTCTLBase frame includes an RW view of this register.

The CNTEL0BaseN frame

For any value of N, the layout of the registers in the CNTEL0BaseN frame is identical to the CNTBaseN frame, except that, in the CNTEL0BaseN frame:

- CNTVOFF is never visible, and the memory at 0x018-0x01C is RAZ/WI.
- CNTEL0ACR is never visible, and the memory at 0x014 is RAZ/WI.

- If implemented in the `CNTBaseN` frame, `CNTELOACR` controls whether `CNTPCT`, `CNTVCT`, `CNTFRQ`, the Physical Timer, and the Virtual Timer registers are visible in the `CNTELOBaseN` frame.
If `CNTELOACR` is not implemented then these registers are not visible in the `CNTELOBaseN` frame, and their addresses in that frame are RAZ/WI.

If an implementation supports 64-bit atomic accesses, then `CNTPCT`, `CNTVCT`, `CNTVOFF`, `CNTP_CVAL`, and `CNTV_CVAL` must be accessible as atomic 64-bit values.

CNTCTLBase status and control fields for the `CNTBaseN` and `CNTELOBaseN` frames

In the `CNTCTLBase` frame:

`CNTTIDR` controls:

- Whether each `CNTBaseN` frame is implemented.
- If a `CNTBaseN` frame is implemented, whether:
 - That `CNTBaseN` frame has virtual timer capability.
 - A corresponding `CNTELOBaseN` frame is implemented.

`CNTNSAR` controls:

In an implementation that recognizes two Security states, determines whether each implemented `CNTBaseN` frame, and any corresponding `CNTELOBaseN` frame, is accessible by Non-secure accesses.

This control also determines whether, in the `CNTCTLBase` frame, the `CNTACR<n>` and `CNTVOFF<n>` registers are accessible by Non-secure accesses.

The `CNTACR<n>` registers control:

For each implemented `CNTBaseN` frame, the accessibility of the following registers in that frame:

- `CNTP_CTL`, `CNTP_CVAL`, and `CNTP_TVAL`.
- `CNTV_CTL`, `CNTV_CVAL`, and `CNTV_TVAL`.
- `CNTVOFF`.
- `CNTFRQ`.
- `CNTPCT`.
- `CNTVCT`.

For `CNTACR<n>`, the value of `<n>` corresponds to the value of `N` for the controlled `CNTBaseN` frame.

The `CNTVOFF<n>` registers provide:

For each implemented `CNTBaseN` frame that has virtual capability, the RW copy of the `CNTVOFF` register for that frame.

————— **Note** —————

In a `CNTBaseN` frame that has virtual timer capability the `CNTVOFF` register is RO.

For `CNTVOFF<n>`, the value of `<n>` corresponds to the value of `N` for the controlled `CNTBaseN` frame.

Chapter I3

Recommended External Interface to the Performance Monitors

This chapter describes the recommended external interface to the Performance Monitors. It contains the following section:

- [About the external interface to the Performance Monitors registers on page I3-7674.](#)

———— **Note** —————

[Performance Monitors external register descriptions on page I5-7689](#) describes the external view of the Performance Monitors registers.

I3.1 About the external interface to the Performance Monitors registers

Arm recommends that:

- An implementation provides the OPTIONAL external debug interface to the Performance Monitors registers.

———— **Note** —————

A debugger can use this interface to access counters in the Performance Monitors.

- The implementation includes the OPTIONAL support for memory-mapped access to the External debug interface.

———— **Note** —————

— Software running on any PE in a system can use this interface to access counters in the Performance Monitors.

— Privileged software should use the MMU to control access to this interface.

- The external debug interface is implemented as defined in [Appendix K2 Recommended External Debug Interface](#).

The following sections describe the memory-mapped views of the Performance Monitors registers:

- [Differences in the external views of the Performance Monitors registers on page I3-7674](#).
- [Synchronization of changes to the memory-mapped views on page I3-7675](#).
- [Access permissions for external views of the Performance Monitors on page I3-7675](#).

In this section, unless the context explicitly indicates otherwise, any reference to *a memory-mapped view* applies equally to a register view using:

- An access through an external debug interface.
- A memory-mapped access.

I3.1.1 Endianness and supported access sizes

When an implementation supports memory-mapped access to the external debug interface the interface is accessed as a little-endian memory-mapped peripheral. [External Performance Monitors registers summary on page I5-7686](#) gives the memory map of these registers.

The memory access sizes supported by any peripheral is IMPLEMENTATION DEFINED by the peripheral. For accesses to the external interface to the Performance Monitors registers implementations must:

- Comply with the requirements of [Supported access sizes on page I1-7656](#).
- Support word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.

I3.1.2 Differences in the external views of the Performance Monitors registers

An external view of the Performance Monitors registers accesses the same registers as the System registers interface described in [Performance Monitors Extension registers on page D7-2940](#), except that:

- The [PMSELR](#) is accessible only in the System registers interface.
- The following registers are accessible only in external views:
 - [PMCFGFR](#)
 - [PMDEVAFF0](#)
 - [PMDEVAFF1](#)
 - [PMLAR](#)
 - [PMLSR](#)
 - [PMAUTHSTATUS](#)

- PMDEVARCH
- PMDEVTYPE
- PMPIDR0
- PMPIDR1
- PMPIDR2
- PMPIDR3
- PMPIDR4
- PMCIDR0
- PMCIDR1
- PMCIDR2
- PMCIDR3

Performance Monitors external register descriptions on page 15-7689 describes these registers.

- The following controls do not affect the external views:
 - PMSELR.
 - PMUSERENR.
 - HDCR.{TPM, TPMCR, HPMN}.

Instead, see the register descriptions in *Chapter 15 External System Control Register Descriptions*.

13.1.3 Synchronization of changes to the memory-mapped views

Synchronization must comply with *Synchronization of memory-mapped registers on page 11-7658*.

In particular, if a Performance Monitor is visible in both System register and an external view, and is accessed simultaneously through these two mechanisms, the behavior must be as if the accesses occurred atomically and in any order. For more information, see *Synchronization of changes to the external debug registers on page H8-7462*.

13.1.4 Access permissions for external views of the Performance Monitors

For more information, see *External debug interface register access permissions on page H8-7468*.

Table 13-1 on page 13-7676 shows the access permissions for the Performance Monitors registers in a v8 Debug implementation. This table uses the following terms:

DLK	When FEAT_DoubleLock is implemented and locked, DoubleLockStatus() == TRUE, accesses to some registers produce an error. Applies to both interfaces.
EPMAD	When AllowExternalPMUAccess() == FALSE, external debug access is disabled for the access. If FEAT_Debugv8p4 is implemented, this applies only for Non-secure access to the register. See also <i>Behavior of a not permitted memory-mapped access on page H8-7467</i> .
Error	Indicates that the access gives an error response.
Default	This shows the default access permissions, if none of the conditions in this list prevent access to the register.
Off	The Core power domain is completely off, or in a low-power state where the Core power domain registers cannot be accessed, and EDPRSR.PU will read as zero.
<hr/> Note <hr/>	
	If debug power is off, then all external debug interface accesses return an error.
OSLK	When the OS Lock is locked, OSLAR_EL1.OSLK == 1, accesses to some registers produces an error. This column shows the effect of this control on accesses using the external debug interface.
SLK	This indicates the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the optional Software Lock is locked. See <i>Register access permissions for memory-mapped accesses on page H8-7466</i> .

For all other accesses, this column is ignored.

- Indicates that the control has no effect on the behavior of the access:
 - If no other control affects the behavior, the Default access behavior applies.
 - However, another control might determine the behavior.

Table 13-1 Access permissions for the Performance Monitors registers

Offset	Register	Domain	Off	DLK	OSLK	EPMAD	Default	SLK
0x000+8xn	PMEVCNTR<n>_EL0 ^a	Core	Error	Error	Error	Error	RW	RO
0x0F8	PMCCNTR_EL0[31:0]	Core	Error	Error	Error	Error	RW	RO
0x0FC	PMCCNTR_EL0[63:32]	Core	Error	Error	Error	Error	RW	RO

0xE00	PMCFGR	Core	Error	Error	Error	Error	RO	RO
0xE04	PMCR_EL0	Core	Error	Error	Error	Error	RW	RO
0xE20	PMCEID0	Core	Error	Error	Error	Error	RO	RO
0xE24	PMCEID1	Core	Error	Error	Error	Error	RO	RO
0xE28	PMCEID2	Core	Error	Error	Error	Error	RO	RO

Table I3-1 Access permissions for the Performance Monitors registers (continued)

Offset	Register	Domain	Off	DLK	OSLK	EPMAD	Default	SLK
0xE2C	PMCEID3	Core	Error	Error	Error	Error	RO	RO
0xE40	PMMIR	Core	Error	Error	Error	Error	RO	RO
0xE80-0xEFC	Integration registers	-	Access is IMPLEMENTATION DEFINED					
0xF00-0xFFC	Management registers and CoreSight compliance on page K2-8432							

- a. Implemented event counters only. *n* is the counter number.
- b. Implemented only if [FEAT_PCSRv8p2](#) is implemented. See [Chapter H7 The PC Sample-based Profiling Extension](#).
- c. Only if the OPTIONAL PMSWINC_EL0 register is implemented in the external debug interface.

13.1.5 Power domains and Performance Monitors registers reset

For Armv8-A implementations, Arm recommends that Performance Monitors are implemented as part of the Core power domain, not as part of a separate Debug power domain. There is no interface to access the Performance Monitors registers when the Core power domain is powered down.

A Warm or Cold reset sets the Performance Monitors registers to their reset values. An External Debug reset does not change the values of the Performance Monitors registers.

For more information about the reset scheme recommended for a v8 Debug implementation see [Chapter H6 Debug Reset and Powerdown Support](#).

[Table I3-2 on page 13-7677](#) shows the Performance Monitors register resets for writable register fields. The column headings use the following terms:

- 64** This is the architectural reset value when resetting into AArch64 state.
- 32** This is the architectural reset value when resetting into AArch32 state.
- This indicates an IMPLEMENTATION DEFINED reset value on the specified reset. This might be UNKNOWN.

———— **Note** —————

This table does not include:

- Read-only identification registers and fields that have a fixed value. In this case, the reset value is that fixed value. An example of this is [PMCR_EL0.N](#).
- Write-only registers and fields that only have an effect on writes. These do not have a reset value. An example of this is [PMSWINC_EL0](#).
- IMPLEMENTATION DEFINED registers. In this case, the reset domains are IMPLEMENTATION DEFINED. The reset values are IMPLEMENTATION DEFINED and might be UNKNOWN.

Table I3-2 Performance Monitors System register resets

Register	Domain	Field	64	32	Description
PMCR_EL0	Warm	DP	-	0	Disable PMCCNTR_EL0 when prohibited
		X	-	0	Export enable
		D	-	0	Clock divider
		E	0	0	Performance Monitors enable

Table I3-2 Performance Monitors System register resets (continued)

Register	Domain	Field	64	32	Description
PMCNTENSET_EL0 PMCNTENCLR_EL0	Warm	-	-	-	All fields in register
PMOVSSSET_EL0 PMOVSSCLR_EL0	Warm	-	-	-	All fields in register
PMSELR_EL0	Warm	SEL	-	-	Selected event counter

		EN	-	0	Enable Performance Monitors access in EL0
PMINTENSET_EL1 PMINTENCLR_EL1	Warm	-	-	-	All fields in register

Chapter I4

Recommended External Interface to the Activity Monitors

This chapter describes the optional external interface to the Activity Monitors Extension registers. It contains the following section:

- [About the external interface to the Activity Monitors Extension registers on page I4-7680](#)

———— **Note** —————

[Activity Monitors external register descriptions on page I5-7767](#) describes the external view of the Activity Monitors Extension registers.

14.1 About the external interface to the Activity Monitors Extension registers

If an implementation supports the Activity Monitors Extension, it may optionally support an external memory-mapped interface to the Activity Monitors Extension, and, if so, may further optionally support CoreSight device registers and ID registers.

The memory access sizes supported by the external interface to the Activity Monitors registers:

- Comply with the requirements of [Supported access sizes on page I1-7656](#).
- Include word-aligned 32-bit accesses to access 32-bit registers or either half of a 64-bit register mapped to a doubleword-aligned pair of adjacent 32-bit locations, even if no PE in the system implements AArch32.

The base address of the memory-mapped view is aligned to a 4KB boundary, but is otherwise IMPLEMENTATION DEFINED. The address offsets for the memory-mapped view are given in [Table I5-2 on page I5-7765](#).

14.1.1 Differences in the external views of the Activity Monitors Extension registers

The external memory-mapped interface view of the Activity Monitors Extension registers accesses the same registers as the System registers interface to the registers, except that:

- The following are accessible only in the System registers interface:
 - [AMUSERENR_EL0](#)
 - [AMEVCNTVOFF0<n>_EL2](#)
 - [AMEVCNTVOFF1<n>_EL2](#)
 - [AMCG1DR_EL0](#)
- If implemented, the following registers are accessible only in the memory-mapped view:
 - [AMIIDR](#)
 - [AMDEVAFF0](#)
 - [AMDEVAFF1](#)
 - [AMDEVARCH](#)
 - [AMDEVTYPE](#)
 - [AMPIDR0](#)
 - [AMPIDR1](#)
 - [AMPIDR2](#)
 - [AMPIDR3](#)
 - [AMPIDR4](#)
 - [AMCIDR0](#)
 - [AMCIDR1](#)
 - [AMCIDR2](#)
 - [AMCIDR3](#)

[Activity Monitors external register descriptions on page I5-7767](#) describes these registers.

- If [FEAT_AMUv1p1](#) virtualization of the activity monitors is enabled, the memory-mapped view of the registers presents the physical view of the counter without any offset. Virtualization of the Activity Monitors does not affect the memory-mapped view of the registers.

———— **Note** —————

The memory mapped view of the activity monitors is unaffected by [AMCR_EL0.CG1RZ](#) and [AMCR.CG1RZ](#).

14.1.2 Access during reset and power transitions

As described in [Power and reset domains on page D8-2943](#), the power and reset domains of the activity monitoring unit are named the AMU domain and AMU reset, and when reset of the AMU power domain occurs, the activity monitoring unit is reset and the counters are reset to zero.

If the AMU domain is an always-on power domain, while the PE is reset or powered down counter values may be preserved and might be accessible by memory-mapped access.

If the AMU domain is the Core power domain, while the PE is reset or powered down and when a memory-mapped access occurs, the access reads as zero and the bus access completes without an error.

Chapter I5

External System Control Register Descriptions

This chapter describes the external system control registers. It excludes the External debug registers that are described in [Chapter H9 External Debug Register Descriptions](#). It contains the following sections:

- [About the external system control register descriptions](#) on page I5-7684.
- [External Performance Monitors registers summary](#) on page I5-7686.
- [Performance Monitors external register descriptions](#) on page I5-7689.
- [External Activity Monitors Extension registers summary](#) on page I5-7765.
- [Activity Monitors external register descriptions](#) on page I5-7767.
- [Generic Timer memory-mapped registers overview](#) on page I5-7804.
- [Generic Timer memory-mapped register descriptions](#) on page I5-7805.
- [RAS register descriptions](#) on page I5-7849.

15.1 About the external system control register descriptions

This chapter describes the external system control registers other than the external debug registers. That is, it describes:

An external view of the Performance Monitors registers

Arm recommends that implementations provide access to the Performance Monitors registers through the OPTIONAL External debug interface, and provide the OPTIONAL memory-mapped interface to this interface:

- [External Performance Monitors registers summary on page I5-7686](#) lists the registers that are accessible in this view of the Performance Monitors, and describes their memory map.
- [Performance Monitors external register descriptions on page I5-7689](#) describes each of the memory-mapped registers.

[Chapter I3 Recommended External Interface to the Performance Monitors](#) describes the recommended interface to these registers.

Note

[Chapter D7 The Performance Monitors Extension](#) describes the Performance Monitors. The following sections describe the System register interfaces to the Performance Monitors:

- [Performance Monitors registers on page D13-3929](#), for accesses from an Exception level that is using AArch64.
 - [Performance Monitors registers on page G8-7074](#), for accesses from an Exception level that is using AArch32.
-

An external view of the Activity Monitors Extension registers

An implementation which supports the Activity Monitors Extension may support an optional external memory-mapped interface to the Activity Monitors Extension registers.

- [External Activity Monitors Extension registers summary on page I5-7765](#) lists the registers that are accessible in this view of the Performance Monitors, and describes their memory map.
- [Activity Monitors external register descriptions on page I5-7767](#) describes each of the memory-mapped registers.

[Chapter I3 Recommended External Interface to the Performance Monitors](#) describes the recommended interface to these registers.

Note

[Chapter D8 The Activity Monitors Extension](#) describes the Activity Monitors. The following sections describe the System register interfaces to the Activity Monitors:

- [Activity Monitors registers on page D13-4001](#), for accesses from an Exception level that is using AArch64.
 - [Activity Monitors registers on page G8-7155](#), for accesses from an Exception level that is using AArch32.
-

The registers for the system level Generic Timer component

Any implementation that includes the Generic Timer must include the memory-mapped system level component described in [Chapter I2 System Level Implementation of the Generic Timer](#). In this chapter:

- [Generic Timer memory-mapped registers overview on page I5-7804](#) gives an overview of the registers, referring to [Chapter I2](#) for more information.
- [Generic Timer memory-mapped register descriptions on page I5-7805](#) describes each of the memory-mapped registers.

Note

Chapter D11 *The Generic Timer in AArch64 state* describes the Generic Timer component that is accessible using the System registers. The following sections describe the System register interfaces to that component:

- *Generic Timer registers on page D13-4139*, for accesses from an Exception level that is using AArch64.
 - *Generic Timer registers on page G8-7253*, for accesses from an Exception level that is using AArch32.
-

Note

Chapter H9 *External Debug Register Descriptions* describes the external debug registers.

15.2 External Performance Monitors registers summary

When an implementation provides access to the Performance Monitors registers through the External debug interface, that interface provides access to:

- Performance Monitors System registers.
- A read-only configuration register, [PMCFGR](#).
- The OPTIONAL CoreSight registers for the Performance Monitors, if they are implemented.

The locations of the registers are defined as offsets from a system-defined base address. [Performance Monitors external register views on page I5-7686](#) defines this memory map.

15.2.1 Performance Monitors external register views

[Table I5-1 on page I5-7686](#) shows the external view of the Performance Monitors registers. All other entries are reserved.

———— **Note** —————

- Counters that are reserved because [HDCR.HPMN](#) has been changed from its reset value remain visible in any external view.
- The registers that relate to an implemented event counter, PMNx, are [PMEVCNTR<n>](#) and [PMEVTPER<n>](#).
- The mapping of the *Performance Monitors Event Counter Registers*, at offsets 0x000-0x0F4, has changed compared to the mappings of the equivalent registers in Armv7.

Each entry in the Name column links to the register description in [Performance Monitors external register descriptions on page I5-7689](#), and:

- If the *System register?* on [page I5-7686](#) column of the table shows that the register is a System register, the memory-mapped interface provides a view of the System register described in:
 - [Performance Monitors registers on page D13-3929](#), for the AArch64 System register.
 - [Performance Monitors registers on page G8-7074](#), for the AArch32 System register.
- Otherwise, the register is accessible only using the external interface.

Table I5-1 Performance Monitors external register views

Name	Type	Description	System register?	Offset
PMEVCNTR<n>_EL0	RW	Performance Monitors Event Counter Register.	Yes	0x000+8n
PMCCNTR_EL0[31:0] PMCCNTR_EL0[63:32]	RW	Performance Monitors Cycle Counter Register ^a	Yes	0x0F8 0x0FC

PMCIDR0^c	RO	Component ID registers	No	0xFF0
PMCIDR1^c	RO			0xFF4
PMCIDR2^c	RO			0xFF8
PMCIDR3^c	RO			0xFFC

- a. The interface must support at least single-copy atomic 32-bit accesses. If single-copy atomic 64-bit access to the registers is not possible, software must use a high-low-high read access to read the counter value if the counter is enabled.
- b. PC Sample-based Profiling Extension registers. Implemented only when [FEAT_PCSRv8p2](#) is implemented, except that from Armv8.2 [PMDEVIDt](#) is required regardless of whether [FEAT_PCSRv8p2](#) is implemented.
 Before Armv8.2, the PC Sample-based Profiling Extension can, instead, be implemented in the memory-mapped debug registers space, see [Chapter H7 The PC Sample-based Profiling Extension](#).
- c. CoreSight interface registers, see [Management registers and CoreSight compliance on page K2-8432](#).
- d. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.

15.3 Performance Monitors external register descriptions

This section describes the external view of the Performance Monitors registers. [External Performance Monitors registers summary on page 15-7686](#) lists these registers in offset order.

15.3.1 PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Configurations

If **FEAT_DoPD** is implemented, this register is in the Core power domain. If **FEAT_DoPD** is not implemented, this register is in the Debug power domain.

This register is **OPTIONAL**, and is required for CoreSight compliance. Arm recommends that this register is implemented.

Attributes

PMAUTHSTATUS is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

Holds the same value as [DBGAUTHSTATUS_EL1.SNID](#).

SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

0b00 Not implemented.

All other values are reserved.

NSNID, bits [3:2]

Holds the same value as [DBGAUTHSTATUS_EL1.NSNID](#).

NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

0b00 Not implemented.

All other values are reserved.

Accessing the PMAUTHSTATUS:

PMAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFB8	PMAUTHSTATUS

This interface is accessible as follows:

- When **FEAT_DoPD** is not implemented or `IsCorePowered()` accesses to this register are RO.

- Otherwise accesses to this register generate an error response.

15.3.2 PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR_EL0](#), increments.

Configurations

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCCFILTR_EL0](#)[31:0].

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCCFILTR](#)[31:0].

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset, RW fields in this register reset to:

- Architecturally UNKNOWN values if the reset is to an Exception level that is using AArch64.
- 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

Attributes

PMCCFILTR_EL0 is a 32-bit register.

Field descriptions

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

- 0b0 Count cycles in EL1.
- 0b1 Do not count cycles in EL1.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

- 0b0 Count cycles in EL0.
- 0b1 Do not count cycles in EL0.

NSK, bit [29]

When EL3 is implemented:

NSK

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

NSU

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

NSH

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If [FEAT_SEL2](#) and EL3 are implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

0b0 Do not count cycles in EL2.

0b1 Count cycles in EL2.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

M

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

———— **Note** —————

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

SH

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

———— **Note** ————

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

Bits [23:0]

Reserved, RES0.

Accessing the PMCCFILTR_EL0:

———— **Note** ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCFILTR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x47C	PMCCFILTR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

15.3.3 PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see *Time as measured by the Performance Monitors cycle counter* on page D7-2852.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

Configurations

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

PMCCNTR_EL0 is in the Core power domain.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCCNTR_EL0:

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCNTR_EL0[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x0F8	PMCCNTR_EL0	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to PMCCNTR_EL0[31:0] are RO.

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to PMCCNTR_EL0[31:0] are RW.
- Otherwise accesses to PMCCNTR_EL0[31:0] generate an error response.

PMCCNTR_EL0[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x0FC	PMCCNTR_EL0	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to PMCCNTR_EL0[63:32] are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to PMCCNTR_EL0[63:32] are RW.
- Otherwise accesses to PMCCNTR_EL0[63:32] generate an error response.

15.3.4 PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F

For more information about the common events and the use of the PMCEIDn registers, see [The PMU event number space and common events on page D7-2875](#).

Note

This view of the register was previously called PMCEID0_EL0.

Configurations

External register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0_EL0](#)[31:0].

External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0](#)[31:0].

PMCEID0 is in the Core power domain.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event n.

For each bit:

- 0b0 The common event is not implemented, or not counted.
- 0b1 The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

———— **Note** —————

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID0:

———— **Note** —————

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE20	PMCEID0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.5 PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

For more information about the common events and the use of the PMCEIDn registers, see [The PMU event number space and common events on page D7-2875](#).

Note

This view of the register was previously called PMCEID1_EL0.

Configurations

External register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1_EL0\[31:0\]](#).

External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID1\[31:0\]](#).

PMCEID1 is in the Core power domain.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event (0x0020 + n).

For each bit:

- 0b0 The common event is not implemented, or not counted.
- 0b1 The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

———— **Note** —————

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID1:

———— **Note** —————

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE24	PMCEID1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.6 PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

For more information about the common events and the use of the PMCEIDn registers, see [The PMU event number space and common events on page D7-2875](#).

Configurations

External register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0_EL0](#)[63:32].

External register PMCEID2 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID2](#)[31:0].

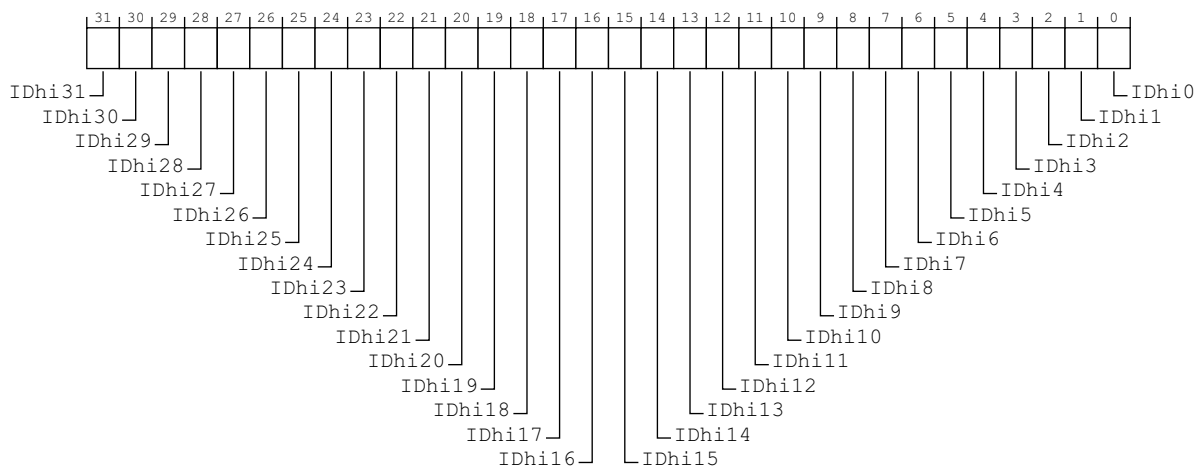

PMCEID2 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

- 0b0 The common event is not implemented, or not counted.
- 0b1 The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

———— **Note** —————

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID2:

———— **Note** —————

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE28	PMCEID2

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.7 PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

For more information about the common events and the use of the PMCEIDn registers, see [The PMU event number space and common events on page D7-2875](#).

Configurations

External register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1_EL0](#)[63:32].

External register PMCEID3 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID3](#)[31:0].

PMCEID3 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are RES0.

Attributes

PMCEID3 is a 32-bit register.

Field descriptions

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing the PMCEID3:

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE2C	PMCEID3

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.8 PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Configurations

PMCFGR is in the Core power domain.

Attributes

PMCFGR is a 32-bit register.

Field descriptions

NCG, bits [31:28]

This feature is not supported, so this field is RAZ.

Bits [27:22]

Reserved, RES0.

FZO, bit [21]

Freeze-on-overflow supported. Defined values are:

0b0 Freeze-on-overflow mechanism is not supported. [PMCR_ELO.FZO](#) is RES0.

0b1 Freeze-on-overflow mechanism is supported. [PMCR_ELO.FZO](#) is RW.

[FEAT_PMUv3p7](#) implements the functionality added by the value 0b1.

From Armv8.7, if [FEAT_PMUv3](#) is implemented, the only permitted value is 0b1.

Bit [20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. [PMUSERENR_ELO](#) is not visible in the external debug interface, so this bit is RAZ.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

EX, bit [16]

Export supported. Value is IMPLEMENTATION DEFINED.

0b0 [PMCR_ELO.X](#) is RES0.

0b1 [PMCR_ELO.X](#) is read/write.

Access to this field is RO.

CCD, bit [15]

Cycle counter has prescale.

This is RES1 if AArch32 is supported, and RAZ otherwise.

0b0 [PMCR_ELO.D](#) is RES0.

0b1 [PMCR_ELO.D](#) is read/write.

CC, bit [14]

Dedicated cycle counter (counter 31) supported. This bit is RAO.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

N, bits [7:0]

Number of counters implemented in addition to the cycle counter, [PMCCNTR_ELO](#). The maximum number of event counters is 31.

0x00 Only [PMCCNTR_ELO](#) implemented.

0x01 [PMCCNTR_ELO](#) plus one event counter implemented.

and so on up to 0b00011111, which indicates [PMCCNTR_ELO](#) and 31 event counters implemented.

Accessing the PMCFGR:

———— Note ————

`AllowExternalPMUAccess()` has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCFGR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE00	PMCFGR

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()` and `AllowExternalPMUAccess()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.9 PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see [About the Component Identification scheme on page K2-8443](#).

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x00.

Access to this field is RO.

Accessing the PMCIDR0:

PMCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF0	PMCIDR0

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.10 PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see [About the Component Identification scheme on page K2-8443](#).

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

0b1001 CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Reads as 0b0000.

Access to this field is RO.

Accessing the PMCIDR1:

PMCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF4	PMCIDR1

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.11 PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see [About the Component Identification scheme on page K2-8443](#).

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is RO.

Accessing the PMCIDR2:

PMCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF8	PMCIDR2

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.12 PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see [About the Component Identification scheme](#) on page K2-8443.

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is RO.

Accessing the PMCIDR3:

PMCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFFC	PMCIDR3

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.13 PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL1](#), captured on reading [PMPCSR](#)[31:0].

Configurations

PMCID1SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMCID1SR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Attributes

PMCID1SR is a 32-bit register.

Field descriptions

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of [FEAT_DoPD](#) that is associated with the most recent [PMPCSR](#) sample. When the most recent [PMPCSR](#) sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register and PMCID1SR samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent [PMPCSR](#) sample.

Because the value written to PMCID1SR is an indirect read of [FEAT_DoPD](#), it is CONSTRAINED UNPREDICTABLE whether PMCID1SR is set to the original or new value if [PMPCSR](#) samples:

- An instruction that writes to [FEAT_DoPD](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCID1SR:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see [Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-7458](#).

PMCID1SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x208	PMCID1SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

PMCID1SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x228	PMCID1SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.14 PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL2](#), captured on reading [PMPCSR](#)[31:0].

Configurations

PMCID2SR is in the Core power domain.

This register is present only when [FEAT_PCSRv8p2](#) is implemented and EL2 is implemented. Otherwise, direct accesses to PMCID2SR are RES0.

Note

If [FEAT_PCSRv8p2](#) is not implemented, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Attributes

PMCID2SR is a 32-bit register.

Field descriptions

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of [CONTEXTIDR_EL2](#) that is associated with the most recent [PMPCSR](#) sample. When the most recent [PMPCSR](#) sample was generated:

- If EL2 is using AArch64, then this field is set to the Context ID sampled from [CONTEXTIDR_EL2](#).
- If EL2 is using AArch32, then this field is set to an UNKNOWN value.

Because the value written to PMCID2SR is an indirect read of [CONTEXTIDR_EL2](#), it is CONstrained UNPREDICTABLE whether PMCID2SR is set to the original or new value if [PMPCSR](#) samples:

- An instruction that writes to [CONTEXTIDR_EL2](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCID2SR:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see *Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN* on page H7-7458.

PMCID2SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x22C	PMCID2SR

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()` and `!OSLockStatus()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.15 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configurations

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENCLR_EL0](#)[31:0].

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENCLR](#)[31:0].

PMCNTENCLR_EL0 is in the Core power domain.

Attributes

PMCNTENCLR_EL0 is a 32-bit register.

Field descriptions

C, bit [31]

[PMCCNTR_EL0](#) disable bit. Disables the cycle counter register. Possible values are:

- 0b0 When read, means the cycle counter is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

- 0b0 When read, means that [PMEVCNTR<n>_EL0](#) is disabled. When written, has no effect.
- 0b1 When read, means that [PMEVCNTR<n>_EL0](#) is enabled. When written, disables [PMEVCNTR<n>_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCNTENCLR_EL0:

———— **Note** ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENCLR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC20	PMCNTENCLR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

15.3.16 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configurations

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENSET_EL0](#)[31:0].

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENSET](#)[31:0].

PMCNTENSET_EL0 is in the Core power domain.

Attributes

PMCNTENSET_EL0 is a 32-bit register.

Field descriptions

C, bit [31]

[PMCCNTR_EL0](#) enable bit. Enables the cycle counter register. Possible values are:

- 0b0 When read, means the cycle counter is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

- 0b0 When read, means that [PMEVCNTR<n>_EL0](#) is disabled. When written, has no effect.
- 0b1 When read, means that [PMEVCNTR<n>_EL0](#) event counter is enabled. When written, enables [PMEVCNTR<n>_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMCNTENSET_ELO:

———— **Note** ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENSET_ELO can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC00	PMCNTENSET_ELO

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

15.3.17 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configurations

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register [PMCR\[7:0\]](#).

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch64 System register [PMCR_EL0\[7:0\]](#).

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal [PMCR](#) System register. An external agent must use other means to discover the information held in [PMCR\[31:11\]](#), such as accessing [PMCFGR](#) and the ID registers.

Attributes

PMCR_EL0 is a 32-bit register.

Field descriptions

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

FZO

Freeze-on-overflow. Stop event counters on overflow.

0b0 Do not freeze on overflow.

0b1 Event counters do not count when [PMOVSLR_EL0](#)[(N-1):0] is nonzero, where N is the value of [MDCR_EL2.HPMN](#) if EL2 is implemented, and [PMCR_EL0.N](#) otherwise.

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. ([MDCR_EL2.HPMN](#)-1)].
- If [MDCR_EL2.HPMN](#) is less than [PMCR_EL0.N](#):
 - This bit does not affect the operation of event counters in the range [[MDCR_EL2.HPMN](#) .. ([PMCR_EL0.N](#)-1)].
 - The operation of this bit ignores the values of [PMOVSLR_EL0](#)[([PMCR_EL0.N](#)-1):[MDCR_EL2.HPMN](#)].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of [PMCCNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

LP

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

0b0 Event counter overflow on increment that causes unsigned overflow of [PMEVCNTR<n>_EL0\[31:0\]](#).

0b1 Event counter overflow on increment that causes unsigned overflow of [PMEVCNTR<n>_EL0\[63:0\]](#).

If EL2 is implemented and [MDCR_EL2.HPMN](#) is less than [PMCR_EL0.N](#), this bit does not affect the operation of event counters in the range [[MDCR_EL2.HPMN](#):([PMCR_EL0.N](#)-1)].

If EL2 is implemented and [HDCR.HPMN](#) is less than [PMCR_EL0.N](#), this bit does not affect the operation of event counters in the range [[HDCR.HPMN](#):([PMCR_EL0.N](#)-1)].

————— Note —————

The effect of [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#) on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#).

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported at EL0:

LC

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

0b0 Cycle counter overflow on increment that causes unsigned overflow of [PMCCNTR_EL0\[31:0\]](#).

0b1 Cycle counter overflow on increment that causes unsigned overflow of [PMCCNTR_EL0\[63:0\]](#).

Arm deprecates use of [PMCR_EL0.LC](#) = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

DP

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

- 0b0 Cycle counting by [PMCCNTR_ELO](#) is not affected by this bit.
- 0b1 When event counting for counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited, cycle counting by [PMCCNTR_ELO](#) is disabled.

For more information, see [Controlling the PMU counters on page D7-2859](#).

The reset behavior of this field is:

- When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:
 - A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
 - 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

X

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

- 0b0 Do not export events.
- 0b1 Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behavior of this field is:

- When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:
 - A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
 - 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported at EL0:

D

Clock divider.

- 0b0 When enabled, [PMCCNTR_ELO](#) counts every clock cycle.
- 0b1 When enabled, [PMCCNTR_ELO](#) counts once every 64 clock cycles.

If [PMCR_ELO.LC](#) == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of `PMCR_EL0.D = 1`.

The reset behavior of this field is:

- When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:
 - A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
 - 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

- 0b0 No action.
- 0b1 Reset `PMCCNTR_EL0` to zero.

———— **Note** —————

Resetting `PMCCNTR_EL0` does not change the cycle counter overflow bit. If `FEAT_PMUv3p5` is implemented, the value of `PMCR_EL0.LC` is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

- 0b0 No action.
- 0b1 Reset all event counters, not including `PMCCNTR_EL0`, to zero.

———— **Note** —————

Resetting the event counters does not change the event counter overflow bits. If `FEAT_PMUv3p5` is implemented, the value of `MDCR_EL2.HLP`, or `PMCR_EL0.LP` is ignored and bits [63:0] of all affected event counters are reset.

Access to this field is WO/RAZ.

E, bit [0]

Enable.

- 0b0 All event counters in the range [0..(PMN-1)] and `PMCCNTR_EL0`, are disabled.
- 0b1 All event counters in the range [0..(PMN-1)] and `PMCCNTR_EL0`, are enabled by `PMCNTENSET_EL0`.

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is `HDCR.HPMN`.
- If EL2 is using AArch64, PMN is `MDCR_EL2.HPMN`.
- If PMN is less than `PMCR_EL0.N`, this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is `PMCR_EL0.N`.

———— **Note** —————

The effect of the following fields on the operation of this bit applies if EL2 is implemented regardless of whether EL2 is enabled in the current Security state:

- `HDCR.HPMN`. See the description of `HDCR.HPMN` for more information.

- [MDCR_EL2.HPMN](#). See the description of [MDCR_EL2.HPMN](#) for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing the PMCR_EL0:

———— **Note** —————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE04	PMCR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

15.3.18 PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configurations

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF0 is a 32-bit register.

Field descriptions

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the PMDEVAFF0:

PMDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFA8	PMDEVAFF0

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.19 PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configurations

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF1 is a 32-bit register.

Field descriptions

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the PMDEVAFF1:

PMDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFAC	PMDEVAFF1

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.20 PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the Performance Monitor component.

Configurations

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Attributes

PMDEVARCH is a 32-bit register.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architecture of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is 0x0.

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For Performance Monitors:

- Bits [15:12] are the architecture version, 0x2.
- Bits [11:0] are the architecture part number, 0xA16.

This corresponds to Performance Monitors architecture version PMUv3.

———— Note —————

The PMUv3 memory-mapped programmers' model can be used by devices other than Armv8 processors. Software must determine whether the PMU is attached to an Armv8 processor by using the [PMDEVAFF0](#) and [PMDEVAFF1](#) registers to discover the [affinity](#) of the PMU to any Armv8 processors.

Accessing the PMDEVARCH:

PMDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFBC	PMDEVARCH

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.21 PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

Purpose

Provides information about features of the Performance Monitors implementation.

Configurations

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain.

If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required from Armv8.2 and in any implementation that includes [FEAT_PCSRv8p2](#). Otherwise, its location is RES0.

———— Note ————

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Attributes

PMDEVID is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers.

0b0000 PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.

0b0001 PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.

All other values are reserved.

[FEAT_PCSRv8p2](#) implements the functionality identified by the value 0b0001.

Accessing the PMDEVID:

PMDEVID can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFC8	PMDEVID

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.22 PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configurations

Implementation of this register is OPTIONAL.

If **FEAT_DoPD** is implemented, this register is in the Core power domain. If **FEAT_DoPD** is not implemented, this register is in the Debug power domain.

Attributes

PMDEVTYPE is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Must read as 0x1 to indicate this is a component within a PE.

MAJOR, bits [3:0]

Major type. Must read as 0x6 to indicate this is a performance monitor component.

Accessing the PMDEVTYPE:

PMDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFCC	PMDEVTYPE

This interface is accessible as follows:

- When **FEAT_DoPD** is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.23 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configurations

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMEVCNTR<n>_EL0](#)[31:0].

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR<n>](#)[31:0].

PMEVCNTR<n>_EL0 is in the Core power domain.

Attributes

PMEVCNTR<n>_EL0 is a:

- 64-bit register when FEAT_PMUv3p5 is implemented
- 32-bit register otherwise

Field descriptions

When FEAT_PMUv3p5 is implemented:

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the [PMCR.LP](#) and [HDCR.HLP](#) bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR<n>_EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64, bits [63:32] of the event counters are not required to be implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVCNTR<n>_EL0:

External accesses to the performance monitors ignore [PMUSERENR_EL0](#) and, if implemented, [MDCR_EL2](#). {TPM, TPMCR, HPMN} and [MDCR_EL3](#).TPM. This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If [FEAT_PMUv3p5](#) is not implemented, when `IsCorePowered()`, `DoubleLockStatus()`, `OSLockStatus()` or `!AllowExternalPMUAccess()`, 32-bit accesses to $0x004+8 \times n$ have a CONSTRAINED UNPREDICTABLE behavior.

———— **Note** —————

`SoftwareLockStatus()` depends on the type of access attempted and `AllowExternalPMUAccess()` has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVCNTR<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	$0x000 + (8 * n)$	PMEVCNTR<n>_EL0

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalPMUAccess()` and `SoftwareLockStatus()` accesses to this register are RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalPMUAccess()` and `!SoftwareLockStatus()` accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

15.3.24 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configurations

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register `PMEVTYPER<n>_EL0`[31:0].

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register `PMEVTYPER<n>`[31:0].

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented:

- When `IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess()`, accesses are RES0.
- Otherwise, it is CONstrained UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

Attributes

PMEVTYPER<n>_EL0 is a 32-bit register.

Field descriptions

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

- 0b0 Count events in EL1.
- 0b1 Do not count events in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

- 0b0 Count events in EL0.
- 0b1 Do not count events in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

NSK

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.P` bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

NSU

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.U` bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

NSH

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If `FEAT_SEL2` and EL3 are implemented, counting in Secure EL2 is further controlled by the `PMEVTYPER<n>_EL0.SH` bit.

0b0 Do not count events in EL2.

0b1 Count events in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

M

EL3 filtering bit.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.P` bit, events in EL3 are counted.

Otherwise, events in EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

———— **Note** —————

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]

When (FEAT_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

MT

Multithreading.

0b0 Count events only on controlling PE.

0b1 Count events from any PE with the same affinity at level 1 and above as this PE.

———— **Note** —————

- When the lowest level of [affinity](#) consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

SH

Secure EL2 filtering.

If the value of this bit is not equal to the value of the [PMEVTYPER<n>_EL0.NSH](#) bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

———— **Note** —————

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

evtCount[15:10]

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>_EL0](#).

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in [Table D7-6 on page D7-2875](#).

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

———— **Note** —————

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMEVTYPER<n>_EL0:

———— **Note** —————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVTYPER<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x400 + (4 * n)	PMEVTYPER<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalPMUAccess()` and `!SoftwareLockStatus()` accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

15.3.25 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_EL0](#), and the event counters [PMEVCNTR<n>_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

Configurations

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1](#)[31:0].

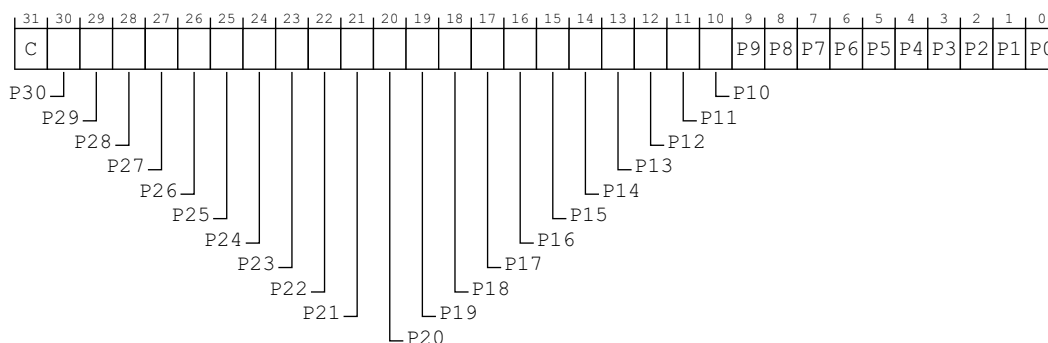

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR](#)[31:0].

PMINTENCLR_EL1 is in the Core power domain.

Attributes

PMINTENCLR_EL1 is a 32-bit register.

Field descriptions

C, bit [31]

[PMCCNTR_EL0](#) overflow interrupt request disable bit. Possible values are:

- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

- 0b0 When read, means that the [PMEVCNTR<n>_EL0](#) event counter interrupt request is disabled. When written, has no effect.
- 0b1 When read, means that the [PMEVCNTR<n>_EL0](#) event counter interrupt request is enabled. When written, disables the [PMEVCNTR<n>_EL0](#) interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMINTENCLR_EL1:

———— **Note** ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC60	PMINTENCLR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

15.3.26 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_ELO](#), and the event counters [PMEVCNTR<n>_ELO](#). Reading the register shows which overflow interrupt requests are enabled.

Configurations

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET_EL1](#)[31:0].

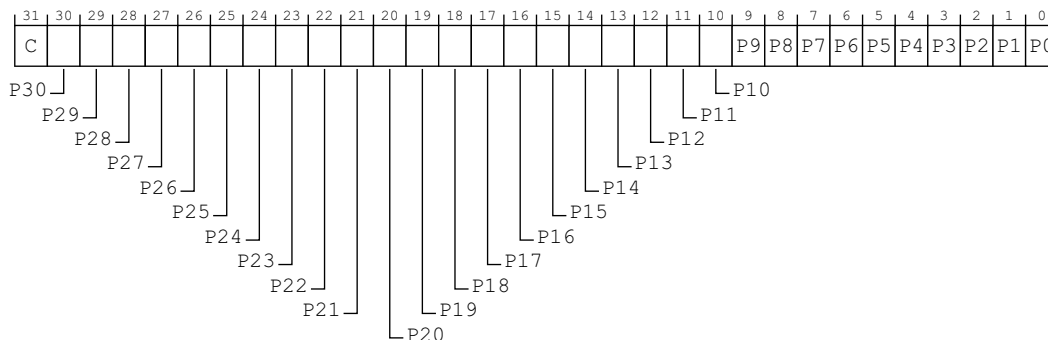

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSET](#)[31:0].

PMINTENSET_EL1 is in the Core power domain.

Attributes

PMINTENSET_EL1 is a 32-bit register.

Field descriptions

C, bit [31]

[PMCCNTR_ELO](#) overflow interrupt request enable bit. Possible values are:

- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>_ELO](#).

If [PMCFGR.N](#) is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

- 0b0 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is disabled. When written, has no effect.
- 0b1 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is enabled. When written, enables the [PMEVCNTR<n>_ELO](#) interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMINTENSET_EL1:

———— **Note** ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC40	PMINTENSET_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

15.3.27 PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

Purpose

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configurations

It is IMPLEMENTATION DEFINED whether PMITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

PMITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0b0 Normal operation.

0b1 Integration mode enabled.

The reset behavior of this field is:

- The following resets apply:
 - If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to 0.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
 - If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to 0.
 - On a Warm reset, the value of this field is unchanged.

Accessing the PMITCTRL:

PMITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xF00	PMITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register are IMPDEF.

15.3.28 PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configurations

If [FEAT_DoPD](#) is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and [PMLSR](#) to check the current status of the lock.

Attributes

PMLAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing the PMLAR:

PMLAR can be accessed through its memory-mapped interface:

Component	Offset	Instance
PMU	0xFB0	PMLAR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.

15.3.29 PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configurations

If [FEAT_DoPD](#) is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

Software uses [PMLAR](#) to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLSR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented and FEAT_DoPD is not implemented:

SLK

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

- 0b0 Lock clear. Writes are permitted to this component's registers.
- 0b1 Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On an External debug reset, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED.

Permitted values are:

- 0b0 Software Lock not implemented or not memory-mapped access.
- 0b1 Software Lock implemented and memory-mapped access.

Accessing the PMLSR:

PMLSR can be accessed through its memory-mapped interface:

Component	Offset	Instance
PMU	0xFB4	PMLSR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.30 PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation.

Configurations

PMMIR is in the Core power domain.

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

Attributes

PMMIR is a 32-bit register.

Field descriptions

Bits [31:20]

Reserved, RES0.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes}) + 1$. Defined values are:

0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is implemented, this field must not be zero.

Accessing the PMMIR:

If the Core power domain is off or in a low-power state, access on this interface returns an Error.

PMMIR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE40	PMMIR

This interface is accessible as follows:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or !AllowExternalPMUAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are RO.

15.3.31 PMOVSLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Configurations

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSLR_EL0](#)[31:0].

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSr](#)[31:0].

PMOVSLR_EL0 is in the Core power domain.

Attributes

PMOVSLR_EL0 is a 32-bit register.

Field descriptions

C, bit [31]

Cycle counter overflow clear bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR_EL0.LC](#) controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

0b0 When read, means that [PMEVCNTR<n>_EL0](#) has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>_EL0](#) has overflowed since this bit was last cleared. When written, clears the [PMEVCNTR<n>_EL0](#) overflow bit to 0.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMOVSLR_EL0:

———— **Note** —————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSLR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC80	PMOVSLR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are RO.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

15.3.32 PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#).

Configurations

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET_EL0](#)[31:0].

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSET](#)[31:0].

PMOVSSET_EL0 is in the Core power domain.

Attributes

PMOVSSET_EL0 is a 32-bit register.

Field descriptions

C, bit [31]

Cycle counter overflow set bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR](#).N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

0b0 When read, means that [PMEVCNTR<n>_EL0](#) has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that [PMEVCNTR<n>_EL0](#) has overflowed since this bit was last cleared. When written, sets the [PMEVCNTR<n>_EL0](#) overflow bit to 1.

If `FEAT_PMUv3p5` is implemented, `MDCR_EL2.HLP` and `PMCR_EL0.LP` control whether an overflow is detected from unsigned overflow of `PMEVCNTR<n>_EL0[31:0]` or unsigned overflow of `PMEVCNTR<n>_EL0[63:0]`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the `PMOVSSET_EL0`:

———— **Note** —————

`SoftwareLockStatus()` depends on the type of access attempted and `AllowExternalPMUAccess()` has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

`PMOVSSET_EL0` can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xCC0	PMOVSSET_EL0

This interface is accessible as follows:

- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalPMUAccess()` and `SoftwareLockStatus()` accesses to this register are RO.
- When `IsCorePowered()`, `!DoubleLockStatus()`, `!OSLockStatus()`, `AllowExternalPMUAccess()` and `!SoftwareLockStatus()` accesses to this register are RW.
- Otherwise accesses to this register generate an error response.

15.3.33 PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configurations

PMPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMPCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

Attributes

PMPCSR is a 64-bit register.

Field descriptions

NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of [SCR.NS](#).

0b0 Sample is from Secure state.

0b1 Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

0b00 Sample is from EL0.

0b01 Sample is from EL1.

0b10 Sample is from EL2.

0b11 Sample is from EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

PCSample[55:32], bits [55:32]

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PCSample[31:0], bits [31:0]

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of PMPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

PMPCSR[31:0] reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) to UNKNOWN values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#). The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the PMPCSR:

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see [Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-7458](#).

PMPCSR[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x200	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[31:0] are RO.
- Otherwise accesses to PMPCSR[31:0] generate an error response.

PMPCSR[31:0] can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x220	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[31:0] are RO.
- Otherwise accesses to PMPCSR[31:0] generate an error response.

PMPCSR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x204	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[63:32] are RO.
- Otherwise accesses to PMPCSR[63:32] generate an error response.

PMPCSR[63:32] can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x224	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to PMPCSR[63:32] are RO.
- Otherwise accesses to PMPCSR[63:32] generate an error response.

15.3.34 PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see [About the Peripheral identification scheme](#) on page K2-8440.

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

Accessing the PMPIDR0:

PMPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE0	PMPIDR0

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.35 PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

PART_1, bits [3:0]

Part number, most significant nibble.

Accessing the PMPIDR1:

PMPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE4	PMPIDR1

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.36 PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see [About the Peripheral identification scheme](#) on page K2-8440.

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

JEDEC, bit [3]

RAO. Indicates a JEP106 identity code is used.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

Accessing the PMPIDR2:

PMPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE8	PMPIDR2

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.37 PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [PMPIDR2.REVISION](#) as an extension to the Part number must use this field as a major revision number.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

Accessing the PMPIDR3:

PMPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFEC	PMPIDR3

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.38 PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

If [FEAT_DoPD](#) is implemented, this register is in the Core power domain. If [FEAT_DoPD](#) is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. RAZ. \log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

Accessing the PMPIDR4:

PMPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFD0	PMPIDR4

This interface is accessible as follows:

- When [FEAT_DoPD](#) is not implemented or `IsCorePowered()` accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.3.39 PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event $0x00$. For more information, see [SW_INCR](#).

Configurations

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMSWINC_EL0](#)[31:0].

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC](#)[31:0].

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is OPTIONAL.

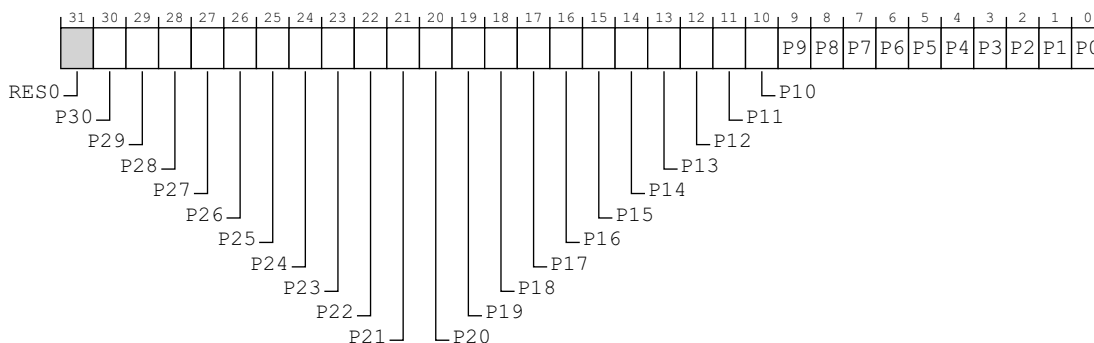

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONstrained UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

Attributes

PMSWINC_EL0 is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are W1.

0b0 No action. The write to this bit is ignored.

0b1 It is CONstrained UNPREDICTABLE whether a SW_INCR event is generated for event counter n.

Accessing the PMSWINC_EL0:

———— Note ————

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMSWINC_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xCA0	PMSWINC_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are WI.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are WO.
- Otherwise accesses to this register generate an error response.

15.3.40 PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

Purpose

Contains the sampled VMID value that is captured on reading [PMPCSR](#)[31:0].

Configurations

PMVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMVIDSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMVIDSR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented:

VMID[15:8]

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

VMID sample. The VMID associated with the most recent [PMPCSR](#) sample. When the most recent [PMPCSR](#) sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
 - EL2 is disabled in the current Security state.
 - The PE is executing at EL2.
 - EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.
- Otherwise:
 - If EL2 is using AArch64 and either [FEAT_VMID16](#) is not implemented or [VTCR_EL2](#).VS is 1, this field is set to [VTTBR_EL2](#).VMID.

- If EL2 is using AArch64, [FEAT_VMID16](#) is implemented, and [VTCR_EL2.VS](#) is 0, [PMVIDSR.VMID\[7:0\]](#) is set to [VTTBR_EL2.VMID\[7:0\]](#) and [PMVIDSR.VMID\[15:8\]](#) is RES0.
- If EL2 is using AArch32, this field is set to [VTTBR.VMID](#).

Because the value written to [PMVIDR](#) is an indirect read of the VMID value, it is **CONSTRAINED UNPREDICTABLE** whether [PMVIDSR](#) is set to the original or new value if [PMPCSR](#) samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the [PMVIDSR](#):

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see [Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN on page H7-7458](#).

[PMVIDSR](#) can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x20C	PMVIDSR

This interface is accessible as follows:

- When [IsCorePowered\(\)](#), [!DoubleLockStatus\(\)](#) and [!OSLockStatus\(\)](#) accesses to this register are RO.
- Otherwise accesses to this register generate an error response.

15.4 External Activity Monitors Extension registers summary

The memory-mapped interface to the Activity Monitors Extension registers provides read-only access to:

- Read-only copies of the Activity Monitors Extension System registers, with the exception of [AMUSERENR](#).
- An implementation identification register, [AMIIDR](#).
- If they are implemented, the OPTIONAL Activity Monitors CoreSight and ID registers.

The locations of the registers are defined as offsets from a base address. The base address of the memory-mapped view must be aligned to a 4KB boundary, but is otherwise IMPLEMENTATION DEFINED. [Activity Monitors external register views on page I5-7765](#) defines this memory map.

15.4.1 Activity Monitors external register views

[Table I5-2 on page I5-7765](#) shows the external view of the Activity Monitors registers. All implemented registers are RO. Offsets within the 4KB region not defined in this table are [RAZ/WI](#).

Each entry in the Name column links to the register description in [Activity Monitors external register descriptions on page I5-7767](#), and:

- If the [System register? on page I5-7686](#) column of the table shows that the register is a System register, the memory-mapped interface provides a view of the System register described in:
 - [Activity Monitors registers on page D13-4001](#), for the AArch64 System register.
 - [Activity Monitors registers on page G8-7155](#), for the AArch32 System register.
- Otherwise, the register is accessible only using the external memory-mapped interface.

Table I5-2 Activity Monitors external register views

Name	Description	System register?	Offset
AMEVCNTR0<n> [31:0] AMEVCNTR0<n> [63:32]	Activity Monitor Event Counter registers 0	Yes	0x000+8n 0x004+8n
AMEVCNTR1<n> [31:0] AMEVCNTR1<n> [63:32]	Activity Monitor Event Counter registers 1	Yes	0x100+8n 0x104+8n
AMEVTYPER0<n>	Activity Monitor Event Type registers 0	Yes	0x400+4n
AMEVTYPER1<n>	Activity Monitor Event Type registers 1	Yes	0x480+4n
AMCNTENSET0	Activity Monitors Counter Enable Set register 0	Yes	0xC00
AMCNTENSET1	Activity Monitors Counter Enable Set register 1	Yes	0xC04
AMCNTENCLR0	Activity Monitors Counter Enable Clear register 0	Yes	0xC20
AMCNTENCLR1	Activity Monitors Counter Enable Clear register 1	Yes	0xC24
AMCGCR	Activity Monitors Counter Group Configuration Register	Yes	0xCE0
AMCFGR	Activity Monitors Configuration Register	Yes	0xE00
AMCR	Activity Monitors Control Register	Yes	0xE04
AMIIDR	Activity Monitors Implementation Identification Register	No	0xE08
AMDEVAFF0 ^a	Device Affinity registers	No	0xFA8
AMDEVAFF1 ^a		No	0xFAC
AMDEVARCH ^a	Device Architecture register	No	0xFBC
AMDEVTYPE ^a	Device Type register	No	0xFCC

Table 15-2 Activity Monitors external register views (continued)

Name	Description	System register?	Offset
AMPIDR4^a	Peripheral ID registers	No	0xFD0
AMPIDR0^a		No	0xFE0
AMPIDR1^a		No	0xFE4
AMPIDR2^a		No	0xFE8
AMPIDR3^a		No	0xFEC
AMCIDR0^a	Component ID registers	No	0xFF0
AMCIDR1^a		No	0xFF4
AMCIDR2^a		No	0xFF8
AMCIDR3^a		No	0xFFC

a. CoreSight interface registers, see [Management registers and CoreSight compliance](#) on page K2-8432.

15.5 Activity Monitors external register descriptions

This section lists the external Activity Monitors registers.

15.5.1 AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configurations

External register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register [AMCFGR_EL0](#)[31:0].

External register AMCFGR bits [31:0] are architecturally mapped to AArch32 System register [AMCFGR](#)[31:0].

The power domain of AMCFGR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are RES0.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is $[AMCFGR.NCG + 1]$.

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of $0b0000$. Otherwise, this field has a value of $0b0001$.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is $0b1$.

$0b0$ [AMCR.HDBG](#) is RES0.

$0b1$ [AMCR.HDBG](#) is read/write.

Access to this field is RO.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is [AMCFGR.SIZE + 1].

The counters are 64-bit.

———— **Note** —————

Software also uses this field to determine the spacing of counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is RO.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR.N + 1].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the AMCFGR:

AMCFGR can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xE00	AMCFGR

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.2 AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configurations

External register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register [AMCGCR_EL0](#)[31:0].

External register AMCGCR bits [31:0] are architecturally mapped to AArch32 System register [AMCGCR](#)[31:0].

The power domain of AMCGCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are RES0.

Attributes

AMCGCR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes [FEAT_AMUv1](#), the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

Access to this field is RO.

Accessing the AMCGCR:

AMCGCR can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xCE0	AMCGCR

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.3 AMCIDR0, Activity Monitors Component Identification Register 0

The AMCIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Component Identification scheme on page K2-8443](#).

Configurations

The power domain of AMCIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is RO.

Accessing the AMCIDR0:

AMCIDR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFF0	AMCIDR0

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.4 AMCIDR1, Activity Monitors Component Identification Register 1

The AMCIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Component Identification scheme](#) on page K2-8443.

Configurations

The power domain of AMCIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

0b1001 CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is RO.

Accessing the AMCIDR1:

AMCIDR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFF4	AMCIDR1

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.5 AMCIDR2, Activity Monitors Component Identification Register 2

The AMCIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Component Identification scheme on page K2-8443](#).

Configurations

The power domain of AMCIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is RO.

Accessing the AMCIDR2:

AMCIDR2 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFF8	AMCIDR2

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.6 AMCIDR3, Activity Monitors Component Identification Register 3

The AMCIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Component Identification scheme](#) on page K2-8443.

Configurations

The power domain of AMCIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is RO.

Accessing the AMCIDR3:

AMCIDR3 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFFC	AMCIDR3

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.7 AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configurations

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR0_EL0](#)[31:0].

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR0](#)[31:0].

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for [AMEVCNTR0<n>](#).

———— Note ————

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes [FEAT_AMUv1](#), the number of architected activity monitor event counters is 4.

Possible values of each bit are:

- 0b0 When read, means that [AMEVCNTR0<n>](#) is disabled.
- 0b1 When read, means that [AMEVCNTR0<n>](#) is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing the AMCNTENCLR0:

AMCNTENCLR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xC20	AMCNTENCLR0

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.8 AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configurations

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR1_ELO](#)[31:0].

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR1](#)[31:0].

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for [AMEVCNTR1<n>](#).

When N is less than 16, bits [15:N] are RAZ, where N is the value in [AMCGCR.CGINC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR1<n>](#) is disabled.

0b1 When read, means that [AMEVCNTR1<n>](#) is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing the AMCNTENCLR1:

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENCLR1 are RAZ. Software must treat reserved accesses as RES0. See [Access requirements for reserved and unallocated registers on page 11-7660](#).

———— Note ————

The number of auxiliary activity monitor event counters implemented is zero exactly when [AMCFGR.NCG](#) == 0b0000.

AMCNTENCLR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xC24	AMCNTENCLR1

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.9 AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configurations

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET0_ELO](#)[31:0].

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENSET0](#)[31:0].

The power domain of AMCNTENSET0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are RES0.

Attributes

AMCNTENSET0 is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter enable bit for [AMEVCNTR0<n>](#).

———— Note ————

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes [FEAT_AMUv1](#), the number of architected activity monitor event counters is 4.

Possible values of each bit are:

- 0b0 When read, means that [AMEVCNTR0<n>](#) is disabled.
- 0b1 When read, means that [AMEVCNTR0<n>](#) is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing the AMCNTENSET0:

AMCNTENSET0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xC00	AMCNTENSET0

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.10 AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configurations

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET1_EL0](#)[31:0].

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENSET1](#)[31:0].

The power domain of AMCNTENSET1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are RES0.

Attributes

AMCNTENSET1 is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter enable bit for [AMEVCNTR1<n>](#).

When N is less than 16, bits [15:N] are RAZ, where N is the value in [AMCGCR.CGINC](#).

Possible values of each bit are:

0b0 When read, means that [AMEVCNTR1<n>](#) is disabled.

0b1 When read, means that [AMEVCNTR1<n>](#) is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing the AMCNTENSET1:

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENSET1 are RAZ. Software must treat reserved accesses as RES0. See [Access requirements for reserved and unallocated registers on page II-7660](#).

Note

The number of auxiliary activity monitor counters implemented is zero exactly when [AMCFGR.NCG](#) == 0b0000.

AMCNTENSET1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xC04	AMCNTENSET1

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.11 AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Configurations

External register AMCR bits [31:0] are architecturally mapped to AArch64 System register [AMCR_EL0](#)[31:0].

External register AMCR bits [31:0] are architecturally mapped to AArch32 System register [AMCR](#)[31:0].

The power domain of AMCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are RES0.

Attributes

AMCR is a 32-bit register.

Field descriptions

Bits [31:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

0b0 Activity monitors do not halt counting when the PE is halted in Debug state.

0b1 Activity monitors halt counting when the PE is halted in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing the AMCR:

AMCR can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xE04	AMCR

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.12 AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configurations

The power domain of AMDEVAFF0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVAFF0 is a 32-bit register.

Field descriptions

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the AMDEVAFF0:

AMDEVAFF0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFA8	AMDEVAFF0

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.13 AMDEVAFF1, Activity Monitors Device Affinity Register 1

The AMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configurations

The power domain of AMDEVAFF1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVAFF1 is a 32-bit register.

Field descriptions

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing the AMDEVAFF1:

AMDEVAFF1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFAC	AMDEVAFF1

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.14 AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the AMU component.

Configurations

The power domain of AMDEVARCH is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVARCH is a 32-bit register.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architecture of the component. For AMU, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

All other values are reserved.

Reads as 0b0000.

Access to this field is RO.

ARCHID, bits [15:0]

Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided.

For AMU:

- Bits [15:12] are the architecture version, 0x0.
- Bits [11:0] are the architecture part number, 0xA66.

This corresponds to AMU architecture version AMUv1.

Reads as 0x0A66.

Access to this field is RO.

Accessing the AMDEVARCH:

AMDEVARCH can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFBC	AMDEVARCH

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.15 AMDEVTYPE, Activity Monitors Device Type Register

The AMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configurations

The power domain of AMDEVTYPE is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVTYPE is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype.

Reads as 0b0001.

Access to this field is RO.

MAJOR, bits [3:0]

Major type.

Reads as 0b0110.

Access to this field is RO.

Accessing the AMDEVTYPE:

AMDEVTYPE can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFCC	AMDEVTYPE

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.16 AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 3

The AMEVCNTR0<n> characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configurations

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch64 System register [AMEVCNTR0<n>_EL0](#)[63:0].

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch32 System register [AMEVCNTR0<n>](#)[63:0].

The power domain of AMEVCNTR0<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are RES0.

Attributes

AMEVCNTR0<n> is a 64-bit register.

Field descriptions

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing the AMEVCNTR0<n>:

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVCNTR0<n> are RAZ. Software must treat reserved accesses as RES0. See [Access requirements for reserved and unallocated registers on page I1-7660](#).

———— Note ————

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

AMEVCNTR0<n>[31:0] can be accessed through its memory-mapped interface:

Component	Offset	Instance	Range
AMU	0x000 + (8 * n)	AMEVCNTR0<n>	31:0

This interface is accessible as follows:

- Accesses to AMEVCNTR0<n>[31:0] are RO.

AMEVCNTR0<n>[63:32] can be accessed through its memory-mapped interface:

Component	Offset	Instance	Range
AMU	$0x004 + (8 * n)$	AMEVCNTR0<n>	63:32

This interface is accessible as follows:

- Accesses to AMEVCNTR0<n>[63:32] are RO.

15.5.17 AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configurations

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register [AMEVCNTR1<n>_EL0](#)[63:0].

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch32 System register [AMEVCNTR1<n>](#)[63:0].

The power domain of AMEVCNTR1<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are RES0.

Attributes

AMEVCNTR1<n> is a 64-bit register.

Field descriptions

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing the AMEVCNTR1<n>:

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVCNTR1<n> are RAZ. Software must treat reserved accesses as RES0. See [Access requirements for reserved and unallocated registers on page I1-7660](#).

———— Note ————

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

AMEVCNTR1<n>[31:0] can be accessed through its memory-mapped interface:

Component	Offset	Instance	Range
AMU	$0x100 + (8 * n)$	AMEVCNTR1<n>	31:0

This interface is accessible as follows:

- Accesses to AMEVCNTR1<n>[31:0] are RO.

AMEVCNTR1<n>[63:32] can be accessed through its memory-mapped interface:

Component	Offset	Instance	Range
AMU	$0x104 + (8 * n)$	AMEVCNTR1<n>	63:32

This interface is accessible as follows:

- Accesses to AMEVCNTR1<n>[63:32] are RO.

15.5.18 AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n> characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>](#) counts.

Configurations

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register [AMEVTYPER0<n>_EL0](#)[31:0].

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER0<n>](#)[31:0].

The power domain of AMEVTYPER0<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are RES0.

Attributes

AMEVTYPER0<n> is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

0x0011	<i>When n == 0:</i> Processor frequency cycles
0x4004	<i>When n == 1:</i> Constant frequency cycles
0x0008	<i>When n == 2:</i> Instructions retired
0x4005	<i>When n == 3:</i> Memory stall cycles

Accessing the AMEVTYPER0<n>:

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVTYPER0<n> are RAZ. Software must treat reserved accesses as RES0. See [Access requirements for reserved and unallocated registers on page I1-7660](#).

————— Note —————

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

AMEVTYPER0<n> can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	$0x400 + (4 * n)$	AMEVTYPER0<n>

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.19 AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>](#) counts.

Configurations

External register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch64 System register [AMEVTYPER1<n>_EL0](#)[31:0].

External register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER1<n>](#)[31:0].

The power domain of AMEVTYPER1<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are RES0.

Attributes

AMEVTYPER1<n> is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing the AMEVTYPER1<n>:

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVTYPER1<n> are RAZ. Software must treat reserved accesses as RES0. See [Access requirements for reserved and unallocated registers on page I1-7660](#).

————— Note —————

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

AMEVTYPER1<n> can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0x480 + (4 * n)	AMEVTYPER1<n>

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.20 AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

Purpose

Defines the implementer and revisions of the AMU.

Configurations

The power domain of AMIIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMIIDR are RES0.

Attributes

AMIIDR is a 32-bit register.

Field descriptions

ProductID, bits [31:20]

This field is an AMU part identifier.

If [AMPIDR0](#) is implemented, [AMPIDR0.PART_0](#) matches bits [27:20] of this field.

If [AMPIDR1](#) is implemented, [AMPIDR1.PART_1](#) matches bits [31:28] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [19:16]

This field distinguishes product variants or major revisions of the product.

If [AMPIDR2](#) is implemented, [AMPIDR2.REVISION](#) matches AMIIDR.Variant.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

This field distinguishes minor revisions of the product.

If [AMPIDR3](#) is implemented, [AMPIDR3.REVAND](#) matches AMIIDR.Revision.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the AMU.

For an Arm implementation, this field reads as 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer.

Bit 7 is RES0

Bits [6:0] contain the JEP106 identity code of the implementer.

If [AMPIDR4](#) is implemented, [AMPIDR4.DES_2](#) matches bits [11:8] of this field.

If [AMPIDR2](#) is implemented, [AMPIDR2.DES_1](#) matches bits [6:4] of this field.

If [AMPIDR1](#) is implemented, [AMPIDR1.DES_0](#) matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the AMIIDR:

AMIIDR can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xE08	AMIIDR

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.21 AMPIDR0, Activity Monitors Peripheral Identification Register 0

The AMPIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

The power domain of AMPIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the AMPIDR0:

AMPIDR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFE0	AMPIDR0

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.22 AMPIDR1, Activity Monitors Peripheral Identification Register 1

The AMPIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

The power domain of AMPIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code.

For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the AMPIDR1:

AMPIDR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFE4	AMPIDR1

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.23 AMPIDR2, Activity Monitors Peripheral Identification Register 2

The AMPIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

The power domain of AMPIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code.

For Arm Limited, this field is 0b011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the AMPIDR2:

AMPIDR2 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFE8	AMPIDR2

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.24 AMPIDR3, Activity Monitors Peripheral Identification Register 3

The AMPIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

The power domain of AMPIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [AMPIDR2.REVISION](#) as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the AMPIDR3:

AMPIDR3 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFEC	AMPIDR3

This interface is accessible as follows:

- Accesses to this register are RO.

15.5.25 AMPIDR4, Activity Monitors Peripheral Identification Register 4

The AMPIDR4 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

The power domain of AMPIDR4 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is RO.

DES_2, bits [3:0]

Designer. JEP106 continuation code, least significant nibble.

For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the AMPIDR4:

AMPIDR4 can be accessed through its memory-mapped interface:

Component	Offset	Instance
AMU	0xFD0	AMPIDR4

This interface is accessible as follows:

- Accesses to this register are RO.

15.6 Generic Timer memory-mapped registers overview

The Generic Timer memory-mapped registers are implemented as multiple register frames, with each register frame having its own base address, as follows:

- A single CNTCTLBase register frame, at base address CNTCTLBase.
- Between one and seven CNTBaseN register frames, each with its own base address CNTBaseN.
- For each CNTBaseN register frame, if required, a CNTEL0BaseN register frame, at base address CNTEL0BaseN, that provides an EL0 view of the CNTBaseN register frame.

For more information, see:

- [Memory-mapped timer components on page I2-7668](#).
- [The CNTBaseN and CNTEL0BaseN frames on page I2-7669](#). This section includes the memory map of the CNTBaseN and CNTEL0BaseN register frames.
- [The CNTCTLBase frame on page I2-7668](#). This section includes the memory map of the CNTCTLBase register frame.

———— **Note** —————

[Providing a complete set of features in a system level implementation on page K5-8468](#) gives an implementation example for a system level implementation of the Generic Timer.

15.7 Generic Timer memory-mapped register descriptions

This section describes the Generic Timer registers. [Generic Timer memory-mapped registers overview on page 15-7804](#) gives an overview of these registers, and includes links to their memory maps.

15.7.1 CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- [CNTNSAR](#) controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the [CNTEL0ACR](#) in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

Configurations

The power domain of CNTACR<n> is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer on page I2-7663](#).

Implemented only if the value of [CNTTIDR.Frame<n>](#) is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

Attributes

CNTACR<n> is a 32-bit register.

Field descriptions

Bits [31:6]

Reserved, RES0.

RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers [CNTP_CVAL](#), [CNTP_TVAL](#), and [CNTP_CTL](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
- 0b1 Read/write access to the EL1 Physical Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RWVT, bit [4]

Read/write access to the Virtual Timer register [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to the Virtual Timer registers in frame <n>. The registers are RES0.
- 0b1 Read/write access to the Virtual Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to [CNTVOFF](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to [CNTVOFF](#) in frame <n>. The register is RES0.
- 0b1 Read-only access to [CNTVOFF](#) in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to [CNTFRQ](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to [CNTFRQ](#) in frame <n>. The register is RES0.
- 0b1 Read-only access to [CNTFRQ](#) in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to [CNTVCT](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to [CNTVCT](#) in frame <n>. The register is RES0.
- 0b1 Read-only access to [CNTVCT](#) in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to [CNTPCT](#), in frame <n>. The possible values of this bit are:

- 0b0 No access to [CNTPCT](#) in frame <n>. The register is RES0.
- 0b1 Read-only access to [CNTPCT](#) in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTACR<n>:

In a system that recognizes two Security states:

- [CNTACR<n>](#) is always accessible by Secure accesses.
- [CNTNSAR.NS<n>](#) determines whether [CNTACR<n>](#) is accessible by Non-secure accesses.

[CNTACR<n>](#) can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x040 + (4 * n)	CNTACR<n>

This interface is accessible as follows:

- Accesses to this register are RW.

15.7.2 CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configurations

The power domain of CNTCR is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTCR is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select. Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see [The Frequency modes table](#) on page I2-7665. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

The reset behavior of this field is:

- On a Timer reset, this field resets to 0.

Bits [7:3]

Reserved, RES0.

SCEN, bit [2]

When FEAT_CNTSC is implemented:

SCEN

Scale Enable.

- | | |
|-----|--|
| 0b0 | Scaling is not enabled. The counter value is incremented by 0x1.0000000 for each counter tick. |
| 0b1 | Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick. |

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the **CNTCV** register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

0b0 System counter ignores Halt-on-debug.

0b1 Asserted Halt-on-debug signal halts system counter update.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

0b0 System counter disabled.

0b1 System counter enabled.

The reset behavior of this field is:

- On a Timer reset, this field resets to 0.

Accessing the CNTCR:

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTCR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x000	CNTCR

This interface is accessible as follows:

- Accesses to this register are RW.

15.7.3 CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Configurations

The power domain of CNTCV is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-7663.

Attributes

CNTCV is a 64-bit register.

Field descriptions

CountValue, bits [63:0]

Indicates the counter value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTCV:

Frame	Accessibility
CNTControlBase	RW
CNTReadBase	RO

A write to CNTCV must be visible in the [CNTPCT](#) register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV[63:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTControlBase	0x008	CNTCV	63:0

This interface is accessible as follows:

- Accesses to CNTCV[63:0] are RW.

CNTCV[63:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTReadBase	0x000	CNTCV	63:0

This interface is accessible as follows:

- Accesses to CNTCV[63:0] are RO.

15.7.4 CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

Purpose

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the [CNTPTCT](#), [CNTVCT](#), [CNTFRQ](#), EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

Configurations

The power domain of CNTEL0ACR is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTEL0ACR is a 32-bit register.

Field descriptions

Bits [31:10]

Reserved, RES0.

ELOPTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the [CNTPT_CVAL](#), [CNTPT_TVAL](#), and [CNTPT_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

- 0b0 No access. Registers are RES0 in the second view.
- 0b1 Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ELOVTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

- 0b0 No access. Registers are RES0 in the second view.
- 0b1 Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL0VCTEN, bit [1]

Second view read access control for [CNTVCT](#) and [CNTFRQ](#). The possible values of this bit are:

0b0 [CNTVCT](#) is not visible in the second view.

If EL0PCTEN is set to 0, [CNTFRQ](#) is not visible in the second view.

0b1 Access permitted. If [CNTVCT](#) and [CNTFRQ](#) are visible in the current frame then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Second view read access control for [CNTPCT](#) and [CNTFRQ](#). The possible values of this bit are:

0b0 [CNTPCT](#) is not visible in the second view.

If EL0VCTEN is set to 0, [CNTFRQ](#) is not visible in the second view.

0b1 Access permitted. If [CNTPCT](#) and [CNTFRQ](#) are visible in the current frame then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTEL0ACR:

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7671](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.
- If the corresponding CNTEL0BaseN frame is implemented, the registers [CNTFRQ](#), [CNTP_CTL](#), [CNTP_CVAL](#), [CNTP_TVAL](#), [CNTPCT](#), [CNTV_CTL](#), [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTVCT](#) are not visible in that frame.

CNTEL0ACR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x014	CNTEL0ACR

This interface is accessible as follows:

- Accesses to this register are RW.

15.7.5 CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Configurations

The power domain of CNTFID0 is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see [The Frequency modes table](#) on page I2-7665.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions

Frequency, bits [31:0]

The base frequency of the system counter, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTFID0:

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTFID0 can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020	CNTFID0

This interface is accessible as follows:

- Accesses to this register are RO or RW.

15.7.6 CNTFID<n>, Counter Frequency IDs, n > 0, n = 1 - 1003

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter update frequencies.

Configurations

The power domain of CNTFID<n> is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer on page I2-7663](#).

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see [The Frequency modes table on page I2-7665](#).

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x0C0-0x0FC, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions

Frequency, bits [31:0]

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

$$\text{increment} = (\text{base frequency}) / (\text{selected frequency})$$

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTFID<n>:

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

CNTFID<n> can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	$0x020 + (4 * n)$	CNTFID<n>

This interface is accessible as follows:

- Accesses to this register are RO or RW.

15.7.7 CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configurations

The power domain of CNTFRQ is IMPLEMENTATION DEFINED.

For more information see [Power and reset domains for the system level implementation of the Generic Timer on page I2-7663](#).

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTFRQ:

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7671](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of `CNTACR<n>.RFRQ` is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
 - CNTFRQ is accessible in the corresponding CNTBaseN frame.
 - Either the value of `CNTEL0ACR.EL0VCTEN` is 1 or the value of `CNTEL0ACR.EL0PCTEN` is 1.

- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x010	CNTFRQ

This interface is accessible as follows:

- Accesses to this register are RO.

CNTFRQ can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTELOBaseN	0x010	CNTFRQ

This interface is accessible as follows:

- Accesses to this register are RO.

CNTFRQ can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x000	CNTFRQ

This interface is accessible as follows:

- Accesses to this register are RO.

15.7.8 CNTID, Counter Identification Register

The CNTID characteristics are:

Purpose

Indicates whether counter scaling is implemented.

Configurations

The power domain of CNTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

Attributes

CNTID is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

CNTSC, bits [3:0]

Indicates whether Counter Scaling is implemented

0b0000 Counter scaling is not implemented.

0b0001 Counter scaling is implemented.

All other values are reserved.

Accessing the CNTID:

In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTID can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x1C	CNTID

This interface is accessible as follows:

- Accesses to this register are RO.

15.7.9 CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

Configurations

The power domain of CNTNSAR is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

NS<n>, bit [n], for n = 7 to 0

Non-secure access to frame n. The possible values of this bit are:

- 0b0 Secure access only. Behaves as RES0 to Non-secure accesses.
- 0b1 Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, [CNTACR<n>](#) and [CNTVOFF<n>](#) are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTNSAR:

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

CNTNSAR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x004	CNTNSAR

This interface is accessible as follows:

- Accesses to this register are RW.

15.7.10 CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configurations

The power domain of CNTP_CTL is IMPLEMENTATION DEFINED.

For more information, see *Power and reset domains for the system level implementation of the Generic Timer* on page I2-7663.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP_TVAL](#) continues to count down.

———— **Note** —————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CTL:

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7671 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CTL is accessible in that frame if both:
 - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x02C	CNTP_CTL

This interface is accessible as follows:

- Accesses to this register are RW.

CNTP_CTL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x02C	CNTP_CTL

This interface is accessible as follows:

- Accesses to this register are RW.

15.7.11 CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the EL1 physical timer.

Configurations

The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- An interrupt is generated if [CNTP_CTL.IMASK](#) is 0.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTP_CVAL:

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#) on page I2-7671 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
 - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x020	CNTP_CVAL	31:0

This interface is accessible as follows:

- Accesses to CNTP_CVAL[31:0] are RW.

CNTP_CVAL[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x020	CNTP_CVAL	31:0

This interface is accessible as follows:

- Accesses to CNTP_CVAL[31:0] are RW.

CNTP_CVAL[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x024	CNTP_CVAL	63:32

This interface is accessible as follows:

- Accesses to CNTP_CVAL[63:32] are RW.

CNTP_CVAL[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x024	CNTP_CVAL	63:32

This interface is accessible as follows:

- Accesses to CNTP_CVAL[63:32] are RW.

15.7.12 CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configurations

The power domain of CNTP_TVAL is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTP_TVAL:

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#) on page I2-7671 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTP_TVAL is accessible in that frame if both:
 - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTELOACR.ELOPTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

CNTP_TVAL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x028	CNTP_TVAL

This interface is accessible as follows:

- Accesses to this register are RW.

CNTP_TVAL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTELOBaseN	0x028	CNTP_TVAL

This interface is accessible as follows:

- Accesses to this register are RW.

15.7.13 CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configurations

The power domain of CNTPCT is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNPCT is a 64-bit register.

Field descriptions

Bits [63:0]

Physical count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTPCT:

CNPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#) on page I2-7671 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNPCT is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RPCT](#) is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNPCT is accessible in that frame if both:
 - CNPCT is accessible in the corresponding CNTBaseN frame.
 - The value of [CNTEL0ACR.EL0PCTEN](#) is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

CNTPCT[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x000	CNTPCT	31:0

This interface is accessible as follows:

- Accesses to CNTPCT[31:0] are RO.

CNTPCT[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTELOBaseN	0x000	CNTPCT	31:0

This interface is accessible as follows:

- Accesses to CNTPCT[31:0] are RO.

CNTPCT[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x004	CNTPCT	63:32

This interface is accessible as follows:

- Accesses to CNTPCT[63:32] are RO.

CNTPCT[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTELOBaseN	0x004	CNTPCT	63:32

This interface is accessible as follows:

- Accesses to CNTPCT[63:32] are RO.

15.7.14 CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configurations

The power domain of CNTSCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer on page I2-7663](#).

Attributes

CNTSCR is a 32-bit register.

Field descriptions

ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the amount added to the counter value for every counter tick.

Counter tick is defined as one period of the current operating frequency of the Generic counter.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when `CNTCR.EN == 0`. If the value of this field is changed when `CNTCR.EN == 1`:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTSCR:

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSCR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x10	CNTSCR

This interface is accessible as follows:

- Accesses to this register are RW.

15.7.15 CNTSR, Counter Status Register

The CNTSR characteristics are:

Purpose

Provides counter frequency status information.

Configurations

The power domain of CNTSR is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer on page I2-7663](#).

Attributes

CNTSR is a 32-bit register.

Field descriptions

FCACK, bits [31:8]

Frequency change acknowledge. Indicates the currently selected entry in the Frequency modes table, see [The Frequency modes table on page I2-7665](#).

The reset behavior of this field is:

- On a Timer reset, this field resets to 0.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

- 0b0 Counter is not halted.
- 0b1 Counter is halted.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing the CNTSR:

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x004	CNTSR

This interface is accessible as follows:

- Accesses to this register are RO.

15.7.16 CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

Purpose

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

Configurations

The power domain of CNTTIDR is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTTIDR is a 32-bit register.

Field descriptions

Frame<n>, bits [4n+3:4n], for n = 7 to 0

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

Bit[2]	Meaning
0b0	Frame<n> does not have a second view. The CNTELOACR register in the first view of the frame is RES0
0b1	Frame<n> has a second view, CNTEL0Base<n>.

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#).
- This CNTCTLBase frame implements the virtual timer offset register [CNTVOFF<n>](#).

The possible values of bit[1] are:

Bit[1]	Meaning
0b0	Frame<n> does not have virtual capability. The virtual time and offset registers are RES0.
0b1	Frame<n> has virtual capability. The virtual time and offset registers are implemented

If bit[0] is 0, bit[1] is RES0.

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

Bit[0]	Meaning
0b0	Frame<n> is not implemented. All registers associated with the frame are RES0.
0b1	Frame<n> is implemented

Accessing the CNTTIDR:

In a system that recognizes two Security states this register is accessible by both Secure and Non-secure accesses.

CNTTIDR can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x008	CNTTIDR

This interface is accessible as follows:

- Accesses to this register are RO.

15.7.17 CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configurations

The power domain of CNTV_CTL is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV_TVAL](#) continues to count down.

———— **Note** —————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CTL:

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7671](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
 - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

CNTV_CTL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x03C	CNTV_CTL

This interface is accessible as follows:

- Accesses to this register are RW.

CNTV_CTL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x03C	CNTV_CTL

This interface is accessible as follows:

- Accesses to this register are RW.

15.7.18 CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the virtual timer.

Configurations

The power domain of CNTV_CVAL is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer.

When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTV_CTL.IMASK is 0.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTV_CVAL:

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#) on page I2-7671 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CVAL is accessible in that frame if both:
 - CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x030	CNTV_CVAL	31:0

This interface is accessible as follows:

- Accesses to CNTV_CVAL[31:0] are RW.

CNTV_CVAL[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x030	CNTV_CVAL	31:0

This interface is accessible as follows:

- Accesses to CNTV_CVAL[31:0] are RW.

CNTV_CVAL[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x034	CNTV_CVAL	63:32

This interface is accessible as follows:

- Accesses to CNTV_CVAL[63:32] are RW.

CNTV_CVAL[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x034	CNTV_CVAL	63:32

This interface is accessible as follows:

- Accesses to CNTV_CVAL[63:32] are RW.

15.7.19 CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configurations

The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If [CNTV_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV_CTL.ENABLE](#) is 1, the value returned is $(\text{CompareValue} - \text{CNTVCT})$.

On a write of this register, CompareValue is set to $(\text{CNTVCT} + \text{TimerValue})$, where TimerValue is treated as a signed 32-bit integer.

When [CNTV_CTL.ENABLE](#) is 1, the timer condition is met when $(\text{CNTVCT} - \text{CompareValue})$ is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer.

When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- If [CNTV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTV_TVAL:

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#) on page I2-7671 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTV_TVAL is accessible in that frame if both:
 - CNTV_TVAL is accessible in the corresponding CNTBaseN frame:
 - The value of CNTELOACR.EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

CNTV_TVAL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x038	CNTV_TVAL

This interface is accessible as follows:

- Accesses to this register are RW.

CNTV_TVAL can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTELOBaseN	0x038	CNTV_TVAL

This interface is accessible as follows:

- Accesses to this register are RW.

15.7.20 CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Configurations

The power domain of CNTVCT is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

Bits [63:0]

Virtual count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTVCT:

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#) on page I2-7671 describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVCT is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
 - CNTVCT is accessible in the corresponding CNTBaseN frame.
 - The value of CNTEL0ACR.EL0VCTEN is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

CNTVCT[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x008	CNTVCT	31:0

This interface is accessible as follows:

- Accesses to CNTVCT[31:0] are RO.

CNTVCT[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTELOBaseN	0x008	CNTVCT	31:0

This interface is accessible as follows:

- Accesses to CNTVCT[31:0] are RO.

CNTVCT[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x00C	CNTVCT	63:32

This interface is accessible as follows:

- Accesses to CNTVCT[63:32] are RO.

CNTVCT[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance	Range
Timer	CNTELOBaseN	0x00C	CNTVCT	63:32

This interface is accessible as follows:

- Accesses to CNTVCT[63:32] are RO.

15.7.21 CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

Configurations

The power domain of CNTVOFF is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer on page I2-7663](#).

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

Bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTVOFF:

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

[CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames on page I2-7671](#) describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of `CNTACR<n>.RVOFF` is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

————— Note —————

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, a CNTVOFF {<n>} register must be accessible as an atomic 64-bit value.

CNTVOFF[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Range
Timer	CNTBaseN	0x018	31:0

This interface is accessible as follows:

- Accesses to CNTVOFF[31:0] are RO.

CNTVOFF[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Range
Timer	CNTBaseN	0x01C	63:32

This interface is accessible as follows:

- Accesses to CNTVOFF[63:32] are RO.

15.7.22 CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

Purpose

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

Configurations

The power domain of CNTVOFF<n> is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

Attributes

CNTVOFF<n> is a 64-bit register.

Field descriptions

Bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing the CNTVOFF<n>:

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see [CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#) on page I2-7671.

———— Note —————

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- [CNTNSAR.NS<n>](#) determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using [CNTVOFF](#).

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

CNTVOFF<n>[31:0] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Range
Timer	CNTCTLBase	0x080 + (8 * n)	31:0

This interface is accessible as follows:

- Accesses to CNTVOFF<n>[31:0] are RW.

CNTVOFF<n>[63:32] can be accessed through its memory-mapped interface:

Component	Frame	Offset	Range
Timer	CNTCTLBase	0x084 + (8 * n)	63:32

This interface is accessible as follows:

- Accesses to CNTVOFF<n>[63:32] are RW.

15.7.23 CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

Configurations

The power domain of CounterID<n> is IMPLEMENTATION DEFINED.

For more information, see [Power and reset domains for the system level implementation of the Generic Timer](#) on page I2-7663.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

Attributes

CounterID<n> is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the CounterID<n>:

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure memory maps the frame is implemented only in the Secure memory map, meaning these registers are implemented only in the Secure memory map.

For the CNTBaseN frames, [CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames](#) on page I2-7671 describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

CounterID<n> can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0xFD0 + (4 * n)	CounterID<n>

This interface is accessible as follows:

- Accesses to this register are RO.

CounterID<n> can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTReadBase	0xFD0 + (4 * n)	CounterID<n>

This interface is accessible as follows:

- Accesses to this register are RO.

CounterID<n> can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0xFD0 + (4 * n)	CounterID<n>

This interface is accessible as follows:

- Accesses to this register are RO.

CounterID<n> can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTELOBaseN	0xFD0 + (4 * n)	CounterID<n>

This interface is accessible as follows:

- Accesses to this register are RO.

CounterID<n> can be accessed through its memory-mapped interface:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0xFD0 + (4 * n)	CounterID<n>

This interface is accessible as follows:

- Accesses to this register are RO.

15.8 RAS register descriptions

This section describes the RAS registers.

15.8.1 ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

ERRCIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.

Reads as 0x0D.

Access to this field is RO.

Accessing the ERRCIDR0:

ERRCIDR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFF0	ERRCIDR0

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.2 ERRCIDR1, Component Identification Register 1

The ERRCIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

ERRCIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

0b1111 Generic peripheral with IMPLEMENTATION DEFINED register layout.

Other values are defined by the CoreSight Architecture.

This field reads as 0xF.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Reads as 0b0000.

Access to this field is RO.

Accessing the ERRCIDR1:

ERRCIDR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFF4	ERRCIDR1

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.3 ERRCIDR2, Component Identification Register 2

The ERRCIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

ERRCIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Component identification preamble, segment 2.

Reads as 0x05.

Access to this field is RO.

Accessing the ERRCIDR2:

ERRCIDR2 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFF8	ERRCIDR2

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.4 ERRCIDR3, Component Identification Register 3

The ERRCIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

ERRCIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.

Reads as 0xB1.

Access to this field is RO.

Accessing the ERRCIDR3:

ERRCIDR3 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFFC	ERRCIDR3

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.5 ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configurations

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

ERRCRICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR0 is a 64-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRCRICR0.ADDR << 2) is the address that the component writes to when signaling the Critical Error Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing the ERRCRICR0:

ERRCRICR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xEA0	ERRCRICR0

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.6 ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configurations

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR1 are RES0.

ERRCRICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR1 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the ERRCRICR1:

ERRCRICR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xEA8	ERRCRICR1

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.7 ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

Purpose

Critical Error Interrupt control and configuration register.

Configurations

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.

ERRCRICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR2 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

IRQEN

Message signaled interrupt enable. Enables generation of message signaled interrupts.

0b0 Disabled.

0b1 Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRCRICR2:

NSMSI

Security attribute. Defines the physical address space for message signaled interrupts.

0b0 Secure.

0b1 Non-secure.

The reset behavior of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRCRICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

SH

Shareability. Defines the Shareability domain for message signaled interrupts.

0b00 Not shared.

0b10 Outer Shareable.

0b11 Inner Shareable.

All other values are reserved.

This field is ignored when ERRCRICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

MemAttr

Memory type. Defines the memory type and attributes for message signaled interrupts.

0b0000 Device-nGnRnE memory.

0b0001 Device-nGnRE memory.

0b0010 Device-nGRE memory.

0b0011 Device-GRE memory.

0b0101 Normal memory, Inner Non-cacheable, Outer Non-cacheable.

0b0110 Normal memory, Inner Write-Through, Outer Non-cacheable.

0b0111 Normal memory, Inner Write-Back, Outer Non-cacheable.

- 0b1001 Normal memory, Inner Non-cacheable, Outer Write-Through.
- 0b1010 Normal memory, Inner Write-Through, Outer Write-Through.
- 0b1011 Normal memory, Inner Write-Back, Outer Write-Through.
- 0b1101 Normal memory, Inner Non-cacheable, Outer Write-Back.
- 0b1110 Normal memory, Inner Write-Through, Outer Write-Back.
- 0b1111 Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

———— **Note** ————

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the ERRCRICR2:

ERRCRICR2 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xEAC	ERRCRICR2

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.8 ERRDEVAFF, Device Affinity Register

The ERRDEVAFF characteristics are:

Purpose

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of [MPIDR_EL1](#) or part of [MPIDR_EL1](#):

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as [MPIDR_EL1](#), and ERRDEVAFF.FOV reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of [MPIDR_EL1](#), and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in [MPIDR_EL1](#).{Aff3,Aff2}, and these values are equal to ERRDEVAFF.{Aff3,Aff2}.
- ERRDEVAFF.Aff1 is nonzero and not 0x80, and ERRDEVAFF.{Aff0,FOV} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is 0b100, then the group of error records has affinity with the up-to 8 PEs that have [MPIDR_EL1](#).Aff1[7:3] = ERRDEVAFF.Aff1[7:3].

If RAS System Architecture v1.1 is not implemented, ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

Configurations

This register is present only when the group of error records has affinity with a PE or cluster of PEs. Otherwise, direct accesses to ERRDEVAFF are RES0.

ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVAFF is a 64-bit register.

Field descriptions

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

PE affinity level 3. The [MPIDR_EL1](#).Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

FOV, bit [31]

Indicates that the ERRDEVAFF.Aff0 field is valid.

- 0b0 ERRDEVAFF.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.
- 0b1 ERRDEVAFF.Aff0 is valid, and the PE affinity is at level 0.

U, bit [30]

When *ERRDEVAFF.FOV* == 1:

U

Uniprocessor. The [MPIDR_EL1.U](#) field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

When *ERRDEVAFF.FOV* == 1:

MT

Multithreaded. The [MPIDR_EL1.MT](#) field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]

When affine with a PE or PEs at affinity level 2 or below:

Aff2

PE affinity level 2. The [MPIDR_EL1.Aff2](#) field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 2:

Aff2

PE affinity level 2. Defines part of the [MPIDR_EL1.Aff2](#) field, viewed from the highest Exception level of the associated PEs.

0bxxxxxx1 ERRDEVAFF.Aff2[7:1] is the value of [MPIDR_EL1.Aff2\[7:1\]](#), viewed from the highest Exception level of the associated PEs.

0bxxxxx10 ERRDEVAFF.Aff2[7:2] is the value of [MPIDR_EL1.Aff2\[7:2\]](#), viewed from the highest Exception level of the associated PEs.

0bxxxxx100 ERRDEVAFF.Aff2[7:3] is the value of [MPIDR_EL1.Aff2\[7:3\]](#), viewed from the highest Exception level of the associated PEs.

0bxxxx1000 ERRDEVAFF.Aff2[7:4] is the value of [MPIDR_EL1.Aff2\[7:4\]](#), viewed from the highest Exception level of the associated PEs.

0bxxx10000 ERRDEVAFF.Aff2[7:5] is the value of [MPIDR_EL1.Aff2\[7:5\]](#), viewed from the highest Exception level of the associated PEs.

0bxx100000 ERRDEVAFF.Aff2[7:6] is the value of [MPIDR_EL1.Aff2\[7:6\]](#), viewed from the highest Exception level of the associated PEs.

0bx1000000 ERRDEVAFF.Aff2[7] is the value of [MPIDR_EL1.Aff2\[7\]](#), viewed from the highest Exception level of the associated PEs.

Otherwise:

Aff2

PE affinity level 2. Indicates whether the PE affinity is at level 3.

0x80 PE affinity is at level 3.

All other values are reserved.

Aff1, bits [15:8]

When affine with a PE or PEs at affinity level 1 or below:

Aff1

PE affinity level 1. The `MPIDR_EL1.Aff1` field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 1:

Aff1

PE affinity level 1. Defines part of the `MPIDR_EL1.Aff1` field, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx1` `ERRDEVAFF.Aff1[7:1]` is the value of `MPIDR_EL1.Aff1[7:1]`, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx10` `ERRDEVAFF.Aff1[7:2]` is the value of `MPIDR_EL1.Aff1[7:2]`, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx100` `ERRDEVAFF.Aff1[7:3]` is the value of `MPIDR_EL1.Aff1[7:3]`, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx1000` `ERRDEVAFF.Aff1[7:4]` is the value of `MPIDR_EL1.Aff1[7:4]`, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx10000` `ERRDEVAFF.Aff1[7:5]` is the value of `MPIDR_EL1.Aff1[7:5]`, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx100000` `ERRDEVAFF.Aff1[7:6]` is the value of `MPIDR_EL1.Aff1[7:6]`, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx1000000` `ERRDEVAFF.Aff1[7]` is the value of `MPIDR_EL1.Aff1[7]`, viewed from the highest Exception level of the associated PEs.

Otherwise:

Aff1

PE affinity level 1. Indicates whether the PE affinity is at level 2.

`0x00` PE affinity is above level 2 or a subset of level 2.

`0x80` PE affinity is at level 2.

Aff0, bits [7:0]

When affine with a PE at affinity level 0:

Aff0

PE affinity level 0. The `MPIDR_EL1.Aff0` field, viewed from the highest Exception level of the associated PE.

When affine with a sub-set of PEs at affinity level 0:

Aff0

PE affinity level 0. Defines part of the `MPIDR_EL1.Aff0` field, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx1` `ERRDEVAFF.Aff0[7:1]` is the value of `MPIDR_EL1.Aff0[7:1]`, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx10` `ERRDEVAFF.Aff0[7:2]` is the value of `MPIDR_EL1.Aff0[7:2]`, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx100` `ERRDEVAFF.Aff0[7:3]` is the value of `MPIDR_EL1.Aff0[7:3]`, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx1000` `ERRDEVAFF.Aff0[7:4]` is the value of `MPIDR_EL1.Aff0[7:4]`, viewed from the highest Exception level of the associated PEs.

`0bxxxxxx10000` `ERRDEVAFF.Aff0[7:5]` is the value of `MPIDR_EL1.Aff0[7:5]`, viewed from the highest Exception level of the associated PEs.

0bxx100000 ERRDEVAFF.Aff0[7:6] is the value of [MPIDR_EL1.Aff0\[7:6\]](#), viewed from the highest Exception level of the associated PEs.

0bxx1000000 ERRDEVAFF.Aff0[7] is the value of [MPIDR_EL1.Aff0\[7\]](#), viewed from the highest Exception level of the associated PEs.

Otherwise:

Aff0

PE affinity level 0. Indicates whether the PE affinity is at level 1.

0x00 PE affinity is above level 1 or a subset of level 1.

0x80 PE affinity is at level 1.

Accessing the ERRDEVAFF:

ERRDEVAFF can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFA8	ERRDEVAFF

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.9 ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

Configurations

ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVARCH is a 32-bit register.

Field descriptions

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

0b01000111011 JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

0b0 Device Architecture information not present.

0b1 Device Architecture information present.

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

0b0000 RAS System Architecture v1.0.

0b0001 RAS System Architecture v1.1. As 0b0000 and also:

- Simplifies ERR<n>STATUS.
- Adds support for additional ERR<n>MISC<m> registers.
- Adds support for the optional RAS Timestamp Extension.
- Adds support for the optional Common Fault Injection Model Extension.

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

0b0000 RAS System Architecture v1.

All other values are reserved.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0b0000.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

0xA00 RAS System Architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA00.

Accessing the ERRDEVARCH:

ERRDEVARCH can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFBC	ERRDEVARCH

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.10 ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

Purpose

Provides discovery information for the component.

Configurations

ERRDEVID is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVID is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the ERRDEVID:

ERRDEVID can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFC8	ERRDEVID

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.11 ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configurations

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR0 are RES0.

ERRERICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR0 is a 64-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. ($\text{ERRERICR0.ADDR} \ll 2$) is the address that the component writes to when signaling the Error Recovery Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED.

Unimplemented high-order physical address bits are RES0.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing the ERRERICR0:

ERRERICR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xE90	ERRERICR0

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.12 ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configurations

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

ERRERICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR1 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the ERRERICR1:

ERRERICR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xE98	ERRERICR1

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.13 ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

Purpose

Error Recovery Interrupt control and configuration register.

Configurations

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

ERRERICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR2 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

IRQEN

Message signaled interrupt enable. Enables generation of message signaled interrupts.

0b0 Disabled.

0b1 Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRERICR2:

NSMSI

Security attribute. Defines the physical address space for message signaled interrupts.

0b0 Secure.

0b1 Non-secure.

The reset behavior of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRERICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

SH

Shareability. Defines the Shareability domain for message signaled interrupts.

0b00 Not shared.

0b10 Outer Shareable.

0b11 Inner Shareable.

All other values are reserved.

This field is ignored when ERRERICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

MemAttr

Memory type. Defines the memory type and attributes for message signaled interrupts.

0b0000 Device-nGnRnE memory.

0b0001 Device-nGnRE memory.

0b0010 Device-nGRE memory.

0b0011 Device-GRE memory.

0b0101 Normal memory, Inner Non-cacheable, Outer Non-cacheable.

0b0110 Normal memory, Inner Write-Through, Outer Non-cacheable.

0b0111 Normal memory, Inner Write-Back, Outer Non-cacheable.

- 0b1001 Normal memory, Inner Non-cacheable, Outer Write-Through.
- 0b1010 Normal memory, Inner Write-Through, Outer Write-Through.
- 0b1011 Normal memory, Inner Write-Back, Outer Write-Through.
- 0b1101 Normal memory, Inner Non-cacheable, Outer Write-Back.
- 0b1110 Normal memory, Inner Write-Through, Outer Write-Back.
- 0b1111 Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the ERRERICR2:

ERRERICR2 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xE9C	ERRERICR2

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.14 ERRFHICR0, Fault Handling Interrupt Configuration Register 0

The ERRFHICR0 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configurations

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR0 are RES0.

ERRFHICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR0 is a 64-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRFHICR0.ADDR << 2) is the address that the component writes to when signaling the Fault Handling Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED.

Unimplemented high-order physical address bits are RES0.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing the ERRFHICR0:

ERRFHICR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xE80	ERRFHICR0

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.15 ERRFHICR1, Fault Handling Interrupt Configuration Register 1

The ERRFHICR1 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configurations

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR1 are RES0.

ERRFHICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR1 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the ERRFHICR1:

ERRFHICR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xE88	ERRFHICR1

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.16 ERRFHICR2, Fault Handling Interrupt Configuration Register 2

The ERRFHICR2 characteristics are:

Purpose

Fault Handling Interrupt control and configuration register.

Configurations

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR2 are RES0.

ERRFHICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR2 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

IRQEN

Message signaled interrupt enable. Enables generation of message signaled interrupts.

0b0 Disabled.

0b1 Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRFHICR2:

NSMSI

Security attribute. Defines the physical address space for message signaled interrupts.

0b0 Secure.

0b1 Non-secure.

The reset behavior of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRFHICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

SH

Shareability. Defines the Shareability domain for message signaled interrupts.

0b00 Not shared.

0b10 Outer Shareable.

0b11 Inner Shareable.

All other values are reserved.

This field is ignored when ERRFHICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

MemAttr

Memory type. Defines the memory type and attributes for message signaled interrupts.

0b0000 Device-nGnRnE memory.

0b0001 Device-nGnRE memory.

0b0010 Device-nGRE memory.

0b0011 Device-GRE memory.

0b0101 Normal memory, Inner Non-cacheable, Outer Non-cacheable.

0b0110 Normal memory, Inner Write-Through, Outer Non-cacheable.

0b0111 Normal memory, Inner Write-Back, Outer Non-cacheable.

- 0b1001 Normal memory, Inner Non-cacheable, Outer Write-Through.
- 0b1010 Normal memory, Inner Write-Through, Outer Write-Through.
- 0b1011 Normal memory, Inner Write-Back, Outer Write-Through.
- 0b1101 Normal memory, Inner Non-cacheable, Outer Write-Back.
- 0b1110 Normal memory, Inner Write-Through, Outer Write-Back.
- 0b1111 Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

———— **Note** ————

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing the ERRFHICR2:

ERRFHICR2 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xE8C	ERRFHICR2

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.17 ERRGSR, Error Group Status Register

The ERRGSR characteristics are:

Purpose

Shows the status for the records in the group.

Configurations

ERRGSR is implemented only as part of a memory-mapped group of error records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

Attributes

ERRGSR is a 64-bit register.

Field descriptions

Bits [63:56]

Reserved, RES0.

S<m>, bit [m], for m = 55 to 0

When error record <m> is implemented and error record <m> supports this type of reporting:

S<m>

The status for error record <m>. A read-only copy of ERR<n>STATUS.V.

0b0 No error.

0b1 One or more errors.

If the Common Fault Injection Model is implemented, up-to 24 records can be implemented meaning bits [55:24] are RES0.

Otherwise:

Reserved, RES0.

Accessing the ERRGSR:

ERRGSR can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xE00	ERRGSR

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.18 ERRIIDR, Implementation Identification Register

The ERRIIDR characteristics are:

Purpose

Defines the implementer of the component.

Configurations

Implementation of this register is OPTIONAL.

This register is present only when RAS System Architecture v1.1 is implemented.

Attributes

ERRIIDR is a 32-bit register.

Field descriptions

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

If ERRPIDR0 and ERRPIDR1 are implemented, ERRPIDR0.PART_0 matches bits [7:0] of ERRIIDR.ProductID and ERRPIDR1.PART_1 matches bits [11:8] of ERRIIDR.ProductID.

Variant, bits [19:16]

Component major revision.

This field distinguishes product variants or major revisions of the product.

If ERRPIDR2 is implemented, ERRPIDR2.REVISION matches ERRIIDR.Variant.

Revision, bits [15:12]

Component minor revision.

This field distinguishes minor revisions of the product.

If ERRPIDR3 is implemented, ERRPIDR3.REVAND matches ERRIIDR.Revision.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the RAS component. For an Arm implementation, this field has the value 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer, and bits [6:0] contain the JEP106 identity code of the implementer. Bit 7 is RES0.

If ERRPIDR4 is implemented, ERRPIDR2 is implemented, and ERRPIDR1 is implemented, ERRPIDR4.DES_2 matches bits [11:8] of ERRIIDR.Implementer, ERRPIDR2.DES_1 matches bits [6:4] of ERRIIDR.Implementer, and ERRPIDR1.DES_0 matches bits [3:0] of ERRIIDR.Implementer.

Accessing the ERRIIDR:

ERRIIDR can be accessed through its memory-mapped interface:

Component	Offset
RAS	0xE10

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.19 ERRIMPDEF<n>, IMPLEMENTATION DEFINED Register <n>, n = 0 - 191

The ERRIMPDEF<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED RAS extensions.

Configurations

This register is present only when the Common Fault Injection Model Extension is not implemented, ERRDEVID.NUM <= 32 and an implementation implements ERRIMPDEF<n>. Otherwise, direct accesses to ERRIMPDEF<n> are RES0.

Attributes

ERRIMPDEF<n> is a 64-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing the ERRIMPDEF<n>:

ERRIMPDEF<n> can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	$0x800 + (8 * n)$	ERRIMPDEF<n>

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.20 ERRIRQCR<n>, Generic Error Interrupt Configuration Register, n = 0 - 15

The ERRIRQCR<n> characteristics are:

Purpose

The ERRIRQCR<n> registers are reserved for IMPLEMENTATION DEFINED interrupt configuration registers.

The architecture provides a recommended layout for the ERRIRQCR<n> registers. These registers are named:

- ERRFHICR0, ERRFHICR1, and ERRFHICR2 for the fault handling interrupt controls.
- ERRERICR0, ERRERICR1, and ERRERICR2 for the error recovery interrupt controls.
- ERRCRICR0, ERRCRICR1, and ERRCRICR2 for the critical error interrupt controls.
- ERRIRQSR for the status register.

This section describes the generic, IMPLEMENTATION DEFINED, format.

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

This register is present only when the interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQCR<n> are RES0.

ERRIRQCR<n> is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQCR<n> is a 64-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED controls. The content of these registers is IMPLEMENTATION DEFINED.

Accessing the ERRIRQCR<n>:

ERRIRQCR<n> can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xE80 + (8 * n)	ERRIRQCR<n>

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.21 ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

Purpose

Interrupt status register.

Configurations

This register is present only when interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQSR are RES0.

ERRIRQSR is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQSR is a 64-bit register.

Field descriptions

When the implementation uses the recommended layout for the ERRIRQCR<n> registers:

Bits [63:6]

Reserved, RES0.

CRIERR, bit [5]

When the Critical Error Interrupt is implemented:

CRIERR

Critical Error Interrupt Error.

0b0 Critical Error Interrupt write has not returned an error since this field was last cleared to zero.

0b1 Critical Error Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is WIC.

Otherwise:

Reserved, RES0.

CRI, bit [4]

When the Critical Error Interrupt is implemented:

CRI

Critical Error Interrupt write in progress.

0b0 Critical Error Interrupt write not in progress.

0b1 Critical Error Interrupt write in progress.
Software must not disable an interrupt whilst the write is in progress.

———— **Note** —————

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is RO.

Otherwise:

Reserved, RES0.

ERIERR, bit [3]

When the Error Recovery Interrupt is implemented:

ERIERR

Error Recovery Interrupt Error.

0b0 Error Recovery Interrupt write has not returned an error since this field was last cleared to zero.

0b1 Error Recovery Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

ERI, bit [2]

When the Error Recovery Interrupt is implemented:

ERI

Error Recovery Interrupt write in progress.

0b0 Error Recovery Interrupt write not in progress.

0b1 Error Recovery Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

———— **Note** —————

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is RO.

Otherwise:

Reserved, RES0.

FHIERR, bit [1]

When the Fault Handling Interrupt is implemented:

FHIERR

Fault Handling Interrupt Error.

0b0 Fault Handling Interrupt write has not returned an error since this field was last cleared to zero.

0b1 Fault Handling Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is WIC.

Otherwise:

Reserved, RES0.

FHI, bit [0]

When the Fault Handling Interrupt is implemented:

FHI

Fault Handling Interrupt write in progress.

0b0 Fault Handling Interrupt write not in progress.

0b1 Fault Handling Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

———— Note ————

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is RO.

Otherwise:

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing the ERRIRQSR:

ERRIRQSR can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xEF8	ERRIRQSR

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.22 ERR<n>ADDR, Error Record Address Register, n = 0 - 65534

The ERR<n>ADDR characteristics are:

Purpose

If an address is associated with a detected error, then it is written to ERR<n>ADDR when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

Configurations

This register is present only when error record <n> is implemented and error record <n> includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

Attributes

ERR<n>ADDR is a 64-bit register.

Field descriptions

NS, bit [63]

Non-secure attribute.

0b0 ERR<n>ADDR.PADDR is a Secure address.

0b1 ERR<n>ADDR.PADDR is a Non-secure address.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SI, bit [62]

Secure Incorrect. Indicates whether ERR<n>ADDR.NS is valid.

0b0 ERR<n>ADDR.NS is correct. That is, it matches the programmers' view of the Non-secure attribute for the recorded location.

0b1 ERR<n>ADDR.NS might not be correct, and might not match the programmers' view of the Non-secure attribute for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

AI, bit [61]

Address Incorrect. Indicates whether ERR<n>ADDR.PADDR is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.

0b0 ERR<n>ADDR.PADDR is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location.

0b1 ERR<n>ADDR.PADDR might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

VA, bit [60]

Virtual Address. Indicates whether ERR<n>ADDR.PADDR field is a virtual address.

0b0 ERR<n>ADDR.PADDR is not a virtual address.

0b1 ERR<n>ADDR.PADDR is a virtual address.

No context information is provided for the virtual address. When ERR<n>ADDR.VA is 1, ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

Support for this field is optional. If this field is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [59:56]

Reserved, RES0.

PADDR, bits [55:0]

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERR<n>ADDR:

ERR<n>ADDR can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0x018 + (64 * n)	ERR<n>ADDR

This interface is accessible as follows:

- When the Common Fault Injection Model Extension is implemented by the node that owns this error record, ERR<q>PFGF.AV == 0 and ERR<n>STATUS.AV == 1 accesses to this register are RO.
- When the Common Fault Injection Model Extension is not implemented by the node that owns this error record and ERR<n>STATUS.AV == 1 accesses to this register are RO.
- Otherwise accesses to this register are RW.

15.8.23 ERR<n>CTLR, Error Record Control Register, n = 0 - 65534

The ERR<n>CTLR characteristics are:

Purpose

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for uncorrected errors.

For each bit, if the node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

Configurations

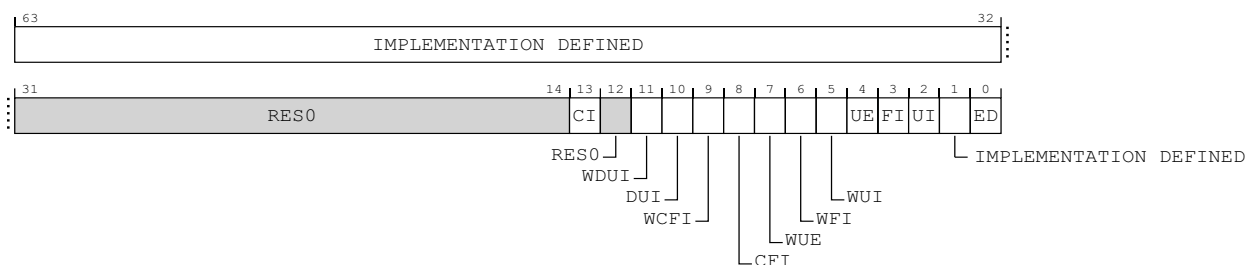

This register is present only when error record <n> is implemented and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>CTLR are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>CTLR is a 64-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [63:32]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

Bits [31:14]

Reserved, RES0.

CI, bit [13]

When ERR<n>FR.CI == 0b10:

CI

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

0b0 Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.

0b1 Critical error interrupt generated for critical errors.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [12]

Reserved, RES0.

WDUI, bit [11]

When $ERR<n>FR.DUI == 0b11$:

WDUI

Error recovery interrupt for Deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on writes.

0b0 Error recovery interrupt not generated for Deferred errors on writes.

0b1 Error recovery interrupt generated for Deferred errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DUI, bit [10]

When $ERR<n>FR.DUI == 0b10$:

DUI

Error recovery interrupt for Deferred errors enable.

When $ERR<n>FR.DUI == 0b10$, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Deferred error.

0b0 Error recovery interrupt not generated for Deferred errors.

0b1 Error recovery interrupt generated for Deferred errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $ERR<n>FR.DUI == 0b11$:

RDUI

Error recovery interrupt for Deferred errors on reads enable.

When $ERR<n>FR.DUI == 0b11$, this field is named RDUI.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on reads.

0b0 Error recovery interrupt not generated for Deferred errors on reads.

0b1 Error recovery interrupt generated for Deferred errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WCFI, bit [9]

When $ERR<n>FR.CFI == 0b11$:

WCFI

Fault handling interrupt for Corrected errors on writes enable.

When enabled:

- If the node implements Corrected error counters for writes, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see $ERR<n>MISC0$.
- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

0b0 Fault handling interrupt not generated for Corrected errors on writes.

0b1 Fault handling interrupt generated for Corrected errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CFI, bit [8]

When $ERR<n>FR.CFI == 0b10$:

CFI

Fault handling interrupt for Corrected errors enable.

When $ERR<n>FR.CFI == 0b10$, this control applies to errors arising from both reads and writes.

When enabled:

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see $ERR<n>MISC0$.
- Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

0b0 Fault handling interrupt not generated for Corrected errors.

0b1 Fault handling interrupt generated for Corrected errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $ERR<n>FR.CFI == 0b11$:

RCFI

Fault handling interrupt for Corrected errors on reads enable.

When $ERR<n>FR.CFI == 0b11$, this field is named RCFI.

When enabled:

- If the node implements Corrected error counters for reads, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see $ERR<n>MISC0$.

- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.

0b0 Fault handling interrupt not generated for Corrected errors on reads.

0b1 Fault handling interrupt generated for Corrected errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUE, bit [7]

When $ERR<n>FR.UE == 0b11$:

WUE

In-band error response on writes enable.

When enabled, responses to writes that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

0b0 In-band error response for uncorrected errors on writes disabled.

0b1 In-band error response for uncorrected errors on writes enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WFI, bit [6]

When $ERR<n>FR.FI == 0b11$:

WFI

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on writes.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
 - If the node implements Corrected error counters for writes, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

0b0 Fault handling interrupt on writes disabled.

0b1 Fault handling interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUI, bit [5]

When $ERR<n>FR.UI == 0b11$:

WUI

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on writes.

0b0 Error recovery interrupt on writes disabled.

0b1 Error recovery interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UE, bit [4]

When $ERR<n>FR.UE == 0b10$:

UE

In-band error response enable.

When $ERR<n>FR.UE == 0b10$, this control applies to errors arising from both reads and writes.

When enabled, responses to transactions that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

0b0 In-band error response for uncorrected errors disabled.

0b1 In-band error response for uncorrected errors enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $ERR<n>FR.UE == 0b11$:

RUE

In-band error response on reads enable.

When $ERR<n>FR.UE == 0b11$, this field is named RUE.

When enabled, responses to reads that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

0b0 In-band error response for uncorrected errors on reads disabled.

0b1 In-band error response for uncorrected errors on reads enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FI, bit [3]

When $ERR<n>FR.FI == 0b10$:

FI

Fault handling interrupt enable.

When $ERR<n>FR.FI == 0b10$, this control applies to errors arising from both reads and writes.

When enabled:

- The fault handling interrupt is generated for all errors recorded as either Deferred error or Uncorrected error.
- If the fault handling interrupt for Corrected errors control is not implemented:
 - If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

0b0 Fault handling interrupt disabled.

0b1 Fault handling interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $ERR<n>FR.FI == 0b11$:

RFI

Fault handling interrupt on reads enable.

When $ERR<n>FR.FI == 0b11$, this field is named RFI.

When enabled:

- The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on reads.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
 - If the node implements Corrected error counters for reads, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.

0b0 Fault handling interrupt on reads disabled.

0b1 Fault handling interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UI, bit [2]

When $ERR<n>FR.UI == 0b10$:

UI

Uncorrected error recovery interrupt enable.

When $ERR<n>FR.UI == 0b10$, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Uncorrected error.

0b0 Error recovery interrupt disabled.

0b1 Error recovery interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $ERR<n>FR.UI == 0b11$:

RUI

Uncorrected error recovery interrupt on reads enable.

When $ERR<n>FR.UI == 0b11$, this field is named RUI.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on reads.

0b0 Error recovery interrupt on reads disabled.

0b1 Error recovery interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bit [1]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

ED, bit [0]

When $ERR<n>FR.ED == 0b10$:

ED

Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

0b0 Error reporting disabled.

0b1 Error reporting enabled.

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrected errors might result in corrupt data being silently propagated by the node.

————— **Note** —————

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this field is set to 0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error

reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be UNKNOWN.

The reset behavior of this field is:

- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Accessing the ERR<n>CTLR:

ERR<n>CTLR can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	$0x008 + (64 * n)$	ERR<n>CTLR

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.24 ERR<n>FR, Error Record Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

Purpose

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED is not 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED is 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configurations

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

Attributes

ERR<n>FR is a 64-bit register.

Field descriptions

When error record <n> is not the first error record owned by the node:

Bits [63:2]

Reserved, RES0.

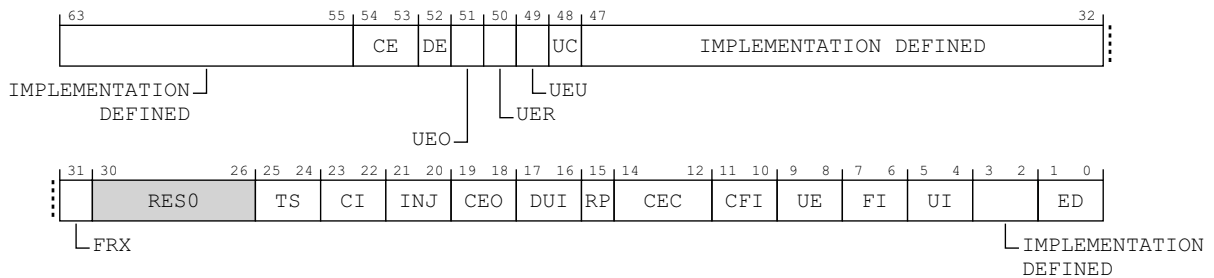

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not the first error record owned the node.

0b00 Error record <n> is not the first error record owned by the node.

This field reads as 0b00.

When error record <n> is the first error record owned by the node:

IMPLEMENTATION DEFINED, bits [63:55]

When ERR<n>FR.FRX != 1:

IMPLEMENTATION DEFINED

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

CE, bits [54:53]

When $ERR<n>FR.FRX == 1$:

CE

Corrected Error recording. Describes the types of Corrected errors the node can record, if any.

0b00 Does not record Corrected errors.

0b01 Records only transient or persistent Corrected errors. That is, Corrected errors recorded by setting $ERR<n>STATUS.CE$ to either 0b01 or 0b11.

0b10 Records only non-specific Corrected errors. That is, Corrected errors recorded by setting $ERR<n>STATUS.CE$ to 0b10.

0b11 Records all types of Corrected error.

Otherwise:

CE

Reserved for identifying IMPLEMENTATION DEFINED controls.

DE, bit [52]

When $ERR<n>FR.FRX == 1$:

DE

Deferred Error recording. Describes whether the node supports recording Deferred errors.

0b0 Does not record Deferred errors.

0b1 Records Deferred errors.

Otherwise:

DE

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEO, bit [51]

When $ERR<n>FR.FRX == 1$:

UEO

Latent or Restartable Error recording. Describes whether the node supports recording Latent or Restartable errors.

0b0 Does not record Latent or Restartable errors.

0b1 Records Latent or Restartable errors.

Otherwise:

UEO

Reserved for identifying IMPLEMENTATION DEFINED controls.

UER, bit [50]

When $ERR<n>FR.FRX == 1$:

UER

Signaled or Recoverable Error recording. Describes whether the node supports recording Signaled or Recoverable errors.

0b0 Does not record Signaled or Recoverable errors.

0b1 Records Signaled or Recoverable errors.

Otherwise:

UER

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEU, bit [49]

When $ERR<n>FR.FRX == 1$:

UEU

Unrecoverable Error recording. Describes whether the node supports recording Unrecoverable errors.

0b0 Does not record Unrecoverable errors.

0b1 Records Unrecoverable errors.

Otherwise:

UEU

Reserved for identifying IMPLEMENTATION DEFINED controls.

UC, bit [48]

When $ERR<n>FR.FRX == 1$:

UC

Uncontainable Error recording. Describes whether the node supports recording Uncontainable errors.

0b0 Does not record Uncontainable errors.

0b1 Records Uncontainable errors.

Otherwise:

UC

Reserved for identifying IMPLEMENTATION DEFINED controls.

IMPLEMENTATION DEFINED, bits [47:32]

Reserved for identifying IMPLEMENTATION DEFINED controls.

FRX, bit [31]

When RAS System Architecture v1.1 is implemented:

FRX

Feature Register extension. Defines whether $ERR<n>FR[63:48]$ are architecturally defined.

0b0 $ERR<n>FR[63:48]$ are IMPLEMENTATION DEFINED.

0b1 $ERR<n>FR[63:48]$ are defined by the architecture.

Otherwise:

Reserved, RES0.

Bits [30:26]

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record $<m>$ owned by this node, $ERR<n>MISC3$ is used as the timestamp register, and, if it is, the timebase used by the timestamp.

0b00 Does not support a timestamp register.

0b01 Implements a timestamp register in $ERR<n>MISC3$ for each error record $<m>$ owned by the node. The timestamp uses the same timebase as the system Generic Timer.

———— **Note** ————

For an error record that has an affinity to a PE, this is the same timer that is visible through `CNTPCT_ELO` at the highest Exception level on that PE.

0b10 Implements a timestamp register in `ERR<n>MISC3` for each error record <m> owned by the node. The timestamp uses an IMPLEMENTATION DEFINED timebase.

All other values are reserved.

CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node.

0b00 Does not support the critical error interrupt. `ERR<n>CTLR.CI` is RES0.

0b01 Critical error interrupt is supported and always enabled. `ERR<n>CTLR.CI` is RES0.

0b10 Critical error interrupt is supported and controllable using `ERR<n>CTLR.CI`.

All other values are reserved.

INJ, bits [21:20]

Fault Injection Extension. Indicates whether the Common Fault Injection Model Extension is implemented by the node.

0b00 Does not support the Common Fault Injection Model Extension.

0b01 Supports the Common Fault Injection Model Extension. See `ERR<n>PFGF` for more information.

All other values are reserved.

CEO, bits [19:18]

When `ERR<n>FR.CEC != 0b000`:

CEO

Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded and a first Corrected error has previously been recorded by an error record <m> owned by the node.

0b00 Keeps the previous error syndrome.

0b01 If `ERR<n>STATUS.OF` is 1 before the Corrected error is counted, then the error record keeps the previous syndrome. Otherwise the previous syndrome is overwritten.

All other values are reserved.

The second or subsequent Corrected error is counted by the Corrected error counter, regardless of the value of this field. If counting the error causes unsigned overflow of the counter, then `ERR<n>STATUS.OF` is set to 1.

This means that, if no other error is subsequently recorded that overwrites the syndrome:

- If `ERR<n>FR.CEO` is 0b00, the error record holds the syndrome for the first recorded Corrected error.
- If `ERR<n>FR.CEO` is 0b01, the error record holds the syndrome for the most recently recorded Corrected error before the counter overflows.

Otherwise:

Reserved, RES0.

DUI, bits [17:16]

When `ERR<n>FR.UI != 0b00`:

DUI

Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors is supported by the node.

- 0b00 Does not support the enabling and disabling of error recovery interrupts on deferred errors. ERR<n>CTLR.DUI is RES0.
- 0b10 Enabling and disabling of error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DUI.
- 0b11 Enabling and disabling of error recovery interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDUI for writes and ERR<n>CTLR.RDUI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

RP, bit [15]

When ERR<n>FR.CEC != 0b000:

RP

Repeat counter. Indicates whether the node implements a second Corrected error counter in ERR<n>MISC0 for each error record <m> owned by the node that can record countable errors.

- 0b0 Implements a single Corrected error counter in ERR<n>MISC0 for each error record <m> owned by the node that can record countable errors.
- 0b1 Implements a first (repeat) counter and a second (other) counter in ERR<n>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter.

Otherwise:

Reserved, RES0.

CEC, bits [14:12]

Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter mechanisms in ERR<n>MISC0 for each error record <m> owned by the node that can record countable errors.

- 0b000 Does not implement the standard Corrected error counter model.
- 0b010 Implements an 8-bit Corrected error counter in ERR<n>MISC0[39:32] for each error record <m> owned by the node that can record countable errors.
- 0b100 Implements a 16-bit Corrected error counter in ERR<n>MISC0[47:32] for each error record <m> owned by the node that can record countable errors.

All other values are reserved.

———— **Note** ————

Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

CFI, bits [11:10]

When ERR<n>FR.FI != 0b00:

CFI

Fault handling interrupt for corrected errors control. Indicates whether the enabling and disabling of fault handling interrupts on corrected errors is supported by the node.

- 0b00 Does not support the enabling and disabling of fault handling interrupts on corrected errors. ERR<n>CTLR.CFI is RES0.

- 0b10 Enabling and disabling of fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTLR.CFI.
- 0b11 Enabling and disabling of fault handling interrupts on corrected errors is supported, and controllable using ERR<n>CTLR.WCFI for writes and ERR<n>CTLR.RCFI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

UE, bits [9:8]

In-band error response (External Abort). Indicates whether the in-band error response and associated controls are implemented by the node.

- 0b00 Does not support the in-band error response. ERR<n>CTLR.UE is RES0.
- 0b01 In-band error response is supported and always enabled. ERR<n>CTLR.UE is RES0.
- 0b10 In-band error response is supported and controllable using ERR<n>CTLR.UE.
- 0b11 In-band error response is supported, and controllable using ERR<n>CTLR.WUE for writes and ERR<n>CTLR.RUE for reads.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

FI, bits [7:6]

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented by the node.

- 0b00 Does not support the fault handling interrupt. ERR<n>CTLR.FI is RES0.
- 0b01 Fault handling interrupt is supported and always enabled. ERR<n>CTLR.FI is RES0.
- 0b10 Fault handling interrupt is supported and controllable using ERR<n>CTLR.FI.
- 0b11 Fault handling interrupt is supported, and controllable using ERR<n>CTLR.WFI for writes and ERR<n>CTLR.RFI for reads.

UI, bits [5:4]

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented by the node.

- 0b00 Does not support the error handling interrupt. ERR<n>CTLR.UI is RES0.
- 0b01 Error handling interrupt is supported and always enabled. ERR<n>CTLR.UI is RES0.
- 0b10 Error handling interrupt is supported and controllable using ERR<n>CTLR.UI.
- 0b11 Error handling interrupt is supported, and controllable using ERR<n>CTLR.WUI for writes and ERR<n>CTLR.RUI for reads.

IMPLEMENTATION DEFINED, bits [3:2]

IMPLEMENTATION DEFINED.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is the first record owned the node, and whether the node implements the controls for enabling and disabling error reporting and logging.

- 0b01 Error reporting and logging always enabled. ERR<n>CTLR.ED is RES0.
- 0b10 Error reporting and logging is controllable using ERR<n>CTLR.ED.

All other values are reserved.

Accessing the ERR<n>FR:

ERR<n>FR can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	$0x000 + (64 * n)$	ERR<n>FR

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.25 ERR<n>MISC0, Error Record Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements architecturally-defined Corrected error counters (ERR<n>FR.CEC != 0b000), and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined Corrected error counter or counters.

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

————— Note —————

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

Attributes

ERR<n>MISC0 is a 64-bit register.

Field descriptions

When ERR<q>FR.CEC == 0b000:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

When $ERR\langle q \rangle FR.CEC == 0b100$ and $ERR\langle q \rangle FR.RP == 0$:

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OF, bit [47]

Sticky overflow bit. Set to 1 when $ERR\langle n \rangle MISC0.CEC$ is incremented and wraps through zero.

0b0 Counter has not overflowed.

0b1 Counter has overflowed.

A direct write that modifies this field might indirectly set $ERR\langle n \rangle STATUS.OF$ to an UNKNOWN value and a direct write to $ERR\langle n \rangle STATUS.OF$ that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [46:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When $ERR\langle q \rangle FR.CEC == 0b010$ and $ERR\langle q \rangle FR.RP == 0$:

IMPLEMENTATION DEFINED, bits [63:40]

IMPLEMENTATION DEFINED syndrome.

OF, bit [39]

Sticky overflow bit. Set to 1 when $ERR\langle n \rangle MISC0.CEC$ is incremented and wraps through zero.

0b0 Counter has not overflowed.

0b1 Counter has overflowed.

A direct write that modifies this field might indirectly set $ERR\langle n \rangle STATUS.OF$ to an UNKNOWN value and a direct write to $ERR\langle n \rangle STATUS.OF$ that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [38:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When $ERR\langle q \rangle FR.CEC == 0b100$ and $ERR\langle q \rangle FR.RP == 1$:

OFO, bit [63]

Sticky overflow bit, other. Set to 1 when $ERR\langle n \rangle MISC0.CECO$ is incremented and wraps through zero.

0b0 Other counter has not overflowed.

0b1 Other counter has overflowed.

A direct write that modifies this field might indirectly set $ERR\langle n \rangle STATUS.OF$ to an UNKNOWN value and a direct write to $ERR\langle n \rangle STATUS.OF$ that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [62:48]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing $ERR\langle n \rangle MISC0.CECR$.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [47]

Sticky overflow bit, repeat. Set to 1 when $ERR\langle n \rangle MISC0.CECR$ is incremented and wraps through zero.

0b0 Repeat counter has not overflowed.

0b1 Repeat counter has overflowed.

A direct write that modifies this field might indirectly set $ERR\langle n \rangle STATUS.OF$ to an UNKNOWN value and a direct write to $ERR\langle n \rangle STATUS.OF$ that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [46:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

———— **Note** ————

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 1:

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OFO, bit [47]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

- 0b0 Other counter has not overflowed.
- 0b1 Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [46:40]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [39]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

- 0b0 Repeat counter has not overflowed.
- 0b1 Repeat counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [38:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

———— **Note** ————

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

Accessing the ERR<n>MISC0:

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<n>PFGF.MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

———— **Note** ————

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0x020 + (64 * n)	ERR<n>MISC0

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.26 ERR<n>MISC1, Error Record Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configurations

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

———— Note —————

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

Attributes

ERR<n>MISC1 is a 64-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing the ERR<n>MISC1:

Reads from ERR<n>MISC1 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<n>PFGF.MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When $\text{ERR}\langle n \rangle\text{STATUS.MV}$ is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

———— **Note** —————

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

$\text{ERR}\langle n \rangle\text{MISC1}$ can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	$0x028 + (64 * n)$	$\text{ERR}\langle n \rangle\text{MISC1}$

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.27 ERR<n>MISC2, Error Record Miscellaneous Register 2, n = 0 - 65534

The ERR<n>MISC2 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configurations

This register is present only when (an implementation implements ERR<n>MISC2 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

———— Note —————

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

Attributes

ERR<n>MISC2 is a 64-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing the ERR<n>MISC2:

Reads from ERR<n>MISC2 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<n>PFGF.MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

———— **Note** —————

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC2 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0x030 + (64 * n)	ERR<n>MISC2

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.28 ERR<n>MISC3, Error Record Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record n supports the RAS Timestamp Extension (ERR<n>FR.TS != 0b00), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

This register is present only when (an implementation implements ERR<n>MISC3 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

———— Note ————

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

Attributes

ERR<n>MISC3 is a 64-bit register.

Field descriptions

When ERR<q>FR.TS != 0b00:

TS, bits [63:0]

Timestamp. Timestamp value recorded when the error was detected. Valid only if $ERR\langle n \rangle STATUS.V = 1$.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO or RW.

When $ERR\langle q \rangle FR.TS == 0b00$:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing the $ERR\langle n \rangle MISC3$:

Reads from $ERR\langle n \rangle MISC3$ return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and $ERR\langle n \rangle PFGF.MV$ is 1, then some parts of this register are read/write when $ERR\langle n \rangle STATUS.MV$ is 1. See $ERR\langle n \rangle PFGF.MV$ for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When $ERR\langle n \rangle STATUS.MV$ is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

$ERR\langle n \rangle MISC3$ can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	$0x038 + (64 * n)$	$ERR\langle n \rangle MISC3$

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.29 ERR<n>PFGCDN, Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

Purpose

Generates one of the errors enabled in the corresponding ERR<n>PFGCTL register.

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGCDN is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

CDN, bits [31:0]

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes ERR<n>PFGCTL.CDNEN with 1.
- The Error Generation Counter decrements to zero and ERR<n>PFGCTL.R == 1.

While ERR<n>PFGCTL.CDNEN == 1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches 0, one of the errors enabled in the ERR<n>PFGCTL register is generated.

———— Note —————

The current Error Generation Counter value is not visible to software.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing the ERR<n>PFGCDN:

ERR<n>PFGCDN can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0x810 + (64 * n)	ERR<n>PFGCDN

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.30 ERR<n>PFGCTL, Pseudo-fault Generation Control Register, n = 0 - 65534

The ERR<n>PFGCTL characteristics are:

Purpose

Enables controlled fault generation.

Configurations

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCTL are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGCTL is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

CDNEN, bit [31]

Countdown Enable. Controls transfers of the value held in ERR<n>PFGCDN to the Error Generation Counter and enables this counter.

0b0 The Error Generation Counter is disabled.

0b1 The Error Generation Counter is enabled. On a write of 1 to this field, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

R, bit [30]

When the node supports this control:

R

Restart. Controls whether the Error Generation Counter restarts or stops counting on reaching zero.

0b0 On reaching zero, the Error Generation Counter will stop counting.

0b1 On reaching zero, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:13]

Reserved, RES0.

Bit [12]

When the node always sets ERR<n>STATUS.MV to 0b1 when an injected error is recorded:

Reserved, RAO/WI.

When the node supports this control:

MV

Miscellaneous syndrome. The value written to ERR<n>STATUS.MV when an injected error is recorded.

0b0 ERR<n>STATUS.MV is set to 0 when an injected error is recorded.

0b1 ERR<n>STATUS.MV is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

When the node always sets ERR<n>STATUS.AV to 0b1 when an injected error is recorded:

Reserved, RAO/WI.

When the node supports this control:

AV

Address syndrome. The value written to ERR<n>STATUS.AV when an injected error is recorded.

0b0 ERR<n>STATUS.AV is set to 0 when an injected error is recorded.

0b1 ERR<n>STATUS.AV is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PN, bit [10]

When the node supports this control:

PN

Poison flag. The value written to ERR<n>STATUS.PN when an injected error is recorded.

0b0 ERR<n>STATUS.PN is set to 0 when an injected error is recorded.

0b1 ERR<n>STATUS.PN is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [9]

When the node supports this control:

ER

Error Reported flag. The value written to ERR<n>STATUS.ER when an injected error is recorded.

0b0 ERR<n>STATUS.ER is set to 0 when an injected error is recorded.

0b1 ERR<n>STATUS.ER is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CI, bit [8]

When the node supports this control:

CI

Critical Error flag. The value written to ERR<n>STATUS.CI when an injected error is recorded.

0b0 ERR<n>STATUS.CI is set to 0 when an injected error is recorded.

0b1 ERR<n>STATUS.CI is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CE, bits [7:6]

When the node supports this control:

CE

Corrected Error generation enable. Controls the type of injected Corrected error generated by the fault injection feature of the node.

0b00 An injected Corrected error will not be generated by the fault injection feature of the node.

0b01 An injected non-specific Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b10 when the injected error is recorded.

0b10 An injected transient Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b01 when the injected error is recorded.

0b11 An injected persistent Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b11 when the injected error is recorded.

The set of permitted values for this field is defined by ERR<n>PFGF.CE.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DE, bit [5]

When the node supports this control:

DE

Deferred Error generation enable. Controls whether an injected Deferred error is generated by the fault injection feature of the node.

0b0 An injected Deferred error will not be generated by the fault generation feature of the node.

0b1 An injected Deferred error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEO, bit [4]

When the node supports this control:

UEO

Latent or Restartable Error generation enable. Controls whether an injected Latent or Restartable error is generated by the fault injection feature of the node.

0b0 An injected Latent or Restartable error will not be generated by the fault generation feature of the node.

0b1 An injected Latent or Restartable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UER, bit [3]

When the node supports this control:

UER

Signaled or Recoverable Error generation enable. Controls whether an injected Signaled or Recoverable error is generated by the fault injection feature of the node.

0b0 An injected Signaled or Recoverable error will not be generated by the fault generation feature of the node.

0b1 An injected Signaled or Recoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEU, bit [2]

When the node supports this control:

UEU

Unrecoverable Error generation enable. Controls whether an injected Unrecoverable error is generated by the fault injection feature of the node.

0b0 An injected Unrecoverable error will not be generated by the fault generation feature of the node.

0b1 An injected Unrecoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UC, bit [1]

When the node supports this control:

UC

Uncontainable Error generation enable. Controls whether an injected Uncontainable error is generated by the fault injection feature of the node.

0b0 An injected Uncontainable error will not be generated by the fault generation feature of the node.

0b1 An injected Uncontainable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OF, bit [0]

When the node supports this control:

OF

Overflow flag. The value written to ERR<n>STATUS.OF when an injected error is recorded.

0b0 ERR<n>STATUS.OF is set to 0 when an injected error is recorded.

0b1 ERR<n>STATUS.OF is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing the ERR<n>PFGCTL:

ERR<n>PFGCTL can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	$0x808 + (64 * n)$	ERR<n>PFGCTL

This interface is accessible as follows:

- Accesses to this register are RW.

15.8.31 ERR<n>PFGF, Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

Purpose

Defines which common architecturally-defined fault generation features are implemented.

Configurations

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGF are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGF is a 64-bit register.

Field descriptions

Bits [63:31]

Reserved, RES0.

R, bit [30]

Restartable. Support for Error Generation Counter restart mode.

0b0 The node does not support this feature. ERR<n>PFGCTL.R is RES0.

0b1 Error Generation Counter restart mode is implemented and is controlled by ERR<n>PFGCTL.R. ERR<n>PFGCTL.R is a read/write field.

SYN, bit [29]

Syndrome. Fault syndrome injection.

0b0 When an injected error is recorded, the node sets ERR<n>STATUS.{IERR, SERR} to IMPLEMENTATION DEFINED values. ERR<n>STATUS.{IERR, SERR} are UNKNOWN when ERR<n>STATUS.V is 0.

0b1 When an injected error is recorded, the node does not update the ERR<n>STATUS.{IERR, SERR} fields. ERR<n>STATUS.{IERR, SERR} are writable when ERR<n>STATUS.V is 0.

Note

If ERR<n>PFGF.SYN is 1, software can write specific values into the ERR<n>STATUS.{IERR, SERR} fields when setting up a fault injection event. The sets of values that can be written to these fields is IMPLEMENTATION DEFINED.

NA, bit [28]

No access required. Defines whether this component fakes detection of the error on an access to the component or spontaneously in the fault injection state.

0b0 The component fakes detection of the error on an access to the component.

0b1 The component fakes detection of the error spontaneously in the fault injection state.

Bits [27:13]

Reserved, RES0.

MV, bit [12]

Miscellaneous syndrome.

Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded.

0b0 When an injected error is recorded, the node might update ERR<n>MISC<m>. If any syndrome is recorded by the node in ERR<n>MISC<m>, then ERR<n>STATUS.MV is set to 1.

ERR<n>PFGCTL.MV is RES0.

0b1 When an injected error is recorded, the node might update some, but not all ERR<n>MISC<m> syndrome fields, and updates ERR<n>STATUS.MV as follows:

- If any syndrome is recorded by the node in ERR<n>MISC<m>, then ERR<n>STATUS.MV is set to 1.
- Otherwise, ERR<n>STATUS.MV is set to ERR<n>PFGCTL.MV.

It is IMPLEMENTATION DEFINED which ERR<n>MISC<m> syndrome fields, if any, are updated. Some syndrome fields might always be updated by the node when an error is recorded. For example, a corrected error counter might always be updated when any countable error, including a countable injected error, is recorded. Other ERR<n>MISC<m> syndrome fields are not updated by the node and are writable when ERR<n>STATUS.MV is 0.

If the node always sets ERR<n>STATUS.MV to 1 when recording an injected error then ERR<n>PFGCTL.MV is RAO/WI, otherwise ERR<n>PFGCTL.MV is a read/write field.

———— **Note** ————

If ERR<n>PFGF.MV is 1, software can write specific additional syndrome values into the ERR<n>MISC<m> registers when setting up a fault injection event. The values that can be written to these registers are IMPLEMENTATION DEFINED.

AV, bit [11]

Address syndrome. Address syndrome injection.

0b0 When an injected error is recorded, the node either sets ERR<n>ADDR and ERR<n>STATUS.AV for the access, or leaves these unchanged. ERR<n>PFGCTL.AV is RES0.

0b1 When an injected error is recorded, the node does not update ERR<n>ADDR and does one of:

- Sets ERR<n>STATUS.AV to ERR<n>PFGCTL.AV. ERR<n>PFGCTL.AV is a read/write field.
- Sets ERR<n>STATUS.AV to 1. ERR<n>PFGCTL.AV is RAO/WI.

ERR<n>ADDR is writable when ERR<n>STATUS.AV is 0.

———— **Note** ————

If ERR<n>PFGF.AV is 1, software can write a specific address value into ERR<n>ADDR when setting up a fault injection event.

PN, bit [10]

When the node supports this flag:

PN

Poison flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.PN status flag.

0b0 When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.PN to 1. ERR<n>PFGCTL.PN is RES0.

0b1 When an injected error is recorded, ERR<n>STATUS.PN is set to ERR<n>PFGCTL.PN. ERR<n>PFGCTL.PN is a read/write field.

This behavior replaces the architecture-defined rules for setting the ERR<n>STATUS.PN bit.

Otherwise:

Reserved, RAZ.

ER, bit [9]

When the node supports this flag:

ER

Error Reported flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.ER status flag.

0b0 When an injected error is recorded, the node sets ERR<n>STATUS.ER according to the architecture-defined rules for setting the ER field. ERR<n>PFGCTL.ER is RES0.

0b1 When an injected error is recorded, ERR<n>STATUS.ER is set to ERR<n>PFGCTL.ER. This behavior replaces the architecture-defined rules for setting the ER bit. ERR<n>PFGCTL.ER is a read/write field.

Otherwise:

Reserved, RAZ.

CI, bit [8]

When the node supports this flag:

CI

Critical Error flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.CI status flag.

0b0 When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.CI to 1. ERR<n>PFGCTL.CI is RES0.

0b1 When an injected error is recorded, ERR<n>STATUS.CI is set to ERR<n>PFGCTL.CI. ERR<n>PFGCTL.CI is a read/write field.

This behavior replaces the architecture-defined rules for setting the ERR<n>STATUS.CI bit.

Otherwise:

Reserved, RAZ.

CE, bits [7:6]

When the node supports this type of error:

CE

Corrected Error generation. Describes the types of Corrected error that the fault generation feature of the node can generate.

0b00 The fault generation feature of the node does not generate Corrected errors. ERR<n>PFGCTL.CE is RES0.

0b01 The fault generation feature of the node allows generation of a non-specific Corrected error, that is, a Corrected error that is recorded by setting ERR<n>STATUS.CE to 0b10. ERR<n>PFGCTL.CE is a read/write field. The values 0b10 and 0b11 in ERR<n>PFGCTL.CE are reserved.

0b11 The fault generation feature of the node allows generation of transient or persistent Corrected errors, that is, Corrected errors that are recorded by setting ERR<n>STATUS.CE to 0b01 or 0b11 respectively. ERR<n>PFGCTL.CE is a read/write field. The value 0b01 in ERR<n>PFGCTL.CE is reserved.

All other values are reserved.

If ERR<n>FR.FRX is 1, then ERR<n>FR.CE indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

DE, bit [5]

When the node supports this type of error:

DE

Deferred Error generation. Describes whether the fault generation feature of the node can generate Deferred errors.

0b0 The fault generation feature of the node does not generate Deferred errors. ERR<n>PFGCTL.DE is RES0.

0b1 The fault generation feature of the node allows generation of Deferred errors. ERR<n>PFGCTL.DE is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.DE indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UEO, bit [4]

When the node supports this type of error:

UEO

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate Latent or Restartable errors.

0b0 The fault generation feature of the node does not generate Latent or Restartable errors. ERR<n>PFGCTL.UEO is RES0.

0b1 The fault generation feature of the node allows generation of Latent or Restartable errors. ERR<n>PFGCTL.UEO is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.UEO indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UER, bit [3]

When the node supports this type of error:

UER

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate Signaled or Recoverable errors.

0b0 The fault generation feature of the node does not generate Signaled or Recoverable errors. ERR<n>PFGCTL.UER is RES0.

0b1 The fault generation feature of the node allows generation of Signaled or Recoverable errors. ERR<n>PFGCTL.UER is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.UER indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UEU, bit [2]

When the node supports this type of error:

UEU

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate Unrecoverable errors.

0b0 The fault generation feature of the node does not generate Unrecoverable errors. ERR<n>PFGCTL.UEU is RES0.

0b1 The fault generation feature of the node allows generation of Unrecoverable errors. ERR<n>PFGCTL.UEU is a read/write field.

If ERR<n>FR.FRXL is 1, then ERR<n>FR.UEU indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UC, bit [1]

When the node supports this type of error:

UC

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate Uncontainable errors.

0b0 The fault generation feature of the node does not generate Uncontainable errors. ERR<n>PFGCTL.UC is RES0.

0b1 The fault generation feature of the node allows generation of Uncontainable errors. ERR<n>PFGCTL.UC is a read/write field.

If ERR<n>FR.FRXL is 1, then ERR<n>FR.UC indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

OF, bit [0]

When the node supports this flag:

OF

Overflow flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.OF status flag.

0b0 When an injected error is recorded, the node sets ERR<n>STATUS.OF according to the architecture-defined rules for setting the OF field. ERR<n>PFGCTL.OF is RES0.

0b1 When an injected error is recorded, ERR<n>STATUS.OF is set to ERR<n>PFGCTL.OF. This behavior replaces the architecture-defined rules for setting the OF bit. ERR<n>PFGCTL.OF is a read/write field.

Otherwise:

Reserved, RAZ.

Accessing the ERR<n>PFGF:

ERR<n>PFGF can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	$0x800 + (64 * n)$	ERR<n>PFGF

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.32 ERR<n>STATUS, Error Record Primary Status Register, n = 0 - 65534

The ERR<n>STATUS characteristics are:

Purpose

Contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- ERR<n>STATUS.{AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- ERR<n>STATUS.{UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- ERR<n>STATUS.{CI, ER, PN, IERR, SERR} are syndrome fields.

Configurations

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>STATUS are RES0.

ERR<n>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<n>CTLR.

Attributes

ERR<n>STATUS is a 64-bit register.

Field descriptions

When RAS System Architecture v1.1 is implemented:

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

AV

Address Valid.

0b0 ERR<n>ADDR not valid.

0b1 ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

0b0 ERR<n>STATUS not valid.

0b1 ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is W1C.

UE, bit [29]

Uncorrected Error.

0b0 No errors have been detected, or all detected errors have been either corrected or deferred.

0b1 At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C.

ER, bit [28]

Error Reported.

- | | |
|-----|--|
| 0b0 | No in-band error response (External Abort) signaled to the Requester making the access or other transaction. |
| 0b1 | An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none">• The applicable one of the ERR<n>CTLR. {WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected.• The applicable one of the ERR<n>CTLR. {WUE, RUE, UE} fields is not implemented and the component always reports errors. |

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

————— Note —————

An in-band error response signaled by the component might be masked and not generate any exception.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if all of the following are true:
 - ERR<n>STATUS.UE == 0.
 - ERR<n>STATUS.DE == 0.
 - This field can be set to 0b1 by a Deferred error.
- UNKNOWN/WI if all of the following are true:
 - ERR<n>STATUS.UE == 0.
 - This field is never set to 0b1 by a Deferred error.
- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is WIC.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- ERR<n>STATUS.V was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously 1, and a type of error other than a Corrected error is recorded.

Otherwise, this field is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an UNKNOWN value.

- | | |
|-----|--|
| 0b0 | Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed. |
|-----|--|

0b1 Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is WIC.

MV, bit [26]

When error record <n> includes an additional information for an error:

MV

Miscellaneous Registers Valid.

0b0 ERR<n>MISC<m> not valid.

0b1 The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.

———— Note ————

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is WIC.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

0b00 No errors were corrected.

0b01 At least one transient error was corrected.

0b10 At least one error was corrected.

0b11 At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is WIC.

DE, bit [23]

Deferred Error.

- 0b0 No errors were deferred.
- 0b1 At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is WIC.

PN, bit [22]

Poison.

- 0b0 Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
- 0b1 Uncorrected error or Deferred error recorded because a poison value was detected.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - ERR<n>STATUS.V == 0.
 - (ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0).
- Otherwise, access to this field is WIC.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

- 0b00 Uncorrected error, Uncontainable error (UC).
- 0b01 Uncorrected error, Unrecoverable error (UEU).
- 0b10 Uncorrected error, Latent or Restartable error (UEO).
- 0b11 Uncorrected error, Signaled or Recoverable error (UER).

————— **Note** —————

Software might use the information in the error record registers to determine what recovery is necessary.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - ERR<n>STATUS.V == 0.
 - ERR<n>STATUS.UE == 0.
- Otherwise, access to this field is WIC.

CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.

- 0b0 No critical error condition.
- 0b1 Critical error condition.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V = 0, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is WIC.

Bits [18:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

———— Note ————

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if all of the following are true:
 - The Common Fault Injection Model Extension is not implemented by the node that owns this error record.
 - ERR<n>STATUS.V = 0.
- UNKNOWN/WI if all of the following are true:
 - ERR<q>PFGF.SYN = 0.
 - ERR<n>STATUS.V = 0.
- Otherwise, access to this field is RW.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

- 0x00 No error.
- 0x01 IMPLEMENTATION DEFINED error.
- 0x02 Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
- 0x03 IMPLEMENTATION DEFINED pin. For example, nSEI pin.
- 0x04 Assertion failure. For example, consistency failure.
- 0x05 Error detected on internal data path. For example, parity on ALU result.
- 0x06 Data value from associative memory. For example, ECC error on cache data.
- 0x07 Address/control value from associative memory. For example, ECC error on cache tag.

0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

———— **Note** —————

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if all of the following are true:
 - The Common Fault Injection Model Extension is not implemented by the node that owns this error record.
 - $ERR<n>STATUS.V == 0$.
- UNKNOWN/WI if all of the following are true:
 - $ERR<q>PFGF.SYN == 0$.

- ERR<n>STATUS.V == 0.
- Otherwise, access to this field is RW.

When RAS System Architecture v1.0 is implemented:

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

AV

Address Valid.

0b0 ERR<n>ADDR not valid.

0b1 ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- RO if all of the following are true:
 - ERR<n>STATUS.DE == 0.
 - ERR<n>STATUS.UE == 0.
 - ERR<n>STATUS.CE != 0b00.
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- RO if all of the following are true:
 - ERR<n>STATUS.UE == 0.
 - ERR<n>STATUS.DE != 0.
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- RO if all of the following are true:
 - ERR<n>STATUS.UE != 0.
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is WIC.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

0b0 ERR<n>STATUS not valid.

0b1 ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- RO if all of the following are true:
 - $ERR\langle n \rangle\text{STATUS.CE} \neq 0b00$.
 - $ERR\langle n \rangle\text{STATUS.CE}$ is not being cleared to $0b00$ in the same write.
- RO if all of the following are true:
 - $ERR\langle n \rangle\text{STATUS.DE} \neq 0$.
 - $ERR\langle n \rangle\text{STATUS.DE}$ is not being cleared to $0b0$ in the same write.
- RO if all of the following are true:
 - $ERR\langle n \rangle\text{STATUS.UE} \neq 0$.
 - $ERR\langle n \rangle\text{STATUS.UE}$ is not being cleared to $0b0$ in the same write.
- Otherwise, access to this field is WIC.

UE, bit [29]

Uncorrected Error.

$0b0$ No errors have been detected, or all detected errors have been either corrected or deferred.

$0b1$ At least one detected error was not corrected and not deferred.

When clearing $ERR\langle n \rangle\text{STATUS.V}$ to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $ERR\langle n \rangle\text{STATUS.V} == 0$, access to this field is UNKNOWN/WI.
- RO if all of the following are true:
 - $ERR\langle n \rangle\text{STATUS.OF} == 1$.
 - $ERR\langle n \rangle\text{STATUS.OF}$ is not being cleared to $0b0$ in the same write.
- Otherwise, access to this field is WIC.

ER, bit [28]

Error Reported.

$0b0$ No in-band error response (External Abort) signaled to the Requester making the access or other transaction.

$0b1$ An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true:

- The applicable one of the $ERR\langle n \rangle\text{CTLR}\{WUE, RUE, UE\}$ fields is implemented and was 1 when an error was detected and not corrected.
- The applicable one of the $ERR\langle n \rangle\text{CTLR}\{WUE, RUE, UE\}$ fields is not implemented and the component always reports errors.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

————— Note —————

An in-band error response signaled by the component might be masked and not generate any exception.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing $ERR\langle n \rangle\text{STATUS.V}$ to 0.
- Clearing $ERR\langle n \rangle\text{STATUS.UE}$ to 0, if this field is never set to 1 by a Deferred error.

- Clearing ERR<n>STATUS.{UE,DE} to {0,0}, if this field can be set to 1 by a Deferred error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if all of the following are true:
 - ERR<n>STATUS.UE == 0.
 - ERR<n>STATUS.DE == 0.
 - This field can be set to 0b1 by a Deferred error.
- UNKNOWN/WI if all of the following are true:
 - ERR<n>STATUS.UE == 0.
 - This field is never set to 0b1 by a Deferred error.
- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- RO if all of the following are true:
 - ERR<n>STATUS.DE == 0.
 - ERR<n>STATUS.UE == 0.
 - ERR<n>STATUS.CE != 0b00.
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- RO if all of the following are true:
 - ERR<n>STATUS.UE == 0.
 - ERR<n>STATUS.DE != 0.
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- RO if all of the following are true:
 - ERR<n>STATUS.UE != 0.
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is WIC.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.
- A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is set to 1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, and ERR<n>STATUS.{UE, DE} != {0, 0}.
- A Corrected error counter is implemented, ERR<n>STATUS.{UE, DE} != {0, 0}, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is cleared to 0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0, and ERR<n>STATUS.DE == 0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE == 0b00.

The IMPLEMENTATION DEFINED clearing of this field might also depend on the value of the other error status fields.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to 0 might indirectly set the counter overflow flag to an UNKNOWN value.

0b0 If $ERR\langle n \rangle STATUS.UE == 1$, then no error syndrome for an Uncorrected error has been discarded.
If $ERR\langle n \rangle STATUS.UE == 0$ and $ERR\langle n \rangle STATUS.DE == 1$, then no error syndrome for a Deferred error has been discarded.
If $ERR\langle n \rangle STATUS.UE == 0$, $ERR\langle n \rangle STATUS.DE == 0$, and a Corrected error counter is implemented, then the counter has not overflowed.
If $ERR\langle n \rangle STATUS.UE == 0$, $ERR\langle n \rangle STATUS.DE == 0$, $ERR\langle n \rangle STATUS.CE != 0b00$, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded.

———— **Note** ————

This field might have been set to 1 when an error syndrome was discarded and later cleared to 0 when a higher priority syndrome was recorded.

0b1 At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing $ERR\langle n \rangle STATUS.V$ to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When $ERR\langle n \rangle STATUS.V == 0$, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is WIC.

MV, bit [26]

When error record <n> includes an additional information for an error:

MV

Miscellaneous Registers Valid.

0b0 $ERR\langle n \rangle MISC\langle m \rangle$ not valid.

0b1 The IMPLEMENTATION DEFINED contents of the $ERR\langle n \rangle MISC\langle m \rangle$ registers contains additional information for an error recorded by this record.

———— **Note** ————

If the $ERR\langle n \rangle MISC\langle m \rangle$ registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- RO if all of the following are true:
 - $ERR\langle n \rangle STATUS.DE == 0$.
 - $ERR\langle n \rangle STATUS.UE == 0$.
 - $ERR\langle n \rangle STATUS.CE != 0b00$.

- ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- RO if all of the following are true:
 - ERR<n>STATUS.UE == 0.
 - ERR<n>STATUS.DE != 0.
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- RO if all of the following are true:
 - ERR<n>STATUS.UE != 0.
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is WIC.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

- | | |
|------|--|
| 0b00 | No errors were corrected. |
| 0b01 | At least one transient error was corrected. |
| 0b10 | At least one error was corrected. |
| 0b11 | At least one persistent error was corrected. |

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- RO if all of the following are true:
 - ERR<n>STATUS.OF == 1.
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is WIC.

DE, bit [23]

Deferred Error.

- | | |
|-----|--|
| 0b0 | No errors were deferred. |
| 0b1 | At least one error was not corrected and deferred. |

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is UNKNOWN/WI.
- RO if all of the following are true:
 - ERR<n>STATUS.OF == 1.
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is WIC.

PN, bit [22]

Poison.

0b0 Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.

0b1 Uncorrected error or Deferred error recorded because a poison value was detected.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - ERR<n>STATUS.V == 0.
 - (ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0).
- RO if all of the following are true:
 - ERR<n>STATUS.DE == 0.
 - ERR<n>STATUS.UE == 0.
 - ERR<n>STATUS.CE != 0b00.
 - ERR<n>STATUS.DE is not being cleared to 0b00 in the same write.
- RO if all of the following are true:
 - ERR<n>STATUS.UE == 0.
 - ERR<n>STATUS.DE != 0.
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- RO if all of the following are true:
 - ERR<n>STATUS.UE != 0.
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is WIC.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

0b00 Uncorrected error, Uncontainable error (UC).

0b01 Uncorrected error, Unrecoverable error (UEU).

0b10 Uncorrected error, Latent or Restartable error (UEO).

0b11 Uncorrected error, Signaled or Recoverable error (UER).

————— **Note** —————

Software might use the information in the error record registers to determine what recovery is necessary.

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if any of the following are true:
 - $ERR\langle n \rangle\text{STATUS.V} == 0$.
 - $ERR\langle n \rangle\text{STATUS.UE} == 0$.
- RO if all of the following are true:
 - $ERR\langle n \rangle\text{STATUS.DE} == 0$.
 - $ERR\langle n \rangle\text{STATUS.UE} == 0$.
 - $ERR\langle n \rangle\text{STATUS.CE} != 0b00$.
 - $ERR\langle n \rangle\text{STATUS.CE}$ is not being cleared to $0b00$ in the same write.
- RO if all of the following are true:
 - $ERR\langle n \rangle\text{STATUS.UE} == 0$.
 - $ERR\langle n \rangle\text{STATUS.DE} != 0$.
 - $ERR\langle n \rangle\text{STATUS.DE}$ is not being cleared to $0b0$ in the same write.
- RO if all of the following are true:
 - $ERR\langle n \rangle\text{STATUS.UE} != 0$.
 - $ERR\langle n \rangle\text{STATUS.UE}$ is not being cleared to $0b0$ in the same write.
- Otherwise, access to this field is WIC.

Bits [19:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code $ERR\langle n \rangle\text{STATUS.SERR}$ value. Further IMPLEMENTATION DEFINED information can be placed in the $ERR\langle n \rangle\text{MISC}\langle m \rangle$ registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

————— Note —————

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if all of the following are true:
 - The Common Fault Injection Model Extension is not implemented by the node that owns this error record.
 - $ERR\langle n \rangle\text{STATUS.V} == 0$.
- UNKNOWN/WI if all of the following are true:
 - $ERR\langle q \rangle\text{PFGF.SYN} == 0$.
 - $ERR\langle n \rangle\text{STATUS.V} == 0$.
- RO if all of the following are true:
 - $ERR\langle n \rangle\text{STATUS.DE} == 0$.
 - $ERR\langle n \rangle\text{STATUS.UE} == 0$.
 - $ERR\langle n \rangle\text{STATUS.CE} != 0b00$.
 - $ERR\langle n \rangle\text{STATUS.CE}$ is not being cleared to $0b00$ in the same write.
- RO if all of the following are true:
 - $ERR\langle n \rangle\text{STATUS.UE} == 0$.
 - $ERR\langle n \rangle\text{STATUS.DE} != 0$.
 - $ERR\langle n \rangle\text{STATUS.DE}$ is not being cleared to $0b0$ in the same write.

- RO if all of the following are true:
 - ERR<n>STATUS.UE != 0.
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is RW.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.

0x1A Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

———— **Note** —————

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI if all of the following are true:
 - The Common Fault Injection Model Extension is not implemented by the node that owns this error record.
 - $ERR<n>STATUS.V == 0$.
- UNKNOWN/WI if all of the following are true:
 - $ERR<q>PFGF.SYN == 0$.
 - $ERR<n>STATUS.V == 0$.
- RO if all of the following are true:
 - $ERR<n>STATUS.DE == 0$.
 - $ERR<n>STATUS.UE == 0$.
 - $ERR<n>STATUS.CE != 0b00$.
 - $ERR<n>STATUS.CE$ is not being cleared to $0b00$ in the same write.
- RO if all of the following are true:
 - $ERR<n>STATUS.UE == 0$.
 - $ERR<n>STATUS.DE != 0$.
 - $ERR<n>STATUS.DE$ is not being cleared to $0b0$ in the same write.
- RO if all of the following are true:
 - $ERR<n>STATUS.UE != 0$.
 - $ERR<n>STATUS.UE$ is not being cleared to $0b0$ in the same write.
- Otherwise, access to this field is RW.

Accessing the ERR<n>STATUS:

ERR<n>STATUS. {AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (WIC) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero.

ERR<n>STATUS. {IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also ERR<n>PFGF.SYN.

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS. {UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS. {UE, DE, CE} are nonzero and are not being cleared to zero.

- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.
- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as UNKNOWN where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the WIC fields that are nonzero in the read value.
- Write zero to all the WIC fields that are zero in the read value.
- Write zero to all the RW fields.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also ERR<n>PFGF.SYN.

ERR<n>STATUS can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	$0x010 + (64 * n)$	ERR<n>STATUS

This interface is accessible as follows:

- When ERR<n>STATUS.V != 0, ERR<n>STATUS.V is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are RO.
- When ERR<n>STATUS.UE != 0, ERR<n>STATUS.UE is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are RO.
- When ERR<n>STATUS.OF != 0, ERR<n>STATUS.OF is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are RO.
- When ERR<n>STATUS.CE != 0b00, ERR<n>STATUS.CE is not being cleared to 0b00 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are RO.
- When ERR<n>STATUS.DE != 0, ERR<n>STATUS.DE is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are RO.
- Otherwise accesses to this register are RW.

15.8.33 ERRPIDR0, Peripheral Identification Register 0

The ERRPIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

ERRPIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, bits [7:0].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REVAND, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the ERRPIDR0:

ERRPIDR0 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFE0	ERRPIDR0

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.34 ERRPIDR1, Peripheral Identification Register 1

The ERRPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

ERRPIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

———— Note —————

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, bits [11:8].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REVAND, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the ERRPIDR1:

ERRPIDR1 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFE4	ERRPIDR1

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.35 ERRPIDR2, Peripheral Identification Register 2

The ERRPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

ERRPIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR2 is a 32-bit register.

Field descriptions

When the component uses a 12-bit part number:

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component major revision. ERRPIDR2.REVISION and ERRPIDR3.REVAND together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, ERRPIDR2.REVISION or ERRPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. ERRPIDR3.REVAND should be set to 0b0000 when ERRPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

When the component uses a 16-bit part number:

Bits [31:8]

Reserved, RES0.

PART_2, bits [7:4]

Part number, bits [15:12].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REVAND, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the ERRPIDR2:

ERRPIDR2 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFE8	ERRPIDR2

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.36 ERRPIDR3, Peripheral Identification Register 3

The ERRPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

ERRPIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR3 is a 32-bit register.

Field descriptions

When the component uses a 12-bit part number:

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Component minor revision. ERRPIDR2.REVISION and ERRPIDR3.REVAND together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, ERRPIDR2.REVISION or ERRPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. ERRPIDR3.REVAND should be set to 0b0000 when ERRPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

When the component uses a 16-bit part number:

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component revision. When a component is changed, ERRPIDR3.REVISION is increased to ensure that software can differentiate the different revisions of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the ERRPIDR3:

ERRPIDR3 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFEC	ERRPIDR3

This interface is accessible as follows:

- Accesses to this register are RO.

15.8.37 ERRPIDR4, Peripheral Identification Register 4

The ERRPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see [About the Peripheral identification scheme on page K2-8440](#).

Configurations

Implementation of this register is OPTIONAL.

ERRPIDR4 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of 0b0000 means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^{\text{ERRPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

———— Note ————

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing the ERRPIDR4:

ERRPIDR4 can be accessed through its memory-mapped interface:

Component	Offset	Instance
RAS	0xFD0	ERRPIDR4

This interface is accessible as follows:

- Accesses to this register are RO.

Part J

Architectural Pseudocode

Chapter J1

Armv8 Pseudocode

This chapter contains pseudocode that describes many features of the Armv8 architecture. It contains the following sections:

- *Pseudocode for AArch64 operation on page J1-7960.*
- *Pseudocode for AArch32 operation on page J1-8134.*
- *Shared pseudocode on page J1-8221.*

J1.1 Pseudocode for AArch64 operation

This section holds the pseudocode for execution in AArch64 state. Functions that are listed in this section are identified as AArch64.FunctionName. Some of these functions have an equivalent AArch32 function, AArch32.FunctionName. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example aarch64/debug/breakpoint.

The top-level sections of the AArch64 pseudocode hierarchy are:

- [aarch64/debug](#) on page J1-7960.
- [aarch64/exceptions](#) on page J1-7973.
- [aarch64/functions](#) on page J1-7997.
- [aarch64/instrs](#) on page J1-8064.
- [aarch64/translation](#) on page J1-8093.

J1.1.1 aarch64/debug

This section includes the following pseudocode functions:

- [aarch64/debug/breakpoint/AArch64.BreakpointMatch](#) on page J1-7960.
- [aarch64/debug/breakpoint/AArch64.BreakpointValueMatch](#) on page J1-7961.
- [aarch64/debug/breakpoint/AArch64.StateMatch](#) on page J1-7963.
- [aarch64/debug/enables/AArch64.GenerateDebugExceptions](#) on page J1-7964.
- [aarch64/debug/enables/AArch64.GenerateDebugExceptionsFrom](#) on page J1-7964.
- [aarch64/debug/pmu/AArch64.CheckForPMUOverflow](#) on page J1-7964.
- [aarch64/debug/pmu/AArch64.CountEvents](#) on page J1-7965.
- [aarch64/debug/statisticalprofiling/CheckProfilingBufferAccess](#) on page J1-7966.
- [aarch64/debug/statisticalprofiling/CheckStatisticalProfilingAccess](#) on page J1-7966.
- [aarch64/debug/statisticalprofiling/CollectContextIDR1](#) on page J1-7967.
- [aarch64/debug/statisticalprofiling/CollectContextIDR2](#) on page J1-7967.
- [aarch64/debug/statisticalprofiling/CollectPhysicalAddress](#) on page J1-7967.
- [aarch64/debug/statisticalprofiling/CollectTimeStamp](#) on page J1-7967.
- [aarch64/debug/statisticalprofiling/OpType](#) on page J1-7968.
- [aarch64/debug/statisticalprofiling/ProfilingBufferEnabled](#) on page J1-7968.
- [aarch64/debug/statisticalprofiling/ProfilingBufferOwner](#) on page J1-7968.
- [aarch64/debug/statisticalprofiling/ProfilingSynchronizationBarrier](#) on page J1-7969.
- [aarch64/debug/statisticalprofiling/SPECCollectRecord](#) on page J1-7969.
- [aarch64/debug/statisticalprofiling/StatisticalProfilingEnabled](#) on page J1-7970.
- [aarch64/debug/statisticalprofiling/SysRegAccess](#) on page J1-7970.
- [aarch64/debug/statisticalprofiling/TimeStamp](#) on page J1-7970.
- [aarch64/debug/takeexceptiondbg/AArch64.TakeExceptionInDebugState](#) on page J1-7970.
- [aarch64/debug/watchpoint/AArch64.WatchpointByteMatch](#) on page J1-7971.
- [aarch64/debug/watchpoint/AArch64.WatchpointMatch](#) on page J1-7972.

aarch64/debug/breakpoint/AArch64.BreakpointMatch

```
// AArch64.BreakpointMatch()  
// =====  
// Breakpoint matching in an AArch64 translation regime.  
  
boolean AArch64.BreakpointMatch(integer n, bits(64) vaddress, AccType acctype, integer size)  
    assert !ELUsingAArch32(S1TranslationRegime());
