
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LPA is not implemented:

Bits [38:35]

Reserved, RES0.

FIPA, bits [34:0]

Faulting Intermediate Physical Address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing HPFAR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HPFAR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HPFAR_EL2;
elsif PSTATE.EL == EL3 then
    return HPFAR_EL2;
```

MSR HPFAR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HPFAR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    HPFAR_EL2 = X[t];
```

D13.2.56 HSTR_EL2, Hypervisor System Trap Register

The HSTR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == 0b1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

Configurations

AArch64 System register HSTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSTR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

HSTR_EL2 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:16, 14, 4]

Reserved, RES0.

T<n>, bit [n], for n = 15, 13 to 5, 3 to 0

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space, are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x03, unless the access is UNDEFINED.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x04, unless the access is UNDEFINED.

0b0 This control has no effect on EL0 or EL1 accesses to System registers.

0b1 System registers in the coproc == 0b1111 encoding space and CRn == <n> or CRm == <n> where T<n> is the name of this field, are trapped as follows:

- An EL1 MCR or MRC access is trapped to EL2.
- An EL0 MCR or MRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0.
- An EL1 MCRR or MRRC access is trapped to EL2.
- An EL0 MCRR or MRRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0.

It is IMPLEMENTATION DEFINED whether an EL0 access using AArch32 is trapped to EL2, or is UNDEFINED.

If the access is UNDEFINED, and generates an exception that is taken to EL1 or EL2 using AArch64, this is reported with EC syndrome value 0x00.

Note

Arm expects that trapping to EL2 of EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to EL1.

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [63:0]

Reserved, RES0.

Accessing HSTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HSTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b011

        NVMem[0x080] = X[t];
    elseif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    HSTR_EL2 = X[t];
elseif PSTATE.EL == EL3 then
    HSTR_EL2 = X[t];
```

D13.2.57 ID_AA64AFR0_EL1, AArch64 Auxiliary Feature Register 0

The ID_AA64AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch64 state.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers](#) on page D13-3045.

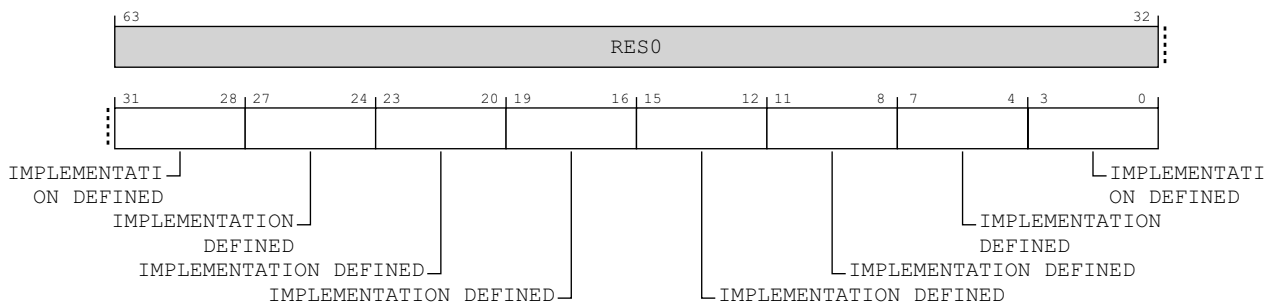

Configurations

There are no configuration notes.

Attributes

ID_AA64AFR0_EL1 is a 64-bit register.

```

D13.2.59 ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0

The ID_AA64DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers](#) on page D13-3045.

Configurations

The external register [EDDFR](#) gives information from this register.

Attributes

ID_AA64DFR0_EL1 is a 64-bit register.

Field descriptions

Bits [63:52]

Reserved, RES0.

MTPMU, bits [51:48]

Multi-threaded PMU extension. Defined values are:

- 0b0000 [FEAT_MTPMU](#) not implemented. If [FEAT_PMUv3](#) is implemented, it is IMPLEMENTATION DEFINED whether [PMEVTYPER<n>_EL0.MT](#) and [PMEVTYPER<n>.MT](#) are read/write or RES0.
- 0b0001 [FEAT_MTPMU](#) and [FEAT_PMUv3](#) implemented. [PMEVTYPER<n>_EL0.MT](#) and [PMEVTYPER<n>.MT](#) are read/write. When [FEAT_MTPMU](#) is disabled, the Effective values of [PMEVTYPER<n>_EL0.MT](#) and [PMEVTYPER<n>.MT](#) are 0.
- 0b1111 [FEAT_MTPMU](#) not implemented. If [FEAT_PMUv3](#) is implemented, [PMEVTYPER<n>_EL0.MT](#) and [PMEVTYPER<n>.MT](#) are RES0.

All other values are reserved.

[FEAT_MTPMU](#) implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes [FEAT_PMUv3](#), the value 0b0000 is not permitted.

In an implementation that does not include [FEAT_PMUv3](#), the value 0b0001 is not permitted.

Bits [47:44]

Reserved, RES0.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

- 0b0000 Armv8.4 Self-hosted Trace Extension not implemented.
- 0b0001 Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

[FEAT_TRF](#) implements the functionality identified by the value 0b0001.

From Armv8.4, if an Embedded Trace Macrocell Architecture PE Trace Unit is implemented, the value 0b0000 is not permitted.

DoubleLock, bits [39:36]

OS Double Lock implemented. Defined values are:

- 0b0000 OS Double Lock implemented. [OSDLR_EL1](#) is RW.
- 0b1111 OS Double Lock not implemented. [OSDLR_EL1](#) is RAZ/WI.

All other values are reserved.

[FEAT_DoubleLock](#) implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If [FEAT_Debugv8p2](#) is implemented and [FEAT_DoPD](#) is not implemented, the permitted values are 0b0000 and 0b1111.

If [FEAT_DoPD](#) is implemented, the only permitted value is 0b1111.

PMSVer, bits [35:32]

Statistical Profiling Extension version. Defined values are:

- 0b0000 Statistical Profiling Extension not implemented.
- 0b0001 Statistical Profiling Extension implemented.
- 0b0010 As 0b0001, and adds:
 - Support for the Event packet Alignment flag.
 - If [FEAT_SVE](#) is implemented, support for the Scalable Vector extensions to Statistical Profiling.
- 0b0011 As 0b0010, and adds:
 - Discard mode.
 - Extended event filtering, including the [PMSNEVFR_EL1](#) System register.
 - Support for the OPTIONAL previous branch target Address packet.
 - If [FEAT_PMUv3](#) is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs.
 - If [FEAT_PMUv3](#) is implemented, the [SAMPLE_FEED_BR](#), [SAMPLE_FEED_EVENT](#), [SAMPLE_FEED_LAT](#), [SAMPLE_FEED_LD](#), [SAMPLE_FEED_OP](#), and [SAMPLE_FEED_ST](#) PMU events.

All other values are reserved.

[FEAT_SPE](#) implements the functionality identified by the value 0b0001.

[FEAT_SPEv1p1](#) implements the functionality identified by the value 0b0010.

[FEAT_SPEv1p2](#) implements the functionality identified by the value 0b0011.

In Armv8.5, if [FEAT_SPE](#) is implemented, the value 0b0001 is not permitted.

From Armv8.7, if [FEAT_SPE](#) is implemented, the value 0b0010 is not permitted.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in [Alternative ID scheme used for the Performance Monitors Extension version on page D13-3047](#)

Defined values are:

0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and also includes support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. If EL2 is implemented, the MDCR_EL2.HPMD control bit.
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the MDCR_EL2.HCCD control bit. If EL3 is implemented, the MDCR_EL3.SCCD control bit.
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO control bits. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} control bits.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

[FEAT_PMUv3](#) implements the functionality identified by the value 0b0001.

[FEAT_PMUv3p1](#) implements the functionality identified by the value 0b0100.

[FEAT_PMUv3p4](#) implements the functionality identified by the value 0b0101.

[FEAT_PMUv3p5](#) implements the functionality identified by the value 0b0110.

[FEAT_PMUv3p7](#) implements the functionality identified by the value 0b0111.

In Armv8.1, if [FEAT_PMUv3](#) is implemented, the value 0b0001 is not permitted.

In Armv8.4, if [FEAT_PMUv3](#) is implemented, the value 0b0100 is not permitted.

In Armv8.5, if [FEAT_PMUv3](#) is implemented, the value 0b0101 is not permitted.

From Armv8.7, if [FEAT_PMUv3](#) is implemented, the value 0b0110 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented.

Defined values are:

0b0000	PE trace unit System registers not implemented.
0b0001	PE trace unit System registers implemented.

All other values are reserved.

See the ETM Architecture Specification for more information.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented.

A PE trace unit might nevertheless be implemented without a System register interface.

DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

- 0b0110 Armv8 debug architecture.
- 0b0111 Armv8 debug architecture with Virtualization Host Extensions.
- 0b1000 Armv8.2 debug architecture.
- 0b1001 Armv8.4 debug architecture.

All other values are reserved.

[FEAT_Debugv8p2](#) adds the functionality identified by the value 0b1000.

[FEAT_Debugv8p4](#) adds the functionality identified by the value 0b1001.

In Armv8.1, the value 0b0110 is not permitted.

In Armv8.2, the value 0b0111 is not permitted.

From Armv8.4, the value 0b1000 is not permitted.

RDM		RES0		Atomic		CRC32		SHA2		SHA1		AES		RES0		

RNRD, bits [63:60]

Indicates support for Random Number instructions in AArch64 state.

Defined values are:

0b0000 No Random Number instructions are implemented.

0b0001 [RNRD](#) and [RNRDRS](#) registers are implemented.

All other values are reserved.

[FEAT_RNG](#) implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

TLB, bits [59:56]

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:

0b0000 Outer shareable and TLB range maintenance instructions are not implemented.

0b0001 Outer shareable TLB maintenance instructions are implemented.

0b0010 Outer shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

[FEAT_TLBIOS](#) implements the functionality identified by the values 0b0001 and 0b0010.

[FEAT_TLBIRANGE](#) implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0010.

TS, bits [55:52]

Indicates support for flag manipulation instructions. Defined values are:

0b0000 No flag manipulation instructions are implemented.

0b0001 CFINV, RMIF, SETF16, and SETF8 instructions are implemented.

0b0010 CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.

All other values are reserved.

[FEAT_FlagM](#) implements the functionality identified by the value 0b0001.

[FEAT_FlagM2](#) implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

In Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

FHM, bits [51:48]

Indicates support for FMLAL and FMLSL instructions. Defined values are:

0b0000 FMLAL and FMLSL instructions are not implemented.

0b0001 FMLAL and FMLSL instructions are implemented.

All other values are reserved.

[FEAT_FHM](#) implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [47:44]

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

0b0000 No Dot Product instructions implemented.

0b0001 UDOT and SDOT instructions implemented.

All other values are reserved.

[FEAT_DotProd](#) implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SM4, bits [43:40]

Indicates support for SM4 instructions in AArch64 state. Defined values are:

0b0000 No SM4 instructions implemented.

0b0001 SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If [FEAT_SM4](#) is not implemented, the value 0b0001 is reserved.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

SM3, bits [39:36]

Indicates support for SM3 instructions in AArch64 state. Defined values are:

0b0000 No SM3 instructions implemented.

0b0001 SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.

All other values are reserved.

If [FEAT_SM3](#) is not implemented, the value 0b0001 is reserved.

[FEAT_SM3](#) implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

SHA3, bits [35:32]

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

0b0000 No SHA3 instructions implemented.

0b0001 EOR3, RAX1, XAR, and BCAX instructions implemented.

All other values are reserved.

If [FEAT_SHA3](#) is not implemented, the value 0b0001 is reserved.

FEAT_SHA3 implements the functionality identified by the value `0b0001`.

From Armv8.2, the permitted values are `0b0000` and `0b0001`.

If the value of `ID_AA64ISAR0_EL1.SHA1` is `0b0000`, this field must have the value `0b0000`.

If the value of this field is `0b0001`, `ID_AA64ISAR0_EL1.SHA2` must have the value `0b0010`.

RDM, bits [31:28]

Indicates support for `SQRDMLAH` and `SQRDMLSH` instructions in AArch64 state. Defined values are:

`0b0000` No RDMA instructions implemented.

`0b0001` `SQRDMLAH` and `SQRDMLSH` instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value `0b0001`.

From Armv8.1, the only permitted value is `0b0001`.

Bits [27:24]

Reserved, `RES0`.

Atomic, bits [23:20]

Indicates support for Atomic instructions in AArch64 state. Defined values are:

`0b0000` No Atomic instructions implemented.

`0b0010` `LDADD`, `LDCLR`, `LDEOR`, `LDSET`, `LDSMAX`, `LDSMIN`, `LDUMAX`, `LDUMIN`, `CAS`, `CASP`, and `SWP` instructions implemented.

All other values are reserved.

FEAT_LSE implements the functionality identified by the value `0b0010`.

From Armv8.1, the only permitted value is `0b0010`.

CRC32, bits [19:16]

Indicates support for CRC32 instructions in AArch64 state. Defined values are:

`0b0000` No CRC32 instructions implemented.

`0b0001` `CRC32B`, `CRC32H`, `CRC32W`, `CRC32X`, `CRC32CB`, `CRC32CH`, `CRC32CW`, and `CRC32CX` instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are `0b0000` and `0b0001`.

From Armv8.1, the only permitted value is `0b0001`.

SHA2, bits [15:12]

Indicates support for SHA2 instructions in AArch64 state. Defined values are:

`0b0000` No SHA2 instructions implemented.

`0b0001` Implements instructions: `SHA256H`, `SHA256H2`, `SHA256SU0`, and `SHA256SU1`.

`0b0010` Implements instructions:

- `SHA256H`, `SHA256H2`, `SHA256SU0`, and `SHA256SU1`.
- `SHA512H`, `SHA512H2`, `SHA512SU0`, and `SHA512SU1`.

All other values are reserved.

FEAT_SHA256 implements the functionality identified by the value `0b0001`.

FEAT_SHA512 implements the functionality identified by the value `0b0010`.

In Armv8, the permitted values are `0b0000` and `0b0001`.

From Armv8.2, the permitted values are `0b0000`, `0b0001`, and `0b0010`.

If the value of `ID_AA64ISAR0_EL1.SHA1` is `0b0000`, this field must have the value `0b0000`.

If the value of this field is 0b0010, ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

SHA1, bits [11:8]

Indicates support for SHA1 instructions in AArch64 state. Defined values are:

- 0b0000 No SHA1 instructions implemented.
- 0b0001 SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.

All other values are reserved.

[FEAT_SHA1](#) implements the functionality identified by the value 0b0001.

From Armv8, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA2 is 0b0000, this field must have the value 0b0000.

AES, bits [7:4]

Indicates support for AES instructions in AArch64 state. Defined values are:

- 0b0000 No AES instructions implemented.
- 0b0001 AESE, AESD, AESMC, and AESIMC instructions implemented.
- 0b0010 As for 0b0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

[FEAT_AES](#) implements the functionality identified by the value 0b0001.

[FEAT_PMULL](#) implements the functionality identified by the value 0b0010.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0010.

Bits [3:0]

Reserved, RES0.

Accessing ID_AA64ISAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64ISAR0_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64ISAR0_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64ISAR0_EL1;

```

D13.2.62 ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers](#) on page D13-3045.

Configurations

If ID_AA64ISAR1_EL1.{API, APA} == {0000, 0000}, then:

- The TCR_EL1.{TBID, TBID0}, TCR_EL2.{TBID0, TBID1}, TCR_EL2.TBID and TCR_EL3.TBID bits are RES0.
- APIAKeyHi_EL1, APIAKeyLo_EL1, APIBKeyHi_EL1, APIBKeyLo_EL1, APDAKeyHi_EL1, APDAKeyLo_EL1, APDBKeyHi_EL1, APDBKeyLo_EL1 are not allocated.
- SCTLR_ELx.EnIA, SCTLR_ELx.EnIB, SCTLR_ELx.EnDA, SCTLR_ELx.EnDB are all RES0.

If ID_AA64ISAR1_EL1.{GPI, GPA, API, APA} == {0000, 0000, 0000, 0000}, then:

- HCR_EL2.APK and HCR_EL2.API are RES0.
- SCR_EL3.APK and SCR_EL3.API are RES0.

Attributes

ID_AA64ISAR1_EL1 is a 64-bit register.

Field descriptions

63	60	59	56	55	52	51	48	47	44	43	40	39	36	35	32
LS64			XS		I8MM		DGH		BF16		SPECRES		SB		FRINTTS
31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
GPI			GPA		LRCPC		FCMA		JSCVT		API		APA		DPB

LS64, bits [63:60]

Indicates support for LD64B and ST64B* instructions, and the ACCDATA_EL1 register. Defined values of this field are:

- 0b0000 The LD64B and ST64B* instructions, the ACCDATA_EL1 register, and associated traps are not supported.
- 0b0001 The LD64B and ST64B instructions are supported.
- 0b0010 The LD64B, ST64B, and ST64BV instructions, and their associated traps are supported.
- 0b0011 The LD64 and ST64B* instructions, the ACCDATA_EL1 register, and their associated traps are supported.

All other values are reserved.

FEAT_LS64 implements the functionality identified by 0b0001.

FEAT_LS64_V implements the functionality identified by 0b0010.

FEAT_LS64_ACCDATA implements the functionality identified by 0b0011.

From Armv8.7, the permitted values are 0b0000, 0b0001, 0b0010, and 0b0011.

XS, bits [59:56]

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the [HCRX_EL2](#).{FGTnXS, FnXS} fields in AArch64 state. Defined values are:

- 0b0000 The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the [HCRX_EL2](#).{FGTnXS, FnXS} fields are not supported.
- 0b0001 The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the [HCRX_EL2](#).{FGTnXS, FnXS} fields are supported.

All other values are reserved.

[FEAT_XS](#) implements the functionality identified by 0b0001.

From Armv8.7, the only permitted value is 0b0001.

I8MM, bits [55:52]

Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values are:

- 0b0000 Int8 matrix multiplication instructions are not implemented.
- 0b0001 SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

[FEAT_I8MM](#) implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.I8MM.

From Armv8.6, the only permitted value is 0b0001.

DGH, bits [51:48]

Indicates support for the Data Gathering Hint instruction. Defined values are:

- 0b0000 Data Gathering Hint is not implemented.
- 0b0001 Data Gathering Hint is implemented.

All other values are reserved.

[FEAT_DGH](#) implements the functionality identified by 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

BF16, bits [47:44]

Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:

- 0b0000 BFloat16 instructions are not implemented.
- 0b0001 BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMLLA instructions are implemented.

All other values are reserved.

[FEAT_BF16](#) implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.BF16.

From Armv8.6, the only permitted value is 0b0001.

SPECRES, bits [43:40]

Indicates support for prediction invalidation instructions in AArch64 state. Defined values are:

- 0b0000 CFP RCTX, DVP RCTX, and CPP RCTX instructions are not implemented.
- 0b0001 CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [39:36]

Indicates support for SB instruction in AArch64 state. Defined values are:

0b0000 SB instruction is not implemented.

0b0001 SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FRINTTS, bits [35:32]

Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

0b0000 FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented.

0b0001 FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.

All other values are reserved.

FEAT_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

GPI, bits [31:28]

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

0b0000 Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.

0b0001 Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is non-zero, this field must have the value 0b0000.

GPA, bits [27:24]

Indicates whether the QARMA5 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

0b0000 Generic Authentication using the QARMA5 algorithm is not implemented.

0b0001 Generic Authentication using the QARMA5 algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is non-zero, this field must have the value 0b0000.

LRCPC, bits [23:20]

Indicates support for weaker release consistency, RCpc, based model. Defined values are:

0b0000 The LDAPR*, LDAPUR*, and STLUR* instructions are not implemented.

0b0001 The LDAPR* instructions are implemented.
The LDAPUR*, and STLUR* instructions are not implemented.

0b0010 The LDAPR*, LDAPUR*, and STLUR* instructions are implemented.

All other values are reserved.

FEAT_LRCPC implements the functionality identified by the value 0b0001.

FEAT_LRCPC2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

In Armv8.3, the permitted values are 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0010.

FCMA, bits [19:16]

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

0b0000 The FCMLA and FCADD instructions are not implemented.

0b0001 The FCMLA and FCADD instructions are implemented.

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

JSCVT, bits [15:12]

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

0b0000 The FJCVTZS instruction is not implemented.

0b0001 The FJCVTZS instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

API, bits [11:8]

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

0b0000 Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.

0b0001 Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.

0b0010 Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.

0b0011 Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

- 0b0100 Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
- 0b0101 Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT_PAuth2 implements the functionality added by the value 0b0011.

FEAT_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.APA is non-zero, this field must have the value 0b0000.

APA, bits [7:4]

Indicates whether the QARMA5 algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

- 0b0000 Address Authentication using the QARMA5 algorithm is not implemented.
- 0b0001 Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
- 0b0010 Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
- 0b0011 Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
- 0b0100 Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
- 0b0101 Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT_PAuth2 implements the functionality added by the value 0b0011.

FEAT_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.API is non-zero, this field must have the value 0b0000.

DPB, bits [3:0]

Data Persistence writeback. Indicates support for the **DC CVAP** and **DC CVADP** instructions in AArch64 state. Defined values are:

- 0b0000 **DC CVAP** not supported.
- 0b0001 **DC CVAP** supported.
- 0b0010 **DC CVAP** and **DC CVADP** supported.

All other values are reserved.

FEAT_DPB implements the functionality identified by the value 0b0001.

FEAT_DPB2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0001 and 0b0010.

From Armv8.5, the only permitted value is 0b0010.

Accessing ID_AA64ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);

    elseif PSTATE.EL == EL3 then
        return ID_AA64ISAR1_EL1;

```

D13.2.63 ID_AA64ISAR2_EL1, AArch64 Instruction Set Attribute Register 2

The ID_AA64ISAR2_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers on page D13-3045](#).

Configurations

———— Note —————

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ISAR2_EL1 is a 64-bit register.

Field descriptions

Bits [63:8]

Reserved, RES0.

RPRES, bits [7:4]

When [FPCR.AH](#) is 1, indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state. Defined values are:

0b0000 Reciprocal and reciprocal square root estimates give 8 bits of mantissa.

0b0001 Reciprocal and reciprocal square root estimates give 12 bits of mantissa.

All other values are reserved.

[FEAT_RPRES](#) implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

WFXT, bits [3:0]

Indicates support for the WFET and WFIT instructions in AArch64 state. Defined values are:

0b0000 WFET and WFIT are not supported.

0b0001 WFET and WFIT are supported, but the register number is not reported in the ESR_ELx on exceptions.

0b0010 WFET and WFIT are supported, and the register number is reported in the ESR_ELx on exceptions.

All other values are reserved.

[FEAT_WFXT](#) implements the functionality identified by the value 0b0001.

[FEAT_WFXT2](#) implements the functionality identified by the value 0b0010.

From Armv8.7, the permitted values are 0b0001 and 0b0010.

Note

Arm deprecates not implementing [FEAT_WFxT2](#).

Accessing ID_AA64ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

```

D13.2.64 ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

There are no configuration notes.

Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

Field descriptions

ECV, bits [63:60]

Indicates presence of Enhanced Counter Virtualization. Defined values are:

- 0b0000 Enhanced Counter Virtualization is not implemented.
- 0b0001 Enhanced Counter Virtualization is implemented. Supports [CNTHCTL_EL2](#).{EL1TVT, EL1TVCT, EL1INV PCT, EL1INV VCT, EVNTIS}, [CNTKCTL_EL1](#).EVNTIS, [CNTPCTSS_EL0](#) counter views, and [CNTVCTSS_EL0](#) counter views. Extends the [PMSCR_EL1](#).PCT, [PMSCR_EL2](#).PCT, [TRFCR_EL1](#).TS, and [TRFCR_EL2](#).TS fields.
- 0b0010 As 0b0001, and also includes support for [CNTHCTL_EL2](#).ECV and [CNTPOFF_EL2](#).

All other values are reserved.

[FEAT_ECV](#) implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.

FGT, bits [59:56]

Indicates presence of the Fine-Grained Trap controls:

- If EL2 is implemented, the [HAFGRTR_EL2](#), [HDFGRTR_EL2](#), [HDFGWTR_EL2](#), [HFGTRTR_EL2](#), [HFGITR_EL2](#) and [HFGWTR_EL2](#) registers, and their associated traps.
- If EL2 is implemented, [MDCR_EL2](#).TDCC.
- If EL3 is implemented, [MDCR_EL3](#).TDCC.
- If both EL2 and EL3 are implemented, [SCR_EL3](#).FGTEn.

Defined values are:

- 0b0000 The fine-grained trap controls are not implemented.
- 0b0001 The fine-grained trap controls are implemented.

All other values are reserved.

[FEAT_FGT](#) implements the functionality identified by the value 0b0001.

From Armv8.6, the only permitted value is 0b0001.

Bits [55:48]

Reserved, RES0.

ExS, bits [47:44]

Indicates support for disabling context synchronizing exception entry and exit. Defined values are:

0b0000 All exception entries and exits are context synchronization events.

0b0001 Non-context synchronizing exception entry and exit are supported.

All other values are reserved.

[FEAT_ExS](#) implements the functionality identified by the value 0b0001.

TGran4_2, bits [43:40]

Indicates support for 4KB memory granule size at stage 2. Defined values are:

0b0000 Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field.

0b0001 4KB granule not supported at stage 2.

0b0010 4KB granule supported at stage 2.

0b0011 *When FEAT_LPA2 is implemented:*
4KB granule at stage 2 supports 52-bit input and output addresses.

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See [Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes on page D13-3048](#) for more information.

TGran64_2, bits [39:36]

Indicates support for 64KB memory granule size at stage 2. Defined values are:

0b0000 Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field.

0b0001 64KB granule not supported at stage 2.

0b0010 64KB granule supported at stage 2.

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See [Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes on page D13-3048](#) for more information.

TGran16_2, bits [35:32]

Indicates support for 16KB memory granule size at stage 2. Defined values are:

0b0000 Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.

0b0001 16KB granule not supported at stage 2.

0b0010 16KB granule supported at stage 2.

0b0011 *When FEAT_LPA2 is implemented:*
16KB granule at stage 2 supports 52-bit input and output addresses.

All other values are reserved.

The 0b0000 value is deprecated.

———— **Note** —————

This field does not follow the standard ID scheme. See [Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes](#) on page D13-3048 for more information.

TGran4, bits [31:28]

Indicates support for 4KB memory translation granule size. Defined values are:

- 0b0000 4KB granule supported.
- 0b0001 *When FEAT_LPA2 is implemented:*
4KB granule supports 52-bit input and output addresses.
- 0b1111 4KB granule not supported.

All other values are reserved.

TGran64, bits [27:24]

Indicates support for 64KB memory translation granule size. Defined values are:

- 0b0000 64KB granule supported.
- 0b1111 64KB granule not supported.

All other values are reserved.

TGran16, bits [23:20]

Indicates support for 16KB memory translation granule size. Defined values are:

- 0b0000 16KB granule not supported.
- 0b0001 16KB granule supported.
- 0b0010 *When FEAT_LPA2 is implemented:*
16KB granule supports 52-bit input and output addresses.

All other values are reserved.

BigEndEL0, bits [19:16]

Indicates support for mixed-endian at EL0 only. Defined values are:

- 0b0000 No mixed-endian support at EL0. The [SCTLR_EL1.EOE](#) bit has a fixed value.
- 0b0001 Mixed-endian support at EL0. The [SCTLR_EL1.EOE](#) bit can be configured.

All other values are reserved.

This field is invalid and is RES0 if [ID_AA64MMFR0_EL1.BigEnd](#) is not 0b0000.

SNSMem, bits [15:12]

Indicates support for a distinction between Secure and Non-secure Memory. Defined values are:

- 0b0000 Does not support a distinction between Secure and Non-secure Memory.
- 0b0001 Does support a distinction between Secure and Non-secure Memory.

———— **Note** —————

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

BigEnd, bits [11:8]

Indicates support for mixed-endian configuration. Defined values are:

- 0b0000 No mixed-endian support. The [SCTLR_ELx.EE](#) bits have a fixed value. See the [BigEndEL0](#) field, bits[19:16], for whether EL0 supports mixed-endian.

0b0001 Mixed-endian support. The `SCTLR_ELx.EE` and `SCTLR_EL1.E0E` bits can be configured.

All other values are reserved.

ASIDBits, bits [7:4]

Number of ASID bits. Defined values are:

0b0000 8 bits.

0b0010 16 bits.

All other values are reserved.

PARange, bits [3:0]

Physical Address range supported. Defined values are:

0b0000 32 bits, 4GB.

0b0001 36 bits, 64GB.

0b0010 40 bits, 1TB.

0b0011 42 bits, 4TB.

0b0100 44 bits, 16TB.

0b0101 48 bits, 256TB.

0b0110 52 bits, 4PB.

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes `FEAT_LPA`, otherwise it is reserved.

Accessing ID_AA64MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64MMFR0_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_AA64MMFR0_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_AA64MMFR0_EL1;

```

D13.2.65 ID_AA64MMFR1_EL1, AArch64 Memory Model Feature Register 1

The ID_AA64MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

There are no configuration notes.

Attributes

ID_AA64MMFR1_EL1 is a 64-bit register.

Field descriptions

Bits [63:52]

Reserved, RES0.

nTLBPA, bits [51:48]

Indicates support for intermediate caching of translation table walks. Defined values are:

- 0b0000 The intermediate caching of translation table walks might include non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE where either:
- The caching is indexed by the physical address of the location holding the translation table entry.
 - The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.
- 0b0001 The intermediate caching of translation table walks does not include non-coherent caches of previous valid translation table entries since the last completed TLBI applicable to the PE where either:
- The caching is indexed by the physical address of the location holding the translation table entry.
 - The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

[FEAT_nTLBPA](#) implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

AFP, bits [47:44]

Indicates support for [FPCR](#).{AH, FIZ, NEP}. Defined values are:

- 0b0000 The [FPCR](#).{AH, FIZ, NEP} fields are not supported.
- 0b0001 The [FPCR](#).{AH, FIZ, NEP} fields are supported.

All other values are reserved.

FEAT_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

HCX, bits [43:40]

Indicates support for **HCRX_EL2** and its associated EL3 trap. Defined values are:

0b0000 **HCRX_EL2** and its associated EL3 trap are not supported.

0b0001 **HCRX_EL2** and its associated EL3 trap are supported.

All other values are reserved.

FEAT_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the only permitted value is 0b0001.

ETS, bits [39:36]

Indicates support for Enhanced Translation Synchronization. Defined values are:

0b0000 Enhanced Translation Synchronization is not supported.

0b0001 Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT_ETS implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

TWED, bits [35:32]

Indicates support for the configurable delayed trapping of WFE. Defined values are:

0b0000 Configurable delayed trapping of WFE is not supported.

0b0001 Configurable delayed trapping of WFE is supported.

All other values are reserved.

FEAT_TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

XNX, bits [31:28]

Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are:

0b0000 Distinction between EL0 and EL1 execute-never control at stage 2 not supported.

0b0001 Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [27:24]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

0b0000 The PE never generates an SError interrupt due to an External abort on a speculative read.

0b0001 The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

PAN, bits [23:20]

Privileged Access Never. Indicates support for the PAN bit in PSTATE, [SPSR_EL1](#), [SPSR_EL2](#), [SPSR_EL3](#), and [DSPSR_EL0](#). Defined values are:

- 0b0000 PAN not supported.
- 0b0001 PAN supported.
- 0b0010 PAN supported and [AT SIE1RP](#) and [AT SIE1WP](#) instructions supported.
- 0b0011 PAN supported, [AT SIE1RP](#) and [AT SIE1WP](#) instructions supported, and [SCTLR_EL1.EPAN](#) and [SCTLR_EL2.EPAN](#) bits supported.

All other values are reserved.

[FEAT_PAN](#) implements the functionality identified by the value 0b0001.

[FEAT_PAN2](#) implements the functionality added by the value 0b0010.

[FEAT_PAN3](#) implements the functionality added by the value 0b0011.

In Armv8.1, the permitted values are 0b0001, 0b0010, and 0b0011.

From Armv8.2, the permitted values are 0b0010 and 0b0011.

From Armv8.7, the only permitted value is 0b0011.

LO, bits [19:16]

LORegions. Indicates support for LORegions. Defined values are:

- 0b0000 LORegions not supported.
- 0b0001 LORegions supported.

All other values are reserved.

[FEAT_LOR](#) implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

HPDS, bits [15:12]

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are:

- 0b0000 Disabling of hierarchical controls not supported.
- 0b0001 Disabling of hierarchical controls supported with the [TCR_EL1](#).{HPD1, HPD0}, [TCR_EL2](#).HPD or [TCR_EL2](#).{HPD1, HPD0}, and [TCR_EL3](#).HPD bits.
- 0b0010 As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

[FEAT_HPDS](#) implements the functionality identified by the value 0b0001.

[FEAT_HPDS2](#) implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

VH, bits [11:8]

Virtualization Host Extensions. Defined values are:

- 0b0000 Virtualization Host Extensions not supported.
- 0b0001 Virtualization Host Extensions supported.

All other values are reserved.

[FEAT_VHE](#) implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

VMIDBits, bits [7:4]

Number of VMID bits. Defined values are:

0b0000 8 bits

0b0010 16 bits

All other values are reserved.

FEAT_VMID16 implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

HAFDBS, bits [3:0]

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

0b0000 Hardware update of the Access flag and dirty state are not supported.

0b0001 Hardware update of the Access flag is supported.

0b0010 Hardware update of both the Access flag and dirty state is supported.

All other values are reserved.

FEAT_HAFDBS implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

Accessing ID_AA64MMFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64MMFR1_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_AA64MMFR1_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_AA64MMFR1_EL1;

```

D13.2.66 ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

———— Note ————

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

Field descriptions

63	60	59	56	55	52	51	48	47	44	43	40	39	36	35	32			
EOPD			EVT		BBM		TTL		RES0		FWB		IDS		AT			
			31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
			ST		NV		CCIDX		VARange		IESB		LSM		UAO		CnP	

EOPD, bits [63:60]

Indicates support for the EOPD mechanism. Defined values are:

0b0000 EOPDx mechanism is not implemented.

0b0001 EOPDx mechanism is implemented.

All other values are reserved.

[FEAT_EOPD](#) implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If [FEAT_EOPD](#) is implemented, [FEAT_CSV3](#) must be implemented.

EVT, bits [59:56]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR_EL2](#).{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

0b0000 [HCR_EL2](#).{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.

0b0001 [HCR_EL2](#).{TOCU, TICAB, TID4} traps are supported. [HCR_EL2](#).{TTLBOS, TTLBIS} traps are not supported.

0b0010 [HCR_EL2](#).{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

[FEAT_EVT](#) implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.

- 0b0010 when EL2 is implemented.

BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

0b0000 Level 0 support for changing block size is supported.

0b0001 Level 1 support for changing block size is supported.

0b0010 Level 2 support for changing block size is supported.

All other values are reserved.

FEAT_BBM implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

TTL, bits [51:48]

Indicates support for TTL field in address operations. Defined values are:

0b0000 TLB maintenance instructions by address have bits[47:44] as RES0.

0b0001 TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

FEAT_TTL implements the functionality identified by the value 0b0001.

This field affects [TLBI IPAS2E1](#), [TLBI IPAS2E1NXS](#), [TLBI IPAS2E1IS](#), [TLBI IPAS2E1ISNXS](#), [TLBI IPAS2E1IOS](#), [TLBI IPAS2E1IOSNXS](#), [TLBI IPAS2LE1](#), [TLBI IPAS2LE1NXS](#), [TLBI IPAS2LE1IS](#), [TLBI IPAS2LE1ISNXS](#), [TLBI IPAS2LE1IOS](#), [TLBI IPAS2LE1IOSNXS](#), [TLBI VAAE1](#), [TLBI VAAE1NXS](#), [TLBI VAAE1IS](#), [TLBI VAAE1ISNXS](#), [TLBI VAAE1IOS](#), [TLBI VAAE1IOSNXS](#), [TLBI VAALE1](#), [TLBI VAALE1NXS](#), [TLBI VAALE1IS](#), [TLBI VAALE1ISNXS](#), [TLBI VAALE1IOS](#), [TLBI VAALE1IOSNXS](#), [TLBI VAE1](#), [TLBI VAE1NXS](#), [TLBI VAE1IS](#), [TLBI VAE1ISNXS](#), [TLBI VAE1IOS](#), [TLBI VAE1IOSNXS](#), [TLBI VAE2](#), [TLBI VAE2NXS](#), [TLBI VAE2IS](#), [TLBI VAE2ISNXS](#), [TLBI VAE2OS](#), [TLBI VAE2OSNXS](#), [TLBI VAE3](#), [TLBI VAE3NXS](#), [TLBI VAE3IS](#), [TLBI VAE3ISNXS](#), [TLBI VAE3OS](#), [TLBI VAE3OSNXS](#), [TLBI VALE1](#), [TLBI VALE1NXS](#), [TLBI VALE1IS](#), [TLBI VALE1ISNXS](#), [TLBI VALE1IOS](#), [TLBI VALE1IOSNXS](#), [TLBI VALE2](#), [TLBI VALE2NXS](#), [TLBI VALE2IS](#), [TLBI VALE2ISNXS](#), [TLBI VALE2OS](#), [TLBI VALE2OSNXS](#), [TLBI VALE3](#), [TLBI VALE3NXS](#), [TLBI VALE3IS](#), [TLBI VALE3ISNXS](#), [TLBI VALE3OS](#), [TLBI VALE3OSNXS](#).

From Armv8.4, the only permitted value is 0b0001.

Bits [47:44]

Reserved, RES0.

FWB, bits [43:40]

Indicates support for [HCR_EL2.FWB](#). Defined values are:

0b0000 [HCR_EL2.FWB](#) bit is not supported.

0b0001 [HCR_EL2.FWB](#) is supported.

All other values reserved.

FEAT_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

IDS, bits [39:36]

Indicates the value of [ESR_ELx.EC](#) that reports an exception generated by a read access to the feature ID space. Defined values are:

0b0000 An exception which is generated by a read access to the feature ID space, other than a trap caused by [HCR_EL2.TIDx](#), [SCTLR_EL1.UCT](#), or [SCTLR_EL2.UCT](#), is reported by [ESR_ELx.EC](#) == 0x0.

0b0001 All exceptions generated by an AArch64 read access to the feature ID space are reported by [ESR_ELx.EC](#) == 0x18.

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with $op0=3$, $op1=\{0, 1, 3\}$, $CRn=0$, $CRm=\{0-7\}$, $op2=\{0-7\}$.

[FEAT_IDST](#) implements the functionality identified by the value `0b0001`.

From Armv8.4, the only permitted value is `0b0001`.

AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

`0b0000` Unaligned single-copy atomicity and atomic functions are not supported.

`0b0001` Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

[FEAT_LSE2](#) implements the functionality identified by the value `0b0001`.

In Armv8.2, the permitted values are `0b0000` and `0b0001`.

From Armv8.4, the only permitted value is `0b0001`.

ST, bits [31:28]

Identifies support for small translation tables. Defined values are:

`0b0000` The maximum value of the `TCR_ELx.T0SZ, T1SZ` and `VTCR_EL2.T0SZ` fields is 39.

`0b0001` The maximum value of the `TCR_ELx.T0SZ, T1SZ` and `VTCR_EL2.T0SZ` fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

[FEAT_TTST](#) implements the functionality identified by the value `0b0001`.

If [FEAT_SEL2](#) is implemented, the only permitted value is `0b0001`.

In an implementation which does not support [FEAT_SEL2](#), the permitted values are `0b0000` and `0b0001`.

NV, bits [27:24]

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

`0b0000` Nested virtualization is not supported.

`0b0001` The `HCR_EL2.{AT, NV1, NV}` bits are implemented.

`0b0010` The `VNCR_EL2` register and the `HCR_EL2.{NV2, AT, NV1, NV}` bits are implemented.

All other values are reserved.

If EL2 is not implemented, the only permitted value is `0b0000`.

[FEAT_NV](#) implements the functionality identified by the value `0b0001`.

[FEAT_NV2](#) implements the functionality identified by the value `0b0010`.

In Armv8.3, if EL2 is implemented, the permitted values are `0b0000` and `0b0001`.

From Armv8.4, if EL2 is implemented, the permitted values are `0b0000`, `0b0001`, and `0b0010`.

CCIDX, bits [23:20]

Support for the use of revised `CCSIDR_EL1` register format. Defined values are:

`0b0000` 32-bit format implemented for all levels of the `CCSIDR_EL1`.

`0b0001` 64-bit format implemented for all levels of the `CCSIDR_EL1`.

All other values are reserved.

[FEAT_CCIDX](#) implements the functionality identified by the value `0b0001`.

From Armv8.3, the permitted values are `0b0000` and `0b0001`.

VARange, bits [19:16]

Indicates support for a larger virtual address. Defined values are:

- 0b0000 VMSAv8-64 supports 48-bit VAs.
- 0b0001 VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The size for other translation granules is not defined by this field.

All other values are reserved.

[FEAT_LVA](#) implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

IESB, bits [15:12]

Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are:

- 0b0000 IESB bit in the [SCTLR_ELx](#) registers is not supported.
- 0b0001 IESB bit in the [SCTLR_ELx](#) registers is supported.

All other values are reserved.

[FEAT_IESB](#) implements the functionality identified by the value 0b0001.

LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in [SCTLR_EL1](#) and [SCTLR_EL2](#). Defined values are:

- 0b0000 LSMAOE and nTLSMD bits not supported.
- 0b0001 LSMAOE and nTLSMD bits supported.

All other values are reserved.

[FEAT_LSMAOC](#) implements the functionality identified by the value 0b0001.

UAO, bits [7:4]

User Access Override. Defined values are:

- 0b0000 UAO not supported.
- 0b0001 UAO supported.

All other values are reserved.

[FEAT_UAO](#) implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

CnP, bits [3:0]

Indicates support for Common not Private translations. Defined values are:

- 0b0000 Common not Private translations not supported.
- 0b0001 Common not Private translations supported.

All other values are reserved.

[FEAT_TTCNP](#) implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Accessing ID_AA64MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b010

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then

    elseif PSTATE.EL == EL2 then
        return ID_AA64MMFR2_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_AA64MMFR2_EL1;
```

D13.2.67 ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers](#) on page D13-3045.

Configurations

The external register [EDPFR](#) gives information from this register.

Attributes

ID_AA64PFR0_EL1 is a 64-bit register.

Field descriptions

63	60	59	56	55	52	51	48	47	44	43	40	39	36	35	32
CSV3			CSV2		RES0		DIT		AMU		MPAM		SEL2		SVE
31	28	27	24	23	20	19	16	15	12	11	8	7	4	3	0
RAS		GIC		AdvSIMD		FP		EL3		EL2		EL1		EL0	

CSV3, bits [63:60]

Speculative use of faulting data. Defined values are:

- 0b0000 This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.
- 0b0001 Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.

All other values are reserved.

[FEAT_CSV3](#) implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If [FEAT_E0PD](#) is implemented, [FEAT_CSV3](#) must be implemented.

CSV2, bits [59:56]

Speculative use of out of context branch targets. Defined values are:

- 0b0000 This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context.
- 0b0001 Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Contexts do not include the SCXTNUM_ELx register contexts. Support for the SCXTNUM_ELx registers is defined in [ID_AA64PFR1_EL1.CSV2_frac](#).
- 0b0010 Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. The SCXTNUM_ELx registers are supported and the contexts include the SCXTNUM_ELx register contexts.

All other values are reserved.

[FEAT_CSV2](#) implements the functionality identified by the value 0b0001.

[FEAT_CSV2_2](#) implements the functionality identified by the value 0b0010.

In Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

Bits [55:52]

Reserved, RES0.

DIT, bits [51:48]

Data Independent Timing. Defined values are:

0b0000 AArch64 does not guarantee constant execution time of any instructions.

0b0001 AArch64 provides the [PSTATE.DIT](#) mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

[FEAT_DIT](#) implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

0b0000 Activity Monitors Extension is not implemented.

0b0001 [FEAT_AMUv1](#) is implemented.

0b0010 [FEAT_AMUv1p1](#) is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

[FEAT_AMUv1](#) implements the functionality identified by the value 0b0001.

[FEAT_AMUv1p1](#) implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

MPAM, bits [43:40]

Indicates support for MPAM Extension. Defined values are:

0b0000 If [ID_AA64PFR1_EL1.MPAM_frac](#) == 0b0000, MPAM Extension is not implemented.
If [ID_AA64PFR1_EL1.MPAM_frac](#) == 0b0001, MPAM Extension version 0.1 is implemented.

0b0001 If [ID_AA64PFR1_EL1.MPAM_frac](#) == 0b0000, MPAM Extension version 1.0 is implemented.
If [ID_AA64PFR1_EL1.MPAM_frac](#) == 0b0001, MPAM Extension version 1.1 is implemented.

All other values are reserved.

SEL2, bits [39:36]

Secure EL2. Defined values are:

0b0000 Secure EL2 is not implemented.

0b0001 Secure EL2 is implemented.

All other values are reserved.

[FEAT_SEL2](#) implements the functionality identified by the value 0b0001.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

- 0b0000 SVE architectural state and programmers' model are not implemented.
- 0b0001 SVE architectural state and programmers' model are implemented.

All other values are reserved.

If implemented, refer to ID_AA64ZFR0_EL1 for information about which SVE instructions are available.

RAS, bits [31:28]

RAS Extension version. Defined values are:

- 0b0000 No RAS Extension.
- 0b0001 RAS Extension implemented.
- 0b0010 [FEAT_RASv1p1](#) implemented and, if EL3 is implemented, [FEAT_DoubleFault](#) implemented. As 0b0001, and adds support for:
 - If EL3 is implemented, [FEAT_DoubleFault](#).
 - Additional ERXMISC<m>_EL1 System registers.
 - Additional System registers [ERXPFPCDN_EL1](#), [ERXPFPCCTL_EL1](#), and [ERXPFPGF_EL1](#), and the [SCR_EL3.FIEN](#) and [HCR_EL2.FIEN](#) trap controls, to support the optional RAS Common Fault Injection Model Extension.

Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

[FEAT_RAS](#) implements the functionality identified by the value 0b0001.

[FEAT_RASv1p1](#) and [FEAT_DoubleFault](#) implement the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if [FEAT_DoubleFault](#) is implemented, the only permitted value is 0b0010.

From Armv8.4, when [FEAT_DoubleFault](#) is not implemented, and [ERRIDR_EL1](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

———— Note —————

When the value of this field is 0b0001, [ID_AA64PFR1_EL1.RAS_frac](#) indicates whether [FEAT_RASv1p1](#) is implemented.

GIC, bits [27:24]

System register GIC CPU interface. Defined values are:

- 0b0000 GIC CPU interface system registers not implemented.
- 0b0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
- 0b0011 System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

- 0b0000 Advanced SIMD is implemented, including support for the following SISD and SIMD operations:
 - Integer byte, halfword, word and doubleword element operations.
 - Single-precision and double-precision floating-point arithmetic.

- Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.

0b0001 As for 0b0000, and also includes support for half-precision floating-point arithmetic.

0b1111 Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the [FEAT_FP16](#) extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the [FEAT_FP16](#) extension.
- 0b1111 in an implementation without Advanced SIMD support.

FP, bits [19:16]

Floating-point. Defined values are:

0b0000 Floating-point is implemented, and includes support for:

- Single-precision and double-precision floating-point types.
- Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.

0b0001 As for 0b0000, and also includes support for half-precision floating-point arithmetic.

0b1111 Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the [FEAT_FP16](#) extension.
- 0b0001 in an implementation with floating-point support that includes the [FEAT_FP16](#) extension.
- 0b1111 in an implementation without floating-point support.

EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

0b0000 EL3 is not implemented.

0b0001 EL3 can be executed in AArch64 state only.

0b0010 EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

0b0000 EL2 is not implemented.

0b0001 EL2 can be executed in AArch64 state only.

0b0010 EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

0b0001 EL1 can be executed in AArch64 state only.

0b0010 EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

0b0001 EL0 can be executed in AArch64 state only.

0b0010 EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

Accessing ID_AA64PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then

            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64PFR0_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_AA64PFR0_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_AA64PFR0_EL1;

```

D13.2.68 ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers](#) on page D13-3045.

Configurations

There are no configuration notes.

Attributes

ID_AA64PFR1_EL1 is a 64-bit register.

Field descriptions

Bits [63:36]

Reserved, RES0.

CSV2_frac, bits [35:32]

CSV2 fractional field. Defined values are:

- 0b0000 This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context. The SCXTNUM_ELx registers are not supported.
- 0b0001 If ID_AA64PFR0_EL1.CSV2 is 0b0001, branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way. The SCXTNUM_ELx registers are not supported and the contexts do not include the SCXTNUM_ELx register contexts.
- 0b0010 If ID_AA64PFR0_EL1.CSV2 is 0b0001, branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way. The SCXTNUM_ELx registers are supported, but the contexts do not include the SCXTNUM_ELx register contexts.

All other values are reserved.

[FEAT_CSV2_1p1](#) implements the functionality identified by the value 0b0001.

[FEAT_CSV2_1p2](#) implements the functionality identified by the value 0b0010.

From Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

This field is valid only if ID_AA64PFR0_EL1.CSV2 is 0b0001.

Bits [31:20]

Reserved, RES0.

MPAM_frac, bits [19:16]

MPAM Extension fractional field. Defined values are:

- 0b0000 If `ID_AA64PFR0_EL1.MPAM == 0b0000`, MPAM Extension not implemented.
If `ID_AA64PFR0_EL1.MPAM == 0b0001`, MPAM Extension v1.0 is implemented.
- 0b0001 If `ID_AA64PFR0_EL1.MPAM == 0b0000`, implements MPAM v0.1, which is like v1.1 but reduces support for Secure PARTIDs.
If `ID_AA64PFR0_EL1.MPAM == 0b0001`, implements MPAM v1.1 and adds support for MPAM2_EL2.TIDR to provide trapping of MPAMIDR_EL1 when MPAMHCR_EL2 is not present.

All other values are reserved.

RAS_frac, bits [15:12]

RAS Extension fractional field. Defined values are:

- 0b0000 If `ID_AA64PFR0_EL1.RAS == 0b0001`, RAS Extension implemented.
- 0b0001 If `ID_AA64PFR0_EL1.RAS == 0b0001`, as 0b0000 and adds support for:
- Additional ERXMISC<m>_EL1 System registers.
 - Additional System registers `ERXPFPCDN_EL1`, `ERXPFPCCTL_EL1`, and `ERXPFPGF_EL1`, and the `SCR_EL3.FIEN` and `HCR_EL2.FIEN` trap controls, to support the optional RAS Common Fault Injection Model Extension.
- Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to `ERR<n>STATUS`, and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

`FEAT_RASv1p1` implements the functionality identified by the value 0b0001.

This field is valid only if `ID_AA64PFR0_EL1.RAS == 0b0001`.

MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

- 0b0000 Memory Tagging Extension is not implemented.
- 0b0001 Instruction-only Memory Tagging Extension is implemented.
- 0b0010 Full Memory Tagging Extension is implemented.
- 0b0011 Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling.

All other values are reserved.

`FEAT_MTE` implements the functionality identified by the value 0b0001.

`FEAT_MTE2` implements the functionality identified by the value 0b0010.

`FEAT_MTE3` implements the functionality identified by the value 0b0011.

In Armv8.5, the permitted values are 0b0000, 0b0001 and 0b0010.

From Armv8.7, the value 0b0001 is not permitted.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

- 0b0000 AArch64 provides no mechanism to control the use of Speculative Store Bypassing.
- 0b0001 AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

0b0010 AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypassing Safe, and the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.

All other values are reserved.

[FEAT_SSBS](#) implements the functionality identified by the value 0b0001.

[FEAT_SSBS](#) implements the functionality identified by the value 0b0010.

BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state. Defined values are:

0b0000 The Branch Target Identification mechanism is not implemented.

0b0001 The Branch Target Identification mechanism is implemented.

All other values are reserved.

[FEAT_BTI](#) implements the functionality identified by the value 0b0001.

From Armv8.5, the only permitted value is 0b0001.

Accessing ID_AA64PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64PFR1_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_AA64PFR1_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_AA64PFR1_EL1;

```

D13.2.69 ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0

The ID_AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D13-3045](#).

Configurations

AArch64 System register ID_AFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_AFR0](#)[31:0].

Attributes

ID_AFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:16]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [15:12]

    return ID_AFR0_EL1;
```

D13.2.70 ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D13-3045](#).

Configurations

AArch64 System register ID_DFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_DFR0](#)[31:0].

Attributes

ID_DFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

0b0000 Armv8.4 Self-hosted Trace Extension not implemented.

0b0001 Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

[FEAT_TRF](#) implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in [Alternative ID scheme used for the Performance Monitors Extension version on page D13-3047](#)

Defined values are:

0b0000 Performance Monitors Extension not implemented.

0b0001 Performance Monitors Extension, PMUv1 implemented.

0b0010 Performance Monitors Extension, PMUv2 implemented.

0b0011 Performance Monitors Extension, PMUv3 implemented.

0b0100 PMUv3 for Armv8.1. As 0b0011, and also includes support for:

- Extended 16-bit [PMEVTYPER<n>.evtCount](#) field.
- If EL2 is implemented, the [HDCR.HPMD](#) control bit.

0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none">• 64-bit event counters.• If EL2 is implemented, the HDCR.HCCD control bit.• If EL3 is implemented, the MDCR_EL3.SCCD control bit.
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none">• The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO control bits.• If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} control bits.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

[FEAT_PMUv3](#) implements the functionality identified by the value 0b0011.

[FEAT_PMUv3p1](#) implements the functionality identified by the value 0b0100.

[FEAT_PMUv3p4](#) implements the functionality identified by the value 0b0101.

[FEAT_PMUv3p5](#) implements the functionality identified by the value 0b0110.

[FEAT_PMUv3p7](#) implements the functionality identified by the value 0b0111.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if [FEAT_PMUv3](#) is implemented, the value 0b0011 is not permitted.

From Armv8.4, if [FEAT_PMUv3](#) is implemented, the value 0b0100 is not permitted.

From Armv8.5, if [FEAT_PMUv3](#) is implemented, the value 0b0101 is not permitted.

From Armv8.7, if [FEAT_PMUv3](#) is implemented, the value 0b0110 is not permitted.

———— **Note** —————

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors. Defined values are:

0b0000 Not supported.

0b0001 Support for M-profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model. Defined values are:

0b0000 Not supported.

0b0001 Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

0b0000 Not supported.

0b0001 Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors. Defined values are:

0b0000 Not supported.

0b0100 Support for Armv7, v7 Debug architecture, with memory-mapped access.

0b0101 Support for Armv7, v7.1 Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDBG, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R-profile processors. Defined values are:

0b0000 Not supported.

0b0010 Support for Armv6, v6 Debug architecture, with System registers access.

0b0011 Support for Armv6, v6.1 Debug architecture, with System registers access.

0b0100 Support for Armv7, v7 Debug architecture, with System registers access.

0b0101 Support for Armv7, v7.1 Debug architecture, with System registers access.

0b0110 Support for Armv8 debug architecture, with System registers access.

0b0111 Support for Armv8 debug architecture, with System registers access, and Virtualization Host Extensions.

0b1000 Support for Armv8.2 debug architecture.

0b1001 Support for Armv8.4 debug architecture.

All other values are reserved.

[FEAT_Debugv8p2](#) adds the functionality identified by the value 0b1000.

[FEAT_Debugv8p4](#) adds the functionality identified by the value 0b1001.

In Armv8.0, the only permitted value is 0b0110.

In Armv8.1, the only permitted value is 0b0111.

In Armv8.2, the only permitted value is 0b1000.

From Armv8.4, the only permitted value is 0b1001.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_DFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_DFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_DFR0_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_DFR0_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_DFR0_EL1;

```

D13.2.71 ID_DFR1_EL1, Debug Feature Register 1

The ID_DFR1_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers](#) on page D13-3045.

Configurations

AArch64 System register ID_DFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR1[31:0].

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_DFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:4]

Reserved, RES0.

MTPMU, bits [3:0]

Multi-threaded PMU extension. Defined values are:

- 0b0000 FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>.MT are read/write or RES0.
- 0b0001 FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>.MT are 0.
- 0b1111 FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>.MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_DFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_DFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b101

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!IsZero(ID_DFR1_EL1) || boolean IMPLEMENTATION_DEFINED "ID_DFR1 trapped by
HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_DFR1_EL1;
elseif PSTATE.EL == EL2 then
    return ID_DFR1_EL1;
elseif PSTATE.EL == EL3 then
    return ID_DFR1_EL1;

```

D13.2.72 ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR0[31:0].

Attributes

ID_ISAR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds SDIV and UDIV in the T32 instruction set.

0b0010 As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

0b0000 None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.

0b0001 Adds generic CDP, LDC, MCR, MRC, and STC.

0b0010 As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.

0b0011 As for 0b0010, and adds generic MCRR and MRRC.

0b0100 As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

0b0000 None implemented.

0b0001 Adds CBNZ and CBZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds BFC, BFI, SBFX, and UBFX.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds CLZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

0b0000 None implemented.

0b0001 Adds SWP and SWPB.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_ISAR0_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_ISAR0_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_ISAR0_EL1;

```

D13.2.73 ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_ISAR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR1[31:0].

Attributes

ID_ISAR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

0b0000 No support for Jazelle.

0b0001 Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the BX instruction, and the T bit in the PSR.

0b0010 As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.

0b0011 As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

0b0000 None implemented.

0b0001 Adds:

- The MOV_T instruction.
- The MOV instruction encodings with zero-extended 16-bit immediates.
- The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

0b0000 None implemented.

0b0001 Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

0b0000 No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.

0b0001 Adds the SXTB, SXT_H, UXTB, and UXTH instructions.

0b0010 As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Except_AR, bits [11:8]

Indicates the implemented A and R-profile exception-handling instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

0b0000 Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.

0b0001 Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_ISAR1_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_ISAR1_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_ISAR1_EL1;

```

D13.2.74 ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2

The ID_ISAR2_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_ISAR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR2[31:0].

Attributes

ID_ISAR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the REV, REV16, and REVSH instructions.
- 0b0010 As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

PSR_AR, bits [27:24]

Indicates the implemented A and R-profile instructions to manipulate the PSR. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the UMULL and UMLAL instructions.
- 0b0010 As for 0b0001, and adds the UMAAL instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the SMULL and SMLAL instructions.
- 0b0010 As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
- 0b0011 As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

- 0b0000 No additional instructions implemented. This means only MUL is implemented.
- 0b0001 Adds the MLA instruction.
- 0b0010 As for 0b0001, and adds the MLS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

- 0b0000 No support. This means the LDM and STM instructions are not interruptible.
- 0b0001 LDM and STM instructions are restartable.
- 0b0010 LDM and STM instructions are continuable.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the PLD instruction.
- 0b0010 Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
- 0b0011 As for 0b0001 (or 0b0010), and adds the PLI instruction.
- 0b0100 As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

- 0b0000 No additional load/store instructions implemented.
- 0b0001 Adds the LDRD and STRD instructions.
- 0b0010 As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_ISAR2_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_ISAR2_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_ISAR2_EL1;

```

D13.2.75 ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_ISAR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR3[31:0].

Attributes

ID_ISAR3_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

0b0000 None implemented.

0b0001 Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

0b0000 None implemented. This means there are no NOP instructions that do not have any register dependencies.

0b0001 Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

- 0b0000 Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
- 0b0001 Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the TBB and TBH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

- 0b0000 If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.
- 0b0001 If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions.
If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
- 0b0010 If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

- 0b0000 Not implemented.
- 0b0001 Adds the SVC instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
- 0b0011 As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

- 0b0000 None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
 - 0b0001 Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.
- All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR3_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b011

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_ISAR3_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_ISAR3_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_ISAR3_EL1;

```

D13.2.76 ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4

The ID_ISAR4_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_ISAR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR4[31:0].

Attributes

ID_ISAR4_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

0b0000 SWP or SWPB instructions not implemented.

0b0001 SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if ID_ISAR0.Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs. Defined values are:

0b0000 None implemented.

0b0001 Adds the M-profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

SynchPrim_frac, bits [23:20]

Used in conjunction with [ID_ISAR3.SynchPrim](#) to indicate the implemented Synchronization Primitive instructions. Possible values are:

- 0b0000 If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
- 0b0011 If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

- 0b0000 None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
- 0b0001 Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

- 0b0000 None implemented.
- 0b0001 Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- If EL3 is implemented and EL1 can use AArch32, the only permitted value is 0b0001.
- If neither EL3 nor EL2 is implemented, the only permitted value is 0b0000.

If EL1 cannot use AArch32, this field has the value 0b0000.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

- 0b0000 Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
- 0b0001 Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

- 0b0000 Nonzero shifts supported only in MOV and shift instructions.
- 0b0001 Adds support for shifts of loads and stores over the range LSL 0-3.
- 0b0011 As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
- 0b0100 As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

0b0000 None implemented. No T variant instructions are implemented.

0b0001 Adds the LDRBT, LDRT, STRBT, and STRT instructions.

0b0010 As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR4_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR4_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b100

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_ISAR4_EL1;
elseif PSTATE.EL == EL2 then
    return ID_ISAR4_EL1;
elseif PSTATE.EL == EL3 then
    return ID_ISAR4_EL1;

```

D13.2.77 ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR5[31:0].

Attributes

ID_ISAR5_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

0b0000 The VCMLA and VCADD instructions are not implemented in AArch32.

0b0001 The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

[FEAT_FCMA](#) implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, the only permitted value is 0b0001.

RDM, bits [27:24]

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

0b0000 No VQRDMLAH and VQRDMLSH instructions implemented.

0b0001 VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

[FEAT_RDM](#) implements the functionality identified by the value 0b0001.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the only permitted value is 0b0001.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

0b0000 No CRC32 instructions implemented.

0b0001 CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

0b0000 No SHA2 instructions implemented.

0b0001 SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

0b0000 No SHA1 instructions implemented.

0b0001 SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

0b0000 No AES instructions implemented.

0b0001 AESE, AESD, AESMC, and AESIMC implemented.

0b0010 As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

0b0000 SEVL is implemented as a NOP.

0b0001 SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR5_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR5_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b101

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then

        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_ISAR5_EL1;
elseif PSTATE.EL == EL2 then
    return ID_ISAR5_EL1;
elseif PSTATE.EL == EL3 then
    return ID_ISAR5_EL1;

```

D13.2.78 ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#) and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR6](#)[31:0].

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:28]

Reserved, RES0.

I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

0b0000 Int8 matrix multiplication instructions are not implemented.

0b0001 VSMMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

[FEAT_AA32I8MM](#) implements the functionality identified by 0b0001.

BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

0b0000 BFloat16 instructions are not implemented.

0b0001 VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMAT, and VMMLA instructions with BF16 operand or result types are implemented.

All other values are reserved.

[FEAT_AA32BF16](#) implements the functionality identified by 0b0001.

SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

- 0b0000 Prediction invalidation instructions are not implemented.
- 0b0001 CFPRECTX, DVPRCTX, and CPPRECTX instructions are implemented.

All other values are reserved.

[FEAT_SPECRES](#) implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [15:12]

Indicates support for the SB instruction in AArch32 state. Defined values are:

- 0b0000 SB instruction is not implemented.
- 0b0001 SB instruction is implemented.

All other values are reserved.

[FEAT_SB](#) implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:

- 0b0000 VFMAL and VMFSL instructions are not implemented.
- 0b0001 VFMAL and VMFSL instructions are implemented.

All other values are reserved.

[FEAT_FHM](#) implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state. Defined values are:

- 0b0000 Dot product instructions are not implemented.
- 0b0001 VUDOT and VSDOT instructions are implemented.

All other values are reserved.

[FEAT_DotProd](#) implements the functionality identified by 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

JSCVT, bits [3:0]

Indicates support for the VJCVT instruction in AArch32 state. Defined values are:

- 0b0000 The VJCVT instruction is not implemented.
- 0b0001 The VJCVT instruction is implemented.

All other values are reserved.

[FEAT_JSCVT](#) implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR6_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR6_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b111

```

        return ID_ISAR6_EL1;

```

D13.2.79 ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR0[31:0].

Attributes

ID_MMFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

- 0b0000 Implemented as Non-cacheable.
- 0b0001 Implemented with hardware coherency support.
- 0b1111 Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNKNOWN.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

- 0b0000 Not supported.
- 0b0001 Support for FCSE.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

- 0b0000 None supported.

- 0b0001 Support for Auxiliary Control Register only.
- 0b0010 Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

———— **Note** —————

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

- 0b0000 Not supported.
- 0b0001 Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.
- 0b0010 Support for TCM only, Armv6 implementation.
- 0b0011 Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

- 0b0000 One level of shareability implemented.
- 0b0001 Two levels of shareability implemented.

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

- 0b0000 Implemented as Non-cacheable.
- 0b0001 Implemented with hardware coherency support.
- 0b1111 Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

- 0b0000 Not supported.
- 0b0001 Support for IMPLEMENTATION DEFINED PMSA.
- 0b0010 Support for PMSAv6, with a Cache Type Register implemented.
- 0b0011 Support for PMSAv7, with support for memory subsections. Armv7-R profile.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

- 0b0000 Not supported.
- 0b0001 Support for IMPLEMENTATION DEFINED VMSA.
- 0b0010 Support for VMSAv6, with Cache and TLB Type Registers implemented.

- 0b0011 Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.
 - 0b0100 As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
 - 0b0101 As for 0b0100, and adds support for the Long-descriptor translation table format.
- All other values are reserved.
In Armv8-A the only permitted value is 0b0101.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b100

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_MMFR0_EL1;
elseif PSTATE.EL == EL2 then
    return ID_MMFR0_EL1;
elseif PSTATE.EL == EL3 then
    return ID_MMFR0_EL1;

```

D13.2.80 ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1

The ID_MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_MMFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR1[31:0].

Attributes

ID_MMFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

- | | |
|--------|--|
| 0b0000 | No branch predictor, or no MMU present. Implies a fixed MPU configuration. |
| 0b0001 | Branch predictor requires flushing on: <ul style="list-style-type: none"> Enabling or disabling a stage of address translation. Writing new data to instruction locations. Writing new mappings to the translation tables. Changes to the TTBR0, TTBR1, or TTBCR registers. Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported. |
| 0b0010 | Branch predictor requires flushing on: <ul style="list-style-type: none"> Enabling or disabling a stage of address translation. Writing new data to instruction locations. Writing new mappings to the translation tables. Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported. |
| 0b0011 | Branch predictor requires flushing only on writing new data to instruction locations. |
| 0b0100 | For execution correctness, branch predictor requires no flushing at any time. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, and 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 data cache test and clean operations are:
 - Test and clean data cache.
- 0b0010 As for 0b0001, and adds:
 - Test, clean, and invalidate data cache.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported entire Level 1 cache operations are:
 - Invalidate cache, including branch predictor if appropriate.
 - Invalidate branch predictor, if appropriate.
- 0b0010 As for 0b0001, and adds:
 - Clean cache, using a recursive model that uses the cache dirty status bit.
 - Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported entire Level 1 cache operations are:
 - Invalidate instruction cache, including branch predictor if appropriate.
 - Invalidate branch predictor, if appropriate.
- 0b0010 As for 0b0001, and adds:
 - Invalidate data cache.
 - Invalidate data cache and instruction cache, including branch predictor if appropriate.
- 0b0011 As for 0b0010, and adds:
 - Clean data cache, using a recursive model that uses the cache dirty status bit.
 - Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 unified cache line maintenance operations by set/way are:
- Clean cache line by set/way.
- 0b0010 As for 0b0001, and adds:
- Clean and invalidate cache line by set/way.
- 0b0011 As for 0b0010, and adds:
- Invalidate cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 Harvard cache line maintenance operations by set/way are:
- Clean data cache line by set/way.
 - Clean and invalidate data cache line by set/way.
- 0b0010 As for 0b0001, and adds:
- Invalidate data cache line by set/way.
- 0b0011 As for 0b0010, and adds:
- Invalidate instruction cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 unified cache line maintenance operations by VA are:
- Clean cache line by VA.
 - Invalidate cache line by VA.
 - Clean and invalidate cache line by VA.
- 0b0010 As for 0b0001, and adds:
- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported Level 1 Harvard cache line maintenance operations by VA are:
- Clean data cache line by VA.
 - Invalidate data cache line by VA.

- Clean and invalidate data cache line by VA.
- Clean instruction cache line by VA.

0b0010 As for 0b0001, and adds:

- Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b101

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_MMFR1_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_MMFR1_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_MMFR1_EL1;

```

D13.2.81 ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2

The ID_MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_MMFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR2[31:0].

Attributes

ID_MMFR2_EL1 is a 64-bit register.

Field descriptions**When AArch32 is supported at EL0:****Bits [63:32]**

Reserved, RES0.

HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

0b0000 Not supported.

0b0001 Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

WFIS Stall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

0b0000 Not supported.

0b0001 Support for WFI stalling.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0001.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

0b0000 None supported.

0b0001 Supported memory barrier System instructions are:

- Data Synchronization Barrier (DSB).

- 0b0010 As for 0b0001, and adds:
- Instruction Synchronization Barrier (ISB).
 - Data Memory Barrier (DMB).

All other values are reserved.

From Armv8, the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

- 0b0000 Not supported.
- 0b0001 Supported unified TLB maintenance operations are:
- Invalidate all entries in the TLB.
 - Invalidate TLB entry by VA.
- 0b0010 As for 0b0001, and adds:
- Invalidate TLB entries by ASID match.
- 0b0011 As for 0b0010, and adds:
- Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.
- 0b0100 As for 0b0011, and adds:
- Invalidate Hyp mode unified TLB entry by VA.
 - Invalidate entire Non-secure PL1&0 unified TLB.
 - Invalidate entire Hyp mode unified TLB.
- 0b0101 As for 0b0100, and adds the following operations: [TLBIMVALIS](#), [TLBIMVAALIS](#), [TLBIMVALHIS](#), [TLBIMVAL](#), [TLBIMVAAL](#), [TLBIMVALH](#).
- 0b0110 As for 0b0101, and adds the following operations: [TLBIIPAS2IS](#), [TLBIIPAS2LIS](#), [TLBIIPAS2](#), [TLBIIPAS2L](#).

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

- 0b0000 Not supported.
- 0b0001 Supported Level 1 Harvard cache maintenance range operations are:
- Invalidate data cache range by VA.
 - Invalidate instruction cache range by VA.
 - Clean data cache range by VA.
 - Clean and invalidate data cache range by VA.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

0b0000 Not supported.

0b0001 Supported Level 1 Harvard cache background fetch operations are:

- Fetch instruction cache range by VA.
- Fetch data cache range by VA.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

0b0000 Not supported.

0b0001 Supported Level 1 Harvard cache foreground fetch operations are:

- Fetch instruction cache range by VA.
- Fetch data cache range by VA.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b110

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    
```

```
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_MMFR2_EL1;
elseif PSTATE.EL == EL2 then
    return ID_MMFR2_EL1;
elseif PSTATE.EL == EL3 then
    return ID_MMFR2_EL1;
```

D13.2.82 ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR3[31:0].

Attributes

ID_MMFR3_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported.

Defined values are:

0b0000 Supersections supported.

0b1111 Supersections not supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

0b0000 4GB, corresponding to a 32-bit physical address range.

0b0001 64GB, corresponding to a 36-bit physical address range.

0b0010 1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

- 0b0000 Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
- 0b0001 Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in [CPSR](#), [SPSR](#), and [DSPSR](#) in AArch32 state. Defined values are:

- 0b0000 PAN not supported.
- 0b0001 PAN supported.
- 0b0010 PAN supported and [ATS1CPRP](#) and [ATS1CPWP](#) instructions supported.

All other values are reserved.

[FEAT_PAN](#) implements the functionality identified by the value 0b0001.

[FEAT_PAN2](#) implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

- 0b0000 Cache, TLB, and branch predictor operations only affect local structures.
- 0b0001 Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
- 0b0010 Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

- 0b0000 None supported.
- 0b0001 Supported branch predictor maintenance operations are:
 - Invalidate all branch predictors.
- 0b0010 As for 0b0001, and adds:
 - Invalidate branch predictors by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

- 0b0000 None supported.

0b0001 Supported hierarchical cache maintenance instructions by set/way are:

- Invalidate data cache by set/way.
- Clean data cache by set/way.
- Clean and invalidate data cache by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

0b0000 None supported.

0b0001 Supported hierarchical cache maintenance operations by VA are:

- Invalidate data cache by VA.
- Clean data cache by VA.
- Clean and invalidate data cache by VA.
- Invalidate instruction cache by VA.
- Invalidate all instruction cache entries.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR3_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b111

```

if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else

```

```
        AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_MMFR3_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_MMFR3_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_MMFR3_EL1;
```

D13.2.83 ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4

The ID_MMFR4_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_MMFR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR4[31:0].

Attributes

ID_MMFR4_EL1 is a 64-bit register.

Field descriptions**When AArch32 is supported at EL0:****Bits [63:32]**

Reserved, RES0.

EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

0b0000 HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.

0b0001 HCR2.{TOCU, TICAB, TID4} traps are supported. HCR2.TTLBIS trap is not supported.

0b0010 HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented supporting AArch32, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented or does not support AArch32.
- 0b0010 when EL2 is implemented and supports AArch32.

CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

0b0000 32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.

0b0001 64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

[FEAT_CCIDX](#) implements the functionality identified by `0b0001`.

From Armv8.3, the permitted values are `0b0000` and `0b0001`.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in [HSCTLR](#) and [SCTLR](#). Defined values are:

`0b0000` LSMAOE and nTLSMD bits not supported.

`0b0001` LSMAOE and nTLSMD bits supported.

All other values are reserved.

[FEAT_LSMAOC](#) implements the functionality identified by the value `0b0001`.

From Armv8.2, the permitted values are `0b0000` and `0b0001`.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables. Defined values are:

`0b0000` Disabling of hierarchical controls not supported.

`0b0001` Supports disabling of hierarchical controls using the [TTBCR2.HPD0](#), [TTBCR2.HPD1](#), and [HTCR.HPD](#) bits.

`0b0010` As for value `0b0001`, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

[FEAT_AA32HPD](#) implements the functionality identified by the value `0b0001`.

[FEAT_HPDS2](#) implements the functionality added by the value `0b0010`.

———— Note —————

The value `0b0000` implies that the encoding for [TTBCR2](#) is UNDEFINED.

CnP, bits [15:12]

Common not Private translations. Defined values are:

`0b0000` Common not Private translations not supported.

`0b0001` Common not Private translations supported.

All other values are reserved.

[FEAT_TTCNP](#) implements the functionality identified by the value `0b0001`.

From Armv8.2 the only permitted value is `0b0001`.

XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

`0b0000` Distinction between EL0 and EL1 execute-never control at stage 2 not supported.

`0b0001` Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

[FEAT_XNX](#) implements the functionality identified by the value `0b0001`.

When [FEAT_XNX](#) is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of `ID_MMFR4_EL1.XNX` is `0b0000` or `0b0001`:
 - `ID_AA64MMFR1_EL1.XNX` == 1.
 - EL2 cannot use AArch32.
 - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is `0b0001`.

AC2, bits [7:4]

Indicates the extension of the [ACTLR](#) and [HACTLR](#) registers using [ACTLR2](#) and [HACTLR2](#).
Defined values are:

0b0000 [ACTLR2](#) and [HACTLR2](#) are not implemented.

0b0001 [ACTLR2](#) and [HACTLR2](#) are implemented.

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [3:0]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

0b0000 The PE never generates an SError interrupt due to an External abort on a speculative read.

0b0001 The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR4_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR4_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b110

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && (!IsZero(ID_MMFR4_EL1) || boolean IMPLEMENTATION_DEFINED "ID_MMFR4_EL1 trapped by
HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_MMFR4_EL1;

```

```
elseif PSTATE.EL == EL2 then  
    return ID_MMFR4_EL1;  
elseif PSTATE.EL == EL3 then  
    return ID_MMFR4_EL1;
```

D13.2.84 ID_MMFR5_EL1, AArch32 Memory Model Feature Register 5

The ID_MMFR5_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_MMFR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR5](#)[31:0].

Attributes

ID_MMFR5_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

**Bits [63:8]**

Reserved, RES0.

nTLBPA, bits [7:4]

Indicates support for intermediate caching of translation table walks. Defined values are:

- 0b0000** The intermediate caching of translation table walks might include non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE where either:
- The caching is indexed by the physical address of the location holding the translation table entry.
 - The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.
- 0b0001** The intermediate caching of translation table walks does not include non-coherent caches of previous valid translation table entries since the last completed TLBI applicable to the PE where either:
- The caching is indexed by the physical address of the location holding the translation table entry.
 - The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

[FEAT_nTLBPA](#) implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

ETS, bits [3:0]

Indicates support for Enhanced Translation Synchronization. Defined values are:

0b0000 Enhanced Translation Synchronization is not supported.

0b0001 Enhanced Translation Synchronization is supported.

All other values are reserved.

[FEAT_ETC](#) implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR5_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR5_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b110

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && (!IsZero(ID_MMFR5_EL1) || boolean IMPLEMENTATION_DEFINED "ID_MMFR5_EL1 trapped by
HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_MMFR5_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_MMFR5_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_MMFR5_EL1;

```

D13.2.85 ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1_EL1.

For general information about the interpretation of the ID registers, see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_PFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR0[31:0].

Attributes

ID_PFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

RAS, bits [31:28]

RAS Extension version. Defined values are:

0b0000 No RAS Extension.

0b0001 RAS Extension implemented.

0b0010 [FEAT_RASv1p1](#) implemented. As 0b0001, and adds support for additional ERXMISC<m> System registers.

Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

[FEAT_RAS](#) implements the functionality identified by the value 0b0001.

[FEAT_RASv1p1](#) implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if [FEAT_DoubleFault](#) is implemented, the only permitted value is 0b0010.

From Armv8.4, when [FEAT_DoubleFault](#) is not implemented, and [ERRIDR_EL1.NUM](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

————— Note —————

When the value of this field is 0b0001, ID_PFR2_EL1.RAS_frac indicates whether [FEAT_RASv1p1](#) is implemented.

DIT, bits [27:24]

Data Independent Timing. Defined values are:

- 0b0000 AArch32 does not guarantee constant execution time of any instructions.
- 0b0001 AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

[FEAT_DIT](#) implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

- 0b0000 Activity Monitors Extension is not implemented.
- 0b0001 [FEAT_AMUv1](#) is implemented.
- 0b0010 [FEAT_AMUv1p1](#) is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

[FEAT_AMUv1](#) implements the functionality identified by the value 0b0001.

[FEAT_AMUv1p1](#) implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

- 0b0000 This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context.
- 0b0001 Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way.
- 0b0010 Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way.

All other values are reserved.

[FEAT_CSV2](#) implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

- 0b0000 Not implemented.
- 0b0001 T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

State2, bits [11:8]

Jazelle extension support. Defined values are:

- 0b0000 Not implemented.

0b0001 Jazelle extension implemented, without clearing of **JOSCR.CV** on exception entry.

0b0010 Jazelle extension implemented, with clearing of **JOSCR.CV** on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

State1, bits [7:4]

T32 instruction set support. Defined values are:

0b0000 T32 instruction set not implemented.

0b0001 T32 encodings before the introduction of Thumb-2 technology implemented:

- All instructions are 16-bit.
- A BL or BLX is a pair of 16-bit instructions.
- 32-bit instructions other than BL and BLX cannot be encoded.

0b0011 T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

State0, bits [3:0]

A32 instruction set support. Defined values are:

0b0000 A32 instruction set not implemented.

0b0001 A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_PFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

```

```
        AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_PFR0_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_PFR0_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_PFR0_EL1;
```

D13.2.86 ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR1[31:0].

Attributes

ID_PFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

**Bits [63:32]**

Reserved, RES0.

GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

0b0000 GIC CPU interface system registers not implemented.

0b0001 System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.

0b0011 System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for Virtualization Extensions. Defined values are:

0b0000 No Virtualization Extensions are implemented.

0b0001 The following Virtualization Extensions are implemented:

- The SCR.SIF bit, if EL3 is implemented.
- The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented.
- The MSR (banked register) and MRS (banked register) instructions.
- The ERET instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.

- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

———— **Note** —————

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for Security Extensions. Defined values are:

0b0000 No Security Extensions are implemented.

0b0001 The following Security Extensions are implemented:

- The VBAR register.
- The TTBCR.PD0 and TTBCR.PD1 bits.

0b0010 As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

0b0000 Generic Timer is not implemented.

0b0001 Generic Timer is implemented.

0b0010 Generic Timer is implemented, and also includes support for CNTHCTL.EVNTIS and CNTKCTL.EVNTIS fields, and CNTPCTSS and CNTVCTSS counter views.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

0b0000 EL2, Hyp mode, and the HVC instruction not implemented.

0b0001 EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]

M-profile programmers' model support. Defined values are:

- 0b0000 Not supported.
- 0b0010 Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Security, bits [7:4]

Security support. Defined values are:

- 0b0000 EL3, Monitor mode, and the SMC instruction not implemented.
- 0b0001 EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
- 0b0010 As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

- 0b0000 Not supported.
- 0b0001 Supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_PFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_PFR1_EL1;
elseif PSTATE.EL == EL2 then
    return ID_PFR1_EL1;
elseif PSTATE.EL == EL3 then
    return ID_PFR1_EL1;
```

D13.2.87 ID_PFR2_EL1, AArch32 Processor Feature Register 2

The ID_PFR2_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.
Must be interpreted with ID_PFR0_EL1 and ID_PFR1_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* on page D13-3045.

Configurations

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR2[31:0].

Attributes

ID_PFR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:12]

Reserved, RES0.

RAS_frac, bits [11:8]

RAS Extension fractional field. Defined values are:

- 0b0000 If ID_PFR0_EL1.RAS == 0b0001, RAS Extension implemented.
- 0b0001 If ID_PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers.

Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

This field is valid only if ID_PFR0_EL1.RAS == 0b0001.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

- 0b0000 AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
- 0b0001 AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

CSV3, bits [3:0]

Speculative use of faulting data. Defined values are:

- 0b0000 This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.
- 0b0001 Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.

All other values are reserved.

[FEAT_CSV3](#) implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If [FEAT_E0PD](#) is implemented, [FEAT_CSV3](#) must be implemented.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_PFR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b100

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then

elseif PSTATE.EL == EL2 then
    return ID_PFR2_EL1;
elseif PSTATE.EL == EL3 then
    return ID_PFR2_EL1;

```

D13.2.88 IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 [IFSR](#) register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configurations

AArch64 System register IFSR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register [IFSR](#)[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to IFSR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Attributes

IFSR32_EL2 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

0b0 [IFAR](#) is valid.

0b1 [IFAR](#) is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

0b00001	PC alignment fault.
0b00010	Debug exception.
0b00011	Access flag fault, level 1.
0b00101	Translation fault, level 1.
0b00110	Access flag fault, level 2.
0b00111	Translation fault, level 2.
0b01000	Synchronous External abort, not on translation table walk.
0b01001	Domain fault, level 1.
0b01011	Domain fault, level 2.
0b01100	Synchronous External abort, on translation table walk, level 1.
0b01101	Permission fault, level 1.
0b01110	Synchronous External abort, on translation table walk, level 2.
0b01111	Permission fault, level 2.
0b10000	TLB conflict abort.
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).
0b11001	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on memory access, not on translation table walk.
0b11100	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on translation table walk, level 1.
0b11110	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on translation table walk, level 2.

All other values are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Short-descriptor translation table lookup on page G5-6373](#).

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

0b0 **IFAR** is valid.

0b1 **IFAR** is not valid, and holds an UNKNOWN value.

This field is only valid for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

0b0 Using the Short-descriptor translation table formats.

0b1 Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

0b000000	Address size fault in translation table base register.
0b000001	Address size fault, level 1.
0b000010	Address size fault, level 2.
0b000011	Address size fault, level 3.
0b000101	Translation fault, level 1.
0b000110	Translation fault, level 2.
0b000111	Translation fault, level 3.
0b001001	Access flag fault, level 1.
0b001010	Access flag fault, level 2.
0b001011	Access flag fault, level 3.
0b001101	Permission fault, level 1.
0b001110	Permission fault, level 2.
0b001111	Permission fault, level 3.
0b010000	Synchronous External abort, not on translation table walk.
0b010101	Synchronous External abort on translation table walk, level 1.
0b010110	Synchronous External abort on translation table walk, level 2.
0b010111	Synchronous External abort on translation table walk, level 3.
0b011000	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on memory access, not on translation table walk.
0b011101	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on memory access on translation table walk, level 1.
0b011110	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on memory access on translation table walk, level 2.
0b011111	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on memory access on translation table walk, level 3.
0b100001	PC alignment fault.
0b100010	Debug exception.
0b110000	TLB conflict abort.

All other values are reserved.

When FEAT_RAS is implemented, 0b011000, 0b011101, 0b011110, and 0b011111 are reserved.

For more information about the lookup level associated with a fault, see [The level associated with MMU faults on a Long-descriptor translation table lookup on page G5-6375](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFSR32_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, IFSR32_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0000	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then

    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    IFSR32_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    IFSR32_EL2 = X[t];

```

D13.2.89 ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

Purpose

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when `SCR_EL3.EEL2 == 0b0`, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when `SCR_EL3.EEL2 == 0b1`:

- If the `HCR_EL2.{IMO,FMO,AMO}` bit has a value of 1, the corresponding `ISR_EL1.{I,F,A}` bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the `HCR_EL2.{IMO,FMO,AMO}` bit has a value of 0, the corresponding `ISR_EL1.{I,F,A}` bit shows the pending status of the physical IRQ, FIQ, or SError.

Configurations

AArch64 System register `ISR_EL1` bits [31:0] are architecturally mapped to AArch32 System register `ISR`[31:0].

Attributes

`ISR_EL1` is a 64-bit register.

Field descriptions

Bits [63:9]

Reserved, RES0.

A, bit [8]

SError interrupt pending bit. Indicates whether an SError interrupt is pending.

0b0 No pending SError.

0b1 An SError interrupt is pending.

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending.

0b0 No pending IRQ.

0b1 An IRQ interrupt is pending.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

0b0 No pending FIQ.

0b1 An FIQ interrupt is pending.

Bits [5:0]

Reserved, RES0.

Accessing ISR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ISR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGRTR_EL2.ISR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ISR_EL1;
elseif PSTATE.EL == EL2 then
    return ISR_EL1;
elseif PSTATE.EL == EL3 then
    return ISR_EL1;

```

D13.2.90 LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

Purpose

Enables and disables LORegions, and selects the current LORegion descriptor.

Configurations

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORC_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

Attributes

LORC_EL1 is a 64-bit register.

Field descriptions

Bits [63:10]

Reserved, RES0.

DS, bits [9:2]

Descriptor Select. Selects the current LORegion descriptor accessed by [LORSA_EL1](#), [LOREA_EL1](#), and [LORN_EL1](#).

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is $\text{Log}_2(\text{Number of LORegion descriptors supported by the implementation})$.

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers [LORN_EL1](#), [LOREA_EL1](#), and [LORSA_EL1](#) are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [1]

Reserved, RES0.

EN, bit [0]

Enable. Indicates whether LORegions are enabled.

0b0 Disabled. Memory accesses do not match any LORegions.

0b1 Enabled. Memory accesses may match a LORegion.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing LORC_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORC_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b011

```

D13.2.91 LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

Purpose

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by [LORC_EL1.DS](#).

Configurations

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC_EL1.DS](#) points to a LORegion that is not supported by the PE.

Attributes

LOREA_EL1 is a 64-bit register.

Field descriptions

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:52]

Reserved, RES0.

EA[51:48], bits [51:48]

When FEAT_LPA is implemented:

EA[51:48]

Extension to EA[47:16]. For more information, see EA[47:16].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA[47:16], bits [47:16]

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by [LORC_EL1.DS](#). Bits[15:0] of this address are defined to be 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When [FEAT_LPA](#) is implemented and 52-bit addresses are in use, EA[51:48] forms the upper part of the address value. Otherwise, when 52-bit addresses are not in use, EA[51:48] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

```

D13.2.92 LORID_EL1, LORegionID (EL1)

The LORID_EL1 characteristics are:

Purpose

Indicates the number of LORegions and LORegion descriptors supported by the PE.

Configurations

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORID_EL1 are UNDEFINED.

If no LORegion descriptors are implemented, then the registers [LORC_EL1](#), [LORN_EL1](#), [LOREA_EL1](#), and [LORSA_EL1](#) are RES0.

Attributes

LORID_EL1 is a 64-bit register.

Field descriptions

Bits [63:24]

Reserved, RES0.

LD, bits [23:16]

Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.

Bits [15:8]

Reserved, RES0.

LR, bits [7:0]

Number of LORegions supported by the PE. This is an 8-bit binary number.

Note

If LORID_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

Accessing LORID_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORID_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b111

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
```

```

    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority
when SDD == '1'" && SCR_EL3.TLOR == '1' then
    UNDEFINED;

            else
                return LORID_EL1;
    elsif PSTATE.EL == EL3 then
        return LORID_EL1;

```

D13.2.93 LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

Purpose

Holds the number of the LORegion described in the current LORegion descriptor selected by [LORC_EL1.DS](#).

Configurations

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORN_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC_EL1.DS](#) points to a LORegion that is not supported by the PE.

Attributes

LORN_EL1 is a 64-bit register.

Field descriptions

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:8]

Reserved, RES0.

Num, bits [7:0]

Number of the LORegion described in the current LORegion descriptor selected by [LORC_EL1.DS](#).

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is ($\text{Log}_2(\text{Number of LORegions supported by the PE})$).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing LORN_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORN_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b010

```

D13.2.94 LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

Purpose

Indicates whether the current LORegion descriptor selected by `LORC_EL1.DS` is enabled, and holds the physical address of the start of the LORegion.

Configurations

This register is present only when `FEAT_LOR` is implemented. Otherwise, direct accesses to `LORSA_EL1` are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- `LORC_EL1.DS` points to a LORegion that is not supported by the PE.

Attributes

`LORSA_EL1` is a 64-bit register.

Field descriptions

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:52]

Reserved, RES0.

SA, bits [51:16]

When FEAT_LPA is implemented:

SA, bits [35:0]

The start physical address of the LORegion described in the current LORegion descriptor selected by `LORC_EL1.DS`.

Bits[15:0] of this address are defined to be `0x0000`.

When 52-bit addresses are in use, `SA[35:32]` forms the upper part of the address value.

When 52-bit addresses are not in use, `SA[35:32]` is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LPA is not implemented:

Bits [35:32]

Reserved, RES0.

SA, bits [31:0]

The start physical address of the LORegion described in the current LORegion descriptor selected by [LORC_EL1.DS](#).

Bits[15:0] of this address are defined to be 0x0000.

For implementations with fewer than 48 bits, the upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:1]

Reserved, RES0.

Valid, bit [0]

Indicates whether the current LORegion descriptor is enabled.

0b0 LORegion descriptor is disabled.

0b1 LORegion descriptor is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing LORSA_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORSA_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b000

```

D13.2.95 MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

Configurations

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MAIRO[31:0] when TTBCR.EAE == 1.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == 1.

Attributes

MAIR_EL1 is a 64-bit register.

Field descriptions

MAIR_EL1 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.

Attr	Meaning
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When [FEAT_XS](#) is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```

D13.2.96 MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

Configurations

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HMAIR0[31:0].

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HMAIR1[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MAIR_EL2 is a 64-bit register.

Field descriptions

MAIR_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.

Attr	Meaning
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When [FEAT_XS](#) is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR_EL2 or MAIR_EL1 is not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0010	0b000

```

if PSTATE.EL == EL0 then

        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.MAIR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        NVMem[0x140] = X[t];
    else
        MAIR_EL1 = X[t];
elseif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        MAIR_EL2 = X[t];
    else
        MAIR_EL1 = X[t];
elseif PSTATE.EL == EL3 then
    MAIR_EL1 = X[t];
```

D13.2.97 MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

Configurations

This register is present only when EL3 is implemented. Otherwise, direct accesses to MAIR_EL3 are UNDEFINED.

Attributes

MAIR_EL3 is a 64-bit register.

Field descriptions

MAIR_EL3 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When [FEAT_XS](#) is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MAIR_EL3;
```

MSR MAIR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MAIR_EL3 = X[t];
```

D13.2.98 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configurations

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MIDR](#)[31:0].

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register [MIDR_EL1](#)[31:0].

Attributes

MIDR_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is RO.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Architecture, bits [19:16]

Architecture version. Defined values are:

0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is RO.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.MIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);

```

```
    elsif EL2Enabled() then
        return VPIDR_EL2;
    else
        return MIDR_EL1;
    elsif PSTATE.EL == EL2 then
        return MIDR_EL1;
    elsif PSTATE.EL == EL3 then
        return MIDR_EL1;
```

D13.2.99 MPIDR_EL1, Multiprocessor Affinity Register

The MPIDR_EL1 characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

Configurations

AArch64 System register MPIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MPIDR](#)[31:0].

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

Attributes

MPIDR_EL1 is a 64-bit register.

Field descriptions

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

0b0 Processor is part of a multiprocessor system.

0b1 Processor is part of a uniprocessor system.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of [affinity](#) consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.

0b0 Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.

0b1 Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the [affinity](#) level that is most significant for determining PE behavior. Higher [affinity](#) levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing MPIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b101

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.MPIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() then
        return VMPIDR_EL2;
    else
        return MPIDR_EL1;
elseif PSTATE.EL == EL2 then
    return MPIDR_EL1;
elseif PSTATE.EL == EL3 then
    return MPIDR_EL1;

```

D13.2.100 MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR1_EL1](#) and [MVFR2_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D13-3045](#).

Configurations

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR0](#)[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

0b0000 Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the [FPSCR](#) setting.

0b0001 All rounding modes supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

0b0000 Short vectors not supported.

0b0001 Short vector operation supported.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

0b0000 Not supported in hardware.

0b0001 Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

0b0000 Not supported in hardware.

0b0001 Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

0b0000 Not supported.

0b0001 Supported.

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

0b0000 Not supported in hardware.

0b0001 Supported, VFPv2.

0b0010 Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

- 0b0000 Not supported in hardware.
- 0b0001 Supported, VFPv2.
- 0b0010 Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

- 0b0000 The implementation has no Advanced SIMD and floating-point support.
- 0b0001 The implementation includes floating-point support with 16 x 64-bit registers.
- 0b0010 The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing MVFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MVFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b000

```

if PSTATE.EL == EL0 then

    elsif PSTATE.EL == EL3 then
        return MVFR0_EL1;

```

D13.2.101 MVFR1_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0_EL1](#) and [MVFR2_EL1](#).

For general information about the interpretation of the ID registers see [Principles of the ID scheme for fields in ID registers on page D13-3045](#).

Configurations

AArch64 System register MVFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR1](#)[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:32]

Reserved, RES0.

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

0b0000 Not implemented.

0b0001 Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

0b0000 Not supported.

0b0001 Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.

0b0010 As for 0b0001, and adds instructions for conversion between double-precision and half-precision.

0b0011 As for 0b0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the [FEAT_FP16](#) extension.
- 0b0011 in an implementation with floating-point support that includes the [FEAT_FP16](#) extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDHP, bits [23:20]

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support.

Defined values are:

- 0b0000 Not supported.
- 0b0001 SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
- 0b0010 As for 0b0001, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0001 in an implementation with SIMD floating-point support that does not include the [FEAT_FP16](#) extension.
- 0b0010 in an implementation with SIMD floating-point support that includes the [FEAT_FP16](#) extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDSP, bits [19:16]

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

- 0b0000 Not implemented.
- 0b0001 Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDIInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

0b0000 Not implemented.

0b0001 Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

0b0000 Not implemented.

0b0001 Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

0b0000 Not implemented, or hardware supports only the Default NaN mode.

0b0001 Hardware supports propagation of NaN values.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPPtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

0b0000 Not implemented, or hardware supports only the Flush-to-Zero mode of operation.

0b0001 Hardware supports full denormalized number arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing MVFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MVFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return MVFR1_EL1;
    elsif PSTATE.EL == EL2 then
        return MVFR1_EL1;
    elsif PSTATE.EL == EL3 then
        return MVFR1_EL1;

```

D13.2.102 MVFR2_EL1, AArch32 Media and VFP Feature Register 2

The MVFR2_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0_EL1](#) and [MVFR1_EL1](#).

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers on page D13-3045](#).

Configurations

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR2](#)[31:0].

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0:

Bits [63:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

0b0000 Not implemented, or no support for miscellaneous features.

0b0001 Support for Floating-point selection.

0b0010 As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes.

0b0011 As 0b0010, and Floating-point Round to Integer Floating-point.

0b0100 As 0b0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0100.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

0b0000 Not implemented, or no support for miscellaneous features.

0b0001 Floating-point Conversion to Integer with Directed Rounding modes.

0b0010 As 0b0001, and Floating-point Round to Integer Floating-point.

0b0011 As 0b0010, and Floating-point MaxNum and MinNum.

All other values are reserved.
In Armv8-A, the permitted values are 0b0000 and 0b0011.

Otherwise:

Bits [63:0]

Reserved, UNKNOWN.

Accessing MVFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MVFR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then

        else
            return MVFR2_EL1;
    elseif PSTATE.EL == EL2 then
        return MVFR2_EL1;
    elseif PSTATE.EL == EL3 then
        return MVFR2_EL1;

```

D13.2.103 PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configurations

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register PAR[63:0].

Attributes

PAR_EL1 is a 64-bit register.

Field descriptions

When *PAR_EL1.F* == 0:

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

————— Note —————

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

PA[51:48], bits [51:48]

When FEAT_LPA is implemented:

PA[51:48]

Extension to PA[47:12]. For more information, see PA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When [FEAT_LPA](#) is implemented and 52-bit addresses are in use, PA[51:48] forms the upper part of the address value. Otherwise, when 52-bit addresses are not in use, PA[51:48] is RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when [SCR_EL3.EEL2](#) is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address.

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

0b0 Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When PAR_EL1.F == 1:

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:12]

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

0b0 Translation aborted because of a fault in the stage 1 translation.

0b1 Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort ESR encoding.

0b000000 Address size fault, level 0 of translation or translation table base register.

0b000001 Address size fault, level 1.

0b000010 Address size fault, level 2.

0b000011 Address size fault, level 3.

0b000100 Translation fault, level 0.

0b000101 Translation fault, level 1.

0b000110 Translation fault, level 2.

0b000111 Translation fault, level 3.

0b001001 Access flag fault, level 1.

0b001010 Access flag fault, level 2.

0b001011 Access flag fault, level 3.

0b001000 *When FEAT_LPA2 is implemented:*
Access flag fault, level 0.

0b001100 *When FEAT_LPA2 is implemented:*
Permission fault, level 0.

0b001101 Permission fault, level 1.

0b001110 Permission fault, level 2.

0b001111 Permission fault, level 3.

0b010011 *When FEAT_LPA2 is implemented:*

	Synchronous External abort on translation table walk or hardware update of translation table, level -1.
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.
0b011011	<i>When FEAT_LPA2 is implemented and FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.
0b011100	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.
0b011101	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.
0b011110	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.
0b011111	<i>When FEAT_RAS is not implemented:</i> Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.
0b101001	<i>When FEAT_LPA2 is implemented:</i> Address size fault, level -1.
0b101011	<i>When FEAT_LPA2 is implemented:</i> Translation fault, level -1.
0b110000	TLB conflict abort.
0b110001	<i>When FEAT_HAFDBS is implemented:</i> Unsupported atomic hardware update fault.
0b111101	<i>When EL1 is capable of using AArch32:</i> Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.
0b111110	<i>When EL1 is capable of using AArch32:</i> Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

0b1 Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

D13.2.104 REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configurations

AArch64 System register REVIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register REVIDR[31:0].

If REVIDR_EL1 has the same value as MIDR_EL1, then its contents have no significance.

Attributes

REVIDR_EL1 is a 64-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing REVIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

D13.2.105 RGSR_EL1, Random Allocation Tag Seed Register.

The RGSR_EL1 characteristics are:

Purpose

Random Allocation Tag Seed Register.

Configurations

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to RGSR_EL1 are UNDEFINED.

When [GCR_EL1.RRND](#)==0b1, updates to RGSR_EL1 are implementation-specific.

Attributes

RGSR_EL1 is a 64-bit register.

Field descriptions

Bits [63:24]

Reserved, RES0.

SEED, bits [23:8]

Seed register used for generating values returned by RandomAllocationTag().

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

TAG, bits [3:0]

Tag generated by the most recent IRG instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RGSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

D13.2.106 RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

Purpose

When this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configurations

AArch64 System register RMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when the highest implemented Exception level is EL1.

This register is present only when the highest implemented Exception level is EL1. Otherwise, direct accesses to RMR_EL1 are UNDEFINED.

When EL1 is the highest implemented Exception level:

- If EL1 can use all Execution states then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

RMR_EL1 is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

AA64, bit [0]

When EL1 is capable of using AArch32:

AA64

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

- 0b0 AArch32.
- 0b1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL1 can only use AArch64 state, this bit is RAO/WI.

The reset behavior of this field is:

- When implemented as a RW field, this field resets to 1 on a Cold reset.

Otherwise:

Reserved, RAO/WI.

Accessing RMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RMR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && IsHighestEL(EL1) then
    return RMR_EL1;
else
    UNDEFINED;
```

MSR RMR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && IsHighestEL(EL1) then
    RMR_EL1 = X[t];
else
    UNDEFINED;
```

D13.2.107 RMR_EL2, Reset Management Register (EL2)

The RMR_EL2 characteristics are:

Purpose

When this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configurations

AArch64 System register RMR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HRMR[31:0] when the highest implemented Exception level is EL2.

This register is present only when the highest implemented Exception level is EL2. Otherwise, direct accesses to RMR_EL2 are UNDEFINED.

When EL2 is the highest implemented Exception level:

- If EL2 can use all Execution states then this register must be implemented.
- If EL2 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

RMR_EL2 is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

AA64, bit [0]

When EL2 is capable of using AArch32:

AA64

When EL2 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

- 0b0 AArch32.
- 0b1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 can only use AArch64 state, this bit is RAO/WI.

The reset behavior of this field is:

- When implemented as a RW field, this field resets to 1 on a Cold reset.

Otherwise:

Reserved, RAO/WI.

Accessing RMR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RMR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
elseif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    return RMR_EL2;
else
    UNDEFINED;
```

MSR RMR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
elseif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    RMR_EL2 = X[t];
else
    UNDEFINED;
```

D13.2.108 RMR_EL3, Reset Management Register (EL3)

The RMR_EL3 characteristics are:

Purpose

If EL3 is implemented and this register is implemented:

- A write to the register at EL3 can request a Warm reset.
- If EL3 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configurations

AArch64 System register RMR_EL3 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when EL3 is implemented.

This register is present only when EL3 is implemented. Otherwise, direct accesses to RMR_EL3 are UNDEFINED.

When EL3 is implemented:

- If EL3 can use all Execution states then this register must be implemented.
- If EL3 cannot use AArch32, then it is IMPLEMENTATION DEFINED whether the register is implemented.

Otherwise, direct accesses to RMR_EL3 are UNDEFINED.

Attributes

RMR_EL3 is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

AA64, bit [0]

When EL3 is capable of using AArch32:

AA64

When EL3 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

0b0 AArch32.

0b1 AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL3 can only use AArch64 state, this bit is RAO/WI.

The reset behavior of this field is:

- When implemented as a RW field, this field resets to 1 on a Cold reset.

Otherwise:

Reserved, RAO/WI.

Accessing RMR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RMR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b0000	0b010

```
if PSTATE.EL == EL3 && IsHighestEL(EL3) then
    return RMR_EL3;
else
    UNDEFINED;
```

MSR RMR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b0000	0b010

```
if PSTATE.EL == EL3 && IsHighestEL(EL3) then
    RMR_EL3 = X[t];
else
    UNDEFINED;
```

D13.2.109 RNDR, Random Number

The RNDR characteristics are:

Purpose

Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

Configurations

This register is present only when FEAT_RNG is implemented. Otherwise, direct accesses to RNDR are UNDEFINED.

Attributes

RNDR is a 64-bit register.

Field descriptions

RNDR, bits [63:0]

Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RNDR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RNDR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0010	0b0100	0b000

```

if PSTATE.EL == EL0 then
    if !IsFeatureImplemented(FEAT_RNG) then
        UNDEFINED;
    else
        return RNDR;
elseif PSTATE.EL == EL1 then
    if !IsFeatureImplemented(FEAT_RNG) then
        UNDEFINED;
    else
        return RNDR;
elseif PSTATE.EL == EL2 then
    if !IsFeatureImplemented(FEAT_RNG) then
        UNDEFINED;

```

```
    else
        return RNR;
elseif PSTATE.EL == EL3 then
    if !IsFeatureImplemented(FEAT_RNG) then
        UNDEFINED;
    else
        return RNR;
```

D13.2.110 RNDRRS, Reseeded Random Number

The RNDRRS characteristics are:

Purpose

Reseeded Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source immediately before the read of the random number.

If the hardware returns a genuine random number, PSTATE.NZCV is set to `0b0000`.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to `0b0100` and the data value returned is 0.

Configurations

This register is present only when FEAT_RNG is implemented. Otherwise, direct accesses to RNDRRS are UNDEFINED.

Attributes

RNDRRS is a 64-bit register.

Field descriptions

RNDRRS, bits [63:0]

Reseeded Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source immediately before this read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RNDRRS

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RNDRRS

op0	op1	CRn	CRm	op2
0b11	0b011	0b0010	0b0100	0b001

```

if PSTATE.EL == EL0 then
    if !IsFeatureImplemented(FEAT_RNG) then
        UNDEFINED;
    else
        return RNDRRS;
elseif PSTATE.EL == EL1 then
    if !IsFeatureImplemented(FEAT_RNG) then
        UNDEFINED;
    else
        return RNDRRS;
elseif PSTATE.EL == EL2 then
    if !IsFeatureImplemented(FEAT_RNG) then
        UNDEFINED;

```

```
    else
        return RNDRRS;
    elsif PSTATE.EL == EL3 then
        if !IsFeatureImplemented(FEAT_RNG) then
            UNDEFINED;
        else
            return RNDRRS;
```

D13.2.111 RVBAR_EL1, Reset Vector Base Address Register (if EL2 and EL3 not implemented)

The RVBAR_EL1 characteristics are:

Purpose

If EL1 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configurations

This register is present only when the highest implemented Exception level is EL1. Otherwise, direct accesses to RVBAR_EL1 are UNDEFINED.

Attributes

RVBAR_EL1 is a 64-bit register.

Field descriptions

ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing RVBAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RVBAR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0000	0b001

```

if PSTATE.EL == EL1 && IsHighestEL(EL1) then
    return RVBAR_EL1;
else
    UNDEFINED;

```

D13.2.112 RVBAR_EL2, Reset Vector Base Address Register (if EL3 not implemented)

The RVBAR_EL2 characteristics are:

Purpose

If EL2 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configurations

This register is present only when the highest implemented Exception level is EL2. Otherwise, direct accesses to RVBAR_EL2 are UNDEFINED.

Attributes

RVBAR_EL2 is a 64-bit register.

Field descriptions

ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing RVBAR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RVBAR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b0000	0b001

```

if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
elseif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    return RVBAR_EL2;
else
    UNDEFINED;

```

D13.2.113 RVBAR_EL3, Reset Vector Base Address Register (if EL3 implemented)

The RVBAR_EL3 characteristics are:

Purpose

If EL3 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configurations

This register is present only when EL3 is implemented. Otherwise, direct accesses to RVBAR_EL3 are UNDEFINED.

Only implemented if the highest Exception level implemented is EL3.

Attributes

RVBAR_EL3 is a 64-bit register.

Field descriptions

ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing RVBAR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RVBAR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b0000	0b001

```
if PSTATE.EL == EL3 && IsHighestEL(EL3) then
    return RVBAR_EL3;
else
    UNDEFINED;
```

D13.2.114 S3_<op1>_<Cn>_<Cm>_<op2>, IMPLEMENTATION DEFINED registers

The S3_<op1>_<Cn>_<Cm>_<op2> characteristics are:

Purpose

This area of the instruction set space is reserved for IMPLEMENTATION DEFINED registers.

Configurations

There are no configuration notes.

Attributes

S3_<op1>_<Cn>_<Cm>_<op2> is a 64-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing S3_<op1>_<Cn>_<Cm>_<op2>

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, S3_<op1>_C<Cn>_C<Cm>_<op2>

op0	op1	CRn	CRm	op2
0b11	op1[2:0]	0b1x11	Cm[3:0]	op2[2:0]

```

if PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TIDCP == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        IMPLEMENTATION_DEFINED "S3";
else
    IMPLEMENTATION_DEFINED "S3";

```

MSR S3_<op1>_C<Cn>_C<Cm>_<op2>, <Xt>

op0	op1	CRn	CRm	op2
0b11	op1[2:0]	0b1x11	Cm[3:0]	op2[2:0]

```

if PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TIDCP == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        IMPLEMENTATION_DEFINED "S3";

```

```
else  
    IMPLEMENTATION_DEFINED "S3";
```

D13.2.115 SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is either Secure or Non-secure.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

Configurations

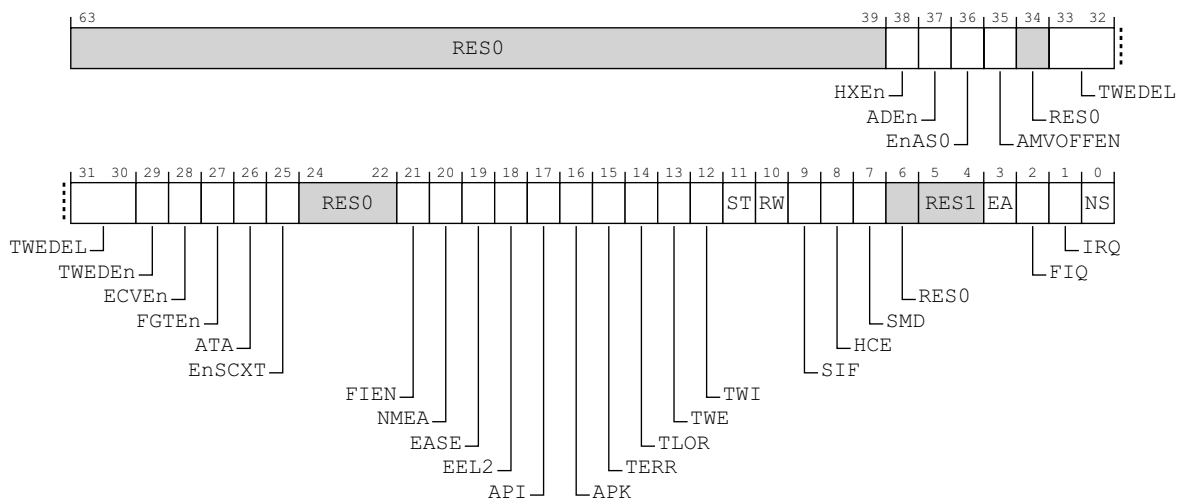

AArch64 System register SCR_EL3 bits [31:0] can be mapped to AArch32 System register SCR[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

Attributes

SCR_EL3 is a 64-bit register.

Field descriptions

Bits [63:39]

Reserved, RES0.

HXEn, bit [38]

When FEAT_HCX is implemented:

HXEn

Enables access to the [HCRX_EL2](#) register at EL2 from EL3.

0b0 Accesses at EL2 to [HCRX_EL2](#) are trapped to EL3. Indirect reads of [HCRX_EL2](#) return 0.

0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ADEn, bit [37]

When FEAT_LS64 is implemented:

ADEn

Enables access to the [ACCDATA_EL1](#) register at EL1 and EL2.

0b0 Accesses to [ACCDATA_EL1](#) at EL1 and EL2 are trapped to EL3, unless the accesses are trapped to EL2 by the EL2 fine-grained trap.

0b1 This control does not cause accesses to [ACCDATA_EL1](#) to be trapped.

If the [HFGWTR_EL2.nACCDATA_EL1](#) or [HFGRTR_EL2.nACCDATA_EL1](#) traps are enabled, they take priority over this trap.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [36]

When FEAT_LS64 is implemented:

EnAS0

Traps execution of an ST64BV0 instruction at EL0, EL1, or EL2 to EL3.

0b0 EL0 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL1 by [SCTLR_EL1.EnAS0](#), or to EL2 by either [HCRX_EL2.EnAS0](#) or [SCTLR_EL2.EnAS0](#).

EL1 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL2 by [HCRX_EL2.EnAS0](#).

EL2 execution of an ST64BV0 instruction is trapped to EL3.

0b1 This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an [ESR_ELx.EC](#) value of 0x0A, with an ISS code of 0x000001.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [35]

When FEAT_AMUv1p1 is implemented:

AMVOFFEN

Activity Monitors Virtual Offsets Enable.

0b0 Accesses to [AMEVCNTVOFF0<n>_EL2](#) and [AMEVCNTVOFF1<n>_EL2](#) at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.

0b1 Accesses to [AMEVCNTVOFF0<n>_EL2](#) and [AMEVCNTVOFF1<n>_EL2](#) are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

TWEDEL, bits [33:30]

When FEAT_TWED is implemented:

TWEDEL

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCR_EL3.TWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [29]

When FEAT_TWED is implemented:

TWEDEn

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCR_EL3.TWE.

Traps are reported using an ESR_ELx.EC value of 0x01.

0b0 The delay for taking the trap is IMPLEMENTATION DEFINED.

0b1 The delay for taking the trap is at least the number of cycles defined in SCR_EL3.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECVEn, bit [28]

When FEAT_ECV is implemented:

ECVEn

ECV Enable. Enables access to the [CNTPOFF_EL2](#) register.

0b0 EL2 accesses to [CNTPOFF_EL2](#) are trapped to EL3, and the value of [CNTPOFF_EL2](#) is treated as 0 for all purposes other than direct reads or writes to the register from EL3.

0b1 EL2 accesses to [CNTPOFF_EL2](#) are not trapped to EL3 by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTE_n, bit [27]

When FEAT_FGT is implemented:

FGTE_n

Fine-Grained Traps Enable. When EL2 is implemented, enables the traps to EL2 controlled by [HAFGRTR_EL2](#), [HDFGRTR_EL2](#), [HDFGWTR_EL2](#), [HFGTRTR_EL2](#), [HFGITR_EL2](#), and [HFGWTR_EL2](#), and controls access to those registers.

———— **Note** —————

If EL2 is not implemented but EL3 is implemented, [FEAT_FGT](#) implements the [MDCR_EL3](#).TDCC traps.

- | | |
|-----|--|
| 0b0 | EL2 accesses to HAFGRTR_EL2 , HDFGRTR_EL2 , HDFGWTR_EL2 , HFGTRTR_EL2 , HFGITR_EL2 and HFGWTR_EL2 registers are trapped to EL3, and the traps to EL2 controlled by those registers are disabled. |
| 0b1 | EL2 accesses to HAFGRTR_EL2 , HDFGRTR_EL2 , HDFGWTR_EL2 , HFGTRTR_EL2 , HFGITR_EL2 and HFGWTR_EL2 registers are not trapped to EL3 by this mechanism. |

Traps caused by accesses to the fine-grained trap registers are reported using an ESR_EL_x.EC value of 0x18 and its associated ISS.

Otherwise:

Reserved, RES0.

ATA, bit [26]

When FEAT_MTE2 is implemented:

ATA

Allocation Tag Access. Controls access at EL2, EL1 and EL0 to Allocation Tags.

- | | |
|-----|--|
| 0b0 | Access to Allocation Tags is prevented. Accesses at EL1 and EL2 to GCR_EL1 , RGSRR_EL1 , TFSR_EL1 , TFSR_EL2 or TFSRE0_EL1 that are not UNDEFINED or trapped to a lower Exception level are trapped to EL3. Accesses at EL2 to TFSR_EL1 that are not UNDEFINED are trapped to EL3. |
| 0b1 | This control does not prevent access to Allocation Tags. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [25]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

EnSCXT

Enable access to the [SCXTNUM_EL2](#), [SCXTNUM_EL1](#), and [SCXTNUM_EL0](#) registers.

- | | |
|-----|---|
| 0b0 | Accesses at EL0, EL1 and EL2 to SCXTNUM_EL0 , SCXTNUM_EL1 , or SCXTNUM_EL2 registers are trapped to EL3 if they are not trapped by a higher priority exception, and the values of these registers are treated as 0. |
| 0b1 | This control does not cause any accesses to be trapped, or register values to be treated as 0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:22]

Reserved, RES0.

FIEN, bit [21]

When FEAT_RASv1p1 is implemented:

FIEN

Fault Injection enable. Trap accesses to the registers [ERXPFPCDN_EL1](#), [ERXPFPCCTL_EL1](#), and [ERXPFPCF_EL1](#) from EL1 and EL2 to EL3, reported using an [ESR_ELx.EC](#) value of 0x18.

0b0 Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.

0b1 This control does not cause any instructions to be trapped.

If EL3 is not implemented, the Effective value of [SCR_EL3.FIEN](#) is 0b1.

If [ERRIDR_EL1.NUM](#) is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [20]

When FEAT_DoubleFault is implemented:

NMEA

Non-maskable External Aborts. When [SCR_EL3.EA](#) == 1, controls whether [PSTATE.A](#) masks SError interrupts at EL3.

0b0 If [SCR_EL3.EA](#) == 1, asserted SError interrupts are not taken at EL3 if [PSTATE.A](#) == 1.

0b1 If [SCR_EL3.EA](#) == 1, asserted SError interrupts are taken at EL3 regardless of the value of [PSTATE.A](#).

When [SCR_EL3.EA](#) == 0:

- Asserted SError interrupts are not taken at EL3 regardless of the value of [PSTATE.A](#) and this field.
- This field is ignored and its Effective value is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EASE, bit [19]

When FEAT_DoubleFault is implemented:

EASE

External aborts to SError interrupt vector.

0b0 Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from [VBAR_EL3](#).

0b1 Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from [VBAR_EL3](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EEL2, bit [18]

When FEAT_SEL2 is implemented:

EEL2

Secure EL2 Enable.

0b0 All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by [FEAT_SEL2](#) are UNDEFINED, and those timers are disabled.

0b1 All behaviors associated with Secure EL2 are enabled.

When the value of this bit is 1, then:

- When $SCR_EL3.NS == 0$, the $SCR_EL3.RW$ bit is treated as 1 for all purposes other than reading or writing the register.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of [ESR_EL2.EC == 0x3](#) :
 - A read or write of the [SCR](#).
 - A read or write of the [NSACR](#).
 - A read or write of the [MVBAR](#).
 - A read or write of the [SDCR](#).
 - Execution of an [ATS12NSO**](#) instruction.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of [ESR_EL2.EC == 0x0](#) :
 - Execution of an SRS instruction that uses [R13_mon](#).
 - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access [SPSR_mon](#), [R13_mon](#), or [R14_mon](#).

————— Note —————

If the Effective value of $SCR_EL3.EEL2$ is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

A Secure only implementation that does not implement EL3 but implements EL2, behaves as if $SCR_EL3.EEL2 == 1$.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [17]

When FEAT_SEL2 is implemented and FEAT_PAuth is implemented:

API

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using an ESR_ELx.EC value of 0x09:

- PACGA, which is always enabled.
 - AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
 - In EL0, when `HCR_EL2.TGE == 0` or `HCR_EL2.E2H == 0`, and the associated `SCTLR_EL1.En<N><M> == 1`.
 - In EL0, when `HCR_EL2.TGE == 1` and `HCR_EL2.E2H == 1`, and the associated `SCTLR_EL2.En<N><M> == 1`.
 - In EL1, when the associated `SCTLR_EL1.En<N><M> == 1`.
 - In EL2, when the associated `SCTLR_EL2.En<N><M> == 1`.
- 0b0 The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the `HCR_EL2.API` bit.
- 0b1 This control does not cause any instructions to be trapped.

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see *System register control of pointer authentication on page D5-2681*.

———— **Note** —————

If `FEAT_PAuth` is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SEL2 is not implemented and FEAT_PAuth is implemented:

API

Controls the use of instructions related to Pointer Authentication:

- PACGA.
 - AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZ, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
 - In Non-secure EL0, when `HCR_EL2.TGE == 0` or `HCR_EL2.E2H == 0`, and the associated `SCTLR_EL1.En<N><M> == 1`.
 - In Non-secure EL0, when `HCR_EL2.TGE == 1` and `HCR_EL2.E2H == 1`, and the associated `SCTLR_EL2.En<N><M> == 1`.
 - In Secure EL0, when the associated `SCTLR_EL1.En<N><M> == 1`.
 - In Secure or Non-secure EL1, when the associated `SCTLR_EL1.En<N><M> == 1`.
 - In EL2, when the associated `SCTLR_EL2.En<N><M> == 1`.
- 0b0 The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the `HCR_EL2.API` bit.
- 0b1 This control does not cause any instructions to be trapped.

———— **Note** —————

If `FEAT_PAuth` is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [16]

When FEAT_PAuth is implemented:

APK

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using an ESR_ELx.EC value of 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps:

- [APIAKeyLo_EL1](#), [APIAKeyHi_EL1](#), [APIBKeyLo_EL1](#), [APIBKeyHi_EL1](#).
- [APDAKeyLo_EL1](#), [APDAKeyHi_EL1](#), [APDBKeyLo_EL1](#), [APDBKeyHi_EL1](#).
- [APGAKeyLo_EL1](#), and [APGAKeyHi_EL1](#).

0b0 Access to the registers holding "key" values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the [HCR_EL2.APK](#) bit or other traps.

0b1 This control does not cause any instructions to be trapped.

For more information, see [System register control of pointer authentication on page D5-2681](#).

Note

If [FEAT_PAuth](#) is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [15]

When FEAT_RAS is implemented:

TERR

Trap Error record accesses. Accesses to the RAS ERR* and RAS ERX* registers from EL1 and EL2 to EL3 are trapped as follows:

- Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
 - [ERRIDR_EL1](#), [ERRSELR_EL1](#), [ERXADDR_EL1](#), [ERXCTLR_EL1](#), [ERXFR_EL1](#), [ERXMISC0_EL1](#), [ERXMISC1_EL1](#), and [ERXSTATUS_EL1](#).
- If [FEAT_RASv1p1](#) is implemented, accesses from EL1 and EL2 using AArch64 to [ERXMISC2_EL1](#), and [ERXMISC3_EL1](#), are trapped and reported using an ESR_ELx.EC value of 0x18.
- Accesses from EL1 and EL2 using AArch32, to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
 - [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).
- If [FEAT_RASv1p1](#) is implemented, accesses from EL1 and EL2 using AArch32 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
 - [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

0b0 This control does not cause any instructions to be trapped.

0b1 Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]

When FEAT_LOR is implemented:

TLOR

Trap LOR registers. Traps accesses to the [LORSA_EL1](#), [LOREA_EL1](#), [LORN_EL1](#), [LORC_EL1](#), and [LORID_EL1](#) registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

0b0 This control does not cause any instructions to be trapped.

0b1 EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped [HCR_EL2.TLOR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from both Security states and both Execution states, reported using an [ESR_ELx.EC](#) value of 0x01.

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, this trap also applies to the WFET instruction.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by [SCTLR.nTWE](#), [HCR.TWE](#), [SCTLR_EL1.nTWE](#), [SCTLR_EL2.nTWE](#), or [HCR_EL2.TWE](#).

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

————— Note —————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see [Wait for Event mechanism and Send event on page D1-2536](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [12]

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from both Security states and both Execution states, reported using an [ESR_ELx.EC](#) value of 0x01.

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, this trap also applies to the WFIT instruction.

0b0 This control does not cause any instructions to be trapped.

0b1 Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by [SCTLR.nTWI](#), [HCR.TWI](#), [SCTLR_EL1.nTWI](#), [SCTLR_EL2.nTWI](#), or [HCR_EL2.TWI](#).

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

———— **Note** ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see [Wait For Interrupt](#) on page D1-2540.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using an [ESR_ELx.EC](#) value of 0x18.

0b0 Secure EL1 using AArch64 accesses to the [CNTPS_TVAL_EL1](#), [CNTPS_CTL_EL1](#), and [CNTPS_CVAL_EL1](#) are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.

0b1 This control does not cause any instructions to be trapped.

———— **Note** ————

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [10]

When EL1 is capable of using AArch32 or EL2 is capable of using AArch32:

RW

Execution state control for lower Exception levels.

0b0 Lower levels are all AArch32.

0b1 The next lower level is AArch64.

If EL2 is present:

- EL2 is AArch64.
- EL2 controls EL1 and EL0 behaviors.

If EL2 is not present:

- EL1 is AArch64.
- EL0 is determined by the Execution state described in the current process state when executing at EL0.

If AArch32 state is supported by the implementation at EL1, [SCR_EL3.NS](#) == 1 and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, [FEAT_SEL2](#) is implemented and [SCR_EL3.{EEL2, NS}](#) == {1, 0}, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

SIF, bit [9]

When FEAT_SEL2 is implemented:

SIF

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from memory marked in the first stage of translation as being Non-secure. The possible values for this bit are:

- 0b0 Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are permitted.
- 0b1 Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are not permitted.

When [FEAT_PAN3](#) is implemented, it is IMPLEMENTATION DEFINED whether SCR_EL3.SIF is also used to determine instruction access permission for the purpose of PAN.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

SIF

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

- 0b0 Secure state instruction fetches from Non-secure memory are permitted.
- 0b1 Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using an ESR_ELx.EC value of 0x00.

- 0b0 HVC instructions are UNDEFINED.
- 0b1 HVC instructions are enabled at EL3, EL2, and EL1.

———— **Note** —————

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from both Security states and both Execution states, reported using an ESR_ELx.EC value of 0x00.

- 0b0 SMC instructions are enabled at EL3, EL2 and EL1.

0b1 SMC instructions are UNDEFINED.

———— **Note** ————

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If [HCR_EL2.TSC](#) or [HCR.TSC](#) traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

EA, bit [3]

External Abort and SError interrupt routing.

0b0 When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3.

In addition, when executing at EL3:

- SError interrupts are not taken.
- External aborts are taken to EL3.

0b1 When executing at any Exception level, External aborts and SError interrupts are taken to EL3.

For more information, see [Asynchronous exception routing on page D1-2501](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQ, bit [2]

Physical FIQ Routing.

0b0 When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3.

When executing at EL3, physical FIQ interrupts are not taken.

0b1 When executing at any Exception level, physical FIQ interrupts are taken to EL3.

For more information, see [Asynchronous exception routing on page D1-2501](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRQ, bit [1]

Physical IRQ Routing.

0b0 When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3.

When executing at EL3, physical IRQ interrupts are not taken.

0b1 When executing at any Exception level, physical IRQ interrupts are taken to EL3.

For more information, see [Asynchronous exception routing on page D1-2501](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [0]

Non-secure bit.

0b0 Indicates that EL0 and EL1 are in Secure state.

0b1 Indicates that Exception levels lower than EL3 are in Non-secure state, so memory accesses from those Exception levels cannot access Secure memory.

When SCR_EL3.{EEL2, NS} == {1, 0}, then EL2 is using AArch64 and in Secure state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SCR_EL3;
```

MSR SCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCR_EL3 = X[t];
```

D13.2.116 SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

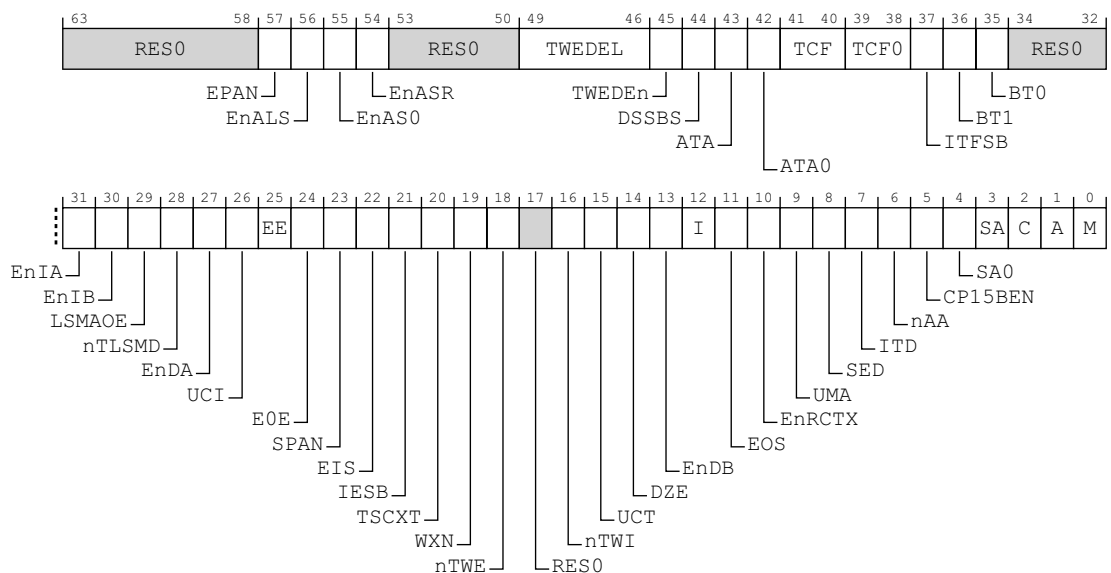

Configurations

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SCTLR[31:0].

Attributes

SCTLR_EL1 is a 64-bit register.

Field descriptions

Bits [63:58]

Reserved, RES0.

EPAN, bit [57]

When FEAT_PAN3 is implemented:

EPAN

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL1 data access to a page with stage 1 EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

0b0 No additional Permission faults are generated by this mechanism.

0b1 An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault.

Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]

When FEAT_LS64 is implemented:

EnALS

When **HCR_EL2**.{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 to EL1.

0b0 Execution of an LD64B or ST64B instruction at EL0 is trapped to EL1.

0b1 This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]

When FEAT_LS64 is implemented:

EnAS0

When **HCR_EL2**.{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 to EL1.

0b0 Execution of an ST64BV0 instruction at EL0 is trapped to EL1.

0b1 This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]

When FEAT_LS64 is implemented:

EnASR

When **HCR_EL2**.{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 to EL1.

0b0 Execution of an ST64BV instruction at EL0 is trapped to EL1.

0b1 This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [53:50]

Reserved, RES0.

TWEDEL, bits [49:46]

When FEAT_TWED is implemented:

TWEDEL

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCTLR_EL1.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]

When FEAT_TWED is implemented:

TWEDEn

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCTLR_EL1.nTWE.

0b0 The delay for taking the trap is IMPLEMENTATION DEFINED.

0b1 The delay for taking the trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:

DSSBS

Default PSTATE.SSBS value on Exception Entry.

0b0 PSTATE.SSBS is set to 0 on an exception to EL1.

0b1 PSTATE.SSBS is set to 1 on an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

ATA

Allocation Tag Access in EL1. When [SCR_EL3.ATA=1](#) and [HCR_EL2.ATA=1](#), controls EL1 access to Allocation Tags.

0b0 Access to Allocation Tags is prevented.

0b1 This control does not prevent access to Allocation Tags.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented:

ATA0

Allocation Tag Access in EL0. When [SCR_EL3.ATA=1](#), [HCR_EL2.ATA=1](#), and [HCR_EL2.{E2H, TGE} != {1, 1}](#), controls EL0 access to Allocation Tags.

0b0 Access to Allocation Tags is prevented.

0b1 This control does not prevent access to Allocation Tags.

———— **Note** —————

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

TCF

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

0b00 Tag Check Faults have no effect on the PE.

0b01 Tag Check Faults cause a synchronous exception.

0b10 Tag Check Faults are asynchronously accumulated.

0b11 *When FEAT_MTE3 is implemented:*

Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]

When FEAT_MTE2 is implemented:

TCF0

Tag Check Fault in EL0. When [HCR_EL2](#).{E2H,TGE} != {1,1}, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

———— **Note** —————

Software may change this control bit on a context switch.

0b00 Tag Check Faults have no effect on the PE.

0b01 Tag Check Faults cause a synchronous exception.

0b10 Tag Check Faults are asynchronously accumulated.

0b11 *When FEAT_MTE3 is implemented:*

Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE2 is implemented:

ITFSB

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL1, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#) and [TFSR_EL1](#) registers.

0b0 Tag Check Faults are not synchronized on entry to EL1.

0b1 Tag Check Faults are synchronized on entry to EL1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT1, bit [36]

When FEAT_BTI is implemented:

BT1

PAC Branch Type compatibility at EL1.

0b0 When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.

0b1 When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]

When FEAT_BTI is implemented:

BT0

PAC Branch Type compatibility at EL0.

0b0 When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.

0b1 When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

When the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, the value of SCTLR_EL1.BT0 has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [34:32]

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

EnIA

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see [System register control of pointer authentication on page D5-2681](#).

0b0 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.

0b1 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAuth is implemented:

EnIB

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see [System register control of pointer authentication on page D5-2681](#).

- | | |
|-----|---|
| 0b0 | Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled. |
| 0b1 | Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled. |

———— **Note** —————

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When FEAT_LSMAOC is implemented:

LSMAOE

Load Multiple and Store Multiple Atomicity and Ordering Enable.

- | | |
|-----|---|
| 0b0 | For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered. |
| 0b1 | The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0. |

This bit is permitted to be cached in a TLB.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When FEAT_LSMAOC is implemented:

nTLSMD

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

0b0 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.

0b1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

EnDA

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see [System register control of pointer authentication on page D5-2681](#).

0b0 Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.

0b1 Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

This applies to [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), and [IC IVAU](#).

If [FEAT_DPB2](#) is implemented, this trap also applies to [DC CVADP](#).

If [FEAT_MTE](#) is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#), and [DC CGDVAP](#).

If [FEAT_DPB2](#) and [FEAT_MTE](#) are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

0b0 Execution of the specified instructions at EL0 using AArch64 is trapped.

0b1 This control does not cause any instructions to be trapped.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

0b0 Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.

0b1 Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.

The possible values of this bit are:

0b0 Explicit data accesses at EL0 are little-endian.

0b1 Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when **SCTLR_EL1.EE** is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when **SCTLR_EL1.EE** is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

When FEAT_PAN is implemented:

SPAN

Set Privileged Access Never, on taking an exception to EL1.

0b0 PSTATE.PAN is set to 1 on taking an exception to EL1.

0b1 The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

EIS

Exception Entry is Context Synchronizing.

0b0 The taking of an exception to EL1 is not a context synchronizing event.

0b1 The taking of an exception to EL1 is a context synchronizing event.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EIS is set to 0b0:

- Indirect writes to [ESR_EL1](#), [FAR_EL1](#), [SPSR_EL1](#), [ELR_EL1](#) are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EIS:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When FEAT_IESB is implemented:

IESB

Implicit Error Synchronization event enable. Possible values are:

0b0 Disabled.

0b1 An implicit error synchronization event is added:

- At each exception taken to EL1.
- Before the operational pseudocode of each ERET instruction executed at EL1.

When the PE is in Debug state, the effect of this field is **CONSTRAINED UNPREDICTABLE**, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

TSCXT

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

0b0 EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.

0b1 EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.

The value of SCXTNUM_EL0 is treated as 0.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

0b0 This control has no effect on memory access permissions.

0b1 Any region that is writable in the EL1&0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.

This bit applies only when SCTLRL_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from both Execution states, reported using an [ESR_ELx.EC](#) value of 0x01.

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, this trap also applies to the WFET instruction.

0b0 Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

———— Note ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from both Execution states, reported using an [ESR_ELx.EC](#) value of 0x01.

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, this trap also applies to the WFIT instruction.

0b0 Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

———— Note ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Traps EL0 accesses to the [CTR_EL0](#) to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from AArch64 state only, reported using an [ESR_ELx.EC](#) value of 0x18.

0b0 Accesses to the [CTR_EL0](#) from EL0 using AArch64 are trapped.

0b1 This control does not cause any instructions to be trapped.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Traps EL0 execution of [DC ZVA](#) instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from AArch64 state only, reported using an [ESR_ELx.EC](#) value of 0x18.

If [FEAT_MTE](#) is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

0b0 Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped.

Reading [DCZID_EL0.DZP](#) from EL0 returns 1, indicating that the instructions this trap applies to are not supported.

0b1 This control does not cause any instructions to be trapped.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

When FEAT_PAuth is implemented:

EnDB

Controls enabling of pointer authentication (using the [APDBKey_EL1](#) key) of instruction addresses in the EL1&0 translation regime.

For more information, see *System register control of pointer authentication on page D5-2681*.

0b0 Pointer authentication (using the [APDBKey_EL1](#) key) of data addresses is not enabled.

0b1 Pointer authentication (using the [APDBKey_EL1](#) key) of data addresses is enabled.

————— **Note** —————

This field controls the behavior of the [AddPACDB](#) and [AuthDB](#) pseudocode functions. Specifically, when the field is 1, [AddPACDB](#) returns a copy of a pointer to which a pointer authentication code has been added, and [AuthDB](#) returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Stage 1 instruction access Cacheability control, for accesses at EL0 and EL1:

0b0 All instruction access to Stage 1 Normal memory from EL0 and EL1 are Stage 1 Non-cacheable.

If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1 This control has no effect on the Stage 1 Cacheability of instruction access to Stage 1 Normal memory from EL0 and EL1.

If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the HCR_EL2.DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.I bit.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

EOS

Exception Exit is Context Synchronizing.

0b0 An exception return from EL1 is not a context synchronizing event

0b1 An exception return from EL1 is a context synchronizing event

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL1 and ELR_EL1 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented:

EnRCTX

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

0b0 EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1.

0b1 EL0 access to these instructions is enabled.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE. {D, A, I, F} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from AArch64 state only, reported using an [ESR_ELx.EC](#) value of 0x18.

0b0 Any attempt at EL0 using AArch64 to execute an MRS, MSR(register), or MSR(immediate) instruction that accesses the [DAIF](#) is trapped.

0b1 This control does not cause any instructions to be trapped.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SED, bit [8]

When EL0 is capable of using AArch32:

SED

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

0b0 SETEND instruction execution is enabled at EL0 using AArch32.

0b1 SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, reported using an [ESR_ELx.EC](#) value of 0x00.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

ITD, bit [7]

When EL0 is capable of using AArch32:

ITD

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

0b0 All IT instruction functionality is enabled at EL0 using AArch32.

0b1 Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using an ESR_ELx.EC value of 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1:

- All encodings of the IT instruction with hw1[3:0]≠1000.
- All encodings of the subsequent instruction with the following values for hw1:
 - 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
 - 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.
 - 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm
 - 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm]
 - 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
 - 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see [Changes to an ITD control by an instruction in an IT block on page E1-4258](#).

ITD is optional, but if it is implemented in the SCTLR_EL1 then it must also be implemented in the SCTLR_EL2, HSCTLR, and SCTLR.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is RAZ/WI.

Otherwise:

Reserved, RES1.

nAA, bit [6]

When FEAT_LSE2 is implemented:

nAA

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

0b0 LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.

0b1 This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When EL0 is capable of using AArch32:

CP15BEN

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

0b0 EL0 using AArch32: EL0 execution of the **CP15DMB**, **CP15DSB**, and **CP15ISB** instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and **HCR_EL2**.TGE is 1. The exception is reported using an **ESR_ELx**.EC value of 0x00.

0b1 EL0 using AArch32: EL0 execution of the **CP15DMB**, **CP15DSB**, and **CP15ISB** instructions is enabled.

CP15BEN is optional, but if it is implemented in the **SCTLR_EL1** then it must also be implemented in the **SCTLR_EL2**, **HSCTLR**, and **SCTLR**.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is RAO/WI.

Otherwise:

Reserved, RES0.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see *SP alignment checking on page D1-2469*.

When **FEAT_VHE** is implemented, and the value of **HCR_EL2**.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-2469](#).

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Stage 1 Cacheability control, for data accesses.

0b0 All data access to Stage 1 Normal memory from EL0 and EL1, and all Normal memory accesses from unified cache to the EL1&0 Stage 1 translation tables, are treated as Stage 1 Non-cacheable.

0b1 This control has no effect on the Stage 1 Cacheability of:

- Data access to Normal memory from EL0 and EL1.
- Normal memory accesses to the EL1&0 Stage 1 translation tables.

When the value of the [HCR_EL2](#).DC bit is 1, the PE ignores SCTLR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

0b0 Alignment fault checking disabled when executing at EL1 or EL0.

Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1 Alignment fault checking enabled when executing at EL1 or EL0.

All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL1&0 stage 1 address translation.

0b0 EL1&0 stage 1 address translation disabled.

See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.

0b1 EL1&0 stage 1 address translation enabled.

If the value of [HCR_EL2](#).{DC, TGE} is not {0, 0} then in Non-secure state the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.

When `FEAT_VHE` is implemented, and the value of `HCR_EL2.{E2H, TGE}` is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

Accessing SCTLR_EL1

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL3 using the mnemonic `SCTLR_EL1` or `SCTLR_EL12` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```

```

D13.2.117 SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL2.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, these controls apply also to execution at EL0.

Configurations

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSCTLR](#)[31:0].

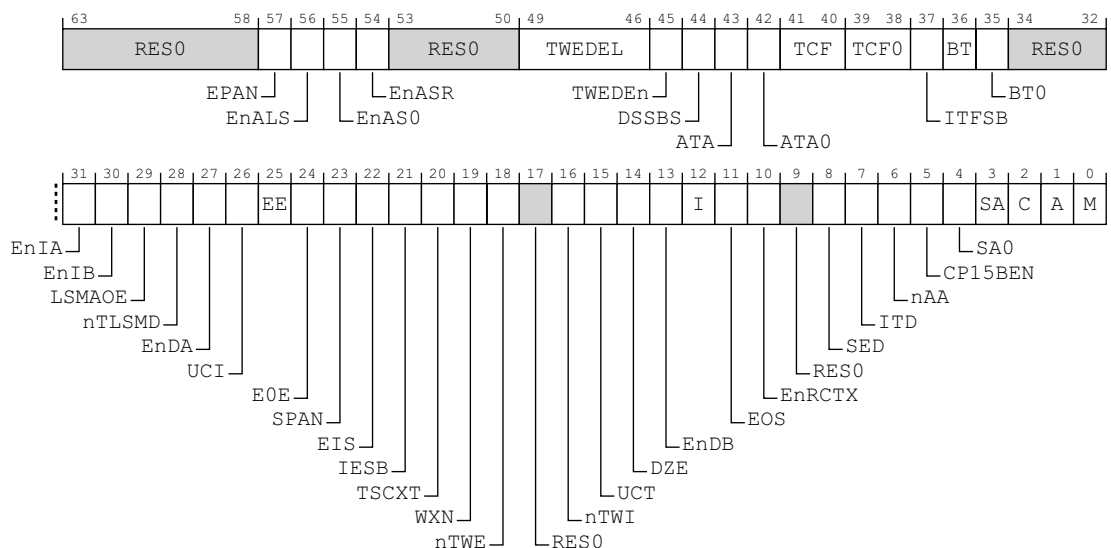

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR_EL2 is a 64-bit register.

Field descriptions

Bits [63:58]

Reserved, RES0.

EPAN, bit [57]

When FEAT_PAN3 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

EPAN

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL2 data access to a page with EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

0b0 No additional Permission faults are generated by this mechanism.

0b1 An EL2 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault.

Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]

When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

EnALS

Traps execution of an LD64B or ST64B instruction at EL0 to EL2.

0b0 Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2.

0b1 This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x000002.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]

When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

EnAS0

Traps execution of an ST64BV0 instruction at EL0 to EL2.

0b0 Execution of an ST64BV0 instruction at EL0 is trapped to EL2.

0b1 This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x000001.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]

When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

EnASR

Traps execution of an ST64BV instruction at EL0 to EL2.

0b0 Execution of an ST64BV instruction at EL0 is trapped to EL2.

0b1 This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x000000.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [53:50]

Reserved, RES0.

TWEDEL, bits [49:46]

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

TWEDEL

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

TWEDEn

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL2.nTWE.

0b0 The delay for taking a WFE trap is IMPLEMENTATION DEFINED.

0b1 The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:

DSSBS

Default PSTATE.SSBS value on Exception Entry.

0b0 PSTATE.SSBS is set to 0 on an exception to EL2.

0b1 PSTATE.SSBS is set to 1 on an exception to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

ATA

Allocation Tag Access in EL2. When [SCR_EL3.ATA](#) is 1, controls EL2 access to Allocation Tags.

0b0 Access to Allocation Tags is prevented.

0b1 This control does not prevent access to Allocation Tags.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

ATA0

Allocation Tag Access in EL0. When [SCR_EL3.ATA](#) is 1, controls EL0 access to Allocation Tags.

0b0 Access to Allocation Tags is prevented.

0b1 This control does not prevent access to Allocation Tags.

———— **Note** —————

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

TCF

Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

0b00 Tag Check Faults have no effect on the PE.

0b01 Tag Check Faults cause a synchronous exception.

0b10 Tag Check Faults are asynchronously accumulated.

0b11 *When FEAT_MTE3 is implemented:*

Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

TCF0

Tag Check Fault in EL0. Controls the effect of Tag Check Faults due to Loads and Stores in EL0.

0b00 Tag Check Faults have no effect on the PE.

0b01 Tag Check Faults cause a synchronous exception.

0b10 Tag Check Faults are asynchronously accumulated.

0b11 *When FEAT_MTE3 is implemented:*

Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

———— **Note** ————

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE2 is implemented:

ITFSB

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL2, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#), [TFSR_EL1](#) and [TFSR_EL2](#) registers.

0b0 Tag Check Faults are not synchronized on entry to EL2.

0b1 Tag Check Faults are synchronized on entry to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]

When FEAT_BTI is implemented:

BT

PAC Branch Type compatibility at EL2.

When [HCR_EL2](#).{E2H, TGE} == {1, 1}, this bit is named BT1.

0b0 When the PE is executing at EL2, PACIASP and PACIBSP are compatible with [PSTATE.BTYPE](#) == 0b11.

0b1 When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with [PSTATE.BTYPE](#) == 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]

When FEAT_BTI is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

BT0

PAC Branch Type compatibility at EL0.

0b0 When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.

0b1 When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [34:32]

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

EnIA

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see [System register control of pointer authentication on page D5-2681](#).

0b0 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.

0b1 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

————— Note —————

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAAuth is implemented:

EnIB

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see [System register control of pointer authentication on page D5-2681](#).

- | | |
|-----|---|
| 0b0 | Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled. |
| 0b1 | Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled. |

———— **Note** —————

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

LSMAOE

Load Multiple and Store Multiple Atomicity and Ordering Enable.

- | | |
|-----|---|
| 0b0 | For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered. |
| 0b1 | The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

nTLSMD

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

- | | |
|-----|--|
| 0b0 | All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault. |
|-----|--|

0b1 All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

EnDA

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see [System register control of pointer authentication on page D5-2681](#).

0b0 Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.

0b1 Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

———— **Note** —————

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

UCI

Traps execution of cache maintenance instructions at EL0 to EL2, from AArch64 state only. This applies to [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), and [IC IVAU](#).

If [FEAT_DPB2](#) is implemented, this trap also applies to [DC CVADP](#).

If [FEAT_MTE](#) is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#), and [DC CGDVAP](#).

If [FEAT_DPB2](#) and [FEAT_MTE](#) are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

0b0 Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.

0b1 This control does not cause any instructions to be trapped.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

- 0b0 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian.
- 0b1 Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

When $HCR_EL2.E2H == 1$ and $HCR_EL2.TGE == 1$:

E0E

Endianness of data accesses at EL0.

- 0b0 Explicit data accesses at EL0 are little-endian.
- 0b1 Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPAN, bit [23]

When $HCR_EL2.E2H == 1$ and $HCR_EL2.TGE == 1$:

SPAN

Set Privileged Access Never, on taking an exception to EL2.

0b0 PSTATE.PAN is set to 1 on taking an exception to EL2.

0b1 The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]

When $FEAT_ExS$ is implemented:

EIS

Exception entry is a context synchronization event.

0b0 The taking of an exception to EL2 is not a context synchronization event.

0b1 The taking of an exception to EL2 is a context synchronization event.

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to [ESR_EL2](#), [FAR_EL2](#), [SPSR_EL2](#), [ELR_EL2](#), and [HPFAR_EL2](#) are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When $FEAT_IESB$ is implemented:

IESB

Implicit Error Synchronization event enable.

0b0 Disabled.

0b1 An implicit error synchronization event is added:

- At each exception taken to EL2.
- Before the operational pseudocode of each ERET instruction executed at EL2.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented), HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

TSCXT

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

- 0b0 EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
- 0b1 EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated as 0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_CSV2_2 is not implemented, FEAT_CSV2_1p2 is not implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

Otherwise:

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

- 0b0 This control has no effect on memory access permissions.
- 0b1 Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

nTWE

Traps execution of WFE instructions at EL0 to EL2, from both Execution states.

- 0b0 Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
- 0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

———— **Note** ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

When $HCR_EL2.E2H == 1$ and $HCR_EL2.TGE == 1$:

nTWI

Traps execution of WFI instructions at EL0 to EL2, from both Execution states.

0b0 Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.

0b1 This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

———— **Note** ————

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

UCT, bit [15]

When $HCR_EL2.E2H == 1$ and $HCR_EL2.TGE == 1$:

UCT

Traps EL0 accesses to the [CTR_EL0](#) to EL2, from AArch64 state only.

0b0 Accesses to the [CTR_EL0](#) from EL0 using AArch64 are trapped to EL2.

0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DZE, bit [14]

When $HCR_EL2.E2H == 1$ and $HCR_EL2.TGE == 1$:

DZE

Traps execution of **DC ZVA** instructions at EL0 to EL2, from AArch64 state only.

If **FEAT_MTE** is implemented, this trap also applies to **DC GVA** and **DC GZVA**.

0b0 Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading **DCZID_EL0.DZP** from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.

0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDB, bit [13]

When $FEAT_PAuth$ is implemented:

EnDB

Controls enabling of pointer authentication (using the **APDBKey_EL1** key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see *System register control of pointer authentication on page D5-2681*.

0b0 Pointer authentication (using the **APDBKey_EL1** key) of data addresses is not enabled.

0b1 Pointer authentication (using the **APDBKey_EL1** key) of data addresses is enabled.

———— **Note** —————

This field controls the behavior of the **AddPACDB** and **AuthDB** pseudocode functions. Specifically, when the field is 1, **AddPACDB** returns a copy of a pointer to which a pointer authentication code has been added, and **AuthDB** returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and, when EL2 is enabled in the current Security state and $HCR_EL2.\{E2H,TGE\} == \{1,1\}$, EL0.

0b0 All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache.

When EL2 is enabled in the current Security state and $HCR_EL2.\{E2H,TGE\} == \{1,1\}$, all instruction accesses to Normal memory from EL0 are Non-cacheable for all levels of instruction and unified cache.

If SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1 This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, instruction access to Normal memory from EL0.

If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or [HCR_EL2](#).{E2H,TGE} != {1,1}, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

EOS

Exception exit is a context synchronization event.

0b0 An exception return from EL2 is not a context synchronization event.

0b1 An exception return from EL2 is a context synchronization event.

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL2](#) and [ELR_EL2](#) on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

EnRCTX

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

0b0 EL0 access to these instructions is disabled, and these instructions are trapped to EL1.

0b1 EL0 access to these instructions is enabled.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

SED

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

0b0 SETEND instruction execution is enabled at EL0 using AArch32.

0b1 SETEND instructions are UNDEFINED at EL0 using AArch32.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

Otherwise:

Reserved, RES0.

ITD, bit [7]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

ITD

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

0b0 All IT instruction functionality is enabled at EL0 using AArch32.

0b1 Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:

- All encodings of the IT instruction with hw1[3:0] != 1000.
- All encodings of the subsequent instruction with the following values for hw1:
 - 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
 - 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5.
 - 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm
 - 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm]
 - 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
 - 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.

It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

- A 16-bit instruction, that can only be followed by another 16-bit instruction.
- The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.

An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see [Changes to an ITD control by an instruction in an IT block on page E1-4258](#).

ITD is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the SCTLR_EL1, HSCTLR, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is RAZ/WI.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

Otherwise:

Reserved, RES0.

nAA, bit [6]

When FEAT_LSE2 is implemented:

nAA

Non-aligned access. This bit controls generation of Alignment faults under certain conditions at EL2, and, when EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}, EL0.

0b0 LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.

0b1 This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

CP15BEN

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

- 0b0 EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
- 0b1 EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the SCTLR_EL1, HSCTLR, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is RAO/WI.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES0.

Otherwise:

Reserved, RES1.

SA0, bit [4]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

SA0

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-2469](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-2469](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Data access Cacheability control, for accesses at EL2 and, when EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}, EL0

0b0 The following are Non-cacheable for all levels of data and unified cache:

- Data accesses to Normal memory from EL2.
- When HCR_EL2.{E2H, TGE} != {1, 1}, Normal memory accesses to the EL2 translation tables.
- When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}:
 - Data accesses to Normal memory from EL0.

- Normal memory accesses to the EL2&0 translation tables.
- 0b1 This control has no effect on the Cacheability of:
- Data access to Normal memory from EL2.
 - When `HCR_EL2.{E2H, TGE} != {1, 1}`, Normal memory accesses to the EL2 translation tables.
 - When EL2 is enabled in the current Security state and `HCR_EL2.{E2H, TGE} == {1, 1}`:
 - Data accesses to Normal memory from EL0.
 - Normal memory accesses to the EL2&0 translation tables.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or `HCR_EL2.{E2H, TGE} != {1, 1}`, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and, when EL2 is enabled in the current Security state and `HCR_EL2.{E2H, TGE} == {1, 1}`, EL0.

- 0b0 Alignment fault checking disabled when executing at EL2.
When EL2 is enabled in the current Security state and `HCR_EL2.{E2H, TGE} == {1, 1}`, alignment fault checking disabled when executing at EL0.
Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
- 0b1 Alignment fault checking enabled when executing at EL2.
When EL2 is enabled in the current Security state and `HCR_EL2.{E2H, TGE} == {1, 1}`, alignment fault checking enabled when executing at EL0.
All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 or EL2&0 stage 1 address translation.

- 0b0 When `HCR_EL2.{E2H, TGE} != {1, 1}`, EL2 stage 1 address translation disabled.
When `HCR_EL2.{E2H, TGE} == {1, 1}`, EL2&0 stage 1 address translation disabled.
See the `SCTLR_EL2.I` field for the behavior of instruction accesses to Normal memory.
- 0b1 When `HCR_EL2.{E2H, TGE} != {1, 1}`, EL2 stage 1 address translation enabled.
When `HCR_EL2.{E2H, TGE} == {1, 1}`, EL2&0 stage 1 address translation enabled.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing SCTLR_EL2

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL2 using the mnemonic `SCTLR_EL2` or `SCTLR_EL1` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    return SCTLR_EL2;
elseif PSTATE.EL == EL3 then
    return SCTLR_EL2;

```

MSR SCTLR_EL2, <Xt>

D13.2.118 SCTLR_EL3, System Control Register (EL3)

The SCTLR_EL3 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL3.

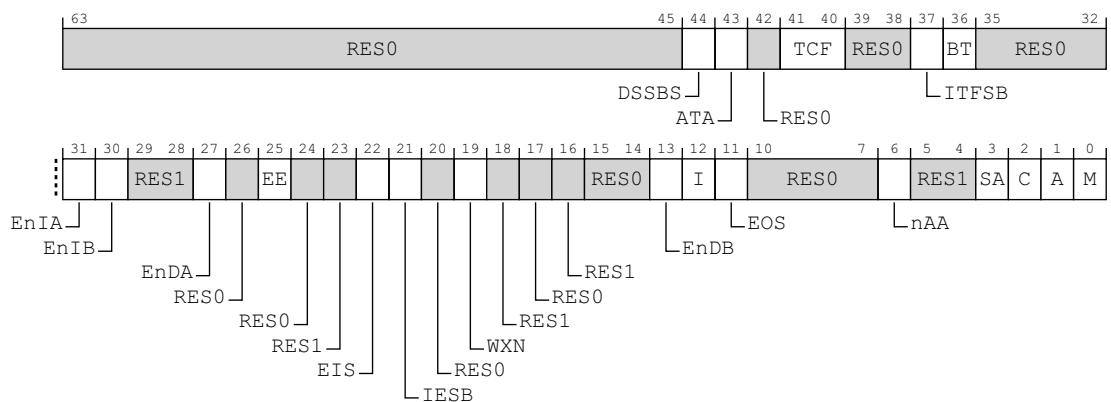

Configurations

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCTLR_EL3 are UNDEFINED.

Attributes

SCTLR_EL3 is a 64-bit register.

Field descriptions

Bits [63:45]

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:

DSSBS

Default PSTATE.SSBS value on Exception Entry.

0b0 PSTATE.SSBS is set to 0 on an exception to EL3.

0b1 PSTATE.SSBS is set to 1 on an exception to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

ATA

Allocation Tag Access in EL3. Controls EL3 access to Allocation Tags.

0b0 Access to Allocation Tags is prevented.

0b1 This control does not prevent access to Allocation Tags.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

TCF

Tag Check Fault in EL3. Controls the effect of Tag Check Faults due to Loads and Stores in EL3.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

0b00 Tag Check Faults have no effect on the PE.

0b01 Tag Check Faults cause a synchronous exception.

0b10 Tag Check Faults are asynchronously accumulated.

0b11 *When FEAT_MTE3 is implemented:*

Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE2 is implemented:

ITFSB

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL3, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#) and [TFSR_ELx](#) registers.

0b0 Tag Check Faults are not synchronized on entry to EL3.

0b1 Tag Check Faults are synchronized on entry to EL3.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]

When FEAT_BTI is implemented:

BT

PAC Branch Type compatibility at EL3.

0b0 When the PE is executing at EL3, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.

0b1 When the PE is executing at EL3, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

EnIA

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

0b0 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.

0b1 Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

For more information, see [System register control of pointer authentication on page D5-2681](#).

———— **Note** —————

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAuth is implemented:

EnIB

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

- 0b0 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
- 0b1 Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

For more information, see [System register control of pointer authentication on page D5-2681](#).

———— **Note** ————

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

—————
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

EnDA

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.

- 0b0 Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
- 0b1 Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

For more information, see [System register control of pointer authentication on page D5-2681](#).

———— **Note** ————

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

—————
The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

- | | |
|-----|---|
| 0b0 | Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian. |
| 0b1 | Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian. |

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bit [23]

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

EIS

Exception Entry is Context Synchronizing.

- | | |
|-----|---|
| 0b0 | The taking of an exception to EL3 is not a context synchronizing event. |
| 0b1 | The taking of an exception to EL3 is a context synchronizing event. |

If SCTLR_EL3.EIS is set to 0b0:

- Indirect writes to [ESR_EL3](#), [FAR_EL3](#), [SPSR_EL3](#), [ELR_EL3](#) are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Debug state exit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When FEAT_IESB is implemented:

IESB

Implicit Error Synchronization event enable.

0b0 Disabled.

0b1 An implicit error synchronization event is added:

- At each exception taken to EL3.
- Before the operational pseudocode of each ERET instruction executed at EL3.

When the PE is in Debug state, the effect of this field is **CONSTRAINED UNPREDICTABLE**, and its Effective value might be 0 or 1 regardless of the value of the field and, if implemented, [SCR_EL3.NMEA](#). If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

When [FEAT_DoubleFault](#) is implemented, the PE is in Non-debug state, and the Effective value of [SCR_EL3.NMEA](#) is 1, this field is ignored and its Effective value is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

0b0 This control has no effect on memory access permissions.

0b1 Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.

This bit applies only when [SCTLR_EL3.M](#) bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally **UNKNOWN** value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]

When FEAT_PAuth is implemented:

EnDB

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.

0b0 Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.

0b1 Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

For more information, see *System register control of pointer authentication on page D5-2681*.

———— **Note** —————

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

0b0 All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache.

If the value of SCTL3_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.

0b1 This control has no effect on the Cacheability of instruction access to Normal memory from EL3.

If the value of SCTL3_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

EOS

Exception Exit is Context Synchronizing.

0b0 An exception return from EL3 is not a context synchronizing event

0b1 An exception return from EL3 is a context synchronizing event

If SCTL3_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL3](#) and [ELR_EL3](#) on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]

When FEAT_LSE2 is implemented:

nAA

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

0b0 LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.

0b1 This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see [SP alignment checking on page D1-2469](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

0b0 All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.

0b1 This control has no effect on the Cacheability of:

- Data access to Normal memory from EL3.
- Normal memory accesses to the EL3 translation tables.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

0b0 Alignment fault checking disabled when executing at EL3.

Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.

0b1 Alignment fault checking enabled when executing at EL3.

All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

0b0 EL3 stage 1 address translation disabled.

See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.

0b1 EL3 stage 1 address translation enabled.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Accessing SCTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    UNDEFINED;
elseif PSTATE.EL == EL2 then

```
if PSTATE.EL == EL0 then  
    UNDEFINED;  
elseif PSTATE.EL == EL1 then  
    UNDEFINED;  
elseif PSTATE.EL == EL2 then  
    UNDEFINED;  
elseif PSTATE.EL == EL3 then  
    SCTLR_EL3 = X[t];
```

D13.2.119 SCXTNUM_EL0, EL0 Read/Write Software Context Number

The SCXTNUM_EL0 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL0 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configurations

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL0 are UNDEFINED.

Attributes

SCXTNUM_EL0 is a 64-bit register.

Field descriptions

Bits [63:0]

Software Context Number. A number to identify the context within the EL0 exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCXTNUM_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCXTNUM_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0000	0b111

```

D13.2.120 SCXTNUM_EL1, EL1 Read/Write Software Context Number

The SCXTNUM_EL1 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL1 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configurations

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL1 are UNDEFINED.

Attributes

SCXTNUM_EL1 is a 64-bit register.

Field descriptions

Bits [63:0]

Software Context Number. A number to identify the context within the EL1 exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCXTNUM_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCXTNUM_EL1

D13.2.121 SCXTNUM_EL2, EL2 Read/Write Software Context Number

The SCXTNUM_EL2 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL2 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configurations

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SCXTNUM_EL2 is a 64-bit register.

Field descriptions

Bits [63:0]

Software Context Number. A number to identify the context within the EL2 exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCXTNUM_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCXTNUM_EL2 or SCXTNUM_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCXTNUM_EL2

op0	op1	CRn	CRm	op2

    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCXTNUM_EL3 = X[t];
```

D13.2.123 TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

Configurations

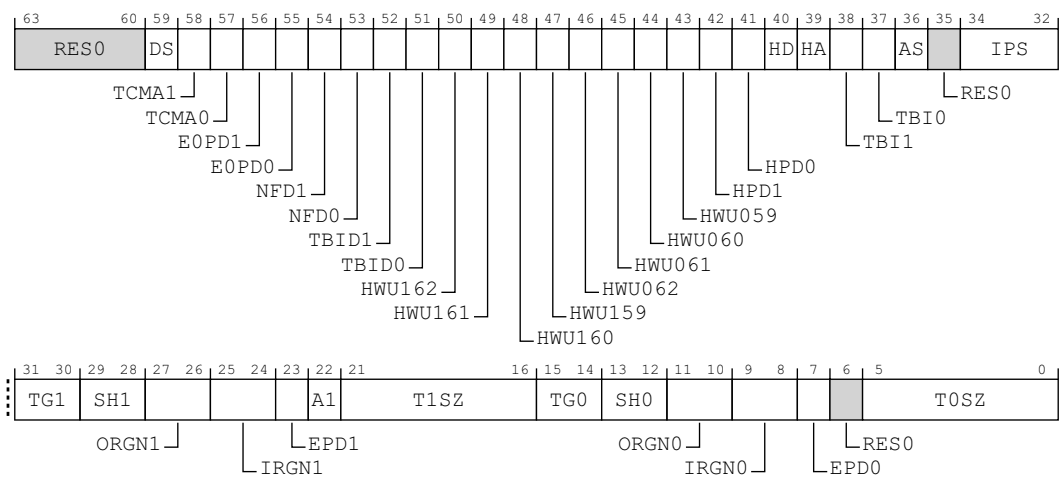

AArch64 System register TCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [TTBCR](#)[31:0].

AArch64 System register TCR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [TTBCR2](#)[31:0].

Attributes

TCR_EL1 is a 64-bit register.

Field descriptions

Any of the bits in TCR_EL1, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:60]

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

DS

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL1&0 translation regime.

- 0b0 Bits[49:48] of translation descriptors are RES0.
Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.
The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.
Output address[51:48] is 0b0000.
- 0b1 Bits[49:48] of translation descriptors hold output address[49:48].
Bits[9:8] of translation table descriptors hold output address[51:50].

The shareability information of block and page descriptors for cacheable locations is determined by:

- TCR_EL1.SH0 if the VA is translated using tables pointed to by [TTBR0_EL1](#).
- TCR_EL1.SH1 if the VA is translated using tables pointed to by [TTBR1_EL1](#).

The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.

Bits[5:2] of [TTBR0_EL1](#) or [TTBR1_EL1](#) are used to hold bits[51:48] of the output address in all cases.

———— **Note** —————

As [FEAT_LVA](#) must be implemented if TCR_EL1.DS == 1, the minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

———— **Note** —————

This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

TCMA1

Controls the generation of Unchecked accesses at EL1, and at EL0 if [HCR_EL2](#).{E2H,TGE} != {1,1}, when address[59:55] = 0b11111.

0b0 This control has no effect on the generation of Unchecked accesses at EL1 or EL0.

0b1 All accesses at EL1 and EL0 are Unchecked.

———— **Note** —————

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

TCMA0

Controls the generation of Unchecked accesses at EL1, and at EL0 if [HCR_EL2](#). {E2H,TGE}!={1,1}, when address[59:55] = 0b00000.

0b0 This control has no effect on the generation of Unchecked accesses at EL1 or EL0.

0b1 All accesses at EL1 and EL0 are Unchecked.

———— **Note** ————

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD1, bit [56]

When FEAT_EOPD is implemented:

EOPD1

Faulting control for Unprivileged access to any address translated by [TTBR1_EL1](#).

0b0 Unprivileged access to any address translated by [TTBR1_EL1](#) will not generate a fault by this mechanism.

0b1 Unprivileged access to any address translated by [TTBR1_EL1](#) will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD0, bit [55]

When FEAT_EOPD is implemented:

EOPD0

Faulting control for Unprivileged access to any address translated by [TTBR0_EL1](#).

0b0 Unprivileged access to any address translated by [TTBR0_EL1](#) will not generate a fault by this mechanism.

0b1 Unprivileged access to any address translated by [TTBR0_EL1](#) will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]

When FEAT_SVE is implemented:

NFD1

Non-fault translation table walk disable for stage 1 translations using [TTBR1_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR1_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see [FEAT_SVE](#).

0b0 Does not disable stage 1 translation table walks using [TTBR1_EL1](#).

0b1 A TLB miss on a virtual address that is translated using [TTBR1_EL1](#) due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When FEAT_SVE is implemented:

NFD0

Non-fault translation table walk disable for stage 1 translations using [TTBR0_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR0_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see [FEAT_SVE](#).

0b0 Does not disable stage 1 translation table walks using [TTBR0_EL1](#).

0b1 A TLB miss on a virtual address that is translated using [TTBR0_EL1](#) due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

TBID1

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see [Address tagging in AArch64 state on page D5-2676](#).

0b0 TCR_EL1.TBI1 applies to Instruction and Data accesses.

0b1 TCR_EL1.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR1_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

TBID0

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see [Address tagging in AArch64 state on page D5-2676](#).

0b0 TCR_EL1.TBI0 applies to Instruction and Data accesses.

0b1 TCR_EL1.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

HWU162

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

0b0 For translations using [TTBR1_EL1](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR1_EL1](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

HWU161

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using `TTBR1_EL1`.

- 0b0 For translations using `TTBR1_EL1`, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using `TTBR1_EL1`, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of `TCR_EL1.HPD1` is 1.

The Effective value of this field is 0 if the value of `TCR_EL1.HPD1` is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU160, bit [48]

When FEAT_HPDS2 is implemented:

HWU160

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using `TTBR1_EL1`.

- 0b0 For translations using `TTBR1_EL1`, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using `TTBR1_EL1`, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of `TCR_EL1.HPD1` is 1.

The Effective value of this field is 0 if the value of `TCR_EL1.HPD1` is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU159, bit [47]

When FEAT_HPDS2 is implemented:

HWU159

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using `TTBR1_EL1`.

- 0b0 For translations using `TTBR1_EL1`, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using `TTBR1_EL1`, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of `TCR_EL1.HPD1` is 1.

The Effective value of this field is 0 if the value of `TCR_EL1.HPD1` is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU062, bit [46]

When FEAT_HPDS2 is implemented:

HWU062

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

HWU061

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU060, bit [44]

When FEAT_HPDS2 is implemented:

HWU060

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

HWU059

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD1, bit [42]

When FEAT_HPDS is implemented:

HPD1

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1_EL1](#).

- 0b0 Hierarchical permissions are enabled.
- 0b1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When FEAT_HPDS is implemented:

HPD0

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL1](#).

- 0b0 Hierarchical permissions are enabled.
- 0b1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

HD

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

0b0 Stage 1 hardware management of dirty state disabled.

0b1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

HA

Hardware Access flag update in stage 1 translations from EL0 and EL1.

0b0 Stage 1 Access flag update disabled.

0b1 Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the [TTBR1_EL1](#) region, or ignored and used for tagged addresses.

0b0 Top Byte used in the address calculation.

0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR1_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If [FEAT_PAAuth](#) is implemented and [TCR_EL1.TBID1](#) is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBIO, bit [37]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL1](#) region, or ignored and used for tagged addresses.

0b0 Top Byte used in the address calculation.

0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If [FEAT_PAuth](#) is implemented and `TCR_EL1.TBID0` is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBIO is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

0b0 8 bit - the upper 8 bits of [TTBR0_EL1](#) and [TTBR1_EL1](#) are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.

0b1 16 bit - the upper 16 bits of [TTBR0_EL1](#) and [TTBR1_EL1](#) are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

0b000 32 bits, 4GB.

0b001 36 bits, 64GB.

0b010 40 bits, 1TB.

0b011 42 bits, 4TB.

0b100 44 bits, 16TB.

0b101 48 bits, 256TB.

0b110 52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and [FEAT_LPA2](#) is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the TTBR1_EL1.

0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1_EL1.

0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1_EL1](#). The encoding of this bit is:

- | | |
|-----|--|
| 0b0 | Perform translation table walks using TTBR1_EL1 . |
| 0b1 | A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether [TTBR0_EL1](#) or [TTBR1_EL1](#) defines the ASID. The encoding of this bit is:

- | | |
|-----|---|
| 0b0 | TTBR0_EL1 .ASID defines the ASID. |
| 0b1 | TTBR1_EL1 .ASID defines the ASID. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1_EL1](#). The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

———— Note —————

For the 4KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL1](#).

- | | |
|------|------|
| 0b00 | 4KB |
| 0b01 | 64KB |
| 0b10 | 16KB |

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0_EL1](#). The encoding of this bit is:

0b0	Perform translation table walks using TTBR0_EL1 .
0b1	A TLB miss on an address that is translated using TTBR0_EL1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL1](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

———— Note —————

For the 4KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TCR_EL1 or TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x120];
    else
        return TCR_EL1;
elseif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return TCR_EL2;
    else
        return TCR_EL1;
elseif PSTATE.EL == EL3 then
    return TCR_EL1;

```

MSR TCR_EL1, <Xt>

D13.2.124 TCR_EL2, Translation Control Register (EL2)

The TCR_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of `HCR_EL2.E2H` is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using `TTBR0_EL2`.
- When the value of `HCR_EL2.E2H` is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
 - A lower VA range, translated using `TTBR0_EL2`.
 - A higher VA range, translated using `TTBR1_EL2`.

Configurations

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register `HTCR`[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

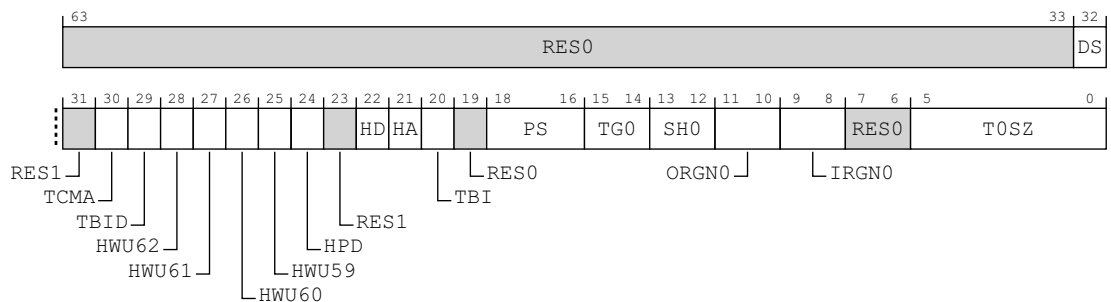

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TCR_EL2 is a 64-bit register.

Field descriptions

When `HCR_EL2.E2H == 0`:

Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:33]

Reserved, RES0.

DS, bit [32]

When `FEAT_LPA2` is implemented:

DS

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2 translation regime.

0b0 Bits[49:48] of translation descriptors are RES0.

Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.

The minimum value of TCR_EL2.TOSZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

Output address[51:48] is 0b0000.

0b1 Bits[49:48] of translation descriptors hold output address[49:48].
Bits[9:8] of translation table descriptors hold output address[51:50].
The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL2.SH0.
The minimum value of TCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.
All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.
Bits[5:2] of **TTBR0_EL2** are used to hold bits[51:48] of the output address in all cases.

———— **Note** —————

As **FEAT_LVA** must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.T0SZ field is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.

———— **Note** —————

This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

TCMA

Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.

0b0 This control has no effect on the generation of Unchecked accesses.

0b1 All accesses are Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When FEAT_PAuth is implemented:

TBID

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see [Address tagging in AArch64 state on page D5-2676](#).

0b0 TCR_EL2.TBI applies to Instruction and Data accesses.

0b1 TCR_EL2.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL2](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

HWU62

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

0b0 Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

HWU61

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

0b0 Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

HWU60

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

0b0 Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

HWU59

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

0b0 Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD, bit [24]

When FEAT_HPDS is implemented:

HPD

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL2](#).

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled.

Note

In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When FEAT_HAFDBS is implemented:

HD

Hardware management of dirty state in stage 1 translations from EL2.

0b0 Stage 1 hardware management of dirty state disabled.

0b1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When FEAT_HAFDBS is implemented:

HA

Hardware Access flag update in stage 1 translations from EL2.

0b0 Stage 1 Access flag update disabled.

0b1 Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL2](#) region, or ignored and used for tagged addresses.

For more information, see [Address tagging in AArch64 state on page D5-2676](#).

0b0 Top Byte used in the address calculation.

0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If [FEAT_PAuth](#) is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and [FEAT_LPA2](#) is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement [FEAT_LPA](#) supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL2](#).

0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

————— Note —————

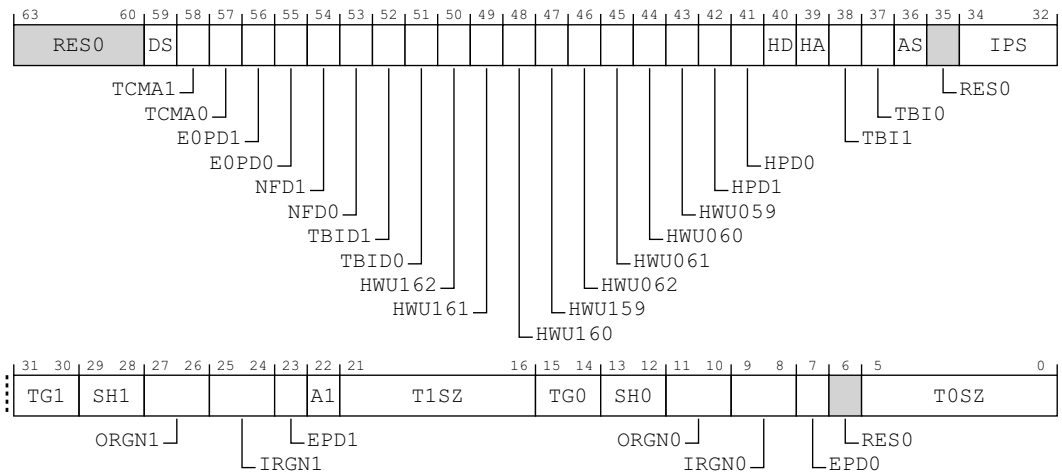

For the 4KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

This view of the register is only valid from Armv8.1 when `HCR_EL2.E2H` is 1.

Any of the bits in `TCR_EL2` are permitted to be cached in a TLB.

Bits [63:60]

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

DS

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2&0 translation regime.

0b0 Bits[49:48] of translation descriptors are RES0.
Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.
The minimum value of the `TCR_EL2.{T0SZ, T1SZ}` fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.
Output address[51:48] is 0b0000.

0b1 Bits[49:48] of translation descriptors hold output address[49:48].
Bits[9:8] of translation table descriptors hold output address[51:50].
The shareability information of block and page descriptors for cacheable locations is determined by:

- `TCR_EL2.SH0` if the VA is an address that is translated using tables pointed to by `TTBR0_EL2`.
- `TCR_EL2.SH1` if the VA is an address that is translated using tables pointed to by `TTBR1_EL2`.

The minimum value of the `TCR_EL2.{T0SZ, T1SZ}` fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

All calculations of the stage 1 base address are modified for tables of fewer than 16 entries so that the table is aligned to 64 bytes.

Bits[5:2] of `TTBR0_EL2` or `TTBR1_EL2` are used to hold bits[51:48] of the output address in all cases.

———— **Note** —————

As **FEAT_LVA** must be implemented if $\text{TCR_EL2.DS} == 1$, the minimum value of the $\text{TCR_EL2}\{T0SZ, T1SZ\}$ fields is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold $\text{BaseADDR}[52:16]$. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as $0b0000$. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as $0b00$.

———— **Note** —————

This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

TCMA1

Controls the generation of Unchecked accesses at EL2, and at EL0 if $\text{HCR_EL2.TGE}=1$, when $\text{address}[59:55] = 0b11111$.

$0b0$ This control has no effect on the generation of Unchecked accesses at EL2 or EL0.

$0b1$ All accesses are Unchecked.

———— **Note** —————

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

TCMA0

Controls the generation of Unchecked accesses at EL2, and at EL0 if $\text{HCR_EL2.TGE}=1$, when $\text{address}[59:55] = 0b00000$.

$0b0$ This control has no effect on the generation of Unchecked accesses at EL2 or EL0.

$0b1$ All accesses are Unchecked.

———— **Note** —————

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]

When FEAT_E0PD is implemented:

E0PD1

Faulting control for Unprivileged access to any address translated by [TTBR1_EL2](#).

0b0 Unprivileged access to any address translated by [TTBR1_EL2](#) will not generate a fault by this mechanism.

0b1 Unprivileged access to any address translated by [TTBR1_EL2](#) will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]

When FEAT_E0PD is implemented:

E0PD0

Faulting control for Unprivileged access to any address translated by [TTBR0_EL2](#).

0b0 Unprivileged access to any address translated by [TTBR0_EL2](#) will not generate a fault by this mechanism.

0b1 Unprivileged access to any address translated by [TTBR0_EL2](#) will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]

When FEAT_SVE is implemented:

NFD1

Non-fault translation table walk disable for stage 1 translations using [TTBR1_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR1_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see [FEAT_SVE](#).

- 0b0 Does not disable stage 1 translation table walks using [TTBR1_EL2](#).
- 0b1 A TLB miss on a virtual address that is translated using [TTBR1_EL2](#) due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]

When FEAT_SVE is implemented:

NFD0

Non-fault translation table walk disable for stage 1 translations using [TTBR0_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR0_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see [FEAT_SVE](#).

- 0b0 Does not disable stage 1 translation table walks using [TTBR0_EL2](#).
- 0b1 A TLB miss on a virtual address that is translated using [TTBR0_EL2](#) due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

TBID1

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see [Address tagging in AArch64 state on page D5-2676](#).

- 0b0 TCR_EL2.TB11 applies to Instruction and Data accesses.
- 0b1 TCR_EL2.TB11 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR1_EL2](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

TBID0

Controls the use of the top byte of instruction addresses for address matching.

For more information, see [Address tagging in AArch64 state on page D5-2676](#).

0b0 TCR_EL2.TBI0 applies to Instruction and Data accesses.

0b1 TCR_EL2.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL2](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

HWU162

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

0b0 For translations using [TTBR1_EL2](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR1_EL2](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

HWU161

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

0b0 For translations using [TTBR1_EL2](#), bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR1_EL2](#), bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU160, bit [48]

When FEAT_HPDS2 is implemented:

HWU160

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

- 0b0 For translations using [TTBR1_EL2](#), bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR1_EL2](#), bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU159, bit [47]

When FEAT_HPDS2 is implemented:

HWU159

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

- 0b0 For translations using [TTBR1_EL2](#), bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR1_EL2](#), bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU062, bit [46]

When FEAT_HPDS2 is implemented:

HWU062

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

HWU061

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU060, bit [44]

When FEAT_HPDS2 is implemented:

HWU060

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 For translations using [TTBR0_EL1](#), bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

HWU059

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

- 0b0 For translations using [TTBR0_EL1](#), bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 For translations using [TTBR0_EL1](#), bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of [TCR_EL2.HPD0](#) is 1.

The Effective value of this field is 0 if the value of [TCR_EL2.HPD0](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD1, bit [42]

When FEAT_HPDS is implemented:

HPD1

Hierarchical Permission Disables. This affects the hierarchical control bits, [APTable](#), [PXNTable](#), and [UXNTable](#), except [NSTable](#), in the translation tables pointed to by [TTBR1_EL2](#).

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When FEAT_HPDS is implemented:

HPD0

Hierarchical Permission Disables. This affects the hierarchical control bits, [APTable](#), [PXNTable](#), and [UXNTable](#), except [NSTable](#), in the translation tables pointed to by [TTBR0_EL2](#).

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

HD

Hardware management of dirty state in stage 1 translations from EL2.

0b0 Stage 1 hardware management of dirty state disabled.

0b1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

HA

Hardware Access flag update in stage 1 translations from EL2.

0b0 Stage 1 Access flag update disabled.

0b1 Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR1_EL2](#) region, or ignored and used for tagged addresses.

For more information, see [Address tagging in AArch64 state on page D5-2676](#).

0b0 Top Byte used in the address calculation.

0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR1_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If [FEAT_PAAuth](#) is implemented and [TCR_EL2.TBID1](#) is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL2](#) region, or ignored and used for tagged addresses.

For more information, see [Address tagging in AArch64 state on page D5-2676](#).

0b0 Top Byte used in the address calculation.

0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If [FEAT_PAAuth](#) is implemented and [TCR_EL2.TBID0](#) is 1, then this field only applies to Data accesses.

If the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.

- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

- 0b0 8 bit - the upper 8 bits of [TTBR0_EL2](#) and [TTBR1_EL2](#) are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
- 0b1 16 bit - the upper 16 bits of [TTBR0_EL2](#) and [TTBR1_EL2](#) are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

- 0b000 32 bits, 4GB.
- 0b001 36 bits, 64GB.
- 0b010 40 bits, 1TB.
- 0b011 42 bits, 4TB.
- 0b100 44 bits, 16TB.
- 0b101 48 bits, 256TB.
- 0b110 *When FEAT_LPA is implemented:*
52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement [FEAT_LPA](#) supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by [TCR_EL2](#) are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the [TTBR1_EL2](#).

- 0b01 16KB.
- 0b10 4KB.
- 0b11 64KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1_EL2](#). The encoding of this bit is:

0b0 Perform translation table walks using [TTBR1_EL2](#).

0b1 A TLB miss on an address that is translated using [TTBR1_EL2](#) generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether [TTBR0_EL2](#) or [TTBR1_EL2](#) defines the ASID. The encoding of this bit is:

0b0 [TTBR0_EL2](#).ASID defines the ASID.

0b1 [TTBR1_EL2](#).ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1_EL2](#). The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL2](#).

0b00 4KB.

0b01 64KB.

0b10 16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0_EL2](#). The encoding of this bit is:

0b0 Perform translation table walks using [TTBR0_EL2](#).

0b1 A TLB miss on an address that is translated using [TTBR0_EL2](#) generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

————— Note —————

For the 4KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [TCR_EL2](#) or [TCR_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return TCR_EL2;
elsif PSTATE.EL == EL3 then
    return TCR_EL2;

```

MSR TCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    TCR_EL2 = X[t];

```

MRS <Xt>, TCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x120];
    else
        return TCR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return TCR_EL2;
    else

```

```

        return TCR_EL1;
    elsif PSTATE.EL == EL3 then
        return TCR_EL1;

```

MSR TCR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGWTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        NVMem[0x120] = X[t];
    else
        TCR_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        TCR_EL2 = X[t];
    else
        TCR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    TCR_EL1 = X[t];

```

D13.2.125 TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

Purpose

The control register for stage 1 of the EL3 translation regime.

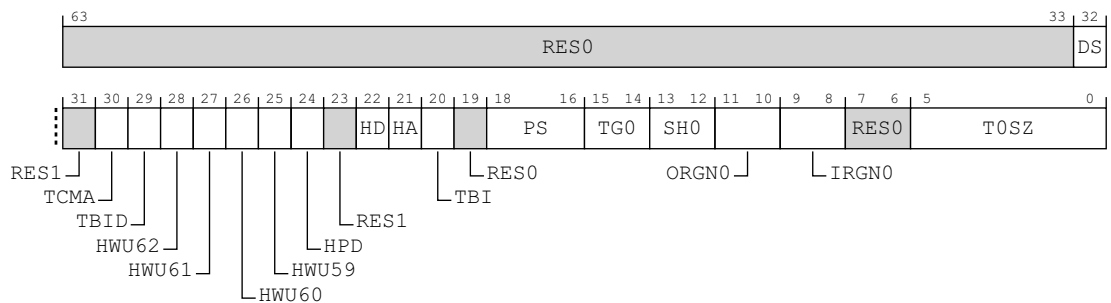

Configurations

This register is present only when EL3 is implemented. Otherwise, direct accesses to TCR_EL3 are UNDEFINED.

Attributes

TCR_EL3 is a 64-bit register.

Field descriptions

Any of the bits in TCR_EL3 are permitted to be cached in a TLB.

Bits [63:33]

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented:

DS

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL3 translation regime.

0b0 Bits[49:48] of translation descriptors are RES0.

Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.

The minimum value of TCR_EL3.TOSZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

Output address[51:48] is 0b0000.

0b1 Bits[49:48] of translation descriptors hold output address[49:48].

Bits[9:8] of table translation descriptors hold output address[51:50].

The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL3.SH0.

The minimum value of TCR_EL3.TOSZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.

All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.

Bits[5:2] of TTBR0_EL3 are used to hold bits[51:48] of the output address in all cases.

———— **Note** —————

As [FEAT_LVA](#) must be implemented if `TCR_EL3.DS == 1`, the minimum value of the `TCR_EL3.T0SZ` field is 12, as determined by that extension.

For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold `BaseADDR[52:16]`. For the 4KB translation granule, bits[15:12] of `BaseADDR` are treated as `0b0000`. For the 16KB translation granule, bits[15:14] of `BaseADDR` are treated as `0b00`.

———— **Note** —————

This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When [FEAT_MTE2](#) is implemented:

TCMA

Controls the generation of Unchecked accesses at EL3 when address [59:56] = `0b0000`.

`0b0` This control has no effect on the generation of Unchecked accesses.

`0b1` All accesses are Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When [FEAT_PAuth](#) is implemented:

TBID

Controls the use of the top byte of instruction addresses for address matching.

`0b0` `TCR_EL3.TBI` applies to Instruction and Data accesses.

`0b1` `TCR_EL3.TBI` applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL3](#).

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

HWU62

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

0b0 Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

HWU61

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

0b0 Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

HWU60

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

0b0 Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

HWU59

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

0b0 Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD, bit [24]

When FEAT_HPDS is implemented:

HPD

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL3.

0b0 Hierarchical permissions are enabled.

0b1 Hierarchical permissions are disabled.

————— **Note** —————

In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When FEAT_HAFDBS is implemented:

HD

Hardware management of dirty state in stage 1 translations from EL3.

0b0 Stage 1 hardware management of dirty state disabled.

0b1 Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When FEAT_HAFDBS is implemented:

HA

Hardware Access flag update in stage 1 translations from EL3.

0b0 Stage 1 Access flag update disabled.

0b1 Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL3](#) region, or ignored and used for tagged addresses.

0b0 Top Byte used in the address calculation.

0b1 Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL3](#). It has an effect whether the EL3 translation regime is enabled or not.

If [FEAT_PAuth](#) is implemented and [TCR_EL3.TBID](#) is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see [Address tagging in AArch64 state on page D5-2676](#).

———— Note —————

This control determines the scope of address tagging. It never causes an exception to be generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

0b000 32 bits, 4GB.

0b001 36 bits, 64GB.

0b010 40 bits, 1TB.

0b011 42 bits, 4TB.

0b100 44 bits, 16TB.

0b101 48 bits, 256TB.

0b110 52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the TTBR0_EL3.

0b00 4KB.

0b01 64KB.

0b10 16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL3.

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

0b00 Normal memory, Inner Non-cacheable.

0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL3](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

————— Note —————

For the 4KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0000	0b010

```

D13.2.126 TFSRE0_EL1, Tag Fault Status Register (EL0).

The TFSRE0_EL1 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL0 that are not taken precisely.

Configurations

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSRE0_EL1 are UNDEFINED.

Attributes

TFSRE0_EL1 is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

TF1, bit [1]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TF0, bit [0]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TFSRE0_EL1

Accesses to this register use the following encodings in the System register encoding space:

D13.2.127 TFSR_EL1, Tag Fault Status Register (EL1)

The TFSR_EL1 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL1 that are not taken precisely.

Configurations

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL1 are UNDEFINED.

Attributes

TFSR_EL1 is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

TF1, bit [1]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TF0, bit [0]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TFSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

D13.2.128 TFSR_EL2, Tag Fault Status Register (EL2)

The TFSR_EL2 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL2 that are not taken precisely.

Configurations

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL2 are UNDEFINED.

Attributes

TFSR_EL2 is a 64-bit register.

Field descriptions**Bits [63:2]**

Reserved, RES0.

TF1, bit [1]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

When [HCR_EL2.E2H](#) == 0b0, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TF0, bit [0]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TFSR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TFSR_EL2 or TFSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TFSR_EL2

op0	op1	CRn	CRm	op2

```

D13.2.135 TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

Configurations

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register [TTBR0](#)[63:0].

Attributes

TTBR0_EL1 is a 64-bit register.

Field descriptions

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL1.A1](#) field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL1.TOSZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL1.IPS](#) is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If [FEAT_LPA](#) is implemented and the value of [TCR_EL1.IPS](#) is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.

- When $x > 6$, register bits $[(x-1):6]$ are RES0.

———— **Note** ————

`TCR_EL1.IPS` == 0b110 is permitted when:

- `FEAT_LPA` is implemented and the 64KB translation granule is used.
- `FEAT_LPA2` is implemented and the 4KB or 16KB translation granule is used.

When the value of `ID_AA64MMFR0_EL1.PARange` indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of `TCR_EL1.IPS` is 0b110 and the value of register bits $[5:2]$ is nonzero, an Address size fault is generated.

If any register bit $[47:1]$ that is defined as RES0 has the value 1 when a translation table walk is done using `TTBR0_EL1`, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits $A[(x-1):0]$ of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

CnP

Common not Private. This bit indicates whether each entry that is pointed to by `TTBR0_EL1` is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of `TTBR0_EL1.CnP` is 1.

0b0 The translation table entries pointed to by `TTBR0_EL1`, for the current translation regime and ASID, are permitted to differ from corresponding entries for `TTBR0_EL1` for other PEs in the Inner Shareable domain. This is not affected by:

- The value of `TTBR0_EL1.CnP` on those other PEs.
- The value of the current ASID.
- If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

0b1 The translation table entries pointed to by `TTBR0_EL1` are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of `TTBR0_EL1.CnP` is 1 and all of the following apply:

- The translation table entries are pointed to by `TTBR0_EL1`.
- The translation tables relate to the same translation regime.
- The ASID is the same as the current ASID.
- If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see *CONstrained UNPREDICTABLE behaviors due to caching of control or data values* on page K1-8409.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```

D13.2.136 TTBR0_EL2, Translation Table Base Register 0 (EL2)

The TTBR0_EL2 characteristics are:

Purpose

When [HCR_EL2.E2H](#) is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When [HCR_EL2.E2H](#) is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

Configurations

AArch64 System register TTBR0_EL2 bits [47:1] are architecturally mapped to AArch32 System register [HTTBR](#)[47:1].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TTBR0_EL2 is a 64-bit register.

Field descriptions

ASID, bits [63:48]

When FEAT_VHE is implemented:

ASID

When [HCR_EL2.E2H](#) is 0, this field is RES0.

When [HCR_EL2.E2H](#) is 1, it holds an ASID for the translation table base address. The [TCR_EL2.A1](#) field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL2.T0SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of `TCR_EL2`.{I}PS is not `0b110`, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are `0b0000`.

If `FEAT_LPA` is implemented and the value of `TCR_EL2`.{I}PS is `0b110`, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When $x > 6$, register bits[(x-1):6] are RES0.

Note

The OA size specified by `TCR_EL2`.{I}PS is determined as follows:

- The value of `TCR_EL2`.PS when the value of `HCR_EL2.E2H` is 0.
- The value of `TCR_EL2`.IPS when the value of `HCR_EL2.E2H` is 1.

`TCR_EL2`.{I}PS=`0b110` is permitted when:

- `FEAT_LPA` is implemented and the 64KB translation granule is used.
- `FEAT_LPA2` is implemented and the 4KB or 16KB translation granule is used.

When the value of `ID_AA64MMFR0_EL1`.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of `TCR_EL2`.{I}PS is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using `TTBR0_EL2`, then the translation table base address might be misaligned, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

CnP

Common not Private. This bit indicates whether each entry that is pointed to by `TTBR0_EL2` is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of `TTBR0_EL2`.CnP is 1.

`0b0` The translation table entries pointed to by `TTBR0_EL2` for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for `TTBR0_EL2` for other PEs in the Inner Shareable domain. This is not affected by:

- The value of `TTBR0_EL2`.CnP on those other PEs.
- When the current translation regime is the EL2&0 regime, the value of the current ASID.

- 0b1 The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply:
- The translation table entries are pointed to by TTBR0_EL2.
 - The translation tables relate to the same translation regime.
 - If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

This field is permitted to be cached in a TLB.

———— **Note** —————

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see *CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-8409*.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0_EL2 or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

        TTBR0_EL1 = X[t];
```

D13.2.137 TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

Configurations

This register is present only when EL3 is implemented. Otherwise, direct accesses to TTBR0_EL3 are UNDEFINED.

Attributes

TTBR0_EL3 is a 64-bit register.

Field descriptions

Bits [63:48]

Reserved, RES0.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL3.T0SZ, the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of TCR_EL3.PS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of TCR_EL3.PS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

Note

TCR_EL3.PS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.

- [FEAT_LPA2](#) is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL3.PS](#) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using [TTBR0_EL3](#), then the translation table base address might be misaligned, with effects that are **CONSTRAINED UNPREDICTABLE**, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

CnP

Common not Private. This bit indicates whether each entry that is pointed to by [TTBR0_EL3](#) is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of [TTBR0_EL3.CnP](#) is 1.

0b0 The translation table entries pointed to by [TTBR0_EL3](#), for the current translation regime, are permitted to differ from corresponding entries for [TTBR0_EL3](#) for other PEs in the Inner Shareable domain. This is not affected by the value of [TTBR0_EL3.CnP](#) on those other PEs.

0b1 The translation table entries pointed to by [TTBR0_EL3](#) are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of [TTBR0_EL3.CnP](#) is 1 and the translation table entries are pointed to by [TTBR0_EL3](#).

This field is permitted to be cached in a TLB.

Note

If the value of the [TTBR0_EL3.CnP](#) bit is 1 on multiple PEs in the same Inner Shareable domain and those [TTBR0_EL3s](#) do not point to the same translation table entries the results of translations using [TTBR0_EL3](#) are **CONSTRAINED UNPREDICTABLE**, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-8409](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TTBR0_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0000	0b000

```

elsif PSTATE.EL == EL3 then
    TTBR0_EL3 = X[t];

```

D13.2.138 TTBR1_EL1, Translation Table Base Register 1 (EL1)

The TTBR1_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

Configurations

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register [TTBR1](#)[63:0].

Attributes

TTBR1_EL1 is a 64-bit register.

Field descriptions

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL1.A1](#) field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL1.T1SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL1.IPS](#) is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If [FEAT_LPA](#) is implemented and the value of [TCR_EL1.IPS](#) is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.

- When $x > 6$, register bits $[(x-1):6]$ are RES0.

———— **Note** ————

`TCR_EL1.IPS`==0b110 is permitted when:

- `FEAT_LPA` is implemented and the 64KB translation granule is used.
- `FEAT_LPA2` is implemented and the 4KB or 16KB translation granule is used.

When the value of `ID_AA64MMFR0_EL1.PARange` indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of `TCR_EL1.IPS` is 0b110 and the value of register bits $[5:2]$ is nonzero, an Address size fault is generated.

If any register bit $[47:1]$ that is defined as RES0 has the value 1 when a translation table walk is done using `TTBR1_EL1`, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits $A[(x-1):0]$ of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

CnP

Common not Private. This bit indicates whether each entry that is pointed to by `TBR1_EL1` is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of `TTBR1_EL1.CnP` is 1.

0b0 The translation table entries pointed to by `TTBR1_EL1`, for the current translation regime and ASID, are permitted to differ from corresponding entries for `TTBR1_EL1` for other PEs in the Inner Shareable domain. This is not affected by:

- The value of `TTBR1_EL1.CnP` on those other PEs.
- The value of the current ASID.
- If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

0b1 The translation table entries pointed to by `TTBR1_EL1` are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of `TTBR1_EL1.CnP` is 1 and all of the following apply:

- The translation table entries are pointed to by `TTBR1_EL1`.
- The translation tables relate to the same translation regime.
- The ASID is the same as the current ASID.
- If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This field is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

———— **Note** ————

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see *CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values* on page K1-8409.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D13.2.139 TTBR1_EL2, Translation Table Base Register 1 (EL2)

The TTBR1_EL2 characteristics are:

Purpose

When [HCR_EL2.E2H](#) is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

———— Note —————

When [HCR_EL2.E2H](#) is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

Configurations

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to TTBR1_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TTBR1_EL2 is a 64-bit register.

Field descriptions

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL2.A1](#) field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL2.T1SZ](#), the translation stage, and the translation granule size.

———— Note —————

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of `TCR_EL2`.{I}PS is not `0b110`, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are `0b0000`.

If `FEAT_LPA` is implemented and the value of `TCR_EL2`.{I}PS is `0b110`, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When $x > 6$, register bits[(x-1):6] are RES0.

Note

The OA size specified by `TCR_EL2`.{I}PS is determined as follows:

- The value of `TCR_EL2`.PS when the value of `HCR_EL2`.E2H is 0.
- The value of `TCR_EL2`.IPS when the value of `HCR_EL2`.E2H is 1.

`TCR_EL2`.{I}PS=`0b110` is permitted when:

- `FEAT_LPA` is implemented and the 64KB translation granule is used.
- `FEAT_LPA2` is implemented and the 4KB or 16KB translation granule is used.

When the value of `ID_AA64MMFR0_EL1`.PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of `TCR_EL2`.{I}PS is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using `TTBR1_EL2`, then the translation table base address might be misaligned, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When `FEAT_TTCNP` is implemented:

CnP

Common not Private. This bit indicates whether each entry that is pointed to by `TBR1_EL2` is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of `TTBR1_EL2`.CnP is 1.

`0b0` The translation table entries pointed to by `TTBR1_EL2` for the current ASID are permitted to differ from corresponding entries for `TTBR1_EL2` for other PEs in the Inner Shareable domain. This is not affected by:

- The value of `TTBR1_EL2`.CnP on those other PEs.
- The value of the current ASID.

`0b1` The translation table entries pointed to by `TTBR1_EL2` are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of `TTBR1_EL2`.CnP is 1 and all of the following apply:

- The translation table entries are pointed to by `TTBR1_EL2`.
- The ASID is the same as the current ASID.

This field is permitted to be cached in a TLB.

Note

- TTBR1_EL2 is accessible only when the value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONstrained UNPREDICTABLE, see *CONstrained UNPREDICTABLE behaviors due to caching of control or data values on page K1-8409*.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR1_EL2 or TTBR1_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```

D13.2.140 VBAR_EL1, Vector Base Address Register (EL1)

The VBAR_EL1 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL1.

Configurations

AArch64 System register VBAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [VBAR](#)[31:0].

Attributes

VBAR_EL1 is a 64-bit register.

Field descriptions

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL1.

Note

If the implementation does not support [FEAT_LVA](#), then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

If the implementation supports [FEAT_LVA](#), then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing VBAR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic VBAR_EL1 or VBAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D13.2.141 VBAR_EL2, Vector Base Address Register (EL2)

The VBAR_EL2 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL2.

Configurations

AArch64 System register VBAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HVBAR](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VBAR_EL2 is a 64-bit register.

Field descriptions

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL2.

———— Note ————

If [FEAT_LVA](#) is implemented:

- If [HCR_EL2.E2H](#) = 0b1:
 - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If [HCR_EL2.E2H](#) = 0b0:
 - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

If [FEAT_LVA](#) is not implemented:

- If [HCR_EL2.E2H](#) = 0b1:
 - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If [HCR_EL2.E2H](#) = 0b0:
 - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing VBAR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic `VBAR_EL2` or `VBAR_EL1` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VBAR_EL2

```

D13.2.142 VBAR_EL3, Vector Base Address Register (EL3)

The VBAR_EL3 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL3.

Configurations

This register is present only when EL3 is implemented. Otherwise, direct accesses to VBAR_EL3 are UNDEFINED.

Attributes

VBAR_EL3 is a 64-bit register.

Field descriptions

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL3.

———— Note ————

If the implementation does not support [FEAT_LVA](#), then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports [FEAT_LVA](#), then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing VBAR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VBAR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b0000	0b000

```

D13.2.143 VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of [MPIDR_EL1](#).

Configurations

AArch64 System register VMPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VMPIDR](#)[31:0].

If EL2 is not implemented, reads of this register return the value of the [MPIDR_EL1](#) and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VMPIDR_EL2 is a 64-bit register.

Field descriptions

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of VMPIDR_EL2.Aff0 for more information.

Aff3 is not supported in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

0b0 Processor is part of a multiprocessor system.

0b1 Processor is part of a uniprocessor system.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of [affinity](#) consists of logical PEs that are implemented using a multithreading type approach. See the description of VMPIDR_EL2.Aff0 for more information about affinity levels.

- 0b0 Performance of PEs at the lowest affinity level is largely independent.
- 0b1 Performance of PEs at the lowest affinity level is very interdependent.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff2, bits [23:16]

Affinity level 2. See the description of VMPIDR_EL2.Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1. See the description of VMPIDR_EL2.Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0. This is the [affinity](#) level that is most significant for determining PE behavior. Higher [affinity](#) levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VMPIDR_EL2

Accesses to this register use the following encodings in the System register encoding space:

D13.2.144 VNCR_EL2, Virtual Nested Control Register

The VNCR_EL2 characteristics are:

Purpose

When FEAT_NV2 is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

Configurations

This register is present only when FEAT_NV2 is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VNCR_EL2 is a 64-bit register.

Field descriptions

RESS, bits [63:53]

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR_EL2 register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].

Where the EL2 translation regime has upper and lower address ranges, bit[52] is used to select between those address ranges to determine if the address space supports more than 48 bits.

BADDR, bits [52:12]

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR_EL2.BADDR:Offset<11:0>, 64).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing VNCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VNCR_EL2

```

D13.2.145 VPIDR_EL2, Virtualization Processor ID Register

The VPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by EL1 reads of [MIDR_EL1](#).

Configurations

AArch64 System register VPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VPIDR](#)[31:0].

If EL2 is not implemented, reads of this register return the value of the [MIDR_EL1](#) and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VPIDR_EL2 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

- 0x00 Reserved for software use.
- 0x41 Arm Limited.
- 0x42 Broadcom Corporation.
- 0x43 Cavium Inc.
- 0x44 Digital Equipment Corporation.
- 0x46 Fujitsu Ltd.
- 0x49 Infineon Technologies AG.
- 0x4D Motorola or Freescale Semiconductor Inc.
- 0x4E NVIDIA Corporation.
- 0x50 Applied Micro Circuits Corporation.
- 0x51 Qualcomm Inc.
- 0x56 Marvell International Ltd.
- 0x69 Intel Corporation.
- 0xC0 Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Architecture, bits [19:16]

Architecture version. Defined values are:

0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VPIDR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```

D13.2.146 VSTCR_EL2, Virtualization Secure Translation Control Register

The VSTCR_EL2 characteristics are:

Purpose

The control register for stage 2 of the Secure EL1&0 translation regime.

Configurations

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VSTCR_EL2 is a 64-bit register.

Field descriptions

Any of the bits in VSTCR_EL2 are permitted to be cached in a TLB.

Bits [63:34]

Reserved, RES0.

SL2, bit [33]

When FEAT_LPA2 is implemented:

SL2

Starting level of the Secure stage 2 translation lookup controlled by VSTCR_EL2.

If [VTCR_EL2.DS](#) == 1, then VSTCR_EL2.SL2, in combination with VSTCR_EL2.SL0, gives encodings for the Secure stage 2 translation table walk initial lookup level.

If [VTCR_EL2.DS](#) == 0, then VSTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

SA, bit [30]

Secure stage 2 translation output address space.

0b0 All stage 2 translations for the Secure IPA space access the Secure PA space.

0b1 All stage 2 translations for the Secure IPA space access the Non-secure PA space.

When the value of VSTCR_EL2.SW is 1, this bit behaves as 1 for all purposes other than reading back the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [29]

Secure stage 2 translation address space.

0b0 All stage 2 translation table walks for the Secure IPA space are to the Secure PA space.

0b1 All stage 2 translation table walks for the Secure IPA space are to the Non-secure PA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [28:16]

Reserved, RES0.

TG0, bits [15:14]

Secure stage 2 granule size for VSTTBR_EL2.

0b00 4KB.

0b01 64KB.

0b10 16KB.

Other values are reserved.

If FEAT_GTG is implemented, ID_AA64MMFR0_EL1.{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for stage 2 translation.

If FEAT_GTG is not implemented, ID_AA64MMFR0_EL1.{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [13:8]

Reserved, RES0.

SL0, bits [7:6]

When FEAT_TTST is implemented:

SL0

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

0b00 If VSTCR_EL2.TG0 is 0b00 (4KB granule):

- If FEAT_LPA2 is not implemented, start at level 2.
- If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 2.
- If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b1, start at level -1.

- If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
- 0b01 If VSTCR_EL2.TG0 is 0b00 (4KB granule):
- If FEAT_LPA2 is not implemented, start at level 1.
 - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 1.
 - If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 01 and VSTCR_EL2.SL2 == 1 is reserved.
- If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
- 0b10 If VSTCR_EL2.TG0 is 0b00 (4KB granule):
- If FEAT_LPA2 is not implemented, start at level 0.
 - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 0.
 - If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 10 and VSTCR_EL2.SL2 == 1 is reserved.
- If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.
- 0b11 If VSTCR_EL2.TG0 is 0b00 (4KB granule):
- If FEAT_LPA2 is not implemented, start at level 3.
 - If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 3.
 - If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 11 and VSTCR_EL2.SL2 == 1 is reserved.
- If VSTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0.

If this field is programmed to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

SL0

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

- 0b00 If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.
- 0b01 If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.
- 0b10 If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]

The size offset of the memory region addressed by VSTTBR_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

———— **Note** ————

For the 4KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if [FEAT_LPA2](#) is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSTCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VSTCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0110	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if !IsSecure() then
        UNDEFINED;
    elsif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x048];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if !IsSecure() then
        UNDEFINED;
    else
        return VSTCR_EL2;
elsif PSTATE.EL == EL3 then
    if SCR_EL3.EEL2 == '0' then
        UNDEFINED;
    else
        return VSTCR_EL2;

```

MSR VSTCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0110	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if !IsSecure() then
        UNDEFINED;
    elsif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x048] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else

```

```
        UNDEFINED;  
elseif PSTATE.EL == EL2 then  
    if !IsSecure() then  
        UNDEFINED;  
    else  
        VSTCR_EL2 = X[t];  
elseif PSTATE.EL == EL3 then  
    if SCR_EL3.EEL2 == '0' then  
        UNDEFINED;  
    else  
        VSTCR_EL2 = X[t];
```

D13.2.147 VSTTBR_EL2, Virtualization Secure Translation Table Base Register

The VSTTBR_EL2 characteristics are:

Purpose

The base register for stage 2 of the Secure EL1&0 translation regime. Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Secure EL1&0 translation regime, and other information for this translation stage.

Configurations

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTTBR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VSTTBR_EL2 is a 64-bit register.

Field descriptions

Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x].

Note

A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

If the value of VTCR_EL2.PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.

Note

When the value of `ID_AA64MMFR0_EL1.PARange` indicates that the implementation does not support a 52-bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the *Effective value* of `VTCCR_EL2.PS` is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of `VTCCR_EL2.PS` is not `0b110`, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are `0b0000`.

If any `VSTTBR_EL2[47:1]` bit that is defined as RES0 has the value 1 when a translation table walk is performed using `VSTTBR_EL2`, then the translation table base address might be misaligned, with effects that are *CONSTRAINED UNPREDICTABLE*, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of `VSTCCR_EL2.T0SZ`, the stage of translation, and the translation granule size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes `FEAT_TTCNP`, indicates whether each entry that is pointed to by `VSTTBR_EL2` is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of `VSTTBR_EL2.CnP` is 1.

- `0b0` The translation table entries pointed to by `VSTTBR_EL2` are permitted to differ from the entries for `VSTTBR_EL2` for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
- `0b1` The translation table entries pointed to by `VSTTBR_EL2` are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of `VSTTBR_EL2.CnP` is 1 and the VMID is the same as the current VMID.

This field is permitted to be cached in a TLB.

Note

If the value of `VSTTBR_EL2.CnP` bit is 1 on multiple PEs in the same Inner Shareable domain and those `VSTTBR_EL2s` do not point to the same translation table entries when using the current VMID, then the results of translations using `VSTTBR_EL2` are *CONSTRAINED UNPREDICTABLE*, see [CONstrained UNpredictable behaviors due to caching of control or data values on page K1-8409](#).

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSTTBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VSTTBR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0110	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if !IsSecure() then
        UNDEFINED;
    elseif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x030];
    elseif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;

    if !IsSecure() then
        UNDEFINED;
    else
        return VSTTBR_EL2;
elseif PSTATE.EL == EL3 then
    if SCR_EL3.EEL2 == '0' then
        UNDEFINED;
    else
        return VSTTBR_EL2;

```

MSR VSTTBR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0110	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if !IsSecure() then
        UNDEFINED;
    elseif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x030] = X[t];
    elseif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    if !IsSecure() then
        UNDEFINED;
    else
        VSTTBR_EL2 = X[t];
elseif PSTATE.EL == EL3 then
    if SCR_EL3.EEL2 == '0' then
        UNDEFINED;
    else
        VSTTBR_EL2 = X[t];

```

D13.2.148 VTCR_EL2, Virtualization Translation Control Register

The VTCR_EL2 characteristics are:

Purpose

The control register for stage 2 of the EL1&0 translation regime.

Configurations

AArch64 System register VTCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VTCR](#)[31:0].

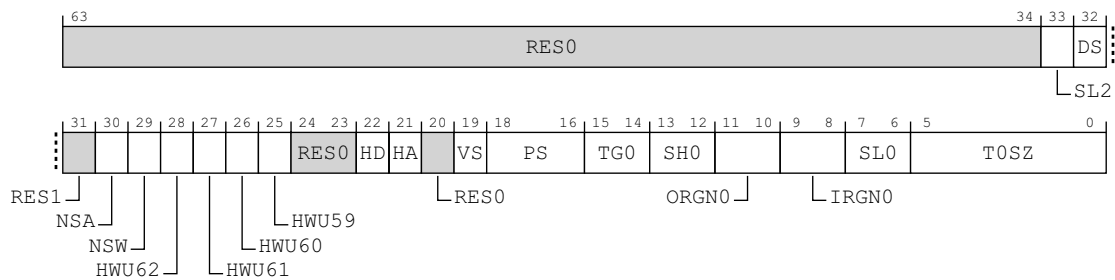

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VTCR_EL2 is a 64-bit register.

Field descriptions

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Bits [63:34]

Reserved, RES0.

SL2, bit [33]

When FEAT_LPA2 is implemented:

SL2

Starting level of the stage 2 translation lookup controlled by VTCR_EL2.

If VTCR_EL2.DS == 1, then VTCR_EL2.SL2, in combination with VTCR_EL2.SLO, gives encodings for the stage 2 translation table walk initial lookup level.

If VTCR_EL2.DS == 0, then VTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented:

DS

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 2 of the EL1&0 translation regime.

0b0 Bits[49:48] of translation descriptors are RES0.
Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.
The minimum value of VTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.
The minimum value of VSTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.
Output address[51:48] is 0000.

0b1 Bits[49:48] of translation descriptors hold output address[49:48].
Bits[9:8] in translation descriptors hold output address[51:50].
The shareability information of block and page descriptors for cacheable locations is determined by VTCR_EL2.SH0.
The minimum value of VTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.
The minimum value of VSTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.

———— **Note** ————

As FEAT_LPA must be implemented if VTCR_EL2.DS == 1, the minimum values of VTCR_EL2.T0SZ and VSTCR_EL2.T0SZ are 12, as determined by that extension.

For the TLBI range instructions affecting IPA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 00.

———— **Note** ————

This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

NSA, bit [30]

When FEAT_SEL2 is implemented:

NSA

Non-secure stage 2 translation output address space for the Secure EL1&0 translation regime.

0b0 All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Secure PA space.

0b1 All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Non-secure PA space.

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The value of VTCR_EL2.NSW is 1.
- The value of VSTCR_EL2.SA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSW, bit [29]

When FEAT_SEL2 is implemented:

NSW

Non-secure stage 2 translation table address space for the Secure EL1&0 translation regime.

0b0 All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Secure PA space.

0b1 All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Non-secure PA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

HWU62

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

0b0 Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

HWU61

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

0b0 Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.

0b1 Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

HWU60

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

- 0b0 Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

HWU59

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

- 0b0 Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
- 0b1 Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [24:23]

Reserved, RES0.

HD, bit [22]

When FEAT_HAFDBS is implemented:

HD

Hardware management of dirty state in stage 2 translations when EL2 is enabled in the current Security state.

- 0b0 Stage 2 hardware management of dirty state disabled.
- 0b1 Stage 2 hardware management of dirty state enabled, only if the VTCR_EL2.HA bit is also set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When FEAT_HAFDBS is implemented:

HA

Hardware Access flag update in stage 2 translations when EL2 is enabled in the current Security state.

0b0 Stage 2 Access flag update disabled.

0b1 Stage 2 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

VS, bit [19]

When FEAT_VMID16 is implemented:

VS

VMID Size.

0b0 8-bit VMID. The upper 8 bits of [VTTBR_EL2](#) are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register.

0b1 16-bit VMID. The upper 8 bits of [VTTBR_EL2](#) are used for allocation and matching in the TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PS, bits [18:16]

Physical address Size for the second stage of translation.

0b000 32 bits, 4GB.

0b001 36 bits, 64GB.

0b010 40 bits, 1TB.

0b011 42 bits, 4TB.

0b100 44 bits, 16TB.

0b101 48 bits, 256TB.

0b110 52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and [FEAT_LPA2](#) is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement [FEAT_LPA](#) supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR_EL2 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the VTTBR_EL2.

0b00 4KB.

0b01 64KB.

0b10 16KB.

Other values are reserved.

If FEAT_GTG is implemented, ID_AA64MMFR0_EL1.{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for stage 2 translation.

If FEAT_GTG is not implemented, ID_AA64MMFR0_EL1.{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

0b00 Non-shareable.

0b10 Outer Shareable.

0b11 Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

0b00 Normal memory, Outer Non-cacheable.

0b01 Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.

0b10 Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.

0b11 Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using VTTBR_EL2 or VSTTBR_EL2.

0b00 Normal memory, Inner Non-cacheable.

- 0b01 Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
- 0b10 Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
- 0b11 Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

When FEAT_TTST is implemented:

SL0

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

0b00 If VTCR_EL2.TG0 is 0b00 (4KB granule):

- If [FEAT_LPA2](#) is not implemented, start at level 2.
 - If [FEAT_LPA2](#) is implemented and VTCR_EL2.SL2 is 0b0, start at level 2.
 - If [FEAT_LPA2](#) is implemented and VTCR_EL2.SL2 is 0b1, start at level -1.
- If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.

0b01 If VTCR_EL2.TG0 is 0b00 (4KB granule):

- If [FEAT_LPA2](#) is not implemented, start at level 1.
- If [FEAT_LPA2](#) is implemented and VTCR_EL2.SL2 is 0b0, start at level 1.
- If [FEAT_LPA2](#) is implemented, the combination of VTCR_EL2.SL0 == 01 and VTCR_EL2.SL2 == 1 is reserved.

If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.

0b10 If VTCR_EL2.TG0 is 0b00 (4KB granule):

- If [FEAT_LPA2](#) is not implemented, start at level 0.
- If [FEAT_LPA2](#) is implemented and VTCR_EL2.SL2 is 0b0, start at level 0.
- If [FEAT_LPA2](#) is implemented, the combination of VTCR_EL2.SL0 == 10 and VTCR_EL2.SL2 == 1 is reserved.

If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

0b11 If VTCR_EL2.TG0 is 0b00 (4KB granule):

- If [FEAT_LPA2](#) is not implemented, start at level 3.
- If [FEAT_LPA2](#) is implemented and VTCR_EL2.SL2 is 0b0, start at level 3.
- If [FEAT_LPA2](#) is implemented, the combination of VTCR_EL2.SL0 == 11 and VTCR_EL2.SL2 == 1 is reserved.

If VTCR_EL2.TG0 is 0b10 (16KB granule) and [FEAT_LPA2](#) is implemented, start at level 0.

If this field is programmed to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

SL0

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

0b00 If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3.

0b01 If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2.

0b10 If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1.

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]

The size offset of the memory region addressed by VTTBR_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in [Chapter D5 The AArch64 Virtual Memory System Architecture](#).

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

———— Note —————

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR_EL2

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VTCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x040];
    elseif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    return VTCR_EL2;
elseif PSTATE.EL == EL3 then
    return VTCR_EL2;

```

MSR VTCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x040] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    VTCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    VTCR_EL2 = X[t];

```

D13.2.149 VTTBR_EL2, Virtualization Translation Table Base Register

The VTTBR_EL2 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&0 translation regime, and other information for this translation regime.

Configurations

AArch64 System register VTTBR_EL2 bits [63:0] are architecturally mapped to AArch32 System register VTTBR[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VTTBR_EL2 is a 64-bit register.

Field descriptions

VMID, bits [63:48]

When FEAT_VMID16 is implemented or (VTCR_EL2.VS == 1 or AArch32 is supported at EL0):

VMID, bits [15:0]

The VMID for the translation table.

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VMID16 is not implemented or (VTCR_EL2.VS == 0 or the implementation only supports execution in AArch64 state):

Bits [15:8]

Reserved, RES0.

VMID, bits [7:0]

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- The VTCR_EL2.VS is 0.

- `FEAT_VMID16` is not implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

———— Note —————

A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes `FEAT_LPA`, if the value of `VTCR_EL2.PS` is `0b110`, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes `FEAT_TTCNP`, bit[0] of the stage 1 translation table base address is zero.

———— Note —————

When the value of `ID_AA64MMFR0_EL1.PARange` indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the *Effective value* of `VTCR_EL2.PS` is `0b110` and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of `VTCR_EL2.PS` is not `0b110` then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are `0b0000`.

If any `VTTBR_EL2[47:0]` bit that is defined as RES0 has the value 1 when a translation table walk is performed using `VTTBR_EL2`, then the translation table base address might be misaligned, with effects that are CONstrained UNpredictable, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of `VTCR_EL2.T0SZ`, the stage of translation, and the translation granule size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

CnP

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

0b0 The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.

0b1 The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID.

This field is permitted to be cached in a TLB.

———— **Note** ————

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are *CONSTRAINED UNPREDICTABLE*, see [CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values on page K1-8409](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing VTTBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VTTBR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x020];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return VTTBR_EL2;
elsif PSTATE.EL == EL3 then
    return VTTBR_EL2;

```

MSR VTTBR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x020] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    VTTBR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    VTTBR_EL2 = X[t];

```

D13.3 Debug registers

This section lists the Debug System registers in AArch64 state, in alphabetic order:

- The principal encoding space for debug registers is $op0==0b10$, $op1==\{0, 3, 4\}$. [Instructions for accessing debug System registers on page D12-3021](#) summarizes the registers in this encoding space and lists them in order of their encodings.
- In addition, the following registers in the $op0==0b11$ encoding space are classified as Debug registers:
 - [DLR_EL0](#).
 - [DSPSR_EL0](#).
 - [MDCR_EL2](#).
 - [MDCR_EL3](#).
 - [SDER32_EL3](#).

D13.3.1 DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configurations

AArch64 System register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGAUTHSTATUS](#)[31:0].

AArch64 System register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to External register [DBGAUTHSTATUS_EL1](#)[31:0].

Attributes

DBGAUTHSTATUS_EL1 is a 64-bit register.

Field descriptions

Bits [63:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

SNID

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

SNID

Secure non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3](#).NS is 1.

0b10 Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of [SCR_EL3](#).NS is 1.

0b10 Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

NSNID

Non-secure non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.

0b11 Implemented and enabled. EL3 is implemented or the Effective value of SCR_EL3.NS is 1.

All other values are reserved.

Otherwise:

NSNID

Non-secure non-invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.

0b10 Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

0b00 Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.

0b10 Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.

0b11 Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing DBGAUTHSTATUS_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGAUTHSTATUS_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0111	0b1110	0b110

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority
when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elseif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HDFGRTR_EL2.DBGAUTHSTATUS_EL1 == '1'
then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif EL2Enabled() && MDCR_EL2.<TDE,TDA> != '00' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
        else
            return DBGAUTHSTATUS_EL1;
elseif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority
when SDD == '1'" && MDCR_EL3.TDA == '1' then

```

```
    UNDEFINED;  
elseif HaveEL(EL3) && MDCR_EL3.TDA == '1' then  
    if Halted() && EDSCR.SDD == '1' then  
        UNDEFINED;  
    else  
        AArch64.SystemAccessTrap(EL3, 0x18);  
    else  
        return DBGAUTHSTATUS_EL1;  
elseif PSTATE.EL == EL3 then  
    return DBGAUTHSTATUS_EL1;
```

D13.3.2 DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>_EL1](#).

Configurations

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to External register [DBGBCR<n>_EL1\[31:0\]](#).

If breakpoint n is not implemented, accesses to this register are UNDEFINED.

Attributes

DBGBCR<n>_EL1 is a 64-bit register.

Field descriptions

Bits [63:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

- 0b0000 Unlinked instruction address match. [DBGBVR<n>_EL1](#) is the address of an instruction.
- 0b0001 As 0b0000, but linked to a Context matching breakpoint.
- 0b0010 Unlinked Context ID match. When [FEAT_VHE](#) is implemented, EL2 is using AArch64, and the Effective value of [HCR_EL2.E2H](#) is 1, if either the PE is executing at EL0 with [HCR_EL2.TGE](#) set to 1 or the PE is executing at EL2, then [DBGBVR<n>_EL1.ContextID](#) must match the [CONTEXTIDR_EL2](#) value. Otherwise, [DBGBVR<n>_EL1.ContextID](#) must match the [CONTEXTIDR_EL1](#) value
- 0b0011 As 0b0010, with linking enabled.
- 0b0110 Unlinked [CONTEXTIDR_EL1](#) match. [DBGBVR<n>_EL1.ContextID](#) is a Context ID compared against [CONTEXTIDR_EL1](#).
- 0b0111 As 0b0110, with linking enabled.
- 0b1000 Unlinked VMID match. [DBGBVR<n>_EL1.VMID](#) is a VMID compared against [VTTBR_EL2.VMID](#).
- 0b1001 As 0b1000, with linking enabled.
- 0b1010 Unlinked VMID and Context ID match. [DBGBVR<n>_EL1.ContextID](#) is a Context ID compared against [CONTEXTIDR_EL1](#), and [DBGBVR<n>_EL1.VMID](#) is a VMID compared against [VTTBR_EL2.VMID](#).
- 0b1011 As 0b1010, with linking enabled.

- 0b1100 Unlinked [CONTEXTIDR_EL2](#) match. [DBGBVR<n>_EL1](#). ContextID2 is a Context ID compared against [CONTEXTIDR_EL2](#).
- 0b1101 As 0b1100, with linking enabled.
- 0b1110 Unlinked Full Context ID match. [DBGBVR<n>_EL1](#). ContextID is compared against [CONTEXTIDR_EL1](#), and [DBGBVR<n>_EL1](#). ContextID2 is compared against [CONTEXTIDR_EL2](#).
- 0b1111 As 0b1110, with linking enabled.

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2589.

For more information on the effect of programming the fields to a reserved value, see [Reserved DBGBCR<n>_EL1.BT values](#) on page D2-2594.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of [DBGBCR<n>_EL1.E](#) is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2589.

For more information on the effect of programming the fields to a reserved set of values, see [Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values](#) on page D2-2594.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions](#) on page D2-2589.

For more information, see [DBGBCR<n>_EL1.SSC](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported at EL0:

BAS

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved. For more information, see [Reserved DBGBCR<n>_EL1.BAS values on page D2-2595](#).

For more information on using the BAS field in address match breakpoints, see [Using the BAS field in Address Match breakpoints on page G2-6183](#).

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see [Execution conditions for which a breakpoint generates Breakpoint exceptions on page D2-2589](#).

For more information, see DBGBCR<n>_EL1.SSC.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint DBGBVR<n>_EL1.

- 0b0 Breakpoint disabled.
- 0b1 Breakpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

D13.3.3 DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>_EL1](#).

Configurations

AArch64 System register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBVR<n>](#)[31:0].

If the breakpoint is context-aware and EL2 is implemented then AArch64 System register DBGBVR<n>_EL1[63:32] is architecturally mapped to AArch32 System register [DBG BXVR<n>](#). Otherwise there is no System register access to DBGBVR<n>_EL1[63:32] from AArch32 state.

AArch64 System register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to External register [DBGBVR<n>_EL1](#)[63:0].

How this register is interpreted depends on the value of [DBGBCR<n>_EL1](#).BT.

- When [DBGBCR<n>_EL1](#).BT is 0b000x, this register holds a virtual address.
- When [DBGBCR<n>_EL1](#).BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>_EL1](#).BT is 0b100x, this register holds a VMID.
- When [DBGBCR<n>_EL1](#).BT is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>_EL1](#).BT is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>_EL1](#).BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When [DBGBCR<n>_EL1](#).BT == 0b000x:

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONstrained UNPREDICTABLE whether the PE ignores this field when comparing an address.
- If the breakpoint is not context-aware, it is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

Bits[52:49]

When FEAT_LVA is implemented:

VA[52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0]

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When [FEAT_LVA](#) is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When $DBGBCR\langle n \rangle_EL1.BT == 0b001x$:

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR_EL2](#) when ([FEAT_VHE](#) is implemented or [FEAT_Debugv8p2](#) is implemented), [HCR_EL2.E2H](#) is 1, and either:

- The PE is executing at EL2.
- [HCR_EL2.TGE](#) is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR\langle n \rangle_EL1.BT == 0b011x$:

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When $DBGBCR<n>_{EL1}.BT == 0b100x$ and EL2 is implemented:

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When $FEAT_VMID16$ is implemented, $VTCR_EL2.VS == 1$ and EL2 is using AArch64:

VMID[15:8]

Extension to VMID[7:0]. For more information, see [DBGBVR<n>_EL1.VMID\[7:0\]](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR_EL2.VS](#) is 0.
- [FEAT_VMID16](#) is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When $DBGBCR<n>_{EL1}.BT == 0b101x$ and EL2 is implemented:

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented, VTCR_EL2.VS == 1 and EL2 is using AArch64:

VMID[15:8]

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR_EL2.VS](#) is 0.
- [FEAT_VMID16](#) is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When $DBGBCR\langle n\rangle_EL1.BT == 0b111x$, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

D13.3.4 DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0. The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET_EL1](#) register.

Configurations

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMCLR](#)[31:0].

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register [DBGCLAIMCLR_EL1](#)[31:0].

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing DBGCLAIMCLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGCLAIMCLR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0111	0b1001	0b110

```

    DBGCLAIMCLR_EL1 = X[t];
```

D13.3.5 DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR_EL1](#) register.

Configurations

AArch64 System register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMSET](#)[31:0].

AArch64 System register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to External register [DBGCLAIMSET_EL1](#)[31:0].

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

Accessing DBGCLAIMSET_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGCLAIMSET_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0111	0b1000	0b110

```

D13.3.6 DBGDTR_EL0, Debug Data Transfer Register, half-duplex

The DBGDTR_EL0 characteristics are:

Purpose

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

Configurations

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register [DBGDTRRXint](#)[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register [DBGDTRRX_EL0](#)[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register [DBGDTRRX_EL0](#)[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRTXint](#)[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register [DBGDTRTX_EL0](#)[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRTX_EL0](#)[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register [DBGDTRTXint](#)[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register [DBGDTRTX_EL0](#)[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register [DBGDTRTX_EL0](#)[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXint](#)[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register [DBGDTRRX_EL0](#)[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRRX_EL0](#)[31:0] when read.

Attributes

DBGDTR_EL0 is a 64-bit register.

Field descriptions

HighWord, bits [63:32]

Writes to this register set DTRRX to the value in this field and do not change RXfull.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRTX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

LowWord, bits [31:0]

Writes to this register set DTRTX to the value in this field and set TXfull to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

Accessing DBGDTR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGDTR_EL0

op0	op1	CRn	CRm	op2

D13.3.7 DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

Configurations

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXint](#)[31:0].

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to External register [DBGDTRRX_EL0](#)[31:0].

Attributes

DBGDTRRX_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRX_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGDTRRX_EL0

op0	op1	CRn	CRm	op2
0b10	0b011	0b0000	0b0101	0b000

```
if Halted() then
    return DBGDTRRX_EL0;
```

```

elseif PSTATE.EL == EL0 then

elseif PSTATE.EL == EL3 then
    return DBGDTRRX_EL0;

```

D13.3.8 DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

Configurations

AArch64 System register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRXint](#)[31:0].

AArch64 System register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to External register [DBGDTRTX_EL0](#)[31:0].

Attributes

DBGDTRTX_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Return DTRTX.

Writes to this register:

- If TXfull is set to 1, set DTRRX and DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTX_EL0

Accesses to this register use the following encodings in the System register encoding space:

MSR DBGDTRTX_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b10	0b011	0b0000	0b0101	0b000

```

    DBGDTRTX_EL0 = X[t];

```

D13.3.9 DBGPRCR_EL1, Debug Power Control Register

The DBGPRCR_EL1 characteristics are:

Purpose

Controls behavior of the PE on powerdown request.

Configurations

AArch64 System register DBGPRCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGPRCR](#)[31:0].

Bit [0] of this register is mapped to [EDPRCR](#).CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

Attributes

DBGPRCR_EL1 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

CORENPDRQ, bit [0]

When FEAT_DoPD is implemented:

CORENPDRQ

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.

0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to its Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see [Core power domain power states on page H6-7440](#).

————— Note —————

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Otherwise:

CORENPDRQ

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

0b0 If the system responds to a powerdown request, it powers down Core power domain.

0b1 If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see [Core power domain power states on page H6-7440](#).

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

Accessing DBGPRCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGPRCR_EL1

D13.3.10 DBGVCR32_EL2, Debug Vector Catch Register

The DBGVCR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register [DBGVCR](#) from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configurations

AArch64 System register DBGVCR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register [DBGVCR](#)[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DBGVCR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Attributes

DBGVCR32_EL2 is a 64-bit register.

Field descriptions

When EL3 is implemented:

Bits [63:32]

Reserved, RES0.

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is $0x1C$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is $0x18$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort vector catch enable in Non-secure state.

The exception vector offset is $0x10$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is 0x1C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.

The exception vector offset is 0x10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When EL3 is not implemented:

Bits [63:8]

Reserved, RES0.

F, bit [7]

FIQ vector catch enable.

The exception vector offset is 0x1C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]

IRQ vector catch enable.

The exception vector offset is 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

D, bit [4]

Data Abort vector catch enable.

The exception vector offset is 0x10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]

Prefetch Abort vector catch enable.

The exception vector offset 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing DBGVCR32_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGVCR32_EL2

op0	op1	CRn	CRm	op2

```

D13.3.11 DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>_EL1](#).

Configurations

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWCR<n>\[31:0\]](#).

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to External register [DBGWCR<n>_EL1\[31:0\]](#).

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWCR<n>_EL1 is a 64-bit register.

Field descriptions

Bits [63:29]

Reserved, RES0.

MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

- 0b00000 No mask.
- 0b00001 Reserved.
- 0b00010 Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

- 0b0 Unlinked data address match.

0b1 Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2600](#).

For more information on the effect of programming the fields to a reserved value, see [Reserved DBGWCR<n>_EL1.{SSC, HMC, PAC} values on page D2-2608](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2600](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>_EL1](#) is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where `DBGWVR<n>_EL1` addresses a double-word:

BAS	Description, if <code>DBGWVR<n>_EL1[2] == 0</code>
xxx1xxxx	Match byte at <code>DBGWVR<n>_EL1 + 4</code>
xx1xxxxx	Match byte at <code>DBGWVR<n>_EL1 + 5</code>
x1xxxxxx	Match byte at <code>DBGWVR<n>_EL1 + 6</code>
1xxxxxxx	Match byte at <code>DBGWVR<n>_EL1 + 7</code>

If `DBGWVR<n>_EL1[2] == 1`, only `BAS[3:0]` are used and `BAS[7:4]` are ignored. Arm deprecates setting `DBGWVR<n>_EL1[2] == 1`.

The valid values for `BAS` are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See [Reserved `DBGWCR<n>_EL1.BAS` values on page D2-2609](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

- `0b01` Match instructions that load from a watchpointed address.
- `0b10` Match instructions that store to a watchpointed address.
- `0b11` Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint `n` is generated.

The fields that indicate when the watchpoint can be generated are: `HMC`, `PAC`, and `SSC`. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see [Execution conditions for which a watchpoint generates Watchpoint exceptions on page D2-2600](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint `n`. Possible values are:

- `0b0` Watchpoint disabled.
- `0b1` Watchpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing `DBGWCR<n>_EL1`

```

D13.3.12 DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>_EL1](#).

Configurations

AArch64 System register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWVR<n>](#)[31:0].

AArch64 System register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to External register [DBGWVR<n>_EL1](#)[63:0].

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- It is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

VA[52:49]

Extension to VA[48:2]. For more information, see [VA\[48:2\]](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0]

Extension to RESS[14:4]. For more information, see [RESS\[14:4\]](#).

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When [FEAT_LVA](#) is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

Arm deprecates setting [DBGWVR<n>_EL1](#)[2] = 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGWVR<n>_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	n[3:0]	0b110

D13.3.13 DLR_EL0, Debug Link Register

The DLR_EL0 characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configurations

AArch64 System register DLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DLR](#)[31:0].

Attributes

DLR_EL0 is a 64-bit register.

Field descriptions

Bits [63:0]

Restart address.

Accessing DLR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DLR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b001

```
if !Halted() then
    UNDEFINED;
else

0b11	0b011	0b0100	0b0101	0b001

```
if !Halted() then
    UNDEFINED;
else
    DLR_EL0 = X[t];
```

D13.3.14 DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configurations

AArch64 System register DSPSR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DSPSR](#)[31:0].

Attributes

DSPSR_EL0 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0 and exiting Debug state to AArch32 state:

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Copied to PSTATE.IT on exiting Debug state.

DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is DSPSR_EL0[26:25].
- IT[7:2] is DSPSR_EL0[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR_EL0.E is RES0. If the implementation does not support little-endian operation, DSPSR_EL0.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Copied to PSTATE.nRW on exiting Debug state.

0b1 AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Copied to PSTATE.M[3:0] on exiting Debug state.

0b0000 User.

0b0001 FIQ.

0b0010 IRQ.

- 0b0011 Supervisor.
- 0b0110 Monitor.
- 0b0111 Abort.
- 0b1010 Hyp.
- 0b1011 Undefined.
- 0b1111 System.

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in *Illegal return events from AArch64 state* on page D1-2486.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When AArch64 is supported at the highest implemented Exception level and entering or exiting Debug state from or to AArch64 state:

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When FEAT_MTE is implemented:

TCO

Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.

When [FEAT_MTE](#) is not implemented, it is CONstrained UNPREDICTABLE whether this field is RES0 or behaves as if [FEAT_MTE](#) is implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When FEAT_DIT is implemented:

DIT

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When FEAT_UAO is implemented:

UAO

User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

PAN

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

SSBS

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

BTYPE

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.

0b0 AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

0b0000 EL0t.

0b0100 EL1t.

0b0101 EL1h.

0b1000 EL2t.

0b1001 EL2h.

0b1100 EL3t.

0b1101 EL3h.

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in *Illegal return events from AArch64 state* on page D1-2486.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DSPSR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DSPSR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    return DSPSR_EL0;
```

MSR DSPSR_EL0, <Xt>

op0	op1	CRn	CRm	op2

```
if !Halted() then
    UNDEFINED;
else
    DSPSR_EL0 = X[t];
```

D13.3.15 MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

Configurations

AArch64 System register MDCCINT_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDCCINT](#)[31:0].

Attributes

MDCCINT_EL1 is a 64-bit register.

Field descriptions

Bits [63:31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

0b0 No interrupt request generated by DTRRX.

0b1 Interrupt request will be generated on RXfull == 1.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

0b0 No interrupt request generated by DTRTX.

0b1 Interrupt request will be generated on TXfull == 0.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [28:0]

Reserved, RES0.

Accessing MDCCINT_EL1

Accesses to this register use the following encodings in the System register encoding space:

elseif PSTATE.EL == EL3 then
    MDCCINT_EL1 = X[t];

```

D13.3.16 MDCCSR_EL0, Monitor DCC Status Register

The MDCCSR_EL0 characteristics are:

Purpose

Read-only register containing control status flags for the DCC.

Configurations

AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to External register [EDSCR](#)[30:29].

AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to AArch32 System register [DBGDSCRint](#)[30:29].

Attributes

MDCCSR_EL0 is a 64-bit register.

Field descriptions

Bits [63:31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the [EDSCR](#).

TXfull, bit [29]

DTRTX full. Read-only view of the equivalent bit in the [EDSCR](#).

Bits [28:19]

Reserved, RES0.

```

D13.3.17 MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

Configurations

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HDCR](#)[31:0].

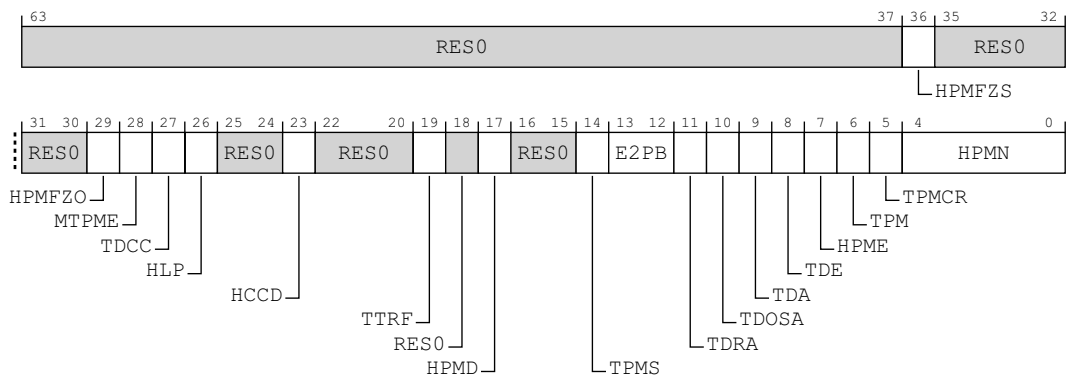

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MDCR_EL2 is a 64-bit register.

Field descriptions

Bits [63:37]

Reserved, RES0.

HPMFZS, bit [36]

When FEAT_SPEv1p2 is implemented:

HPMFZS

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when [PMBLIMITR_EL1](#).{PMFZ, E} == {1, 1} and [PMBSR_EL1](#).S == 1.

0b0 Do not freeze on Statistical Profiling Buffer Management event.

0b1 Event counters do not count following a Statistical Profiling Buffer Management event.

If MDCR_EL2.HPMN is less than [PMCR_EL0](#).N, this field affects the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].

If MDCR_EL2.HPMN is equal to [PMCR_EL0](#).N, this field has no effect.

This field does not affect the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)] and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:30]

Reserved, RES0.

HPMFZO, bit [29]

When FEAT_PMUv3p7 is implemented:

HPMFZO

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

0b0 Do not freeze on overflow.

0b1 Event counters do not count when
[PMOVSLR_EL0](#)[([PMCR_EL0](#).N-1):[MDCR_EL2](#).HPMN] is nonzero.

If [MDCR_EL2](#).HPMN is less than [PMCR_EL0](#).N, this field affects the operation of event counters in the range [[MDCR_EL2](#).HPMN .. ([PMCR_EL0](#).N-1)].

If [MDCR_EL2](#).HPMN is equal to [PMCR_EL0](#).N, this field has no effect.

This field does not affect the operation of event counters in the range [0 .. ([MDCR_EL2](#).HPMN-1)] and [PMCCNTR_EL0](#).

The operation of this field ignores the values of [PMOVSLR_EL0](#)[([MDCR_EL2](#).HPMN-1):0].

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented and EL3 is not implemented:

MTPME

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>_EL0](#).MT bits.

0b0 [FEAT_MTPMU](#) is disabled. The Effective value of [PMEVTYPER<n>_EL0](#).MT is zero.

0b1 [PMEVTYPER<n>_EL0](#).MT bits not affected by this field.

If [FEAT_MTPMU](#) is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

TDCC

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

0b0 This control does not cause any register accesses to be trapped.

0b1 If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception.

Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: [OSDTRRX_EL1](#), [OSDTRTX_EL1](#), [MDCCSR_EL0](#), [MDCCINT_EL1](#), and, when the PE is in Non-debug state, [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL2.TDCC does not trap any accesses to:

AArch64: [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HLP, bit [26]

When FEAT_PMUv3p5 is implemented:

HLP

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

- | | |
|-----|--|
| 0b0 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0] . |
| 0b1 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0] . |

If MDCR_EL2.HPMN is less than [PMCR_EL0.N](#) or [PMCR.N](#), this bit affects the operation of event counters in the range [[MDCR_EL2.HPMN](#)..[PMCR_EL0.N-1](#)] or [[MDCR_EL2.HPMN](#)..[PMCR.N-1](#)]. Otherwise this bit has no effect on the operation of the event counters.

————— Note —————

The effect of MDCR_EL2.HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the MDCR_EL2.HPMN field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [25:24]

Reserved, RES0.

HCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

HCCD

Hypervisor Cycle Counter Disable. Prohibits `PMCCNTR_EL0` from counting at EL2.

0b0 Cycle counting by `PMCCNTR_EL0` is not affected by this mechanism.

0b1 Cycle counting by `PMCCNTR_EL0` is prohibited at EL2.

This field does not affect the `CPU_CYCLES` event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

When `FEAT_TRF` is implemented:

TTRF

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to `TRFCR_EL1` is trapped to EL2, reported using EC syndrome value 0x18.
- Access to `TRFCR` is trapped to EL2, reported using EC syndrome value 0x03.

0b0 Accesses to `TRFCR_EL1` and `TRFCR` at EL1 are not affected by this control.

0b1 Accesses to `TRFCR_EL1` and `TRFCR` at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When `FEAT_PMUv3p1` is implemented and `FEAT_Debugv8p2` is implemented:

HPMD

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

0b0 Event counting and `PMCCNTR_EL0` are not affected by this mechanism.

0b1 Event counting by some event counters is prohibited at EL2. If `PMCR_EL0.DP` is 1, `PMCCNTR_EL0` is disabled at EL2. Otherwise, `PMCCNTR_EL0` is not affected by this mechanism.

This field applies only to:

- The event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- If `PMCR_EL0.DP` is 1, `PMCCNTR_EL0`.

The other event counters are not affected. When `PMCR_EL0.DP` is 0, `PMCCNTR_EL0` is not affected.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When `FEAT_PMUv3p1` is implemented:

HPMD

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

0b0 Event counting and `PMCCNTR_EL0` are not affected by this mechanism.

0b1 If ExternalSecureNoninvasiveDebugEnabled () is FALSE, event counting by some event counters is prohibited at EL2, and if [PMCR_EL0.DP](#) is 1, [PMCCNTR_EL0](#) is disabled at EL2.

If ExternalSecureNoninvasiveDebugEnabled () is TRUE, the event counters and [PMCCNTR_EL0](#) are not affected by this field.

Otherwise, this field applies only to:

- The event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- If [PMCR_EL0.DP](#) is 1, [PMCCNTR_EL0](#).

The other event counters are not affected. When [PMCR_EL0.DP](#) is 0, [PMCCNTR_EL0](#) is not affected.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:15]

Reserved, RES0.

TPMS, bit [14]

When FEAT_SPE is implemented:

TPMS

Trap Performance Monitor Sampling. If EL2 is implemented and enabled in the current Security state, controls access to Statistical Profiling control registers from EL1.

0b0 Do not trap Statistical Profiling controls to EL2.

0b1 If EL2 is implemented and enabled in the current Security state, accesses to Statistical Profiling control registers at EL1 generate a Trap exception to EL2.

The Statistical Profiling control registers trapped by this control are:

- [PMSCR_EL1](#), [PMSEVFR_EL1](#), [PMSFCR_EL1](#), [PMSICR_EL1](#), [PMSIDR_EL1](#), [PMSIRR_EL1](#), and [PMSLATFR_EL1](#).
- If FEAT_SPEv1p2 is implemented, [PMSNEVFR_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2PB, bits [13:12]

When FEAT_SPE is implemented:

E2PB

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

0b00 If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&0 stage 1 translation regime.

If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.

- 0b10 Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
- 0b11 Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: [PMBLIMITR_EL1](#), [PMBPTR_EL1](#), and [PMBSR_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to [MDRAR_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
 - [DBGDRAR](#), [DBGDSAR](#).

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by [DBGDSCRExt.UDCCdis](#) or [MDSCR_EL1.TDCC](#).

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1.
- [HCR_EL2.TGE](#) == 1.

———— **Note** —————

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

TDOSA

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [OSLAR_EL1](#), [OSLSR_EL1](#), [OSDLR_EL1](#), and [DBGPRCR_EL1](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
 - [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and [DBGPRCR](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- 0b0 This control does not cause any instructions to be trapped.
- 0b1 EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

———— **Note** —————

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1.
- [HCR_EL2.TGE](#) == 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

TDOSA

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [OSLAR_EL1](#), [OSLSR_EL1](#), and [DBGPRCR_EL1](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
 - [DBGOSLSR](#), [DBGOSLAR](#), and [DBGPRCR](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [OSDLR_EL1](#) are trapped.

It is IMPLEMENTATION DEFINED whether accesses to [DBGOSDLR](#) are trapped.

- 0b0 This control does not cause any instructions to be trapped.
- 0b1 EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

———— **Note** —————

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1.
- [HCR_EL2.TGE](#) == 1.

———— **Note** ————

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR_EL2.TDRA or MDCR_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x18:
 - MDCCSR_EL0, MDCCINT_EL1, OSDTRRX_EL1, MDSCR_EL1, OSDTRTX_EL1, OSECCR_EL1, DBGBVR<n>_EL1, DBGBCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_EL1, DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1.
 - When not in Debug state, DBGDTR_EL0, DBGDTRRX_EL0, DBGDTRTX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05.
 - DBGDIDR, DBGDSCRint, DBGDCCINT, DBGWFAR, DBGVCR, DBGDSCRext, DBGDTRTXext, DBGDTRRXext, DBGBVR<n>, DBGBCR<n>, DBG BXVR<n>, DBGWCR<n>, DBGWVR<n>, DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBG OSECCR.
 - When not in Debug state, DBGDTRRXint and DBGDTRTXint.
- In AArch32 state, STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint are trapped to EL2, reported using EC syndrome value 0x06.

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception.

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

Traps of AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0 are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1
- HCR_EL2.TGE == 1

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDE, bit [8]

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

0b0 The debug target Exception level is EL1.

0b1 If EL2 is enabled for the current Effective value of SCR_EL3.NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1.

The MDCR_EL2.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see [Routing debug exceptions on page D2-2569](#).

This field is treated as being 1 for all purposes other than a direct read when `HCR_EL2.TGE == 1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPME, bit [7]

When FEAT_PMUv3 is implemented:

HPME

[MDCR_EL2.HPMN..(N-1)] event counters enable.

0b0 Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are disabled.

0b1 Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are enabled by `PMCNTENSET_EL0`.

If MDCR_EL2.HPMN is less than `PMCR_EL0.N` or `PMCR.N`, the event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] or [HDCR.HPMN..(PMCR.N-1)], are enabled and disabled by this bit. Otherwise this bit has no effect on the operation of the event counters.

Note

The effect of MDCR_EL2.HPMN on the operation of this bit applies regardless of whether EL2 is enabled in the current Security state.

For more information see the description of the HPMN field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

TPM

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - `PMCR_EL0`, `PMCNTENSET_EL0`, `PMCNTENCLR_EL0`, `PMOVSCLR_EL0`, `PMSWINC_EL0`, `PMSELR_EL0`, `PMCEID0_EL0`, `PMCEID1_EL0`, `PMCCNTR_EL0`, `PMXEVTYPER_EL0`, `PMXVCNTR_EL0`, `PMUSERENR_EL0`, `PMINTENSET_EL1`, `PMINTENCLR_EL1`, `PMOVSSET_EL0`, `PMEVCNTR<n>_EL0`, `PMEVTYPER<n>_EL0`, `PMCCFILTR_EL0`.
 - If `FEAT_PMUv3p4` is implemented, `PMMIR_EL1`
 - In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value 0x04:
 - `PMCR`, `PMCNTENSET`, `PMCNTENCLR`, `PMOVS`, `PMSWINC`, `PMSELR`, `PMCEID0`, `PMCEID1`, `PMCCNTR`, `PMXEVTYPER`, `PMXVCNTR`, `PMUSERENR`, `PMINTENSET`, `PMINTENCLR`, `PMOVSSET`, `PMEVCNTR<n>`, `PMEVTYPER<n>`, `PMCCFILTR`.
 - If `FEAT_PMUv3p1` is implemented, `PMCEID2`, and `PMCEID3`.
 - If `FEAT_PMUv3p4` is implemented, `PMMIR`.
- 0b0 This control does not cause any instructions to be trapped.

0b1 EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.

———— **Note** ————

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When FEAT_PMUv3 is implemented:

TPMCR

Trap [PMCR_ELO](#) or [PMCR](#) accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [PMCR_ELO](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to [PMCR](#) are trapped to EL2, reported using EC syndrome value 0x03.

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 and EL1 accesses to the [PMCR_ELO](#) or [PMCR](#) are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by [PMUSERENR.EN](#) or [PMUSERENR_ELO.EN](#).

———— **Note** ————

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]

When FEAT_PMUv3 is implemented:

HPMN

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is less than [PMCR_ELO.N](#), HPMN divides the Performance Monitors into two ranges: [0..(HPMN-1)] and [HPMN..([PMCR_ELO.N](#)-1)].

For an event counter in the range [0..(HPMN-1)]:

- The counter is accessible from EL3, EL2, and EL1, and from EL0 if permitted by [PMUSERENR_ELO](#) or [PMUSERENR](#).
- If [FEAT_PMUv3p5](#) is implemented, [PMCR_ELO.LP](#) or [PMCR.LP](#) determines whether the counter overflow flag is set on unsigned overflow of [PMEVCNTR<n>_ELO\[31:0\]](#) or [PMEVCNTR<n>_ELO\[63:0\]](#).
- The counter is enabled by [PMCR_ELO.E](#) or [PMCR.E](#) and bit <n> of [PMCNTENSET_ELO](#).

Note

If HPMN is equal to `PMCR_EL0.N`, this applies to all event counters.

If HPMN is less than `PMCR_EL0.N`, for an event counter in the range `[HPMN..(PMCR_EL0.N-1)]`:

- The counter is accessible from EL2 and EL3.
- If `FEAT_SEL2` is disabled or is not implemented, the counter is also accessible from Secure EL1, and from Secure EL0 if permitted by `PMUSERENR_EL0`.
- If `FEAT_PMUv3p5` is implemented, `MDCR_EL2.HLP` or `HDCR.HLP` determines whether the counter overflow flag is set on unsigned overflow of `PMEVCNTR<n>_EL0[31:0]` or `PMEVCNTR<n>_EL0[63:0]`.
- The counter is enabled by `MDCR_EL2.HPME` or `HDCR.HPME` and bit `<n>` of `PMCNTENSET_EL0`.

If this field is set to 0, or to a value larger than `PMCR_EL0.N`, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of `MDCR_EL2.HPMN` is UNKNOWN.
- Either:
 - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if `MDCR_EL2.HPMN` is set to an UNKNOWN non-zero value less than or equal to `PMCR_EL0.N`.
 - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in `PMCR_EL0.N`.

Otherwise:

Reserved, RES0.

Accessing MDCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority
when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elseif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);

```

```

else
    return MDCR_EL2;
elseif PSTATE.EL == EL3 then
    return MDCR_EL2;

```

MSR MDCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority
when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elseif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        MDCR_EL2 = X[t];
elseif PSTATE.EL == EL3 then
    MDCR_EL2 = X[t];

```

D13.3.18 MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

Configurations

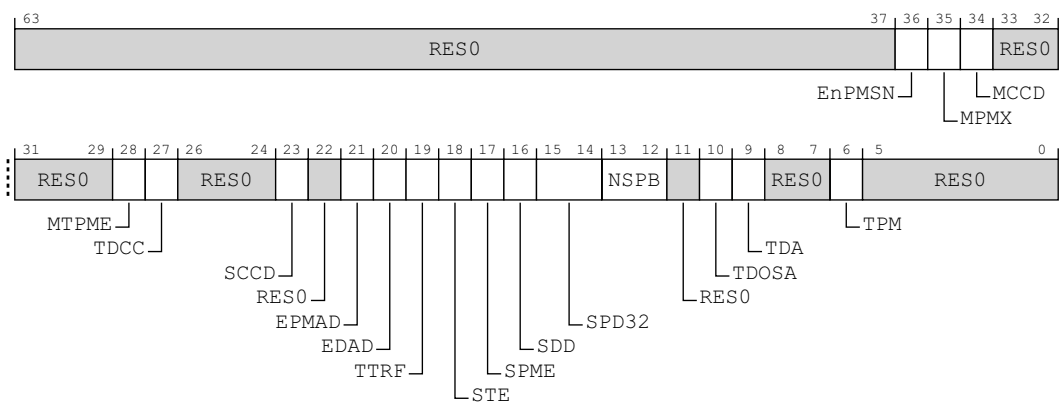

AArch64 System register MDCR_EL3 bits [31:0] can be mapped to AArch32 System register SDCR[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

Attributes

MDCR_EL3 is a 64-bit register.

Field descriptions

Bits [63:37]

Reserved, RES0.

EnPMSN, bit [36]

When FEAT_SPEv1p2 is implemented:

EnPMSN

Trap accesses to PMSNEVFR_EL1. Controls access to Statistical Profiling PMSNEVFR_EL1 System register from EL2 and EL1.

0b0 Accesses to PMSNEVFR_EL1 at EL2 and EL1 generate a Trap exception to EL3.

0b1 Do not trap PMSNEVFR_EL1 to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MPMX, bit [35]

When FEAT_PMUv3p7 is implemented:

MPMX

Monitor Performance Monitors Extended control. In conjunction with MDCR_EL3.SPME, controls when event counters are enabled at EL3 and in other Secure Exception levels.

- 0b0 Event counting and `PMCCNTR_EL0` are not affected by this mechanism.
- 0b1 Event counting by some or all event counters is prohibited at EL3. If `PMCR_EL0.DP` is 1, `PMCCNTR_EL0` is disabled at EL3. Otherwise, `PMCCNTR_EL0` is not affected by this mechanism.

If EL2 is implemented, `MDCR_EL3.SPME == 1`, and `MDCR_EL2.HPMN` is less than `PMCR_EL0.N` then all the following are true:

- This field affects the operation of event counters in the range $[0 .. (\text{MDCR_EL2.HPMN}-1)]$ at EL3, and if `PMCR_EL0.DP` is 1, the operation of `PMCCNTR_EL0` at EL3.
- This field does not affect the operation of event counters in the range $[\text{MDCR_EL2.HPMN} .. (\text{PMCR_EL0.N}-1)]$.
- This applies even when EL2 is disabled in Secure state.

If EL2 is not implemented, `MDCR_EL3.SPME == 0`, or `MDCR_EL2.HPMN` is equal to `PMCR_EL0.N` then this field affects the operation of all event counters at EL3, and if `PMCR_EL0.DP` is 1, the operation of `PMCCNTR_EL0` at EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

MCCD, bit [34]

When FEAT_PMUv3p7 is implemented:

MCCD

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, `PMCCNTR_EL0`, from counting at EL3.

- 0b0 Cycle counting by `PMCCNTR_EL0` is not affected by this mechanism.
- 0b1 Cycle counting by `PMCCNTR_EL0` is prohibited at EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [33:29]

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented:

MTPME

Multi-threaded PMU Enable. Enables use of the `PMEVTYPER<n>_EL0.MT` bits.

- 0b0 `FEAT_MTPMU` is disabled. The Effective value of `PMEVTYPER<n>_EL0.MT` is zero.
- 0b1 `PMEVTYPER<n>_EL0.MT` bits not affected by this field.

If `FEAT_MTPMU` is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

TDCC

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

0b0 This control does not cause any register accesses to be trapped.

0b1 Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception.

Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: [OSDTRRX_EL1](#), [OSDTRTX_EL1](#), [MDCCSR_EL0](#), [MDCCINT_EL1](#), and, when the PE is in Non-debug state, [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [26:24]

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

SCCD

Secure Cycle Counter Disable. Prohibits [PMCCNTR_EL0](#) from counting in Secure state.

0b0 Cycle counting by [PMCCNTR_EL0](#) is not affected by this mechanism.

0b1 Cycle counting by [PMCCNTR_EL0](#) is prohibited in Secure state.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

EPMAD, bit [21]

When FEAT_Debug8p4 is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

EPMAD

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

0b0 Non-secure access to Performance Monitor registers from external debugger is permitted.

0b1 Non-secure access to Performance Monitor registers from external debugger is not permitted.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

EPMAD

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

0b0 Access to Performance Monitor registers from external debugger is permitted.

0b1 Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]

When FEAT_Debug8p4 is implemented:

EDAD

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

0b0 Non-secure access to debug registers from external debugger is permitted.

0b1 Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debug8p2 is implemented:

EDAD

External Debug Access Disable. Controls access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

- 0b0 Access to debug registers, and to [OSLAR_EL1](#) from external debugger is permitted.
- 0b1 Access to breakpoint and watchpoint registers, and to [OSLAR_EL1](#) from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

EDAD

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally [OSLAR_EL1](#) registers by an external debugger.

- 0b0 Access to debug registers from external debugger is permitted.
- 0b1 Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the [OSLAR_EL1](#) register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TTRF, bit [19]

When FEAT_TRF is implemented:

TTRF

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- [TRFCR_EL2](#), [TRFCR_EL12](#), [TRFCR_EL1](#), reported using EC syndrome value 0x18.
- [HTRFCR](#) and [TRFCR](#), reported using EC syndrome value 0x03.

- 0b0 Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.
- 0b1 Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.

Otherwise:

Reserved, RES0.

STE, bit [18]

When FEAT_TRF is implemented:

STE

Secure Trace enable. Enables tracing in Secure state.

- 0b0 Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
- 0b1 Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See [Register controls to enable self-hosted trace on page D3-2628](#).

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When FEAT_PMUv3 is implemented and FEAT_PMUv3p7 is implemented:

SPME

Secure Performance Monitors Enable. Controls event counting in Secure state and EL3.

0b0 When MDCR_EL3.MPMX == 0: Event counting is prohibited in Secure state. If [PMCR_EL0.DP](#) is 1, [PMCCNTR_EL0](#) is disabled in Secure state. Otherwise, [PMCCNTR_EL0](#) is not affected by this mechanism.

0b1 When MDCR_EL3.MPMX == 0: Event counting and [PMCCNTR_EL0](#) are not affected by this mechanism.

When MDCR_EL3.MPMX is 0, this field affects the operation of all event counters in Secure state, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) in Secure state.

When MDCR_EL3.MPMX is 1, this field affects the operation of event counters at EL3 only, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) at EL3 only. See MDCR_EL3.MPMX for more information.

When [PMCR_EL0.DP](#) is 0, [PMCCNTR_EL0](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

SPME

Secure Performance Monitors Enable. Controls event counting in Secure state.

0b0 Event counting is prohibited in Secure state. If [PMCR_EL0.DP](#) is 1, [PMCCNTR_EL0](#) is disabled in Secure state. Otherwise, [PMCCNTR_EL0](#) is not affected by this mechanism.

0b1 Event counting and [PMCCNTR_EL0](#) are not affected by this mechanism.

This field affects the operation of all event counters in Secure state, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) in Secure state. When [PMCR_EL0.DP](#) is 0, [PMCCNTR_EL0](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented:

SPME

Secure Performance Monitors Enable. Controls event counting in Secure state.

0b0 If `ExternalSecureNoninvasiveDebugEnabled()` is FALSE, event counting is prohibited in Secure state, and if [PMCR_EL0.DP](#) is 1, [PMCCNTR_EL0](#) is disabled in Secure state.

0b1 Event counting and [PMCCNTR_EL0](#) are not affected by this mechanism.

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, the event counters and [PMCCNTR_EL0](#) are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) in Secure state. When [PMCR_EL0.DP](#) is 0, [PMCCNTR_EL0](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SDD, bit [16]

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

0b0 Debug exceptions in Secure state are not affected by this bit.

0b1 Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of [SCR_EL3.RW](#) is 0b1.

If Secure EL2 is implemented and enabled, and Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER32_EL3.SUIDEN](#) is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SPD32, bits [15:14]

When EL1 is capable of using AArch32:

SPD32

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

0b00 Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.

0b10 Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.

0b11 Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of [SCR_EL3.RW](#) is 0b0.

If Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER32_EL3.SUIDEN](#) is 0b1.

If EL3 is not implemented and the Effective value of `SCR_EL3.NS` is `0b0`, then the Effective value of this field is `0b11`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPB, bits [13:12]

When *FEAT_SPE* is implemented:

NSPB

Non-secure Profiling Buffer. Controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

- | | |
|-------------------|--|
| <code>0b00</code> | Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3. |
| <code>0b01</code> | Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3. |
| <code>0b10</code> | Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3. |
| <code>0b11</code> | Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3. |

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- `PMBLIMITR_EL1`, `PMBPTR_EL1`, `PMBSR_EL1`, `PMSCR_EL1`, `PMSCR_EL2`, `PMSCR_EL12`, `PMSEVFR_EL1`, `PMSFCR_EL1`, `PMSICR_EL1`, `PMSIDR_EL1`, `PMSIRR_EL1`, and `PMSLATFR_EL1`.
- If `FEAT_SPEv1p2` is implemented, `PMSNEVFR_EL1`.

If EL3 is not implemented and the Effective value of `SCR_EL3.NS` is 1, then the Effective value of this field is `0b11`.

If EL3 is not implemented and the Effective value of `SCR_EL3.NS` is 0, then the Effective value of this field is `0b01`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TDOSA, bit [10]

When *FEAT_DoubleLock* is implemented:

TDOSA

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, [OSLAR_EL1](#), [OSLSR_EL1](#), [OSDLR_EL1](#), [DBGPRCR_EL1](#), and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to [DBGOSLAR](#), [DBGOSLSR](#), [DBGOSDLR](#), and [DBGPRCR](#), are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

0b0 This control does not cause any instructions to be trapped.

0b1 EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by [HDCR.TDOSA](#) or [MDCR_EL2.TDOSA](#).

———— **Note** ————

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

TDOSA

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: [OSLAR_EL1](#), [OSLSR_EL1](#), and [DBGPRCR_EL1](#).
- AArch32: [DBGOSLAR](#), [DBGOSLSR](#), and [DBGPRCR](#).
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to [OSDLR_EL1](#) and [DBGOSDLR](#) are trapped.

0b0 This control does not cause any instructions to be trapped.

0b1 EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by [HDCR.TDOSA](#) or [MDCR_EL2.TDOSA](#).

———— **Note** ————

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the [MDCR_EL3.TDOSA](#) field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
 - [DBGBVR<n>_EL1](#), [DBGBCR<n>_EL1](#), [DBGWVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGCLAIMSET_EL1](#), [DBGCLAIMCLR_EL1](#), [DBGAUTHSTATUS_EL1](#), [DBGVCR32_EL2](#).

- AArch64: `MDCR_EL2`, `MDRAR_EL1`, `MDCCSR_EL0`, `MDCCINT_EL1`, `MDSR_EL1`, `OSDTRRX_EL1`, `OSDTRTX_EL1`, `OSECCR_EL1`.
 - In AArch32 state, `SDER` is trapped to EL3 and reported using EC syndrome value `0x03`.
 - In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value `0x05`, accesses using MCRR or MRRC are reported using EC syndrome value `0x0C`:
 - `HDCR`, `DBGDRAR`, `DBGDSAR`, `DBGDIDR`, `DBGDCCINT`, `DBGWFR`, `DBGVCR`, `DBGBVR<n>`, `DBGBCR<n>`, `DBGBXVR<n>`, `DBGWCR<n>`, `DBGWVR<n>`.
 - `DBGCLAIMSET`, `DBGCLAIMCLR`, `DBGAUTHSTATUS`, `DBGDEVID`, `DBGDEVID1`, `DBGDEVID2`, `DBGOSECCR`.
 - In AArch32 state, STC accesses to `DBGDTRRXint` and LDC accesses to `DBGDTRTXint` are reported using EC syndrome value `0x06`.
 - When not in Debug state, the following registers are also trapped to EL3:
 - AArch64 accesses to `DBGDTR_EL0`, `DBGDTRRX_EL0`, and `DBGDTRTX_EL0`, reported using EC syndrome value `0x18`.
 - AArch32 accesses using MCR or MRC to `DBGDTRRXint` and `DBGDTRTXint`, reported using EC syndrome value `0x05`.
- `0b0` This control does not cause any instructions to be trapped.
- `0b1` EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by `MDCR_EL3.TDOSA`, are trapped to EL3, from both Security states and both Execution states, unless it is trapped by `DBGDSCRExt.UDCCdis`, `MDSR_EL1.TDCC`, `HDCR.TDA` or `MDCR_EL2.TDA`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:7]

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

TPM

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1, and EL2 to EL3, from both Security states and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value `0x18`:
 - `PMCR_EL0`, `PMCNTENSET_EL0`, `PMCNTENCLR_EL0`, `PMOVSCLR_EL0`, `PMSWINC_EL0`, `PMSELR_EL0`, `PMCEID0_EL0`, `PMCEID1_EL0`, `PMCCNTR_EL0`, `PMXEVTYPYPER_EL0`, `PMXVCNTR_EL0`, `PMUSERENR_EL0`, `PMINTENSET_EL1`, `PMINTENCLR_EL1`, `PMOVSSET_EL0`, `PMEVCNTR<n>_EL0`, `PMEVTYPYPER<n>_EL0`, `PMCCFILTR_EL0`.
 - If `FEAT_PMUv3p4` is implemented, `PMMIR_EL1`.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value `0x03`, accesses using MCRR or MRRC are reported using EC syndrome value `0x04`:
 - `PMCR`, `PMCNTENSET`, `PMCNTENCLR`, `PMOVS`, `PMSWINC`, `PMSELR`, `PMCEID0`, `PMCEID1`, `PMCCNTR`, `PMXEVTYPYPER`, `PMXVCNTR`, `PMUSERENR`, `PMINTENSET`, `PMINTENCLR`, `PMOVSSET`, `PMEVCNTR<n>`, `PMEVTYPYPER<n>`, `PMCCFILTR`.
 - If `FEAT_PMUv3p1` is implemented, `PMCEID2`, and `PMCEID3`.

— If `FEAT_PMUv3p4` is implemented, `PMMIR`.

0b0 This control does not cause any instructions to be trapped.

0b1 EL2, EL1, and EL0 System register accesses to all Performance Monitor registers are trapped to EL3, unless it is trapped by `HDCCR.TPM` or `MDCR_EL2.TPM`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

Accessing `MDCR_EL3`

Accesses to this register use the following encodings in the System register encoding space:

MRS `<Xt>`, `MDCR_EL3`

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MDCR_EL3;
```

MSR `MDCR_EL3`, `<Xt>`

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MDCR_EL3 = X[t];
```

D13.3.19 MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

Configurations

AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register [DBGDRAR](#)[63:0].

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

Bits [63:52]

Reserved, RES0.

ROMADDR, bits [51:12]

When FEAT_LPA is implemented:

ROMADDR, bits [39:0]

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR_EL1.Valid == 0b00, then this field is UNKNOWN.

The upper part of the address value.

If the physical address size in bits (PAsize) is less than 52, then the register bits corresponding to ROMADDR [39:PAsize] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LPA is not implemented or AArch32 is supported at EL0:

Bits [39:36]

Reserved, RES0.

ROMADDR, bits [35:0]

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR_EL1.Valid == 0b00, then this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

0b00 ROM Table address is not valid. Software must ignore ROMADDR.

0b11 ROM Table address is valid.

Other values are reserved.

Arm recommends implementations set this field to zero.

Accessing MDRAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDRAR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if HalTED() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority
when SDD == '1'" && MDCR_EL3.TDA == '1' then
    UNDEFINED;
    elseif EL2Enabled() && MDCR_EL2.<TDE,TDRA> != '00' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elseif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
        if HalTED() && EDSCR.SDD == '1' then
            UNDEFINED;
        else

```

```
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return MDRAR_EL1;
    elsif PSTATE.EL == EL2 then
        if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority
when SDD == '1'" && MDCR_EL3.TDA == '1' then
            UNDEFINED;
        elsif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
            if Halted() && EDSCR.SDD == '1' then
                UNDEFINED;
            else
                AArch64.SystemAccessTrap(EL3, 0x18);
        else
            return MDRAR_EL1;
    elsif PSTATE.EL == EL3 then
        return MDRAR_EL1;
```

D13.3.20 MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

Purpose

Main control register for the debug implementation.

Configurations

AArch64 System register MDSCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDSCRExt](#)[31:0].

AArch64 System register MDSCR_EL1 bit [15] is architecturally mapped to AArch32 System register [DBGDSCRint](#)[15].

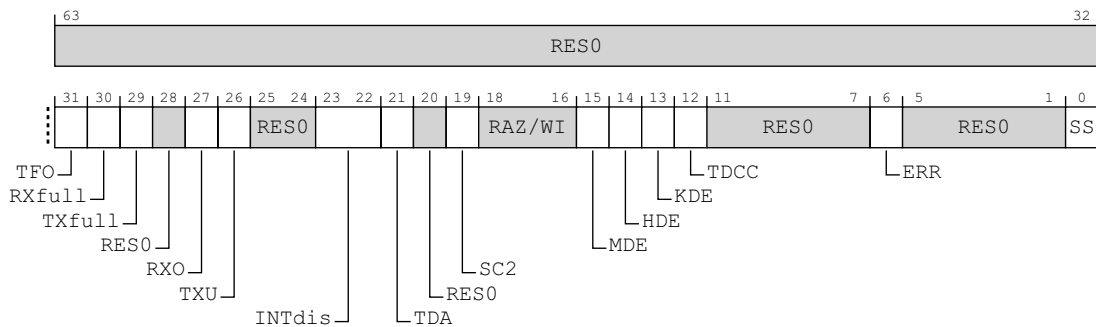

AArch64 System register MDSCR_EL1 bit [12] is architecturally mapped to AArch32 System register [DBGDSCRint](#)[12].

AArch64 System register MDSCR_EL1 bits [5:2] are architecturally mapped to AArch32 System register [DBGDSCRint](#)[5:2].

Attributes

MDSCR_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

TFO, bit [31]

When FEAT_TRF is implemented:

TFO

Trace Filter override. Used for save/restore of [EDSCR.TFO](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TFO](#). Reads and writes of this bit are indirect accesses to [EDSCR.TFO](#).

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is RW.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is RO.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

Used for save/restore of [EDSCR.RXfull](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.RXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXfull](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is RW.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is RO.

TXfull, bit [29]

Used for save/restore of [EDSCR.TXfull](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXfull](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is RW.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is RO.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of [EDSCR.RXO](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.RXO](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXO](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is RW.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is RO.

TXU, bit [26]

Used for save/restore of [EDSCR.TXU](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TXU](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXU](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is RW.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is RO.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of [EDSCR.INTdis](#).

When [OSLSR_EL1.OSLK](#) == 0, and software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this field holds the value of [EDSCR.INTdis](#). Reads and writes of this field are indirect accesses to [EDSCR.INTdis](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is RW.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is RO.

TDA, bit [21]

Used for save/restore of [EDSCR.TDA](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TDA](#). Reads and writes of this bit are indirect accesses to [EDSCR.TDA](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is RW.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is RO.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:

SC2

Used for save/restore of [EDSCR.SC2](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.SC2](#). Reads and writes of this bit are indirect accesses to [EDSCR.SC2](#).

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is RW.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [18:16]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

0b0 Breakpoint, Watchpoint, and Vector Catch exceptions disabled.

0b1 Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HDE, bit [14]

Used for save/restore of [EDSCR.HDE](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.HDE](#). Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is RW.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is RO.

KDE, bit [13]

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D . Permitted values are:

0b0 Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D .

0b1 All debug exceptions enabled within EL_D .

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDCC, bit [12]

Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
 - [MDCCSR_EL0](#).
 - If not in Debug state, [DBGDTR_EL0](#), [DBGDTRTX_EL0](#), and [DBGDTRRX_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x05.
 - [DBGDSCRint](#), [DBGDIDR](#), [DBGDSAR](#), [DBGDRAR](#).
 - If not in Debug state, [DBGDTRRXint](#), and [DBGDTRTXint](#).
- In AArch32 state, LDC access to [DBGDTRRXint](#) and STC access to [DBGDTRTXint](#) are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#) are trapped, reported using EC syndrome value 0x0C.

0b0 This control does not cause any instructions to be trapped.

0b1 EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped.
 EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of [EDSCR.ERR](#).

When `OSLSR_EL1.OSLK == 0`, software must treat this bit as UNK/SBZP.

When `OSLSR_EL1.OSLK == 1`, this bit holds the value of `EDSCR.ERR`. Reads and writes of this bit are indirect accesses to `EDSCR.ERR`.

The reset behavior of this field is:

- The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When `OSLSR_EL1.OSLK == 1`, access to this field is RW.
- When `OSLSR_EL1.OSLK == 0`, access to this field is RO.

Bits [5:1]

Reserved, RES0.

SS, bit [0]

Software step control bit. If `ELD` is using AArch64, enable Software step. Permitted values are:

0b0 Software step disabled

0b1 Software step enabled.

RES0 if `ELD` is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MDSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDSCR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0010	0b010

D13.3.21 OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

Purpose

Used to control the OS Double Lock.

Configurations

AArch64 System register OSDLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGOSDLR](#)[31:0].

Attributes

OSDLR_EL1 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

DLK, bit [0]

When FEAT_DoubleLock is implemented:

DLK

OS Double Lock control bit.

0b0 OS Double Lock unlocked.

0b1 OS Double Lock locked, if [DBGPRCR_EL1](#).CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

Accessing OSDLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSDLR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0011	0b100

D13.3.22 OSDTRRX_EL1, OS Lock Data Transfer Register, Receive

The OSDTRRX_EL1 characteristics are:

Purpose

Used for save and restore of [DBGDTRRX_EL0](#). It is a component of the Debug Communications Channel.

Configurations

AArch64 System register OSDTRRX_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXext](#)[31:0].

Attributes

OSDTRRX_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see [Chapter H4 The Debug Communication Channel and Instruction Transfer Register](#).

Accessing OSDTRRX_EL1

Arm deprecates reads and writes of OSDTRRX_EL1 when the OS Lock is unlocked.

Accesses to this register use the following encodings in the System register encoding space:

D13.3.24 OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of [EDECCR](#) that are otherwise invisible to software, so it can save/restore the contents of [EDECCR](#) over powerdown on behalf of the external debugger.

Configurations

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGOSECCR](#)[31:0].

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register [EDECCR](#)[31:0].

If [OSLSR_EL1.OSLK](#) == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

Attributes

OSECCR_EL1 is a 64-bit register.

Field descriptions

When [OSLSR_EL1.OSLK](#) == 1:

Bits [63:32]

Reserved, RES0.

EDECCR, bits [31:0]

Used for save/restore to [EDECCR](#) over powerdown.

Reads or writes to this field are indirect accesses to [EDECCR](#).

Accessing OSECCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSECCR_EL1

op0	op1	CRn	CRm	op2

D13.3.25 OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configurations

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to External register [OSLAR_EL1](#)[31:0].

The OS Lock can also be locked or unlocked using [DBGOSLAR](#).

Attributes

OSLAR_EL1 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use [OSLSR_EL1](#).OSLK to check the current status of the lock.

Accessing OSLAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MSR OSLAR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b100

```

D13.3.26 OLSR_EL1, OS Lock Status Register

The OLSR_EL1 characteristics are:

Purpose

Provides the status of the OS Lock.

Configurations

AArch64 System register OLSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGOSLSR](#)[31:0].

Attributes

OLSR_EL1 is a 64-bit register.

Field descriptions

Bits [63:4]

Reserved, RES0.

OSLM, bits [3, 0]

OS Lock model implemented. Identifies the form of OS save and restore mechanism implemented.

0b00 OS Lock not implemented.

0b10 OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OLSR_EL1[3].
- OSLM[0] is OLSR_EL1[0].

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]

OS Lock Status.

0b0 OS Lock unlocked.

0b1 OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Accessing OLSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSLSR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0001	0b100

```

D13.3.27 SDER32_EL2, AArch32 Secure Debug Enable Register

The SDER32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register [SDER](#) from Secure EL2 and EL3 only.

Configurations

AArch64 System register SDER32_EL2 bits [63:0] are architecturally mapped to AArch64 System register [SDER32_EL3](#)[63:0] when EL3 is implemented.

AArch64 System register SDER32_EL2 bits [31:0] are architecturally mapped to AArch32 System register [SDER](#)[31:0].

This register is present only when EL2 is implemented, FEAT_SEL2 is implemented and EL1 is capable of using AArch32. Otherwise, direct accesses to SDER32_EL2 are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

Attributes

SDER32_EL2 is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

0b0 This bit does not affect Performance Monitors event counting at Secure EL0.

0b1 If EL1 is using AArch32, Performance Monitors event counting is allowed in Secure EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SUIDEN, bit [0]

Secure User Invasive Debug Enable.

0b0 This bit does not affect the generation of debug exceptions at Secure EL0.

0b1 If EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SDER32_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SDER32_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0011	0b001

```

D13.3.28 SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

Purpose

Allows access to the AArch32 register [SDER](#) from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configurations

AArch64 System register SDER32_EL3 bits [63:0] are architecturally mapped to AArch64 System register [SDER32_EL2](#)[63:0] when EL2 is implemented and FEAT_SEL2 is implemented.

AArch64 System register SDER32_EL3 bits [31:0] are architecturally mapped to AArch32 System register [SDER](#)[31:0].

This register is present only when EL3 is implemented and EL1 is capable of using AArch32. Otherwise, direct accesses to SDER32_EL3 are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

Attributes

SDER32_EL3 is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

0b0 This bit does not affect Performance Monitors event counting at Secure EL0.

0b1 If EL1 is using AArch32, Performance Monitors event counting is allowed in Secure EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SUIDEN, bit [0]

Secure User Invasive Debug Enable.

0b0 This bit does not affect the generation of debug exceptions at Secure EL0.

0b1 If EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SDER32_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SDER32_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b001

```

D13.3.29 TRFCR_EL1, Trace Filter Control Register (EL1)

The TRFCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Trace.

Configurations

AArch64 System register TRFCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [TRFCR](#)[31:0].

This register is present only when FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR_EL1 are UNDEFINED.

Attributes

TRFCR_EL1 is a 64-bit register.

Field descriptions

Bits [63:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

0b01 Virtual timestamp. The traced timestamp is the physical counter value minus the value of [CNTVOFF_EL2](#).

0b10 *When FEAT_ECV is implemented:*

Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of [CNTPOFF_EL2](#):

- [SCR_EL3.ECVEn](#) == 0.
- [CNTHCTL_EL2.ECV](#) == 0.

0b11 Physical timestamp. The traced timestamp is the physical counter value.

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and [TRFCR_EL2.TS](#) != 0b00.
- `SelfHostedTraceEnabled()` == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

0b0 Trace is prohibited at EL1.

0b1 Trace is allowed at EL1.

This field is ignored if `SelfHostedTraceEnabled() == FALSE`.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

0b0 Trace is prohibited at EL0.

0b1 Trace is allowed at EL0.

This field is ignored if any of the following are true:

- `SelfHostedTraceEnabled() == FALSE`.
- EL2 is implemented and enabled in the current Security state and `HCR_EL2.TGE == 1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRFCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

D13.3.30 TRFCR_EL2, Trace Filter Control Register (EL2)

The TRFCR_EL2 characteristics are:

Purpose

Provides EL2 controls for Trace.

Configurations

AArch64 System register TRFCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HTRFCR](#)[31:0].

This register is present only when FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TRFCR_EL2 is a 64-bit register.

Field descriptions

Bits [63:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

0b00 Timestamp controlled by [TRFCR_EL1.TS](#) or [TRFCR.TS](#).

0b01 Virtual timestamp. The traced timestamp is the physical counter value minus the value of [CNTVOFF_EL2](#).

0b10 *When FEAT_ECV is implemented:*

Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of [CNTPOFF_EL2](#):

- [SCR_EL3.ECVEn](#) == 0.
- [CNTHCTL_EL2.ECV](#) == 0.

0b11 Physical timestamp. The traced timestamp is the physical counter value.

This field is ignored by the PE when `SelfHostedTraceEnabled()` == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [4]

Reserved, RES0.

CX, bit [3]

[CONTEXTIDR_EL2](#) and VMID trace enable.

0b0 [CONTEXTIDR_EL2](#) and VMID trace prohibited.

0b1 CONTEXTIDR_EL2 and VMID trace allowed.
This field is ignored if SelfHostedTraceEnabled() == FALSE.
The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.
0b0 Trace is prohibited at EL2.
0b1 Trace is allowed at EL2.
This field is ignored if SelfHostedTraceEnabled() == FALSE.
The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

E0HTRE, bit [0]

EL0 Trace Enable.
0b0 Trace is prohibited at EL0 when HCR_EL2.TGE == 1.
0b1 Trace is allowed at EL0 when HCR_EL2.TGE == 1.
This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is disabled in the current security state.
- HCR_EL2.TGE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRFCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

D13.4 Performance Monitors registers

This section lists the Performance Monitoring registers in AArch64.

D13.4.1 PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR_EL0](#), increments.

Configurations

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCCFILTR](#)[31:0].

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register [PMCCFILTR_EL0](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

Attributes

PMCCFILTR_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

0b0 Count cycles in EL1.

0b1 Do not count cycles in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

0b0 Count cycles in EL0.

0b1 Do not count cycles in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

NSK

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

NSU

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

NSH

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

0b0 Do not count cycles in EL2.

0b1 Count cycles in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

M

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

SH

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

PMCCFILTR_EL0 can also be accessed by using [PMXEVTYPYPER_EL0](#) with [PMSELR_EL0.SEL](#) set to 0b11111.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCCFILTR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b11110	0b11111	0b111

D13.4.2 PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See *Time as measured by the Performance Monitors cycle counter* on page D7-2852 for more information.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

Configurations

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCCNTR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b000

D13.4.3 PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

For more information about the common events and the use of the PMCEID<n>_EL0 registers see [The PMU event number space and common events on page D7-2875](#).

Configurations

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0](#)[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register [PMCEID2](#)[31:0].

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register [PMCEID0](#)[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register [PMCEID2](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

Attributes

PMCEID0_EL0 is a 64-bit register.

Field descriptions

IDhi<n>, bit [n+32], for n = 31 to 0

When FEAT_PMUv3p1 is implemented:

IDhi<n>

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

- 0b0 The common event is not implemented, or not counted.
- 0b1 The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

———— **Note** ————

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

———— **Note** ————

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event n.

For each bit:

0b0 The common event is not implemented, or not counted.

0b1 The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

———— **Note** ————

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

———— **Note** ————

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

D13.4.5 PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configurations

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENCLR](#)[31:0].

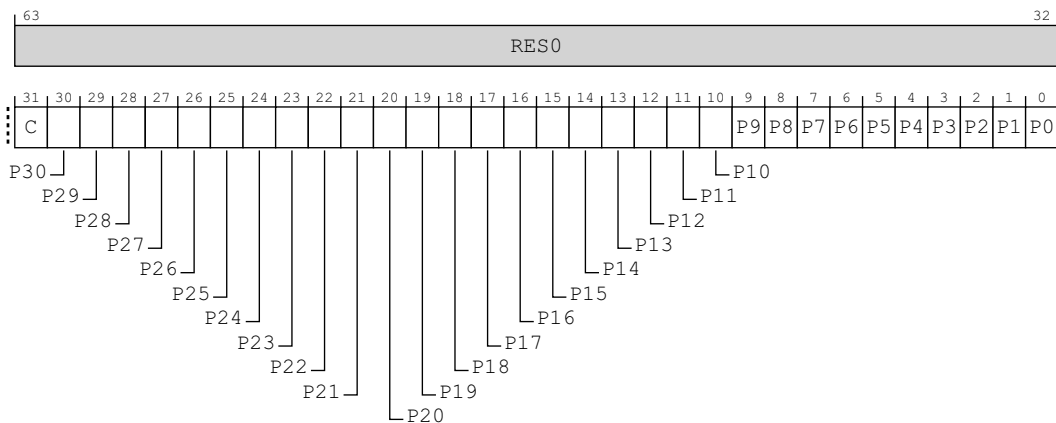

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to External register [PMCNTENCLR_EL0](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are UNDEFINED.

Attributes

PMCNTENCLR_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

C, bit [31]

[PMCCNTR_EL0](#) disable bit. Disables the cycle counter register. Possible values are:

- 0b0 When read, means the cycle counter is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

- 0b0 When read, means that [PMEVCNTR<n>_EL0](#) is disabled. When written, has no effect.

0b1 When read, means that `PMEVCNTR<n>_EL0` is enabled. When written, disables `PMEVCNTR<n>_EL0`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNENCLR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCNENCLR_EL0

D13.4.6 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configurations

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENSET](#)[31:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to External register [PMCNTENSET_EL0](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET_EL0 are UNDEFINED.

Attributes

PMCNTENSET_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

C, bit [31]

[PMCCNTR_EL0](#) enable bit. Enables the cycle counter register. Possible values are:

0b0 When read, means the cycle counter is disabled. When written, has no effect.

0b1 When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#). Otherwise, N is the value in [PMCR_EL0.N](#).

0b0 When read, means that [PMEVCNTR<n>_EL0](#) is disabled. When written, has no effect.

0b1 When read, means that `PMEVCNTR<n>_EL0` event counter is enabled. When written, enables `PMEVCNTR<n>_EL0`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENSET_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCNTENSET_EL0

```

D13.4.7 PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configurations

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCR](#)[31:0].

AArch64 System register PMCR_EL0 bits [7:0] are architecturally mapped to External register [PMCR_EL0](#)[7:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

Attributes

PMCR_EL0 is a 64-bit register.

Field descriptions

Bits [63:33]

Reserved, RES0.

FZS, bit [32]

When FEAT_SPEv1p2 is implemented:

FZS

Freeze-on-SPE event. Stop counters when [PMBLIMITR_EL1](#).{PMFZ,E} == {1,1} and [PMBSR_EL1](#).S == 1.

0b0 Do not freeze on Statistical Profiling Buffer Management event.

0b1 Event counters do not count following a Statistical Profiling Buffer Management event.

If EL2 is implemented, then:

- This field affects the operation of event counters in the range [0 .. ([MDCR_EL2](#).HPMN-1)].
- If [MDCR_EL2](#).HPMN is less than PMCR_EL0.N:
 - This field does not affect the operation of event counters in the range [[MDCR_EL2](#).HPMN .. (PMCR_EL0.N-1)].
- This applies even when EL2 is disabled in the current Security state.

This field does not affect the operation of [PMCCNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported at EL0, this field resets to 0.

- When the implementation only supports execution in AArch64 state, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMP, bits [31:24]

When FEAT_PMUv3p7 is not implemented:

IMP

Implementer code.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use MIDR_EL1 to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as MIDR_EL1.Implementer.

Use of this field is deprecated.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]

When PMCR_EL0.IMP != 0x00:

IDCODE

Identification code. Use of this field is deprecated. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is RO.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b00000-0b11111. If the value is 0b00000 then only PMCCNTR_EL0 is implemented. If the value is 0b11111 PMCCNTR_EL0 and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of MDCR_EL2.HPMN.

Access to this field is RO.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

FZO

Freeze-on-overflow. Stop event counters on overflow.

0b0 Do not freeze on overflow.

0b1 Event counters do not count when [PMOVSLR_EL0](#)[(N-1):0] is nonzero, where N is the value of [MDCR_EL2.HPMN](#) if EL2 is implemented, and [PMCR_EL0.N](#) otherwise.

If EL2 is implemented, then:

- This field affects the operation of event counters in the range [0 .. ([MDCR_EL2.HPMN](#)-1)].
- If [MDCR_EL2.HPMN](#) is less than [PMCR_EL0.N](#):
 - This field does not affect the operation of event counters in the range [[MDCR_EL2.HPMN](#) .. ([PMCR_EL0.N](#)-1)].
 - The operation of this field ignores the values of [PMOVSLR_EL0](#)[([PMCR_EL0.N](#)-1):[MDCR_EL2.HPMN](#)].
- This applies even when EL2 is disabled in the current Security state.

This field does not affect the operation of [PMCCNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

LP

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

0b0 Event counter overflow on increment that causes unsigned overflow of [PMEVCNTR<n>_EL0](#)[31:0].

0b1 Event counter overflow on increment that causes unsigned overflow of [PMEVCNTR<n>_EL0](#)[63:0].

If EL2 is implemented and [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#) is less than [PMCR_EL0.N](#), this bit does not affect the operation of event counters in the range [[HDCR.HPMN](#)..([PMCR_EL0.N](#)-1)] or [[MDCR_EL2.HPMN](#)..([PMCR_EL0.N](#)-1)].

———— **Note** —————

The effect of [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#) on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported at EL0:

LC

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

0b0 Cycle counter overflow on increment that causes unsigned overflow of [PMCCNTR_ELO](#)[31:0].

0b1 Cycle counter overflow on increment that causes unsigned overflow of [PMCCNTR_ELO](#)[63:0].

Arm deprecates use of [PMCR_ELO](#).LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

DP

Disable cycle counter when event counting is prohibited.

0b0 Cycle counting by [PMCCNTR_ELO](#) is not affected by this bit.

0b1 When event counting for counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited, cycle counting by [PMCCNTR_ELO](#) is disabled.

For more information see [Controlling the PMU counters on page D7-2859](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

X

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

0b0 Do not export events.

0b1 Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported at EL0:

D

Clock divider.

0b0 When enabled, [PMCCNTR_EL0](#) counts every clock cycle.

0b1 When enabled, [PMCCNTR_EL0](#) counts once every 64 clock cycles.

If [PMCR_EL0.LC](#) == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of [PMCR_EL0.D](#) = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

0b0 No action.

0b1 Reset [PMCCNTR_EL0](#) to zero.

———— **Note** —————

Resetting [PMCCNTR_EL0](#) does not change the cycle counter overflow bit. If [FEAT_PMUv3p5](#) is implemented, the value of [PMCR_EL0.LC](#) is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

0b0 No action.

0b1 Reset all event counters accessible in the current Exception level, not including [PMCCNTR_EL0](#), to zero.

In EL0 and EL1:

- If EL2 is implemented and enabled in the current Security state, and [MDCR_EL2.HPMN](#) is less than [PMCR_EL0.N](#), a write of 1 to this bit does not reset event counters in the range [[MDCR_EL2.HPMN](#)..[PMCR_EL0.N](#)-1].
- If EL2 is not implemented, EL2 is disabled in the current Security state, or [MDCR_EL2.HPMN](#) equals [PMCR_EL0.N](#), a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

———— **Note** —————

Resetting the event counters does not change the event counter overflow bits. If [FEAT_PMUv3p5](#) is implemented, the values of [MDCR_EL2.HLP](#) and [PMCR_EL0.LP](#) are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO/RAZ.

E, bit [0]

Enable.

0b0 All event counters in the range [0..[PMN](#)-1] and [PMCCNTR_EL0](#), are disabled.

0b1 All event counters in the range [0..[PMN](#)-1] and [PMCCNTR_EL0](#), are enabled by [PMCNTENSET_EL0](#).

If EL2 is implemented, then:

- If EL2 is using AArch32, [PMN](#) is [HDCR.HPMN](#).
- If EL2 is using AArch64, [PMN](#) is [MDCR_EL2.HPMN](#).

- If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is PMCR_EL0.N.

———— **Note** ————

The effect of [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#) on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

D13.4.8 PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configurations

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR<n>\[31:0\]](#).

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to External register [PMEVCNTR<n>_EL0\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are UNDEFINED.

Attributes

PMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions

When FEAT_PMUv3p5 is implemented:

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

PMEVCNTR<n>_EL0 can also be accessed by using [PMXEVCNTR_EL0](#) with [PMSELR_EL0.SEL](#) set to the value of <n>.

If [FEAT_FGT](#) is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVCNTR<n>_EL0](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If [FEAT_FGT](#) is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVCNTR<n>_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

———— Note ————

In EL0, an access is permitted if it is enabled by [PMUSERENR_EL0](#).{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2.HPMN](#) identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [MDCR_EL2.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMEVCNTR<n>_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b10:n[4:3]	n[2:0]

D13.4.9 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configurations

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to External register [PMEVTYPER<n>_EL0\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

0b0 Count events in EL1.

0b1 Do not count events in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

0b0 Count events in EL0.

0b1 Do not count events in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

NSK

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.P` bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

NSU

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.U` bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

NSH

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the `PMEVTYPER<n>_EL0.SH` bit.

0b0 Do not count events in EL2.

0b1 Count events in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

M

EL3 filtering bit.

If the value of this bit is equal to the value of the `PMEVTYPER<n>_EL0.P` bit, events in EL3 are counted.

Otherwise, events in EL3 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]

When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

MT

Multithreading.

0b0 Count events only on controlling PE.

0b1 Count events from any PE with the same affinity at level 1 and above as this PE.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this field is RES0. See [ID_AA64DFR0_EL1.MTPMU](#).

This field is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

SH

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

evtCount[15:10]

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter **PMEVCNTR<n>_EL0**.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in [Table D7-6 on page D7-2875](#).

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

PMEVTYPER<n>_EL0 can also be accessed by using **PMXEVTYPER_EL0** with **PMSELR_EL0.SEL** set to n.

If **FEAT_FGT** is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of **PMEVTYPER<n>_EL0** is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If **FEAT_FGT** is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of **PMEVTYPER<n>_EL0** are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by **PMUSERENR_EL0.EN**.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, **MDCR_EL2.HPMN** identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [MDCR_EL2.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMEVTYPER<n>_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b11:n[4:3]	n[2:0]

D13.4.10 PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_ELO](#), and the event counters [PMEVCNTR<n>_ELO](#). Reading the register shows which overflow interrupt requests are enabled.

Configurations

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR](#)[31:0].

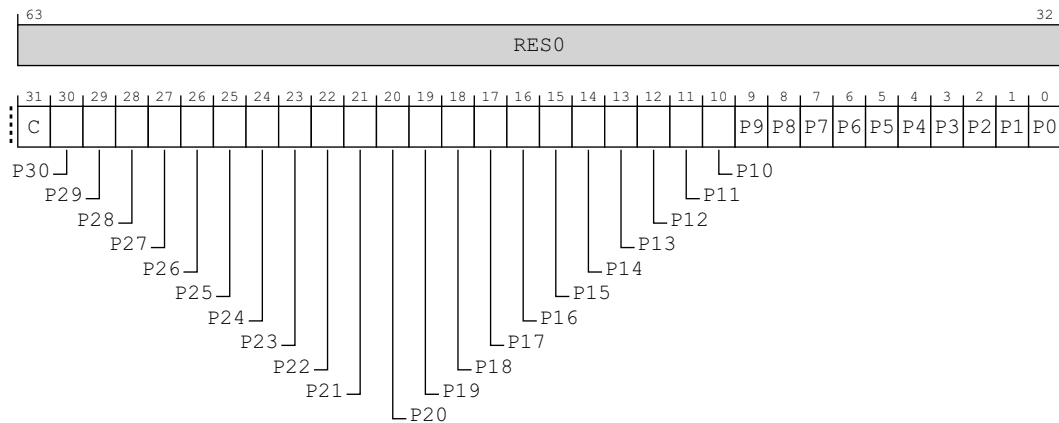

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register [PMINTENCLR_EL1](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are UNDEFINED.

Attributes

PMINTENCLR_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

C, bit [31]

[PMCCNTR_ELO](#) overflow interrupt request disable bit. Possible values are:

- 0b0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
- 0b1 When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>_ELO](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR_EL2.HPMN](#). Otherwise, N is the value in [PMCR_ELO.N](#).

- 0b0 When read, means that the [PMEVCNTR<n>_ELO](#) event counter interrupt request is disabled. When written, has no effect.

0b1 When read, means that the `PMEVCNTR<n>_EL0` event counter interrupt request is enabled. When written, disables the `PMEVCNTR<n>_EL0` interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D13.4.12 PMMIR_EL1, Performance Monitors Machine Identification Register

The PMMIR_EL1 characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configurations

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR_EL1 are UNDEFINED.

Attributes

PMMIR_EL1 is a 64-bit register.

Field descriptions

Bits [63:20]

Reserved, RES0.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes}) + 1$. Defined values are:

0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might be RAZ.

Accessing PMMIR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMMIR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b110

```

```

D13.4.13 PMOVSLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Configurations

AArch64 System register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSr](#)[31:0].

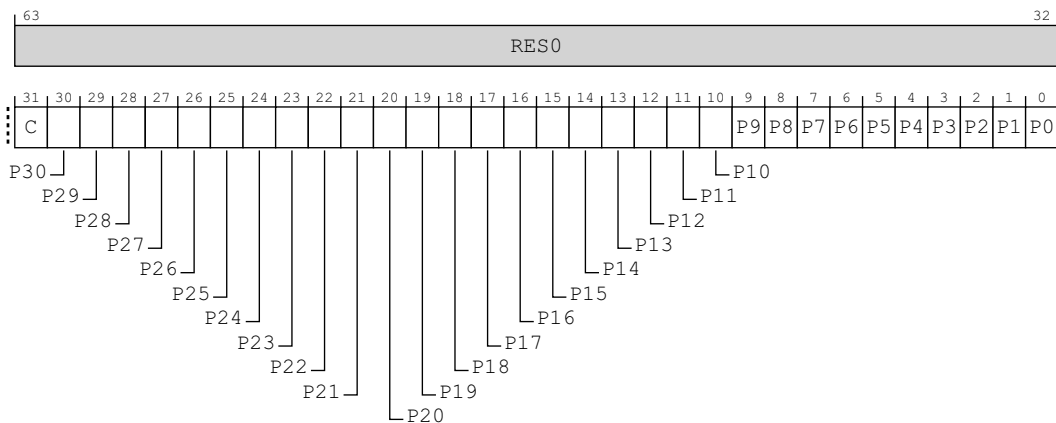

AArch64 System register PMOVSLR_EL0 bits [31:0] are architecturally mapped to External register [PMOVSLR_EL0](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSLR_EL0 are UNDEFINED.

Attributes

PMOVSLR_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

C, bit [31]

Cycle counter overflow clear bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared.
When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared.
When written, clears the cycle counter overflow bit to 0.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in `MDCR_EL2.HPMN`. Otherwise, N is the value in `PMCR_EL0.N`.

0b0 When read, means that `PMEVCNTR<n>_EL0` has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that `PMEVCNTR<n>_EL0` has overflowed since this bit was last cleared. When written, clears the `PMEVCNTR<n>_EL0` overflow bit to 0.

If `FEAT_PMUv3p5` is implemented, `MDCR_EL2.HLP` and `PMCR_EL0.LP` control whether an overflow is detected from unsigned overflow of `PMEVCNTR<n>_EL0`[31:0] or unsigned overflow of `PMEVCNTR<n>_EL0`[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSLR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMOVSLR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b011

D13.4.14 PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#).

Configurations

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSET](#)[31:0].

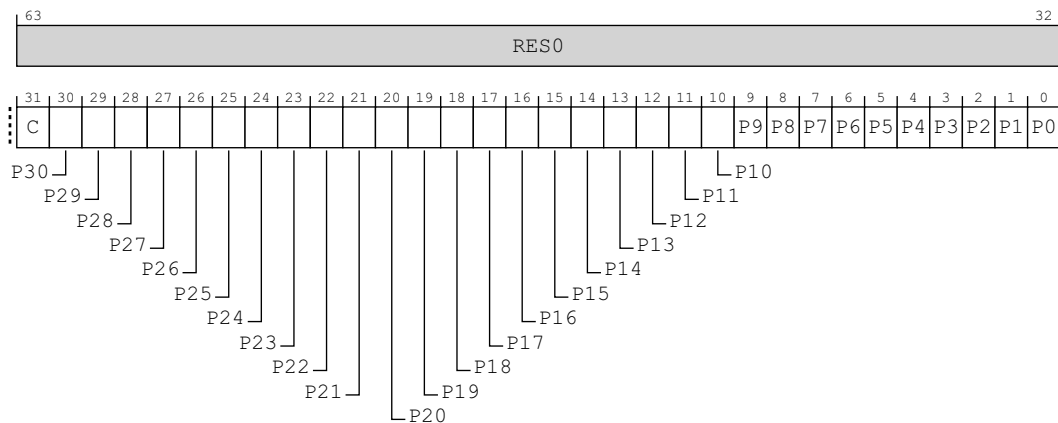

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to External register [PMOVSSET_EL0](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are UNDEFINED.

Attributes

PMOVSSET_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

C, bit [31]

Cycle counter overflow set bit.

0b0 When read, means the cycle counter has not overflowed since this bit was last cleared.
When written, has no effect.

0b1 When read, means the cycle counter has overflowed since this bit was last cleared.
When written, sets the cycle counter overflow bit to 1.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in `MDCR_EL2.HPMN`. Otherwise, N is the value in `PMCR_EL0.N`.

0b0 When read, means that `PMEVCNTR<n>_EL0` has not overflowed since this bit was last cleared. When written, has no effect.

0b1 When read, means that `PMEVCNTR<n>_EL0` has overflowed since this bit was last cleared. When written, sets the `PMEVCNTR<n>_EL0` overflow bit to 1.

If `FEAT_PMUv3p5` is implemented, `MDCR_EL2.HLP` and `PMCR_EL0.LP` control whether an overflow is detected from unsigned overflow of `PMEVCNTR<n>_EL0`[31:0] or unsigned overflow of `PMEVCNTR<n>_EL0`[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D13.4.15 PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

Purpose

Selects the current event counter [PMEVCNTR<n>_EL0](#) or the cycle counter, CCNT.

PMSELR_EL0 is used in conjunction with [PMXEVTYPER_EL0](#) to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with [PMXEVCNTR_EL0](#), to determine the value of a selected event counter.

Configurations

AArch64 System register PMSELR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSELR](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR_EL0 are UNDEFINED.

Attributes

PMSELR_EL0 is a 64-bit register.

Field descriptions

Bits [63:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, [PMEVCNTR<n>_EL0](#), where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to [PMXEVTYPER_EL0](#) or [PMXEVCNTR_EL0](#) occurs.

This field can take any value from 0 (0b00000) to (PMCR.N)-1, or 31 (0b11111).

When PMSELR_EL0.SEL is 0b11111, it selects the cycle counter and:

- A read of the [PMXEVTYPER_EL0](#) returns the value of [PMCCFILTR_EL0](#).
- A write of the [PMXEVTYPER_EL0](#) writes to [PMCCFILTR_EL0](#).
- A read or write of [PMXEVCNTR_EL0](#) has CONSTRAINED UNPREDICTABLE effects. For more information, see [PMXEVCNTR_EL0](#).

For more information about the results of accesses to the event counters, see [PMXEVTYPER_EL0](#) and [PMXEVCNTR_EL0](#).

For more information about the number of counters accessible at each Exception level, see [MDCR_EL2.HPMN](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR_EL0

Accesses to this register use the following encodings in the System register encoding space:

D13.4.16 PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event $0x00$. For more information, see [SW_INCR](#).

Configurations

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC](#)[31:0].

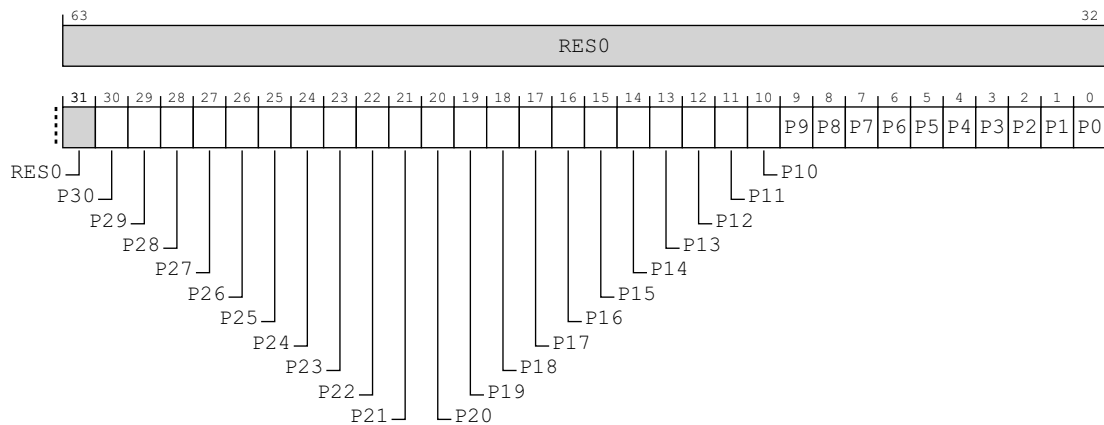

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to External register [PMSWINC_EL0](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC_EL0 are UNDEFINED.

Attributes

PMSWINC_EL0 is a 64-bit register.

Field descriptions

Bits [63:31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#). Otherwise, N is the value in [PMCR_EL0.N](#).

0b0 No action. The write to this bit is ignored.

0b1 If [PMEVCNTR<n>_EL0](#) is enabled and configured to count the software increment event, increments [PMEVCNTR<n>_EL0](#) by 1. If [PMEVCNTR<n>_EL0](#) is disabled, or not configured to count the software increment event, the write to this bit is ignored.

Accessing PMSWINC_EL0

Accesses to this register use the following encodings in the System register encoding space:

MSR PMSWINC_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b100

```

D13.4.17 PMUSERENR_EL0, Performance Monitors User Enable Register

The PMUSERENR_EL0 characteristics are:

Purpose

Enables or disables EL0 access to the Performance Monitors.

Configurations

AArch64 System register PMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMUSERENR](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR_EL0 are UNDEFINED.

Attributes

PMUSERENR_EL0 is a 64-bit register.

Field descriptions

Bits [63:4]

Reserved, RES0.

ER, bit [3]

Event counter Read. Traps EL0 access to event counters to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

0b0 EL0 using AArch64: EL0 reads of the [PMXEVNTR_EL0](#) and [PMEVCNTR<n>_EL0](#), and EL0 read/write accesses to the [PMSELR_EL0](#), are trapped if PMUSERENR_EL0.EN is also 0.

EL0 using AArch32: EL0 reads of the [PMXEVNTR](#) and [PMEVCNTR<n>](#), and EL0 read/write accesses to the [PMSELR](#), are trapped if PMUSERENR_EL0.EN is also 0.

0b1 Overrides PMUSERENR_EL0.EN and enables:

- RO access to [PMXEVNTR_EL0](#) and [PMEVCNTR<n>_EL0](#) at EL0.
- RW access to [PMSELR_EL0](#) at EL0.
- RW access to [PMSELR](#) at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CR, bit [2]

Cycle counter Read. Traps EL0 access to cycle counter reads to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped MRC accesses are reported using EC syndrome value 0x03, trapped MRRC accesses are reported using EC syndrome value 0x04.

- 0b0 EL0 using AArch64: EL0 read accesses to the [PMCCNTR_EL0](#) are trapped if [PMUSERENR_EL0.EN](#) is also 0.
EL0 using AArch32: EL0 read accesses to the [PMCCNTR](#) are trapped if [PMUSERENR_EL0.EN](#) is also 0.
- 0b1 Overrides [PMUSERENR_EL0.EN](#) and enables access to:
- [PMCCNTR_EL0](#) at EL0.
 - [PMCCNTR](#) at EL0.

SW, bit [1]

Traps Software Increment writes to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

- 0b0 EL0 using AArch64: EL0 writes to the [PMSWINC_EL0](#) are trapped if [PMUSERENR_EL0.EN](#) is also 0.
EL0 using AArch32: EL0 writes to the [PMSWINC](#) are trapped if [PMUSERENR_EL0.EN](#) is also 0.
- 0b1 Overrides [PMUSERENR_EL0.EN](#) and enables access to:
- [PMSWINC_EL0](#) at EL0.
 - [PMSWINC](#) at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Traps EL0 accesses to the Performance Monitor registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from both Execution states as follows:

- In AArch64 state, MRS or MSR accesses to the following registers are reported using EC syndrome value 0x18:
 - [PMCR_EL0](#), [PMOVSLR_EL0](#), [PMSELR_EL0](#), [PMCEID0_EL0](#), [PMCEID1_EL0](#), [PMCCNTR_EL0](#), [PMXEVTYPER_EL0](#), [PMXVCNTR_EL0](#), [PMCNTENSET_EL0](#), [PMCNTENCLR_EL0](#), [PMOVSSET_EL0](#), [PMEVCNTR<n>_EL0](#), [PMEVTYPER<n>_EL0](#), [PMCCFILTR_EL0](#), [PMSWINC_EL0](#).
 - If [FEAT_PMUv3p4](#) is implemented, [PMMIR_EL1](#).
 - In AArch32 state, MRC or MCR accesses to the following registers are reported using EC syndrome value 0x03:
 - [PMCR](#), [PMOVSR](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXVCNTR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#), [PMSWINC](#).
 - If [FEAT_PMUv3p4](#) is implemented, [PMMIR](#).
 - If [FEAT_PMUv3p1](#) is implemented, in AArch32 state, [PMCEID2](#), and [PMCEID3](#).
 - In AArch32 state, MRRC or MCRR accesses to [PMCCNTR](#) are reported using EC syndrome value 0x04.
- 0b0 While at EL0, accesses to the specified registers at EL0 are trapped, unless overridden by one of [PMUSERENR_EL0](#).{ER, CR, SW}.
- 0b1 While at EL0, software can access all of the specified registers.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMUSERENR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMUSERENR_EL0

op0	op1	CRn	CRm	op2

D13.4.18 PMXEVNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVNTR_EL0 characteristics are:

Purpose

Reads or writes the value of the selected event counter, [PMEVCNTR<n>_EL0](#). [PMSELR_EL0](#).SEL determines which event counter is selected.

Configurations

AArch64 System register PMXEVNTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVNTR_EL0 are UNDEFINED.

Attributes

PMXEVNTR_EL0 is a 64-bit register.

Field descriptions

When FEAT_PMUv3p5 is implemented:

PMEVCNTR<n>, bits [63:0]

Value of the selected event counter, [PMEVCNTR<n>_EL0](#), where n is the value stored in [PMSELR_EL0](#).SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [63:32]

Reserved, RES0.

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, [PMEVCNTR<n>_EL0](#), where n is the value stored in [PMSELR_EL0](#).SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVNTR_EL0

If `FEAT_FGT` is implemented and `PMSELR_EL0.SEL` is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of `PMXEVNTR_EL0` is as follows:

- If `PMSELR_EL0.SEL` selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If `FEAT_FGT` is not implemented and `PMSELR_EL0.SEL` is greater than or equal to the number of accessible event counters, then reads and writes of `PMXEVNTR_EL0` are CONstrained UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if `PMSELR_EL0.SEL` has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and `PMSELR_EL0.SEL` is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

———— Note ————

In EL0, an access is permitted if it is enabled by `PMUSERENR_EL0.{ER,EN}`.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, `MDCR_EL2.HPMN` identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see `MDCR_EL2.HPMN`.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMXEVNTR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b010

D13.4.19 PMXEVTYPER_ELO, Performance Monitors Selected Event Type Register

The PMXEVTYPER_ELO characteristics are:

Purpose

When [PMSELR_ELO.SEL](#) selects an event counter, this accesses a [PMEVTYPER<n>_ELO](#) register. When [PMSELR_ELO.SEL](#) selects the cycle counter, this accesses [PMCCFILTR_ELO](#).

Configurations

AArch64 System register PMXEVTYPER_ELO bits [31:0] are architecturally mapped to AArch32 System register [PMXEVTYPER](#)[31:0].

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER_ELO are UNDEFINED.

Attributes

PMXEVTYPER_ELO is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Bits [31:0]

When [PMSELR_ELO.SEL](#) == 31, this register accesses [PMCCFILTR_ELO](#).

Otherwise, this register accesses [PMEVTYPER<n>_ELO](#) where n is the value in [PMSELR_ELO.SEL](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVTYPER_ELO

If [FEAT_FGT](#) is implemented, and [PMSELR_ELO.SEL](#) is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMXEVTYPER_ELO](#) is as follows:

- If [PMSELR_ELO.SEL](#) selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If [FEAT_FGT](#) is not implemented, and [PMSELR_ELO.SEL](#) is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVTYPER_ELO](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if [PMSELR_ELO.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.

- Accesses to the register behave as if `PMSELR_EL0.SEL` is 31.
- If EL2 is implemented and enabled in the current Security state, `PMSELR_EL0` is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

———— **Note** ————

In EL0, an access is permitted if it is enabled by `PMUSERENR_EL0.EN`.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, `MDCR_EL2.HPMN` identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see `MDCR_EL2.HPMN`.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMXEVTYPER_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b001

D13.5 Activity Monitors registers

This section lists the Activity Monitors registers in AArch64.

D13.5.1 AMCFGR_EL0, Activity Monitors Configuration Register

The AMCFGR_EL0 characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters.

AMCFGR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCFGR](#)[31:0].

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to External register [AMCFGR](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR_EL0 are UNDEFINED.

Attributes

AMCFGR_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is [AMCFGR_EL0.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is 0b1.

0b0 [AMCR_EL0.HDBG](#) is RES0.

0b1 [AMCR_EL0.HDBG](#) is read/write.

Access to this field is RO.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the activity monitors Extension is [AMCFGR_EL0.SIZE + 1].

———— **Note** ————

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is RO.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR_EL0.N + 1].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMCFGR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AMCFGR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b001

```

D13.5.2 AMCG1IDR_EL0, Activity Monitors Counter Group 1 Identification Register

The AMCG1IDR_EL0 characteristics are:

Purpose

Defines which auxiliary counters are implemented, and which of them have a corresponding virtual offset register, [AMEVCNTVOFF1<n>_EL2](#) implemented.

Configurations

This register is present only when FEAT_AMUv1p1 is implemented. Otherwise, direct accesses to AMCG1IDR_EL0 are UNDEFINED.

Attributes

AMCG1IDR_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

AMEVCNTOFF1<n>_EL2, bit [n+16], for n = 15 to 0

Indicates which implemented auxiliary counters have a corresponding virtual offset register, [AMEVCNTVOFF1<n>_EL2](#) implemented.

- 0b0 When read, mean that [AMEVCNTR1<n>_EL0](#) does not have an offset, or is not implemented.
- 0b1 When read, means the offset [AMEVCNTVOFF1<n>_EL2](#) is implemented for [AMEVCNTR1<n>_EL0](#).

AMEVCNTR1<n>_EL0, bit [n], for n = 15 to 0

Indicates which auxiliary counters [AMEVCNTR1<n>_EL0](#) are implemented.

- 0b0 When read, means that [AMEVCNTR1<n>_EL0](#) is not implemented.
- 0b1 When read, means that [AMEVCNTR1<n>_EL0](#) is implemented.

Accessing AMCG1IDR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AMCG1IDR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b110

```

D13.5.3 AMCGCR_EL0, Activity Monitors Counter Group Configuration Register

The AMCGCR_EL0 characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configurations

AArch64 System register AMCGCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCGCR](#)[31:0].

AArch64 System register AMCGCR_EL0 bits [31:0] are architecturally mapped to External register [AMCGCR](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR_EL0 are UNDEFINED.

Attributes

AMCGCR_EL0 is a 64-bit register.

Field descriptions

Bits [63:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes [FEAT_AMUv1](#), the permitted range of values is 0x0 to 0x10.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

Access to this field is RO.

Accessing AMCGCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AMCGCR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b010

```

D13.5.4 AMCNTENCLR0_EL0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0_EL0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>_EL0](#).

Configurations

AArch64 System register AMCNTENCLR0_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR0](#)[31:0].

AArch64 System register AMCNTENCLR0_EL0 bits [31:0] are architecturally mapped to External register [AMCNTENCLR0](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0_EL0 are UNDEFINED.

Attributes

AMCNTENCLR0_EL0 is a 64-bit register.

Field descriptions

Bits [63:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for [AMEVCNTR0<n>_EL0](#).

Note

[AMCGCR_EL0.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes [FEAT_AMUv1](#), the number of architected activity monitor event counters is 4.

Possible values of each bit are:

- 0b0 When read, means that [AMEVCNTR0<n>_EL0](#) is disabled. When written, has no effect.
- 0b1 When read, means that [AMEVCNTR0<n>_EL0](#) is enabled. When written, disables [AMEVCNTR0<n>_EL0](#).

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR0_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AMCNTENCLR0_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b100

```

The AMCR_EL0 characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch64 System register AMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCR](#)[31:0].

AArch64 System register AMCR_EL0 bits [31:0] are architecturally mapped to External register [AMCR](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR_EL0 are UNDEFINED.

Attributes

AMCR_EL0 is a 64-bit register.

Field descriptions

Bits [63:18]

Reserved, RES0.

CG1RZ, bit [17]

When FEAT_AMUv1p1 is implemented:

CG1RZ

Counter Group 1 Read Zero.

0b0 System register reads of [AMEVCNTR1<n>_EL0](#) return the event count at all implemented and enabled Exception levels.

0b1 If the current Exception level is the highest implemented Exception level, system register reads of [AMEVCNTR1<n>_EL0](#) return the event count. Otherwise, reads of [AMEVCNTR1<n>_EL0](#) return a zero value.

———— Note ————

Reads from the memory-mapped view are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

0b0 Activity monitors do not halt counting when the PE is halted in Debug state.

0b1 Activity monitors halt counting when the PE is halted in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

D13.5.9 AMEVCNTR0<n>_EL0, Activity Monitors Event Counter Registers 0, n = 0 - 3

The AMEVCNTR0<n>_EL0 characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configurations

AArch64 System register AMEVCNTR0<n>_EL0 bits [63:0] are architecturally mapped to AArch32 System register [AMEVCNTR0<n>\[63:0\]](#).

AArch64 System register AMEVCNTR0<n>_EL0 bits [63:0] are architecturally mapped to External register [AMEVCNTR0<n>\[63:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n>_EL0 are UNDEFINED.

Attributes

AMEVCNTR0<n>_EL0 is a 64-bit register.

Field descriptions

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

If FEAT_AMUv1p1 is implemented, [HCR_EL2.AMVOFFEN](#) is 1, [SCR_EL3.AMVOFFEN](#) is 1, [HCR_EL2.{E2H, TGE}](#) is not {1,1}, and EL2 is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount<63:0> - [AMEVCNTVOFF0<n>_EL2<63:0>](#)).

PCount is the physical count returned when AMEVCNTR0<n>_EL0 is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMEVCNTR0<n>_EL0

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n>_EL0 are UNDEFINED.

———— Note ————

[AMCGCR_EL0.CG0NC](#) identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

D13.5.13 AMEVTYPEPER0<n>_EL0, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPEPER0<n>_EL0 characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>_EL0](#) counts.

Configurations

AArch64 System register AMEVTYPEPER0<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPEPER0<n>\[31:0\]](#).

AArch64 System register AMEVTYPEPER0<n>_EL0 bits [31:0] are architecturally mapped to External register [AMEVTYPEPER0<n>\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPEPER0<n>_EL0 are UNDEFINED.

Attributes

AMEVTYPEPER0<n>_EL0 is a 64-bit register.

Field descriptions

Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>_EL0](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

0x0011	When n == 0: Processor frequency cycles
0x4004	When n == 1: Constant frequency cycles
0x0008	When n == 2: Instructions retired
0x4005	When n == 3: Memory stall cycles

Accessing AMEVTYPEPER0<n>_EL0

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPEPER0<n>_EL0 are UNDEFINED.

————— Note —————

[AMCGCR_EL0.CG0NC](#) identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AMEVTYPEP<n>_ELO

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b011:n[3]	n[2:0]

D13.5.14 AMEVTYPER1<n>_EL0, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n>_EL0 characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>_EL0](#) counts.

Configurations

AArch64 System register AMEVTYPER1<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER1<n>\[31:0\]](#).

AArch64 System register AMEVTYPER1<n>_EL0 bits [31:0] are architecturally mapped to External register [AMEVTYPER1<n>\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n>_EL0 are UNDEFINED.

Attributes

AMEVTYPER1<n>_EL0 is a 64-bit register.

Field descriptions

Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>_EL0](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter [AMEVCNTR1<n>_EL0](#), then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by [AMEVCNTR1<n>_EL0](#) might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter [AMEVCNTR1<n>_EL0](#) is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>_EL0

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n>_EL0 are UNDEFINED.

———— Note —————

[AMCGCR_EL0.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

D13.5.15 AMUSERENR_EL0, Activity Monitors User Enable Register

The AMUSERENR_EL0 characteristics are:

Purpose

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch64 System register AMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMUSERENR](#)[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR_EL0 are UNDEFINED.

Attributes

AMUSERENR_EL0 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

EN, bit [0]

Traps EL0 accesses to the activity monitors registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
 - [AMCFGR_EL0](#), [AMCGCR_EL0](#), [AMCNTENCLR0_EL0](#), [AMCNTENCLR1_EL0](#), [AMCNTENSET0_EL0](#), [AMCNTENSET1_EL0](#), [AMCR_EL0](#), [AMEVCNTR0<n>_EL0](#), [AMEVCNTR1<n>_EL0](#), [AMEVTYPER0<n>_EL0](#), and [AMEVTYPER1<n>_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
 - [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVCNTR0<n>](#), [AMEVCNTR1<n>](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).

0b0 EL0 accesses to the activity monitors registers are trapped.

0b1 This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

Note

- AMUSERENR_EL0 can always be read at EL0 and is not governed by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMUSERENR_EL0

D13.6 Statistical Profiling Extension registers

This section lists the Statistical Profiling Extension registers in AArch64.

D13.6.1 PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

Purpose

Provides information to software as to whether the buffer can be programmed at the current Exception level.

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are UNDEFINED.

Attributes

PMBIDR_EL1 is a 64-bit register.

Field descriptions

Bits [63:6]

Reserved, RES0.

F, bit [5]

Flag updates. Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state. Defined values are:

- 0b0 Hardware management of the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is always disabled for all translation stages.
- 0b1 Hardware management for the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is controlled in the same way as explicit memory accesses in the owning translation regime.

If hardware management of the Access Flag is disabled for a stage of translation, an access to Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

P, bit [4]

Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the Profiling Buffer is owned by a higher Exception level or another Security state. Defined values are:

- 0b0 Programming is allowed.
- 0b1 Programming not allowed.

The value read from this field depends on the current Exception level and the Effective values of [MDCR_EL3.NSPB](#) and [MDCR_EL2.E2PB](#):

- If EL3 is implemented, and the owning Security state is Secure state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - If Secure EL2 is implemented and enabled, and [MDCR_EL2.E2PB](#) is 0b00, Secure EL1.

- If EL3 is implemented, and the owning Security state is Non-secure state, this field reads as one from:
 - Secure EL1.
 - If Secure EL2 is implemented, Secure EL2.
 - If EL2 is implemented and `MDCR_EL2.E2PB` is `0b00`, Non-secure EL1.
- If EL3 is not implemented, EL2 is implemented, and `MDCR_EL2.E2PB` is `0b00`, this field reads as one from EL1.
- Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for `PMBPTR_EL1`. If this field is non-zero, then the PE must pad every record up to a multiple of this size. Defined values are:

0b0000	Byte
0b0001	Halfword.
0b0010	Word.
0b0011	Doubleword.

    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HDFGRTR_EL2.PMBIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return PMBIDR_EL1;
elsif PSTATE.EL == EL2 then
    return PMBIDR_EL1;
elsif PSTATE.EL == EL3 then
    return PMBIDR_EL1;

```

D13.6.2 PMBLIMITR_EL1, Profiling Buffer Limit Address Register

The PMBLIMITR_EL1 characteristics are:

Purpose

Defines the upper limit for the profiling buffer, and enables the profiling buffer

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBLIMITR_EL1 are UNDEFINED.

Attributes

PMBLIMITR_EL1 is a 64-bit register.

Field descriptions

LIMIT, bits [63:12]

Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, $\log_2(\text{smallest implemented translation granule})$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:6]

Reserved, RES0.

PMFZ, bit [5]

When FEAT_SPEv1p2 is implemented:

PMFZ

Freeze PMU on SPE event. Stop PMU event counters when `PMBSR_EL1.S == 1`.

0b0 Do not freeze PMU event counters on Statistical Profiling Buffer Management event.

0b1 Freeze PMU event counters on Statistical Profiling Buffer Management event.

The PMU event counters affected by this control is controlled by `PMCR_EL0.FZS` and, if EL2 is implemented, `MDCR_EL2.HPMFZS`. See the descriptions of these control bits for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

FM, bits [2:1]

Fill mode.

0b00 Fill mode. Stop collection and raise maintenance interrupt on buffer fill.

0b10 *When FEAT_SPEv1p2 is implemented:*
Discard mode. All output is discarded.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Profiling Buffer enable

0b0 All output is discarded.

0b1 Profiling buffer enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMBLIMITR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBLIMITR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1010	0b000

```

D13.6.3 PMBPTR_EL1, Profiling Buffer Write Pointer Register

The PMBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the profiling buffer.

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBPTR_EL1 are UNDEFINED.

Attributes

PMBPTR_EL1 is a 64-bit register.

Field descriptions

PTR, bits [63:0]

Current write address. Defines the virtual address of the next entry to be written to the buffer.

The architecture places restrictions on the values software can write to the pointer. For more information see [Restrictions on the current write pointer on page D9-2968](#).

Note

As a result, an implementation might treat some of bits[M:0], where M is defined by [PMBIDR_EL1.Align](#), as RES0.

On a management interrupt, PMBPTR_EL1 is frozen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMBPTR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBPTR_EL1

op0	op1	CRn	CRm	op2

```

D13.6.4 PMBSR_EL1, Profiling Buffer Status/syndrome Register

The PMBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software when the buffer is disabled because the management interrupt has been raised.

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBSR_EL1 are UNDEFINED.

Attributes

PMBSR_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception class

Top-level description of the cause of the buffer management event

EC == 0b000000

Other buffer management event. All buffer management events other than those described by other defined Exception class codes.

See [MSS encoding for other buffer management events](#).

EC == 0b011111

Buffer management event for an IMPLEMENTATION DEFINED reason.

See [MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason](#).

EC == 0b100100

Stage 1 Data Abort on write to Profiling Buffer.

See [MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer](#).

EC == 0b100101

Stage 2 Data Abort on write to Profiling Buffer.

See [MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer](#).

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost.

Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

0b0 PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer.

0b1 Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer.

When the buffer management event was because of an asynchronous External abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]

External abort.

0b0 An External abort has not been asserted.

0b1 An External abort has been asserted and detected by the Statistical Profiling Extension.

This bit is RES0 if the PE never sets this bit as the result of an External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [17]

Service

0b0 PMBIRQ is not asserted.

0b1 PMBIRQ is asserted. All profiling data has either been written to the buffer or discarded.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

0b0 No collision events detected.

0b1 At least one collision event was recorded.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

Management Event Specific Syndrome.

Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

- 0b000000 Address size fault, level 0 of translation or translation table base register.
- 0b000001 Address size fault, level 1.
- 0b000010 Address size fault, level 2.
- 0b000011 Address size fault, level 3.
- 0b000100 Translation fault, level 0.
- 0b000101 Translation fault, level 1.
- 0b000110 Translation fault, level 2.
- 0b000111 Translation fault, level 3.
- 0b001001 Access flag fault, level 1.
- 0b001010 Access flag fault, level 2.
- 0b001011 Access flag fault, level 3.
- 0b001000 *When FEAT_LPA2 is implemented:*
Access flag fault, level 0.
- 0b001100 *When FEAT_LPA2 is implemented:*
Permission fault, level 0.
- 0b001101 Permission fault, level 1.
- 0b001110 Permission fault, level 2.
- 0b001111 Permission fault, level 3.
- 0b010000 Synchronous External abort, not on translation table walk or hardware update of translation table.
- 0b010001 Asynchronous External abort.
- 0b010011 *When FEAT_LPA2 is implemented:*
Synchronous External abort on translation table walk or hardware update of translation table, level -1.
- 0b010100 Synchronous External abort on translation table walk or hardware update of translation table, level 0.
- 0b010101 Synchronous External abort on translation table walk or hardware update of translation table, level 1.
- 0b010110 Synchronous External abort on translation table walk or hardware update of translation table, level 2.
- 0b010111 Synchronous External abort on translation table walk or hardware update of translation table, level 3.
- 0b011011 *When FEAT_LPA2 is implemented and FEAT_RAS is not implemented:*
Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.
- 0b100001 Alignment fault.
- 0b101001 *When FEAT_LPA2 is implemented:*

- Address size fault, level -1.
- 0b101011 *When FEAT_LPA2 is implemented:*
Translation fault, level -1.
- 0b110000 TLB conflict abort.
- 0b110001 *When FEAT_HAFDBS is implemented:*
Unsupported atomic hardware update fault.

All other values are reserved.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see [Faults and watchpoints on page D9-2974](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for other buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Buffer status code

- 0b000000 Buffer not filled
- 0b000001 Buffer filled

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

```

D13.6.5 PMSCR_EL1, Statistical Profiling Control Register (EL1)

The PMSCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Statistical Profiling.

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are UNDEFINED.

Attributes

PMSCR_EL1 is a 64-bit register.

Field descriptions

Bits [63:8]

Reserved, RES0.

PCT, bits [7:6]

When EL2 is implemented:

PCT

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer is owned by EL1, requests which timestamp counter value is collected.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

0b00 Virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2.

0b01 Physical timestamp. The collected timestamp is the physical counter.

0b11 When FEAT_ECV is implemented:

Guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2:

- SCR_EL3.ECVen == 0.
- CNTHCTL_EL2.ECV == 0.

If EL2 is enabled in the current Security state, then the value of PMSCR_EL2.PCT might override or modify the meaning of this field.

This field is ignored by the PE when the Profiling Buffer owning Exception level is EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

PCT

Physical Timestamp. Reserved. This field reads as 0b01 and ignores writes. Software should treat this field as UNK/SBZP.

When EL2 is not implemented, the Effective values of `CNTVOFF_EL2` and `CNTPOFF_EL2` are zero, meaning the virtual counter and physical counter have the same value.

TS, bit [5]

Timestamp enable.

0b0 Timestamp sampling disabled.

0b1 Timestamp sampling enabled.

This bit is ignored by the PE if EL2 is implemented and the Profiling Buffer is owned by EL2. For more information, see [Controlling the data that is collected](#) on page D9-2965.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address sample enable.

0b0 Physical addresses are not collected.

0b1 Physical addresses are collected.

If EL2 is implemented:

- If the Profiling Buffer is owned by EL1, this bit is combined with `PMSCR_EL2.PA` to determine which address is collected. For more information, see [Controlling the data that is collected](#) on page D9-2965.
- If the Profiling Buffer is owned by EL2, this bit is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

`CONTEXTIDR_EL1` sample enable.

0b0 `CONTEXTIDR_EL1` is not collected.

0b1 `CONTEXTIDR_EL1` is collected.

If EL2 is implemented and enabled in the current Security state when an operation is sampled:

- If the PE is at EL2, this bit is ignored by the PE.
- If `HCR_EL2.TGE == 1`, this bit is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E1SPE, bit [1]

EL1 Statistical Profiling Enable.

0b0 Sampling disabled at EL1.

0b1 Sampling enabled at EL1.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when `HCR_EL2.TGE == 1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E0SPE, bit [0]

EL0 Statistical Profiling Enable. Controls sampling at EL0 when `HCR_EL2.TGE == 0` or if EL2 is disabled or not implemented.

0b0 Sampling disabled at EL0.

0b1 Sampling enabled at EL0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when `HCR_EL2.TGE == 1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D13.6.6 PMSCR_EL2, Statistical Profiling Control Register (EL2)

The PMSCR_EL2 characteristics are:

Purpose

Provides EL2 controls for Statistical Profiling.

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL2 are UNDEFINED.

Attributes

PMSCR_EL2 is a 64-bit register.

Field descriptions

Bits [63:8]

Reserved, RES0.

PCT, bits [7:6]

Physical Timestamp. If timestamp sampling is enabled, determines which counter is collected. The behavior depends on the Profiling Buffer owning Exception level.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

0b00 Virtual timestamp. The collected timestamp is the physical counter minus a virtual offset. If any of the following are true, the virtual offset is zero, otherwise the virtual offset is the value of CNTVOFF_EL2:

- The sampled operation executed at EL2 and HCR_EL2.E2H == 1.
- The sampled operation executed at EL0 and HCR_EL2.{E2H,TGE} == {1,1}.

Note

If the Profiling Buffer owning Exception level is EL1, the virtual offset is always CNTVOFF_EL2.

0b01 If the Profiling Buffer owning Exception level is EL1, then the timestamp value is selected by PMSCR_EL1.PCT.

Otherwise, physical timestamp. The collected timestamp is the physical counter.

0b11 When FEAT_ECV is implemented:

If the Profiling Buffer owning Exception level is EL1 and PMSCR_EL1.PCT == 0b00, then guest virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2.

Otherwise, guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2:

- SCR_EL3.ECVen == 0.
- CNTHCTL_EL2.ECV == 0.

All other values are reserved.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b01, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TS, bit [5]

Timestamp Enable.

0b0 Timestamp sampling disabled.

0b1 Timestamp sampling enabled.

This bit is ignored by the PE when any of the following are true:

- The Profiling Buffer owning Exception level is EL1.
- In Secure state, and either [FEAT_SEL2](#) is not implemented or Secure EL2 is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address Sample Enable.

0b0 Physical addresses are not collected.

0b1 Physical addresses are collected.

If the Profiling Buffer owning Exception level is EL1, and EL2 is enabled in the current Security state, this bit is combined with [PMSCR_EL1.PA](#) to determine which address is collected.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit and behaves as if this bit is set to 1, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

[CONTEXTIDR_EL2](#) Sample Enable.

0b0 [CONTEXTIDR_EL2](#) is not collected.

0b1 [CONTEXTIDR_EL2](#) is collected.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E2SPE, bit [1]

EL2 Statistical Profiling Enable.

0b0 Sampling disabled at EL2.

0b1 Sampling enabled at EL2.

This bit is RES0 if [MDCR_EL2.E2PB](#) != 0b00.

If EL2 is disabled in the current Security state, this bit is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E0HSPE, bit [0]

EL0 Statistical Profiling Enable.

0b0 Sampling disabled at EL0.

0b1 Sampling enabled at EL0.

If `MDCR_EL2.E2PB` != 0b00, this bit is RES0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when `HCR_EL2.TGE` == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

```

D13.6.7 PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 set (TLB walk) are recorded.

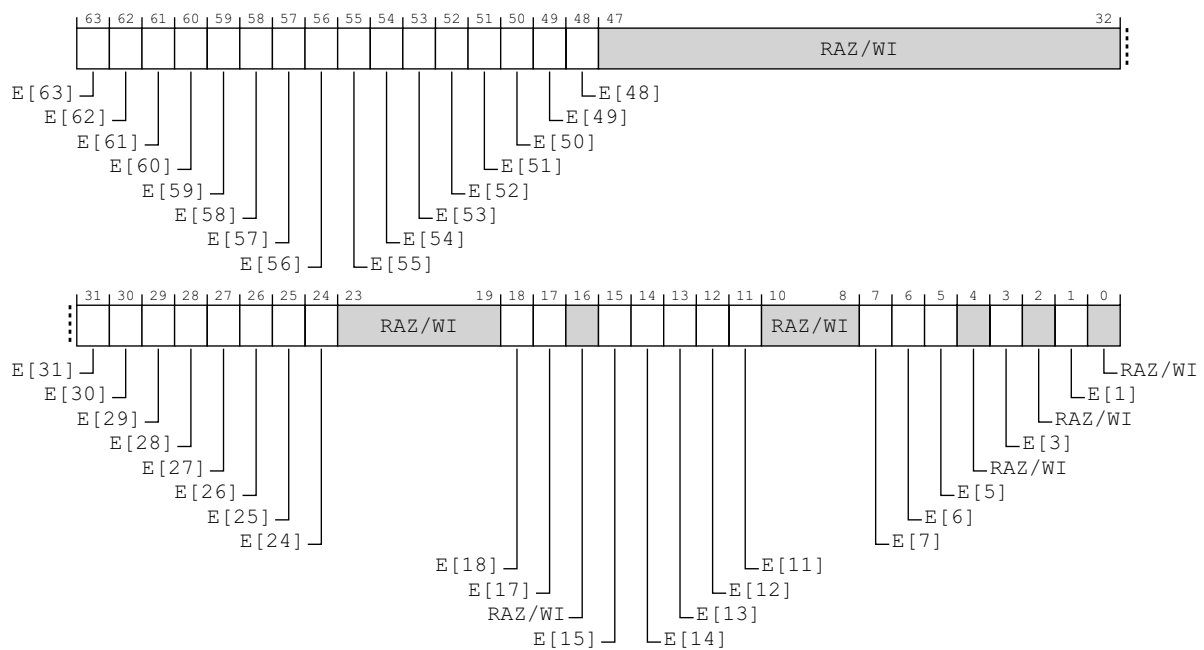

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

Attributes

PMSEVFR_EL1 is a 64-bit register.

Field descriptions

E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12

E[<x>] is the event filter for event <x>. If event <x> is not implemented, or filtering on event <x> is not supported, the corresponding bit is RAZ/WI.

0b0 Event <x> is ignored.

0b1 Do not record samples that have event <x> == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE == 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:32]

Reserved, RAZ/WI.

Bits [23:19]

Reserved, RAZ/WI.

E[18], bit [18]

When FEAT_SPEv1p1 is implemented and FEAT_SVE is implemented:

E[18]

Empty predicate.

0b0 Empty predicate event is ignored.

0b1 Do not record samples that have the Empty predicate event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]

When FEAT_SPEv1p1 is implemented and FEAT_SVE is implemented:

E[17]

Partial predicate.

0b0 Partial predicate event is ignored.

0b1 Do not record samples that have the Partial predicate event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [16]

Reserved, RAZ/WI.

E[11], bit [11]

When FEAT_SPEv1p1 is implemented:

E[11]

Alignment.

0b0 Alignment event is ignored.

0b1 Do not record samples that have the Alignment event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [10:8]

Reserved, RAZ/WI.

E[7], bit [7]

Mispredicted.

0b0 Mispredicted event is ignored.

0b1 Do not record samples that have the Mispredicted event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]

When FEAT_SPEv1p2 is implemented:

E[6]

Not taken.

0b0 Not taken event is ignored.

0b1 Do not record samples that have the Not taken event == 0.

This field is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[5], bit [5]

TLB walk.

0b0 TLB walk event is ignored.

0b1 Do not record samples that have the TLB walk event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RAZ/WI.

E[3], bit [3]

Level 1 data or unified cache refill.

0b0 Level 1 data or unified cache refill event is ignored.

0b1 Do not record samples that have the Level 1 data or unified cache refill event == 0.

This bit is ignored by the PE when [PMSFCR_EL1.FE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RAZ/WI.

E[1], bit [1]

When the PE supports sampling of speculative instructions:

E[1]

Architecturally executed.

When the PE supports sampling of speculative instructions:

0b0 Architecturally executed event is ignored.

0b1 Do not record samples that have the Architecturally executed event == 0.

This bit is ignored by the PE when `PMSFCR_EL1.FE == 0`.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, UNKNOWN.

Bit [0]

Reserved, RAZ/WI.

D13.6.8 PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

Purpose

Controls sample filtering. The filter is the logical AND of the FL, FT and FE bits. For example, if $FE == 1$ and $FT == 1$ only samples including the selected operation types and the selected events will be recorded

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSFCR_EL1 are UNDEFINED.

Attributes

PMSFCR_EL1 is a 64-bit register.

Field descriptions

Bits [63:19]

Reserved, RES0.

ST, bit [18]

Store filter enable

0b0 Do not record store operations

0b1 Record all store operations, including vector stores and all atomic operations

This bit is ignored by the PE when $PMSFCR_EL1.FT == 0$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LD, bit [17]

Load filter enable

0b0 Do not record load operations

0b1 Record all load operations, including vector loads and atomic operations that return data

This bit is ignored by the PE when $PMSFCR_EL1.FT == 0$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

B, bit [16]

Branch filter enable

0b0 Do not record branch and exception return operations

0b1 Record all branch and exception return operations

This bit is ignored by the PE when $PMSFCR_EL1.FT == 0$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:4]

Reserved, RES0.

FnE, bit [3]

When FEAT_SPEv1p2 is implemented:

FnE

Filter by event, inverted.

0b0 Inverted event filtering disabled.

0b1 Inverted event filtering enabled. Samples including the events selected by [PMSNEVFR_EL1](#) will not be recorded.

If any of the following are true, it is CONstrained UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FnE == 0:

- PMSFCR_EL1.FnE == 1 and [PMSNEVFR_EL1](#) is zero.
- PMSFCR_EL1.FnE == 1, PMSFCR_EL1.FE == 1, and there exists a value x such that [PMSEVFR_EL1.E\[x\]](#) == 1 and [PMSNEVFR_EL1.E\[x\]](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FL, bit [2]

Filter by latency

0b0 Latency filtering disabled

0b1 Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded

If this field is set to 1 and PMSLATFR_EL1.MINLAT is set to zero, it is CONstrained UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is set to 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FT, bit [1]

Filter by operation type. The filter is the logical OR of the ST, LD and B bits. For example, if LD and ST are both set, both load and store operations are recorded

0b0 Type filtering disabled

0b1 Type filtering enabled. Samples not one of the selected operation types will not be recorded

If this field is set to 1 and the PMSFCR_EL1.{ST, LD, B} bits are all set to zero, it is CONstrained UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is set to 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FE, bit [0]

Filter by event.

0b0 Event filtering disabled.

0b1 Event filtering enabled. Samples not including the events selected by [PMSEVFR_EL1](#) will not be recorded.

If any of the following are true, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE == 0:

- PMSFCR_EL1.FE == 1 and PMSEVFR_EL1 is zero.
- FEAT_SPEv1p2 is implemented, PMSFCR_EL1.FnE == 1, PMSFCR_EL1.FE == 1, and there exists a value x such that PMSEVFR_EL1.E[x] == 1 and PMSNEVFR_EL1.E[x] == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

```

D13.6.9 PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

Purpose

Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSICR_EL1 are UNDEFINED.

The value of PMSICR_EL1 does not change whilst profiling is disabled.

Attributes

PMSICR_EL1 is a 64-bit register.

Field descriptions

ECOUNT, bits [63:56]

When PMSIDR_EL1.ERnd == 1:

ECOUNT

Secondary sample interval counter.

This field provides the secondary counter used after the primary counter reaches zero. Whilst the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

COUNT, bits [31:0]

Primary sample interval counter

Provides the primary counter used for sampling.

The primary counter is reloaded when the value of this register is zero and the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled

Whilst the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population

When the counter reaches zero, the behavior depends on the values of PMSIDR_EL1.ERnd and PMSIRR_EL1.RND

- If PMSIRR_EL1.RND == 0 or PMSIDR_EL1.ERnd == 0:
 - A member of the sampling population is selected for sampling
 - The primary counter is reloaded
- If PMSIRR_EL1.RND == 1 and PMSIDR_EL1.ERnd == 1:
 - The secondary counter is set to a random or pseudorandom value in the range 0x00 to 0xFF
 - The primary counter is reloaded

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSICR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSICR_EL1

D13.6.10 PMSIDR_EL1, Sampling Profiling ID Register

The PMSIDR_EL1 characteristics are:

Purpose

Describes the Statistical Profiling implementation to software

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIDR_EL1 are UNDEFINED.

Attributes

PMSIDR_EL1 is a 64-bit register.

Field descriptions

Bits [63:25]

Reserved, RES0.

PBT, bit [24]

Previous branch target Address packet. Defined values are:

0b0 Previous branch target Address packet not supported.

0b1 Previous branch target Address packet support implemented.

FEAT_SPEv1p2 adds the OPTIONAL functionality identified by the value 1.

Format, bits [23:20]

From Armv8.7:

Format

Defines the format of the sample records. Defined values are:

0b0000 Format 0.

All other values are reserved.

Otherwise:

Reserved, RAZ.

CountSize, bits [19:16]

Defines the size of the counters. Defined values are:

0b0010 12-bit saturating counters.

All other values are reserved.

MaxSize, bits [15:12]

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment (PMBIDR_EL1.Align), then each record is exactly this size. Defined values are:

0b0100	16 bytes
0b0101	32 bytes
0b0110	64 bytes
0b0111	128 bytes
0b1000	256 bytes
0b1001	512 bytes
0b1010	1024 bytes
0b1011	2KB

All other values are reserved.

The values 0b0100 and 0b0101 are not permitted for an implementation.

Interval, bits [11:8]

Recommended minimum sampling interval. This provides guidance from the implementer to the smallest minimum sampling interval, N. Defined values are:

0b0000	256
0b0010	512
0b0011	768
0b0100	1,024
0b0101	1,536
0b0110	2,048
0b0111	3,072
0b1000	4,096

All other values are reserved.

Bit [7]

Reserved, RES0.

FnE, bit [6]

Filtering by events, inverted. Defined values are:

0b0	PMSNEVFR_EL1 is not implemented and PMSFCR_EL1.FnE is RES0.
0b1	PMSNEVFR_EL1 and PMSFCR_EL1.FnE are implemented.

The value 1 indicates support for the FEAT_SPEv1p2 feature.

ERnd, bit [5]

Defines how the random number generator is used in determining the interval between samples, when enabled by PMSIRR_EL1.RND. Defined values are:

0b0	The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.
0b1	The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.

LDS, bit [4]

Data source indicator for sampled load instructions. Defined values are:

0b0	Loaded data source not implemented.
-----	-------------------------------------

0b1 Loaded data source implemented.

ArchInst, bit [3]

Architectural instruction profiling. Defined values are:

0b0 Micro-op sampling implemented.

0b1 Architecture instruction sampling implemented.

FL, bit [2]

Filtering by latency. This bit is RAO.

FT, bit [1]

Filtering by operation type. This bit is RAO.

FE, bit [0]

Filtering by events. This bit is RAO.

```

D13.6.11 PMSIRR_EL1, Sampling Interval Reload Register

The PMSIRR_EL1 characteristics are:

Purpose

Defines the interval between samples.

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIRR_EL1 are UNDEFINED.

Attributes

PMSIRR_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

INTERVAL, bits [31:8]

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a non-zero value. If software sets this to zero, an UNKNOWN sampling interval is used. Software should set this to a value greater than the minimum indicated by PMSIDR_EL1.Interval.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:1]

Reserved, RES0.

RND, bit [0]

Controls randomization of the sampling interval.

0b0 Disable randomization of sampling interval.

0b1 Add (pseudo-)random jitter to sampling interval.

The random number generator is not architected.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSIRR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

D13.6.12 PMSLATFR_EL1, Sampling Latency Filter Register

The PMSLATFR_EL1 characteristics are:

Purpose

Controls sample filtering by latency

Configurations

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSLATFR_EL1 are UNDEFINED.

Attributes

PMSLATFR_EL1 is a 64-bit register.

Field descriptions

Bits [63:12]

Reserved, RES0.

MINLAT, bits [11:0]

Minimum latency. When PMSFCR_EL1.FL == 1, defines the minimum total latency for filtered operations. Samples with a total latency less than MINLAT will not be recorded

This field is ignored by the PE when PMSFCR_EL1.FL == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSLATFR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

D13.6.13 PMSNEVFR_EL1, Sampling Inverted Event Filter Register

The PMSNEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 (TLB walk) clear are recorded.

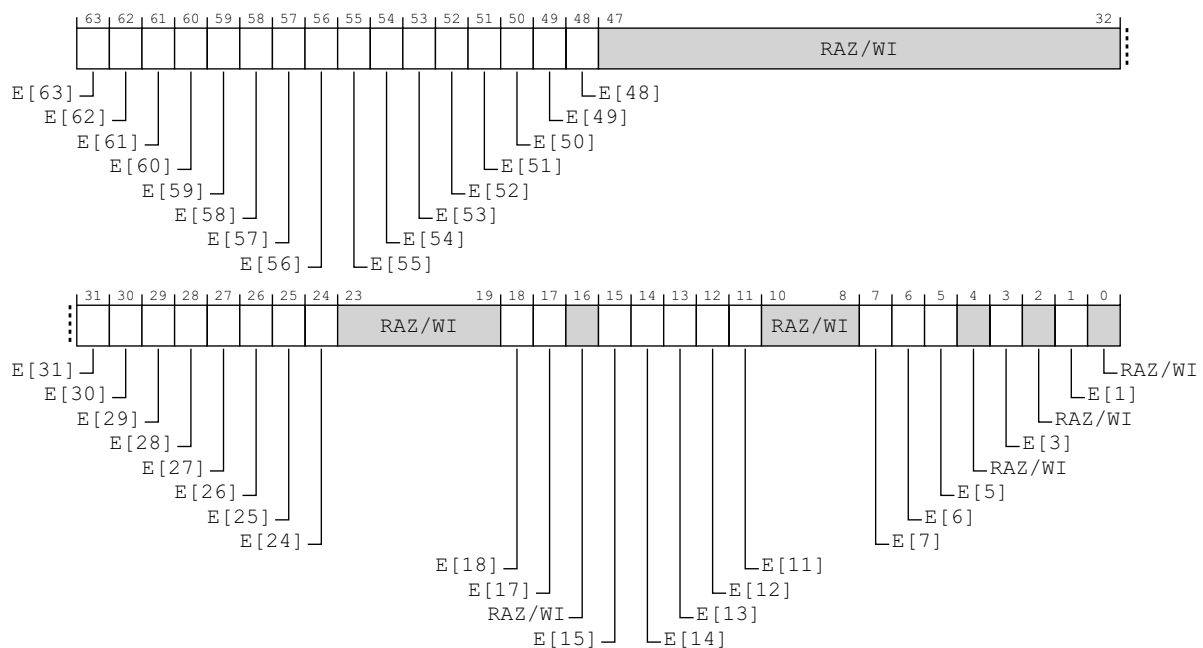

Configurations

This register is present only when FEAT_SPEv1p2 is implemented. Otherwise, direct accesses to PMSNEVFR_EL1 are UNDEFINED.

Attributes

PMSNEVFR_EL1 is a 64-bit register.

Field descriptions

E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12

E[<x>] is the event filter for IMPLEMENTATION DEFINED event <x>.

0b0 Event <x> is ignored.

0b1 Do not record samples that have event <x> == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This bit is ignored by the PE when PMSFCR_EL1.FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When event <x> is not implemented, or filtering on event <x> is not supported, access to this field is RAZ/WI.

Bits [47:32]

Reserved, RAZ/WI.

Bits [23:19]

Reserved, RAZ/WI.

E[18], bit [18]

When FEAT_SVE is implemented and FEAT_SPEv1p1 is implemented:

E[18]

Not empty predicate.

0b0 Empty predicate event is ignored.

0b1 Do not record samples that have the Empty predicate event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]

When FEAT_SVE is implemented and FEAT_SPEv1p1 is implemented:

E[17]

Not partial predicate.

0b0 Partial predicate event is ignored.

0b1 Do not record samples that have the Partial predicate event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [16]

Reserved, RAZ/WI.

E[11], bit [11]

When FEAT_SPEv1p1 is implemented:

E[11]

Aligned.

0b0 Misalignment event is ignored.

0b1 Do not record samples that have the Misalignment event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [10:8]

Reserved, RAZ/WI.

E[7], bit [7]

Correctly predicted.

0b0 Mispredicted event is ignored.

0b1 Do not record samples that have the Mispredicted event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]

Taken.

0b0 Not taken event is ignored.

0b1 Do not record samples that have the Not taken event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[5], bit [5]

TLB hit.

0b0 TLB walk event is ignored.

0b1 Do not record samples that have the TLB walk event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RAZ/WI.

E[3], bit [3]

Level 1 data or unified cache hit.

0b0 Level 1 data or unified cache refill event is ignored.

0b1 Do not record samples that have the Level 1 data or unified cache refill event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RAZ/WI.

E[1], bit [1]

When the PE supports sampling of speculative instructions:

E[1]

Speculative.

0b0 Architecturally executed event is ignored.

0b1 Do not record samples that have the Architecturally executed event == 1.

This field is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [0]

Reserved, RAZ/WI.

Accessing PMSNEVFR_EL1

Accesses to this register use the following encodings in the System register encoding space:

D13.7 RAS registers

This section lists [The Reliability, Availability, and Serviceability Extension](#) registers in AArch64.

D13.7.1 DISR_EL1, Deferred Interrupt Status Register

The DISR_EL1 characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configurations

AArch64 System register DISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DISR](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to DISR_EL1 are UNDEFINED.

Attributes

DISR_EL1 is a 64-bit register.

Field descriptions

When *DISR_EL1.IDS == 0*:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError interrupt type.

0b0 Deferred error uses architecturally-defined format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:13]

Reserved, RES0.

AET, bits [12:10]

Asynchronous Error Type. See the description of ESR_ELx.AET for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort Type. See the description of ESR_ELx.EA for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

Fault Status Code. See the description of ESR_ELx.DFSC for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When DISR_EL1.IDS == 1:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError interrupt type.

0b1 Deferred error uses IMPLEMENTATION DEFINED format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

IMPLEMENTATION DEFINED syndrome. See the description of ESR_ELx[23:0] for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DISR_EL1

An indirect write to DISR_EL1 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR_EL1 occurring in program order after the ESB instruction.

DISR_EL1 is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, SCR_EL3.EA == 1, and any of the following apply:

- At EL2.
- At EL1 and ((SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0) || HCR_EL2.AMO == 0).

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DISR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.AMO == '1' then
        return VDISR_EL2;

        return Zeros();
    else
        return DISR_EL1;
elseif PSTATE.EL == EL2 then
    if HaveEL(EL3) && !Halted() && SCR_EL3.EA == '1' then
        return Zeros();
    else
        return DISR_EL1;
elseif PSTATE.EL == EL3 then
    return DISR_EL1;

```

MSR DISR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.AMO == '1' then
        VDISR_EL2 = X[t];
    elseif HaveEL(EL3) && !Halted() && SCR_EL3.EA == '1' then
        //no operation
    else
        DISR_EL1 = X[t];
elseif PSTATE.EL == EL2 then
    if HaveEL(EL3) && !Halted() && SCR_EL3.EA == '1' then
        //no operation
    else
        DISR_EL1 = X[t];
elseif PSTATE.EL == EL3 then
    DISR_EL1 = X[t];

```

D13.7.2 ERRIDR_EL1, Error Record ID Register

The ERRIDR_EL1 characteristics are:

Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

Configurations

AArch64 System register ERRIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERRIDR](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR_EL1 are UNDEFINED.

Attributes

ERRIDR_EL1 is a 64-bit register.

Field descriptions

Bits [63:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

Accessing ERRIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERRIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap priority

            else
                AArch64.SystemAccessTrap(EL3, 0x18);
        else
            return ERRIDR_EL1;
    elsif PSTATE.EL == EL3 then
        return ERRIDR_EL1;
```

D13.7.3 ERRSELR_EL1, Error Record Select Register

The ERRSELR_EL1 characteristics are:

Purpose

Selects an error record to be accessed through the Error Record System registers.

Configurations

AArch64 System register ERRSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERRSELR](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRSELR_EL1 are UNDEFINED.

If [ERRIDR_EL1](#) indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR_EL1 is UNDEFINED or RES0.

Attributes

ERRSELR_EL1 is a 64-bit register.

Field descriptions

Bits [63:16]

Reserved, RES0.

SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR_EL1.SEL is 0x0004, then direct reads and writes of [ERXSTATUS_EL1](#) access ERR4STATUS.

If ERRSELR_EL1.SEL is greater than or equal to [ERRIDR_EL1.NUM](#), then all of the following apply:

- The value read back from ERRSELR_EL1.SEL is UNKNOWN.
- One of the following occurs:
 - An UNKNOWN error record is selected.
 - The ERX*_EL1 registers are RAZ/WI.
 - ERX*_EL1 register reads and writes are NOPs.
 - ERX*_EL1 register reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ERRSELR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERRSELR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b001

```

    ERRSELR_EL1 = X[t];
```

D13.7.4 ERXADDR_EL1, Selected Error Record Address Register

The ERXADDR_EL1 characteristics are:

Purpose

Accesses ERR<n>ADDR for the error record <n> selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

AArch64 System register ERXADDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXADDR](#)[31:0].

AArch64 System register ERXADDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXADDR2](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR_EL1 are UNDEFINED.

Attributes

ERXADDR_EL1 is a 64-bit register.

Field descriptions

Bits [63:0]

ERXADDR_EL1 accesses ERR<n>ADDR, where <n> is the value in [ERRSELR_EL1.SEL](#).

Accessing ERXADDR_EL1

If [ERRIDR_EL1.NUM](#) is 0x0000 or [ERRSELR_EL1.SEL](#) is greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR_EL1 is RAZ/WI.
- Direct reads and writes of ERXADDR_EL1 are NOPs.
- Direct reads and writes of ERXADDR_EL1 are UNDEFINED.

ERR<n>ADDR describes additional constraints that also apply when ERR<n>ADDR is accessed through ERXADDR_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXADDR_EL1

op0	op1	CRn	CRm	op2

elseif PSTATE.EL == EL3 then
    ERXADDR_EL1 = X[t];
```

D13.7.5 ERXCTLR_EL1, Selected Error Record Control Register

The ERXCTLR_EL1 characteristics are:

Purpose

Accesses ERR<n>CTLR for the error record <n> selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

AArch64 System register ERXCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXCTLR](#)[31:0].

AArch64 System register ERXCTLR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXCTLR2](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTLR_EL1 are UNDEFINED.

Attributes

ERXCTLR_EL1 is a 64-bit register.

Field descriptions

Bits [63:0]

ERXCTLR_EL1 accesses ERR<n>CTLR, where <n> is the value in [ERRSELR_EL1.SEL](#).

Accessing ERXCTLR_EL1

If [ERRIDR_EL1.NUM](#) is 0x0000 or [ERRSELR_EL1.SEL](#) is greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR_EL1 is RAZ/WI.
- Direct reads and writes of ERXCTLR_EL1 are NOPS.
- Direct reads and writes of ERXCTLR_EL1 are UNDEFINED.

If [ERRSELR_EL1.SEL](#) is not the index of the first error record owned by a node, then ERR<n>CTLR is not present, meaning reads and writes of ERXCTLR_EL1 are RES0.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXCTLR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b001

```

D13.7.10 ERXMISC3_EL1, Selected Error Record Miscellaneous Register 3

The ERXMISC3_EL1 characteristics are:

Purpose

Accesses ERR<n>MISC3 for the error record <n> selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

AArch64 System register ERXMISC3_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXMISC6](#)[31:0].

AArch64 System register ERXMISC3_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXMISC7](#)[31:0].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC3_EL1 are UNDEFINED.

Attributes

ERXMISC3_EL1 is a 64-bit register.

Field descriptions

Bits [63:0]

ERXMISC3_EL1 accesses ERR<n>MISC3, where <n> is the value in [ERRSELR_EL1.SEL](#).

Accessing ERXMISC3_EL1

If [ERRIDR_EL1.NUM](#) is 0x0000 or [ERRSELR_EL1.SEL](#) is greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC3_EL1 is RAZ/WI.
- Direct reads and writes of ERXMISC3_EL1 are NOPs.
- Direct reads and writes of ERXMISC3_EL1 are UNDEFINED.

ERR<n>MISC3 describes additional constraints that also apply when ERR<n>MISC3 is accessed through ERXMISC3_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXMISC3_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0101	0b011

```

D13.7.11 ERXPFPCDN_EL1, Selected Pseudo-fault Generation Countdown register

The ERXPFPCDN_EL1 characteristics are:

Purpose

Accesses ERR<n>PFGCDN for the error record <n> selected by [ERRSELR_EL1.SEL](#).

For details of this, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for the Armv8-A architecture profile*.

Configurations

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFPCDN_EL1 are UNDEFINED.

Attributes

ERXPFPCDN_EL1 is a 64-bit register.

Field descriptions

Bits [63:0]

ERXPFPCDN_EL1 accesses ERR<n>PFGCDN, where <n> is the value in [ERRSELR_EL1.SEL](#).

Accessing ERXPFPCDN_EL1

If [ERRIDR_EL1.NUM](#) is 0x0000 or [ERRSELR_EL1.SEL](#) is greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFPCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFPCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFPCDN_EL1 are UNDEFINED.

If [ERRSELR_EL1.SEL](#) selects an error record owned by a node that does not implement the Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFPCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFPCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFPCDN_EL1 are UNDEFINED.

———— Note ————

A node does not implement the Common Fault Injection Model Extension if ERR<n>FR.INJ reads as 0b00. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in [ERRSELR_EL1.SEL](#). If the node owns a single record, then q = n.

If [ERRSELR_EL1.SEL](#) is not the index of the first error record owned by a node, then ERR<n>PFGCDN is not present, meaning reads and writes of ERXPFPCDN_EL1 are RES0.

ERR<n>PFGCDN describes additional constraints that also apply when ERR<n>PFGCDN is accessed through ERXPFGCDN_EL1.

Accesses to this register use the following encodings in the System register encoding space:

Bits [63:0]

ERXSTATUS_EL1 accesses ERR<n>STATUS, where <n> is the value in [ERRSELR_EL1.SEL](#).

Accessing ERXSTATUS_EL1

If [ERRIDR_EL1.NUM](#) is 0x0000 or [ERRSELR_EL1.SEL](#) is greater than or equal to [ERRIDR_EL1.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXSTATUS_EL1 is RAZ/WI.
- Direct reads and writes of ERXSTATUS_EL1 are NOPs.
- Direct reads and writes of ERXSTATUS_EL1 are UNDEFINED.

ERR<n>STATUS describes additional constraints that also apply when ERR<n>STATUS is accessed through ERXSTATUS_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXSTATUS_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b010

```

D13.7.15 VDISR_EL2, Virtual Deferred Interrupt Status Register

The VDISR_EL2 characteristics are:

Purpose

Records that a virtual SError interrupt has been consumed by an ESB instruction executed at EL1. An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of [DISR_EL1](#) or [DISR](#) occurring in program order after the ESB instruction.

Configurations

AArch64 System register VDISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VDISR](#)[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VDISR_EL2 is a 64-bit register.

Field descriptions

When EL1 is using AArch64:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

The value copied from [VSESR_EL2.IDS](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

The value copied from [VSESR_EL2.ISS](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When EL1 is using AArch32 and VDISR_EL2.LPAE == 0:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VSESR_EL2.AET](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VSESR_EL2.ExT](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt.

0b10110 Asynchronous SError interrupt.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR_EL2[10].
- FS[3:0] is VDISR_EL2[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to [TTBCR.EAE](#) when an ESB instruction defers a virtual SError interrupt.

0b0 Using the Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When EL1 is using AArch32 and VDISR_EL2.LPAE == 1:

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VSESR_EL2.AET](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VSESR_EL2.ExT](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to [TTBCR.EAE](#) when an ESB instruction defers a virtual SError interrupt.

0b1 Using the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

0b010001 Asynchronous SError interrupt.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR_EL2

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of [DISR_EL1](#) or [DISR](#) occurring in program order after the ESB instruction.

Accesses to this register use the following encodings in the System register encoding space:

D13.7.16 VESR_EL2, Virtual SError Exception Syndrome Register

The VESR_EL2 characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt injected using HCR_EL2.VSE is taken to EL1 using AArch64, then the syndrome value is reported in ESR_EL1.

When the virtual SError interrupt injected using HCR_EL2.VSE is taken to EL1 using AArch32, then the syndrome value is reported in DFSR. {AET, ExT} and the remainder of DFSR is set as defined by VMSAv8-32. For more information, see [Chapter G5 The AArch32 Virtual Memory System Architecture](#).

When the virtual SError interrupt injected using HCR_EL2.VSE is deferred by an ESB instruction, then the syndrome value is written to VDISR_EL2.

Configurations

AArch64 System register VESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register VDFSFR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VESR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VESR_EL2 is a 64-bit register.

Field descriptions

When EL1 is using AArch32:

Bits [63:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[15:4] is set to VESR_EL2.AET.

When a virtual SError interrupt is deferred by an ESB instruction, VDISR_EL2[15:4] is set to VESR_EL2.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR\[12\]](#) is set to VESR_EL2.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2\[12\]](#) is set to VESR_EL2.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

When EL1 is using AArch64:

Bits [63:25]

Reserved, RES0.

IDS, bit [24]

When a virtual SError interrupt is taken to EL1 using AArch64, [ESR_EL1\[24\]](#) is set to VESR_EL2.IDS.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2\[24\]](#) is set to VESR_EL2.IDS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

When a virtual SError interrupt is taken to EL1 using AArch64, [ESR_EL1\[23:0\]](#) is set to VESR_EL2.ISS.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2\[23:0\]](#) is set to VESR_EL2.ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VESR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VESR_EL2

op0	op1	CRn	CRm	op2

```

D13.8 Generic Timer registers

This section lists the Generic Timer registers in AArch64.

D13.8.1 CNTFRQ_EL0, Counter-timer Frequency register

The CNTFRQ_EL0 characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configurations

AArch64 System register CNTFRQ_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTFRQ[31:0].

Attributes

CNTFRQ_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTFRQ_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b000

```

if PSTATE.EL == EL0 then

```

MSR CNTFRQ_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b000

```

if IsHighestEL(PSTATE.EL) then
CNTFRQ_EL0 = X[t];
else
UNDEFINED;

```

D13.8.2 CNTHCTL_EL2, Counter-timer Hypervisor Control register

The CNTHCTL_EL2 characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

Configurations

AArch64 System register CNTHCTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHCTL](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

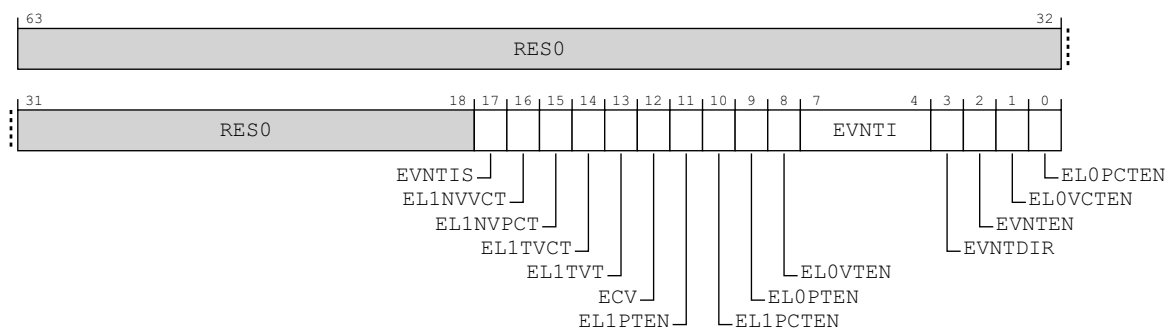

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CNTHCTL_EL2 is a 64-bit register.

Field descriptions

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

Bits [63:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

EVNTIS

Controls the scale of the generation of the event stream.

0b0 The CNTHCTL_EL2.EVNTI field applies to [CNTPCT_EL0](#)[15:0].

0b1 The CNTHCTL_EL2.EVNTI field applies to [CNTPCT_EL0](#)[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]

When FEAT_ECV is implemented:

EL1NVVCT

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 If $((\text{HCR_EL2.E2H}=1 \ \&\& \ \text{HCR_EL2.TGE}=1) \ || \ \text{HCR_EL2.NV2}=0 \ || \ \text{HCR_EL2.NV1}=1 \ || \ \text{HCR_EL2.NV}=0)$, this control does not cause any instructions to be trapped.

If $((\text{HCR_EL2.E2H}=0 \ || \ \text{HCR_EL2.TGE}=0) \ \&\& \ \text{HCR_EL2.NV2}=1 \ \&\& \ \text{HCR_EL2.NV1}=0 \ \&\& \ \text{HCR_EL2.NV}=1)$, then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]

When FEAT_ECV is implemented:

EL1NVPCT

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 If $((\text{HCR_EL2.E2H}=1 \ \&\& \ \text{HCR_EL2.TGE}=1) \ || \ \text{HCR_EL2.NV2}=0 \ || \ \text{HCR_EL2.NV1}=1 \ || \ \text{HCR_EL2.NV}=0)$, this control does not cause any instructions to be trapped.

If $(\text{HCR_EL2.E2H}=0 \ || \ \text{HCR_EL2.TGE}=0) \ \&\& \ \text{HCR_EL2.NV2}=1 \ \&\& \ \text{HCR_EL2.NV1}=0 \ \&\& \ \text{HCR_EL2.NV}=1$, then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]

When FEAT_ECV is implemented:

EL1TVCT

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 If $\text{HCR_EL2}\{E2H, TGE\}$ is $\{1, 1\}$, this control does not cause any instructions to be trapped.

If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then:

- In AArch64 state, traps EL0 and EL1 accesses to CNTVCT_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN.

- In AArch32 state, traps EL0 and EL1 accesses to `CNTVCT` to EL2, unless they are trapped by `CNTKCTL_EL1.EL0VCTEN` or `CNTKCTL.PL0VCTEN`.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the `CNTHCTL_EL2.ECV` bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]

When FEAT_ECV is implemented:

EL1TVT

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 If `HCR_EL2.{E2H, TGE}` is {1, 1}, this control does not cause any instructions to be trapped.

If `HCR_EL2.E2H` is 0 or `HCR_EL2.TGE` is 0, then:

- In AArch64 state, traps EL0 and EL1 accesses to `CNTV_CTL_EL0`, `CNTV_CVAL_EL0`, and `CNTV_TVAL_EL0` to EL2, unless they are trapped by `CNTKCTL_EL1.EL0VTEN`.
- In AArch32 state, traps EL0 and EL1 accesses to `CNTV_CTL`, `CNTV_CVAL`, and `CNTV_TVAL` to EL2, unless they are trapped by `CNTKCTL_EL1.EL0VTEN` or `CNTKCTL.PL0VTEN`.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the `CNTHCTL_EL2.ECV` bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]

When FEAT_ECV is implemented:

ECV

Enables the Enhanced Counter Virtualization functionality registers.

0b0 Enhanced Counter Virtualization functionality is disabled.

0b1 When `HCR_EL2.{E2H, TGE}` == {1, 1} or `SCR_EL3.{NS, EEL2}` == {0, 0}, then Enhanced Counter Virtualization functionality is disabled.

When `SCR_EL3.NS` or `SCR_EL3.EEL2` are 1, and `HCR_EL2.E2H` or `HCR_EL2.TGE` are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that:

- An MRS to `CNTPCT_EL0` from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - `CNTPOFF_EL2`<63:0>).

- The EL1 physical timer interrupt is triggered when $((\text{PCount}<63:0> - \text{CNTPOFF_EL2}<63:0>) - \text{PCVal}<63:0>)$ is greater than or equal to 0. $\text{PCount}<63:0>$ is the physical count returned when `CNTPCT_EL0` is read from EL2 or EL3. $\text{PCVal}<63:0>$ is the EL1 physical timer compare value for this timer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1PTEN, bit [11]

When `HCR_EL2.TGE` is 0, traps EL0 and EL1 accesses to the E1 physical timer registers to EL2 when EL2 is enabled in the current Security state.

- 0b0 From AArch64 state: EL0 and EL1 accesses to the `CNTP_CTL_EL0`, `CNTP_CVAL_EL0`, and `CNTP_TVAL_EL0` are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by `CNTKCTL_EL1.EL0PTEN`. From AArch32 state: EL0 and EL1 accesses to the `CNTP_CTL`, `CNTP_CVAL`, and `CNTP_TVAL` are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by `CNTKCTL_EL1.ELOPTEN` or `CNTKCTL.PL0PTEN`.
- 0b1 This control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [10]

When `HCR_EL2.TGE` is 0, traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to `CNTPCT_EL0` are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to `CNTPCT` are trapped to EL2, reported using EC syndrome value 0x04.

- 0b0 From AArch64 state: EL0 and EL1 accesses to the `CNTPCT_EL0` are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by `CNTKCTL_EL1.EL0PCTEN`. From AArch32 state: EL0 and EL1 accesses to the `CNTPCT` are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by `CNTKCTL_EL1.EL0PCTEN` or `CNTKCTL.PL0PCTEN`.
- 0b1 This control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PTEN, bit [9]

When `HCR_EL2.TGE` is 0, this control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, traps EL0 accesses to the physical timer registers to EL2.

- 0b0 EL0 using AArch64: EL0 accesses to the `CNTP_CTL_EL0`, `CNTP_CVAL_EL0`, and `CNTP_TVAL_EL0` registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the `CNTP_CTL`, `CNTP_CVAL` and `CNTP_TVAL` registers are trapped to EL2.
- 0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

When `HCR_EL2.TGE` is 0, this control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, traps EL0 accesses to the virtual timer registers to EL2.

0b0 EL0 using AArch64: EL0 accesses to the `CNTV_CTL_EL0`, `CNTV_CVAL_EL0`, and `CNTV_TVAL_EL0` registers are trapped to EL2.

EL0 using AArch32: EL0 accesses to the `CNTV_CTL`, `CNTV_CVAL`, and `CNTV_TVAL` registers are trapped to EL2.

0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of the counter register `CNTPCT_EL0` is the trigger for the event stream generated from that counter, when that stream is enabled.

If `FEAT_ECV` is implemented, and `CNTHCTL_EL2.EVNTIS` is 1, this field selects a trigger bit in the range 8 to 23 of the counter register `CNTPCT_EL0`.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register `CNTPCT_EL0` trigger bit, defined by `EVNTI`, generates an event when the event stream is enabled.

0b0 A 0 to 1 transition of the trigger bit triggers an event.

0b1 A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register `CNTPCT_EL0`.

0b0 Disables the event stream.

0b1 Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VCTEN, bit [1]

When `HCR_EL2.TGE` is 0, this control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

0b0 EL0 using AArch64: EL0 accesses to the `CNTVCT_EL0` are trapped to EL2.

EL0 using AArch64: EL0 accesses to the `CNTFRQ_EL0` register are trapped to EL2, if `CNTHCTL_EL2.EL0PCTEN` is also 0.

EL0 using AArch32: EL0 accesses to the `CNTVCT` are trapped to EL2.

EL0 using AArch32: EL0 accesses to the `CNTFRQ` register are trapped to EL2, if `CNTHCTL_EL0PCTEN` is also 0.

0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

When `HCR_EL2.TGE` is 0, this control does not cause any instructions to be trapped.

When `HCR_EL2.TGE` is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

- 0b0 EL0 using AArch64: EL0 accesses to the `CNTPCT_EL0` are trapped to EL2.
 EL0 using AArch64: EL0 accesses to the `CNTRFQ_EL0` register are trapped to EL2, if `CNTHCTL_EL2.EL0VCTEN` is also 0.
 EL0 using AArch32: EL0 accesses to the `CNTPCT` are trapped to EL2.
 EL0 using AArch32: EL0 accesses to the `CNTRFQ` and register are trapped to EL2, if `CNTHCTL_EL2.EL0VCTEN` is also 0.

- 0b1 This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

This format applies in all Armv8.0 implementations, and it also contains a description of the behavior when EL3 is implemented and EL2 is not implemented.

Bits [63:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

EVNTIS

Controls the scale of the generation of the event stream.

- 0b0 The `CNTHCTL_EL2.EVNTI` field applies to `CNTPCT_EL0`[15:0].

- 0b1 The `CNTHCTL_EL2.EVNTI` field applies to `CNTPCT_EL0`[23:8].

This control applies regardless of the value of the `CNTHCTL_EL2.ECV` bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]

When FEAT_ECV is implemented:

EL1NVVCT

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 If $((\text{HCR_EL2.E2H}=1 \ \&\& \ \text{HCR_EL2.TGE}=1) \ || \ \text{HCR_EL2.NV2}=0 \ || \ \text{HCR_EL2.NV1}=1 \ || \ \text{HCR_EL2.NV}=0)$, this control does not cause any instructions to be trapped.

If $((\text{HCR_EL2.E2H}=0 \ || \ \text{HCR_EL2.TGE}=0) \ \&\& \ \text{HCR_EL2.NV2}=1 \ \&\& \ \text{HCR_EL2.NV1}=0 \ \&\& \ \text{HCR_EL2.NV}=1)$, then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]

When FEAT_ECV is implemented:

EL1NVPCT

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 If $((\text{HCR_EL2.E2H}=1 \ \&\& \ \text{HCR_EL2.TGE}=1) \ || \ \text{HCR_EL2.NV2}=0 \ || \ \text{HCR_EL2.NV1}=1 \ || \ \text{HCR_EL2.NV}=0)$, this control does not cause any instructions to be trapped.

If $(\text{HCR_EL2.E2H}=0 \ || \ \text{HCR_EL2.TGE}=0) \ \&\& \ \text{HCR_EL2.NV2}=1 \ \&\& \ \text{HCR_EL2.NV1}=0 \ \&\& \ \text{HCR_EL2.NV}=1)$, then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]

When FEAT_ECV is implemented:

EL1TVCT

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 If $\text{HCR_EL2}\{E2H, TGE\}$ is $\{1, 1\}$, this control does not cause any instructions to be trapped.

If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then:

In AArch64 state, traps EL0 and EL1 accesses to `CNTVCT_EL0` to EL2, unless they are trapped by `CNTKCTL_EL1.EL0VCTEN`. In AArch32 state, traps EL0 and EL1 accesses to `CNTVCT` to EL2, unless they are trapped by `CNTKCTL_EL1.EL0VCTEN` or `CNTKCTL.PL0VCTEN`.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the `CNTHCTL_EL2.ECV` bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]

When FEAT_ECV is implemented:

EL1TVT

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

0b0 This control does not cause any instructions to be trapped.

0b1 If `HCR_EL2.{E2H, TGE}` is {1, 1}, this control does not cause any instructions to be trapped.

If `HCR_EL2.E2H` is 0 or `HCR_EL2.TGE` is 0, then:

- In AArch64 state, traps EL0 and EL1 accesses to `CNTV_CTL_EL0`, `CNTV_CVAL_EL0`, and `CNTV_TVAL_EL0` to EL2, unless they are trapped by `CNTKCTL_EL1.EL0VTEN`.
- In AArch32 state, traps EL0 and EL1 accesses to `CNTV_CTL`, `CNTV_CVAL`, and `CNTV_TVAL` to EL2, unless they are trapped by `CNTKCTL_EL1.EL0VTEN` or `CNTKCTL.PL0VTEN`.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the `CNTHCTL_EL2.ECV` bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]

When FEAT_ECV is implemented:

ECV

Enables the Enhanced Counter Virtualization functionality registers.

0b0 Enhanced Counter Virtualization functionality is disabled.

0b1 When `HCR_EL2.{E2H, TGE}` == {1, 1} or `SCR_EL3.{NS, EEL2}` == {0, 0}, then Enhanced Counter Virtualization functionality is disabled.

When `SCR_EL3.NS` or `SCR_EL3.EEL2` are 1, and `HCR_EL2.E2H` or `HCR_EL2.TGE` are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that:

- An MRS to `CNTPCT_EL0` from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - `CNTPOFF_EL2`<63:0>).

- The EL1 physical timer interrupt is triggered when $((\text{PCount}<63:0> - \text{CNTPOFF_EL2}<63:0>) - \text{PCVal}<63:0>)$ is greater than or equal to 0. PCCount is the physical count returned when CNTPCT_ELO is read from EL2 or EL3. PCVal<63:0> is the EL1 physical timer compare value for this timer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [11:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit of the counter register CNTPCT_ELO is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register CNTPCT_ELO.

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register CNTPCT_ELO trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

0b0 A 0 to 1 transition of the trigger bit triggers an event.

0b1 A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register CNTPCT_ELO.

0b0 Disables the event stream.

0b1 Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCEN, bit [1]

Traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTP_CTL_ELO, CNTP_CVAL_ELO, CNTP_TVAL_ELO are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x3 and MRRC and MCRR accesses are trapped to EL2, reported using EC syndrome value 0x04:

— CNTP_CTL, CNTP_CVAL, CNTP_TVAL.

0b0 From AArch64 state: EL0 and EL1 accesses to the CNTP_CTL_ELO, CNTP_CVAL_ELO, and CNTP_TVAL_ELO are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN.

From AArch32 state: EL0 and EL1 accesses to the [CNTP_CTL](#), [CNTP_CVAL](#), and [CNTP_TVAL](#) are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by [CNTKCTL_EL1.ELOPTEN](#) or [CNTKCTL.PLOPTEN](#).

0b1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [0]

Traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTPCT_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to [CNTPCT](#) are trapped to EL2, reported using EC syndrome value 0x04.

0b0 From AArch64 state: EL0 and EL1 accesses to the [CNTPCT_EL0](#) are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by [CNTKCTL_EL1.EL0PCTEN](#).

From AArch32 state: EL0 and EL1 accesses to the [CNTPCT](#) are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by [CNTKCTL_EL1.EL0PCTEN](#) or [CNTKCTL.PL0PCTEN](#).

0b1 This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHCTL_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHCTL_EL2](#) or [CNTKCTL_EL1](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTHCTL_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```

D13.8.3 CNTHP_CTL_EL2, Counter-timer Hypervisor Physical Timer Control register

The CNTHP_CTL_EL2 characteristics are:

Purpose

Control register for the EL2 physical timer.

Configurations

AArch64 System register CNTHP_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHP_CTL\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CTL_EL2 is a 64-bit register.

Field descriptions

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.

0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP_TVAL_EL2](#) continues to count down.

———— **Note** —————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_CTL_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHP_CTL_EL2](#) or [CNTPT_CTL_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTHP_CTL_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0010	0b001

D13.8.4 CNTHP_CVAL_EL2, Counter-timer Physical Timer CompareValue register (EL2)

The CNTHP_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the EL2 physical timer.

Configurations

AArch64 System register CNTHP_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register [CNTHP_CVAL](#)[63:0].

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CVAL_EL2 is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHP_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHP_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHP_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHP_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_CVAL_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHP_CVAL_EL2](#) or [CNTP_CVAL_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D13.8.5 CNTHP_TVAL_EL2, Counter-timer Physical Timer TimerValue register (EL2)

The CNTHP_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 physical timer.

Configurations

AArch64 System register CNTHP_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHP_TVAL](#)[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_TVAL_EL2 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHP_CTL_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHP_CTL_EL2.ENABLE](#) is 1, the value returned is ([CNTHP_CVAL_EL2](#) - [CNTPCT_EL0](#)).

On a write of this register, [CNTHP_CVAL_EL2](#) is set to ([CNTPCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHP_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - [CNTHP_CVAL_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHP_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHP_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHP_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_TVAL_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHP_TVAL_EL2](#) or [CNTP_TVAL_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

Control register for the Secure EL2 physical timer.

Configurations

AArch64 System register CNTHPS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_CTL[31:0].

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL_EL2 are UNDEFINED.

Attributes

CNTHPS_CTL_EL2 is a 64-bit register.

Field descriptions

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHPS_TVAL_EL2](#) continues to count down.

————— Note —————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_CTL_EL2

Accesses to this register use the following encodings in the System register encoding space:

D13.8.7 CNTHPS_CVAL_EL2, Counter-timer Secure Physical Timer CompareValue register (EL2)

The CNTHPS_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the Secure EL2 physical timer.

Configurations

AArch64 System register CNTHPS_CVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHPS_CVAL](#)[31:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL_EL2 are UNDEFINED.

Attributes

CNTHPS_CVAL_EL2 is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHPS_CTL_EL2](#).ENABLE is 1, the timer condition is met when ([CNTPCT_ELO](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHPS_CTL_EL2](#).ISTATUS is set to 1.
- If [CNTHPS_CTL_EL2](#).IMASK is 0, an interrupt is generated.

When [CNTHPS_CTL_EL2](#).ENABLE is 0, the timer condition is not met, but [CNTPCT_ELO](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D13.8.8 CNTHPS_TVAL_EL2, Counter-timer Secure Physical Timer TimerValue register (EL2)

The CNTHPS_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the Secure EL2 physical timer.

Configurations

AArch64 System register CNTHPS_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHPS_TVAL](#)[31:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL_EL2 are UNDEFINED.

Attributes

CNTHPS_TVAL_EL2 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHPS_CTL_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHPS_CTL_EL2.ENABLE](#) is 1, the value returned is ([CNTHPS_CVAL_EL2](#) - [CNTPCT_EL0](#)).

On a write of this register, [CNTHPS_CVAL_EL2](#) is set to ([CNTPCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHPS_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - [CNTHPS_CVAL_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHPS_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHPS_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHPS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_TVAL_EL2

Accesses to this register use the following encodings in the System register encoding space:

D13.8.9 CNTHV_CTL_EL2, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL_EL2 characteristics are:

Purpose

Control register for the EL2 virtual timer.

Configurations

AArch64 System register CNTHV_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_CTL[31:0].

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHV_CTL_EL2 is a 64-bit register.

Field descriptions

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHV_TVAL_EL2](#) continues to count down.

————— Note —————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_CTL_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic [CNTHV_CTL_EL2](#) or [CNTV_CTL_EL0](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D13.8.10 CNTHV_CVAL_EL2, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the EL2 virtual timer.

Configurations

AArch64 System register CNTHV_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHV_CVAL[63:0].

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHV_CVAL_EL2 is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_CVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_CVAL_EL2 or CNTV_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D13.8.11 CNTHV_TVAL_EL2, Counter-timer Virtual Timer TimerValue Register (EL2)

The CNTHV_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 virtual timer.

Configurations

AArch64 System register CNTHV_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHV_TVAL](#)[31:0].

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHV_TVAL_EL2 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHV_CTL_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHV_CTL_EL2.ENABLE](#) is 1, the value returned is ([CNTHV_CVAL_EL2](#) - [CNTVCT_EL0](#)).

On a write of this register, [CNTHV_CVAL_EL2](#) is set to ([CNTVCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHV_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT_EL0](#) - [CNTHV_CVAL_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHV_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHV_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHV_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_TVAL_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_TVAL_EL2 or CNTV_TVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D13.8.12 CNTHVS_CTL_EL2, Counter-timer Secure Virtual Timer Control register (EL2)

The CNTHVS_CTL_EL2 characteristics are:

Purpose

Control register for the Secure EL2 virtual timer.

Configurations

AArch64 System register CNTHVS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_CTL[31:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL_EL2 are UNDEFINED.

Attributes

CNTHVS_CTL_EL2 is a 64-bit register.

Field descriptions

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the CNTHVS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the CNTHVS_CTL_EL2.ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHVS_TVAL_EL2](#) continues to count down.

————— Note —————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D13.8.13 CNTHVS_CVAL_EL2, Counter-timer Secure Virtual Timer CompareValue register (EL2)

The CNTHVS_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the Secure EL2 virtual timer.

Configurations

AArch64 System register CNTHVS_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register [CNTHVS_CVAL](#)[63:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CVAL_EL2 are UNDEFINED.

Attributes

CNTHVS_CVAL_EL2 is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the Secure EL2 virtual timer CompareValue.

When [CNTHVS_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTVCT_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHVS_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHVS_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

D13.8.14 CNTHVS_TVAL_EL2, Counter-timer Secure Virtual Timer TimerValue register (EL2)

The CNTHVS_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the Secure EL2 virtual timer.

Configurations

AArch64 System register CNTHVS_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_TVAL[31:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL_EL2 are UNDEFINED.

Attributes

CNTHVS_TVAL_EL2 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHVS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHVS_CTL_EL2.ENABLE is 1, the value returned is (CNTHVS_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHVS_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHVS_CTL_EL2.ENABLE is 1, the timer condition is met when ((CNTVCT_EL0 - CNTHVS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHVS_CTL_EL2.ISTATUS is set to 1.
- If CNTHVS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHVS_TVAL_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTHVS_TVAL_EL2

D13.8.15 CNTKCTL_EL1, Counter-timer Kernel Control register

The CNTKCTL_EL1 characteristics are:

Purpose

When [FEAT_VHE](#) is not implemented, or when [HCR_EL2](#).{E2H, TGE} is not {1, 1}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When [FEAT_VHE](#) is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by [CNTHTCTL_EL2](#).

Configurations

AArch64 System register CNTKCTL_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CNTKCTL](#)[31:0].

Attributes

CNTKCTL_EL1 is a 64-bit register.

Field descriptions

Bits [63:18]

Reserved, RES0.

EVENTIS, bit [17]

When FEAT_ECV is implemented:

EVENTIS

Controls the scale of the generation of the event stream.

0b0 The CNTKCTL_EL1.EVNTI field applies to [CNTVCT_EL0](#)[15:0].

0b1 The CNTKCTL_EL1.EVNTI field applies to [CNTVCT_EL0](#)[23:8].

This control applies regardless of the value of the [CNTHTCTL_EL2](#).ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:10]

Reserved, RES0.

EL0PTEN, bit [9]

Traps EL0 accesses to the physical timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
 - [CNTP_CTL_EL0](#), [CNTP_CVAL_EL0](#), and [CNTP_TVAL_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped, reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped, reported using EC syndrome value 0x04:
 - [CNTP_CTL](#), [CNTP_CVAL](#), [CNTP_TVAL](#).

0b0 EL0 accesses to the physical timer registers are trapped to EL1.

0b1 This control does not cause any instructions to be trapped.

When [FEAT_VHE](#) is implemented and [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Traps EL0 accesses to the virtual timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
 - [CNTV_CTL_EL0](#), [CNTV_CVAL_EL0](#), and [CNTV_TVAL_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped using EC syndrome value 0x04:
 - [CNTV_CTL](#), [CNTV_CVAL](#), and [CNTV_TVAL](#).

0b0 EL0 accesses to the virtual timer registers are trapped.

0b1 This control does not cause any instructions to be trapped.

When [FEAT_VHE](#) is implemented and [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of the counter register [CNTVCT_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If [FEAT_ECV](#) is implemented, and [CNTKCTL_EL1.EVNTIS](#) is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTVCT_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register [CNTVCT_EL0](#) trigger bit, defined by [EVNTI](#), generates an event when the event stream is enabled.

0b0 A 0 to 1 transition of the trigger bit triggers an event.

0b1 A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

When **FEAT_VHE** is not implemented, or when **HCR_EL2**.{E2H, TGE} is not {1, 1}, enables the generation of an event stream from the counter register **CNTVCT_EL0**.

0b0 Disables the event stream.

0b1 Enables the event stream.

When **FEAT_VHE** is implemented and **HCR_EL2**.{E2H, TGE} is {1, 1}, this control does not enable the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VCTEN, bit [1]

Traps EL0 accesses to the frequency register and virtual counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and **HCR_EL2**.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
 - **CNTVCT_EL0** and if **CNTKCTL_EL1**.EL0PCTEN is 0, **CNTFRQ_EL0**.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
 - **CNTVCT** and if **CNTKCTL_EL1**.EL0PCTEN is 0, **CNTFRQ**.

0b0 EL0 accesses to the frequency register and virtual counter registers are trapped.

0b1 This control does not cause any instructions to be trapped.

When **FEAT_VHE** is implemented and **HCR_EL2**.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Traps EL0 accesses to the frequency register and physical counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and **HCR_EL2**.TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
 - **CNTPCT_EL0** and if **CNTKCTL_EL1**.EL0VCTEN is 0, **CNTFRQ_EL0**.
- In AArch32 state, MCR or MRC accesses the following registers are trapped, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped and reported using EC syndrome value 0x04:
 - **CNTPCT** and if **CNTKCTL_EL1**.EL0VCTEN is 0, **CNTFRQ**.

0b0 EL0 accesses to the frequency register and physical counter register are trapped.

0b1 This control does not cause any instructions to be trapped.

When **FEAT_VHE** is implemented and **HCR_EL2**.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTKCTL_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL_EL1 or CNTKCTL_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTKCTL_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1110	0b0001	0b000

```

D13.8.16 CNTP_CTL_EL0, Counter-timer Physical Timer Control register

The CNTP_CTL_EL0 characteristics are:

Purpose

Control register for the EL1 physical timer.

Configurations

AArch64 System register CNTP_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CNTP_CTL](#)[31:0].

Attributes

CNTP_CTL_EL0 is a 64-bit register.

Field descriptions

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from `CNTP_TVAL_ELO` continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CTL_ELO

When `HCR_EL2.E2H` is 1, without explicit synchronization, access from EL3 using the mnemonic `CNTP_CTL_ELO` or `CNTP_CTL_ELO2` are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTP_CTL_ELO

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0010	0b001

D13.8.17 CNTP_CVAL_EL0, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL_EL0 characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configurations

AArch64 System register CNTP_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTP_CVAL](#)[63:0].

Attributes

CNTP_CVAL_EL0 is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP_CTL_EL0.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTP_CTL_EL0.ISTATUS](#) is set to 1.
- If [CNTP_CTL_EL0.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL_EL0.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL_EL0

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CVAL_EL0 or CNTP_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTP_CVAL_EL0

D13.8.18 CNTP_TVAL_EL0, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL_EL0 characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configurations

AArch64 System register CNTP_TVAL_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CNTP_TVAL](#)[31:0].

Attributes

CNTP_TVAL_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP_CTL_EL0.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP_CTL_EL0.ENABLE](#) is 1, the value returned is ([CNTP_CVAL_EL0](#) - [CNTPCT_EL0](#)).

On a write of this register, [CNTP_CVAL_EL0](#) is set to ([CNTPCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP_CTL_EL0.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - [CNTP_CVAL_EL0](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP_CTL_EL0.ISTATUS](#) is set to 1.
- If [CNTP_CTL_EL0.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL_EL0.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL_EL0

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_TVAL_EL0 or CNTP_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D13.8.19 CNTPCTSS_EL0, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS_EL0 characteristics are:

Purpose

Holds the self-synchronized view of the 64-bit physical count value.

Configurations

AArch64 System register CNTPCTSS_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTPCTSS](#)[63:0].

This register is present only when FEAT_ECV is implemented. Otherwise, direct accesses to CNTPCTSS_EL0 are UNDEFINED.

All reads to the CNTPCTSS_EL0 occur in program order relative to reads to [CNTPCT_EL0](#) or CNTPCTSS_EL0.

This register is a self-synchronised view of the [CNTPCT_EL0](#) counter, and cannot be read speculatively.

Attributes

CNPCTSS_EL0 is a 64-bit register.

Field descriptions

Bits [63:0]

Self-synchronized physical count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCTSS_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTPCTSS_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b101

```

D13.8.20 CNTPCT_EL0, Counter-timer Physical Count register

The CNTPCT_EL0 characteristics are:

Purpose

Holds the 64-bit physical count value.

Configurations

AArch64 System register CNTPCT_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTPCT](#)[63:0].

All reads to the CNTPCT_EL0 occur in program order relative to reads to [CNTPCTSS_EL0](#) or CNTPCT_EL0.

Attributes

CNPCT_EL0 is a 64-bit register.

Field descriptions

Bits [63:0]

Physical count value.

Reads of CNTPCT_EL0 from EL0 or EL1 return (PhysicalCountInt<63:0> - [CNTPOFF_EL2](#)<63:0>) if the access is not trapped, and all of the following are true:

- [CNTHCTL_EL2](#).ECV is 1.
- [HCR_EL2](#).{E2H, TGE} is not {1, 1}.

Where PhysicalCountInt<63:0> is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTPCT_EL0

D13.8.21 CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control register

The CNTPS_CTL_EL1 characteristics are:

Purpose

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configurations

There are no configuration notes.

Attributes

CNTPS_CTL_EL1 is a 64-bit register.

Field descriptions

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTPS_TVAL_EL1](#) continues to count down.

———— **Note** ————

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_CTL_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

D13.8.22 CNTPOFF_EL2, Counter-timer Physical Offset register

The CNTPOFF_EL2 characteristics are:

Purpose

Holds the 64-bit physical offset. This is the offset for the AArch64 physical timers and counters when Enhanced Counter Virtualization is enabled.

Configurations

This register is present only when FEAT_ECV is implemented. Otherwise, direct accesses to CNTPOFF_EL2 are UNDEFINED.

The CNTPOFF_EL2 offset applies to:

- Direct reads of the physical counter from EL0 or EL1.
- Indirect reads of the physical counter by the EL1 physical timer.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if any of the following are true:

- [CNTHCTL_EL2](#).ECV is 0.
- [SCR_EL3](#).ECVEn is 0.
- [HCR_EL2](#).{E2H, TGE} is {1, 1}.

Attributes

CNTPOFF_EL2 is a 64-bit register.

Field descriptions

Bits [63:0]

Physical offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPOFF_EL2

Accesses to this register use the following encodings in the System register encoding space:

```

D13.8.23 CNTPS_CVAL_EL1, Counter-timer Physical Secure Timer CompareValue register

The CNTPS_CVAL_EL1 characteristics are:

Purpose

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configurations

There are no configuration notes.

Attributes

CNTPS_CVAL_EL1 is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the secure physical timer CompareValue.

When CNTPS_CTL_EL1.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

When CNTPS_CTL_EL1.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_CVAL_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTPS_CVAL_EL1

op0	op1	CRn	CRm	op2
0b11	0b111	0b1110	0b0010	0b010

```

D13.8.24 CNTPS_TVAL_EL1, Counter-timer Physical Secure Timer TimerValue register

The CNTPS_TVAL_EL1 characteristics are:

Purpose

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configurations

There are no configuration notes.

Attributes

CNTPS_TVAL_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the secure physical timer.

On a read of this register:

- If `CNTPS_CTL_EL1.ENABLE` is 0, the value returned is UNKNOWN.
- If `CNTPS_CTL_EL1.ENABLE` is 1, the value returned is $(CNTPS_CVAL_EL1 - CNTPCT_EL0)$.

On a write of this register, `CNTPS_CVAL_EL1` is set to $(CNTPCT_EL0 + \text{TimerValue})$, where `TimerValue` is treated as a signed 32-bit integer.

When `CNTPS_CTL_EL1.ENABLE` is 1, the timer condition is met when $(CNTPCT_EL0 - CNTPS_CVAL_EL1)$ is greater than or equal to zero. This means that `TimerValue` acts like a 32-bit downcounter timer. When the timer condition is met:

- `CNTPS_CTL_EL1.ISTATUS` is set to 1.
- If `CNTPS_CTL_EL1.IMASK` is 0, an interrupt is generated.

When `CNTPS_CTL_EL1.ENABLE` is 0, the timer condition is not met, but `CNTPCT_EL0` continues to count, so the `TimerValue` view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_TVAL_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTPS_TVAL_EL1

op0	op1	CRn	CRm	op2
0b11	0b111	0b1110	0b0010	0b000

```

```

D13.8.25 CNTV_CTL_EL0, Counter-timer Virtual Timer Control register

The CNTV_CTL_EL0 characteristics are:

Purpose

Control register for the virtual timer.

Configurations

AArch64 System register CNTV_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CNTV_CTL\[31:0\]](#).

Attributes

CNTV_CTL_EL0 is a 64-bit register.

Field descriptions

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

- 0b0 Timer condition is not met.
- 0b1 Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

- 0b0 Timer interrupt is not masked by the IMASK bit.
- 0b1 Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

- 0b0 Timer disabled.
- 0b1 Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV_TVAL_ELO](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CTL_ELO

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic [CNTV_CTL_ELO](#) or [CNTV_CTL_ELO2](#) are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTV_CTL_ELO

op0	op1	CRn	CRm	op2
0b11	0b011	0b11110	0b0011	0b001

```

D13.8.26 CNTV_CVAL_EL0, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL_EL0 characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configurations

AArch64 System register CNTV_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTV_CVAL](#)[63:0].

Attributes

CNTV_CVAL_EL0 is a 64-bit register.

Field descriptions

CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When [CNTV_CTL_EL0.ENABLE](#) is 1, the timer condition is met when ([CNTVCT_EL0](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTV_CTL_EL0.ISTATUS](#) is set to 1.
- If [CNTV_CTL_EL0.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL_EL0.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT_EL0](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL_EL0

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_CVAL_EL0 or CNTV_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTV_CVAL_ELO

D13.8.27 CNTV_TVAL_EL0, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL_EL0 characteristics are:

Purpose

Holds the timer value for the EL1 virtual timer.

Configurations

AArch64 System register CNTV_TVAL_EL0 bits [31:0] are architecturally mapped to AArch32 System register [CNTV_TVAL](#)[31:0].

Attributes

CNTV_TVAL_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL1 virtual timer.

On a read of this register:

- If [CNTV_CTL_EL0.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV_CTL_EL0.ENABLE](#) is 1, the value returned is ([CNTV_CVAL_EL0](#) - [CNTVCT_EL0](#)).

On a write of this register, [CNTV_CVAL_EL0](#) is set to ([CNTVCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTV_CTL_EL0.ENABLE](#) is 1, the timer condition is met when ([CNTVCT_EL0](#) - [CNTV_CVAL_EL0](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV_CTL_EL0.ISTATUS](#) is set to 1.
- If [CNTV_CTL_EL0.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL_EL0.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL_EL0

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_TVAL_EL0 or CNTV_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

D13.8.28 CNTVCTSS_EL0, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS_EL0 characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in [CNTPCT_EL0](#) minus the virtual offset visible in [CNTVOFF_EL2](#).

Configurations

AArch64 System register CNTVCTSS_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTVCTSS](#)[63:0].

This register is present only when FEAT_ECV is implemented. Otherwise, direct accesses to CNTVCTSS_EL0 are UNDEFINED.

All reads to the CNTVCTSS_EL0 occur in program order relative to reads to [CNTVCT_EL0](#) or CNTVCTSS_EL0.

This register is a self-synchronised view of the [CNTVCT_EL0](#) counter, and cannot be read speculatively.

Attributes

CNTVCTSS_EL0 is a 64-bit register.

Field descriptions

Bits [63:0]

Self-synchronized virtual count value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCTSS_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTVCTSS_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b110

```

D13.8.29 CNTVCT_EL0, Counter-timer Virtual Count register

The CNTVCT_EL0 characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in [CNTVOFF_EL2](#).

Configurations

AArch64 System register CNTVCT_EL0 bits [63:0] are architecturally mapped to AArch32 System register [CNTVCT](#)[63:0].

The value of this register is the same as the value of [CNTPCT_EL0](#) in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented, [HCR_EL2.E2H](#) is 1, and this register is read from EL2.
- When EL2 is implemented and enabled in the current Security state, [HCR_EL2](#).{E2H, TGE} is {1, 1}, and this register is read from EL0 or EL2.

All reads to the CNTVCT_EL0 occur in program order relative to reads to [CNTVCTSS_EL0](#) or CNTVCT_EL0.

Attributes

CNTVCT_EL0 is a 64-bit register.

Field descriptions

Bits [63:0]

Virtual count value.

The reset behavior of this field is:

            return PhysicalCountInt() - CNTVOFF;
        else
            return PhysicalCountInt();
```

D13.8.30 CNTVOFF_EL2, Counter-timer Virtual Offset register

The CNTVOFF_EL2 characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in [CNTPCT_EL0](#) and the virtual count value visible in [CNTVCT_EL0](#).

Configurations

AArch64 System register CNTVOFF_EL2 bits [63:0] are architecturally mapped to AArch32 System register [CNTVOFF](#)[63:0].

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

———— Note —————

When EL2 is implemented and enabled in the current Security state, and is using AArch64, the virtual counter uses a fixed virtual offset of zero in the following situations:

- [HCR_EL2.E2H](#) is 1, and [CNTVCT_EL0](#) is read from EL2.
- [HCR_EL2.{E2H, TGE}](#) is {1, 1}, and either:
 - [CNTVCT_EL0](#) is read from EL0 or EL2.
 - [CNTVCT](#) is read from EL0.

Attributes

CNTVOFF_EL2 is a 64-bit register.

Field descriptions

Bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTVOFF_EL2

```

Part E

The AArch32 Application Level Architecture

Chapter E1

The AArch32 Application Level Programmers' Model

This chapter gives an Application level description of the programmers' model for software executing in AArch32 state. This means it describes execution in EL0 when EL0 is using AArch32. It contains the following sections:

- *About the Application level programmers' model on page E1-4248.*
- *The Application level programmers' model in AArch32 state on page E1-4249.*
- *Advanced SIMD and floating-point instructions on page E1-4260.*
- *About the AArch32 System register interface on page E1-4278.*
- *Exceptions on page E1-4279.*

E1.1 About the Application level programmers' model

This chapter contains the programmers' model information required for the development of applications that will execute in AArch32 state.

The information in this chapter is distinct from the system information required to service and support application execution under an operating system, or higher level of system software. However, some knowledge of that system information is needed to put the Application level programmers' model into context.

Depending on the implementation, the architecture supports multiple levels of execution privilege. These privilege levels are indicated by different *Exception levels* that number upwards from EL0, where EL0 corresponds to the lowest privilege level and is often described as *unprivileged*. The Application level programmers' model is the programmers' model for software executing at EL0. For more information, see [Armv8 architectural concepts on page A1-37](#).

System software determines the Exception level, and therefore the level of privilege, at which application software runs. When an operating system supports execution at both EL1 and EL0, an application usually runs unprivileged. This has the following effects:

- It means that the operating system can allocate system resources to an application in a unique or shared manner.
- It provides a degree of protection from other processes, and so helps protect the operating system from malfunctioning software.

This chapter indicates where some System level understanding is helpful, and if appropriate it gives a reference to the System level description.

Application level software is generally unaware of its Security state, and of any virtualization. For more information, see [The Armv8-A security model on page G1-6019](#) and [The effect of implementing EL2 on the Exception model on page G1-6024](#).

Note

- When an implementation includes EL3, application and operating system software normally executes in Non-secure state.
 - Older documentation, describing implementations or architecture versions that support only two privilege levels, often refers to execution at EL1 as *privileged* execution.
 - In this manual, the terms *CONSTRAINED UNPREDICTABLE*, *IMPLEMENTATION DEFINED*, *OPTIONAL*, *RES0*, *RES1*, *UNDEFINED*, *UNKNOWN*, and *UNPREDICTABLE* have Arm-specific meanings, as defined in the [Glossary](#). In body text, these terms are shown in SMALL CAPS, for example IMPLEMENTATION DEFINED.
-

E1.2 The Application level programmers' model in AArch32 state

The following sections give more information about the application level programmers' model in AArch32 state:

- [Instruction sets, arithmetic operations, and register files on page E1-4249.](#)
- [Core data types and arithmetic in AArch32 state on page E1-4249.](#)
- [The general-purpose registers, and the PC, in AArch32 state on page E1-4251.](#)
- [Process state, PSTATE on page E1-4253.](#)
- [Jazelle support on page E1-4259.](#)

E1.2.1 Instruction sets, arithmetic operations, and register files

The A32 and T32 instruction sets both provide a wide range of integer arithmetic and logical operations, that operate on a register file of sixteen 32-bit registers, that are comprised of the AArch32 general-purpose registers and the PC. As described in [The general-purpose registers, and the PC, in AArch32 state on page E1-4251](#), these registers include the registers SP (R13) and LR (R14), which have specialized uses. [Core data types and arithmetic in AArch32 state on page E1-4249](#) gives more information about these operations.

In addition, an implementation that implements the T32 and A32 instruction sets includes both:

- Scalar floating-point instructions.
- The Advanced SIMD vector instructions.

Floating-point and vector instructions operate on a separate common register file, described in [The SIMD and floating-point register file on page E1-4260](#). [Advanced SIMD and floating-point instructions on page E1-4260](#) gives more information about these instructions.

E1.2.2 Core data types and arithmetic in AArch32 state

When executing in AArch32 state, a PE supports the following data types in memory:

Byte	8 bits.
Halfword	16 bits.
Word	32 bits.
Doubleword	64 bits.

PE registers are 32 bits in size. The instruction sets provide instructions that use the following data types for data held in registers:

- 32-bit pointers.
- Unsigned or signed 32-bit integers.
- Unsigned 16-bit or 8-bit integers, held in zero-extended form.
- Signed 16-bit or 8-bit integers, held in sign-extended form.
- Two 16-bit integers packed into a register.
- Four 8-bit integers packed into a register.
- Unsigned or signed 64-bit integers held in two registers.

Load and store operations can transfer bytes, halfwords, or words to and from memory. Loads of bytes or halfwords zero-extend or sign-extend the data as it is loaded, as specified in the appropriate load instruction.

The instruction sets include load and store operations that transfer two or more words to and from memory. Software can load and store doublewords using these instructions.

———— **Note** ————

For information about the atomicity of memory accesses see [Atomicity in the Arm architecture on page E2-4284](#).

When any of the data types is described as *unsigned*, the N-bit data value represents a non-negative integer in the range 0 to 2^N-1 , using normal binary format.

When any of these types is described as *signed*, the N-bit data value represents an integer in the range $-2^{(N-1)}$ to $+2^{(N-1)}-1$, using two's complement format.

The instructions that operate on packed halfwords or bytes include some multiply instructions that use only one of two halfwords, and SIMD instructions that perform parallel addition or subtraction on all of the halfwords or bytes.

———— **Note** ————

These SIMD instructions operate on values held in the general-purpose registers, and must not be confused with the Advanced SIMD instructions that operate on a separate register file that provides registers of up to 128 bits.

Direct instruction support for 64-bit integers is limited, and most 64-bit operations require sequences of two or more instructions to synthesize them.

Integer arithmetic

The instruction set provides a wide range of operations on the values in registers, including bitwise logical operations, shifts, additions, subtractions, multiplications, and divisions. The pseudocode described in [Appendix K14 *Arm Pseudocode Definition*](#) defines these operations, usually in one of three ways:

- By direct use of the pseudocode operators and built-in functions defined in [Operators on page K14-8582](#).
- By use of pseudocode helper functions defined in the main text.
- By a sequence of the form:
 1. Use of the `SInt()`, `UInt()`, and `Int()` built-in functions defined in [Converting bitstrings to integers on page K14-8594](#) to convert the bitstring contents of the instruction operands to the unbounded integers that they represent as two's complement or unsigned integers.
 2. Use of mathematical operators, built-in functions and helper functions on those unbounded integers to calculate other such integers.
 3. Use of either the bitstring extraction operator defined in [Bitstring concatenation and slicing on page K14-8583](#) or of the saturation helper functions described in [Pseudocode description of saturation on page E1-4251](#) to convert an unbounded integer result into a bitstring result that can be written to a register.

Shift and rotate operations

The following types of shift and rotate operations are used in instructions:

Logical Shift Left

The `LSL()` pseudocode function moves each bit of a bitstring left by a specified number of bits. Zeros are shifted in at the right end of the bitstring. Bits that are shifted off the left end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

Logical Shift Right

The `LSR()` pseudocode function moves each bit of a bitstring right by a specified number of bits. Zeros are shifted in at the left end of the bitstring. Bits that are shifted off the right end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

Arithmetic Shift Right

The `ASR()` pseudocode function moves each bit of a bitstring right by a specified number of bits. Copies of the leftmost bit are shifted in at the left end of the bitstring. Bits that are shifted off the right end of the bitstring are discarded, except that the last such bit can be produced as a carry output.

Rotate Right The `ROR()` pseudocode function moves each bit of a bitstring right by a specified number of bits. Each bit that is shifted off the right end of the bitstring is re-introduced at the left end. The last bit shifted off the right end of the bitstring can be produced as a carry output.

Rotate Right with Extend

The `RRX()` pseudocode function moves each bit of a bitstring right by one bit. A carry input is shifted in at the left end of the bitstring. The bit shifted off the right end of the bitstring can be produced as a carry output.

Pseudocode description of addition and subtraction

In pseudocode, addition and subtraction can be performed on any combination of unbounded integers and bitstrings, provided that if they are performed on two bitstrings, the bitstrings must be identical in length. The result is another unbounded integer if both operands are unbounded integers, and a bitstring of the same length as the bitstring operand or operands otherwise. For the definition of these operations, see [Addition and subtraction on page K14-8584](#).

The main addition and subtraction instructions can produce status information about both unsigned carry and signed overflow conditions. When necessary, multi-word additions and subtractions can be synthesized from this status information. In pseudocode the `AddWithCarry()` function provides an addition with a carry input and a set of output Condition flags including carry output and overflow:

An important property of the `AddWithCarry()` function is that if:

`(result, nzcvc) = AddWithCarry(x, NOT(y), carry_in)`

Then:

- If `carry_in == '1'`, then `result == x-y` with:
 - `nzcvc<0> == '1'` if signed overflow occurred during the subtraction.
 - `nzcvc<1> == '1'` if unsigned borrow did not occur during the subtraction, that is, if $x \geq y$.
- If `carry_in == '0'`, then `result == x-y-1` with:
 - `nzcvc<0> == '1'` if signed overflow occurred during the subtraction.
 - `nzcvc<1> == '1'` if unsigned borrow did not occur during the subtraction, that is, if $x \geq y$.

Taken together, this means that the `carry_in` and `nzcvc<1>` output in `AddWithCarry()` calls can act as NOT borrow flags for subtractions as well as carry flags for additions.

Pseudocode description of saturation

Some instructions perform *saturating arithmetic*, that is, if the result of the arithmetic overflows the destination signed or unsigned N-bit integer range, the result produced is the largest or smallest value in that range, rather than wrapping around modulo 2^N . This is supported in pseudocode by:

- The `SignedSatQ()` and `UnsignedSatQ()` functions when an operation requires, in addition to the saturated result, a Boolean argument that indicates whether saturation occurred.
- The `SignedSat()` and `UnsignedSat()` functions when only the saturated result is required.

`SatQ(i, N, unsigned)` returns either `UnsignedSatQ(i, N)` or `SignedSatQ(i, N)` depending on the value of its third argument, and `Sat(i, N, unsigned)` returns either `UnsignedSat(i, N)` or `SignedSat(i, N)` depending on the value of its third argument.

E1.2.3 The general-purpose registers, and the PC, in AArch32 state

In the AArch32 Application level view, a PE has:

- Fifteen general-purpose 32-bit registers, R0 to R14, of which R13 and R14 have alternative names reflecting how they are, or can be, used:
 - R13 is usually identified as SP.
 - R14 is usually identified as LR.
- The PC (*program counter*), that can be described as R15.

The specialized uses of the SP (R13), LR (R14), and PC (R15) are:

SP, the stack pointer

The PE uses SP as a pointer to the active stack.

In the T32 instruction set, some instructions cannot access SP. Instructions that can access SP can use SP as a general-purpose register.

The A32 instruction set provides more general access to SP, and it can be used as a general-purpose register.

———— **Note** ————

Using SP for any purpose other than as a stack pointer might break the requirements of operating systems, debuggers, and other software systems, causing them to malfunction.

Software can refer to SP as R13.

LR, the link register

The link register can be used to hold return link information, and some cases described in this manual require this use of the LR. When software does not require the LR for linking, it can use it for other purposes. Software can refer to LR as R14.

PC, the program counter

- When executing an A32 instruction, PC reads as the address of the current instruction plus 8.
- When executing a T32 instruction, PC reads as the address of the current instruction plus 4.
- Writing an address to PC causes a branch to that address.

Most T32 instructions cannot access PC.

The A32 instruction set provides more general access to the PC, and many A32 instructions can use the PC as a general-purpose register. However, Arm deprecates the use of PC for any purpose other than as the program counter. See [Writing to the PC on page E1-4252](#) for more information.

Software can refer to PC as R15.

See [AArch32 general-purpose registers, the PC, and the Special-purpose registers on page G1-6031](#) for the system level view of these registers.

———— **Note** ————

In general, Arm strongly recommends using the names SP, LR, and PC instead of R13, R14 and R15. However, sometimes it is simpler to use the R13-R15 names when referring to a group of registers. For example, it is simpler to refer to *registers R8 to R15*, rather than to *registers R8 to R12, the SP, LR, and PC*. These two descriptions of the group of registers have exactly the same meaning.

Writing to the PC

In the A32 and T32 instruction sets, many data-processing instructions can write to the PC. Writes to the PC are handled as follows:

- In T32 state, the following 16-bit T32 instruction encodings branch to the value written to the PC:
 - Encoding T2 of *ADD, ADDS (register)* on page F5-4578.
 - Encoding T1 of *MOV, MOVS (register)* on page F5-4841.The value written to the PC is forced to be halfword-aligned by ignoring its least significant bit, treating that bit as being 0.
- The B, BL, CBNZ, CBZ, CHKA, HB, HBL, HBLP, HBP, TBB, and TBH instructions remain in the same instruction set state and branch to the value written to the PC.
The definition of each of these instructions ensures that the value written to the PC is correctly aligned for the current instruction set state.
- The BLX (immediate) instruction switches between A32 and T32 states and branches to the value written to the PC. Its definition ensures that the value written to the PC is correctly aligned for the new instruction set state.
- The following instructions write a value to the PC, treating that value as an interworking address to branch to, with low-order bits that determine the new instruction set state:
 - BLX (register), BX, and BXJ.

- LDR instructions with <Rt> equal to the PC.
- POP and all forms of LDM except LDM (exception return), when the register list includes the PC.
- In A32 state only, ADC, ADD, ADR, AND, ASR (immediate), BIC, EOR, LSL (immediate), LSR (immediate), MOV, MVN, ORR, ROR (immediate), RRX, RSB, RSC, SBC, and SUB instructions with <Rd> equal to the PC and without flag-setting specified.

For details of how an interworking address specifies the new instruction set state and instruction address, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC](#) on page E1-4253.

———— **Note** —————

The register-shifted register instructions, that are available only in the A32 instruction set and are summarized in [Data-processing register \(register shift\)](#) on page F4-4506, are CONSTRAINED UNPREDICTABLE if they attempt to write to the PC, see [Using R15 by instruction](#) on page K1-8387.

- Some instructions are treated as exception return instructions, and write both the PC and the CPSR. For more information, including which instructions are exception return instructions, see [Exception return to an Exception level using AArch32](#) on page G1-6065.
- Some instructions cause an exception, and the exception handler address is written to the PC as part of the exception entry.

Pseudocode description of operations on the AArch32 general-purpose registers and the PC

In pseudocode, the uses of the `R[]` function, with an index parameter `n`, are:

- Reading or writing R0-R12, SP, and LR, using `n = 0-12, 13, and 14` respectively.
- Reading the PC, using `n = 15`.

[Pseudocode description of general-purpose register and PC operations](#) on page G1-6033 describes accesses to these registers.

Descriptions of A32 store instructions that store the PC value use the `PCStoreValue()` pseudocode function to specify the PC value stored by the instruction.

Writing an address to the PC causes either a simple branch to that address or an *interworking* branch that also selects the instruction set to execute after the branch. A simple branch is performed by the `BranchWritePC()` function.

An interworking branch is performed by the `BXWritePC()` function.

The `LoadWritePC()` and `ALUWritePC()` functions are used for two cases where the behavior was systematically modified between architecture versions.

E1.2.4 Process state, PSTATE

Process state or `PSTATE` is an abstraction of process state information. All of the instruction sets provide instructions that operate on elements of `PSTATE`.

———— **Note** —————

In this chapter, references to `PSTATE` link to the more appropriate of:

- The Application-level view of `PSTATE` given in this section.
- The System-level description in [Process state, PSTATE](#) on page G1-6035.

The following **PSTATE** information is accessible at EL0:

The Condition flags

Flag-setting instructions set these. They are:

- N** Negative Condition flag. If the result of the instruction is regarded as a two's complement signed integer, the PE sets this to:
 - 1 if the result is negative.
 - 0 if the result is positive or zero.
- Z** Zero Condition flag. Set to:
 - 1 if the result of the instruction is zero.
 - 0 otherwise.

A result of zero often indicates an equal result from a comparison.
- C** Carry Condition flag. Set to:
 - 1 if the instruction results in a carry condition, for example an unsigned overflow that is the result of an addition.
 - 0 otherwise.
- V** Overflow Condition flag. Set to:
 - 1 if the instruction results in an overflow condition, for example a signed overflow that is the result of an addition.
 - 0 otherwise.

Conditional instructions test the N, Z, C, and V Condition flags, combining them with the *Condition code* for the instruction, to determine whether the instruction must be executed. In this way, execution of the instruction is conditional on the result of a previous operation. For more information about conditional execution, see [Conditional execution on page F1-4349](#).

The overflow or saturation flag

- Q** Some instructions can set this. For those instructions that can, the PE:
 - Sets it to 1 if the instruction indicates overflow or saturation.
 - Leaves it unchanged otherwise.

For more information, see [Pseudocode description of saturation on page E1-4251](#).

The greater than or equal flags

- GE[3:0]** The instructions described in [Parallel addition and subtraction instructions on page F2-4386](#) update these to indicate the results from individual bytes or halfwords of the operation. These flags can control a later SEL instruction. For more information, see [SEL on page F5-5002](#).

PSTATE also contains *PE state controls*. There is no direct access to these from application level instructions, but they can be changed by side-effects of application level instructions. They are:

Instruction set state

- J, T** The current instruction set state, as shown in [Table E1-1 on page E1-4254](#). In Armv8, the J bit is RES0, see the Note in this section.

Table E1-1 PSTATE.{J, T} encoding

J	T	Instruction set state
0	0	A32
0	1	T32

- A32** The PE is executing the A32 instruction set, summarized in [Chapter F4.A32 Instruction Set Encoding](#).

T32 The PE is executing the T32 instruction set, summarized in [Chapter F3 T32 Instruction Set Encoding](#).

———— **Note** —————

Encoding with J==1 before Armv8, Jazelle, and T32EE states

In previous versions of the Arm architecture, the encoding {1, 0} selected Jazelle state, and encoding {1, 1} selected T32EE state. Armv8 does not support either of these states, and these are encodings for unimplemented instruction set states, see [Unimplemented instruction sets on page G1-6041](#). Armv8 AArch32 state requires a Trivial Jazelle implementation, see [Trivial implementation of the Jazelle extension on page G1-6041](#).

The IT block state

IT[7:0] The If-Then controls for the T32 IT instruction, that applies to the *IT block* of instructions that immediately follow the IT instruction. See [IT on page F5-4702](#) for a description of the IT instruction and its associated IT block.
For more information about the use of `PSTATE.IT`, see [Use of PSTATE.IT on page E1-4257](#).

Endianness mapping

E For data accesses, controls the endianness:
0 Little-endian.
1 Big-endian.
If an implementation does not provide:

- Big-endian support for data accesses, this bit is RES0.
- Little-endian support for data accesses, this bit is RES1.

Instruction fetches are always little-endian, and ignore `PSTATE.E`.

Timing control bits

DIT *Data Independent Timing* (DIT) bit. For more information, see [About the DIT bit on page E1-4259](#).
This bit is implemented only when `FEAT_DIT` is implemented.
On a reset to AArch32 state, this bit is set to 0.

Accessing PSTATE fields at EL0

The following sections describe which `PSTATE` fields can be directly accessed at EL0, and how they can be accessed:

- [The Application Program Status Register, APSR on page E1-4255](#).
- [The SETEND instruction on page E1-4256](#).

The Application Program Status Register, APSR

At EL0, some `PSTATE` fields can be accessed using the Special-purpose *Application Program Status Register* (APSR). The APSR can be directly read using the `MRS` instruction, and directly written using the `MSR (register)` and `MSR (immediate)` instructions.

The APSR bit assignments are:

N, Z, C, V, bits [31:28]

The **PSTATE** Condition flags.

Q, bit [27] The **PSTATE** overflow or saturation flag.

Bits[26:24] Reserved, RES0. Software can use MSR instructions that write the top byte of the **APSR** without using a read-modify-write sequence. If it does this, it must write zeros to bits[26:24].

Bits[23:20, 15:0]

Reserved bits that are allocated to system features, or are available for future expansion. Unprivileged execution ignores writes to fields that are accessible only at EL1 or higher. However, application level software that writes to the APSR must treat reserved bits as *Do-Not-Modify* (DNM) bits. For more information about the reserved bits, see *The Current Program Status Register, CPSR on page G1-6037*.

These bits are UNKNOWN on a Read, and it is permitted that, on a read of **APSR**:

- Bit[22] returns the value of **PSTATE.PAN**.
- Bit[9] returns the value of **PSTATE.E**.
- Bits[8:6] return the value of **PSTATE.{A,I,F}**, the mask bits.
- Bits[4:0] return the value of **PSTATE.M[4:0]**. Bit[4] is RES1 indicating that the PE is in AArch32 state.

Note

This is an exception to the general rule that an UNKNOWN field must not return information that cannot be obtained, at the current Privilege level, by an architected mechanism.

GE[3:0], bits [19:16]

The **PSTATE** greater than or equal flags.

The other **PSTATE** fields cannot be accessed by using the APSR.

The system level alias for the APSR is the **CPSR**. The **CPSR** is a superset of the APSR. See *The Current Program Status Register, CPSR on page G1-6037*.

Writes to the **PSTATE** fields have side-effects on various aspects of PE operation. All of these side-effects, except side-effects on memory accesses associated with fetching instructions, are synchronous to the APSR write. This means they are guaranteed:

- Not to be visible to earlier instructions in the execution stream.
- To be visible to later instructions in the execution stream.

The SETEND instruction

The A32 and T32 instruction sets both include an instruction to manipulate **PSTATE.E**:

- SETEND BE Sets **PSTATE.E** to 1, for big-endian operation.
- SETEND LE Sets **PSTATE.E** to 0, for little-endian operation.

The SETEND instruction is unconditional. For more information, see *SETEND on page F5-5004*. Arm deprecates use of the SETEND instruction.

Use of PSTATE.IT

PSTATE.IT provides the If-Then controls for the T32 IT instruction, that applies to the *IT block* of instructions that immediately follow the IT instruction.

PSTATE.IT divides into two subfields:

IT[7:5] Holds the *base condition* for the current IT block. The base condition is the top three bits of the Condition code specified by the <firstcond> field of the IT instruction.

IT[4:0] Encodes:

- Implicitly, the size of the IT block. This is the number of instructions that are to be conditionally executed. The size of the block is indicated by the position of the least significant 1 in this field, as shown in [Table E1-2 on page E1-4257](#).
- For each instruction in the IT block, the least significant bit of the Condition code. This is encoded in the IT block entries that [Table E1-2 on page E1-4257](#) shows as Nx.

———— **Note** —————

Changing the least significant bit of a Condition code from 0 to 1 has the effect of inverting the Condition code.

Both subfields are all zeros when no IT block is active.

When an IT instruction is executed, PSTATE.IT is set according to the <firstcond> field of the instruction and the *Then* and *Else* (T and E) parameters in the instruction, see [IT on page F5-4702](#). This means that, on executing an IT instruction, the initial state of PSTATE.IT depends on the number of instructions in the IT block, as [Table E1-2 on page E1-4257](#) shows:

Table E1-2 Initial state of PSTATE.IT on executing an IT instruction

Number of instructions in IT block	PSTATE.IT bits ^a						Notes
	[7:5]	[4]	[3]	[2]	[1]	[0]	
4	cond_base	N1	N2	N3	N4	1	-
3	cond_base	N1	N2	N3	1	0	-
2	cond_base	N1	N2	1	0	0	-
1	cond_base	N1	1	0	0	0	-
Not executing an IT instruction	000	0	0	0	0	0	No IT block is active

a. Combinations of the IT bits not shown in this table are reserved.

In [Table E1-2 on page E1-4257](#), N1 refers to the first instruction in the IT block, and N2, N3, and N4 refer to the second, third, and fourth instructions in the IT block if they are present,

When permitted, an instruction in an IT block is conditional, see [Conditional instructions on page F2-4377](#) and [Conditional execution on page F1-4349](#). The Condition code used is the current value of IT[7:4]. When an instruction in an IT block completes its execution normally, PSTATE.IT[4:0] is left-shifted by one bit, so that PSTATE[4] always relates to the next instruction to be executed.

Table E1-3 on page E1-4258 shows how `PSTATE.IT` during the execution of an IT instruction with four instructions in the IT block.

Table E1-3 Updates to `PSTATE.IT` when executing an IT instruction with a four-instruction IT block

IT block instruction being executed	PSTATE.IT bits						Notes
	[7:5]	[4]	[3]	[2]	[1]	[0]	
First	cond_base	N1	N2	N3	N4	1	-
Second	cond_base	N2	N3	N4	1	0	-
Third	cond_base	N3	N4	1	0	0	-
Fourth	cond_base	N4	1	0	0	0	-
Not executing an IT instruction	000	0	0	0	0	0	No IT block is active

A few instructions, for example `BKPT`, cannot be conditional and therefore are always executed ignoring the current value of `PSTATE.IT`.

For details of what happens if an instruction in an IT block takes an exception, see [Overview of exception entry on page G1-6050](#).

An instruction that might complete its normal execution by branching is only permitted in an IT block as the last instruction in the block. This means that normal execution of the instruction always results in `PSTATE.IT` advancing to execution where no IT block is active.

Implementations can provide a set of ITD control fields, `SCTLR.ITD`, `SCTLR_EL1.ITD`, and `HSCTLR.ITD`, to disable use of IT for some instructions, making them `UNDEFINED`. When an implementation includes ITD control fields, [Changes to an ITD control by an instruction in an IT block on page E1-4258](#) describes the permitted `CONSTRAINED UNPREDICTABLE` behaviors if an instruction in an IT block changes the value of an ITD control to disable the use of the IT instruction.

On a branch or an exception return, if `PSTATE.IT` is set to a value that is not consistent with the instruction stream being branched to or returned to, then instruction execution is `CONSTRAINED UNPREDICTABLE`.

`PSTATE.IT` affects instruction execution only in T32 state. In A32 state, `PSTATE.IT` must be `0b00000000`, otherwise the behavior is `CONSTRAINED UNPREDICTABLE`.

For more information, see [CONSTRAINED UNPREDICTABLE behavior associated with IT instructions and PSTATE.IT on page K1-8388](#).

Changes to an ITD control by an instruction in an IT block

In an implementation that includes `SCTLR.ITD`, `SCTLR_EL1.ITD`, and `HSCTLR.ITD` controls, if an instruction in an IT block changes an ITD control so that the IT instruction using the IT block would be disabled, then one of the following behaviors applies:

- The change to the ITD field, once synchronized, has no effect on the execution of instructions in the current IT block, but applies only to any subsequent execution of an IT instruction to which the control applies.
- Synchronizing the change to the ITD field guarantees that all bits of `PSTATE.IT` are cleared to 0.

In addition, after the change to the ITD field has been synchronized, any remaining instructions in the IT block that would be made `UNDEFINED` by the new value of ITD are either:

- Executed normally.
- Treated as `UNDEFINED`.

The choice between the options described in this section is determined by the implementation, and any choice can vary between different changes to an ITD control by an instruction in an IT block.

Pseudocode description of PSTATE PE state fields

The pseudocode function [CurrentInstrSet\(\)](#) returns the current instruction set. The pseudocode function [SelectInstrSet\(\)](#) selects a new instruction set.

[PSTATE.IT](#) advances after normal execution of an IT block instruction. This is described by the [AArch32.ITAdvance\(\)](#) pseudocode function.

The pseudocode function [InITBlock\(\)](#) tests whether the current instruction is in an IT block. The pseudocode function [LastInITBlock\(\)](#) tests whether the current instruction is the last instruction in an IT block.

The [BigEndian\(\)](#) pseudocode function tests whether big-endian data memory accesses are currently selected.

E1.2.5 About the DIT bit

When the value of [CPSR.DIT](#) is 1:

- The instructions listed in [CPSR](#) are required to have;
 - Timing which is independent of the values of the data supplied in any of its registers, and the values of the NZCV flags.
 - Responses to asynchronous exceptions which do not vary based on the values supplied in any of their registers, or the values of the NZCV flags.
- All loads and stores have their timing insensitive to the value of the data being loaded or stored.

———— Note —————

When the value of [CPSR.DIT](#) is 0, the architecture makes no statement about the timing properties of any instructions.

A corresponding DIT bit is added to [PSTATE](#) in AArch64 state, and to [CPSR](#) in AArch32 state.

When an exception is taken from AArch32 state to AArch32 state, [CPSR.DIT](#) is copied to [SPSR.DIT](#).

When an exception is taken from AArch32 state to AArch64 state, [CPSR.DIT](#) is copied to [SPSR_ELx.DIT](#).

When an exception returns to AArch32 state from AArch32 state, [SPSR.DIT](#) is copied to [CPSR.DIT](#).

When an exception returns to AArch32 state from AArch64 state, [SPSR_ELx.DIT](#) is copied to [CPSR.DIT](#).

[CPSR.DIT](#) bit can be written using an MSR instruction at any Exception Level in AArch32 state, and read using an MRS instruction at any Exception Level.

E1.2.6 Jazelle support

Armv8 requires AArch32 state to include a trivial implementation of the Jazelle extension, as described in [Trivial implementation of the Jazelle extension on page G1-6041](#).

E1.3 Advanced SIMD and floating-point instructions

In general, Armv8 requires implementation of Advanced SIMD and floating-point instructions in the T32 and A32 instruction sets, but see [Implications of not including Advanced SIMD and floating-point support on page E1-4273](#).

The Advanced SIMD instructions perform packed *Single Instruction Multiple Data* (SIMD) operations, either integer or single-precision floating-point. The floating-point instructions perform single-precision or double-precision scalar floating-point operations. When FEAT_FP16 is implemented, half-precision floating-point can also be used for data processing.

These instructions permit *floating-point exceptions*, such as Overflow or Divide by Zero, to be handled without trapping. When handled in this way, a floating-point exception causes a cumulative status register bit to be set to 1 and a default result to be produced by the operation. Armv8 also optionally supports the trapping of floating-point exceptions. For more information about floating-point exceptions, see [Floating-point exceptions and exception traps on page E1-4268](#).

The Advanced SIMD and floating-point instructions also provide the following conversion functions:

- Between half-precision floating-point and single-precision floating point, in both directions.
- From double-precision, floating-point to single-precision floating point or integer.
- When FEAT_AA32BF16 is implemented, between single-precision floating-point and BFloat16 floating-point.

Some Advanced SIMD instructions support polynomial arithmetic over $\{0, 1\}$, as described in [Polynomial arithmetic over \$\{0, 1\}\$ on page A1-50](#).

For system level information about the Advanced SIMD and Floating-point implementation see [Advanced SIMD and floating-point support on page G1-6112](#).

The following sections give more information about the Advanced SIMD and floating-point instructions:

- [Floating-point standards, and terminology on page A1-53](#).
- [The SIMD and floating-point register file on page E1-4260](#).
- [Data types supported by the Advanced SIMD implementation on page E1-4262](#).
- [Advanced SIMD and floating-point System registers on page E1-4262](#).
- [Floating-point data types and arithmetic on page E1-4262](#).
- [Flushing denormalized numbers to zero on page E1-4263](#).
- [Floating-point exceptions and exception traps on page E1-4268](#).
- [Controls of Advanced SIMD operation that do not apply to floating-point operation on page E1-4273](#).
- [Implications of not including Advanced SIMD and floating-point support on page E1-4273](#).
- [Pseudocode description of floating-point operations on page E1-4273](#).

E1.3.1 The SIMD and floating-point register file

The Advanced SIMD and floating-point instructions use the same register file, that comprises 32 registers. This is distinct from the register file that holds the general-purpose registers and the PC.

The Advanced SIMD and floating-point views of the register file are different. The following sections describe these different views. [Figure E1-1 on page E1-4261](#) shows the views of the register file, and the way the word, doubleword, and quadword registers overlap.

Advanced SIMD views of the register file

Advanced SIMD can view this register file as:

- Sixteen 128-bit quadword registers, Q0-Q15.
- Thirty-two 64-bit doubleword registers, D0-D31.

These views can be used simultaneously. For example, a program might hold 64-bit vectors in D0 and D1 and a 128-bit vector in Q1.

Floating-point views of the register file

The Advanced SIMD and floating-point register file consists of thirty-two doubleword registers, that can be viewed as:

- Thirty-two 64-bit doubleword registers, D0-D31. This view is also available to Advanced SIMD instructions.
- Thirty-two 32-bit single word registers, S0-S31. Only half of the set is accessible in this view.

———— Note ————

In AArch32 state, half-precision floating point values are always represented using the bottom 16 bits of a single word register, S0-S31. When a half-precision value is written to a single word register, the top 16 bits of that register are set to 0.

The two views can be used simultaneously.

SIMD and Floating-point register file mapping onto registers

Figure E1-1 on page E1-4261 shows the different views of the SIMD and floating-point register file, and the relationship between them.

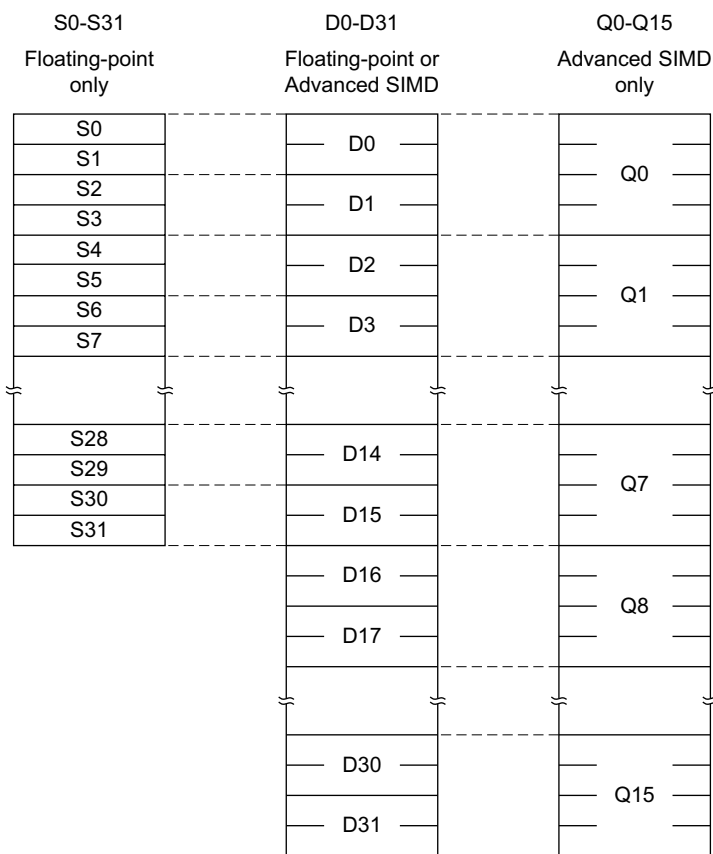

Figure E1-1 SIMD and floating-point register file, AArch32 operation

The mapping between the registers is as follows:

- S<2n> maps to the least significant half of D<n>.
- S<2n+1> maps to the most significant half of D<n>.
- D<2n> maps to the least significant half of Q<n>.
- D<2n+1> maps to the most significant half of Q<n>.

For example, software can access the least significant half of the elements of a vector in Q6 by referring to D12, and the most significant half of the elements by referring to D13.

Pseudocode description of the SIMD and Floating-point register file

The functions `_Dclone`, `S[]`, and `D[]` provide the S0-S31, D0-D31, and Q0-Q15 views of the Advanced SIMD and floating-point registers:

The `Din[]` function returns a doubleword register from the `_Dclone[]` copy of the SIMD and Floating-point register file, and the `Qin[]` function returns a quadword register from that register file.

———— Note ————

The `CheckAdvSIMDEnabled()` function copies the `D[]` register file to `_Dclone[]`, see [Pseudocode description of enabling SIMD and floating-point functionality on page G1-6151](#).

E1.3.2 Data types supported by the Advanced SIMD implementation

Advanced SIMD instructions can operate on integer and floating-point data, and the implementation defines a set of data types that support the required data formats. [Vector formats in AArch32 state on page A1-42](#) describes these formats.

Advanced SIMD vectors

In an implementation that includes support for Advanced SIMD operation, a register can hold one or more packed elements, all of the same size and type. The combination of a register and a data type describes a vector of elements. The vector is considered to be an array of elements of the data type specified in the instruction. The number of elements in the vector is implied by the size of the data elements and the size of the register.

Vector indices are in the range 0 to (number of elements – 1). An index of 0 refers to the least significant end of the vector. In [Vector formats in AArch32 state on page A1-42](#), [Figure A1-3 on page A1-44](#) shows the Advanced SIMD vector formats.

Pseudocode description of Advanced SIMD vectors

The pseudocode function `Elem[]` accesses the element of a specified index and size in a vector.

E1.3.3 Advanced SIMD and floating-point System registers

The Advanced SIMD and floating-point instructions have a shared register space for System registers. The only register in this space that is accessible at the Application level is the `FPSCR`.

Writes to the `FPSCR` can have side-effects on various aspects of PE operation. All of these side-effects are synchronous to the `FPSCR` write. This means they are guaranteed not to be visible to earlier instructions in the execution stream, and they are guaranteed to be visible to later instructions in the execution stream.

See [Advanced SIMD and floating-point System registers on page G1-6114](#) for the system level view of the registers.

These registers can be described as the *SIMD and floating-point System registers*.

E1.3.4 Floating-point data types and arithmetic

The T32 and A32 floating-point instructions support single-precision (32-bit) and double-precision (64-bit) data types and arithmetic as defined by the IEEE 754 floating-point standard. They also support the half-precision (16-bit) floating-point data type for data storage, by supporting conversions between single-precision and half-precision data types. When `FEAT_FP16` is implemented, it also supports the half-precision floating-point data type for data processing operations. When `FEAT_AA32BF16` is implemented, it also supports the BFloat16 floating-point storage format.

Arm standard floating-point arithmetic means IEEE 754 floating-point arithmetic with the restrictions described in [Advanced SIMD and floating-point support on page A1-52](#), including supporting only the input and output values described in [Arm standard floating-point input and output values on page A1-54](#).

The AArch32 Advanced SIMD instructions support single-precision and, when `FEAT_FP16` is implemented, half-precision Arm standard floating-point arithmetic.

The following sections describe the Advanced SIMD and floating-point formats:

- [Half-precision floating-point formats](#) on page A1-44.
- [Single-precision floating-point format](#) on page A1-46.
- [Double-precision floating-point format](#) on page A1-47.
- [BFloat16 floating-point format](#) on page A1-48.

The following sections describe features of Advanced SIMD and floating-point processing:

- [Flushing denormalized numbers to zero](#) on page E1-4263.
- [NaN handling and the Default NaN](#) on page A1-57.

E1.3.5 Flushing denormalized numbers to zero

Calculations involving denormalized numbers and Underflow exceptions can reduce the performance of floating-point processing. For many algorithms, replacing the denormalized operands and Intermediate results with zeros can recover this performance, without significantly affecting the accuracy of the final result. Arm floating-point implementations allow denormalized numbers to be flushed to zero to permit this optimization. If a number satisfies the condition $0 < \text{Abs}(\text{result}) < \text{MinNorm}$, it is treated as a denormalized number.

MinNorm is defined as follows:

- For half-precision numbers, MinNorm is 2^{-14} .
- For single-precision and BFloat16 numbers, MinNorm is 2^{-126} .
- For double-precision numbers, MinNorm is 2^{-1022} .

Flushing denormals to zero is incompatible with the IEEE 754 standard, and must not be used when IEEE 754 compatibility is a requirement. Enabling flushing of denormals to zero must be done with care. Although it can improve performance on some algorithms, there are significant limitations on its use. These are application-dependent:

- On many algorithms, it has no noticeable effect, because the algorithm does not usually process denormalized numbers.
- On other algorithms, it can cause exceptions to occur and can seriously reduce the accuracy of the results of the algorithm.

Flushing denormalized inputs to zero

If flushing denormalized inputs to zero is enabled for an instruction and a data type, and an input to that instruction is a denormalized number of that data type, the input operand is flushed to zero, and its sign bit is not changed. If a floating-point operation has an input denormalized number that is flushed to zero, for all purposes within the instruction other than calculating Input Denormal floating-point exceptions, all inputs that are denormalized numbers are treated as though they were zero with the same sign as the input.

For Advanced SIMD and floating-point instructions, other than FABS and FNEG, that process half-precision inputs, flushing denormalized inputs to zero can be controlled as follows:

- If `FPSCR.FZ16` is 0, denormalized half-precision inputs are not flushed to zero.
- If `FPSCR.FZ16` is 1, flushing denormalized inputs to zero occurs as follows:
 - If an instruction does not convert a half-precision input to a higher precision output, all input denormalized numbers are flushed to zero.
 - If an instruction converts a half-precision input to a higher precision output, input denormalized numbers are not flushed to zero.

For Advanced SIMD and scalar floating-point instructions, other than FABS and FNEG, that process single-precision, or double-precision inputs, flushing denormalized inputs to zero can be controlled as follows:

- If `FPSCR.FZ` is 0, flushing denormalized inputs to zero occurs as follows:
 - For Advanced SIMD floating-point instructions, all single-precision and double-precision inputs that are denormalized numbers are flushed to zero.

- For scalar floating-point instructions, single-precision and double-precision inputs that are denormalized numbers are not flushed to zero.
- If `FPSCR.FZ` is 1, for all A32, and T32 instructions, single-precision, and double-precision inputs that are denormalized numbers are flushed to zero.

If `FEAT_AA32BF16` is implemented, for Advanced SIMD and scalar floating-point instructions, other than FABS and FNEG, that process BF16 inputs, flushing denormalized inputs to zero is treated as follows:

- Instructions that convert from single-precision floating-point values to BF16 format flush denormalized inputs to zero.
- For any value of `FPSCR.FZ`, `VDOT (vector)`, `VDOT (by element)`, and `VMMLA` instructions flush all BF16 inputs that are denormalized numbers to zero.

Flushing to zero of denormalized numbers as Intermediate results of some BF16 instructions

BF16 arithmetic instructions `VDOT (by element)`, `VDOT (vector)`, and `VMMLA`, convert BF16 input values to IEEE single-precision format, and calculate N-way dot-products, accumulating the products in single-precision accumulators.

If `FEAT_AA32BF16` is implemented, for Advanced SIMD and floating-point instructions, if a BF16 arithmetic instruction processes an Intermediate result that is a single-precision denormalized number, the Intermediate result is unconditionally flushed to zero.

Flushing denormalized outputs to zero

If flushing denormalized outputs to zero is enabled for an instruction and a data type, and an output from that instruction is a denormalized number of that data type, the output operand is flushed to zero, and its sign bit is not changed.

If a floating-point operation has an output denormalized number that is flushed to zero, for all purposes within the instruction other than calculating floating-point exceptions, all outputs that are denormalized numbers are treated as though they were zero with the same sign as the output.

For Advanced SIMD and floating-point instructions, other than FABS and FNEG, that generate half-precision outputs, flushing denormalized outputs to zero can be controlled as follows:

- If `FPSCR.FZ16` is 0, denormalized half-precision outputs are not flushed to zero.
- If `FPSCR.FZ16` is 1, flushing denormalized outputs to zero occurs as follows:
 - If the instruction does not convert a half-precision input to a higher precision output, all output denormalized numbers are flushed to zero.
 - If the instruction converts a half-precision input to a higher precision output, output denormalized numbers are not flushed to zero.

For Advanced SIMD and scalar floating-point instructions, other than FABS and FNEG, that process single-precision, or double-precision inputs, flushing denormalized outputs to zero can be controlled as follows:

- If `FPSCR.FZ` is 0, flushing denormalized outputs to zero occurs as follows:
 - For Advanced SIMD floating-point instructions, all single-precision and double-precision outputs that are denormalized numbers are flushed to zero.
 - For scalar floating-point instructions, single-precision and double-precision outputs that are denormalized numbers are not flushed to zero.
- If `FPSCR.FZ` is 1, for all A32, and T32 instructions, single-precision, and double-precision outputs that are denormalized numbers are flushed to zero.

If `FEAT_AA32BF16` is implemented, for Advanced SIMD and scalar floating-point instructions, other than FABS and FNEG, that generate BF16 outputs, flushing denormalized outputs to zero can be controlled as follows:

- BF16 arithmetic instructions flush denormalized outputs to zero.

- If `FPSCR.FZ` instructions that convert from single-precision floating-point values to BF16 format flush denormalized outputs to zero.
- `VDOT (vector)`, `VDOT (by element)`, and `VMMLA` instructions flush all BF16 outputs that are denormalized numbers to zero regardless of the value of `FPSCR.FZ`.

E1.3.6 NaN handling and the Default NaN

The IEEE 754 standard defines a NaN as a number with all exponent bits set to 1 and a nonzero number in the mantissa. The Arm architecture also defines a Default NaN which does not follow this format.

The IEEE 754 standard specifies that the sign bit of a NaN has no significance.

For a quiet NaN output derived from a signaling NaN operand, the most significant fraction bit is set to 1.

The Default NaN

The Default NaN is encoded as described in [Table E1-4 on page E1-4265](#).

Table E1-4 Default NaN encoding

	Half-precision, IEEE format	Single-precision	Double-precision	BFloat16
Sign bit	0	0	0	0
Exponent	0x1F	0xFF	0x7FF	0xFF
Fraction	Bit[9] == 1, bits[8:0] == 0	Bit[22] == 1, bits[21:0] == 0	Bit[51] == 1, bits[50:0] == 0	Bit[6] == 1, bits[5:0] == 0

If `FPSCR.DN` is 1, for Advanced SIMD and floating-point instructions other than `FABS`, `FMAX*`, `FMIN*` and `FNEG`, if any input to a floating-point operation performed by the instruction is a NaN, the output of the floating-point operation is the Default NaN.

For `FABS`, `FNEG`, `FMAX*`, and `FMIN*`, Default NaN behavior is explained in the instruction description.

If `FPSCR.DN` is 0, for floating-point processing the Default NaN is not used for NaN propagation.

If `VDOT (vector)`, `VDOT (by element)`, and `VMMLA` instructions generate a NaN, the NaN is the default NaN, regardless of the setting of `FPSCR.DN`.

If a floating-point instruction performs a floating-point operation, and that instruction generates an untrapped Invalid Operation floating-point exception for a reason other than one of the inputs being a signaling NaN, the output is the Default NaN.

NaN handling

The IEEE 754 standard does not specify which input NaN is used as the output NaN. Therefore, where the Arm architecture specifies which input NaN to use, this is an addition to the requirements in the IEEE 754 standard.

Depending on the operation, the exact value of a derived quiet NaN output might have both a different sign and a different number of fraction bits from its source. See instruction descriptions for details.

NaN propagation

If an output NaN is derived from one of the operands, how the input NaN propagates to the output depends on the instruction and the number of operands.

If an output NaN is derived from an input NaN and if the size of the output format is the same as the input format, then all of the following apply:

- If the input NaN is a quiet NaN, the output NaN is the same as the input NaN.
- If the input NaN is a signaling NaN, the output NaN is derived as follows:
 - If the handling of a signaling NaN by the instruction generates an Invalid Operation exception, the output NaN is the quieted version of the input NaN.
 - If the handling of a signaling NaN by the instruction does not generate an Invalid Operation exception, the output NaN is the same as the input NaN. This case applies for FABS, FNEG, and FTSSSEL instructions.

If an output NaN is derived from an input NaN and if the size of the output format is larger than the input format, all of the following apply:

- If the input NaN is a quiet NaN, the output NaN is the same as the input NaN except that the mantissa is zero-extended in the low-order bit to fit the output format, and the exponent field is set to all ones.
- If the input NaN is a signaling NaN, the output NaN is the quieted version of the input NaN, except that the mantissa is zero-extended in the low-order bits and the exponent field is set to all ones.

If an output NaN is derived from an input NaN and if the size of the output format is smaller than the input format, all of the following apply:

- If the input NaN is a quiet NaN, the output NaN is the same as the input NaN except that the mantissa is truncated in the lower-order bits to fit the output format, and the exponent field is set to all ones.
- If the input NaN is a signaling NaN, the output NaN is the quieted version of the input NaN except that the mantissa is truncated in the lower-order bits to fit the output format, and the exponent field is set to all ones.

For the following descriptions, when an operand is described as *first* this relates to the left-to-right ordering of the arguments of the pseudocode function that describes the operation.

If `FPSCR.DN` is 0, for Advanced SIMD, floating-point, or BF16 instructions that perform a floating-point operation, other than FABS, FNEG, `FMAX*`, and `FMIN*`, NaN outputs that derive from NaN inputs are derived as follows:

- If all of the following apply, an instruction outputs a quiet NaN derived from the first signaling NaN operand:
 - At least one operand is a signaling NaN.
 - The instruction is not trapped.
- If all of the following apply, an instruction outputs a quiet NaN derived from the first NaN operand:
 - At least one operand is a NaN, but none of the operands is a signaling NaN.
 - The instruction is not trapped.

If an output NaN is derived from an input NaN, the pseudocode functions `FPAbs()`, and `FPNeg()` can change the sign of the NaN,

E1.3.7 Rounding

The rounding mode specifies how the exact result of a floating-point operation is rounded to a value in the destination format.

The rounding mode is either determined by the rounding mode control field `FPSCR.RMode` or by the instruction.

The rounding mode control field `FPSCR.RMode` can select the following rounding modes:

- Round to Nearest (RN) mode.
- Round towards Plus Infinity (RP) mode.
- Round towards Minus Infinity (RM) mode.
- Round towards Zero (RZ) mode.

The following two additional rounding modes are not selected by `FPSCR.RMode`, but are used by some instructions:

- Round to Odd mode.
- Round to Nearest with ties to away mode.

Round to Nearest mode

Round to Nearest rounding mode rounds the exact result of a floating-point operation to a value that is representable in the destination format as follows:

- If the value before rounding has an absolute value that is too large to represent in the output format, the rounded value is an Infinity. The sign of the rounded value is the same as the sign of the value before rounding.
- If the value before rounding has an absolute value that is not too large to represent in the output format, the result is calculated as follows:
 - If the two nearest floating-point numbers bracketing the value before rounding are equally near, the result is the number with an even least significant digit.
 - If the two nearest floating-point numbers bracketing the value before rounding are not equally near, the result is the floating-point number nearest to the value before rounding.

Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the `RMode` bits.

Round towards Plus Infinity mode

Round towards Plus Infinity rounding mode rounds the exact result of a floating-point operation to a value that is representable in the destination format. The result is the floating-point number in the output format that is closest to and not less than the value before rounding. The result can be plus infinity.

Round towards Minus Infinity mode

Round towards Minus Infinity rounding mode rounds the exact result of a floating-point operation to a value that is representable in the destination format. The result is the number in the output format that is closest to and not greater than the value before rounding. The result can be minus infinity.

Round towards Zero mode

Round towards Zero rounding mode rounds the exact result of a floating-point operation to a value that is representable in the destination format. The result is the floating-point number in the output format that is closest to and not greater in absolute value than the value before rounding.

Round to Nearest with Ties to Away

Round to Nearest with Ties to Away rounding mode is used by the `VCVTA (Advanced SIMD)`, `VCVTA (floating-point)`, `VRINTA (Advanced SIMD)`, and `VRINTA (floating-point)` instructions.

Round to Nearest with Ties to Away rounding mode rounds the exact result of a floating-point operation to a value that is representable in the destination format as follows:

- If the value before rounding has an absolute value that is too large to represent in the output format, the rounded value is an Infinity, the sign of the rounded value is the same as the sign of the value before rounding.
- If the value before rounding has an absolute value that is not too large to represent in the output format, the result is calculated as follows:
 - If the two nearest floating-point numbers bracketing the value before rounding are equally near, the result is the larger number.
 - If the two nearest floating-point numbers bracketing the value before rounding are not equally near, the result is the floating-point number nearest to the value before rounding.

Round to Odd mode

Round to Odd mode is not defined by IEEE 754.

For BF16 instructions, if an intermediate format has at least two more bits of precision than the result format, Round to Odd mode is used and operates as follows:

- If the rounded value is inexact, the least significant bit of the fraction is set to 1.
- If the value is too large to represent in the single-precision format, the rounded value is a single-precision Infinity, the sign of the rounded value is the same as the sign of the value before rounding.

E1.3.8 Floating-point exceptions and exception traps

Execution of a floating-point instruction, or execution of an Advanced SIMD instruction that performs floating-point operations, can generate an exceptional condition, called a *floating-point exception*.

———— Note ————

An Advanced SIMD instruction that operates on floating-point values can perform multiple floating-point operations. Therefore, this section describes the handling of a floating-point exception on an *operation*, rather than on an *instruction*.

The Armv8-A architecture does not support asynchronous reporting of floating-point exceptions.

For each of the following floating-point exceptions, it is IMPLEMENTATION DEFINED whether an implementation includes synchronous exception generation:

- Input Denormal.
- Inexact.
- Underflow.
- Overflow.
- Divide by Zero.
- Invalid Operation.

If an implementation does not support synchronous exception generation from a floating-point exception, then that synchronous exception is never generated, and all statements about synchronous exception generation from that floating-point exception do not apply to the implementation.

If an implementation supports synchronous exception generation for a floating-point exception, then the registers that are presented to the exception handler are consistent with the state of the PE immediately before the instruction that caused the exception.

On return from a synchronous floating-point exception, software might not restore the cumulative exception flags.

Trapped floating-point exceptions are taken to the following levels:

- If a trapped floating-point exception occurs at EL0, the exception level it is taken to is as follows:
 - If EL2 is using AArch32 and `HCR.TGE` is 1, the exception is taken to EL2.
 - If EL2 is using AArch64 and `HCR_EL2.TGE` is 1, the exception is taken to EL2
 - Otherwise, the exception is taken to EL1
- If a trapped floating-point exception occurs at EL1, it is taken to EL1.
- If a trapped floating-point exception occurs at EL2, it is taken to EL2.
- If a trapped floating-point exception occurs at EL3, it is taken to EL3.

If a trapped floating-point exception is taken to an Exception level that is using AArch64, then it is reported in the `ELR_ELx` for the target Exception level, as described in [Exception entry on page D1-2475](#).

If the exception is taken to an Exception level that is using AArch32, then it is taken as an Undefined Instruction exception, see [Undefined Instruction exception on page G1-6078](#). The `FPEXC` identifies the floating-point exceptions that occurred since the corresponding status bits in that register were last set to 0.

Input Denormal exceptions

The cumulative floating-point exception bit `FPSCR.IDC`, and the trap enable bit `FPSCR.IDE` both relate to Input Denormal exceptions.

If a single-precision or double-precision floating-point input is flushed to zero, an Input Denormal exception is generated.

If a half-precision floating-point value is flushed to zero, an Input Denormal exception is not generated.

Inexact exceptions

The cumulative floating-point exception bit `FPSCR.IXC`, and the trap enable bit `FPSCR.IXE` both relate to Inexact exceptions.

If a denormalized output is flushed to zero, an Inexact exception is not generated.

If a result is not flushed to zero, and the result does not equal the result computed with unbounded exponent range and unbounded precision, then an Inexact exception is generated.

Underflow exceptions

The cumulative floating-point exception bit `FPSCR.UFC`, and the trap enable bit `FPSCR.UFE` both relate to Underflow exceptions.

For the purpose of underflow floating-point exception generation, a denormalized number is detected before rounding is applied.

If the result of a floating-point operation is a denormalized number that is not flushed to zero, then the underflow exception is generated as follows:

- If `FPSCR.UFE` is 0, and the result is inexact, then the underflow floating-point exception is generated.
- If `FPSCR.UFE` is 1, for both exact and inexact results, the underflow floating-point exception is generated.

If the result of a floating-point operation is a denormalized number that is flushed to zero, then the Underflow floating-point exception is generated. The Underflow exception is not trapped regardless of the value of `FPSCR.UFE`.

Overflow exceptions

The cumulative floating-point exception bit `FPSCR.OFC`, and the trap enable bit `FPSCR.OFE` both relate to Overflow exceptions.

If the output of an instruction rounded with an unbounded exponent is greater than the maximum normalized number for the output precision, an overflow exception is generated.

If an untrapped Overflow exception is generated, the result is determined by the rounding mode and the sign of the result before rounding as follows:

- Round to Nearest carries all overflows to infinity with the sign of the result before rounding.
- Round towards Plus Infinity carries negative overflows to the most negative finite number of the output precision, and carries positive overflows to plus infinity.
- Round towards Minus Infinity carries positive overflows to the largest finite number of the output precision, and carries negative overflows to minus infinity.
- Round towards Zero carries all overflows to the output precision's largest finite number with the sign of the result before rounding.

Divide by Zero exceptions

The cumulative floating-point exception bit `FPSCR.DZC`, and the trap enable bit `FPSCR.DZE` both relate to Divide by Zero exceptions.

If a floating-point operation divides a finite nonzero number by zero, a Divide by Zero exception is generated.

For the purpose of Divide by Zero exception generation, testing for zero occurs after flushing of denormalized numbers to zero.

A denormalized dividend that is flushed to zero is treated as zero and prevents Divide by Zero from occurring.

If the dividend is a finite nonzero, normalized number, and the divisor is a denormalized number, the divisor is treated as zero and causes Divide by Zero to occur.

For the reciprocal and reciprocal square root estimate functions, the dividend is assumed to be +1.0. This means that a zero or denormalized operand to these functions causes generation of a Divide by Zero floating-point exception.

If a floating-point operation divides a finite nonzero number by zero, and the Divide by Zero exception is untrapped, the result is a correctly signed infinity.

Invalid Operation exceptions

The cumulative floating-point exception bit `FPSCR.IOC`, and the trap enable bit `FPSCR.IOE` both relate to Invalid Operation exceptions.

For any floating-point instruction that performs a floating-point operation, if any of the following apply, the instruction generates an Invalid Operation exception:

- At least one operand is a signaling NaN, and the instruction is not `FABS` or `FNEG`.
- Magnitude subtraction of infinities.
- Multiplying a zero by an infinity.
- Dividing a zero by a zero.
- Dividing an infinity by an infinity.
- Square root of an operand that is less than zero.

For the purpose of Invalid Operation Exception generation, testing for zero occurs after flushing of denormalized numbers to zero. So a denormalized input that is flushed to zero is treated as zero.

If the input is one of: a quiet NaN, an infinity, or a number that overflows the values that can be represented in the output format, and if another exception is not generated to signal the condition, then a conversion from floating-point to either integer or fixed-point format, generates an Invalid Operation exception.

For the signaling compare instructions `FCMPE` and `FCCMPE`, if either of the source operands is any type of NaN, the instruction generates an Invalid Operation floating-point exception.

Floating-point exception traps

For Advanced SIMD instructions, and for floating-point instructions when floating-point exception trapping is not supported, these are non-trapping exceptions and the data-processing instructions do not generate any trapped exceptions.

For floating-point instructions when floating-point exception trapping is supported:

- The floating-point exceptions can be trapped, by setting trap enable bits in the `FPSCR`, see *Floating-point exceptions and exception traps on page E1-4268*, and:
 - When a trap is not enabled the corresponding floating-point exception updates the corresponding `FPSCR` cumulative bit, but does not generate an exception.
 - When a trap is enabled the corresponding floating-point exception does not update the `FPSCR`, but generates an exception. In this case, bits in the `FPEXC` indicate which floating-point exceptions have occurred.

- The definition of the Underflow floating-point exception is different in the trapped and cumulative exception cases. In the trapped case, the definition is:
 - The trapped Underflow floating-point exception occurs if the absolute value of the result of an operation, produced before rounding, is less than the minimum positive normalized number for the destination precision, regardless of whether the rounded result is inexact.
- As with cumulative exceptions, higher priority trapped exceptions can prevent lower priority exceptions from occurring, as described in [Combinations of floating-point exceptions on page E1-4271](#).
- For Invalid Operation floating-point exceptions, for details of which quiet NaN is produced as the default result see [NaN handling and the Default NaN on page A1-57](#).
- For Overflow floating-point exceptions, the sign bit of the default result is determined normally for the overflowing operation.
- For Divide by Zero floating-point exceptions, the sign bit of the default result is determined normally for a division. This means it is the exclusive OR of the sign bits of the two operands.

[Table E1-5 on page E1-4271](#) shows the results of untrapped floating-point exceptions. That table uses the following abbreviations:

MaxNorm	The maximum normalized number of the destination precision.
RM	Round towards Minus Infinity mode, as defined in the IEEE 754 standard.
RN	Round to Nearest mode, as defined in the IEEE 754 standard.
RP	Round towards Plus Infinity mode, as defined in the IEEE 754 standard.
RZ	Round towards Zero mode, as defined in the IEEE 754 standard.

For more information about the IEEE 754 descriptions of the rounding modes, see [Floating-point standards, and terminology on page A1-53](#).

Table E1-5 Results of untrapped floating-point exceptions

Exception type	Default result for positive sign	Default result for negative sign
IOC, Invalid Operation	Quiet NaN	Quiet NaN
DZC, Divide by Zero	+infinity	-infinity
OFC, Overflow	RN, RP: +infinity RM, RZ: +MaxNorm	RN, RM: -infinity RP, RZ: -MaxNorm
UFC, Underflow	Normal rounded result	Normal rounded result
IXC, Inexact	Normal rounded result	Normal rounded result
IDC, Input Denormal	Normal rounded result	Normal rounded result

Combinations of floating-point exceptions

Many pseudocode functions perform *floating-point operations*, including [FixedToFP\(\)](#), [FPAdd\(\)](#), [FPCompare\(\)](#), [FPCompareEQ\(\)](#), [FPCompareGE\(\)](#), [FPCompareGT\(\)](#), [FPDiv\(\)](#), [FPMax\(\)](#), [FPMIn\(\)](#), [FPMu1\(\)](#), [FPMu1Add\(\)](#), [FPRecipEstimate\(\)](#), [FPRecipStep\(\)](#), [FPRSqrtEstimate\(\)](#), [FPRSqrtStep\(\)](#), [FPSqrt\(\)](#), [FPSub\(\)](#), and [FPToFixed\(\)](#). All of these operations can generate floating-point exceptions.

———— Note —————

[FPAbs\(\)](#) and [FPNeg\(\)](#) are not classified as *floating-point operations* because:

- They cannot generate floating-point exceptions.
- The floating-point operation behavior described in the following sections does not apply to them:
 - [Flushing denormalized numbers to zero on page A1-54](#).
 - [NaN handling and the Default NaN on page A1-57](#).

More than one exception can occur on the same operation. The only combinations of floating-point exceptions that can occur are:

- Overflow with Inexact.
- Underflow with Inexact.
- Input Denormal with other floating-point exceptions.

The priority order of these floating-point exceptions is that the Inexact exception is treated as lowest priority, and the Input Denormal exception is treated as highest priority.

When none of the floating-point exceptions caused by an operation is trapped, any floating-point exception that occurs causes the associated cumulative bit in the `FPSCR` to be set.

When one or more floating-point exceptions caused by an operation is trapped, the behavior of the instruction depends on the priority of the exceptions:

- If the higher priority floating-point exception is trapped, its trap handler is called. It is IMPLEMENTATION DEFINED whether any information about the lower priority floating-point exception is provided.

———— **Note** —————

Information about the lower priority floating-point exception might be provided in:

- The `FPEXC`, if the exception generated by the trap is taken to an Exception level that is using AArch32.
- The `ESR_ELx.ISS` field, if the exception generated by the trap is taken to an Exception level that is using AArch64.

However, information might be provided in another IMPLEMENTATION DEFINED way, for example using an IMPLEMENTATION DEFINED register.

Apart from this, the lower priority floating-point exception is ignored in this case.

- If the higher priority floating-point exception is untrapped, its cumulative bit is set to 1 and its default result is evaluated. Then the lower priority floating-point exception is handled normally, using this default result.

Some floating-point instructions specify more than one floating-point operation, as indicated by the pseudocode descriptions of the instruction. In such cases, a floating-point exception on one operation is treated as higher priority than a floating-point exception on another operation if the occurrence of the second floating-point exception depends on the result of the first operation. Otherwise, it is CONstrained UNPREDICTABLE which floating-point exception is treated as higher priority.

For example, a `VMLA.F32` instruction specifies a floating-point multiplication followed by a floating-point addition. The addition can generate Overflow, Underflow and Inexact floating-point exceptions, all of which depend on both operands to the addition and so are treated as lower priority than any floating-point exception on the multiplication. The same applies to Invalid Operation floating-point exceptions on the addition caused by adding opposite-signed infinities. The addition can also generate an Input Denormal floating-point exception, caused by the addend being a denormalized number while in Flush-to-zero mode. It is CONstrained UNPREDICTABLE which of an Input Denormal floating-point exception on the addition and a floating-point exception on the multiplication is treated as higher priority, because the occurrence of the Input Denormal floating-point exception does not depend on the result of the multiplication. The same applies to an Invalid Operation floating-point exception on the addition caused by the addend being a signaling NaN.

———— **Note** —————

The `VFMA` instruction performs a vector addition and a vector multiplication as a single operation. The `VFMS` instruction performs a vector subtraction and a vector multiplication as a single operation.

E1.3.9 Controls of Advanced SIMD operation that do not apply to floating-point operation

Armv7 permitted implementation of either, both, or neither of the Advanced SIMD and floating-point additions to the base instruction set, and provided some controls that applied to the Advanced SIMD functionality but not to the floating-point functionality. In Armv8, Advanced SIMD functionality cannot be separated from floating-point functionality, but in AArch32 state these controls function as they did in Armv7. This means they apply only to the following instructions and instruction encodings:

- All instructions with encodings defined in:
 - [Advanced SIMD data-processing on page F3-4434](#), for the T32 instruction set.
 - [Advanced SIMD data-processing on page F4-4543](#), for the A32 instruction set.
- All instructions with encodings defined in:
 - [Advanced SIMD element or structure load/store on page F3-4470](#), for the T32 instruction set.
 - [Advanced SIMD element or structure load/store on page F4-4555](#), for the A32 instruction set.
- The form of the VDUP instruction described in [VDUP \(general-purpose register\) on page F6-5489](#).
- The byte and halfword forms of the VMOV instructions described in each of:
 - [VMOV \(general-purpose register to scalar\) on page F6-5669](#).
 - [VMOV \(scalar to general-purpose register\) on page F6-5673](#).

The controls of this functionality are:

- The CPACR.ASEDIS field.
- The HCPTR.TASE field.

In an implementation that supports Advanced SIMD functionality, support for each of these controls is optional:

- If the CPACR.ASEDIS control is not supported then the CPACR.ASEDIS field is RAZ/WI. This is equivalent to the control permitting the execution of Advanced SIMD instructions at EL1 and EL0.
- If the HCPTR.TASE control is not supported then the HCPTR.TASE field is RAZ/WI. This means the HCPTR does not provide a control that can trap Non-secure execution of Advanced SIMD instructions to Hyp mode.

E1.3.10 Implications of not including Advanced SIMD and floating-point support

In general, Armv8 requires the inclusion of the Advanced SIMD and floating-point instructions in all instruction sets. Exceptionally, for implementation targeting specialized markets, Arm might produce or license an Armv8-A implementation that does not provide any support for Advanced SIMD and floating-point instructions. In such an implementation, in AArch32 state:

- Each of the CPACR.{cp10, cp11} fields is RES0.
- The CPACR.ASEDIS bit is RES0.
- Each of the HCPTR.{TASE, TCP10, TCP11} fields is RES1.
- Each of the NSACR.{NSASEDIS, cp10, cp11} fields is RES0.
- The FPEXC register is UNDEFINED.

E1.3.11 Pseudocode description of floating-point operations

The following subsections contain pseudocode definitions of the floating-point functionality supported by the Armv8 architecture:

- [Generation of specific floating-point values on page E1-4274](#).
- [Floating-point negation and absolute value on page E1-4274](#).
- [Floating-point value unpacking on page E1-4274](#).
- [Floating-point exception and NaN handling on page E1-4274](#).
- [Floating-point rounding on page E1-4274](#).
- [Selection of Arm standard floating-point arithmetic on page E1-4274](#).
- [Floating-point comparisons on page E1-4275](#).

- [Floating-point maximum and minimum](#) on page E1-4275.
- [Floating-point addition and subtraction](#) on page E1-4275.
- [Floating-point multiplication and division](#) on page E1-4275.
- [Floating-point fused multiply-add](#) on page E1-4275.
- [Floating-point reciprocal estimate and step](#) on page E1-4275.
- [Floating-point square root](#) on page E1-4276.
- [Floating-point reciprocal square root estimate and step](#) on page E1-4276.
- [Floating-point conversions](#) on page E1-4277.

Generation of specific floating-point values

The following pseudocode functions generate specific floating-point values. The `sign` argument is '0' for the positive version and '1' for the negative version:

- [FPInfinity\(\)](#).
- [FPMaxNormal\(\)](#).
- [FPZero\(\)](#).
- [FPTwo\(\)](#).
- [FPThree\(\)](#).
- [FPDefaultNaN\(\)](#).

Floating-point negation and absolute value

The floating-point negation and absolute value operations only affect the sign bit. They do not treat NaN operands specially, nor denormalized number operands when flush-to-zero is selected.

The floating-point negation operation is described by the pseudocode function [FPNeg\(\)](#). The floating-point absolute value operation is described by the pseudocode function [FPAbs\(\)](#).

Floating-point value unpacking

The [FPUnpack\(\)](#) function determines the type of a floating-point number, defined by [FPType{}](#), and its numerical value. It also does flush-to-zero processing on input operands.

Floating-point exception and NaN handling

The [FPProcessException\(\)](#) procedure checks whether a floating-point exception is trapped, and handles it accordingly. The floating-point exception types are defined by [FPExc{}](#).

The [FPProcessNaN\(\)](#) function processes a NaN operand, producing the correct result value and generating an Invalid Operation floating-point exception if necessary. The [FPProcessNaNs\(\)](#) function performs the standard NaN processing for a two-operand operation. The [FPProcessNaNs3\(\)](#) function performs the standard NaN processing for a three-operand operation.

Floating-point rounding

The [FPRound\(\)](#) function rounds and encodes a floating-point result to a specified destination format. This includes processing Overflow, Underflow and Inexact floating-point exceptions and performing flush-to-zero processing on result values.

Selection of Arm standard floating-point arithmetic

The [StandardFPSCRValue\(\)](#) function returns the [FPSCR](#) value that selects Arm standard floating-point arithmetic. Most of the arithmetic functions have a Boolean `fpscr_controlled` argument that is TRUE for Floating-point operations and FALSE for Advanced SIMD operations, and that selects between using the real [FPSCR](#) value and this value.

Floating-point comparisons

The `FPCmpare()` function compares two floating-point numbers, producing a {N, Z, C, V} Condition flags result as shown in [Table E1-6 on page E1-4275](#):

Table E1-6 Effect of a Floating-point comparison on the Condition flags

Comparison result	N	Z	C	V
Equal	0	1	1	0
Less than	1	0	0	0
Greater than	0	0	1	0
Unordered	0	0	1	1

This result defines the operation of the VCMP floating-point instruction. The VCMP instruction writes these flag values in the FPSCR. After using a VMRS instruction to transfer them to the APSR, they can control conditional execution as shown in [Table F1-1 on page F1-4349](#).

The `FPCmpareEQ()`, `FPCmpareGE()`, and `FPCmpareGT()` functions describe the operation of Advanced SIMD instructions that perform floating-point comparisons.

Floating-point maximum and minimum

The `FPMax()` function returns the maximum of two floating-point numbers. The `FPMin()` function returns the minimum of two floating-point numbers.

Floating-point addition and subtraction

The `FPAAdd()` function adds two floating-point numbers. The `FPSub()` function subtracts one floating-point number from another floating-point number.

Floating-point multiplication and division

The `FPMu1()` function multiplies two floating-point numbers. The `FPDiv()` function divides one floating-point number by another floating-point number.

Floating-point fused multiply-add

The `FPMu1Add()` function performs a floating-point fused multiply-add.

Floating-point reciprocal estimate and step

The Advanced SIMD implementation includes instructions that support Newton-Raphson calculation of the reciprocal of a number.

The VRECPE instruction produces the initial estimate of the reciprocal. It uses the pseudocode functions:

- `FPrecipEstimate()`.
- `UnsignedRecipEstimate()`.

Table E1-7 on page E1-4276 shows the results where input values are out of range.

Table E1-7 VRECPE results for out of range inputs

Number type	Input Vm[i]	Result Vd[i]
Integer	$\leq 0x7FFFFFFF$	0xFFFFFFFF
Floating-point	NaN	Default NaN
Floating-point	± 0 or denormalized number	\pm infinity ^a
Floating-point	\pm infinity	± 0
Floating-point	Absolute value $\geq 2^{126}$	± 0

a. FPSCR.DZC is set to 1

The Newton-Raphson iteration:

$$x_{n+1} = x_n(2 - dx_n)$$

converges to $(1/d)$ if x_0 is the result of VRECPE applied to d .

The VRECPS instruction performs a $(2 - \text{op1} \times \text{op2})$ calculation and can be used with a multiplication to perform a step of this iteration. The functionality of this instruction is defined by the `FPrecipStep()` pseudocode function.

Table E1-8 on page E1-4276 shows the results where input values are out of range.

Table E1-8 VRECPS results for out of range inputs

Input Vn[i]	Input Vm[i]	Result Vd[i]
Any NaN	-	Default NaN
-	Any NaN	Default NaN
± 0.0 or denormalized number	\pm infinity	2.0
\pm infinity	± 0.0 or denormalized number	2.0

Floating-point square root

The `FPSqrt()` function returns the square root of a floating-point number.

Floating-point reciprocal square root estimate and step

The Advanced SIMD implementation includes instructions that support Newton-Raphson calculation of the reciprocal of the square root of a number.

The VRSQRTE instruction produces the initial estimate of the reciprocal of the square root. It uses the pseudocode functions:

- `FPRSqrtEstimate()`.
- `UnsignedRSqrtEstimate()`.

Table E1-9 on page E1-4277 shows the results where input values are out of range.

Table E1-9 VRSQRTE results for out of range inputs

Number type	Input Vm[i]	Result Vd[i]
Integer	$\leq 0x3FFFFFFF$	0xFFFFFFFF
Floating-point	NaN, $-(\text{normalized number})$, $-\text{infinity}$	Default NaN
Floating-point	-0 or $-(\text{denormalized number})$	$-\text{infinity}$ ^a
Floating-point	$+0$ or $+(\text{denormalized number})$	$+\text{infinity}$ ^a
Floating-point	$+\text{infinity}$	$+0$

a. FPSCR.DZC is set to 1.

The Newton-Raphson iteration:

$$x_{n+1} = x_n(3 - dx_n^2)/2$$

converges to $(1/\sqrt{d})$ if x_0 is the result of VRSQRTE applied to d .

The VRSQRTS instruction performs a $(3 - \text{op1} \times \text{op2})/2$ calculation and can be used with two multiplications to perform a step of this iteration. The functionality of this instruction is defined by the [FPRSqrtStep\(\)](#) pseudocode function.

Table E1-10 on page E1-4277 shows the results where input values are out of range.

Table E1-10 VRSQRTS results for out of range inputs

Input Vn[i]	Input Vm[i]	Result Vd[i]
Any NaN	-	Default NaN
-	Any NaN	Default NaN
± 0.0 or denormalized number	$\pm \text{infinity}$	1.5
$\pm \text{infinity}$	± 0.0 or denormalized number	1.5

[FPRSqrtStep\(\)](#) calls the [FPHalvedSub\(\)](#) pseudocode function.

Floating-point conversions

The [FPConvert\(\)](#) pseudocode function performs conversions between half-precision, single-precision, and double-precision floating-point numbers.

The [FPToFixed\(\)](#) and [FixedToFP\(\)](#) functions perform conversions between floating-point numbers and integers or fixed-point numbers.

E1.4 About the AArch32 System register interface

AArch32 state provides a System register encoding space, that is indexed by the parameter set {coproc, opc1, CRn, CRm, opc2}, and a set of System register access instructions. This encoding space is used for:

- System registers.
- System instructions, for:
 - Cache and branch predictor maintenance.
 - Address translation.
 - TLB maintenance.

In Armv8, this encoding space uses only the coproc values 0b111x.

———— Note ————

The encoding space with coproc values 0b101x is redefined to provide Advanced SIMD and floating-point functionality.

In Armv8:

- The (coproc==0b1111) encodings provide system control functionality, by providing access to System registers and System instructions. This includes architecture and feature identification, as well as control, status information and configuration support.

The following sections give a general description of these encodings:

- [About the System registers for VMSAv8-32 on page G5-6396.](#)
- [VMSAv8-32 organization of registers in the \(coproc==0b1111\) encoding space on page G7-6420.](#)
- [Functional grouping of VMSAv8-32 System registers on page G5-6401.](#)

These encodings also provide:

- The Performance Monitor registers. For more information, see [Chapter D7 The Performance Monitors Extension.](#)
The Activity Monitor registers. For more information, see [Chapter D8 The Activity Monitors Extension.](#)

- The (coproc==0b1110) encodings provide access to additional registers, that support:
 - Debug, see [Chapter G2 AArch32 Self-hosted Debug.](#)
 - The Jazelle identification registers, see [Jazelle support on page E1-4259.](#)

[UNPREDICTABLE, CONSTRAINED UNPREDICTABLE, and UNDEFINED behavior for AArch32 System register accesses on page G8-6439](#) gives information more information about permitted accesses to the System registers in AArch32 state.

Most functionality in the (coproc==0b111x) encoding space cannot be accessed by software executing at EL0. This manual clearly identifies those functions that can be accessed at EL0.

For more information:

- About this encoding space, including the naming of the parameters that index the space, see [The AArch32 System register interface on page G1-6109.](#)
- About the System interface access instructions, see [System register access instructions on page F2-4397.](#)

E1.5 Exceptions

The Arm architecture uses the following terms to describe various types of exceptional condition:

Exceptions In the Arm architecture, an *exception* causes entry to EL1, EL2, or EL3. If the Exception level that is entered is using AArch32, it also causes entry to the PE mode in which the exception must be taken. A software handler for the exception is then executed.

———— **Note** —————

The term *floating-point exception* does not use this meaning of *exception*. This term is described later in this list.

Exceptions include:

- Reset.
- Interrupts.
- Memory system aborts.
- Undefined instructions.
- Supervisor calls (SVCs), Secure Monitor calls (SMCs), and Hypervisor calls (HVCs).
- Debug exceptions.

Most details of exception handling are not visible to application level software, and are described in [Handling exceptions that are taken to an Exception level using AArch32 on page G1-6043](#). In an Armv8 implementation that includes all the Exception levels, aspects that are visible to application level software are:

- The SVC instruction causes a Supervisor Call exception. This provides a mechanism for unprivileged software to make a call to the operating system, or other system component that is accessible only at EL1.
- The SMC instruction causes a Secure Monitor Call exception, but only if software execution is at EL1 or higher. Unprivileged software can only cause a Secure Monitor Call exception by methods defined by the operating system, or by another component of the software system that executes at EL1 or higher.
- The HVC instruction causes a Hypervisor Call exception, but only if software execution is at EL1 or higher. Unprivileged software can only cause a Hypervisor Call exception by methods defined by the hypervisor, or by another component of the software system that executes at EL1 or higher.
- The BKPT instruction causes a Breakpoint Instruction exception, that is taken as a Prefetch Abort exception. This provides a mechanism for a debugger to insert breakpoints into unprivileged software, or for unprivileged software to make a call into a debugger that is accessible at EL1.
- The WFI (Wait for Interrupt) instruction provides a hint that nothing needs to be done until an interrupt or another WFI wakeup event occurs, see [Wait For Interrupt on page G1-6107](#). This means the hardware might enter a low-power state until the wakeup event occurs.
- The WFE (Wait for Event) instruction provides a hint that nothing needs to be done until either an SEV instruction generates an event, or another WFE wakeup event occurs, see [Wait For Event and Send Event on page G1-6104](#). This means the hardware might enter a low-power state until the wakeup event occurs.

Floating-point exceptions

These relate to exceptional conditions encountered during floating-point arithmetic, such as Divide by Zero or Overflow. For more information, see:

- [Floating-point exceptions and exception traps on page E1-4268](#).
- The **FPEXC** and **FPSCR** register descriptions.
- ANSI/IEEE Std. 754, *IEEE Standard for Binary Floating-Point Arithmetic*.

Chapter E2

The AArch32 Application Level Memory Model

This chapter gives an application level description of the memory model for software executing in AArch32 state. This means it describes the memory model for execution in EL0 when EL0 is using AArch32 in the following sections:

- *About the Arm memory model* on page E2-4282.
- *Atomicity in the Arm architecture* on page E2-4284.
- *Definition of the Armv8 memory model* on page E2-4288.
- *Ordering of translation table walks* on page E2-4306.
- *Caches and memory hierarchy* on page E2-4307.
- *Alignment support* on page E2-4312.
- *Endian support* on page E2-4314.
- *Memory types and attributes* on page E2-4318.
- *Mismatched memory attributes* on page E2-4328.
- *Synchronization and semaphores* on page E2-4331

Note

In this chapter, System register names usually link to the description of the register in [Chapter G8 AArch32 System Register Descriptions](#), for example [SCTLR](#).

E2.1 About the Arm memory model

The Arm architecture is a weakly ordered memory architecture that permits the observation and completion of memory accesses in a different order from the program order. The following sections of this chapter provide the complete definition of the Armv8 memory model, this introduction is not intended to contradict the definition found in those sections. In general, the basic principles of the Armv8 memory model are:

- To provide a memory model that has similar weaknesses to those found in the memory models used by high-level programming languages such as C or Java. For example, by permitting independent memory accesses to be reordered as seen by other observers.
- To avoid the requirement for multi-copy atomicity in the majority of memory types.
- The provision of instructions and memory barriers to compensate for the lack of multi-copy atomicity in the cases where it would be needed.
- The use of address, data, and control dependencies in the creation of order so as to avoid having excessive numbers of barriers or other explicit instructions in common situations where some order is required by the programmer or the compiler.

This section contains:

- [Address space on page E2-4282.](#)
- [Memory type overview on page E2-4282.](#)

E2.1.1 Address space

Address calculations are performed using 32-bit registers. Supervisory software determines the valid address range.

Attempting to access an address that is not valid generates an MMU fault.

Address calculations are performed modulo 2^{32} .

The result of an address calculation is UNKNOWN if it overflows or underflows the 32-bit address range A[31:0].

Memory accesses use the `MemA[]`, `MemO[]`, `MemU[]`, and `MemU_unpriv[]` pseudocode functions:

- The `MemA[]` function makes an aligned access of the required type.
- The `MemO[]` function makes an ordered access of the required type.
- The `MemU[]` function makes an unaligned access of the required type
- The `MemU_unpriv[]` function makes an unaligned, unprivileged access of the required type.

Each of these functions calls `Mem_with_type[]` function, that specifies the required access. This calls `AArch32.MemSingle[]`, which performs an atomic, little-endian read of size bytes.

The `AccType` enumeration defines the different access types.

Note

- [Chapter G4 The AArch32 System Level Memory Model](#) and [Chapter G5 The AArch32 Virtual Memory System Architecture](#) include descriptions of memory system features that are transparent to the application, including memory access, address translation, memory maintenance instructions, and alignment checking and the associated fault handling. These chapters also reference pseudocode descriptions of these operations.
- For references to the pseudocode that relates to memory accesses, see [Basic memory access on page G4-6258](#), [Unaligned memory access on page G4-6258](#), and [Aligned memory access on page G4-6258](#).

E2.1.2 Memory type overview

Armv8 provides the following mutually-exclusive memory types:

Normal This is generally used for bulk memory operations, both read/write and read-only operations.

Device The Arm architecture forbids speculative reads of any type of Device memory. This means Device memory types are suitable attributes for read-sensitive locations.

Locations of the memory map that are assigned to peripherals are usually assigned the Device memory attribute.

Device memory has additional attributes that have the following effects:

- They prevent aggregation of reads and writes, maintaining the number and size of the specified memory accesses. See [Gathering on page E2-4324](#).
- They preserve the access order and synchronization requirements, both for accesses to a single peripheral and where there is a synchronization requirement on the observability of one or more memory write and read accesses. See [Reordering on page E2-4325](#)
- They indicate whether a write can be acknowledged other than at the end point. See [Early Write Acknowledgement on page E2-4326](#).

For more information on Normal memory and Device memory, see [Memory types and attributes on page E2-4318](#).

———— **Note** —————

Earlier versions of the Arm architecture defined a single Device memory type and a Strongly-ordered memory type. A Note in [Device memory on page E2-4322](#) describes how these memory types map onto the Armv8 memory types.

E2.2 Atomicity in the Arm architecture

Atomicity is a feature of memory accesses, described as *atomic* accesses. The Arm architecture description refers to two types of atomicity, *single-copy atomicity* and *multi-copy atomicity*. In the Armv8 architecture, the atomicity requirements for memory accesses depend on the memory type, and whether the access is explicit or implicit. For more information, see:

- [Requirements for single-copy atomicity on page E2-4284.](#)
- [Properties of single-copy atomic accesses on page E2-4285.](#)
- [Multi-copy atomicity on page E2-4285.](#)
- [Requirements for multi-copy atomicity on page E2-4286.](#)
- [Concurrent modification and execution of instructions on page E2-4286.](#)

For more information about the memory types, see [Memory type overview on page E2-4282.](#)

E2.2.1 Requirements for single-copy atomicity

In AArch32 state, the single-copy atomic PE accesses are:

- All byte accesses.
- All halfword accesses to halfword-aligned locations.
- All word accesses to word-aligned locations.
- Memory accesses caused by LDREXD and STREXD instructions to doubleword-aligned locations.

LDM, LDC, LDRD, STM, STC, STRD, PUSH, POP, RFE, SRS, VLDM, VLDR, VSTM, and VSTR instructions are executed as a sequence of word-aligned word accesses. Each 32-bit word access is guaranteed to be single-copy atomic. The architecture does not require subsequences of two or more word accesses from the sequence to be single-copy atomic.

LDRD and STRD accesses to 64-bit aligned locations are 64-bit single-copy atomic as seen by translation table walks and accesses to translation tables.

———— **Note** —————

This requirement has been added to avoid the need for complex measures to avoid atomicity issues when changing translation table entries, without creating a requirement that all locations in the memory system are 64-bit single-copy atomic. This addition means:

- The system designer must ensure that all writable memory locations that might be used to hold translations, such as bulk SDRAM, can be accessed with 64-bit single-copy atomicity.
- Software must ensure that translation tables are not held in memory locations that cannot meet this atomicity requirement, such as peripherals that are typically accessed using a narrow bus.

This requirement places no burden on read-only memory locations for which reads have no side effects, since it is impossible to detect the size of memory accesses to such locations.

Advanced SIMD element and structure loads and stores are executed as a sequence of accesses of the element or structure size. The architecture requires the element accesses to be single-copy atomic if and only if both:

- The element size is 32 bits, or smaller.
- The elements are naturally-aligned.

Accesses to 64-bit elements or structures that are 32-bit aligned are executed as a sequence of 32-bit accesses, each of which is single-copy atomic. The architecture does not require subsequences of two or more 32-bit accesses from the sequence to be single-copy atomic.

When an access is not single-copy atomic by the rules described in this section, it is executed as a sequence of one or more accesses that aggregate to the size of the original access. Each of the accesses in this sequence is single-copy atomic, at least at the byte level.

Note

In this section, the terms *before the write operation* and *after the write operation* mean before or after the write operation has had its effect on the coherence order of the bytes of the memory location accessed by the write operation.

If, according to these rules, an instruction is executed as a sequence of accesses, a synchronous Data Abort exception or Debug state entry can be taken during that sequence. This causes execution of the instruction to be abandoned. See [Data Abort exception on page G1-6089](#) and, when FEAT_LSMAOC is implemented, [Taking an interrupt or other exception during a multiple-register load or store on page G1-6077](#).

If the synchronous Data Abort exception is returned from using the preferred return address, the instruction that generated the sequence of accesses is re-executed and so any access that was performed before the exception was taken is repeated. This also applies to an exit from Debug state.

Note

The exception behavior for these multiple access instructions means they are not suitable for use for writes to memory for the purpose of software synchronization.

For implicit accesses:

- Cache linefills and evictions have no effect on the single-copy atomicity of explicit transactions or instruction fetches.
- Instruction fetches are single-copy atomic:
 - At 32-bit granularity in A32 state.
 - At 16-bit granularity in T32 state.

[Concurrent modification and execution of instructions on page E2-4286](#) describes additional constraints on the behavior of instruction fetches.
- Translation table walks are performed using accesses that are single-copy atomic:
 - At 32-bit granularity when using Short-descriptor format translation tables.
 - At 64-bit granularity when using Long-descriptor format translation tables.

E2.2.2 Properties of single-copy atomic accesses

A memory access instruction that is single-copy atomic has the following properties:

1. For a pair of overlapping single-copy atomic store instructions, all of the overlapping writes generated by one of the stores are [Coherence-after](#) the corresponding overlapping writes generated by the other store.
2. For a single-copy atomic load instruction L_1 that overlaps a single-copy atomic store instruction S_2 , if one of the overlapping reads generated by L_1 [Reads-from](#) one of the overlapping writes generated by S_2 , then none of the overlapping writes generated by S_2 are [Coherence-after](#) the corresponding overlapping reads generated by L_1 .

For more information, see [Definition of the Armv8 memory model on page E2-4288](#).

E2.2.3 Multi-copy atomicity

In a multiprocessing system, writes to a memory location are *multi-copy atomic* if the following conditions are both true:

- All writes to the same location are *serialized*, meaning they are observed in the same order by all observers, although some observers might not observe all of the writes.
- A read of a location does not return the value of a write until all observers observe that write.

———— **Note** —————

Writes that are not coherent are not multi-copy atomic.

E2.2.4 Requirements for multi-copy atomicity

For Normal memory, writes are not required to be multi-copy atomic.

For Device memory, writes are not required to be multi-copy atomic.

The Armv8 memory model is [Other-multi-copy atomic](#). For more information, see [Ordering constraints on page E2-4293](#).

E2.2.5 Concurrent modification and execution of instructions

The Armv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization.

Concurrent modification and execution of instructions can lead to the resulting instruction performing any behavior that can be achieved by executing any sequence of instructions that can be executed from the same Exception level, except where the instruction before modification and the instruction after modification are:

- When executing the A32 instruction set, a B, BKPT, BL, HVC, ISB, NOP, SMC, or SVC instruction.
- When executing the T32 instruction set, a 16-bit B, BKPT, BLX, BX, NOP, or SVC instruction.

In addition, for the 32-bit T32 instructions, for which [Instruction encodings on page F1-4344](#) describes the meaning of {hw1, hw2}:

- hw1 of a 32-bit BL (immediate) instruction can be concurrently modified to hw1 of another BL (immediate) instruction:
 - This means that some of the most significant bits of the immediate value can be modified.
- hw1 of a 32-bit BLX (immediate) instruction can be concurrently modified to hw1 of another BLX immediate instruction:
 - This means that some of the most significant bits of the immediate value can be modified.
- hw1 of a 32-bit BL (immediate) or BLX (immediate) instruction can be concurrently modified to a T32 16-bit B, BX, BLX, BKPT, or SVC instruction. This modification also works in reverse.
- hw2 of a 32-bit BL (immediate) instruction can be concurrently modified to hw2 of another BL (immediate) instruction with a different immediate:
 - This means that some bits of the immediate value, including the least significant bits, can be modified.
- hw2 of a 32-bit BLX (immediate) instruction can be concurrently modified to hw2 of another BLX (immediate) instruction with a different immediate:
 - This means that some bits of the immediate value, including the least significant bits, can be modified.
- hw2 of a 32-bit B (immediate) instruction with a condition field can be concurrently modified to hw2 of another 32-bit B (immediate) instruction with a condition field with a different immediate:
 - This means that some bits of the immediate value, including the least significant bits, can be modified.
- hw2 of a 32-bit B (immediate) instruction without a condition field can be concurrently modified to hw2 of another 32-bit B (immediate) instruction without a condition field:
 - This means that some bits of the immediate value, including the least significant bits, can be modified.

———— **Note** —————

- In the T32 instruction set:
 - The only encodings of BKPT and SVC are 16-bit.
 - The only encoding of BL is 32-bit.

- The ISB instruction can be concurrently modified and executed in the A32 and A64 instruction sets, but not in the T32 instruction set.

For the instructions explicitly identified in this section, the architecture guarantees that, after modification of the instruction, behavior is consistent with execution of either:

- The instruction originally fetched.
- A fetch of the modified instruction.

The instructions to which this applies are the B, BL, NOP, BKPT, SVC, HVC, and SMC instructions.

For both instruction sets, if one thread of execution changes a conditional branch instruction to another conditional branch instruction, and the change affects both the condition field and the branch target, execution of the changed instruction by another thread of execution before the change is synchronized can lead to either:

- The old condition being associated with the new target address.
- The new condition being associated with the old target address.

These possibilities apply regardless of whether the condition, either before or after the change to the branch instruction, is the *always* condition.

For all other instructions, to avoid UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior, instruction modifications must be explicitly synchronized before they are executed. The required synchronization is as follows:

1. No PE must be executing an instruction when another PE is modifying that instruction.
2. To ensure that the modified instructions are observable, a PE that is writing the instructions must issue the following sequence of instructions and operations:

```

; Coherency example for self-modifying code
; Enter this code with <Rt> containing a new 32-bit instruction,
; to be held in Cacheable space at a location pointed to by Rn. Use STRH in the first
; line instead of STR for a 16-bit instruction.
STR <Rt>, [Rn]
DCCMVAU Rn          ; Clean data cache by MVA to point of unification (PoU)
DSB                 ; Ensure visibility of the data stored
ICIMVAU Rn          ; Invalidate instruction cache by VA to PoU
BPIMVA Rn           ; Invalidate branch predictor by MVA to PoU
DSB

```

Note

- The DCCMVAU operation is not required if the area of memory is either Non-cacheable or Write-Through Cacheable.
- If the contents of physical memory differ between the mappings, changing the mapping of VAs to PAs can cause the instructions to be concurrently modified by one PE and executed by another PE. If the modifications affect instructions other than those listed as being acceptable for modification, synchronization must be used to avoid UNPREDICTABLE or CONSTRAINED UNPREDICTABLE behavior.

3. In a multiprocessor system, the ICIMVAU and BPIMVA are broadcast to all PEs within the Inner Shareable domain of the PE running this sequence. However, once the modified instructions are observable, each PE that is executing the modified instructions must issue the following instruction to ensure execution of the modified instructions:

```
ISB                ; Synchronize fetched instruction stream
```

For more information about the required synchronization operation, see [Synchronization and coherency issues between data and instruction accesses on page E2-4309](#).

For information about memory accesses caused by instruction fetches, see [Ordering constraints on page E2-4293](#).

E2.3 Definition of the Armv8 memory model

This section describes observation and ordering in the Armv8 memory model. It contains the following subsections:

- [Basic definitions](#) on page E2-4288.
- [Dependency definitions](#) on page E2-4290.
- [Ordering relations](#) on page E2-4291.
- [Ordering constraints](#) on page E2-4293.
- [Internal visibility requirement](#) on page E2-4293.
- [External ordering constraints](#) on page E2-4293.
- [Completion and endpoint ordering](#) on page E2-4295.
- [Ordering of instruction fetches](#) on page E2-4297.
- [Restrictions on the effects of speculation](#) on page E2-4297.
- [Memory barriers](#) on page E2-4299.

For more information on endpoint ordering of memory accesses, see [Reordering](#) on page E2-4325.

In the Armv8 memory model, the Shareability memory attribute indicates the degree to which hardware must ensure memory coherency between a set of observers, see [Memory types and attributes](#) on page E2-4318.

The Armv8 architecture defines additional memory attributes and associated behaviors, which are defined in the system level section of this manual. See:

- [Chapter G4 The AArch32 System Level Memory Model](#).
- [Chapter G5 The AArch32 Virtual Memory System Architecture](#).

See also [Mismatched memory attributes](#) on page E2-4328.

E2.3.1 Basic definitions

The Armv8 memory model provides a set of definitions that are used to construct conditions on the permitted sequences of accesses to memory.

Observer

An *Observer* refers to a processing element or mechanism in the system, such as a peripheral device, that can generate reads from, or writes to, memory.

Common Shareability Domain

For the purpose of this section, all *Observers* are assumed to belong to a *Common Shareability Domain*. All read and write effects access only Normal memory locations in a Common Shareability Domain, and exudes the situations described in [Mismatched memory attributes](#) on page E2-4328.

Location

A *Location* is a byte that is associated with an address in the physical address space.

———— Note —————

It is expected that an operating system will present the illusion to the application programmer that is consistent with a location also being considered as a byte that is associated with an address in the virtual address space.

Effects

The *Effects* of an instruction can be:

- Register effects.
- Memory effects.
- Barrier effects.
- Branching effects.

The effects of an instruction I_1 are said to appear in program order before the effects of an instruction I_2 if and only if I_1 occurs before I_2 in the order specified by the program. Each effect generated by an instruction has a unique identifier, which characterizes it amongst the events generated by the same instruction.

Register effect

The *Register effects* of an instruction are register reads or register writes of that instruction. For an instruction that accesses registers, a register read effect is generated for each register read by the instruction and a register write effect is generated for each register written by the instruction. An instruction may generate both read and write register Register effects.

Memory effect

The *Memory effects* of an instruction are the memory reads or writes generated by that instruction. For an instruction that accesses memory, a memory read effect is generated for each [Location](#) read by the instruction and a memory write effect is generated for each [Location](#) written by the instruction. An instruction may generate both read and write Memory effects.

Branching effect

The *Branching effects* of an instruction are effects which correspond to a branching decision being taken.

———— **Note** —————

Conditional and compare-and-swap instructions do not create Branching effects.

Intrinsic order

There is a per-instruction *Intrinsic order* relation that provides a partial order over the effects of that instruction, according to the operation of that instruction.

The operation of an instruction is defined by the pseudocode in [Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions](#).

Reads-from-register

The *Reads-from-register* relation couples register read and write effects to the same register such that each register read effect is paired with exactly one register write effect in the execution of a program. A register read effect R_2 Reads-from-register a register write effect W_1 to the same register if and only if R_2 takes its data from W_1 . By construction W_1 must be in program order before R_2 and there must be no intervening write to the same register in program order between W_1 and R_2 .

Reads-from

The *Reads-from* relation couples memory read and write effects to the same [Location](#) such that each memory read effect is paired with exactly one memory write effect in the execution of a program. A memory read effect R_2 from a [Location](#) Reads-from a memory write effect W_1 to the same [Location](#) if and only if R_2 takes its data from W_1 .

Coherence order

There is a per-location *Coherence order* relation that provides a total order over all memory write effects from all coherent [Observers](#) to that [Location](#), starting with a notional memory write effect of the initial value. The Coherence order of a [Location](#) represents the order in which memory write effects to the [Location](#) arrive at memory.

Local read successor

A memory read effect R_2 of a [Location](#) is the *Local read successor* of a memory write effect W_1 from the same [Observer](#) to the same [Location](#) if and only if W_1 appears in program order before R_2 and there is not a memory write effect W_3 from the same [Observer](#) to the same [Location](#) appearing in program order between W_1 and R_2 .

Local write successor

A memory write effect W_2 of a **Location** is a *Local write successor* of a memory read or write effect RW_1 from the same **Observer** to the same **Location** if and only if RW_1 appears in program order before W_2 .

Coherence-after

A memory write effect W_2 to a **Location** is *Coherence-after* another memory write effect W_1 to the same **Location** if and only if W_2 is sequenced after W_1 in the **Coherence order** of the **Location**.

A memory write effect W_2 to a **Location** is *Coherence-after* a memory read effect R_1 of the same location if and only if R_1 **Reads-from** a memory write effect W_3 to the same **Location** and W_2 is *Coherence-after* W_3 .

Observed-by

A memory read or write effect RW_1 from an **Observer** is *Observed-by* a memory write effect W_2 from a different **Observer** if and only if W_2 is coherence-after RW_1 .

A memory write effect W_1 from an **Observer** is *Observed-by* a memory read effect R_2 from a different **Observer** if and only if R_2 **Reads-from** W_1 .

———— Note ————

The *Observed-by* relation only relates **Memory effects** generated by different **Observers**.

Overlapping accesses

Two **Memory effects** overlap if and only if they access the same **Location**. Two instructions overlap if and only if one or more of their generated **Memory effects** overlap.

Single-copy-atomic-ordered-before

A memory read effect R_1 is *Single-copy-atomic-ordered-before* another memory read effect R_2 if and only if all of the following statements are true:

- R_1 and R_2 are memory read effects generated by the same instruction.
- R_1 is not a **Local read successor** of a memory write effect.
- R_2 is a **Local read successor** of a memory write effect.

DMB FULL

A **DMB FULL** is a **DMB** with neither the **LD** or the **ST** qualifier.

Where this section refers to **DMB** without any qualification, then it is referring to all types of **DMB**. Unless a specific shareability domain is defined, a **DMB** applies to the **Common Shareability Domain**.

All properties that apply to **DMB** also apply to the corresponding **DSB**.

Context synchronization instruction

A *Context synchronization instruction* is one of the following:

- An **ISB** instruction.
- An instruction that generates a synchronous exception.
- An exception return instruction.
- A **DCPS** or **DRPS** instruction.

E2.3.2 Dependency definitions

Dependency through registers

A *Dependency through registers* from a first effect E_1 to a second effect E_2 exists within a **PE** if and only if at least one of the following applies:

- E_1 is a register write effect W_1 which has not been generated by a **Store Exclusive**, E_2 is a register read effect R_2 and R_2 **Reads-from-register** W_1 .

- E_1 and E_2 have been generated by the same instruction and E_1 is before E_2 in the **Intrinsic order** of that instruction.
- There is a **Dependency through registers** from E_1 to a third effect E_3 , and there is a **Dependency through registers** from E_3 to E_2 .

Address dependency

An *Address dependency* from a memory read effect R_1 to a **Memory effect** RW_2 exists if and only if there is a **Dependency through registers** from R_1 to a **Register effect** E_3 generated by RW_2 , and E_3 affects the address part of RW_2 , and either:

- RW_2 is a memory write effect W_2 .
- RW_2 is a memory read effect R_2 and there is no **Branching effect** D_4 such that there is a **Dependency through registers** from R_1 to D_4 and from D_4 to R_2 .

Data dependency

A *Data dependency* from a memory read effect R_1 to a memory write effect W_2 exists if and only if there is a **Dependency through registers** from R_1 to a **Register effect** E_3 generated by W_2 , and E_3 affects the data part of W_2 .

Control dependency

A *Control dependency* from a memory read effect R_1 to a subsequent **Memory effect** RW_2 exists if and only if either:

- There is a **Dependency through registers** from R_1 to a **Branching effect** B_3 and B_3 is in program order before RW_2 .
- There is a **Dependency through registers** from R_1 to the determination of a synchronous exception on an instruction generating an effect RW_3 , and RW_2 appears in program order after RW_3 .

Note

This notion is under review. Arm's intent is that a branch instruction between a read and a write, where the branch condition is dependent on the read, will provide order, regardless of whether the branch is taken. This only applies to branch instructions and not to conditional selection or other conditional data processing instructions. A formal definition of this change will be issued soon as an erratum to the Armv8 Architecture Reference Manual.

E2.3.3 Ordering relations

Dependency-ordered-before

A dependency creates externally-visible order between a memory read effect and another **Memory effect** generated by the same **Observer**. A memory read effect R_1 is *Dependency-ordered-before* a memory read or write effect RW_2 from the same **Observer** if and only if R_1 appears in program order before RW_2 and any of the following cases apply:

- There is an **Address dependency** or a **Data dependency** from R_1 to RW_2 .
- RW_2 is a memory write effect W_2 and there is a **Control dependency** from R_1 to W_2 .
- RW_2 is a memory read effect R_2 generated by an instruction appearing in program order after an instruction that generates a **Context synchronization event** E_3 , and there is a **Control dependency** from R_1 to E_3 .
- RW_2 is a memory write effect W_2 appearing in program order after a memory read or write effect RW_3 and there is an **Address dependency** from R_1 to RW_3 .
- RW_2 is a **Local read successor** R_2 of a memory write effect W_3 and there is an **Address dependency** or a **Data dependency** from R_1 to W_3 .

Atomic-ordered-before

Load-Exclusive and Store-Exclusive instructions provide some ordering guarantees, even in the absence of dependencies. A memory read or write effect RW_1 is *Atomic-ordered-before* a memory read or write effect RW_2 from the same **Observer** if and only if RW_1 appears in program order before RW_2 and either of the following cases apply:

- RW_1 is a memory read effect R_1 and RW_2 is a memory write effect W_2 such that R_1 and W_2 are generated by an atomic instruction or a successful Load-Exclusive/Store-Exclusive instruction pair to the same **Location**.
- RW_1 is a memory write effect W_1 generated by an atomic instruction or a successful Store-Exclusive instruction and RW_2 is a memory read effect R_2 generated by an instruction with Acquire semantics such that R_2 is a **Local read successor** of W_1 .

For more information, see *Synchronization and semaphores* on page E2-4331.

Barrier-ordered-before

Barrier instructions order prior **Memory effects** before subsequent **Memory effects** generated by the same **Observer**. A memory read or write effect RW_1 is *Barrier-ordered-before* a memory read or write effect RW_2 from the same **Observer** if and only if RW_1 appears in program order before RW_2 and any of the following cases apply:

- RW_1 appears in program order before a DMB FULL that appears in program order before RW_2 .
- RW_1 is a memory write effect W_1 and is generated by an atomic instruction with both Acquire and Release semantics.
- RW_1 is a memory write effect W_1 generated by an instruction with Release semantics and RW_2 is a memory read effect R_2 generated by an instruction with Acquire semantics.
- RW_1 is a memory read effect R_1 and appears in program order before a DMB LD that appears in program order before RW_2 .
- RW_1 is a memory read effect R_1 and is generated by an instruction with Acquire or AcquirePC semantics.
- RW_1 is a memory write effect W_1 and RW_2 is a memory write effect W_2 appearing in program order before a DMB ST that appears in program order before W_2 .
- RW_2 is a memory write effect W_2 and is generated by an instruction with Release semantics.

Locally-ordered-before

Dependencies, **Local write successor**, load/store-exclusive, atomic and barrier instructions can be composed within an **Observer** to create externally-visible order. A memory read or write effect RW_1 is *Locally-ordered-before* a memory read or write effect RW_2 from the same **Observer** if and only if any of the following apply:

- RW_1 is a memory write effect W_1 and RW_2 is a memory write effect W_2 that is equal to or generated by the same instruction as a **Local write successor** of RW_1 .
- RW_1 is **Dependency-ordered-before** RW_2 .
- RW_1 is **Atomic-ordered-before** RW_2 .
- RW_1 is **Barrier-ordered-before** RW_2 .
- RW_1 is Locally-ordered-before a memory read or write effect that is Locally-ordered-before RW_2 .

E2.3.4 Ordering constraints

The Armv8 memory model is described as being **Other-multi-copy atomic**. The definition of Other-multi-copy atomic is as follows:

Other-multi-copy atomic

In an *Other-multi-copy atomic* system, it is required that a memory write effect from an **Observer**, if observed by a different **Observer**, is then observed by all other **Observers** that access the **Location** coherently. It is, however, permitted for an **Observer** to observe its own writes prior to making them visible to other observers in the system.

The **Other-multi-copy atomic** property of the Armv8 memory model is enforced by placing constraints on the possible executions of a program. Those executions that meet the constraints given by the ordering model are said to be **Architecturally well-formed**. An implementation that is executing a program is only permitted to exhibit behavior consistent with an **Architecturally well-formed** execution.

Architecturally well-formed

An *Architecturally well-formed* execution must satisfy both the **Internal visibility requirement** and any of the three alternative **External ordering constraints**.

E2.3.5 Internal visibility requirement

For a memory read or write effect RW_1 that appears in program order before a memory read or write effect RW_2 to the same **Location**, the *Internal visibility requirement* requires that exactly one of the following statements is true:

- RW_2 is a memory write effect W_2 that is **Coherence-after** RW_1 .
- RW_1 is a memory write effect W_1 , RW_2 is a memory read effect R_2 and either:
 - R_2 **Reads-from** W_1 .
 - R_2 **Reads-from** a memory write effect that is **Coherence-after** W_1 .
- RW_1 and RW_2 are both reads R_1, R_2 , R_1 **Reads-from** a memory write effect W_3 and either:
 - R_2 **Reads-from** W_3 .
 - R_2 **Reads-from** a memory write effect that is **Coherence-after** W_3 .

Informally, if a **Memory effect** M_1 from an **Observer** appears in program order before a **Memory effect** M_2 from the same **Observer**, then M_1 will be seen to occur before M_2 by that **Observer**.

E2.3.6 External ordering constraints

The Armv8 memory model offers the following three alternative representations of the *External ordering constraint*:

- **External visibility requirement.**
- **External completion requirement.**
- **External global completion requirement.**

An **Architecturally well-formed** execution must satisfy both the **Internal visibility requirement** and one of the three alternative representations in the **External ordering constraints**.

External visibility requirement

Ordered-before

An arbitrary pair of **Memory effects** is ordered if it can be linked by a chain of ordered accesses consistent with external observation. A memory read or write effect RW_1 is *Ordered-before* a memory read or write effect RW_2 if and only if any of the following cases apply:

- RW_1 is **Observed-by** a memory read or write effect RW_3 that is generated by the same instruction as RW_2 .
- RW_1 is **Locally-ordered-before** RW_2 .
- RW_1 is **Ordered-before** a memory read or write effect that is **Ordered-before** RW_2 .

For a memory read or write effect RW_1 from an **Observer** that is **Ordered-before** a memory read or write effect RW_2 from a different **Observer**, the External visibility requirement requires that RW_2 is not **Observed-by** RW_1 . This means that an **Architecturally well-formed** execution must not exhibit a cycle in the **Ordered-before** relation.

Informally, if a **Memory effect** M_1 from an **Observer** is **Ordered-before** another **Memory effect** M_2 from a different **Observer**, then M_1 will be seen to occur before M_2 by all **Observers** in the system.

Completes-before order

The *Completes-before order* is a total order that corresponds to the order in which **Memory effects** complete within the system. The following effects constitute a single entry in the Completes-before order:

- Writes from the same instruction.
- Reads from the same instruction which read from external writes.
- Reads from the same instruction which read from the same internal write.

All other reads constitute distinct entries in the Completes-before order.

Completes-before

A memory read or write effect RW_1 *Completes-before* a memory read or write effect RW_2 if and only if RW_1 appears in the **Completes-before order** before RW_2 .

Deriving Reads-from and Coherence order from the Completes-before order

The **Completes-before order** can be used to resolve the **Reads-from** and **Coherence order** relations for every memory access in the system as follows:

- For a memory read effect R_1 of a memory location by an **Observer**, then:
 - If there is a memory write effect W_2 to the same **Location** from the same **Observer** and all of the following are true:
 - W_2 appears in program order before R_1 .
 - R_1 **Completes-before** W_2 .
 - There are no writes to the **Location** appearing in program order between W_2 and R_1 then R_1 **Reads-from** W_2 .
 - Otherwise, R_1 **Reads-from** its closest preceding write in the **Completes-before order** to the same **Location**. If no such write exists, then R_1 **Reads-from** the initial value of the memory location.
- The **Coherence order** of writes to a memory location is the order in which those writes appear in the **Completes-before order**. The final value of each memory location is therefore determined by the final write to each **Location** in the **Completes-before order**. If no such write exists for a given **Location**, the final value is the initial value of that **Location**.

External completion requirement

A memory read or write effect RW_1 **Globally-completes-before** a memory read or write effect RW_2 if and only if any of the following statements are true:

- RW_1 is **Locally-ordered-before** RW_2 .
- RW_1 is a memory read effect R_1 and RW_2 is a memory read effect R_2 and R_1 is **Single-copy-atomic-ordered-before** R_2 .

Globally-completes-before order

The *Globally-completes-before order* is a total order that corresponds to the order in which **Memory effects** globally-complete within the system. The following effects constitute a single entry in the Globally-completes-before order:

- Writes from the same instruction.
- Reads from the same instruction which read from external writes.
- Reads from the same instruction which read from the same internal write.

All other reads constitute distinct entries in the Globally-completes-before order.

Globally-completes-before

A memory read or write effect RW_1 *globally-completes-before* a memory read or write effect RW_2 if and only if RW_1 appears in the [Globally-completes-before order](#) before RW_2 .

Deriving Reads-from and Coherence order from the Globally-completes-before order

The [Globally-completes-before order](#) can be used to resolve the [Reads-from](#) and [Coherence order](#) relations for every memory access in the system as follows:

- A memory read effect R_1 of a memory location by an [Observer Reads-from](#) its closest preceding write in the [Globally-completes-before order](#) to the same [Location](#). If no such write exists, then R_1 [Reads-from](#) the initial value of the memory location.
- The [Coherence order](#) of writes to a memory location is the order in which those writes appear in the [Globally-completes-before order](#). The final value of each memory location is therefore determined by the final write to each [Location](#) in the [Globally-completes-before order](#). If no such write exists for a given [Location](#), the final value is the initial value of that [Location](#).

External global completion requirement

The *External global completion requirement* requires that a memory read or write effect RW_1 [Globally-completes-before](#) a memory read or write effect RW_2 if and only if any of the following statements are true:

- RW_1 is [Locally-ordered-before](#) RW_2 and either:
 - RW_1 is a memory write effect.
 - RW_1 is a memory read effect R_1 and either:
 - R_1 is not a [Local read successor](#) of a memory write effect.
 - R_1 is a [Local read successor](#) of a memory write effect that is [Locally-ordered-before](#) RW_2 .
- RW_1 is a memory read effect R_1 and RW_2 is a memory read effect R_2 and R_1 is [Single-copy-atomic-ordered-before](#) R_2 .

E2.3.7 Completion and endpoint ordering

Interaction between [Observers](#) in a system is not restricted to communication via shared variables in coherent memory. For example, an [Observer](#) could configure an interrupt controller to raise an interrupt on another [Observer](#) as a form of message passing. These interactions typically involve an additional agent, which defines the instruction sequence that is required to establish communication links between different [Observers](#). When these forms of interaction are used in conjunction with shared variables, a DSB instruction can be used to enforce ordering between them.

For all memory, the completion rules are defined as:

- A memory read effect R_1 to a [Location](#) is complete for a shareability domain when all of the following are true:
 - Any write to the same [Location](#) by an [Observer](#) within the shareability domain will be [Coherence-after](#) R_1 .
 - Any translation table walks associated with R_1 are complete for that shareability domain.
- A memory write effect W_1 to a [Location](#) is complete for a shareability domain when all of the following are true:
 - Any write to the same [Location](#) by an [Observer](#) within the shareability domain will be [Coherence-after](#) W_1 .
 - Any read to the same [Location](#) by an [Observer](#) within the shareability domain will either [Reads-from](#) W_1 or [Reads-from](#) a memory write effect that is [Coherence-after](#) W_1 .
 - Any translation table walks associated with the write are complete for that shareability domain.

- A translation table walk is complete for a shareability domain when the memory accesses, including the updates to translation table entries, associated with the translation table walk are complete for that shareability domain, and the TLB is updated.
- A cache or branch predictor maintenance instruction is complete for a shareability domain when the memory effects of the instruction are complete for that shareability domain, and any translation table walks that arise from the instruction are complete for that shareability domain.
- A TLB invalidate instruction is complete when all memory accesses using the TLB entries that have been invalidated are complete.

The completion of any cache, branch predictor, or TLB maintenance instruction includes its completion on all PEs that are affected by both the instruction and the DSB operation that is required to guarantee visibility of the maintenance instruction.

———— **Note** —————

These completion rules mean that, for example, a cache maintenance instruction that operates by VA to the PoC completes only after memory at the PoC has been updated.

Additionally, for Device-nGnRnE memory, a read or write of a Location in a Memory-mapped peripheral that exhibits side-effects is complete only when the read or write both:

- Can begin to affect the state of the Memory-mapped peripheral.
- Can trigger all associated side-effects, whether they affect other peripheral devices, PEs, or memory.

———— **Note** —————

This requirement for Device-nGnRnE memory is consistent with the memory access having reached the peripheral endpoint.

Peripherals

This section defines a Memory-mapped peripheral and the total order of reads and write to a peripheral which is defined as the Peripheral coherence order:

Memory-mapped peripheral

A *Memory-mapped peripheral* occupies a memory region of IMPLEMENTATION DEFINED size and can be accessed using load and store instructions. Memory effects to a Memory-mapped peripheral can have side-effects, such as causing the peripheral to perform an action. Values that are read from addresses within a Memory-mapped peripheral might not correspond to the last data value written to those addresses. As such, Memory effects to a Memory-mapped peripheral might not appear in the Reads-from or Coherence order relations.

Peripheral coherence order

The *Peripheral coherence order* of a Memory-mapped peripheral is a total order on all reads and writes to that peripheral.

———— **Note** —————

The Peripheral coherence order for a Memory-mapped peripheral signifies the order in which accesses arrive at the endpoint.

For a memory read or write effect RW_1 and a memory read or write effect RW_2 to the same peripheral, then RW_1 will appear in the Peripheral coherence order for the peripheral before RW_2 if either of the following cases apply:

- RW_1 and RW_2 are accesses using Non-cacheable or Device attributes and RW_1 is Ordered-before RW_2 .
- RW_1 and RW_2 are accesses using Device-nGnRE or Device-nGnRnE attributes and RW_1 appears in program order before RW_2 .

Out-of-band-ordered-before

A memory read or write effect RW_1 is *Out-of-band-ordered-before* a memory read or write effect RW_2 if and only if either of the following cases apply:

- RW_1 appears in program order before a DSB instruction that begins an IMPLEMENTATION DEFINED instruction sequence indirectly leading to the generation of RW_2 .
- RW_1 is *Ordered-before* a memory read or write effect RW_3 and RW_3 is *Out-of-band-ordered-before* RW_2 .

If a *Memory effect* M_1 is *Out-of-band-ordered-before* a memory read or write effect M_2 , then M_1 is seen to occur before M_2 by all *Observers*.

E2.3.8 Ordering of instruction fetches

For two memory locations A and B, if A has been written to and been made coherent with the instruction fetches of the shareability domain, before an update to B by an observer in the same shareability domain, then the instruction stream of each observer in the shareability domain will not see the updated value of B without also seeing the updated value of A.

A write has been made coherent with an instruction fetch of a shareability domain when:

CTR.{DIC, IDC} == {0, 0}

The location written to has been cleaned to the *Point of unification (PoU)* from the data cache, and that clean is complete for the shareability domain. Subsequently the location has been invalidated to the *Point of unification (PoU)* from the instruction cache, and that invalidation is complete for the shareability domain.

CTR.{DIC, IDC} == {1, 0}

The location written to has been cleaned to the *Point of unification (PoU)* from the data cache, and that clean is complete for the shareability domain.

CTR.{DIC, IDC} == {0, 1}

The write is complete for the shareability domain. Subsequently the location has been invalidated to the *Point of unification (PoU)* from the instruction cache, and that invalidation is complete for the shareability domain.

CTR.{DIC, IDC} == {1, 1}

The write is complete for the shareability domain.

———— Note —————

Microarchitecturally, this means that these situations cannot both be true in an implementation:

- After delays in fetching from memory, the instruction queue can have entries written into it out of order.
- For an implementation:
 - When **CTR.DIC** == 0, if there is an outstanding entry in the instruction queue, then later entries in the instruction queue are not impacted by the **ICIMVAU** instructions of a different core.
 - When **CTR.DIC** == 1, if there is a write to the location that is held in the queue when there is an outstanding entry in the instruction queue for an older entry, then the instruction queue does not have entries invalidated from it.

E2.3.9 Restrictions on the effects of speculation

This section covers restrictions on speculation effects, including:

- *Restrictions on the effects of speculation* on page E2-4298.
- *Speculative Store Bypass Safe (SSBS)* on page E2-4298.
- *Further restrictions on the effects of speculation from Armv8.5* on page E2-4299.

Restrictions on the effects of speculation

The Arm architecture places certain restrictions on the effects of speculation. These are:

- Each load from a location using a particular VA after an exception return that is a [Context synchronization event](#) will not speculatively read an entry from earlier in the coherence order for the location being loaded from than the entry generated by the latest store to that location using the same VA before the exception exit.
- Each load from a location using a particular VA after an exception entry that is a [Context synchronization event](#) will not speculatively read an entry from earlier in the coherence order for the location being loaded from than the entry generated by the latest store to that location using the same VA before the exception entry.
- Any load from a location using a particular VA before an exception entry that is a [Context synchronization event](#) will not speculatively read data from a store to the same location using the same VA after the exception entry.
- Any load from a location using a particular VA before an exception return that is a [Context synchronization event](#) will not speculatively read data from a store to the same location using the same VA after the exception exit.
- When data is loaded under speculation with a Translation fault, it cannot be used to form an address or generate condition codes to be used by other instructions in the speculative sequence.
- When data is loaded under speculation from a location without a translation for the translation regime being speculated in, the data cannot be used to form an address or generate condition codes to be used by other instructions in the speculative sequence.
- Changes to System registers must not occur speculatively in a way that can affect a speculative memory access that can cause a change to the micro-architectural state.
- Changes to Special-purpose registers can occur speculatively.
- Execute-never controls apply to speculative instruction fetching. See [Access permissions for instruction execution on page G5-6312](#).

Note

The prohibition of using data loaded under speculation with faults to form addresses, condition codes or SVE predicate values does not prohibit the use of value predicted data from such locations for such purposes, so long as the training of the data value prediction was from the hardware defined context that is using the prediction. A consequence of this is that training of value prediction cannot be based on data loaded under speculation with a translation or Permission fault.

Speculative Store Bypass Safe (SSBS)

When [FEAT_SSBS](#) is implemented, [CPSR.SSBS](#) is a control that can be set by software to indicate whether hardware is use, in a manner that is potentially speculatively exploitable, a speculative value in a register that has been loaded from memory using a load instruction that speculatively read an entry for the location being loaded from, where the entry that is speculatively read is from earlier in the coherence order than the entry generated by the latest store to that location using the same virtual address as the load instruction.

A speculative value in a register is used in a potentially speculatively exploitable manner if it is used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence or if the execution timing of any other instructions in the speculative sequence is a function of the data loaded under speculation.

When the value of [CPSR.SSBS](#) is 0, hardware is not permitted to use speculative register values in a potentially speculatively exploitable manner if the speculative read that loads the register is from earlier in the coherence order than the entry generated by the latest store to that location using the same virtual address as the load instruction.

When the value of [CPSR.SSBS](#) is 1, hardware is permitted to use speculative register values in a potentially speculatively exploitable manner if the speculative read that loads the register is from earlier in the coherence order than the entry generated by the latest store to that location using the same virtual address as the load instruction.

Note

- If speculation is permitted, then cache timing side channels can lead to addresses being derived using reads of address values that have been speculatively loaded from memory to a register.
 - Software written for architectures from Armv8.0 to Armv8.4 will set [SPSR.SSBS](#) to 0. This means that [CPSR.SSBS](#) will not set, so hardware will not be permitted to use speculative loads with outstanding memory disambiguation issues for any subsequent speculative memory accesses if there is any possibility of those subsequent memory accesses creating a cache timing side channel.
-

Further restrictions on the effects of speculation from Armv8.5

From Armv8.5, there are some further restrictions on the effects of speculation in addition to those in Armv8.0:

- Data loaded under speculation with a permission or domain fault cannot be used to form an address or to generate condition codes to be used by other instructions in the speculative sequence.
- Any System register read under speculation to a register that is not architecturally accessible from the current Exception level cannot be used to form an address or to generate condition codes to be used by other instructions in the speculative sequence.

Note

As the effects of speculation are not architecturally visible, this restriction level requires that the effect of any speculation cannot give rise to side channels that will leak the values of memory locations, System registers, or Special-purpose registers to a level of privilege that would otherwise not be able to determine those values.

- For all execution prediction resources that predict address or register values, speculative execution at one hardware defined context should be separated in a hard-to-determine manner from control by a different hardware defined context. In the case of this definition, the hardware defined context is determined by:
 - The Exception level.
 - The Security state.
 - When executing at EL1 and when EL2 is enabled in the current Security state, the VMID.
 - When executing at EL0 and using the EL1&0 translation regime, the ASID and, when EL2 is enabled in the current Security state, the VMID.
 - When executing at EL0 and using the EL2&0 translation regime, the ASID.

Note

- The definition of “hard-to-determine manner” is left open to implementations. Examples could include the complete separation of prediction resources, or the isolation of the predictions using a cryptographic or pseudo-random mechanism to separate each context.
 - The architecture does not require that prediction resources that simply predict the direction of a branch are separated in this way.
-

- Changes to System registers must not occur speculatively in a way that can affect a speculative memory access that can cause a change to the micro-architectural state.
- Changes to Special-purpose registers can occur speculatively.

E2.3.10 Memory barriers

The Arm architecture is a weakly ordered memory architecture that supports out of order completion. *Memory barrier* is the general term applied to an instruction, or sequence of instructions, that forces synchronization events by a PE with respect to retiring load/store instructions. The memory barriers defined by the Armv8 architecture provide a range of functionality, including:

- Ordering of load/store instructions.
- Completion of load/store instructions.

- Context synchronization.

The following subsections describe the Armv8 memory barrier instructions:

- [Instruction Synchronization Barrier \(ISB\)](#) on page E2-4300.
- [Data Memory Barrier \(DMB\)](#) on page E2-4300.
- [Data Synchronization Barrier \(DSB\)](#) on page E2-4301.
- [Speculation Barrier \(SB\)](#) on page E2-4301.
- [Consumption of Speculative Data Barrier \(CSDB\)](#) on page E2-4302.
- [Speculative Store Bypass Barrier \(SSBB\)](#) on page E2-4302.
- [Physical Speculative Store Bypass Barrier \(PSSBB\)](#) on page E2-4303.
- [Trace Synchronization Barrier \(TSB CSYNC\)](#) on page E2-4303.
- [Shareability and access limitations on the data barrier operations](#) on page E2-4304.
- [Load-Acquire, Store-Release](#) on page E2-4305.

Note

Depending on the required synchronization, a program might use memory barriers on their own, or it might use them in conjunction with cache maintenance and memory management instructions that in general are only available when software execution is at EL1 or higher.

The DMB and DSB memory barriers affect reads and writes to the memory system generated by load/store instructions and data or unified cache maintenance instructions being executed by the PE.

AArch32 state also supports the legacy barrier instructions [CP15DMB](#), [CP15DSB](#), and [CP15ISB](#). These instructions are executed as MCRs using the appropriate encoding, and are accessible from EL0. However, for performance reasons Arm deprecates any use of these operations, and strongly recommends that software uses the DMB, DSB, and ISB instructions described in this section instead. Optionally, an implementation can support a CP15BEN control that supervisory software can use to disable use of these instructions, meaning the corresponding MCR encodings are UNDEFINED. When the CP15BEN control is supported, setting one of the following CP15BEN fields to 0 makes execution of [CP15DMB](#), [CP15DSB](#), and [CP15ISB](#) UNDEFINED:

- [SCTLR_EL1.CP15BEN](#), for execution of these instructions at EL0 using AArch32 when EL1 is using AArch64.
- [SCTLR.CP15BEN](#), for execution of these instructions at EL0 or EL1 when EL1 is using AArch32.
- [HSCTLR.CP15BEN](#), for execution of these instructions at EL2 when EL2 is using AArch32.

Instruction Synchronization Barrier (ISB)

An ISB instruction ensures that all instructions that come after the ISB instruction in program order are fetched from the cache or memory after the ISB instruction has completed. Using an ISB ensures that the effects of context-changing operations executed before the ISB are visible to the instructions fetched after the ISB instruction. Examples of context-changing operations that require the insertion of an ISB instruction to ensure the effects of the operation are visible to instructions fetched after the ISB instruction are:

- Completed cache and TLB maintenance instructions.
- Changes to System registers.

Any context-changing operations appearing in program order after the ISB instruction only take effect after the ISB has been executed.

The pseudocode function for the operation of an ISB is [InstructionSynchronizationBarrier\(\)](#).

See also [Memory barriers](#) on page G4-6260.

Data Memory Barrier (DMB)

The DMB instruction is a memory barrier instruction that ensures the relative order of memory accesses before the barrier with memory accesses after the barrier. The DMB instruction does not ensure the completion of any of the memory accesses for which it ensures relative order.

The full definition of the DMB instruction is covered formally in the [Definition of the Armv8 memory model on page E2-4288](#) and this introduction to the DMB instruction is not intended to contradict that section.

The basic principle of a DMB instruction is to introduce order between memory accesses that are specified to be affected by the DMB options supplied as arguments to the DMB instruction. The DMB instruction ensures that all affected memory accesses by the PE executing the DMB instruction that appear in program order before the DMB instruction and those which originate from a different PE, to the extent required by the DMB options, which have been **Observed-by** the PE before the DMB instruction is executed, are **Observed-by** each PE, to the extent required by the DMB options, before any affected memory accesses that appear in program order after the DMB instruction are **Observed-by** that PE.

The use of a DMB instruction creates order between the **Memory effects** of instructions as described in the definition of **Barrier-ordered-before**.

The pseudocode function for the operation of a DMB instruction is `DataMemoryBarrier()`.

Data Synchronization Barrier (DSB)

A DSB instruction is a memory barrier that ensures that memory accesses that occur before the DSB instruction have completed before the completion of the DSB instruction. In doing this, it acts as a stronger barrier than a DMB and all ordering that is created by a DMB with specific options is also generated by a DSB with the same options.

Execution of a DSB at EL2 ensures that any memory accesses caused by speculative translation table walks from the Non-secure PL1&0 translation regime have been observed.

For more information, see [Use of out-of-context translation regimes on page G5-6268](#).

A DSB executed by a PE, PEe, completes when all of the following apply:

- All explicit memory effects of the required access types appearing in program order before the DSB are complete for the set of observers in the required shareability domain.
- If the required access types of the DSB is reads and writes, the following instructions issued by PEe before the DSB are complete for the required shareability domain:
 - All cache maintenance instructions.
 - All AArch32 TLB maintenance instructions.
 - All PSB CYNCR instructions.
- If the required access types of the DSB is reads and writes, completion of a DSB instruction executed by PEe ensures that:
 - All previous TLB maintenance operations generated by AArch32 TLB maintenance instructions executed at EL1 by PEe when `HCRX_EL2.FnXS` is 1 are finished for all PEs in the shareability domain of the DSB instruction.
 - All previous TLB maintenance operations generated by AArch32 TLB maintenance instructions are finished for all PEs in the shareability domain of the DSB instruction.

In addition, no instruction that appears in program order after the DSB instruction can alter any state of the system or perform any part of its functionality until the DSB completes, other than:

- Being fetched from memory and decoded.
- Reading the general-purpose, SIMD and floating-point, Special-purpose, or System registers that are directly or indirectly read without causing side-effects.

The pseudocode function for the operation of a DSB is `DataSynchronizationBarrier()`.

See also [Memory barrier instructions on page G4-6257](#) and [Memory barriers on page G4-6260](#).

Speculation Barrier (SB)

An SB is a memory barrier that prevents speculative execution of instructions until after the barrier has completed when those instructions could be observed through side-channels.

Until the barrier completes, the speculative execution of any instruction appearing later in the program order than the barrier:

- Cannot be performed to the extent that such speculation can be observed through side-channels as a result of control flow speculation or data value speculation.
- Can be performed when predicting that an instruction that could generate an exception does not generate an exception.

Speculative execution of an SB instruction:

- Cannot be as a result of control flow speculation.
- Cannot be as a result of data value speculation.
- Can be as a result of predicting that an instruction that could generate an exception does not generate an exception.

An SB instruction can complete when:

- It is known that it is not speculative.
- All the predicted data values generated by instructions appearing in program order before the SB instruction have their predicted values confirmed.

———— **Note** —————

The SB instruction has no effect on the use of prediction resources to predict the instruction stream that is being fetched, so long as the prediction of the instruction stream is not informed by data taken from the register outputs of the speculative execution of instructions appearing in program order after an uncompleted SB instruction.

Consumption of Speculative Data Barrier (CSDB)

The CSDB instruction is a memory barrier instruction that controls speculative execution and data value prediction. This includes:

- Data value predictions of any instructions.
- PSTATE. {N,Z,C,V} predictions of any instructions other than conditional branch instructions appearing in program order before the CSDB that have not been architecturally resolved.
- Predictions of SVE prediction state for any SVE instructions.

For purposes of the definition of CSDB, PSTATE. {N,Z,C,V} is not considered a data value. This definition permits:

- Control flow speculation before and after the CSDB.
- Speculative execution of conditional data processing instructions after the CSDB, unless they use the results of data value or PSTATE. {N,Z,C,V} predictions of instructions appearing in program order before the CSDB that have not been architecturally resolved.

Speculative Store Bypass Barrier (SSBB)

The SSBB instruction is a memory barrier that prevents speculative loads from bypassing earlier stores to the same virtual address under certain conditions.

The semantics of the Speculative Store Bypass Barrier are:

- When a load to a location appears in program order after the SSBB, then the load does not speculatively read an entry earlier in the coherence order for that location than the entry generated by the latest store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store uses the same virtual address as the load.
 - The store appears in program order before the SSBB instruction.

- When a load to a location appears in program order before the SSBB, then the load does not speculatively read data from any store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store uses the same virtual address as the load.
 - The store appears in program order after the SSBB instruction.

Physical Speculative Store Bypass Barrier (PSSBB)

The PSSBB instruction is a memory barrier that prevents speculative loads from bypassing earlier stores to the same physical address under certain conditions.

The semantics of the Speculative Store Bypass Barrier are:

- When a load to a location appears in program order after the PSSBB, then the load does not speculatively read an entry earlier in the coherence order for that location than the entry generated by the latest store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store appears in program order before the PSSBB instruction.
- When a load to a location appears in program order before the PSSBB, then the load does not speculatively read data from any store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store appears in program order after the PSSBB instruction.

———— Note —————

The effect of this barrier applies to accesses to the same location even if they are accessed with different virtual addresses and from different Exception levels.

Trace Synchronization Barrier (TSB CSYNC)

The TSB CSYNC is a memory barrier instruction that preserves the relative order of memory accesses to System registers due to trace operations and other memory accesses to the same registers.

A trace operation is an operation of the PE Trace Unit generating trace for an instruction when `FEAT_TRF` is implemented and enabled.

A TSB CSYNC is not required to execute in program order with respect to other instructions. This includes being reordered with respect to other trace instructions. One or more Context synchronization events are required to ensure that TSB CSYNC is executed in the necessary order.

If trace is generated between a Context synchronization event and a TSB CSYNC operation, these trace operations may be reordered with respect to the TSB CSYNC operation, and therefore may not be synchronized.

The following situations are synchronized using a TSB CSYNC:

- A direct write B to a System register is ordered after an indirect read or indirect write of the same register by a trace operation of a traced instruction A, if all of the following are true:
 - A is executed in program order before a Context synchronization event C.
 - C is in program order before a TSB CSYNC operation T.
 - B is executed in program order after T.
- A direct read B of a System register is ordered after an indirect write to the same register by a trace operation of a traced instruction A if all the following are true:
 - A is executed in program order before a Context synchronization event C1.
 - C1 is in program order before TSB CSYNC operation T.
 - T is executed in program order before a second Context synchronization event C2.
 - B is executed in program order after C2.

A TSB CSYNC is not needed when a direct write B to a System register is ordered before an indirect read or indirect write of the same register by a trace operation of a traced instruction A, if all the following are true:

- A is executed in program order after a Context synchronization event C.
- B is executed in program order before C.

The pseudocode function for the operation of a TSB CSYNC is TraceSynchronizationBarrier().

Shareability and access limitations on the data barrier operations

The DMB and DSB instructions can each take an optional limitation argument that specifies:

- The shareability domain over which the instruction must operate. This is one of:
 - Full system.
 - Outer Shareable.
 - Inner Shareable.
 - Non-shareable.

Full system applies to all the observers in the system and, as such, encompasses the Inner and Outer Shareable domains of the processor.

———— **Note** —————

The distinction between Full system and Outer Shareable is only applicable for Normal Non-cacheable memory accesses and Device memory accesses.

- The accesses for which the instruction operates. This is one of:
 - Read and write accesses, both before and after the barrier instruction.
 - Write accesses only, before and after the barrier instruction.
 - Read accesses before the barrier instruction, and read and write accesses after the barrier instruction.

———— **Note** —————

This form of a DMB or DSB instruction can be described as a load-load/store barrier.

For more information on whether an access is before or after a barrier instruction, see [Data Memory Barrier \(DMB\) on page E2-4300](#) or [Data Synchronization Barrier \(DSB\) on page E2-4301](#).

Table E2-1 on page E2-4304 shows how these options are encoded in the <option> field of the instruction.

Table E2-1 Encoding of the DMB and DSB <option> parameter

Accesses		Shareability domain			
Before the barrier	After the barrier	Full system	Outer Shareable	Inner Shareable	Non-shareable
Reads and writes	Reads and writes	SY	OSH	ISH	NSH
Writes	Writes	ST	OSHST	ISHST	NSHST
Reads	Reads and writes	LD	OSHL	ISHL	NSHL

If no <option> is specified then the instruction operates for read and write accesses, over the full system, meaning the operation is the same as for the SY option. See the instruction descriptions for more information:

- [DMB on page F5-4677](#).
- [DSB on page F5-4680](#).

———— **Note** —————

ISB also supports an optional limitation argument that can only contain one value that corresponds to full system operation, see [ISB on page F5-4700](#).

Load-Acquire, Store-Release

Armv8 provides a set of instructions with Acquire semantics for loads, and Release semantics for stores.

The full definition of the Load-Acquire instruction is covered formally in the [Definition of the Armv8 memory model on page E2-4288](#) and this introduction to the Load-Acquire instruction is not intended to contradict that section.

The basic principle of a Load-Acquire instruction is to introduce order between the memory access generated by the Load-Acquire instruction and the memory accesses appearing in program order after the Load-Acquire instruction, such that the memory access generated by the Load-Acquire instruction is **Observed-by** each PE, to the extent that PE is required to observe the access coherently, before any of the memory accesses appearing in program order after the Load-Acquire instruction are **Observed-by** that PE, to the extent that the PE is required to observe the accesses coherently.

The use of a Load-Acquire instruction creates order between the **Memory effects** of instructions as described in the definition of **Barrier-ordered-before**.

The full definition of the Store-Release instruction is covered formally in the [Definition of the Armv8 memory model on page E2-4288](#) and this introduction to the Store-Release instruction is not intended to contradict that section.

The basic principle of a Store-Release instruction is to introduce order between the memory accesses generated by the PEE executing the Store-Release instruction, together with those which originate from a different PE, to the extent that the PEE is required to observe them coherently, **Observed-by** the PEE before executing the Store-release.

The use of a Store-Release instruction creates order between the **Memory effects** of instructions as described in the definition of **Barrier-ordered-before**.

In addition, the use of a Load-Acquire or a Store-Release instruction on accesses to a **Memory-mapped peripheral** introduces order between the **Memory effects** of the instructions that access that peripheral, as described in the definition of **Peripheral coherence order**.

Load-Acquire and Store-Release, other than LDAEXD and STLEXD, access only a single data element. This access is single-copy atomic. The address of the data object must be aligned to the size of the data element being accessed, otherwise the access generates an Alignment fault.

LDAEXD and STLEXD access two data elements. The address supplied to the instructions must be doubleword-aligned, otherwise the access generates an Alignment fault.

A Store-Release Exclusive instruction only has the release semantics if the store is successful.

———— Note —————

- Each Load-Acquire Exclusive and Store-Release Exclusive instruction is essentially a variant of the equivalent Load-Exclusive or Store-Exclusive instruction. All usage restrictions and single-copy atomicity properties:
 - That apply to the Load-Exclusive instructions also apply to the Load-Acquire Exclusive instructions.
 - That apply to the Store-Exclusive instructions also apply to the Store-Release Exclusive instructions.
- The Load-Acquire/Store-Release instructions can remove the requirement to use the explicit DMB memory barrier instruction.

[Table E2-2 on page E2-4305](#) summarizes the Load-Acquire/Store-release instructions.

Table E2-2 Load-Acquire/Store-Release instructions

Data type	Load-Acquire	Store-Release	Load-Acquire Exclusive	Store-Release Exclusive
32-bit word	LDA	STL	LDAEX	STLEX
16-bit halfword	LDAH	STLH	LDAEXH	STLEXH
8-bit byte	LDAB	STLB	LDAEXB	STLEXB
64-bit doubleword	-	-	LDAEXD	STLEXD

E2.4 Ordering of translation table walks

If FEAT_ETS is implemented, and a memory access RW_1 is Ordered-before a second memory access RW_2 , then RW_1 is also Ordered-before any translation table walk generated by RW_2 that generates any of the following:

- A Translation fault.
- An Address size fault.
- An Access flag fault.

E2.5 Caches and memory hierarchy

The implementation of a memory system depends heavily on the microarchitecture and therefore many details of the memory system are IMPLEMENTATION DEFINED. Armv8 defines the application level interface to the memory system, including a hierarchical memory system with multiple levels of cache. This section describes an application level view of this system. It contains the subsections:

- [Introduction to caches on page E2-4307.](#)
- [Memory hierarchy on page E2-4307.](#)
- [Implication of caches for the application programmer on page E2-4308.](#)
- [Preloading caches on page E2-4310.](#)

E2.5.1 Introduction to caches

A cache is a block of high-speed memory that contains a number of entries, each consisting of:

- Main memory address information, commonly known as a *tag*.
- The associated data.

Caches increase the average speed of a memory access and take account of two principles of locality:

Spatial locality

An access to one location is likely to be followed by accesses to adjacent locations. Examples of this principle are:

- Sequential instruction execution.
- Accessing a data structure.

Temporal locality

An access to an area of memory is likely to be repeated in a short time period. An example of this principle is the execution of a software loop.

To minimize the quantity of control information stored, the spatial locality property groups several locations together under the same tag. This logical block is commonly known as a *cache line*. When data is loaded into a cache, access times for subsequent loads and stores are reduced, resulting in overall performance benefits. An access to information already in a cache is known as a *cache hit*, and other accesses are called *cache misses*.

Normally, caches are self-managing, with the updates occurring automatically. Whenever the PE accesses a cacheable memory location, the cache is checked. If the access is a cache hit, the access occurs in the cache. Otherwise, the access is made to memory. Typically, when making this access, a cache location is allocated and the cache line loaded from memory. Armv8 permits different cache topologies and access policies, provided they comply with the memory coherency model described in this manual.

Caches introduce a number of potential problems, mainly because:

- Memory accesses can occur at times other than when the programmer would expect them.
- A data item can be held in multiple physical locations.

E2.5.2 Memory hierarchy

Typically memory close to a PE has very low latency, but is limited in size and expensive to implement. Further from the PE it is common to implement larger blocks of memory but these have increased latency. To optimize overall performance, an Armv8 memory system can include multiple levels of cache in a hierarchical memory system that exploits this trade-off between size and latency. [Figure E2-1 on page E2-4308](#) shows an example of such a system in an Armv8-A system that supports virtual addressing.

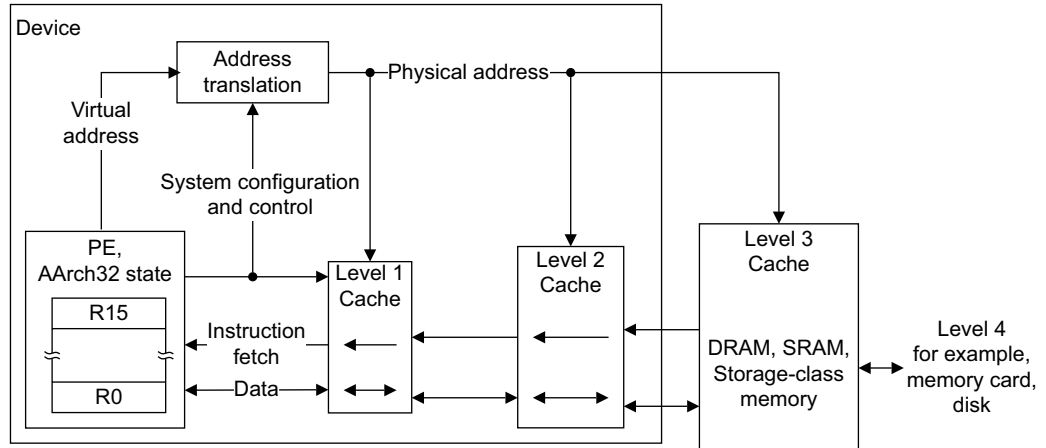

Figure E2-1 Multiple levels of cache in a memory hierarchy

———— **Note** ————

In this manual, in a hierarchical memory system, Level 1 refers to the level closest to the PE, as shown in Figure E2-1 on page E2-4308.

Instructions and data can be held in separate caches or in a unified cache. A cache hierarchy can have one or more levels of separate instruction and data caches, with one or more unified caches located at the levels closest to the main memory. Memory coherency for cache topologies can be defined using the conceptual points [Point of Unification \(PoU\)](#) and [Point of Coherency \(PoC\)](#). For more information, including the definitions of [PoU](#) and [PoC](#), see [About cache maintenance in AArch32 state on page G4-6235](#).

———— **Note** ————

Armv8 [FEAT_DPB](#) adds architectural support for an additional conceptual point, [Point of Persistence](#), but this support is provided only in AArch64 state. For more information, see [About cache maintenance in AArch64 state on page D4-2644](#).

The Cacheability and Shareability memory attributes

Cacheability and Shareability are two attributes that describe the memory hierarchy in a multiprocessing system:

Cacheability This term defines whether memory locations are allowed to be allocated into a cache or not. Cacheability is defined independently for Inner and Outer Cacheability locations.

Shareability This term defines whether memory locations are shareable between different agents in a system. Marking a memory location as shareable for a particular domain requires hardware to ensure that the location is coherent for all agents in that domain. Shareability is defined independently for Inner and Outer Shareability domains.

For more information about the Cacheability and Shareability attributes, see [Memory types and attributes on page E2-4318](#).

E2.5.3 Implication of caches for the application programmer

In normal operation, the caches are largely invisible to the application programmer. However they can become visible when there is a breakdown in the coherency of the caches. Such a breakdown can occur:

- When memory locations are updated by other agents in the system that do not use hardware management of coherency.
- When memory updates made from the application software must be made visible to other agents in the system, without the use of hardware management of coherency.

For example:

- In the absence of hardware management of coherency of DMA accesses, in a system with a DMA controller that reads memory locations that are held in the data cache of a PE, a breakdown of coherency occurs when the PE has written new data in the data cache, but the DMA controller reads the old data held in memory.
- In a Harvard cache implementation, where there are separate instruction and data caches, a breakdown of coherency occurs when new instruction data has been written into the data cache, but the instruction cache still contains the old instruction data.

Data coherency issues

Software can ensure the data coherency of caches in the following ways:

- By not using the caches in situations where coherency issues can arise. This can be achieved by:
 - Using Non-cacheable or, in some cases, Write-Through Cacheable memory.
 - Not enabling caches in the system.
- By using system calls to functions using cache maintenance instructions that execute at a higher Exception level.
- By using hardware coherency mechanisms to ensure the coherency of data accesses to memory for cacheable locations by observers within the different shareability domains, see [Non-shareable Normal memory on page E2-4320](#) and [Shareable, Inner Shareable, and Outer Shareable Normal memory on page E2-4319](#).

————— Note —————

The performance of these hardware coherency mechanisms is highly implementation-specific. In some implementations the mechanism suppresses the ability to cache shareable locations. In other implementations, cache coherency hardware can hold data in caches while managing coherency between observers within the shareability domains.

Synchronization and coherency issues between data and instruction accesses

How far ahead of the current point of execution instructions are fetched from is IMPLEMENTATION DEFINED. Such prefetching can be either a fixed or a dynamically varying number of instructions, and can follow any or all possible future execution paths. For all types of memory:

- The PE might have fetched the instructions from memory at any time since the last [Context synchronization event](#) on that PE.
- Any instructions fetched in this way might be executed multiple times, if this is required by the execution of the program, without being re-fetched from memory.

The Arm architecture does not require the hardware to ensure coherency between instruction caches and memory, even for locations of shared memory.

If software requires coherency between instruction execution and memory, it must manage this coherency using [Context synchronization events](#) and cache maintenance instructions. These can only be accessed from an Exception level that is higher than EL0, and therefore require a system call, see [Exception-generating and exception-handling instructions on page F2-4395](#). The following code sequence can be used for this purpose:

```
; Coherency example for data and instruction accesses within the same Inner Shareable domain.
; Enter this code with <Rt> containing a new 32-bit instruction,
; to be held in Cacheable space at a location pointed to by Rn. Use STRH in the first line
; instead of STR for a 16-bit instruction.
STR Rt, [Rn]
DCCMVAU Rn      ; Clean data cache by MVA to point of unification (PoU)
DSB             ; Ensure visibility of the data cleaned from cache
ICIMVAU Rn     ; Invalidate instruction cache by MVA to PoU
BPIMVA Rn      ; Invalidate branch predictor by MVA to PoU
DSB             ; Ensure completion of the invalidations
ISB            ; Synchronize the fetched instruction stream
```

A write has been made coherent with an instruction fetch of a shareability domain when:

CTR.{DIC, IDC} == {0, 0}

The location written to has been cleaned to the *Point of unification (PoU)* from the data cache, and that clean is complete for the shareability domain. Subsequently the location has been invalidated to the *Point of unification (PoU)* from the instruction cache, and that invalidation is complete for the shareability domain.

CTR.{DIC, IDC} == {1, 0}

The location written to has been cleaned to the *Point of unification (PoU)* from the data cache, and that clean is complete for the shareability domain.

CTR.{DIC, IDC} == {0, 1}

The write is complete for the shareability domain. Subsequently the location has been invalidated to the *Point of unification (PoU)* from the instruction cache, and that invalidation is complete for the shareability domain.

CTR.{DIC, IDC} == {1, 1}

The write is complete for the shareability domain.

Note

- For accesses that are Non-cacheable or Write-Through, the clean data cache instruction is not required. For accesses that are Non-cacheable, the invalidate instruction cache is not required, because in AArch32 state these accesses are not permitted to be held in an instruction cache.
- This code can be used when the thread of execution modifying the code is the same thread of execution that is executing the code. The Armv8 architecture limits the set of instructions that can be executed by one thread of execution as they are being modified by another thread of execution without requiring explicit synchronization. See *Concurrent modification and execution of instructions on page E2-4286*.

E2.5.4 Preloading caches

The Arm architecture provides the memory system hints PLD (Preload Data), PLDW (Preload Data With Intent To Write) and PLI (Preload Instruction) that software can use to communicate the expected use of memory locations to the hardware. The memory system can respond by taking actions that are expected to speed up the memory accesses if they occur. The effect of these memory system hints is IMPLEMENTATION DEFINED. Typically, implementations use this information to bring data or instruction locations into caches.

The Preload instructions are hints, and so implementations can treat them as NOPs without affecting the functional behavior of the device. The instructions cannot generate synchronous Data Abort exceptions, but the resulting memory system operations might, under exceptional circumstances, generate an asynchronous External abort, which is reported using an SError interrupt and taken using an asynchronous Data Abort exception. For more information, see *Data Abort exception on page G1-6089*.

A PLD, PLDW, or PLI instruction can only cause allocation to software-visible caching structures such as caches or TLBs for memory locations that can be accessed, according to the permissions defined by the current translation regime or a translation regime for a higher Exception level in the current Security state, by any of:

- Reads.
- Writes.
- Instruction fetches.

A PLD, PLDW, or PLI instruction can access any memory location in Normal memory that can be accessed, according to the permissions defined by the current translation regime or a translation regime for a higher Exception level in the current Security state, by any of:

- Reads.
- Writes.
- Instruction fetches.

———— **Note** —————

In each case, the entire list applies to each of PLD, PLDW, and PLI.

A PLD, PLDW, or PLI instruction is guaranteed not to access any type of Device memory.

A PLI instruction must not perform any access that cannot be performed by a speculative instruction fetch by the processor. Therefore in a VMSA implementation, if all associated MMUs are disabled, a PLI instruction cannot access any memory location that cannot be accessed by instruction fetches.

The pseudocode enumeration [PrefetchHint](#) defines the prefetch hint types.

The [Hint_Prefetch\(\)](#) pseudocode function signals to the memory system that memory accesses of the type hint to or from the specified address are likely to occur in the near future. The memory system might take some action to speed up the memory accesses when they do occur, such as preloading the specified address into one or more caches as indicated by the innermost cache level target and non-temporal hint stream.

For more information on PLD, PLI, and PLDW, see:

- [PLD, PLDW \(immediate\)](#) on page F5-4898.
- [PLD \(literal\)](#) on page F5-4901.
- [PLD, PLDW \(register\)](#) on page F5-4903.
- [PLI \(immediate, literal\)](#) on page F5-4906.
- [PLI \(register\)](#) on page F5-4909.

E2.6 Alignment support

This section describes alignment support. It contains the following subsections:

- [Instruction alignment](#) on page E2-4312.
- [Unaligned data access](#) on page E2-4312.
- [Cases where unaligned accesses are CONstrained UNPREDICTABLE](#) on page E2-4313.
- [Unaligned data access restrictions](#) on page E2-4313.
- [Generation of Alignment faults by load/store multiple accesses to Device memory](#) on page E2-4313.

For more information about Alignment faults, see [Alignment faults](#) on page G5-6363.

E2.6.1 Instruction alignment

A32 instructions are word-aligned.

T32 instructions are halfword-aligned.

E2.6.2 Unaligned data access

An Armv8 implementation must support unaligned data accesses to Normal memory by some load and store instructions. As [Table E2-3 on page E2-4312](#) shows, software can control whether a misaligned access to Normal memory by one of these instructions causes an Alignment fault Data Abort exception:

- By setting [SCTLR.A](#), for unaligned accesses from any mode other than Hyp mode.
- By setting [HSCTLR.A](#), for unaligned accesses from Hyp mode.

Table E2-3 Alignment requirements of load/store instructions

Instructions	Alignment check	Result if check fails when:	
		SCTLR.A or HSCTLR.A is 0	SCTLR.A or HSCTLR.A is 1
LDRB, LDREXB, LDRBT, LDRSB, LDRSBT, STRB, STREXB, STRBT, TBB	None	-	-
LDRH, LDRHT, LDRSH, LDRSHT, STRH, STRHT, TBH	Halfword	Unaligned access	Alignment fault
LDREXH, STREXH, LDAH, STLH, LDAEXH, STLEXH	Halfword	Alignment fault	Alignment fault
LDR, LDRT, STR, STRT PUSH, encodings T3 and A2 only POP, encodings T3 and A2 only	Word	Unaligned access	Alignment fault
LDREX, STREX, LDA, STL, LDAEX, STLEX	Word	Alignment fault	Alignment fault
LDREXD, STREXD, LDAEXD, STLEXD	Doubleword	Alignment fault	Alignment fault
All forms of LDM and STM, LDRD, RFE, SRS, STRD	Word	Alignment fault	Alignment fault
LDC, STC	Word	Alignment fault	Alignment fault
VLDM, VPOP, VPUSH, VSTM	Word	Alignment fault	Alignment fault
VLDR, VSTR - single-precision scalar and double-precision scalar	Word	Alignment fault	Alignment fault

Table E2-3 Alignment requirements of load/store instructions (continued)

Instructions	Alignment check	Result if check fails when:	
		SCTLR.A or HSCTLR.A is 0	SCTLR.A or HSCTLR.A is 1
VLDL, VSTR - half-precision scalar	Halfword	Alignment fault	Alignment fault
VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4, all with standard alignment	Element size	Unaligned access	Alignment fault
VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4, all with :<align> specified ^a	As specified by :<align>	Alignment fault	Alignment fault

- a. Previous versions of this manual used @<align> to specify alignment. Both forms are supported, see [Chapter F6 T32 and A32 Advanced SIMD and Floating-point Instruction Descriptions](#) for more information.

———— **Note** ————

Any unaligned access to any type of Device memory generates an Alignment fault, see [Alignment faults on page G5-6363](#).

E2.6.3 Cases where unaligned accesses are CONSTRAINED UNPREDICTABLE

Any load instruction that is not faulted by the alignment restrictions shown in [Table E2-3 on page E2-4312](#) and that loads the PC has CONSTRAINED UNPREDICTABLE behavior if the address it loads from is not word-aligned, see [Loads and Stores to unaligned locations on page K1-8388](#). This overrides any permitted load/store behavior shown in [Table E2-3 on page E2-4312](#).

E2.6.4 Unaligned data access restrictions

The following points apply to unaligned data accesses in Armv8:

- Accesses are not guaranteed to be single-copy atomic except at the byte access level, see [Atomicity in the Arm architecture on page E2-4284](#).
- Unaligned accesses typically take a number of additional cycles to complete compared to a naturally-aligned access.
- An operation that performs an unaligned access can abort on any memory access that it makes, and can abort on more than one access. This means that an unaligned access that occurs across a page boundary can generate an abort on either side of the boundary.

E2.6.5 Generation of Alignment faults by load/store multiple accesses to Device memory

When [FEAT_LSMAOC](#) is implemented and the value of the applicable nTLSMD field is 0, any memory access by an AArch32 Load Multiple or Store Multiple instruction to an address that the stage 1 translation assigns as Device-nGRE, Device-nGnRE, or Device-nGnRnE generates an Alignment fault.

The applicable nTLSMD field is the field in the [SCTLR_EL1](#), [SCTLR_EL2](#), [HSCTLR](#), or [SCTLR](#) register that applies to the Exception level and Security state at which the LDM or STM instruction is executed.

E2.7 Endian support

[General description of endianness in the Arm architecture](#) on page E2-4314 describes the relationship between endianness and memory addressing in the Arm architecture.

The following subsections then describe the endianness schemes supported by the architecture:

- [Instruction endianness](#) on page E2-4314.
- [Data endianness](#) on page E2-4315.
- [Endianness of memory-mapped peripherals](#) on page E2-4316.

E2.7.1 General description of endianness in the Arm architecture

This section only describes memory addressing and the effects of endianness for data elements up to doubleword of 64 bits. However, this description can be extended to apply to larger data elements.

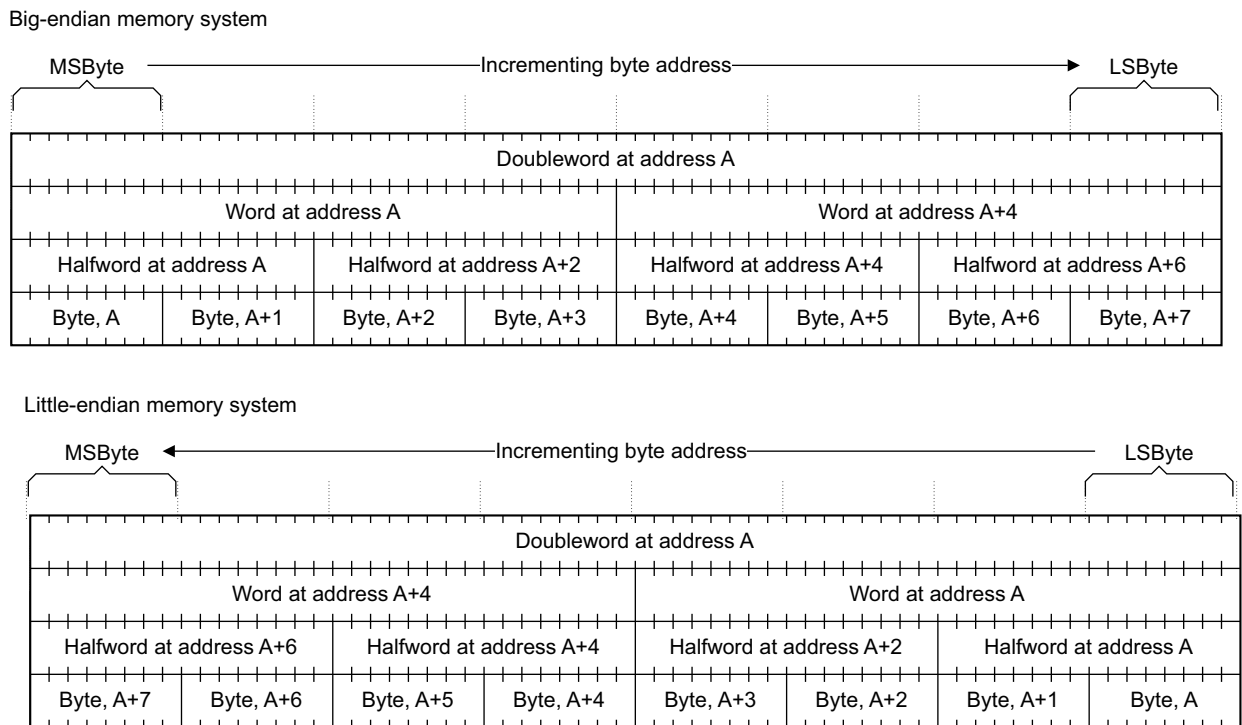

For an address A, [Figure E2-2](#) on page E2-4314 shows, for big-endian and little-endian memory systems, the relationship between:

- The doubleword at address A.
- The words at addresses A and A+4.
- The halfwords at addresses A, A+2, A+4, and A+6.
- The bytes at addresses A, A+1, A+2, A+3, A+4, A+5, A+6, and A+7.

The terms in [Figure E2-2](#) on page E2-4314 have the following definitions:

MSByte Most significant byte.

LSByte Least significant byte.

In this figure, *Byte, A+1* is an abbreviation for *Byte at address A+1*

Figure E2-2 Endianness relationships in AArch32 state

E2.7.2 Instruction endianness

In Armv8-A, the mapping of instruction memory is always little-endian.

E2.7.3 Data endianness

The size of the data value that is loaded or stored is the size that is used for the purpose of endian conversion for floating-point, Advanced SIMD, and general-purpose register loads and stores.

Table E2-4 on page E2-4315 shows the element sizes of all the load/store instructions, for all instruction sets.

Table E2-4 Element size of load/store instructions

Instructions	Element size
LDRB, LDREXB, LDRBT, LDRSB, LDRSBT, STRB, STREXB, STRBT, TBB	Byte
LDRH, LDREXH, LDRHT, LDRSH, LDRSHT, STRH, STREXH, STRHT, TBH	Halfword
LDR, LDRT, LDREX, STR, STRT, STREX	Word
LDRD, LDREXD, STRD, STREXD	Word
All forms of LDM, PUSH, POP, RFE, SRS, all forms of STM,	Word
LDC, STC	Word
Forms of VLDM, VLDR, VPOP, VPUSH, VSTM, VSTR that transfer 32-bit Si registers	Word
Forms of VLDM, VLDR, VPOP, VPUSH, VSTM, VSTR that transfer 64-bit Di registers	Doubleword
VLD1, VLD2, VLD3, VLD4, VST1, VST2, VST3, VST4	Element size of the Advanced SIMD access

CPSR.E determines the data endianness.

The data size used for endianness conversions:

- Is the size of the data value that is loaded or stored for Advanced SIMD and floating-point register and general-purpose register loads and stores.
- Is the size of the data element that is loaded or stored for Advanced SIMD element and data structure loads and stores. For more information, see *Endianness in Advanced SIMD* on page E2-4316.

Instructions to reverse bytes in registers

An application or device driver might have to interface to memory-mapped peripheral registers or shared memory structures that are not the same endianness as the internal data structures. Similarly, the endianness of the operating system might not match that of the peripheral registers or shared memory. In these cases, the PE requires an efficient method to transform explicitly the endianness of the data.

Table E2-5 on page E2-4315 shows the instructions that provide this functionality in the A32 and T32 instruction sets.

Table E2-5 Byte reversal instructions

Function	T32 / A32 instruction	Notes
Reverse bytes in whole register	REV	For use with general purpose registers.
Reverse bytes in 16-bit halfwords	REV16	For use with general purpose registers.
Reverse bytes in halfword and sign-extend	REVSH	For use with general purpose registers.

Table E2-5 Byte reversal instructions (continued)

Function	T32 / A32 instruction	Notes
Reverse elements in doublewords, vector	VREV64	For use with registers in the SIMD and floating-point register file
Reverse elements in words, vector	VREV32	For use with registers in the SIMD and floating-point register file
Reverse elements in halfwords, vector	VREV16	For use with registers in the SIMD and floating-point register file

Endianness in Advanced SIMD

Advanced SIMD element load/store instructions transfer vectors of elements between memory and the SIMD and floating-point register file. An instruction specifies both the length of the transfer and the size of the data elements being transferred. This information is used by the PE to load and store data correctly in both big-endian and little-endian systems.

Consider, for example, the A32 or T32 instruction:

```
VLD1.16 {D0}, [R1]
```

This loads a 64-bit register with four 16-bit values. The four elements appear in the register in array order, with the lowest indexed element fetched from the lowest address. The order of bytes in the elements depends on the endianness configuration, as shown in [Figure E2-3 on page E2-4316](#). Therefore, the order of the elements in the registers is the same regardless of the endianness configuration.

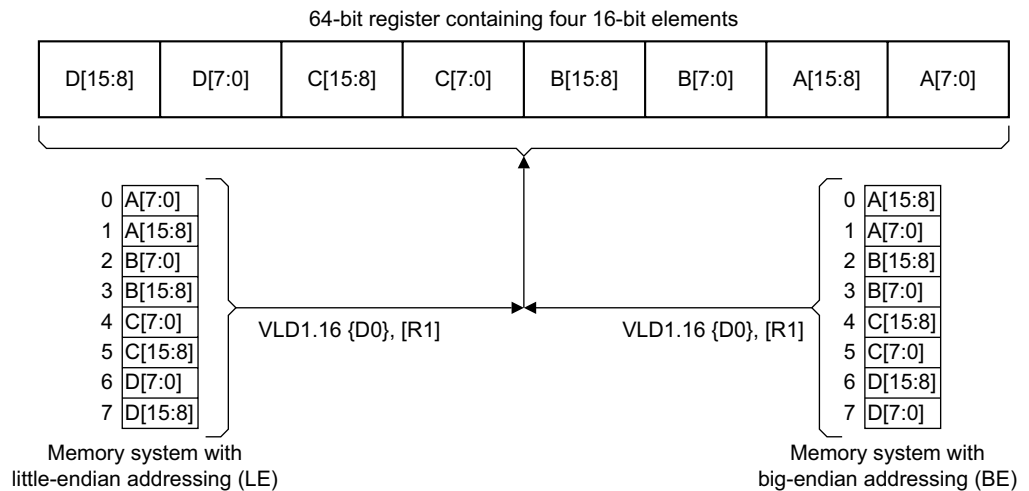

Figure E2-3 Advanced SIMD byte order example for AArch32 state

For information about the alignment of Advanced SIMD instructions, see [Alignment support on page E2-4312](#).

The `BigEndian()` pseudocode function determines the current endianness of the data.

The `BigEndianReverse()` pseudocode function reverses the endianness of a bitstring.

The `BigEndian()` and `BigEndianReverse()` functions are defined in [Chapter J1 Armv8 Pseudocode](#).

E2.7.4 Endianness of memory-mapped peripherals

All memory-mapped peripherals defined in the Arm architecture must be little-endian.

Peripherals to which this requirement applies include:

- Memory-mapped register interfaces to a debugger, or to a cross-trigger interface, see [Chapter H8 About the External Debug Registers](#).
- The memory-mapped register interface to the system level implementation of the Generic Timer, see [Chapter I2 System Level Implementation of the Generic Timer](#).
- A memory-mapped register interface to the Performance Monitors, see [Chapter I3 Recommended External Interface to the Performance Monitors](#).
- A memory-mapped register interface to the Activity Monitors, see [Chapter I4 Recommended External Interface to the Activity Monitors](#).
- Memory-mapped register interfaces to an Arm Generic Interface Controller, see the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0*.
- The memory-mapped register interface to an Arm trace component. See, for example, the *ARM® Embedded Trace Macrocell Architecture Specification, ETMv4*.

E2.8 Memory types and attributes

In Armv8 the ordering of accesses for addresses in memory, referred to as the memory order model, is defined by the memory attributes. The following sections describe this model:

- [Normal memory on page E2-4318.](#)
- [Device memory on page E2-4322.](#)
- [Memory access restrictions on page E2-4327.](#)

E2.8.1 Normal memory

The Normal memory type attribute applies to most memory in a system. It indicates that the hardware is permitted by the architecture to perform *Speculative* data read accesses to these locations, regardless of the access permissions for these locations.

The Normal memory type has the following properties:

- A write to a memory location with the Normal attribute completes in finite time.
- Writes to a memory location with the Normal memory type that is either Non-cacheable or Write-Through cacheable for both the Inner and Outer cacheability must reach the endpoint for that location in the memory system in finite time. Two writes to the same location, where at least one is using the Normal memory type, might be merged before they reach the endpoint unless there is an ordered-before relationship between the two writes.
- Unaligned memory accesses can access Normal memory if the system is configured to generate such accesses.
- There is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register load/store instructions. See [Multi-register loads and stores that access Normal memory on page E2-4322.](#)

Note

- The Normal memory attribute is appropriate for locations of memory that are idempotent, meaning that they exhibit all of the following properties:
 - Read accesses can be repeated with no side-effects.
 - Repeated read accesses return the last value written to the resource being read.
 - Read accesses can fetch additional memory locations with no side-effects.
 - Write accesses can be repeated with no side-effects if the contents of the location accessed are unchanged between the repeated writes or as the result of an exception, as described in this section.
 - Unaligned accesses can be supported.
 - Accesses can be merged before accessing the target memory system.
- Normal memory allows speculative reads and may be affected by intermediate buffering and forwarding of data. If non-idempotent memory locations are mapped as Normal memory, the following may occur:
 - Memory accesses return UNKNOWN values.
 - UNPREDICTABLE effects on memory-mapped peripherals.
- An instruction that generates a sequence of accesses as described in [Atomicity in the Arm architecture on page E2-4284](#) might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is restarted, and therefore one or more of the memory locations might be accessed multiple times. This can result in repeated write accesses to a location that has been changed between the write accesses.

The following sections describe the other attributes for Normal memory:

- [Shareable Normal memory on page E2-4319.](#)
- [Non-shareable Normal memory on page E2-4320.](#)
- [Cacheability attributes for Normal memory on page E2-4320.](#)

See also:

- [Multi-register loads and stores that access Normal memory on page E2-4322.](#)
- [Atomicity in the Arm architecture on page E2-4284.](#)
- [Memory barriers on page E2-4299.](#) For accesses to Normal memory, a DMB instruction is required to ensure the required ordering.
- [Concurrent modification and execution of instructions on page E2-4286.](#)

Shareable Normal memory

A Normal memory location has a Shareability attribute that is defined as one of:

- Inner Shareable.
- Outer Shareable.
- Non-shareable.

The shareability attributes define the data coherency requirements of the location, that hardware must enforce. They do not affect the coherency requirements of instruction fetches, see [Synchronization and coherency issues between data and instruction accesses on page E2-4309.](#)

———— Note ————

- System designers can use the Shareability attribute to specify the locations in Normal memory for which coherency must be maintained. However, software developers must not assume that specifying a memory location as Non-shareable permits software to make assumptions about the incoherency of the location between different PEs in a shared memory system. Such assumptions are not portable between different multiprocessing implementations that might use the Shareability attribute. Any multiprocessing implementation might implement caches that are shared, inherently, between different PEs.
- This architecture assumes that all PEs that use the same operating system or hypervisor are in the same Inner Shareable shareability domain.

Shareable, Inner Shareable, and Outer Shareable Normal memory

The Arm architecture abstracts the system as a series of Inner and Outer Shareability domains.

Each Inner Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Inner Shareable attribute made by any member of that set.

Each Outer Shareability domain contains a set of observers that are data coherent for each member of that set for data accesses with the Outer Shareable attribute made by any member of that set.

The following properties also hold:

- Each observer is only a member of a single Inner Shareability domain.
- Each observer is only a member of a single Outer Shareability domain.
- All observers in an Inner Shareability domain are always members of the same Outer Shareability domain. This means that an Inner Shareability domain is a subset of an Outer Shareability domain, although it is not required to be a proper subset.

———— Note ————

- Because all data accesses to Non-cacheable locations are data coherent to all observers, Non-cacheable locations are always treated as Outer Shareable.
- The Inner Shareable domain is expected to be the set of PEs controlled by a single hypervisor or operating system.

The details of the use of the Shareability attributes are system-specific. [Example E2-1 on page E2-4320](#) shows how they might be used.

Example E2-1 Use of shareability attributes

In an implementation, a particular subsystem with two clusters of PEs has the requirement that:

- In each cluster, the data caches or unified caches of the PEs in the cluster are transparent for all data accesses to memory locations with the Inner Shareable attribute.
- However, between the two clusters, the caches:
 - Are not required to be coherent for data accesses that have only the Inner Shareable attribute.
 - Are coherent for data accesses that have the Outer Shareable attribute.

In this system, each cluster is in a different Shareability domain for the Inner Shareable attribute, but all components of the subsystem are in the same Shareability domain for the Outer Shareable attribute.

A system might implement two such subsystems. If the data caches or unified caches of one subsystem are not transparent to the accesses from the other subsystem, this system has two Outer Shareable Shareability domains.

Having two levels of shareability means system designers can reduce the performance and power overhead for shared memory locations that do not need to be part of the Outer Shareable Shareability domain.

For Shareable Normal memory, the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer in the same Shareability domain.

Non-shareable Normal memory

For Normal memory locations, the Non-shareable attribute identifies Normal memory that is likely to be accessed only by a single PE.

A location in Normal memory with the Non-shareable attribute does not require the hardware to make data accesses by different observers coherent, unless the memory is Non-cacheable. For a Non-shareable location, if other observers share the memory system, software must use cache maintenance instructions, if the presence of caches might lead to coherency issues when communicating between the observers. This cache maintenance requirement is in addition to the barrier operations that are required to ensure memory ordering.

For Non-shareable Normal memory, it is IMPLEMENTATION DEFINED whether the Load-Exclusive and Store-Exclusive synchronization primitives take account of the possibility of accesses by more than one observer.

Cacheability attributes for Normal memory

In addition to being Outer Shareable, Inner Shareable or Non-shareable, each region of Normal memory is assigned a Cacheability attribute that is one of:

- Write-Through Cacheable.
- Write-Back Cacheable.
- Non-cacheable.

Also, for Write-Through Cacheable and Write-Back Cacheable Normal memory regions:

- A region might be assigned cache allocation hints for read and write accesses.
- It is IMPLEMENTATION DEFINED whether the cache allocation hints can have an additional attribute of Transient or Non-transient.

For more information, see [Cacheability, cache allocation hints, and cache transient hints on page G4-6232](#).

A memory location can be marked as having different cacheability attributes, for example when using aliases in a VA to PA mapping:

- If the attributes differ only in the cache allocation hint this does not affect the behavior of accesses to that location.
- For other cases, see [Mismatched memory attributes on page E2-4328](#).

The cacheability attributes provide a mechanism of coherency control with observers that lie outside the Shareability domain of a region of memory. In some cases, the use of Write-Through Cacheable or Non-cacheable regions of memory might provide a better mechanism for controlling coherency than the use of hardware coherency mechanisms or the use of cache maintenance routines. To this end, the architecture requires the following properties for Non-cacheable or Write-Through Cacheable memory:

- A completed write to a memory location that is Non-cacheable or Write-Through Cacheable for a level of cache made by an observer accessing the memory system inside the level of cache is visible to all observers accessing the memory system outside the level of cache without the need of explicit cache maintenance.
- A completed write to a memory location that is Non-cacheable for a level of cache made by an observer accessing the memory system outside the level of cache is visible to all observers accessing the memory system inside the level of cache without the need of explicit cache maintenance.

Note

Implementations can use the cache allocation hints to indicate a probable performance benefit of caching. For example, a programmer might know that a piece of memory is not going to be accessed again and would be better treated as Non-cacheable. The distinction between memory regions with attributes that differ only in the cache allocation hints exists only as a hint for performance.

For Normal memory, the Arm architecture provides cacheability attributes that are defined independently for each of two conceptual levels of cache, the *inner* and the *outer* cache. The relationship between these conceptual levels of cache and the implemented physical levels of cache is IMPLEMENTATION DEFINED, and can differ from the boundaries between the Inner and Outer Shareability domains. However:

- Inner refers to the innermost caches, meaning the caches that are closest to the PE, and always includes the lowest level of cache.
- No cache that is controlled by the Inner cacheability attributes can lie outside a cache that is controlled by the Outer cacheability attributes.
- An implementation might not have any outer cache.

[Example E2-2 on page E2-4321](#), [Example E2-3 on page E2-4322](#), and [Example E2-4 on page E2-4322](#) describe the possible ways of implementing a system with three levels of cache, *level 1* (L1) to *level 3* (L3).

Note

- L1 cache is the level closest to the PE, see [Memory hierarchy on page E2-4307](#).
- When managing coherency, system designs must consider both the inner and outer cacheability attributes, as well as the Shareability attributes. This is because hardware might have to manage the coherency of caches at one conceptual level, even when another conceptual level has the Non-cacheable attribute.

Example E2-2 Implementation with two inner and one outer cache levels

Implement the three levels of cache in the system, L1 to L3, with:

- The Inner cacheability attribute applied to L1 and L2 cache.
 - The Outer cacheability attribute applied to L3 cache.
-

Example E2-3 Implementation with three inner and no outer cache levels

Implement the three levels of cache in the system, L1 to L3, with the Inner cacheability attribute applied to L1, L2, and L3 cache. Do not use the Outer cacheability attribute.

Example E2-4 Implementation with one inner and two outer cache levels

Implement the three levels of cache in the system, L1 to L3, with:

- The Inner cacheability attribute applied to L1 cache.
 - The Outer cacheability attribute applied to L2 and L3 cache.
-

Multi-register loads and stores that access Normal memory

For all instructions that load or store more than one general-purpose register from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load or store instructions.

For all instructions that load or store more than one general-purpose register from an Exception level the order in which the registers are accessed is not defined by the architecture.

For all instructions that load or store one or more registers from the SIMD and floating-point register file from an Exception level there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load or store instructions.

E2.8.2 Device memory

The Device memory type attributes define memory locations where an access to the location can cause side-effects, or where the value returned for a load can vary depending on the number of loads performed. Typically, the Device memory attributes are used for memory-mapped peripherals and similar locations.

The attributes for Armv8 Device memory are:

Gathering Identified as G or nG, see [Gathering on page E2-4324](#).

Reordering Identified as R or nR, see [Reordering on page E2-4325](#).

Early Write Acknowledgement

Identified as E or nE, see [Early Write Acknowledgement on page E2-4326](#).

The Armv8 Device memory types are:

Device-nGnRnE Device non-Gathering, non-Reordering, No Early Write Acknowledgement.
Equivalent to the Strongly-ordered memory type in earlier versions of the architecture.

Device-nGnRE Device non-Gathering, non-Reordering, Early Write Acknowledgement.
Equivalent to the Device memory type in earlier versions of the architecture.

Device-nGRE Device non-Gathering, Reordering, Early Write Acknowledgement.
Armv8 adds this memory type to the translation table formats found in earlier versions of the architecture. The use of barriers is required to order accesses to Device-nGRE memory. The Device-nGRE memory type is introduced into the AArch32 translation table formats when the PE is using the Long Descriptor Translation Table format.

Device-GRE Device Gathering, Reordering, Early Write Acknowledgement.

Armv8 adds this memory type to the translation table formats found in earlier versions of the architecture. Device-GRE memory has the fewest constraints. It behaves similar to Normal memory, with the restriction that speculative accesses to Device-GRE memory is forbidden.

The Device-GRE memory type is introduced into the AArch32 translation table formats when the PE is using the Long Descriptor Translation Table format.

Collectively these are referred to as *any Device memory type*. Going down the list, the memory types are described as getting *weaker*; conversely the going up the list the memory types are described as getting *stronger*.

Note

- As the list of types shows, these additional attributes are hierarchical. For example, a memory location that permits Gathering must also permit Reordering and Early Write Acknowledgement.
- The architecture does not require an implementation to distinguish between each of these memory types and Arm recognizes that not all implementations will do so. The subsection that describes each of the attributes, describes the implementation rules for the attribute.
- Earlier versions of the Arm architecture defined the following memory types:
 - Strongly-ordered memory. This is the equivalent of the Device-nGnRnE memory type.
 - Device memory. This is the equivalent of the Device-nGnRE memory type.

All of these memory types have the following properties:

- Speculative data accesses are not permitted to any memory location with any Device memory attribute. This means that each memory access to any Device memory type must be one that would be generated by a simple sequential execution of the program.

An exception to this applies:

- Reads generated by the Advanced SIMD and floating-point instructions can access bytes that are not explicitly accessed by the instruction if the bytes accessed are in a 16-byte window, aligned to 16-bytes, that contains at least one byte that is explicitly accessed by the instruction.

Note

- An instruction that generates a sequence of accesses as described in [Atomicity in the Arm architecture on page E2-4284](#) might be abandoned as a result of an exception being taken during the sequence of accesses. On return from the exception the instruction is restarted, and therefore one or more of the memory locations might be accessed multiple times. This can result in repeated accesses to a location where the program only defines a single access. For this reason, Arm strongly recommends that no accesses to Device memory are performed from a single instruction that spans the boundary of a translation granule or which in some other way could lead to some of the accesses being aborted.
- Write speculation that is visible to other observers is prohibited for all memory types.

-
- A write to a memory location with any Device memory type completes in finite time.
 - If a value that would be returned from a read of a memory location with the Device memory type changes without an explicit memory write effect by an observer, this change must also be globally observed for all observers in the system in finite time. Such a change might occur in a peripheral location that holds status information.
 - Data accesses to memory locations are coherent for all observers in the system, and correspondingly are treated as being Outer Shareable.
 - A memory location with any Device memory attribute cannot be allocated into a cache.
 - Writes to a memory location with any Device memory attribute must reach the endpoint for that address in the memory system in finite time. Two writes of Device memory type to the same location might be merged before they reach the endpoint, unless both writes have the non-Gathering attribute or there is an ordered-before relationship between the two writes.

- If a memory location is not capable of supporting unaligned memory accesses, then an unaligned access to that memory location generates an Alignment fault at the first stage of translation that defined the location as being Device.
- If a memory location is capable of supporting unaligned memory accesses, and such a memory location is marked as Device, then it is IMPLEMENTATION DEFINED whether an unaligned access to that memory location generates an Alignment fault at the first stage of translation that defined the location as being Device.
- Hardware does not prevent speculative instruction fetches from a memory location with any of the Device memory attributes unless the memory location is also marked as execute-never for all Exception levels.

———— **Note** ————

This means that to prevent speculative instruction fetches from memory locations with Device memory attributes, any location that is assigned any Device memory type must also be marked as execute-never for all Exception levels. Failure to mark a memory location with any Device memory attribute as execute-never for all Exception levels is a programming error.

———— **Note** ————

In the Non-secure PL1&0 translation regime in systems where `HCR.TGE==1` and `HCR.DC==0`, any Alignment fault that results from the fact that all locations are treated as Device is a fault at the first stage of translation. This causes the value of `HSR.ISS.[24]` to be 0.

See also [Memory access restrictions on page E2-4327](#).

The memory types for translation table walks cannot be defined as any Device memory type within the TCR. For the Non-secure EL1&0 translation regime, the memory accesses made during a stage 1 translation table walk are subject to a stage 2 translation, and as a result of this second stage of translation, the accesses from the first stage translation table walk might be made to memory locations with any Device memory type. These accesses might be made speculatively. When the value of the `HCR.PTW` bit is 1, a stage 2 Permission fault is generated if a first stage translation table walk is made to any Device memory type.

For an instruction fetch from a memory location with the Device attribute that is not marked as execute-never for the current Exception level, an implementation can either:

- Treat the instruction fetch as if it were to a memory location with the Normal Non-cacheable attribute.
- Take a Permission fault.

Gathering

In the Device memory attribute:

- G** Indicates that the location has the Gathering attribute.
nG Indicates that the location does not have the Gathering attribute, meaning it is non-Gathering.

The Gathering attribute determines whether it is permissible for either:

- Multiple memory accesses of the same type, read or write, to the same memory location to be merged into a single transaction.
- Multiple memory accesses of the same type, read or write, to different memory locations to be merged into a single memory transaction on an interconnect.

For memory types with the Gathering attribute, either of these behaviors is permitted, provided that the ordering and coherency rules of the memory location are followed.

For memory types with the non-Gathering attribute, neither of these behaviors is permitted. As a result:

- The number of memory accesses that are made corresponds to the number that would be generated by a simple sequential execution of the program.

- All access occur at their programmed size, except that there is no requirement for the memory system beyond the PE to be able to identify the elements accessed by multi-register load/store instructions. See [Multi-register loads and stores that access Device memory on page E2-4326](#).

Gathering between memory accesses separated by a memory barrier that affects those memory accesses is not permitted.

Gathering between two memory accesses generated by a Load-Acquire/Store-Release is not permitted.

A read from a memory location with the non-Gathering attribute cannot come from a cache or a buffer, but must come from the endpoint for that address in the memory system. Typically this is a peripheral or physical memory.

———— **Note** —————

- A read from a memory location with the Gathering attribute can come from intermediate buffering of a previous write, provided that:
 - The accesses are not separated by a DMB or DSB barrier that affects both of the accesses.
 - The accesses are not separated by other ordering constructions that require that the accesses are in order. Such a construction might be a combination of Load-Acquire and Store-Release.
 - The accesses are not generated by a Store-Release instruction.
- The Arm architecture only defines programmer visible behavior. Therefore, gathering can be performed if a programmer cannot tell whether gathering has occurred.

An implementation is permitted to perform an access with the Gathering attribute in a manner consistent with the requirements specified by the non-Gathering attribute.

An implementation is not permitted to perform an access with the non-Gathering attribute in a manner consistent with the relaxations allowed by the Gathering attribute.

Reordering

In the Device memory attribute:

- R** Indicates that the location has the Reordering attribute.
- nR** Indicates that the location does not have the Reordering attribute, meaning it is non-Reordering.

For all memory types with the non-Reordering attribute, the order of memory accesses arriving at a single peripheral of IMPLEMENTATION DEFINED size, as defined by the peripheral, must be the same order that occurs in a simple sequential execution of the program. That is, the accesses appear in program order. This ordering applies to all accesses using any of the memory types with the non-Reordering attribute. As a result, if there is a mixture of Device-nGnRE and Device-nGnRnE accesses to the same peripheral, these occur in program order. If the memory accesses are not to a peripheral, then this attribute imposes no restrictions.

———— **Note** —————

- The IMPLEMENTATION DEFINED size of the single peripheral is the same as applies for the ordering guarantee provided by the DMB instruction.
- The Arm architecture only defines programmer visible behavior. Therefore, reordering can be performed if a programmer cannot tell whether reordering has occurred.

An implementation is permitted to perform an access with the Reordering attribute in a manner consistent with the requirements specified by the non-Reordering attribute.

An additional relaxation is that an implementation is not permitted to perform an access with the non-Reordering attribute in a manner consistent with the relaxations allowed by the Reordering attribute.

The non-Reordering attribute does not require any additional ordering, other than that which applies to Normal memory, between:

- Accesses to one physical address with the non-Reordering attribute and accesses to a different physical address with the Reordering attribute.

- Access to one physical address with the non-Reordering attribute and access to a different physical address to Normal memory.
- Accesses with the non-Reordering attribute and accesses to different peripherals of IMPLEMENTATION DEFINED size.

Early Write Acknowledgement

In the Device memory attribute:

- E** Indicates that the location has the Early Write Acknowledgement attribute.
- nE** Indicates that the location has the No Early Write Acknowledgement attribute.

If the No Early Write Acknowledgement attribute is assigned for a Device memory location:

- For memory system endpoints where the system architecture in which the PE is operating requires that acknowledgement of a write comes from the endpoint, it is guaranteed that:
 - Only the endpoint of the write access returns a write acknowledgement of the access.
 - No earlier point in the memory system returns a write acknowledgement.
- For memory system endpoints where the system architecture in which the PE is operating does not require that acknowledgement of a write comes from the endpoint, the acknowledgement of a write is not required to come from the endpoint.

———— Note —————

A write with the No Early Write Acknowledgement attribute assigned for a Device memory location is not expected to generate an abort in any situation where the equivalent write to the same location without the No Early Write Acknowledgement attribute assigned does not generate an abort.

This means that a DSB barrier instruction, executed by the PE that performed the write to the No Early Write Acknowledgement [Location](#), completes only after the write has reached its endpoint in the memory system.

Peripherals are an example of system endpoints that require that the acknowledgement of a write comes from the endpoint.

———— Note —————

- The Early Write Acknowledgement attribute only affects where the endpoint acknowledgment is returned from, and does not affect the ordering of arrival at the endpoint between accesses, which is determined by either the Device Reordering attribute, or the use of barriers to create order.
- The areas of the physical memory map for which write acknowledgment from the endpoint is required is outside the scope of the Arm Architecture definition and must be defined as part of the system architecture in which the PE is operating. In particular, regions of memory handled as PCIe configuration writes are expected to support write acknowledgment from the endpoint.
- Arm recognizes that not all areas of a physical memory map will be capable of supporting write acknowledgment from the endpoint. In particular, Arm expects that regions of memory handled as posted writes under PCIe will not support write acknowledgment from the endpoint.
- For maximum software compatibility, Arm strongly recommends that all peripherals for which standard software drivers expect that the use of a DSB instruction will determine that a write has reached its endpoint are placed in areas of the physical memory map that support write acknowledgment from the endpoint.

Multi-register loads and stores that access Device memory

For all instructions that load or store more than one general-purpose register there is no requirement for the memory system beyond the PE to be able to identify the size of the elements accessed by these load and store instructions.

For all instructions that load or store one or more registers from the SIMD and floating-point register file there is no requirement for the memory system beyond the PE to be able to identify the size of the element accessed by these load and store instructions.

For an LDRD, STRD, or LDM instruction with a register list that includes the PC, or an STM instruction with a register list that includes the PC, the order in which the registers are accessed is not defined by the architecture.

For a load or store of an Advanced SIMD element or structure, the order in which the registers are accessed is not defined by the architecture.

For a VLDM and VSTM instruction with a register list that does not include the PC, all registers are accessed in ascending address order for accesses to Device memory with the non-Reordering attribute.

For a LDM or STM instruction with a register list that does not include the PC:

- When [FEAT_LSMAOC](#) is not implemented, and when [FEAT_LSMAOC](#) is implemented and the value of the applicable LSMAOE field is 1, all registers are accessed in ascending address order for accesses to Device memory with the non-Reordering attribute.
- When [FEAT_LSMAOC](#) is implemented and the value of the applicable LSMAOE field is 0, no memory accesses are required to be ordered.
- When [FEAT_LSMAOC](#) is implemented and the value of the applicable nTLSMD field is 0, any memory access to an address that the stage 1 translation assigns as Device-nGRE, Device-nGnRE, or Device-nGnRnE generates an Alignment fault.

The applicable LSMAOE or nTLSMD field is the field in the [SCTLR_EL1](#), [SCTLR_EL2](#), [HSCTLR](#), or [SCTLR](#) register that applies to the Exception level and Security state at which the LDM or STM instruction is executed.

Armv8.2 deprecates software relying on accesses to Device memory made by a single LDM or STM instruction not being reordered.

E2.8.3 Memory access restrictions

The following restrictions apply to memory accesses:

- For two explicit memory reads to any two adjacent bytes in memory, p and $p+1$, generated by the same instruction, and for two explicit writes to any two adjacent bytes in memory, p and $p+1$, that are generated by the same instruction:
 - The bytes p and $p+1$ must have the same memory type and Shareability attributes. otherwise the results are CONstrained UNPREDICTABLE. For example, an LDC, LDM, LDRD STC, STM or STRD instruction, or an unaligned load or store that spans the boundary between Normal memory and Device memory is CONstrained UNPREDICTABLE.
 - Except for possible differences in the cache allocation hints, Arm deprecates having different cacheability attributes for bytes p and $p+1$.

For the permitted CONstrained UNPREDICTABLE behavior, see [Crossing a page boundary with different memory types or Shareability attributes on page K1-8397](#).

- If the accesses of an instruction that causes multiple accesses to any type of Device memory cross a 4KB address boundary then behavior is CONstrained UNPREDICTABLE and [Crossing a 4KB boundary with a Device access on page K1-8397](#) describes the permitted behaviors.

———— **Note** —————

- The boundary referred to is between two Device memory regions that are both of 4KB and aligned to 4KB.
- This restriction means it is important that an access to a volatile memory device is not made using a single instruction that crosses a 4KB address boundary.
- Arm expects this restriction to constrain the placing of volatile memory devices in the system memory map, rather than expecting a compiler to be aware of the alignment of memory accesses.

E2.9 Mismatched memory attributes

In the Armv8 architecture mismatched memory attributes are controlled by privileged software. For more information, see [Chapter G5 The AArch32 Virtual Memory System Architecture](#).

Physical memory [Locations](#) are accessed with *mismatched attributes* if all accesses to the [Location](#) do not use a common definition of all of the following attributes of that [Location](#):

- Memory type: Device-nGnRnE, Device-nGnRE, Device-nGRE, Device-GRE or Normal.
- Shareability.
- Cacheability, for the same level of the inner or outer cache, but excluding any cache allocation hints.

Collectively these are referred to as memory attributes.

———— **Note** ————

In this document, the terms *location* and *memory location* refer to any byte within the current coherency granule and are used interchangeably.

When a memory [Location](#) is accessed with mismatched attributes the only software visible effects are one or more of the following:

- Uniprocessor semantics for reads and writes to that memory [Location](#) might be lost. This means:
 - A read of the memory [Location](#) by one agent might not return the value most recently written to that memory [Location](#) by the same agent.
 - Multiple writes to the memory [Location](#) by one agent with different memory attributes might not be ordered in program order.
- There might be a loss of coherency when multiple agents attempt to access a memory [Location](#).
- There might be a loss of properties derived from the memory type, as described in later bullets in this section.
- If all Load-Exclusive/Store-Exclusive instructions executed across all threads to access a given memory [Location](#) do not use consistent memory attributes, the Exclusives monitor state becomes UNKNOWN.
- Bytes written without the Write-Back cacheable attribute within the same Write-Back granule as bytes written with the Write-Back cacheable attribute might have their values reverted to the old values as a result of cache Write-Back.

The loss of properties associated with mismatched memory type attributes refers only to the following properties of Device memory that are additional to the properties of Normal memory:

- Prohibition of speculative read accesses.
- Prohibition on Gathering.
- Prohibition on Reordering.

For the following situations, when a physical memory [Location](#) is accessed with mismatched attributes, a more restrictive set of behaviors applies. The description of each situation also describes the behaviors that apply:

1. Any agent that reads that memory [Location](#) using the same common definition of the Memory type, Shareability and Cacheability attributes is guaranteed to access it coherently, to the extent required by that common definition of the memory attributes, only if all the following conditions are met:
 - All writes are performed to an alias of the memory [Location](#) that uses the same definition of the Memory type, Shareability and Cacheability attributes.
 - Either:
 - In the Non-secure PL1&0 translation regime, [HCR2](#).MIOCNCEN has a value of 0.
 - All aliases with write permission have the Inner Cacheability attribute the same as the Outer Cacheability attribute.
 - Either:
 - All writes are performed to an alias of the memory [Location](#) that has Inner Cacheability and Outer Cacheability attributes both as Non-cacheable.

- All aliases to a memory [Location](#) use a definition of the Shareability attributes that encompasses all the agents with permission to access the [Location](#).
2. The possible software-visible effects caused by mismatched attributes for a memory [Location](#) are defined more precisely if all of the mismatched attributes define the memory [Location](#) as one of:
- Any Device memory type.
 - Normal Inner Non-cacheable, Outer Non-cacheable memory.
- In these cases, the only permitted software-visible effects of the mismatched attributes are one or more of the following:
- Possible loss of properties derived from the memory type when multiple agents attempt to access the memory [Location](#).
 - Possible reordering of memory transactions to the same memory [Location](#) with different memory attributes, potentially leading to a loss of coherency or uniprocessor semantics. Any possible loss of coherency or uniprocessor semantics can be avoided by inserting DMB barrier instructions between accesses to the same memory [Location](#) that might use different attributes.

Where there is a loss of the uniprocessor semantics, ordering, or coherency, the following approaches can be used:

1. If the mismatched attributes for a memory [Location](#) all assign the same Shareability attribute to a [Location](#) that has a cacheable attribute, any loss of uniprocessor semantics, ordering, or coherency within a Shareability domain can be avoided by use of software cache management. To do so, software must use the techniques that are required for the software management of the ordering or coherency of cacheable [Locations](#) between agents in different shareability domains. This means:
- Before writing to a cacheable [Location](#) not using the Write-Back attribute, software must invalidate, or clean, a [Location](#) from the caches if any agent might have written to the [Location](#) with the Write-Back attribute. This avoids the possibility of overwriting the [Location](#) with stale data.
 - After writing to a cacheable [Location](#) with the Write-Back attribute, software must clean the [Location](#) from the caches, to make the write visible to external memory.
 - Before reading the [Location](#) with a cacheable attribute, software must invalidate, or clean and invalidate, the [Location](#) from the caches, to ensure that any value held in the caches reflects the last value made visible in external memory.
 - Executing a DMB barrier instruction, with scope that applies to the common Shareability of the accesses, between any accesses to the same cacheable [Location](#) that use different attributes.

———— **Note** —————

In AArch32 state, cache maintenance instructions can only be accessed from an Exception level that is higher than EL0, and therefore require a system call. For information on system calls, see [Exception-generating and exception-handling instructions on page F2-4395](#). For information about the AArch32 cache maintenance instructions, see [AArch32 cache and branch predictor support on page G4-6229](#).

In all cases:

- [Location](#) refers to any byte within the current coherency granule.
- A clean and invalidate instruction can be used instead of a clean instruction, or instead of an invalidate instruction.
- In the sequences outlined in this section, all cache maintenance instructions and memory transactions must be completed, or ordered by the use of barrier operations, if they are not naturally ordered by the use of a common address, see [Ordering of cache and branch predictor maintenance instructions on page G4-6248](#).

———— **Note** —————

With software management of coherency, race conditions can cause loss of data. A race condition occurs when different agents write simultaneously to bytes that are in the same [Location](#), and the invalidate, write, clean sequence of one agent overlaps with the equivalent sequence of another agent. A race condition also occurs if the first operation of either sequence is a clean, rather than an invalidate.

2. If the mismatched attributes for a [Location](#) mean that multiple cacheable accesses to the [Location](#) might be made with different Shareability attributes, then ordering and coherency are guaranteed only if:
 - Software running on a PE cleans and invalidates a [Location](#) from cache before and after each read or write to that [Location](#) by that PE.
 - A DMB barrier with scope that covers the full Shareability of the accesses is placed between any accesses to the same memory [Location](#) that use different attributes.

———— **Note** —————

The Note in rule 1 of this list, about possible race conditions, also applies to this rule.

In addition, if multiple agents attempt to use Load-Exclusive or Store-Exclusive instructions to access a [Location](#), and the accesses from the different agents have different memory attributes associated with the [Location](#), the Exclusives monitor state becomes UNKNOWN.

Arm strongly recommends that software does not use mismatched attributes for aliases of the same [Location](#). An implementation might not optimize the performance of a system that uses mismatched aliases.

———— **Note** —————

As described in [Non-cacheable accesses and instruction caches on page D4-2643](#), a non-cacheable access is permitted to be cached in an instruction cache, despite the fact that a non-cacheable access is not permitted to be cached in a unified cache. Despite this, when cacheable and non-cacheable aliases exist for memory which is executable, these must be treated as mismatched aliases to avoid coherency issues from the data or unified caches that might hold entries that will be brought into the instruction caches.

E2.10 Synchronization and semaphores

Armv8 provides non-blocking synchronization of shared memory, using *synchronization primitives*. The information in this section about memory accesses by synchronization primitives applies to accesses to both Normal and Device memory.

———— **Note** ————

Use of the Armv8 synchronization primitives scales for multiprocessing system designs.

Table E2-6 on page E2-4331 shows the synchronization primitives and the associated CLREX instruction.

Table E2-6 Synchronization primitives and associated instruction, T32 and A32 instruction sets

Transaction size	Additional semantics	Load-Exclusive ^a	Store-Exclusive ^a	Other ^a
Byte	-	LDREXB	STREXB	-
	Load-Acquire/Store-Release	LDAEXB	STLEXB	-
Halfword	-	LDREXH	STREXH	-
	Load-Acquire/Store-Release	LDAEXH	STLEXH	-
Word	-	LDREX	STREX	-
	Load-Acquire/Store-Release	LDAEX	STLEX	-
Doubleword	-	LDREXD	STREXD	-
	Load-Acquire/Store-Release	LDAEXD	STLEXD	-
None	Clear-Exclusive	-	-	CLREX

a. Instruction in the T32 and A32 instruction sets.

Except for the row showing the CLREX instruction, the two instructions in a single row are a Load-Exclusive/Store-Exclusive instruction pair. The model for the use of a Load-Exclusive/Store-Exclusive instruction pair accessing a non-aborting memory address x is:

- The Load-Exclusive instruction reads a value from memory address x .
- The corresponding Store-Exclusive instruction succeeds in writing back to memory address x only if no other observer, process, or thread has performed a more recent store to address x . The Store-Exclusive instruction returns a status bit that indicates whether the memory write succeeded.

A Load-Exclusive instruction marks a small block of memory for exclusive access. The size of the marked block is IMPLEMENTATION DEFINED, see [Marking and the size of the marked memory block on page E2-4337](#). A Store-Exclusive instruction to any address in the marked block clears the marking.

———— **Note** ————

In this section, the term PE includes any observer that can generate a Load-Exclusive or a Store-Exclusive instruction.

The following sections give more information:

- [Exclusive access instructions and Non-shareable memory locations on page E2-4332](#).
- [Exclusive access instructions and shareable memory locations on page E2-4333](#).
- [Marking and the size of the marked memory block on page E2-4337](#).
- [Context switch support on page E2-4337](#).
- [Load-Exclusive and Store-Exclusive instruction usage restrictions on page E2-4337](#).
- [Use of WFE and SEV instructions by spin-locks on page E2-4340](#).

E2.10.1 Exclusive access instructions and Non-shareable memory locations

For memory locations for which the Shareability attribute is Non-shareable, the exclusive access instructions rely on a *local Exclusives monitor*, or *local monitor*, that marks any address from which the PE executes a Load-Exclusive instruction. Any non-aborted attempt by the same PE to use a Store-Exclusive instruction to modify any address is guaranteed to clear the marking.

A Load-Exclusive instruction performs a load from memory, and:

- The executing PE marks the physical memory address for exclusive access.
- The local monitor of the executing PE transitions to the Exclusive Access state.

A Store-Exclusive instruction performs a conditional store to memory that depends on the state of the local monitor:

If the local monitor is in the Exclusive Access state

- If the address of the Store-Exclusive instruction is the same as the address that has been marked in the monitor by an earlier Load-Exclusive instruction, then the store occurs. Otherwise, it is IMPLEMENTATION DEFINED whether the store occurs.
- A status value is returned to a register:
 - If the store took place the status value is 0.
 - Otherwise, the status value is 1.
- The local monitor of the executing PE transitions to the Open Access state.

When an Exclusives monitor is in the Exclusive Access state the monitor is *set*.

If the local monitor is in the Open Access state

- No store takes place.
- A status value of 1 is returned to a register.
- The local monitor remains in the Open Access state.

When an Exclusives monitor is in the Exclusive Access state the monitor is *clear*.

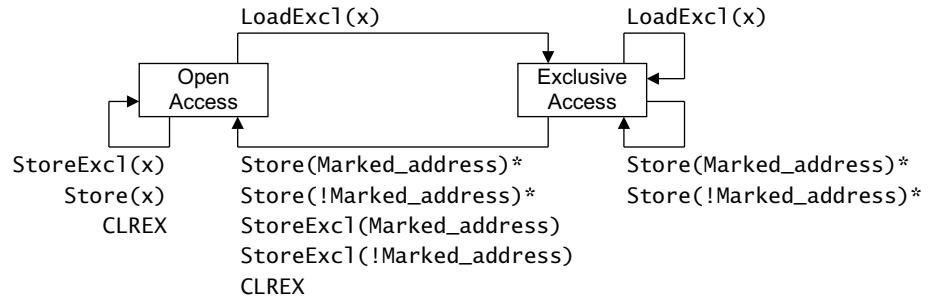

The Store-Exclusive instruction defines the register to which the status value is returned.

When a PE writes using any instruction other than a Store-Exclusive instruction:

- If the write is to a PA that is not marked as Exclusive Access by its local monitor and that local monitor is in the Exclusive Access state it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.
- If the write is to a PA that is marked as Exclusive Access by its local monitor it is IMPLEMENTATION DEFINED whether the write affects the state of the local monitor.

It is IMPLEMENTATION DEFINED whether a store to a marked PA causes a mark in the local monitor to be cleared if that store is by an observer other than the one that caused the PA to be marked.

[Figure E2-4 on page E2-4333](#) shows the state machine for the local monitor and the effect of each of the operations shown in the figure.

Operations marked * are possible alternative IMPLEMENTATION DEFINED options.

In the diagram: LoadExcl represents any Load-Exclusive instruction
StoreExcl represents any Store-Exclusive instruction
Store represents any other store instruction.

Any LoadExcl operation updates the marked address to the most significant bits of the address x used for the operation.

Figure E2-4 Local monitor state machine diagram

For more information about marking, see [Marking and the size of the marked memory block](#) on page E2-4337.

———— **Note** ————

For the local monitor state machine, as shown in [Figure E2-4 on page E2-4333](#):

- The IMPLEMENTATION DEFINED options for the local monitor are consistent with the local monitor being constructed so that it does not hold any PA, but instead treats any access as matching the address of the previous Load-Exclusive instruction.
- A local monitor implementation can be unaware of Load-Exclusive and Store-Exclusive instructions from other PEs.
- The architecture does not require a load instruction, by another PE, that is not a Load-Exclusive instruction, to have any effect on the local monitor.
- It is IMPLEMENTATION DEFINED whether the transition from Exclusive Access to Open Access state occurs when the Store or StoreExcl is from another observer.

Changes to the local monitor state resulting from speculative execution

The architecture permits a local monitor to transition to the Open Access state as a result of speculation, or from some other cause. This is in addition to the transitions to Open Access state caused by the architectural execution of an operation shown in [Figure E2-4 on page E2-4333](#).

An implementation must ensure that:

- The local monitor cannot be seen to transition to the Exclusive Access state except as a result of the architectural execution of one of the operations shown in [Figure E2-4 on page E2-4333](#).
- Any transition of the local monitor to the Open Access state not caused by the architectural execution of an operation shown in [Figure E2-4 on page E2-4333](#) must not indefinitely delay forward progress of execution.

E2.10.2 Exclusive access instructions and shareable memory locations

In the context of this section, a shareable memory location is a memory location that has, or is treated as if it has, a Shareability attribute of Inner Shareable or Outer Shareable.

For shareable memory locations, exclusive access instructions rely on:

- A *local monitor* for each PE in the system, that marks any address from which the PE executes a Load-Exclusive. The local monitor operates as described in *Exclusive access instructions and Non-shareable memory locations* on page E2-4332, except that for shareable memory any Store-Exclusive is then subject to checking by the global monitor if it is described in that section as doing at least one of the following:
 - Updating memory.
 - Returning a status value of 0.

The local monitor can ignore accesses from other PEs in the system.

- A *global monitor* that marks a PA as exclusive access for a particular PE. This marking is used later to determine whether a Store-Exclusive to that address that has not been failed by the local monitor can occur. Any successful write to the marked block by any other observer in the Shareability domain of the memory location is guaranteed to clear the marking. For each PE in the system, the global monitor:
 - Can hold at least one marked block.
 - Maintains a state machine for each marked block it can hold.

———— **Note** —————

For each PE, the architecture only requires global monitor support for a single marked address. Any situation that might benefit from the use of multiple marked addresses on a single PE is CONstrained UNPREDICTABLE, see *Load-Exclusive and Store-Exclusive instruction usage restrictions* on page E2-4337.

———— **Note** —————

The global monitor can either reside in a block that is part of the hardware on which the PE executes or exist as a secondary monitor at the memory interfaces. The IMPLEMENTATION DEFINED aspects of the monitors mean that the global monitor and local monitor can be combined into a single unit, provided that the unit performs the global monitor and local monitor functions defined in this manual.

For shareable memory locations, in some implementations and for some memory types, the properties of the global monitor require functionality outside the PE. Some system implementations might not implement this functionality for all locations of memory. In particular, this can apply to:

- Any type of memory in the system implementation that does not support hardware cache coherency.
- Non-cacheable memory, or memory treated as Non-cacheable, in an implementation that does support hardware cache coherency.

In such a system, it is defined by the system:

- Whether the global monitor is implemented.
- If the global monitor is implemented, which address ranges or memory types it monitors.

———— **Note** —————

To support the use of the Load-Exclusive/Store-Exclusive mechanism when address translation is disabled, a system might define at least one location of memory, of at least the size of the translation granule, in the system memory map to support the global monitor for all PEs within a common Inner Shareable domain. However, this is not an architectural requirement. Therefore, architecturally-compliant software that requires mutual exclusion must not rely on using the Load-Exclusive/Store-Exclusive mechanism, and must instead use a software algorithm such as Lamport's Bakery algorithm to achieve mutual exclusion.

Because implementations can choose which memory types are treated as Non-cacheable, the only memory types for which it is architecturally guaranteed that a global Exclusives monitor is implemented are:

- Inner Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hint and Write allocation hint and not transient.
- Outer Shareable, Inner Write-Back, Outer Write-Back Normal memory with Read allocation hint and Write allocation hints and not transient.

If the global monitor is not implemented for an address range or memory type, then performing a Load-Exclusive/Store-Exclusive instruction to such a location has one or more of the following effects:

- The instruction generates an External abort.
 - The instruction generates an IMPLEMENTATION DEFINED MMU fault. This is reported using the Fault status code of:
 - `DFSR.STATUS = 0b110101` when using the Long-descriptor translation table format. The fault can also be reported in the `HSR.ISS[5:0]` field for exceptions to Hyp mode.
 - `DFSR.FS = 0b10101` when using the Short-descriptor translation table format.
- If the IMPLEMENTATION DEFINED MMU fault is generated for the Non-secure PL1&0 translation regime then:
- If the fault is generated because of the memory type defined in the first stage of translation, or if the second stage of translation is disabled, then this is a first stage fault and the exception is taken to EL1.
 - Otherwise, the fault is a second stage fault and the exception is taken to EL2.
- The priority of this fault is IMPLEMENTATION DEFINED.
- The instruction is treated as a NOP.
 - The Load-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN.
 - The Store-Exclusive instruction is treated as if it were accessing a Non-shareable location, but the state of the local monitor becomes UNKNOWN.
 - The value held in the result register of the Store-Exclusive instruction becomes UNKNOWN.

In addition, for write transactions generated by non-PE observers that do not implement exclusive accesses or other atomic access mechanisms, the effect that writes have on the global and local monitors used by an Arm PE is IMPLEMENTATION DEFINED. The writes might not clear the global monitors of other PEs for:

- Some address ranges.
- Some memory types.

Operation of the global Exclusives monitor

A Load-Exclusive instruction from shareable memory performs a load from memory, and causes the PA of the access to be marked as exclusive access for the requesting PE. This access can also cause the exclusive access mark to be removed from any other PA that has been marked by the requesting PE.

———— Note —————

The global monitor only supports a single outstanding exclusive access to shareable memory for each PE.

A Load-Exclusive instruction by one PE has no effect on the global monitor state for any other PE.

A Store-Exclusive instruction performs a conditional store to memory:

- The store is guaranteed to succeed only if the PA accessed is marked as exclusive access for the requesting PE and both the local monitor and the global monitor state machines for the requesting PE are in the Exclusive Access state. In this case:
 - A status value of 0 is returned to a register to acknowledge the successful store.
 - The final state of the global monitor state machine for the requesting PE is IMPLEMENTATION DEFINED.
 - If the address accessed is marked for exclusive access in the global monitor state machine for any other PE then that state machine transitions to Open Access state.
- If no address is marked as exclusive access for the requesting PE, the store does not succeed:
 - A status value of 1 is returned to a register to indicate that the store failed.
 - The global monitor is not affected and remains in Open Access state for the requesting PE.
- If a different PA is marked as exclusive access for the requesting PE, it is IMPLEMENTATION DEFINED whether the store succeeds or not:
 - If the store succeeds a status value of 0 is returned to a register, otherwise a value of 1 is returned.

- If the global monitor state machine for the PE was in the Exclusive Access state before the Store-Exclusive instruction it is IMPLEMENTATION DEFINED whether that state machine transitions to the Open Access state.

The Store-Exclusive instruction defines the register to which the status value is returned.

In a shared memory system, the global monitor implements a separate state machine for each PE in the system. The state machine for accesses to shareable memory by PE(n) can respond to all the shareable memory accesses visible to it. This means it responds to:

- Accesses generated by PE(n).
- Accesses generated by the other observers in the Shareability domain of the memory location. These accesses are identified as (!n).

In a shared memory system, the global monitor implements a separate state machine for each observer that can generate a Load-Exclusive or a Store-Exclusive instruction in the system.

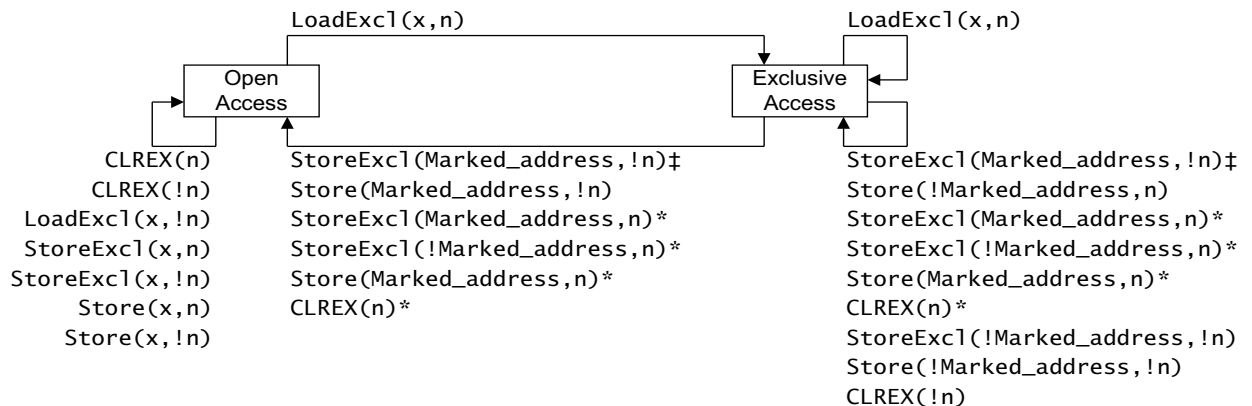

A global monitor:

- In the Exclusive Access state is *set*.
- In the Open Access state is *clear*.

Clear global monitor event

Whenever the global monitor state for a PE changes from Exclusive access to Open access, an event is generated and held in the Event register for that PE. This register is used by the Wait for Event mechanism, see [Wait For Event and Send Event on page G1-6104](#).

Figure E2-5 on page E2-4336 shows the state machine for PE(n) in a global monitor.

‡StoreExc1(Marked_address,!n) clears the monitor only if the StoreExc1 updates memory

Operations marked * are possible alternative IMPLEMENTATION DEFINED options.

In the diagram: LoadExc1 represents any Load-Exclusive instruction

StoreExc1 represents any Store-Exclusive instruction

Store represents any other store instruction.

Any LoadExc1 operation updates the marked address to the most significant bits of the address x used for the operation.

Figure E2-5 Global monitor state machine diagram for PE(n) in a multiprocessor system

For more information about marking, see [Marking and the size of the marked memory block on page E2-4337](#).

————— Note —————

For the global monitor state machine, as shown in [Figure E2-5 on page E2-4336](#):

- The architecture does not require a load instruction by another PE, that is not a Load-Exclusive instruction, to have any effect on the global monitor.

- Whether a Store-Exclusive instruction successfully updates memory or not depends on whether the address accessed matches the marked shareable memory address for the PE issuing the Store-Exclusive instruction, and whether the local and global monitors are in the exclusive state. For this reason, [Figure E2-5 on page E2-4336](#) only shows how the operations by (!n) cause state transitions of the state machine for PE(n).
 - A Load-Exclusive instruction can only update the marked shareable memory address for the PE issuing the Load-Exclusive instruction.
 - When the global monitor is in the Exclusive Access state, it is IMPLEMENTATION DEFINED whether a CLREX instruction causes the global monitor to transition from Exclusive Access to Open Access state.
 - It is IMPLEMENTATION DEFINED:
 - Whether a modification to a Non-shareable memory location can cause a global monitor to transition from Exclusive Access to Open Access state.
 - Whether a Load-Exclusive instruction to a Non-shareable memory location can cause a global monitor to transition from Open Access to Exclusive Access state.
-

E2.10.3 Marking and the size of the marked memory block

When a Load-Exclusive instruction is executed, the resulting marked block ignores the least significant bits of the 64-bit memory address.

When a Load-Exclusive instruction is executed, a marked block of size 2^a bytes is created by ignoring the least significant bits of the memory address. A marked address is any address within this marked block. The size of the marked memory block is called the *Exclusives reservation granule*. The Exclusives reservation granule is IMPLEMENTATION DEFINED in the range 4 - 512 words.

———— **Note** —————

This definition means that the Exclusives reservation granule is:

- 4 words in an implementation where a is 4.
- 512 words in an implementation where a is 11.

For example, in an implementation where a is 4, a successful LDREXB of address 0x341B4 defines a marked block using bits[47:4] of the address. This means that the four words of memory from 0x341B0 to 0x341BF are marked for exclusive access.

In some implementations the CTR identifies the Exclusives reservation granule, see [CTR](#). Otherwise, software must assume that the maximum Exclusives reservation granule, 512 words, is implemented.

E2.10.4 Context switch support

An exception return clears the local monitor. As a result, performing a CLREX instruction as part of a context switch is not required in most situations.

———— **Note** —————

Context switching is not an application level operation. However, this information is included here to complete the description of the exclusive operations.

E2.10.5 Load-Exclusive and Store-Exclusive instruction usage restrictions

The Load-Exclusive and Store-Exclusive instructions are intended to work together as a pair, for example a LDREX/STREX pair or a LDREXB/STREXB pair. To support different implementations of these functions, software must follow the notes and restrictions given in this subsection.

The following notes describe use of a Load-Exclusive/ Store-Exclusive instruction pair, LoadExc1/StoreExc1, to indicate the use of any of the Load-Exclusive/Store-Exclusive instruction pairs shown in [Table E2-6 on page E2-4331](#). In this context, a LoadExc1/StoreExc1 pair comprises two instructions in the same thread of execution:

- The exclusives support a single outstanding exclusive access for each PE thread that is executed. The architecture makes use of this by not requiring an address or size check as part of the `IsExclusiveLocal()` function. If the target VA of a StoreExc1 is different from the VA of the preceding LoadExc1 instruction in the same thread of execution, behavior can be CONSTRAINED UNPREDICTABLE with the following behavior:

- The StoreExc1 either passes or fails, the status value returned by the StoreExc1 is UNKNOWN, and the states of the local and global monitors for that PE are UNKNOWN.

———— **Note** —————

This means the StoreExc1 might pass for some instances of a LoadExc1/StoreExc1 pair with mismatched addresses, and fail for other instances of a LoadExc1/StoreExc1 pair with mismatched addresses.

- The data at the address accessed by the LoadExc1, and at the address accessed by the StoreExc1, is UNKNOWN.

This means software can rely on a LoadExc1/StoreExc1 pair to eventually succeed only if the LoadExc1 and the StoreExc1 are executed with the same VA.

- An implementation of the Load-Exclusive and Store-Exclusive instructions can require that, in any thread of execution, the transaction size of a StoreExc1 instruction is the same as the transaction size of the preceding LoadExc1 instruction executed in that thread. If the transaction size of a StoreExc1 instruction is different from the preceding LoadExc1 instruction in the same thread of execution, behavior can be CONSTRAINED UNPREDICTABLE with the following behavior:

- The StoreExc1 either passes or fails, and the status value returned by the StoreExc1 is UNKNOWN.

———— **Note** —————

This means the StoreExc1 might pass for some instances of a LoadExc1/StoreExc1 pair with mismatched transaction sizes, and fail for other instances of a LoadExc1/StoreExc1 pair with mismatched transaction sizes.

- The block of data of the size of the larger of the transaction sizes used by the LoadExc1/StoreExc1 pair at the address accessed by the LoadExc1/StoreExc1 pair, is UNKNOWN.

This means software can rely on a LoadExc1/StoreExc1 pair to eventually succeed only if the LoadExc1 and the StoreExc1 have the same transaction size.

- LoadExc1/StoreExc1 loops are guaranteed to make forward progress only if, for any LoadExc1/StoreExc1 loop within a single thread of execution, the software meets all of the following conditions:

- 1 Between the Load-Exclusive and the Store-Exclusive, there are no explicit memory effects, preloads, direct or indirect System register writes, address translation instructions, cache or TLB maintenance instructions, exception generating instructions, exception returns, or indirect branches.
- 2 Between the Store-Exclusive returning a failing result and the retry of the corresponding Load-Exclusive:
 - There are no stores or PLDW instructions to any address within the Exclusives reservation granule accessed by the Store-Exclusive.
 - There are no loads or preloads to any address within the Exclusives reservation granule accessed by the Store-Exclusive that use a different VA alias to that address.
 - There are no direct or indirect System register writes, other than changes to the flag fields in the `CPSR` or `FPSCR`, caused by data processing or comparison instructions.
 - There are no direct or indirect address translation instructions, cache or TLB maintenance instructions, exception generating instructions, exception returns, or indirect branches.
 - All loads and stores are to a block of contiguous virtual memory of not more than 512 bytes in size.

The Exclusives monitor can be cleared at any time without an application-related cause, provided that such clearing is not systematically repeated so as to prevent the forward progress in finite time of at least one of the threads that is accessing the Exclusives monitor. However, it is permissible for the LoadExc1/StoreExc1 loop not to make forward progress if a different thread is repeatedly doing any of the following in a tight loop:

- Performing stores to a PA covered by the Exclusives monitor.
 - Prefetching with intent to write to a PA covered by the Exclusives monitor.
 - Executing data cache clean, data cache invalidate, or data cache clean and invalidate instructions to a PA covered by the Exclusives monitor.
 - Executing instruction cache invalidate all instructions.
 - Executing instruction cache invalidate by VA instructions to a PA covered by the Exclusives monitor.
- Implementations can benefit from keeping the LoadExc1 and StoreExc1 operations close together in a single thread of execution. This minimizes the likelihood of the Exclusives monitor state being cleared between the LoadExc1 instruction and the StoreExc1 instruction. Therefore, for best performance, Arm strongly recommends a limit of 128 bytes between LoadExc1 and StoreExc1 instructions in a single thread of execution.
 - The architecture sets an upper limit of 2048 bytes on the Exclusives reservation granule that can be marked as exclusive. For performance reasons, Arm recommends that objects that are accessed by exclusive accesses are separated by the size of the Exclusives reservation granule. This is a performance guideline rather than a functional requirement.
 - After taking a Data Abort exception, the state of the Exclusives monitors is UNKNOWN.
 - For the memory location accessed by a LoadExc1/StoreExc1 pair, if the memory attributes for a StoreExc1 instruction are different from the memory attributes for the preceding LoadExc1 instruction in the same thread of execution, behavior is CONSTRAINED UNPREDICTABLE. Where this occurs because the translation of the accessed address changes between the LoadExc1 instruction and the StoreExc1 instruction, the CONSTRAINED UNPREDICTABLE behavior is as follows:
 - The StoreExc1 either passes or fails, and the status value returned by the StoreExc1 is UNKNOWN.

———— **Note** ————

This means the StoreExc1 might pass for some instances of a LoadExc1/StoreExc1 pair with changed memory attributes, and fail for other instances of a LoadExc1/StoreExc1 pair with changed memory attributes.

- The data at the address accessed by the StoreExc1 is UNKNOWN.

———— **Note** ————

Another bullet point in this list covers the case where the memory attributes of a LoadExc1/StoreExc1 pair differ as a result of using different VAs with different attributes that point to the same PA.

- The effect of a data or unified cache invalidate, clean, or clean and invalidate instruction on a local or global Exclusives monitor that is in the Exclusive Access state is CONSTRAINED UNPREDICTABLE, and the instruction might clear the monitor, or it might leave it in the Exclusive Access state. For address-based maintenance instructions, this also applies to the monitors of other PEs in the same Shareability domain as the PE executing the cache maintenance instruction, as determined by the Shareability domain of the address being maintained.

———— **Note** ————

Arm strongly recommends that implementations ensure that the use of such maintenance instructions by a PE in the Non-secure state cannot cause a denial of service on a PE in the Secure state.

- If the mapping of the VA to PA is changed between the LoadExc1 instruction and the StoreExc1 instruction, and the change is performed using a break-before-make sequence as described in [Using break-before-make when updating translation table entries on page G5-6337](#), if the StoreExc1 is performed after another write

to the same PA as the StoreExc1, and that other write was performed after the old translation was properly invalidated and that invalidation was properly synchronized, then the StoreExc1 will not pass its monitor check.

———— **Note** —————

Arm expects that, in many implementations, either:

- The TLB invalidation will clear either the local or global monitor.
- The PA will be checked between the LoadExc1 and StoreExc1.

- The Exclusive Access state for an address accessed by a PE can be lost as a result of a PLDW instruction to the same PA executed by another PE. This means that a very high rate of repeated PLDW accesses to a memory location might impede the forward progress of another PE.

———— **Note** —————

In the event of repeatedly-contending LoadExc1/StoreExc1 instruction sequences from multiple PEs, an implementation must ensure that forward progress is made by at least one PE.

E2.10.6 Use of WFE and SEV instructions by spin-locks

Armv8 provides Wait For Event, Send Event, and Send Event Local instructions, WFE, SEV, SEVL, that can assist with reducing power consumption and bus contention caused by PEs repeatedly attempting to obtain a spin-lock. These instructions can be used at the application level, but a complete understanding of what they do depends on a system level understanding of exceptions. They are described in [Wait For Event and Send Event on page G1-6104](#). However, in Armv8, when the global monitor for a PE changes from Exclusive Access state to Open Access state, an event is generated.

———— **Note** —————

This is equivalent to issuing an SEVL instruction on the PE for which the monitor state has changed. It removes the need for spinlock code to include an SEV instruction after clearing a spinlock.

Part F

The AArch32 Instruction Sets

Chapter F1

About the T32 and A32 Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Format of instruction descriptions* on page F1-4344.
- *Standard assembler syntax fields* on page F1-4348.
- *Conditional execution* on page F1-4349.
- *Shifts applied to a register* on page F1-4351.
- *Memory accesses* on page F1-4353.
- *Encoding of lists of general-purpose registers and the PC* on page F1-4354.
- *General information about the T32 and A32 instruction descriptions* on page F1-4355.
- *Additional pseudocode support for instruction descriptions* on page F1-4368.
- *Additional information about Advanced SIMD and floating-point instructions* on page F1-4369.

F1.1 Format of instruction descriptions

The instruction descriptions in [Chapter F5 T32 and A32 Base Instruction Set Instruction Descriptions](#) and [Chapter F6 T32 and A32 Advanced SIMD and Floating-point Instruction Descriptions](#) normally use the following format:

- Instruction section title.
- Introduction to the instruction.
- A description of each encoding of the instruction.
- Assembler syntax.
- Pseudocode describing how the instruction operates.
- Notes, if applicable.

Each of these items is described in more detail in the following subsections.

F1.1.1 Instruction section title

The instruction section title gives the base mnemonic for the instruction or instructions described in the section. When one mnemonic has multiple forms described in separate instruction sections, this is followed by a short description of the form in parentheses. The most common use of this is to distinguish between forms of an instruction in which one of the operands is an immediate value and forms in which it is a register.

F1.1.2 Introduction to the instruction

The introduction to the instruction briefly describes the main features of the instruction. This description is not necessarily complete and is not definitive. If there is any conflict between it and the more detailed information that follows, the latter takes priority.

F1.1.3 Instruction encodings

This is a list of one or more instruction encodings. Each instruction encoding is labeled as:

- A1, A2, A3 ... for the first, second, third, and any additional A32 encodings.
- T1, T2, T3 ... for the first, second, third, and any additional T32 encodings.

Each instruction encoding description consists of:

- An assembly syntax that ensures that the assembler selects the encoding in preference to any other encoding. Sometimes, multiple syntax variants are given. These are written in a typewriter font using the conventions described in [Assembler syntax prototype line conventions on page F1-4346](#). The correct one to use can be indicated by:
 - A subheading that identifies the encodings that correspond to the syntax. See, for example, the subheading *Flag setting, rotate right with extend variant* in the description of the A1 encoding of the ADC, ADCS (register) instructions in [A1 on page F5-4568](#).
 - An annotation to the syntax, such as *Inside IT block* or *Outside IT block*. See, for example, the syntax descriptions of the T1 encoding of the ADC, ADCS (register) instructions in [T1 on page F5-4569](#).

In other cases, the correct one to use can be determined by looking at the assembler syntax description and using it to determine which syntax corresponds to the instruction being disassembled.

There is usually more than one syntax variant that ensures re-assembly to any particular encoding, and the exact set of syntaxes that do so usually depends on the register numbers, immediate constants, and other operands to the instruction. For example, when assembling to the T32 instruction set, the syntax `AND R0, R0, R8` ensures selection of a 32-bit encoding but `AND R0, R0, R1` selects a 16-bit encoding.

For each instruction encoding belonging to a target instruction set, an assembler can use this information to determine whether it can use that encoding to encode the instruction requested by the UAL source. If multiple encodings can encode the instruction, then:

- If both a 16-bit encoding and a 32-bit encoding can encode the instruction, the architecture *prefers* the 16-bit encoding. This means the assembler must use the 16-bit encoding rather than the 32-bit encoding.

Software can use the `.W` and `.N` qualifiers to specify the required encoding width, see [Standard assembler syntax fields on page F1-4348](#).

- If multiple encodings of the same length can encode the instruction, the *Assembler syntax* subsection says which encoding is preferred, and how software can, instead, select the other encodings.

Each encoding also documents UAL syntax that selects it in preference to any other encoding.

If no encodings of the target instruction set can encode the instruction requested by the UAL source, normally the assembler generates an error saying that the instruction is not available in that instruction set.

———— **Note** —————

In some cases, an instruction is available in one instruction set but not in another. The *Assembler syntax* subsection identifies many of these cases. For example, the A32 instructions with bits<31:28> == 0b1111 described in [Branch, branch with link, and block data transfer on page F4-4521](#), [System register access, Advanced SIMD, floating-point, and Supervisor call on page F4-4523](#), and [Unconditional instructions on page F4-4541](#) cannot have a Condition code, but the equivalent T32 instructions often can, and this usually appears in the *Assembler syntax* subsection as a statement that the A32 instruction cannot be conditional.

However, some such cases are too complex to describe in the available space, so the definitive test of whether an instruction is available in a given instruction set is whether there is an available encoding for it in that instruction set.

The assembly syntax given for an encoding is therefore a suitable one for a disassembler to disassemble that encoding to. However, disassemblers might wish to use simpler syntaxes when they are suitable for the operand combination, to produce more readable disassembled code.

- An encoding diagram, where:
 - For a 32-bit A32 encoding diagram, the bits are numbered from 31-0.
 - For a 16-bit T32 encoding diagram, the bits are numbered from 15-0. This halfword can be described as `hw1` of the instruction.
 - For a 32-bit T32 encoding diagram, the bits are numbered from 15-0 for each halfword, as a reminder that a 32-bit T32 instruction consists of two consecutive halfwords rather than a word. In this case, the left-hand halfword in the diagram is identified as `hw1`, and the right-hand halfword is identified as `hw2`.

Where instructions are stored using the standard little-endian instruction endianness:

- The encoding diagram for an A32 instruction at address `A` shows, from left to right, the bytes at addresses `A+3`, `A+2`, `A+1`, `A`.
- The encoding diagram for a 32-bit T32 instruction shows bytes in the order `A+1`, `A` for `hw1`, followed by bytes `A+3`, `A+2` for `hw2`.
- Encoding-specific pseudocode. This is pseudocode that translates the encoding-specific instruction fields into inputs to the encoding-independent pseudocode in the *Operation* subsection, and that picks out any special cases in the encoding. For a detailed description of the pseudocode used and of the relationship between the encoding diagram, the encoding-specific pseudocode and the encoding-independent pseudocode, see [Appendix K14 Arm Pseudocode Definition](#).

F1.1.4 Assembler symbols

The *Assembly symbols* describe the standard UAL syntax for the instruction.

Each syntax description consists of the following elements:

- Descriptions of all variable or optional fields of the syntax.

Some syntax fields are standardized across all or most instructions. *Standard assembler syntax fields on page F1-4348* describes these fields.

By default, syntax fields that specify registers, such as <Rd>, <Rn>, or <Rt>, can be any of R0-R12 or LR in T32 instructions, and any of R0-R12, SP, or LR in A32 instructions. These require that the encoding-specific pseudocode set the corresponding integer variable (such as d, n, or t) to the corresponding register number, using 0-12 for R0-R12, 13 for SP, or 14 for LR:

- Normally, software can do this by setting the corresponding field in the instruction, typically named Rd, Rn, Rt, to the binary encoding of that number.
- In the case of 16-bit T32 encodings, the field is normally of length 3, and so the encoding is only available when the assembler syntax specifies one of R0-R7. Such encodings often use a register field name like Rdn. This indicates that the encoding is only available if <Rd> and <Rn> specify the same register, and that the register number of that register is encoded in the field if they do.

The description of a syntax field that specifies a register sometimes extends or restricts the permitted range of registers or documents other differences from the default rules for such fields. Examples of extensions are permitting the use of the SP in a T32 instruction, or permitting the use of the PC, identified using register number 15.

- Where appropriate, text that briefly describes changes from the pre-UAL assembler syntax. Where present, this usually consists of an alternative pre-UAL form of the assembler mnemonic. The pre-UAL assembler syntax does not conflict with UAL. Arm recommends that it is supported, as an optional extension to UAL, so that pre-UAL assembler source files can be assembled.

Assembler syntax prototype line conventions

The following conventions are used in assembler syntax prototype lines and their subfields:

< > Any item bracketed by < and > is a short description of a type of value to be supplied by the user in that position. A longer description of the item is normally supplied by subsequent text. Such items often correspond to a similarly named field in an encoding diagram for an instruction. When the correspondence only requires the binary encoding of an integer value or register number to be substituted into the instruction encoding, it is not described explicitly. For example, if the assembler syntax for an instruction contains an item <Rn> and the instruction encoding diagram contains a 4-bit field named Rn, the number of the register specified in the assembler syntax is encoded in binary in the instruction field.

If the correspondence between the assembler syntax item and the instruction encoding is more complex than simple binary encoding of an integer or register number, the item description indicates how it is encoded. This is often done by specifying a required output from the encoding-specific pseudocode, such as `add = TRUE`. The assembler must only use encodings that produce that output.

{ } Any item bracketed by { and } is optional. A description of the item and of how its presence or absence is encoded in the instruction is normally supplied by subsequent text.

Many instructions have an optional destination register. Unless otherwise stated, if such a destination register is omitted, it is the same as the immediately following source register in the instruction syntax.

In the assembler syntax, numeric constants are normally preceded by a #. Some UAL instruction syntax descriptions explicitly show this # as optional. Any UAL assembler:

- Must treat the # as optional where an instruction syntax description shows it as optional.
- Can treat the # either as mandatory or as optional where an instruction syntax description does not show it as optional.

————— Note —————

Arm recommends that UAL assemblers treat all uses of # shown in this manual as optional.

spaces Single spaces are used for clarity, to separate items. When a space is obligatory in the assembler syntax, two or more consecutive spaces are used.

+/- This indicates an optional + or - sign. If neither is coded, + is assumed.

All other characters must be encoded precisely as they appear in the assembler syntax. Apart from { and }, the special characters described above do not appear in the basic forms of assembler instructions documented in this manual. In a few places, the { and } characters must be encoded as part of a variable item. When this happens, the long description of the variable item indicates how they must be used.

F1.1.5 Pseudocode describing how the instruction operates

The *Operation for all classes* subsection contains encoding-independent pseudocode that describes the main operation of the instruction. For a detailed description of the pseudocode used and of the relationship between the encoding diagram, the encoding-specific pseudocode and the encoding-independent pseudocode, see [Appendix K14 Arm Pseudocode Definition](#).

F1.2 Standard assembler syntax fields

The following assembler syntax fields are standard across all or most instructions:

<c> Is an optional field. It specifies the condition under which the instruction is executed. See [Conditional execution on page F1-4349](#) for the range of available conditions and their encoding. If <c> is omitted, it defaults to *always* (AL).

<q> Specifies optional assembler qualifiers on the instruction. The following qualifiers are defined:

.N Meaning narrow, specifies that the assembler must select a 16-bit encoding for the instruction. If this is not possible, an assembler error is produced.

.W Meaning wide, specifies that the assembler must select a 32-bit encoding for the instruction. If this is not possible, an assembler error is produced.

If neither .W nor .N is specified, the assembler can select either 16-bit or 32-bit encodings. If both are available, it must select a 16-bit encoding. In a few cases, more than one encoding of the same length can be available for an instruction. The rules for selecting between such encodings are instruction-specific and are part of the instruction description. The assembler syntax includes a mandatory .W qualifier, along with a note describing the cases in which it applies, where this qualifier is required to select a particular encoding for an instruction. Additional assembler syntax will describe the syntax when the conditions are not met.

———— **Note** —————

When assembling to the A32 instruction set, the .N qualifier produces an assembler error and the .W qualifier has no effect.

F1.3 Conditional execution

Most T32 and A32 instructions can be executed conditionally, based on the values of the APSR Condition flags. [Table F1-1 on page F1-4349](#) lists the available conditions.

Table F1-1 Condition codes

cond	Mnemonic extension	Meaning (integer)	Meaning (floating-point) ^a	Condition flags
0000	EQ	Equal	Equal	Z == 1
0001	NE	Not equal	Not equal, or unordered	Z == 0
0010	CS ^b	Carry set	Greater than, equal, or unordered	C == 1
0011	CC ^c	Carry clear	Less than	C == 0
0100	MI	Minus, negative	Less than	N == 1
0101	PL	Plus, positive or zero	Greater than, equal, or unordered	N == 0
0110	VS	Overflow	Unordered	V == 1
0111	VC	No overflow	Not unordered	V == 0
1000	HI	Unsigned higher	Greater than, or unordered	C == 1 and Z == 0
1001	LS	Unsigned lower or same	Less than or equal	C == 0 or Z == 1
1010	GE	Signed greater than or equal	Greater than or equal	N == V
1011	LT	Signed less than	Less than, or unordered	N != V
1100	GT	Signed greater than	Greater than	Z == 0 and N == V
1101	LE	Signed less than or equal	Less than, equal, or unordered	Z == 1 or N != V
1110	None (AL) ^d	Always (unconditional)	Always (unconditional)	Any

- a. Unordered means at least one NaN operand.
- b. HS (unsigned higher or same) is a synonym for CS.
- c. L0 (unsigned lower) is a synonym for CC.
- d. AL is an optional mnemonic extension for always, except in IT instructions. For details, see [IT on page F5-4702](#).

In T32 instructions, the condition, if it is not AL, is normally encoded in a preceding IT instruction. For more information, see [Conditional instructions on page F2-4377](#) and [IT on page F5-4702](#). Some conditional branch instructions do not require a preceding IT instruction, because they include a Condition code in their encoding.

Implementations can provide a set of ITD control fields, [SCTLR.ITD](#), [SCTLR_EL1.ITD](#), and [HSCTLR.ITD](#), to disable use of IT for some instructions, making them UNDEFINED. For more information, see:

- [Disabling or enabling PL0 and PL1 use of AArch32 optional functionality on page G1-6120](#).
- [Disabling or enabling EL2 use of AArch32 optional functionality on page G1-6129](#).

In A32 instructions, bits[31:28] of the instruction contain either:

- The Condition code, see [The Condition code field in A32 instruction encodings on page F1-4349](#).
- 0b1111 for some A32 instructions that can only be executed unconditionally.

F1.3.1 The Condition code field in A32 instruction encodings

Every conditional A32 instruction contains a 4-bit Condition code field, the cond field, in bits 31-28:

This field contains one of the values 0b0000-0b1110, as shown in [Table F1-1 on page F1-4349](#). Most instruction mnemonics can be extended with the letters defined in the *Mnemonic extension on page F1-4349* column of that table.

If the *always* (AL) condition is specified, the instruction is executed irrespective of the value of the Condition flags. The absence of a Condition code on an instruction mnemonic implies the AL Condition code.

F1.3.2 Pseudocode description of conditional execution

The `AArch32.CurrentCond()` function returns a 4-bit condition specifier as follows:

- For A32 instructions, it returns bits[31:28] of the instruction.
- For the T1 and T3 encodings of the Branch instruction (see [B on page F5-4613](#)), it returns the 4-bit cond field of the encoding.
- For all other T32 instructions:
 - If `PSTATE.IT<3:0> != '0000'` it returns `PSTATE.IT<7:4>`.
 - If `PSTATE.IT<7:0> == '00000000'` it returns `'1110'`.
 - Otherwise, execution of the instruction is CONstrained UNPREDICTABLE.

For more information, see [Process state, PSTATE on page E1-4253](#).

The `ConditionPassed()` function uses this condition specifier and the Condition flags to determine whether the instruction must be executed, by calling the `ConditionHolds()` function.

[Chapter J1 Armv8 Pseudocode](#) includes the definitions of these functions.

[Undefined Instruction exception on page G1-6078](#) describes the handling of conditional instructions that are UNDEFINED, UNPREDICTABLE, or CONstrained UNPREDICTABLE. The pseudocode in the manual, as a sequential description of the instructions, has limitations in this respect. For more information, see [Limitations of the instruction pseudocode on page K14-8576](#).

F1.4 Shifts applied to a register

A32 register offset load/store word and unsigned byte instructions can apply a wide range of different constant shifts to the offset register. Both T32 and A32 data-processing instructions can apply the same range of different constant shifts to the second operand register. For details, see [Constant shifts on page F1-4351](#).

A32 data-processing instructions can apply a register-controlled shift to the second operand register.

F1.4.1 Constant shifts

These are the same in T32 and A32 instructions, except that the input bits come from different positions.

<shift> is an optional shift to be applied to <Rm>. It can be any one of:

(omitted)	No shift.
LSL #<n>	Logical shift left <n> bits. $1 \leq \langle n \rangle \leq 31$.
LSR #<n>	Logical shift right <n> bits. $1 \leq \langle n \rangle \leq 32$.
ASR #<n>	Arithmetic shift right <n> bits. $1 \leq \langle n \rangle \leq 32$.
ROR #<n>	Rotate right <n> bits. $1 \leq \langle n \rangle \leq 31$.
RRX	Rotate right one bit, with extend. Bit[0] is written to shifter_carry_out, bits[31:1] are shifted right one bit, and the Carry flag is shifted into bit[31].

————— Note —————

Assemblers can permit the use of some or all of ASR #0, LSL #0, LSR #0, and ROR #0 to specify that no shift is to be performed. This is not standard UAL, and the encoding selected for T32 instructions might vary between UAL assemblers if it is used. To ensure disassembled code assembles to the original instructions, disassemblers must omit the shift specifier when the instruction specifies no shift.

Similarly, assemblers can permit the use of #0 in the immediate forms of ASR, LSL, LSR, and ROR instructions to specify that no shift is to be performed, that is, that a MOV (register) instruction is wanted. Again, this is not standard UAL, and the encoding selected for T32 instructions might vary between UAL assemblers if it is used. To ensure disassembled code assembles to the original instructions, disassemblers must use the MOV (register) syntax when the instruction specifies no shift.

Encoding

The assembler encodes <shift> into two type bits and five immediate bits, as follows:

(omitted)	type = 0b00, immediate = 0.
LSL #<n>	type = 0b00, immediate = <n>.
LSR #<n>	type = 0b01. If <n> < 32, immediate = <n>. If <n> == 32, immediate = 0.
ASR #<n>	type = 0b10. If <n> < 32, immediate = <n>. If <n> == 32, immediate = 0.
ROR #<n>	type = 0b11, immediate = <n>.
RRX	type = 0b11, immediate = 0.

F1.4.2 Register controlled shifts

These are only available in A32 instructions.

<type> is the type of shift to apply to the value read from <Rm>. It must be one of:

ASR	Arithmetic shift right, encoded as type = 0b10.
LSL	Logical shift left, encoded as type = 0b00.
LSR	Logical shift right, encoded as type = 0b01.
ROR	Rotate right, encoded as type = 0b11.

The bottom byte of <Rs> contains the shift amount.

F1.4.3 Pseudocode description of instruction-specified shifts and rotates

The pseudocode enumeration `SRTType{}` defines the shift types. Shift and rotate instruction decode is described by the pseudocode function:

- `DecodeImmShift()` for a constant shift.
- `DecodeRegShift()` for a register controlled shift.

Shift and rotate operations are made by the pseudocode function `Shift()`.

F1.5 Memory accesses

Commonly, the following addressing modes are permitted for memory access instructions:

Offset addressing

The offset value is applied to an address obtained from the base register. The result is used as the address for the memory access. The value of the base register is unchanged.

The assembly language syntax for this mode is:

[<Rn>, <offset>]

Pre-indexed addressing

The offset value is applied to an address obtained from the base register. The result is used as the address for the memory access, and written back into the base register.

The assembly language syntax for this mode is:

[<Rn>, <offset>]!

Post-indexed addressing

The address obtained from the base register is used, unchanged, as the address for the memory access. The offset value is applied to the address, and written back into the base register.

The assembly language syntax for this mode is:

[<Rn>], <offset>

In each case, <Rn> is the base register. <offset> can be:

- An immediate constant, such as <imm8> or <imm12>.
- An index register, <Rm>.
- A shifted index register, such as <Rm>, LSL #<shift>.

For information about unaligned access, endianness, and exclusive access, see:

- [Alignment support on page E2-4312.](#)
- [Endian support on page E2-4314.](#)
- [Synchronization and semaphores on page E2-4331.](#)

F1.6 Encoding of lists of general-purpose registers and the PC

A number of instructions operate on lists of general-purpose registers. For some load instructions, the list of registers to be loaded can include the PC. For these instructions, the assembler syntax includes a <registers> field, that provides a list of the registers to be operated on, with list entries separated by commas.

The registers list is encoded in the instruction encoding. Most often, this is done using an 8-bit, 13-bit, or 16-bit register_list field. This section gives more information about these and other possible register list encodings.

In a register_list field, each bit corresponds to a single register, and if the <registers> field of the assembler instruction includes Rt then register_list<t> is set to 1, otherwise it is set to 0.

The full rules for the encoding of lists of general-purpose registers, and possibly the PC, are:

- Except for the cases listed here, 16-bit T32 encodings use an 8-bit register list, and can access only registers R0-R7.

The exceptions to this rule are:

- The T1 encoding of POP uses an 8-bit register list, and an additional bit, P, that corresponds to the PC. This means it can access any of R0-R7 and the PC.
- The T1 encoding of PUSH uses an 8-bit register list, and an additional bit, M, that corresponds to the LR. This means it can access any of R0-R7 and the LR.

- 32-bit T32 encodings of load operations use a 13-bit register list, and two additional bits, M, corresponding to the LR, and P, corresponding to the PC. This means these instructions can access any of R0-R12 and the LR and PC.

- 32-bit T32 encodings of store operations use a 13-bit register list, and one additional bit, M, corresponding to the LR. This means these instructions can access any of R0-R12 and the LR.

- Except for the case listed here, A32 encodings use a 16-bit register list. This means these instructions can access any of R0-R12 and the SP, LR, and PC.

The exception to this rule is:

- The System instructions LDM (exception return) and LDM (User registers) use a 15-bit register list. This means these instructions can access any of R0-R12 and the SP and LR.

- The T3 and A2 encodings of POP, and the T3 and A2 encodings of PUSH, access a single register from the set of registers {R0-R12, LR, PC} and encode the register number in the Rt field.

———— **Note** —————

POP is a load operation, and PUSH is a store operation.

In every case, the encoding-specific pseudocode converts the register list into a 32-bit variable, registers, with a bit corresponding to each of the registers R0-R12, SP, LR, and PC.

———— **Note** —————

Some Advanced SIMD and floating-point instructions operate on lists of SIMD and floating-point registers. The assembler syntax of these instructions includes a <list> field that specifies the registers to be operated on, and the description of the instruction in *Alphabetical list of T32 and A32 base instruction set instructions* on page F5-4564 defines the use and encoding of this field.

F1.7 General information about the T32 and A32 instruction descriptions

Chapter F3 *T32 Instruction Set Encoding* describes the T32 instruction encodings, and Chapter F4 *A32 Instruction Set Encoding* describes the A32 instruction encodings. The following subsections give more information about the descriptions of these instructions and their encodings:

- [Execution of instructions in debug state on page F1-4355.](#)
- [Fixed values in AArch32 instruction and System register descriptions on page F1-4355.](#)
- [UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space on page F1-4356.](#)
- [T32 and A32 Advanced SIMD and floating-point instruction encodings on page F1-4357.](#)
- [The PC and the use of 0b1111 as a register specifier in T32 and A32 instructions on page F1-4361.](#)
- [The SP and the use of 0b1101 as a register specifier in T32 and A32 instructions on page F1-4362.](#)
- [Modified immediate constants in T32 and A32 instructions on page F1-4362.](#)

F1.7.1 Execution of instructions in debug state

In general, except for the instructions described in [Debug state on page F2-4396](#), the T32 instruction descriptions do not indicate any differences in the behavior of the instruction if it is executed in Debug state. For this information, see [Executing instructions in Debug state on page H2-7349](#).

———— **Note** —————

- A32 instructions cannot be executed in Debug state.
- For many T32 instructions, execution is unchanged in Debug state. [Executing instructions in Debug state on page H2-7349](#) identifies these instructions.

F1.7.2 Fixed values in AArch32 instruction and System register descriptions

This section summarizes the terms used to describe fixed values in AArch64 register and instruction descriptions. The [Glossary](#) gives full descriptions of these terms, and each entry in this section includes a link to the corresponding [Glossary](#) entry.

———— **Note** —————

In register descriptions, the meaning of some bits depends on the PE state. This affects the definitions of RES0 and RES1, as shown in the [Glossary](#).

The following terms are used to describe bits or fields with fixed values:

- RAZ** Read-As-Zero. See [Read-As-Zero \(RAZ\)](#).
In diagrams, a RAZ bit can be shown as 0.
- (0), RES0** Reserved, [Should-Be-Zero \(SBZ\)](#) or [RES0](#).
In instruction encoding diagrams, and sometimes in other descriptions, (0) indicates an SBZ bit. If the bit is set to 1, behavior is CONSTRAINED UNPREDICTABLE, and must be one of the following:
- The instruction is UNDEFINED.
 - The instruction is treated as a NOP.
 - The instruction executes as if the value of the bit was 0.
 - Any destination registers of the instruction become UNKNOWN.

This notation can be expanded for fields, so a three-bit field can be shown as either (0)(0)(0) or as (000).

In register diagrams, but not in the A64 encoding and instruction descriptions, bits or fields can be shown as RES0. For more information, see the [Glossary](#) definition of [RES0](#).

———— **Note** —————

Some of the System instruction descriptions in this chapter are based on the *field description* of the input value for the instruction. These are register descriptions and therefore can include RES0 fields,

- The (0) and RES0 descriptions can be applied to bits or bitfields that are read-only, or are write-only. The [Glossary](#) definitions cover these cases.
- RAO** Read-As-One. See [Read-As-One \(RAO\)](#).
In diagrams, a RAO bit can be shown as 1.
- (1), RES1** Reserved, [Should-Be-One \(SBO\)](#) or [RES1](#).
In instruction encoding diagrams, and sometimes in other descriptions, (1) indicates an SBO bit. If the bit is set to 0, behavior is CONSTRAINED UNPREDICTABLE, and must be one of the following:
- The instruction is UNDEFINED.
 - The instruction is treated as a NOP.
 - The instruction executes as if the value of the bit was 1.
 - Any destination registers of the instruction become UNKNOWN.
- This notation can be expanded for fields, so a three-bit field can be shown as either (1)(1)(1) or as (111).
- In register diagrams, but not in the A64 encoding and instruction descriptions, bits or fields can be shown as RES1. For more information, see the [Glossary](#) definition of [RES1](#).

———— **Note** —————

Some of the System instruction descriptions in this chapter are based on the *field description* of the input value for the instruction. These are register descriptions and therefore can include RES1 fields,

The (1) and RES1 descriptions can be applied to bits or bitfields that are read-only, or are write-only. The [Glossary](#) definitions cover these cases.

———— **Note** —————

In register diagrams, (0) is a synonym for RES0, and (1) is a synonym for RES1, where RES0 and RES1 are defined in the [Glossary](#). However, when used in an instruction encoding diagram, (0) and (1) have the narrower definition that behavior is UNPREDICTABLE or CONSTRAINED UNPREDICTABLE if either:

- A bit marked as (0) has the value 1.
- A bit marked as (1) has the value 0.

F1.7.3 UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space

An attempt to execute an unallocated instruction results in either:

- Unpredictable behavior. The instruction is described as UNPREDICTABLE or CONSTRAINED UNPREDICTABLE. Armv8-A greatly reduces the architecturally UNPREDICTABLE behavior in AArch32 state. Most cases that earlier versions of the architecture describe as UNPREDICTABLE become either:
 - CONSTRAINED UNPREDICTABLE, meaning the architecture defines a limited range of permitted behaviors.
 - Fully predictable.For more information, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).
- An Undefined Instruction exception. The instruction is described as UNDEFINED.

An instruction is UNDEFINED if it is declared as UNDEFINED in an instruction description, or in [Chapter F3 T32 Instruction Set Encoding](#) or [Chapter F4 A32 Instruction Set Encoding](#).

An instruction is UNPREDICTABLE only if:

- It is declared as UNPREDICTABLE in an instruction description or in [Chapter F3](#) or [Chapter F4](#), and [Appendix K1](#) does not redefine the behavior as CONSTRAINED UNPREDICTABLE.
- The pseudocode for that encoding does not indicate that a different special case applies, and a bit marked (0) or (1) in the encoding diagram of an instruction is not 0 or 1 respectively. In most cases, Armv8 makes these cases CONSTRAINED UNPREDICTABLE, as described in [SBZ or SBO fields T32 and A32 in instructions on page K1-8390](#).

Unless otherwise specified, T32 and A32 instructions provided as part of an architectural extension, or by an optional feature of the architecture, are UNDEFINED in an implementation that does not include that extension or feature.

———— **Note** —————

Examples of where this rule applies are:

- The instructions provided by the Cryptographic Extension.
- The System instructions that provide access to the System registers of the OPTIONAL Performance Monitors Extension.
- The Advanced SIMD and floating-point instructions.

For more information about UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction behavior, see [Undefined Instruction exception on page G1-6078](#).

F1.7.4 T32 and A32 Advanced SIMD and floating-point instruction encodings

The T32 and A32 encodings of Advanced SIMD and floating-point instructions that are described in [Chapter F3 T32 Instruction Set Encoding](#) and in [Chapter F4 A32 Instruction Set Encoding](#) are common to the T32 and A32 instruction sets. This means:

- The instruction groups, and the set of instructions in each group, are identical for T32 and A32.
- For each instruction:
 - Each T32 encoding is exactly equivalent to an A32 encoding.
 - There is no T32 encoding without an equivalent A32 encoding, and no A32 encoding without an equivalent T32 encoding.

———— **Note** —————

- In the T32 instruction sets, the Advanced SIMD and floating-point instructions have 32-bit encodings.
- In the base instruction sets, some instructions are common to the T32 and A32 instruction sets, whereas other instructions have equivalent but not identical functionality in the two instruction sets.

32-bit T32 encodings are described as two contiguous halfwords, {hw1:hw2}, as described in [Instruction encodings on page F1-4344](#). In general:

- hw1 of a T32 encoding maps onto bits[31:16] of an equivalent A32 encoding.
- hw2 of a T32 encoding maps onto bits[15:0] of an equivalent A32 encoding.

However, the different structures of the T32 instruction encoding space and the A32 instruction encoding space mean that:

- For a given Advanced SIMD and floating-point instruction group:
 - The positions of the fields that identify the instruction, or instruction encoding, within the instruction group might differ between the T32 encodings and the A32 encodings.
 - However, the field values that identify the instruction or instruction encoding are identical for the T32 encoding and the A32 encoding.

The remainder of this section describes the equivalence of the T32 and A32 encodings for each of the Advanced SIMD and floating-point instruction groups.

Advanced SIMD data-processing

The T32 encoding of the Advanced SIMD data-processing group is:

The A32 encoding of the Advanced SIMD data-processing group is:

The encodings in this group are identified by:

- $hw1[15:13]$ of the T32 encoding is equivalent to bits[27:25] of the A32 encoding, and:
 - Has the value $0b111$ in the T32 encoding.
 - Has the value $0b001$ in the A32 encoding.
- $hw1[11:8]$ of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and has the value $0b111$.

This table shows the equivalence of the fields that identify the instructions, or instruction encodings, within this group:

T32 encoding	A32 encoding	Field size
op0:op1	op0	2 bits
op2	op1	15 bits
op3	op2	1 bit
op4	op3	1 bit

Advanced SIMD element or structure load/store

The T32 encoding of the Advanced SIMD element or structure load/store group is:

The A32 encoding of the Advanced SIMD element or structure load/store group is:

The encodings in this group are identified by:

- $hw1[15:12]$ of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and has the value $0b1111$.

- hw1[11:8] of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and:
 - Has the value 0b1001 in the T32 encoding.
 - Has the value 0b0100 in the A32 encoding.

- hw1[4] of the T32 encoding is equivalent to bit[20] of the A32 encoding, and has the value 0b0.

op0, op1, and op2 are the fields that identify the instructions, or instruction encodings, within this group, and they are in equivalent positions in the T32 and A32 encodings.

Advanced SIMD and floating-point load/store and 64-bit register moves

The T32 encoding of the Advanced SIMD and floating-point load/store and 64-bit register moves group is:

15	8	5 4	0 15	12 11	8	0
1110110	op0			101		

The A32 encoding of the Advanced SIMD and floating-point load/store and 64-bit register moves group is:

31	27	24	21 20	12 11	8	0
!=1111	110	op0		101		

The encodings in the group are identified by:

- hw1[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
 - Has the value 0b1110 in the T32 encoding.
 - Can have any value other than 0b1111 in the A32 encoding.
This range of values is required because A32 instructions in this group can be executed conditionally, see [Conditional execution on page F1-4349](#).
- hw1[11:9] of the T32 encoding is equivalent to bits[27:25] of the A32 encoding, and has the value 0b110.
- hw2[11:9] of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value 0b101.

op0 is the field that identifies the instructions, or instruction encodings, within this group, and is in equivalent positions in the T32 and A32 encodings.

Advanced SIMD and floating-point 32-bit register moves

The T32 encoding of the Advanced SIMD and floating-point 32-bit register moves group is:

15	7	5 4	0 15	12 11	8	7	5 4	0
11101110	op0			101			1	

op1

The A32 encoding of the Advanced SIMD 32-bit register moves group is:

31	27	23	21 20	12 11	8	7	5 4	0
!=1111	1110	op0		101			1	

op1

The encodings in this group are identified by:

- hw1[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
 - Has the value 0b1110 in the T32 encoding.
 - Can have any value other than 0b1111 in the A32 encoding.
 This range of values is required because A32 instructions in this group can be executed conditionally, see [Conditional execution on page F1-4349](#).
- hw1[11:8] of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and has the value 0b1110.
- hw2[11:9] of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value 0b101.
- hw2[4] of the T32 encoding is equivalent to bit[4] of the A32 encoding, and has the value 0b1.

op0 is the field that identifies the instructions, or instruction encodings, within this group, and is in equivalent positions in the T32 and A32 encodings.

Floating-point data-processing

The T32 encoding of the Floating-point data-processing group is:

The A32 encoding of the Floating-point data-processing group is:

The encodings in this group are identified by:

- hw1[15:12] of the T32 encoding is equivalent to bits[31:28] of the A32 encoding, and:
 - In the T32 encoding, hw1[15:13] has the value 0b1111, and hw1[12] is the op0 parameter used in identifying instruction encodings within this group.
 - In the A32 encoding, is the cond field and also implies the value of bit[28] of some A32 instruction encodings within this group, as the following table shows:

cond	Significance of bit[28] in A32 encodings
!= 0b1111	Part of the cond field.
0b1111	Has fixed value of 1.

The range of cond values other than 0b1111 is required because A32 instructions in this group can be executed conditionally, see [Conditional execution on page F1-4349](#).

- hw1[11:8] of the T32 encoding is equivalent to bits[27:24] of the A32 encoding, and has the value 0b1110.
- hw2[11:9] of the T32 encoding is equivalent to bits[11:9] of the A32 encoding, and has the value 0b101.
- hw2[4] of the T32 encoding is equivalent to bit[4] of the A32 encoding, and has the value 0b0.

This table shows the equivalence of the fields that identify the instructions, or instruction encodings, within this group:

T32 encoding	A32 encoding
op0	Bit[28] of the instruction encoding is 1 when cond is 0b1111.
op1	op0
op2	op1
op3	op2

F1.7.5 The PC and the use of 0b1111 as a register specifier in T32 and A32 instructions

Restrictions on the use of PC or 0b1111 as a register specifier differ between the T32 and the A32 instruction sets, as described in:

- [T32 restrictions on the use of the PC, and use of 0b1111 as a register specifier on page F1-4361.](#)
- [A32 restrictions on the use of PC or 0b1111 as a register specifier on page F1-4362.](#)

T32 restrictions on the use of the PC, and use of 0b1111 as a register specifier

The use of 0b1111 as a register specifier is not normally permitted in T32 instructions. When a value of 0b1111 is permitted, a variety of meanings is possible. For register reads, these meanings include:

- Read the PC value, that is, the address of the current instruction + 4. The base register of the table branch instructions TBB and TBH can be the PC. This means branch tables can be placed in memory immediately after the instruction.

———— **Note** —————

Arm deprecates use of the PC as the base register in the STC instruction.

- Read the word-aligned PC value, that is, the address of the current instruction + 4, with bits[1:0] forced to zero. The base register of LDC, LDR, LDRB, LDRD (pre-indexed, no writeback), LDRH, LDRSB, and LDRSH instructions can be the word-aligned PC. This provides PC-relative data addressing. In addition, some encodings of the ADD and SUB instructions permit their source registers to be 0b1111 for the same purpose.
- Read zero. This is done in some cases when one instruction is a special case of another, more general instruction, but with one operand zero. In these cases, the instructions are listed on separate pages, with a special case in the pseudocode for the more general instruction cross-referencing the other page.

For register writes, these meanings include:

- The PC can be specified as the destination register of an LDR instruction. This is done by encoding Rt as 0b1111. The loaded value is treated as an address, and the effect of execution is a branch to that address. Bit[0] of the loaded value selects whether to execute A32 or T32 instructions after the branch.
- Some other instructions write the PC in similar ways. An instruction can specify that the PC is written:
 - Implicitly, for example, branch instructions.
 - Explicitly by a register specifier of 0b1111, for example 16-bit MOV (register) instructions.
 - Explicitly by using a register mask, for example LDM instructions.

The address to branch to can be:

- A loaded value, for example, RFE.
- A register value, for example, BX.
- The result of a calculation, for example, TBB or TBH.

The method of choosing the instruction set used after the branch can be:

- Similar to the LDR case, for example, LDM or BX.
 - A fixed instruction set other than the one currently being used, for example, the immediate form of BLX.
 - Unchanged, for example, branch instructions or 16-bit MOV (register) instructions.
 - Set from the [SPSR.T](#) bit, for RFE and SUBS PC, LR, #imm8.
- Discard the result of a calculation. This is done in some cases when one instruction is a special case of another, more general instruction, but with the result discarded. In these cases, the instructions are listed on separate pages, with a special case in the pseudocode for the more general instruction cross-referencing the other page.
 - If the destination register specifier of an LDRB, LDRH, LDRSB, or LDRSH instruction is 0b1111, the instruction is a memory hint instead of a load operation.
 - If the destination register specifier of an MRC instruction is 0b1111, bits[31:28] of the value transferred from the System register are written to the N, Z, C, and V condition flags in the APSR, and bits[27:0] are discarded.

A32 restrictions on the use of PC or 0b1111 as a register specifier

In A32 instructions, the use of 0b1111 as a register specifier specifies the PC.

Many instructions are CONstrained UNpredictable if they use 0b1111 as a register specifier. This is specified by pseudocode in the instruction description. Armv8-A constrains the resulting CONstrained UNpredictable behavior, see [Using R15 by instruction on page K1-8387](#).

———— **Note** —————

Arm deprecates use of the PC as the base register in any store instruction.

F1.7.6 The SP and the use of 0b1101 as a register specifier in T32 and A32 instructions

In the T32 and A32 instruction sets, Arm recommends that the use of 0b1101 as a register specifier specifies the SP.

———— **Note** —————

- The recommendation that the register specifier 0b1101 is only used to specify the SP applies to both the T32 and the A32 instruction sets.
- Despite this recommendation, T32 instructions that can access R13, or the SP, behave predictably in Armv8. This differs from Armv7, where many uses of R13 are defined as UNpredictable. For more information about these cases, see the *ARM® Architecture Reference Manual, ARMv7-A and ARMv7-R edition*.

F1.7.7 Modified immediate constants in T32 and A32 instructions

The following sections describe the encoding of modified immediate constants:

- [Modified immediate constants in T32 instructions on page F1-4362](#).
- [Modified immediate constants in A32 instructions on page F1-4364](#).
- [Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F1-4365](#).
- [Modified immediate constants in T32 and A32 floating-point instructions on page F1-4366](#).

Modified immediate constants in T32 instructions

The encoding of a modified immediate constant in a 32-bit T32 instruction is:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
														i

Table F1-2 on page F1-4363 shows the range of modified immediate constants available in T32 data-processing instructions, and their encoding in the a, b, c, d, e, f, g, h, and i bits, and the imm3 field, in the instruction.

Table F1-2 Encoding of modified immediates in T32 data-processing instructions

i:imm3:a	<const> ^a
0000x	00000000 00000000 00000000 abcdefgh
0001x	00000000 abcdefgh 00000000 abcdefgh ^b
0010x	abcdefgh 00000000 abcdefgh 00000000 ^b
0011x	abcdefgh abcdefgh abcdefgh abcdefgh ^b
01000	1bcdefgh 00000000 00000000 00000000
01001	01bcdefg h0000000 00000000 00000000 ^c
01010	001bcdef gh000000 00000000 00000000
01011	0001bcde fgh00000 00000000 00000000 ^c
.	.
.	. 8-bit values shifted to other positions
.	.
11101	00000000 00000000 000001bc defgh000 ^c
11110	00000000 00000000 0000001b cdefgh00
11111	00000000 00000000 00000001 bcdefgh0 ^c

- a. This table shows the immediate constant value in binary form, to relate abcdefgh to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).
- b. Arm deprecates using a modified immediate with abcdefgh == 00000000, and these cases are CONstrained UNPREDICTABLE, see [UNPREDICTABLE cases in immediate constants in T32 data-processing instructions on page K1-8390](#).
- c. Not available in A32 instructions if h == 1.

———— **Note** —————

As the footnotes to Table F1-2 on page F1-4363 show, the range of values available in T32 modified immediate constants is slightly different from the range of values available in A32 instructions. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the A32 values.

Carry out

A logical instruction with i:imm3:a == '00xxx' does not affect the Carry flag. Otherwise, a logical flag-setting instruction sets the Carry flag to the value of bit[31] of the modified immediate constant.

Operation of modified immediate constants, T32 instructions

For a T32 data-processing instruction, the `T32ExpandImm()` pseudocode function returns the value of the 32-bit immediate constant, calling `T32ExpandImm_C()` to evaluate the constant.

Modified immediate constants in A32 instructions

The encoding of a modified immediate constant in an A32 instruction is:

Table F1-3 on page F1-4364 shows the range of modified immediate constants available in A32 data-processing instructions, and their encoding in the a, b, c, d, e, f, g, and h bits and the rotation field in the instruction.

Table F1-3 Encoding of modified immediates in A32 processing instructions

rotation	<const> ^a
0000	00000000 00000000 00000000 abcdefgh
0001	gh000000 00000000 00000000 00abcdef
0010	efgh0000 00000000 00000000 0000abcd
0011	cdefgh00 00000000 00000000 000000ab
0100	abcdefgh 00000000 00000000 00000000
.	.
.	. 8-bit values shifted to other even-numbered positions
.	.
1001	00000000 00abcdef gh000000 00000000
.	.
.	. 8-bit values shifted to other even-numbered positions
.	.
1110	00000000 00000000 0000abcd efgh0000
1111	00000000 00000000 000000ab cdefgh00

a. This table shows the immediate constant value in binary form, to relate abcdefgh to the encoding diagram. In assembly syntax, the immediate value is specified in the usual way (a decimal number by default).

Note

The range of values available in A32 modified immediate constants is slightly different from the range of values available in 32-bit T32 instructions. See *Modified immediate constants in T32 instructions on page F1-4362*.

Carry out

A logical instruction with the rotation field set to 0b0000 does not affect APSR.C. Otherwise, a logical flag-setting instruction sets APSR.C to the value of bit[31] of the modified immediate constant.

Constants with multiple encodings

Some constant values have multiple possible encodings. In this case, a UAL assembler must select the encoding with the lowest unsigned value of the rotation field. This is the encoding that appears first in Table F1-3 on page F1-4364. For example, the constant #3 must be encoded with (rotation, abcdefgh) = (0b0000, 0b00000011), not (0b0001, 0b00001100), (0b0010, 0b00110000), or (0b0011, 0b11000000).

In particular, this means that all constants in the range 0-255 are encoded with rotation == 0b0000, and permitted constants outside that range are encoded with rotation != 0b0000. A flag-setting logical instruction with a modified immediate constant therefore leaves APSR.C unchanged if the constant is in the range 0-255 and sets it to the most significant bit of the constant otherwise. This matches the behavior of T32 modified immediate constants for all constants that are permitted in both the A32 and T32 instruction sets.

An alternative syntax is available for a modified immediate constant that permits the programmer to specify the encoding directly. In this syntax, #<const> is instead written as #<byte>, #<rot>, where:

<byte> Is the numeric value of abcdefgh, in the range 0-255.

<rot> Is twice the numeric value of rotation, an even number in the range 0-30.

This syntax permits all A32 data-processing instructions with modified immediate constants to be disassembled to assembler syntax that assembles to the original instruction.

This syntax also makes it possible to write variants of some flag-setting logical instructions that have different effects on APSR.C to those obtained with the normal #<const> syntax. For example, ANDS R1, R2, #12, #2 has the same behavior as ANDS R1, R2, #3 except that it sets APSR.C to 0 instead of leaving it unchanged. Such variants of flag-setting logical instructions do not have equivalents in the T32 instruction set, and Arm deprecates their use.

Operation of modified immediate constants, A32 instructions

For an A32 data-processing instruction, the `A32ExpandImm()` pseudocode function returns the value of the 32-bit immediate constant, calling `A32ExpandImm_C()` to evaluate the constant.

Modified immediate constants in T32 and A32 Advanced SIMD instructions

Table F1-4 on page F1-4365 shows the modified immediate constants available with Advanced SIMD instructions, and how they are encoded.

Table F1-4 Modified immediate values for Advanced SIMD instructions

op	cmode	Constant ^a	<dt> ^b	Notes
-	000x	00000000 00000000 00000000 abcdefgh 00000000 00000000 00000000 abcdefgh	I32	c
	001x	00000000 00000000 abcdefgh 00000000 00000000 00000000 abcdefgh 00000000	I32	c, d
	010x	00000000 abcdefgh 00000000 00000000 00000000 abcdefgh 00000000 00000000	I32	c, d
	011x	abcdefgh 00000000 00000000 00000000 abcdefgh 00000000 00000000 00000000	I32	c, d
	100x	00000000 abcdefgh 00000000 abcdefgh 00000000 abcdefgh 00000000 abcdefgh	I16	c
	101x	abcdefgh 00000000 abcdefgh 00000000 abcdefgh 00000000 abcdefgh 00000000	I16	c, d
	1100	00000000 00000000 abcdefgh 11111111 00000000 00000000 abcdefgh 11111111	I32	d, e
	1101	00000000 abcdefgh 11111111 11111111 00000000 abcdefgh 11111111 11111111	I32	d, e
0	1110	abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh abcdefgh	I8	f
	1111	aBbbbbbc defgh000 00000000 00000000 aBbbbbbc defgh000 00000000 00000000	F32	f, g
1	1110	aaaaaaaa bbbbbbbb cccccccc dddddddd eeeeeeee ffffffff gggggggg hhhhhhhh	I64	f
	1111	UNDEFINED	-	-

a. In this table, the immediate value is shown in binary form, to relate abcdefgh to the encoding diagram. In assembler syntax, the constant is specified by a data type and a value of that type. That value is specified in the normal way (a decimal number by default) and is replicated enough times to fill the 64-bit immediate. For example, a data type of I32 and a value of 10 specify the 64-bit constant 0x0000000A0000000A.

- b. This specifies the data type used when the instruction is disassembled. On assembly, the data type must be matched in the table if possible. Other data types are permitted as pseudo-instructions when a program is assembled, provided the 64-bit constant specified by the data type and value is available for the instruction. If a constant is available in more than one way, the first entry in this table that can produce it is used. For example, `VMOV.I64 D0, #0x8000000080000000` does not specify a 64-bit constant that is available from the I64 line of the table, but does specify one that is available from the fourth I32 line or the F32 line. It is assembled to the first of these, and therefore is disassembled as `VMOV.I32 D0, #0x80000000`.
- c. This constant is available for the VBIC, VMOV, VMVN, and VORR instructions.
- d. CONSTRAINED UNPREDICTABLE if `abcd efgh == 0b00000000`, see [UNPREDICTABLE cases in immediate constants in Advanced SIMD instructions on page K1-8390](#). The required behavior is that these encodings produce an immediate constant of zero.
- e. This constant is available for the VMOV and VMVN instructions only.
- f. This constant is available for the VMOV instruction only.
- g. In this entry, $B = \text{NOT}(b)$. The bit pattern represents the floating-point number $(-1)^S \times 2^{\text{exp}} \times \text{mantissa}$, where $S = \text{UInt}(a)$, $\text{exp} = \text{UInt}(\text{NOT}(b):c:d)-3$ and $\text{mantissa} = (16+\text{UInt}(e:f:g:h))/16$.

Operation of modified immediate constants, Advanced SIMD instructions

For a T32 or A32 Advanced SIMD instruction that uses a modified immediate constant, the operation described by the `AdvSIMDExpandImm()` pseudocode function returns the value of the 64-bit immediate constant.

Modified immediate constants in T32 and A32 floating-point instructions

[Table F1-5 on page F1-4366](#) shows the immediate constants available in the VMOV (immediate) floating-point instruction, and [Table F1-6 on page F1-4366](#) shows the resulting floating-point values.

Table F1-5 Floating-point modified immediate constants

Data type	imm4H	imm4L	Constant ^a
F16	abcd	efgh	aBbb cdef gh000000
F32	abcd	efgh	aBbbbbbc defgh000 00000000 00000000
F64	abcd	efgh	aBbbbbbb bbcdefgh 00000000 00000000 00000000 00000000 00000000 00000000

a. In this column, $B = \text{NOT}(b)$. The bit pattern represents the floating-point number $(-1)^S \times 2^{\text{exp}} \times \text{mantissa}$, where $S = \text{UInt}(a)$, $\text{exp} = \text{UInt}(\text{NOT}(b):c:d)-3$ and $\text{mantissa} = (16+\text{UInt}(e:f:g:h))/16$.

Table F1-6 Floating-point constant values

Operation of modified immediate constants, floating-point instructions

For a T32 or A32 floating-point instruction that uses a modified immediate constant, the operation described by the [VFPEExpandImm\(\)](#) pseudocode function returns the value of the immediate constant.

F1.8 Additional pseudocode support for instruction descriptions

Earlier sections of this chapter include pseudocode that describes features of the execution of A32 and T32 instructions, see:

- [Pseudocode description of conditional execution on page F1-4350.](#)
- [Pseudocode description of instruction-specified shifts and rotates on page F1-4352](#)

The following subsection gives additional pseudocode support functions for some of the instructions described in [Alphabetical list of T32 and A32 base instruction set instructions on page F5-4564](#). See also [Pseudocode support for the banked register transfer instructions on page F5-5285](#).

F1.8.1 Pseudocode description of operations for System register access instructions

The `AArch32.SysRegRead()` function obtains the word for an MRC instruction from the System register.

The `AArch32.SysRegRead64()` function obtains the two words for an MRRC instruction from the System register.

———— **Note** —————

The relative significance of the two words returned is IMPLEMENTATION DEFINED, but all uses within this manual present the two words in the order (most significant, least significant).

The `AArch32.SysRegWrite()` procedure sends the word for an MCR instruction to the System register.

The `AArch32.SysRegWrite64()` procedure sends the two words for an MCRR instruction to the System register.

———— **Note** —————

The relative significance of word2 and word1 is IMPLEMENTATION DEFINED, but all uses within this manual treat word2 as more significant than word1.

F1.8.2 Pseudocode details of system calls

The `AArch32.CallSupervisor()` pseudocode function generates a Supervisor Call exception. Valid execution of the SVC instruction calls this function.

The `AArch32.CallHypervisor()` pseudocode function generates an HVC exception. Valid execution of the HVC instruction calls this function.

F1.9 Additional information about Advanced SIMD and floating-point instructions

The following subsections give additional information about the Advanced SIMD and floating-point instructions:

- [Advanced SIMD and floating-point instruction syntax on page F1-4369.](#)
- [The Advanced SIMD addressing mode on page F1-4369.](#)
- [Advanced SIMD instruction modifiers on page F1-4370.](#)
- [Advanced SIMD operand shapes on page F1-4370.](#)
- [Data type specifiers on page F1-4371.](#)
- [Register specifiers on page F1-4372.](#)
- [Register lists on page F1-4373.](#)
- [Register encoding on page F1-4373.](#)
- [Advanced SIMD scalars on page F1-4374.](#)

———— Note ————

The Advanced SIMD architecture, its associated implementations, and supporting software, are commonly referred to as NEON™ technology.

F1.9.1 Advanced SIMD and floating-point instruction syntax

Advanced SIMD and floating-point instructions use the general conventions of the T32 and A32 instruction sets.

Advanced SIMD and floating-point data-processing instructions use the following general format:

$V\{\langle\text{modifier}\rangle\}\langle\text{operation}\rangle\{\langle\text{shape}\rangle\}\{\langle\text{c}\rangle\}\{\langle\text{q}\rangle\}\{.\langle\text{dt}\rangle\} \{\langle\text{dest}\rangle,\} \langle\text{src1}\rangle, \langle\text{src2}\rangle$

All Advanced SIMD and floating-point instructions begin with a V. This distinguishes Advanced SIMD vector and floating-point instructions from scalar instructions.

The main operation is specified in the $\langle\text{operation}\rangle$ field. It is usually a three letter mnemonic the same as or similar to the corresponding scalar integer instruction.

The $\langle\text{c}\rangle$ and $\langle\text{q}\rangle$ fields are standard assembler syntax fields. For details, see [Standard assembler syntax fields on page F1-4348.](#)

F1.9.2 The Advanced SIMD addressing mode

All the element and structure load/store instructions use this addressing mode. There is a choice of three formats:

$[\langle\text{Rn}\rangle\{:\langle\text{align}\rangle\}]$ The address is contained in general-purpose register Rn.

Rn is not updated by this instruction.

Encoded as Rm = 0b1111.

If Rn is encoded as 0b1111, the instruction is CONSTRAINED UNPREDICTABLE.

$[\langle\text{Rn}\rangle\{:\langle\text{align}\rangle\}]!$ The address is contained in general-purpose register Rn.

Rn is updated by this instruction: $Rn = Rn + \text{transfer_size}$

Encoded as Rm = 0b1101.

transfer_size is the number of bytes transferred by the instruction. This means that, after the instruction is executed, Rn points to the address in memory immediately following the last address loaded from or stored to.

If Rn is encoded as 0b1111, the instruction is CONSTRAINED UNPREDICTABLE.

This addressing mode can also be written as:

$[\langle\text{Rn}\rangle\{:\langle\text{align}\rangle\}], \#\langle\text{transfer_size}\rangle$

However, disassembly produces the $[\langle\text{Rn}\rangle\{:\langle\text{align}\rangle\}]!$ form.

[<Rn>{:<align>}], <Rm>

The address is contained in general-purpose register <Rn>.

Rn is updated by this instruction: $Rn = Rn + Rm$

Encoded as $Rm = Rm$. Rm must not be encoded as 0b1111 or 0b1101, the PC or the SP.

If Rn is encoded as 0b1111, the instruction is CONSTRAINED UNPREDICTABLE.

The CONSTRAINED UNPREDICTABLE behavior of encodings where Rn is 0b1111 is described in the section: [Using R15 by instruction on page K1-8387](#).

In all cases, <align> specifies an alignment, as specified by the individual instruction descriptions.

Previous versions of the manual used the @ character for alignment. So, for example, the first format in this section was shown as [<Rn>{@<align>}]. Both @ and : are supported. However, to ensure portability of code to assemblers that treat @ as a comment character, : is preferred.

F1.9.3 Advanced SIMD instruction modifiers

The <modifier> field provides additional variants of some instructions. [Table F1-7 on page F1-4370](#) provides definitions of the modifiers. Modifiers are not available for every instruction.

Table F1-7 Advanced SIMD instruction modifiers

<modifier>	Meaning
Q	The operation uses saturating arithmetic.
R	The operation performs rounding.
D	The operation doubles the result (before accumulation, if any).
H	The operation halves the result.

F1.9.4 Advanced SIMD operand shapes

The <shape> field provides additional variants of some instructions. [Table F1-8 on page F1-4370](#) provides definitions of the shapes. Operand shapes are not available for every instruction.

Table F1-8 Advanced SIMD operand shapes

<shape>	Meaning	Typical register shape
(none)	The operands and result are all the same width.	Dd, Dn, Dm Qd, Qn, Qm
L	Long operation - result is twice the width of both operands	Qd, Dn, Dm
N	Narrow operation - result is half the width of both operands	Dd, Qn, Qm
W	Wide operation - result and first operand are twice the width of the second operand	Qd, Qn, Dm

———— **Note** —————

- Some assemblers support a Q shape specifier, that requires all operands to be Q registers. An example of using this specifier is VADDQ.S32 q0, q1, q2. This is not standard UAL, and Arm recommends that programmers do not use a Q shape specifier.
- A disassembler must not generate any shape specifier not shown in [Table F1-8 on page F1-4370](#).

F1.9.5 Data type specifiers

The <dt> field normally contains one data type specifier. Unless the assembler syntax description for the instruction indicates otherwise, this indicates the data type contained in:

- The second operand, if any.
- The operand, if there is no second operand.
- The result, if there are no operand registers.

The data types of the other operand and result are implied by the <dt> field combined with the instruction shape. For information about data type formats, see [Data types supported by the Advanced SIMD implementation on page E1-4262](#).

In the instruction syntax descriptions in [Chapter F1 About the T32 and A32 Instruction Descriptions](#), the <dt> field is usually specified as a single field. However, where more convenient, it is sometimes specified as a concatenation of two fields, <type><size>.

Syntax flexibility

There is some flexibility in the data type specifier syntax:

- Software can specify three data types, specifying the result and both operand data types. For example:
 VSUBW.I16.I16.S8 Q3, Q5, D0 instead of VSUBW.S8 Q3, Q5, D0
- Software can specify two data types, specifying the data types of the two operands. The data type of the result is implied by the instruction shape. For example:
 VSUBW.I16.S8 Q3, Q5, D0 instead of VSUBW.S8 Q3, Q5, D0
- Software can specify two data types, specifying the data types of the single operand and the result. For example:
 VMOVN.I16.I32 D0, Q1 instead of VMOVN.I32 D0, Q1
- Where an instruction requires a less specific data type, software can instead specify a more specific type, as shown in [Table F1-9 on page F1-4371](#).
- Where an instruction does not require a data type, software can provide one.
- The F32 data type can be abbreviated to F.
- The F64 data type can be abbreviated to D.

In all cases, if software provides additional information, the additional information must match the instruction shape. Disassembly does not regenerate this additional information.

Table F1-9 Data type specification flexibility

Specified data type	Permitted more specific data types				
None	Any				
.I<size>	-	.S<size>	.U<size>	-	-
.8	.I8	.S8	.U8	.P8	-
.16	.I16	.S16	.U16	.P16	.F16
.32	.I32	.S32	.U32	-	.F32 or .F
.64	.I64	.S64	.U64	-	.F64 or .D

F1.9.6 Register specifiers

The <dest>, <src1>, and <src2> fields contain register specifiers, or in some cases scalar specifiers or register lists. [Table F1-10 on page F1-4372](#) shows the register and scalar specifier formats that appear in the instruction descriptions.

If <dest> is omitted, it is the same as <src1>.

Table F1-10 Advanced SIMD and floating-point register specifier formats

<specifier>	Usual meaning ^a	Used in
<Qd>	A quadword destination register for the result vector.	Advanced SIMD
<Qn>	A quadword source register for the first operand vector.	Advanced SIMD
<Qm>	A quadword source register for the second operand vector.	Advanced SIMD
<Dd>	A doubleword destination register for the result vector.	Both
<Dn>	A doubleword source register for the first operand vector.	Both
<Dm>	A doubleword source register for the second operand vector.	Both
<Sd>	A singleword destination register for the result vector.	Floating-point
<Sn>	A singleword source register for the first operand vector.	Floating-point
<Sm>	A singleword source register for the second operand vector.	Floating-point
<Dd[x]>	A destination scalar for the result. Element x of vector <Dd>.	Advanced SIMD
<Dn[x]>	A source scalar for the first operand. Element x of vector <Dn>.	Both ^b
<Dm[x]>	A source scalar for the second operand. Element x of vector <Dm>.	Advanced SIMD
<Rt>	A general-purpose register, used for a source or destination address.	Both
<Rt2>	A general-purpose register, used for a source or destination address.	Both
<Rn>	A general-purpose register, used as a load or store base address.	Both
<Rm>	A general-purpose register, used as a post-indexed address source.	Both

a. In some instructions the roles of registers are different.

b. In the floating-point instructions, <Dn[x]> is used only in *VMOV* (scalar to general-purpose register), see *VMOV (scalar to general-purpose register)* on page F6-5673.

F1.9.7 Register lists

A register list is a list of register specifiers separated by commas and enclosed in brackets { and }. There are restrictions on what registers can appear in a register list. These restrictions are described in the individual instruction descriptions. Table F1-11 on page F1-4373 shows some register list formats, with examples of actual register lists corresponding to those formats.

———— **Note** —————

Register lists must not wrap around the end of the register bank.

Syntax flexibility

There is some flexibility in the register list syntax:

- Where a register list contains consecutive registers, they can be specified as a range, instead of listing every register, for example {D0-D3} instead of {D0, D1, D2, D3}.
- Where a register list contains an even number of consecutive doubleword registers starting with an even-numbered register, it can be written as a list of quadword registers instead, for example {Q1, Q2} instead of {D2-D5}.
- Where a register list contains only one register, the enclosing braces can be omitted, for example VLD1.8 D0, [R0] instead of VLD1.8 {D0}, [R0].

Table F1-11 Example register lists

Format	Example	Alternative
{<Dd>}	{D3}	D3
{<Dd>, <Dd+1>, <Dd+2>}	{D3, D4, D5}	{D3-D5}
{<Dd[x]>, <Dd+2[x]>}	{D0[3], D2[3]}	-
{<Dd[]>}	{D7[]}	D7[]

F1.9.8 Register encoding

An Advanced SIMD register is either:

- *Quadword*, meaning it is 128 bits wide.
- *Doubleword*, meaning it is 64 bits wide.

Some instructions have options for either doubleword or quadword registers. This is normally encoded in Q, bit[6], as Q = 0 for doubleword operations, or Q = 1 for quadword operations.

A floating-point register is either:

- *Double-precision*, meaning it is 64 bits wide.
- *Single-precision*, meaning it is 32 bits wide.

This is encoded in the sz field, bit[8], as sz = 1 for double-precision operations, or sz = 0 for single-precision operations.

The T32 instruction encoding of Advanced SIMD or floating-point registers is:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
										D	Vn					Vd					sz	N	Q	M	Vm						

The A32 instruction encoding of Advanced SIMD or floating-point registers is:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
										D	Vn					Vd					sz	N	Q	M	Vm						

Some instructions use only one or two registers, and use the unused register fields as additional opcode bits.

Table F1-12 on page F1-4374 shows the encodings for the registers.

Table F1-12 Encoding of register numbers

Register mnemonic	Usual usage	Register number encoded in ^a	Notes ^a	Used in
<Qd>	Destination (quadword)	D, Vd (bits[22, 15:13])	bit[12] == 0 ^b	Advanced SIMD
<Qn>	First operand (quadword)	N, Vn (bits[7, 19:17])	bit[16] == 0 ^b	Advanced SIMD
<Qm>	Second operand (quadword)	M, Vm (bits[5, 3:1])	bit[0] == 0 ^b	Advanced SIMD
<Dd>	Destination (doubleword)	D, Vd (bits[22, 15:12])	-	Both
<Dn>	First operand (doubleword)	N, Vn (bits[7, 19:16])	-	Both
<Dm>	Second operand (doubleword)	M, Vm (bits[5, 3:0])	-	Both
<Sd>	Destination (single-precision)	Vd, D (bits[15:12, 22])	-	Floating-point
<Sn>	First operand (single-precision)	Vn, N (bits[19:16, 7])	-	Floating-point
<Sm>	Second operand (single-precision)	Vm, M (bits[3:0, 5])	-	Floating-point

- a. Bit numbers given for the A32 instruction encoding. See the figures in this section for the equivalent bits in the T32 encoding.
 b. If this bit is 1, the instruction is UNDEFINED.

F1.9.9 Advanced SIMD scalars

Advanced SIMD scalars can be 8-bit, 16-bit, 32-bit, or 64-bit. Instructions other than multiply instructions can access any element in the register set. The instruction syntax refers to the scalars using an index into a doubleword vector. The descriptions of the individual instructions contain details of the encodings.

Table F1-13 on page F1-4374 shows the form of encoding for scalars used in multiply instructions. These instructions cannot access scalars in some registers. The descriptions of the individual instructions contain cross references to this section where appropriate.

32-bit Advanced SIMD scalars, when used as single-precision floating-point numbers, are equivalent to Floating-point single-precision registers. That is, Dm[x] in a 32-bit context (0 ≤ m ≤ 15, 0 ≤ x ≤ 1) is equivalent to S[2m + x].

Table F1-13 Encoding of scalars in multiply instructions

Scalar mnemonic	Usual usage	Scalar size	Register specifier	Index specifier	Accessible registers
<Dm[x]>	Second operand	16-bit	Vm[2:0]	M, Vm[3]	D0-D7
		32-bit	Vm[3:0]	M	D0-D15

Chapter F2

The AArch32 Instruction Sets Overview

This chapter describes the T32 and A32 instruction sets. It contains the following sections:

- *Support for instructions in different versions of the Arm architecture* on page F2-4376.
- *Unified Assembler Language* on page F2-4377.
- *Branch instructions* on page F2-4379.
- *Data-processing instructions* on page F2-4380.
- *PSTATE and banked register access instructions* on page F2-4388.
- *Load/store instructions* on page F2-4389.
- *Load/store multiple instructions* on page F2-4392.
- *Miscellaneous instructions* on page F2-4393.
- *Exception-generating and exception-handling instructions* on page F2-4395.
- *System register access instructions* on page F2-4397.
- *Advanced SIMD and floating-point load/store instructions* on page F2-4398.
- *Advanced SIMD and floating-point register transfer instructions* on page F2-4400.
- *Advanced SIMD data-processing instructions* on page F2-4401.
- *Floating-point data-processing instructions* on page F2-4412.

F2.1 Support for instructions in different versions of the Arm architecture

This manual describes the T32 and A32 instruction sets for the Armv8 architecture. Therefore, it indicates how any options or extensions in the Armv8 architecture affect the available instructions.

F2.2 Unified Assembler Language

This manual uses the Arm *Unified Assembler Language* (UAL). This assembly language syntax provides a canonical form for all T32 and A32 instructions.

UAL describes the syntax for the mnemonic and the operands of each instruction. In addition, it assumes that instructions and data items can be given labels. It does not specify the syntax to be used for labels, nor what assembler directives and options are available. See your assembler documentation for these details.

Most earlier Arm assembly language mnemonics are still supported as synonyms, as described in the instruction details.

———— **Note** ————

Most earlier T32 assembly language mnemonics are *not* supported.

UAL includes *instruction selection* rules that specify which instruction encoding is selected when more than one can provide the required functionality. For example, both 16-bit and 32-bit encodings exist for an `ADD R0, R1, R2` instruction. The most common instruction selection rule is that when both a 16-bit encoding and a 32-bit encoding are available, the 16-bit encoding is selected, to optimize code density.

Syntax options exist to override the normal instruction selection rules and ensure that a particular encoding is selected. These are useful when disassembling code, to ensure that subsequent assembly produces the original code, and in some other situations.

F2.2.1 Conditional instructions

For maximum portability of UAL assembly language between the T32 and A32 instruction sets, Arm recommends that:

- IT instructions are written before conditional instructions in the correct way for the T32 instruction set.
- When assembling to the A32 instruction set, assemblers check that any IT instructions are correct, but do not generate any code for them.

Although other T32 instructions are unconditional, all instructions that are made conditional by an IT instruction must be written with a condition. These conditions must match the conditions imposed by the IT instruction. For example, an `ITTEE EQ` instruction imposes the EQ condition on the first two following instructions, and the NE condition on the next two. Those four instructions must be written with EQ, EQ, NE and NE conditions respectively.

Some instructions cannot be made conditional by an IT instruction. Some instructions can be conditional if they are the last instruction in the IT block, but not otherwise.

The branch instruction encodings that include a Condition code field cannot be made conditional by an IT instruction. If the assembler syntax indicates a conditional branch that correctly matches a preceding IT instruction, it is assembled using a branch instruction encoding that does not include a Condition code field.

F2.2.2 Use of labels in UAL instruction syntax

The UAL syntax for some instructions includes the label of an instruction or a literal data item that is at a fixed offset from the instruction being specified. The assembler must:

1. Calculate the `PC` or `Align(PC, 4)` value of the instruction. The `PC` value of an instruction is its address plus 4 for a T32 instruction, or plus 8 for an A32 instruction. The `Align(PC, 4)` value of an instruction is its `PC` value ANDed with `0xFFFFF0` to force it to be word-aligned. There is no difference between the `PC` and `Align(PC, 4)` values for an A32 instruction, but there can be for a T32 instruction.
2. Calculate the offset from the `PC` or `Align(PC, 4)` value of the instruction to the address of the labeled instruction or literal data item.
3. Assemble a *PC-relative* encoding of the instruction, that is, one that reads its `PC` or `Align(PC, 4)` value and adds the calculated offset to form the required address.

Note

For instructions that can encode a subtraction operation, if the instruction cannot encode the calculated offset but can encode minus the calculated offset, the instruction encoding specifies a subtraction of minus the calculated offset.

The syntax of the following instructions includes a label:

- B, BL, and BLX (immediate). The assembler syntax for these instructions always specifies the label of the instruction that they branch to. Their encodings specify a sign-extended immediate offset that is added to the PC value of the instruction to form the target address of the branch.
- CBZ and CBZ. The assembler syntax for these instructions always specifies the label of the instruction that they branch to. Their encodings specify a zero-extended immediate offset that is added to the PC value of the instruction to form the target address of the branch. They do not support backward branches.
- LDR, LDRB, LDRD, LDRH, LDRSB, LDRSH, PLD, PLDW, PLI, and VLDR. The normal assembler syntax of these load instructions can specify the label of a literal data item that is to be loaded. The encodings of these instructions specify a zero-extended immediate offset that is either added to or subtracted from the `Align(PC, 4)` value of the instruction to form the address of the data item. A few such encodings perform a fixed addition or a fixed subtraction and must only be used when that operation is required, but most contain a bit that specifies whether the offset is to be added or subtracted.

When the assembler calculates an offset of 0 for the normal syntax of these instructions, it must assemble an encoding that adds 0 to the `Align(PC, 4)` value of the instruction. Encodings that subtract 0 from the `Align(PC, 4)` value cannot be specified by the normal syntax.

There is an alternative syntax for these instructions that specifies the addition or subtraction and the immediate offset explicitly. In this syntax, the label is replaced by `[PC, #+/-<imm>]`, where:

+/- Is + or omitted to specify that the immediate offset is to be added to the `Align(PC, 4)` value, or - if it is to be subtracted.

<imm> Is the immediate offset.

This alternative syntax makes it possible to assemble the encodings that subtract 0 from the `Align(PC, 4)` value, and to disassemble them to a syntax that can be re-assembled correctly.

- ADR. The normal assembler syntax for this instruction can specify the label of an instruction or literal data item whose address is to be calculated. Its encoding specifies a zero-extended immediate offset that is either added to or subtracted from the `Align(PC, 4)` value of the instruction to form the address of the data item, and some opcode bits that determine whether it is an addition or subtraction.

When the assembler calculates an offset of 0 for the normal syntax of this instruction, it must assemble the encoding that adds 0 to the `Align(PC, 4)` value of the instruction. The encoding that subtracts 0 from the `Align(PC, 4)` value cannot be specified by the normal syntax.

There is an alternative syntax for this instruction that specifies the addition or subtraction and the immediate value explicitly, by writing them as additions `ADD <Rd>, PC, #<imm>` or subtractions `SUB <Rd>, PC, #<imm>`. This alternative syntax makes it possible to assemble the encoding that subtracts 0 from the `Align(PC, 4)` value, and to disassemble it to a syntax that can be re-assembled correctly.

Note

Arm recommends that where possible, software avoids using:

- The alternative syntax for the ADR, LDC, LDR, LDRB, LDRD, LDRH, LDRSB, LDRSH, PLD, PLI, PLDW, and VLDR instructions.
 - The encodings of these instructions that subtract 0 from the `Align(PC, 4)` value.
-

F2.3 Branch instructions

Table F2-1 on page F2-4379 summarizes the branch instructions in the T32 and A32 instruction sets. In addition to providing for changes in the flow of execution, some branch instructions can change instruction set.

Table F2-1 Branch instructions

Instruction	See	Range, T32	Range, A32
Branch to target address	<i>B</i> on page F5-4613	±16MB	±32MB
Compare and Branch on Nonzero Compare and Branch on Zero	<i>CBNZ</i> , <i>CBZ</i> on page F5-4639	0-126 bytes	.. ^a
Call a subroutine	<i>BL</i> , <i>BLX (immediate)</i> on page F5-4631	±16MB	±32MB
Call a subroutine, change instruction set ^b		±16MB	±32MB
Call a subroutine, optionally change instruction set	<i>BLX (register)</i> on page F5-4634	Any	Any
Branch to target address, change instruction set	<i>BX</i> on page F5-4636	Any	Any
Change to Jazelle state	<i>BXJ</i> on page F5-4638	-	-
Table Branch (byte offsets)	<i>TBB</i> , <i>TBH</i> on page F5-5191	0-510 bytes	.. ^a
Table Branch (halfword offsets)		0-131070 bytes	

a. These instructions do not exist in the A32 instruction set.

b. The range is determined by the instruction set of the *BLX* instruction, not of the instruction it branches to.

Branches to loaded and calculated addresses can be performed by *LDR*, *LDM* and data-processing instructions. For details, see *Load/store instructions* on page F2-4389, *Load/store multiple instructions* on page F2-4392, *Standard data-processing instructions* on page F2-4380, and *Shift instructions* on page F2-4382.

In addition to the branch instructions shown in Table F2-1 on page F2-4379:

- In the A32 instruction set, a data-processing instruction that targets the PC behaves as a branch instruction. For more information, see *Data-processing instructions* on page F2-4380.
- In the T32 and A32 instruction sets, a load instruction that targets the PC behaves as a branch instruction. For more information, see *Load/store instructions* on page F2-4389.

F2.4 Data-processing instructions

Core data-processing instructions belong to one of the following groups:

- [Standard data-processing instructions](#) on page F2-4380.
- [Shift instructions](#) on page F2-4382.
- [Multiply instructions](#) on page F2-4382.
- [Saturating instructions](#) on page F2-4384.
- [Saturating addition and subtraction instructions](#) on page F2-4384.
- [Packing and unpacking instructions](#) on page F2-4385.
- [Parallel addition and subtraction instructions](#) on page F2-4386.
- [Divide instructions](#) on page F2-4387.
- [Miscellaneous data-processing instructions](#) on page F2-4387.

For related Advanced SIMD and floating-point instructions see [Advanced SIMD data-processing instructions](#) on page F2-4401 and [Floating-point data-processing instructions](#) on page F2-4412.

F2.4.1 Standard data-processing instructions

These instructions perform basic data-processing operations, and share a common format with some variations.

These instructions generally have a destination register Rd, a first operand register Rn, and a second operand. The second operand can be another register Rm, or an immediate constant.

If the second operand is an immediate constant, it can be:

- Encoded directly in the instruction.
- A *modified immediate constant* that uses 12 bits of the instruction to encode a range of constants. T32 and A32 instructions have slightly different ranges of modified immediate constants. For more information, see [Modified immediate constants in T32 instructions](#) on page F1-4362 and [Modified immediate constants in A32 instructions](#) on page F1-4364.

If the second operand is another register, it can optionally be shifted in any of the following ways:

LSL	Logical Shift Left by 1-31 bits.
LSR	Logical Shift Right by 1-32 bits.
ASR	Arithmetic Shift Right by 1-32 bits.
ROR	Rotate Right by 1-31 bits.
RRX	Rotate Right with Extend. For details, see Shift and rotate operations on page E1-4250.

In T32 code, the amount to shift by is always a constant encoded in the instruction. In A32 code, the amount to shift by is either a constant encoded in the instruction, or the value of a register, Rs.

For instructions other than CMN, CMP, TEQ, and TST, the result of the data-processing operation is placed in the destination register. In the A32 instruction set, the destination register can be the PC, causing the result to be treated as a branch address. In the T32 instruction set, this is only permitted for some 16-bit forms of the ADD and MOV instructions.

These instructions can optionally set the Condition flags, according to the result of the operation. If they do not set the flags, existing flag settings from a previous instruction are preserved.

[Table F2-2 on page F2-4381](#) summarizes the main data-processing instructions in the T32 and A32 instruction sets. Generally, each of these instructions is described in three sections in [Chapter F1 About the T32 and A32 Instruction Descriptions](#), one section for each of the following:

- INSTRUCTION (immediate) where the second operand is a modified immediate constant.
- INSTRUCTION (register) where the second operand is a register, or a register shifted by a constant.
- INSTRUCTION (register-shifted register) where the second operand is a register shifted by a value obtained from another register. These are only available in the A32 instruction set.

Table F2-2 Standard data-processing instructions

Instruction	Mnemonic	Notes
Add with Carry	ADC	-
Add	ADD	T32 instruction set permits use of a modified immediate constant or a zero-extended 12-bit immediate constant.
Form PC-relative Address	ADR	First operand is the PC. Second operand is an immediate constant. T32 instruction set uses a zero-extended 12-bit immediate constant. Operation is an addition or a subtraction.
Bitwise AND	AND	-
Bitwise Bit Clear	BIC	-
Compare Negative	CMN	Sets flags. Like ADD but with no destination register.
Compare	CMP	Sets flags. Like SUB but with no destination register.
Bitwise Exclusive OR	EOR	-
Copy operand to destination	MOV	Has only one operand, with the same options as the second operand in most of these instructions. If the operand is a shifted register, the instruction is an LSL, LSR, ASR, or ROR instruction instead. For details, see Shift instructions on page F2-4382 . The T32 and A32 instruction sets permit use of a modified immediate constant or a zero-extended 16-bit immediate constant.
Bitwise NOT	MVN	Has only one operand, with the same options as the second operand in most of these instructions.
Bitwise OR NOT	ORN	Not available in the A32 instruction set.
Bitwise OR	ORR	-
Reverse Subtract	RSB	Subtracts first operand from second operand. This permits subtraction from constants and shifted registers.
Reverse Subtract with Carry	RSC	Not available in the T32 instruction set.
Subtract with Carry	SBC	-
Subtract	SUB	T32 instruction set permits use of a modified immediate constant or a zero-extended 12-bit immediate constant.
Test Equivalence	TEQ	Sets flags. Like EOR but with no destination register.
Test	TST	Sets flags. Like AND but with no destination register.

F2.4.2 Shift instructions

Table F2-3 on page F2-4382 lists the shift instructions in the T32 and A32 instruction sets.

Instruction	See
Arithmetic Shift Right	<i>ASR (immediate)</i> on page F5-4605 <i>ASR (register)</i> on page F5-4607 <i>ASRS (immediate)</i> on page F5-4609 <i>ASRS (register)</i> on page F5-4611
Logical Shift Left	<i>LSL (immediate)</i> on page F5-4813 <i>LSL (register)</i> on page F5-4815 <i>LSLS (immediate)</i> on page F5-4817 <i>LSLS (register)</i> on page F5-4819
Logical Shift Right	<i>LSR (immediate)</i> on page F5-4821 <i>LSR (register)</i> on page F5-4823 <i>LSRS (immediate)</i> on page F5-4825 <i>LSRS (register)</i> on page F5-4827
Rotate Right	<i>ROR (immediate)</i> on page F5-4955 <i>ROR (register)</i> on page F5-4957 <i>RORS (immediate)</i> on page F5-4959 <i>RORS (register)</i> on page F5-4961
Rotate Right with Extend	<i>RRX</i> on page F5-4963 <i>RRXS</i> on page F5-4965

In the A32 instruction set only, the destination register of these instructions can be the PC, causing the result to be treated as an address to branch to.

F2.4.3 Multiply instructions

These instructions can operate on signed or unsigned quantities. In some types of operation, the results are the same whether the operands are signed or unsigned.

- [Table F2-4 on page F2-4382](#) summarizes the multiply instructions where there is no distinction between signed and unsigned quantities.
 The least significant 32 bits of the result are used. More significant bits are discarded.
- [Table F2-5 on page F2-4383](#) summarizes the signed multiply instructions.
- [Table F2-6 on page F2-4383](#) summarizes the unsigned multiply instructions.

Instruction	See	Operation (number of bits)
Multiply Accumulate	<i>MLA, MLAS</i> on page F5-4833	$32 = 32 + 32 \times 32$
Multiply and Subtract	<i>MLS</i> on page F5-4835	$32 = 32 - 32 \times 32$
Multiply	<i>MUL, MULS</i> on page F5-4871	$32 = 32 \times 32$

Table F2-5 Signed multiply instructions

Instruction	See	Operation (number of bits)
Signed Multiply Accumulate (halfwords)	<i>SMLABB, SMLABT, SMLATB, SMLATT</i> on page F5-5024	$32 = 32 + 16 \times 16$
Signed Multiply Accumulate Dual	<i>SMLAD, SMLADX</i> on page F5-5026	$32 = 32 + 16 \times 16 + 16 \times 16$
Signed Multiply Accumulate Long	<i>SMLAL, SMLALS</i> on page F5-5028	$64 = 64 + 32 \times 32$
Signed Multiply Accumulate Long (halfwords)	<i>SMLALBB, SMLALBT, SMLALTB, SMLALTT</i> on page F5-5030	$64 = 64 + 16 \times 16$
Signed Multiply Accumulate Long Dual	<i>SMLALD, SMLALDX</i> on page F5-5033	$64 = 64 + 16 \times 16 + 16 \times 16$
Signed Multiply Accumulate (word by halfword)	<i>SMLAWB, SMLAWT</i> on page F5-5036	$32 = 32 + 32 \times 16^a$
Signed Multiply Subtract Dual	<i>SMLSDB, SMLSDBX</i> on page F5-5038	$32 = 32 + 16 \times 16 - 16 \times 16$
Signed Multiply Subtract Long Dual	<i>SMLSDB, SMLSDBX</i> on page F5-5040	$64 = 64 + 16 \times 16 - 16 \times 16$
Signed Most Significant Word Multiply Accumulate	<i>SMMLA, SMMLAR</i> on page F5-5042	$32 = 32 + 32 \times 32^b$
Signed Most Significant Word Multiply Subtract	<i>SMMLS, SMMLSR</i> on page F5-5044	$32 = 32 - 32 \times 32^b$
Signed Most Significant Word Multiply	<i>SMMUL, SMMULR</i> on page F5-5046	$32 = 32 \times 32^b$
Signed Dual Multiply Add	<i>SMUAD, SMUADX</i> on page F5-5048	$32 = 16 \times 16 + 16 \times 16$
Signed Multiply (halfwords)	<i>SMULBB, SMULBT, SMULTB, SMULTT</i> on page F5-5050	$32 = 16 \times 16$
Signed Multiply Long	<i>SMULL, SMULLS</i> on page F5-5052	$64 = 32 \times 32$
Signed Multiply (word by halfword)	<i>SMULWB, SMULWT</i> on page F5-5054	$32 = 32 \times 16^a$
Signed Dual Multiply Subtract	<i>SMUSD, SMUSDX</i> on page F5-5056	$32 = 16 \times 16 - 16 \times 16$

a. The most significant 32 bits of the 48-bit product are used. Less significant bits are discarded.

b. The most significant 32 bits of the 64-bit product are used. Less significant bits are discarded.

Table F2-6 Unsigned multiply instructions

Instruction	See	Operation (number of bits)
Unsigned Multiply Accumulate Accumulate Long	<i>UMAAL</i> on page F5-5232	$64 = 32 + 32 + 32 \times 32$
Unsigned Multiply Accumulate Long	<i>UMLAL, UMLALS</i> on page F5-5234	$64 = 64 + 32 \times 32$
Unsigned Multiply Long	<i>UMULL, UMULLS</i> on page F5-5236	$64 = 32 \times 32$

F2.4.4 Saturating instructions

Table F2-7 on page F2-4384 lists the saturating instructions in the T32 and A32 instruction sets. For more information, see *Pseudocode description of saturation* on page E1-4251.

Table F2-7 Saturating instructions

Instruction	See	Operation
Signed Saturate	SSAT on page F5-5062	Saturates optionally shifted 32-bit value to selected range
Signed Saturate 16	SSAT16 on page F5-5064	Saturates two 16-bit values to selected range
Unsigned Saturate	USAT on page F5-5254	Saturates optionally shifted 32-bit value to selected range
Unsigned Saturate 16	USAT16 on page F5-5256	Saturates two 16-bit values to selected range

F2.4.5 Saturating addition and subtraction instructions

Table F2-8 on page F2-4384 lists the saturating addition and subtraction instructions in the T32 and A32 instruction sets. For more information, see *Pseudocode description of saturation* on page E1-4251.

Table F2-8 Saturating addition and subtraction instructions

Instruction	See	Operation
Saturating Add	QADD on page F5-4924	Add, saturating result to the 32-bit signed integer range
Saturating Subtract	QSUB on page F5-4938	Subtract, saturating result to the 32-bit signed integer range
Saturating Double and Add	QADD on page F5-4924	Doubles one value and adds a second value, saturating the doubling and the addition to the 32-bit signed integer range
Saturating Double and Subtract	QDSUB on page F5-4934	Doubles one value and subtracts the result from a second value, saturating the doubling and the subtraction to the 32-bit signed integer range

F2.4.6 Packing and unpacking instructions

Table F2-9 on page F2-4385 lists the packing and unpacking instructions in the T32 and A32 instruction sets.

Table F2-9 Packing and unpacking instructions

Instruction	See	Operation
Pack Halfword	PKHBT, PKHTB on page F5-4895	Combine halfwords
Signed Extend and Add Byte	SXTAB on page F5-5179	Extend 8 bits to 32 and add
Signed Extend and Add Byte 16	SXTAB16 on page F5-5181	Dual extend 8 bits to 16 and add
Signed Extend and Add Halfword	SXTAH on page F5-5183	Extend 16 bits to 32 and add

Unsigned Extend Halfword	UXTH on page F5-5274	Extend 16 bits to 32

F2.4.7 Parallel addition and subtraction instructions

These instructions perform additions and subtractions on the values of two registers and write the result to a destination register, treating the register values as sets of two halfwords or four bytes. That is, they perform SIMD additions or subtractions on the general-purpose registers.

These instructions consist of a prefix followed by a main instruction mnemonic. The prefixes are as follows:

S	Signed arithmetic modulo 2^8 or 2^{16} .
Q	Signed saturating arithmetic.
SH	Signed arithmetic, halving the results.
U	Unsigned arithmetic modulo 2^8 or 2^{16} .
UQ	Unsigned saturating arithmetic.
UH	Unsigned arithmetic, halving the results.

The main instruction mnemonics are as follows:

ADD16	Adds the top halfwords of two operands to form the top halfword of the result, and the bottom halfwords of the same two operands to form the bottom halfword of the result.
ASX	Exchanges halfwords of the second operand, and then adds top halfwords and subtracts bottom halfwords.
SAX	Exchanges halfwords of the second operand, and then subtracts top halfwords and adds bottom halfwords.
SUB16	Subtracts each halfword of the second operand from the corresponding halfword of the first operand to form the corresponding halfword of the result.
ADD8	Adds each byte of the second operand to the corresponding byte of the first operand to form the corresponding byte of the result.
SUB8	Subtracts each byte of the second operand from the corresponding byte of the first operand to form the corresponding byte of the result.

The instruction set permits all 36 combinations of prefix and main instruction operand, as [Table F2-10 on page F2-4386](#) shows.

See also [Advanced SIMD parallel addition and subtraction on page F2-4402](#).

Table F2-10 Parallel addition and subtraction instructions

Main instruction	Signed	Saturating	Signed halving	Unsigned	Unsigned saturating	Unsigned halving
ADD16, add, two halfwords	SADD16	QADD16	SHADD16	UADD16	UQADD16	UHADD16
ASX, add and subtract with exchange	SASX	QASX	SHASX	UASX	UQASX	UHASX
SAX, subtract and add with exchange	SSAX	QSAX	SHSAX	USAX	UQSAX	UHSAX
SUB16, subtract, two halfwords	SSUB16	QSUB16	SHSUB16	USUB16	UQSUB16	UHSUB16
ADD8, add, four bytes	SADD8	QADD8	SHADD8	UADD8	UQADD8	UHADD8
SUB8, subtract, four bytes	SSUB8	QSUB8	SHSUB8	USUB8	UQSUB8	UHSUB8

F2.4.8 Divide instructions

In Armv8, signed and unsigned integer divide instructions are included in both the T32 instruction set and the A32 instruction set.

For descriptions of the instructions see:

- [SDIV](#) on page F5-5000.
- [UDIV](#) on page F5-5218.

For the SDIV and UDIV instructions, division by zero always returns a zero result.

The `ID_ISAR0.Divide_instrs` field indicates the level of support for these instructions. The field value of `0b0010` indicates they are implemented in both the T32 and A32 instruction sets.

F2.4.9 Miscellaneous data-processing instructions

[Table F2-11](#) on page F2-4387 lists the miscellaneous data-processing instructions in the T32 and A32 instruction sets. Immediate values in these instructions are simple binary numbers.

Table F2-11 Miscellaneous data-processing instructions

Instruction	See	Notes
BitField Clear	BFC on page F5-4616	-
BitField Insert	BFI on page F5-4618	-
Count Leading Zeros	CLZ on page F5-4641	-
Move Top	MOVT on page F5-4850	Moves 16-bit immediate value to top halfword. Bottom halfword unchanged.
Reverse Bits	RBIT on page F5-4944	-
Byte-Reverse Word	REV on page F5-4946	-
Byte-Reverse Packed Halfword	REV16 on page F5-4948	-

Unsigned Sum of Absolute Differences and Accumulate	USADA8 on page F5-5252	-

F2.5 PSTATE and banked register access instructions

These instructions transfer PE state information to or from a general-purpose register.

F2.5.1 PSTATE access instructions

PSTATE holds process state information, see *Process state, PSTATE* on page E1-4253. In AArch32 state:

- At EL1 or higher, **PSTATE** is accessible using the *Current Program Status Register (CPSR)*.
- At EL0, a subset of the **CPSR** is accessible as the *Application Program Status Register (APSR)*.
- On taking an exception, the contents of the **CPSR** are copied to the *Saved Program Status Register (SPSR)* of the mode from which the exception is taken.

The MRS and MSR instructions move the contents of the **CPSR**, **APSR**, or the **SPSR** of the current mode to or from a general-purpose register, see:

- *MRS* on page F5-4856.
- *MSR (immediate)* on page F5-4866.
- *MSR (register)* on page F5-4868.

When executed at EL0, MRS and MSR instructions can only access the **APSR**.

The **PSTATE** Condition flags, **PSTATE**.{N, Z, C, V} are set by the execution of data-processing instructions, and can control the execution of conditional instructions. However, software can set the Condition flags explicitly using the MSR instruction, and can read the current state of the Condition flags explicitly using the MRS instruction.

In addition, at EL1 or higher, software can use the CPS instruction to change the **PSTATE**.M field and the **PSTATE**.{A, I, F} interrupt mask bits, see *CPS, CPSID, CPSIE* on page F5-4657.

F2.5.2 Banked register access instructions

At EL1 or higher, the MRS (banked register) and MSR (banked register) instructions move the contents of a banked general-purpose register, the **SPSR**, or the **ELR_hyp**, to or from a general-purpose register. See:

- *MRS (Banked register)* on page F5-4858.
- *MSR (Banked register)* on page F5-4862.

F2.6 Load/store instructions

Table F2-12 on page F2-4389 summarizes the general-purpose register load/store instructions in the T32 and A32 instruction sets. Some of these instructions can also operate on the PC. See also:

- [Load/store multiple instructions on page F2-4392.](#)
- [Synchronization and semaphores on page E2-4331](#), for more information about the Load-Exclusive and Store-Exclusive instructions.
- [Load-Acquire, Store-Release on page E2-4305](#), for more information about the Load-Acquire/Store-Release and Load-Acquire Exclusive/Store-Release Exclusive instructions.
- [Advanced SIMD and floating-point load/store instructions on page F2-4398.](#)

Load/store instructions have several options for addressing memory. For more information, see [Addressing modes on page F2-4390](#).

Table F2-12 Load/store instructions

Data type	Load	Store	Unprivileged		Exclusive		Load-Acquire	Store-Release	Exclusive	
			Load	Store	Load	Store			Load-Acquire	Store-Release
32-bit word	LDR	STR	LDRT	STRT	LDREX	STREX	LDA	STL	LDAEX	STLEX
16-bit halfword	-	STRH	-	STRHT	-	STREXH	LDAH	STLH	LDAEXH	STLEXH
16-bit unsigned halfword	LDRH	-	LDRHT	-	LDREXH	-	-	-	-	-
16-bit signed halfword	LDRSH	-	LDRSHT	-	-	-	-	-	-	-
8-bit byte	-	STRB	-	STRBT	-	STREXB	LDAB	STLB	LDAEXB	STLEXB
8-bit unsigned byte	LDRB	-	LDRBT	-	LDREXB	-	-	-	-	-
8-bit signed byte	LDRSB	-	LDRSBT	-	-	-	-	-	-	-
Two 32-bit words	LDRD	STRD	-	-	-	-	-	-	-	-
64-bit doubleword	-	-	-	-	LDREXD	STREXD	-	-	LDAEXD	STLEXD

F2.6.1 Loads to the PC

The LDR instruction can load a value into the PC. The value loaded is treated as an interworking address, as described by the `LoadWritePC()` pseudocode function in [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

F2.6.2 Halfword and byte loads and stores

Halfword and byte stores store the least significant halfword or byte from the register, to 16 or 8 bits of memory respectively. There is no distinction between signed and unsigned stores.

Halfword and byte loads load 16 or 8 bits from memory into the least significant halfword or byte of a register. Unsigned loads zero-extend the loaded value to 32 bits, and signed loads sign-extend the value to 32 bits.

F2.6.3 Load unprivileged and Store unprivileged

When executing at EL0, a Load unprivileged or Store unprivileged instruction operates in exactly the same way as the corresponding ordinary load or store instruction. For example, an LDRT instruction executes in exactly the same way as the equivalent LDR instruction. When executed at PL1, Load unprivileged and Store unprivileged instructions behave as they would if they were executed at EL0. For example, an LDRT instruction executes in exactly the way that the equivalent LDR instruction would execute at EL0. In particular, the instructions make unprivileged memory accesses.

———— **Note** ————

As described in [Security state, Exception levels, and AArch32 execution privilege on page G1-6022](#), execution at PL1 describes all of the following:

- Execution at Non-secure EL1 using AArch32.
- Execution at Secure EL1 using AArch32 when EL3 is not implemented.
- Execution at Secure EL1 using AArch32 when EL3 is implemented and is using AArch64.
- Execution at Secure EL3 when EL3 is implemented and is using AArch32.

The Load unprivileged and Store unprivileged instructions are CONstrained UNPREDICTABLE if executed at EL2.

For more information about execution privilege, see [About access permissions on page G5-6308](#).

F2.6.4 Load-Exclusive and Store-Exclusive

Load-Exclusive and Store-Exclusive instructions provide shared memory synchronization. For more information, see [Synchronization and semaphores on page E2-4331](#).

F2.6.5 Load-Acquire and Store-Release

Load-Acquire and Store-Release instructions provide memory barriers. Load-Acquire Exclusive and Store-Release Exclusive instructions provide memory barriers with shared memory synchronization. For more information, see [Load-Acquire, Store-Release on page E2-4305](#).

F2.6.6 Addressing modes

The address for a load or store is formed from two parts: a value from a base register, and an offset.

The base register can be any one of the general-purpose registers R0-R12, SP, or LR.

For loads, the base register can be the PC. This provides PC-relative addressing for position-independent code. Instructions marked (literal) in their title in [Chapter F1 About the T32 and A32 Instruction Descriptions](#) are PC-relative loads.

The offset takes one of three formats:

Immediate	The offset is an unsigned number that can be added to or subtracted from the base register value. Immediate offset addressing is useful for accessing data elements that are a fixed distance from the start of the data object, such as structure fields, stack offsets, and input/output registers.
Register	The offset is a value from a general-purpose register. The value can be added to, or subtracted from, the base register value. Register offsets are useful for accessing arrays or blocks of data.
Scaled register	The offset is a general-purpose register, shifted by an immediate value, then added to or subtracted from the base register. This means an array index can be scaled by the size of each array element.

The offset and base register can be used in three different ways to form the memory address. The addressing modes are described as follows:

Offset	The offset is added to or subtracted from the base register to form the memory address.
---------------	---

Pre-indexed The offset is added to or subtracted from the base register to form the memory address. The base register is then updated with this new address, to permit automatic indexing through an array or memory block.

Post-indexed The value of the base register alone is used as the memory address. The offset is then added to or subtracted from the base register. The result is stored back in the base register, to permit automatic indexing through an array or memory block.

———— **Note** —————

Not every variant is available for every instruction, and the range of permitted immediate values and the options for scaled registers vary from instruction to instruction. See [Chapter F1 About the T32 and A32 Instruction Descriptions](#) for full details for each instruction.

F2.7 Load/store multiple instructions

Load Multiple instructions load from memory a subset, or possibly all, of the general-purpose registers and the PC.

Store Multiple instructions store to memory a subset, or possibly all, of the general-purpose registers.

The memory locations are consecutive word-aligned words. The addresses used are obtained from a base register, and can be either above or below the value in the base register. The base register can optionally be updated by the total size of the data transferred.

Table F2-13 on page F2-4392 summarizes the load/store multiple instructions in the T32 and A32 instruction sets.

Table F2-13 Load/store multiple instructions

Instruction	See
Load Multiple, Increment After or Full Descending	LDM, LDMIA, LDMFD on page F5-4722
Load Multiple, Decrement After or Full Ascending ^a	LMDMA, LDMFA on page F5-4730
Load Multiple, Decrement Before or Empty Ascending	LDMDB, LDMEA on page F5-4732
Load Multiple, Increment Before or Empty Descending ^a	LDMIB, LDMED on page F5-4735
Pop multiple registers off the stack ^b	POP on page F5-4911
Push multiple registers onto the stack ^c	PUSH on page F5-4919
Store Multiple, Increment After or Empty Ascending	STM, STMIA, STMEA on page F5-5094
Store Multiple, Decrement After or Empty Descending ^a	STMDA, STMED on page F5-5100
Store Multiple, Decrement Before or Full Descending	STMDB, STMFD on page F5-5102
Store Multiple, Increment Before or Full Ascending ^a	STMIB, STMFA on page F5-5105

- a. Not available in the T32 instruction set.
- b. This instruction is equivalent to an LDM instruction with the SP as base register, and base register updating.
- c. This instruction is equivalent to an STMDB instruction with the SP as base register, and base register updating.

When executing at EL1, variants of the LDM and STM instructions load and store User mode registers. Another system level variant of the LDM instruction performs an exception return.

F2.7.1 Loads to the PC

The LDM, LMDMA, LDMDB, LDMIB, and POP instructions can load a value into the PC. The value loaded is treated as an interworking address, as described by the [LoadWritePC\(\)](#) pseudocode function in [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

F2.8 Miscellaneous instructions

Table F2-14 on page F2-4393 summarizes the miscellaneous instructions in the T32 and A32 instruction sets.

Table F2-14 Miscellaneous instructions

Instruction	See
Clear-Exclusive	<i>CLREX</i> on page F5-4640
Data Memory Barrier	<i>DMB</i> on page F5-4677
Data Synchronization Barrier	<i>DSB</i> on page F5-4680
Error Synchronization Barrier	<i>ESB</i> on page F5-4694
Instruction Synchronization Barrier	<i>ISB</i> on page F5-4700
If-Then	<i>IT</i> on page F5-4702
No Operation	<i>NOP</i> on page F5-4880
Preload Data	<i>PLD, PLDW (immediate)</i> on page F5-4898 <i>PLD (literal)</i> on page F5-4901 <i>PLD, PLDW (register)</i> on page F5-4903
Preload Instruction	<i>PLI (immediate, literal)</i> on page F5-4906 <i>PLI (register)</i> on page F5-4909
Speculation Barrier	<i>SB</i> on page F5-4987
Set Endianness	<i>SETEND</i> on page F5-5004 ^a
Set Privileged Access Never	<i>SETPAN</i> on page F5-5005
Send Event	<i>SEV</i> on page F5-5006
Send Event Local	<i>SEVL</i> on page F5-5008
Wait For Event	<i>WFE</i> on page F5-5276
Wait For Interrupt	<i>WFI</i> on page F5-5278
Yield	<i>YIELD</i> on page F5-5280 ^b

a. Arm deprecates any use of the SETEND instruction.

b. See also *The Yield instruction* on page F2-4393.

———— Note —————

Previous versions of the architecture defined the DBG instruction, that could provide a hint to the debug system, in this group. In Armv8, this instruction executes as a NOP. Arm deprecates any use of the DBG instruction.

F2.8.1 The Yield instruction

In a *Symmetric Multithreading* (SMT) design, a thread can use the YIELD instruction to give a hint to the PE that it is running on. The YIELD hint indicates that whatever the thread is currently doing is of low importance, and so could yield. For example, the thread might be sitting in a spin-lock. A similar use might be in modifying the arbitration priority of the snoop bus in a multiprocessor (MP) system. Defining such an instruction permits binary compatibility between SMT and SMP systems.

AArch32 state defines a YIELD instruction as a specific NOP (No Operation) hint instruction.

The YIELD instruction has no effect in a single-threaded system, but developers of such systems can use the instruction to flag its intended use on migration to a multiprocessor or multithreading system. Operating systems can use YIELD in places where a yield hint is wanted, knowing that it will be treated as a NOP if there is no implementation benefit.

F2.9 Exception-generating and exception-handling instructions

The following instructions are intended specifically to cause a synchronous exception to occur:

- The SVC instruction generates a Supervisor Call exception. For more information, see [Supervisor Call \(SVC\) exception on page G1-6082](#).
- The Breakpoint instruction BKPT provides software breakpoints. For more information, see [Breakpoint Instruction exceptions on page G2-6167](#).
- In an implementation that includes EL3 the SMC instruction generates a Secure Monitor Call exception. For more information, see [Secure Monitor Call \(SMC\) exception on page G1-6083](#).
- In an implementation that includes EL2 the HVC instruction generates a Hypervisor Call exception. For more information, see [Hypervisor Call \(HVC\) exception on page G1-6084](#).

[Debug state on page F2-4396](#) summarizes the Debug state instructions.

For an exception taken to an EL1 mode:

- The system level variants of the SUBS and LDM instructions can perform a return from an exception.

———— **Note** —————

The variants of SUBS include MOV_S. See the references to [Subtract \(exception return\) on page F2-4395](#), [Move \(exception return\) on page F2-4395](#), and [Load Multiple \(exception return\) on page F2-4395](#) in [Table F2-15 on page F2-4395](#) for more information.

- The SRS instruction can be used near the start of the handler, to store return information. The RFE instruction can then perform a return from the exception using the stored return information.

In an implementation that includes EL2, the ERET instruction performs a return from an exception taken to Hyp mode.

For more information, see [Exception return to an Exception level using AArch32 on page G1-6065](#).

[Table F2-15 on page F2-4395](#) summarizes the instructions, in the T32 and A32 instruction sets, for generating or handling an exception. Except for BKPT and SVC, these are system level instructions.

Table F2-15 Exception-generating and exception-handling instructions

Instruction	See
Supervisor Call	SVC on page F5-5177
Breakpoint	BKPT on page F5-4629
Secure Monitor Call	SMC on page F5-5022
Return From Exception	RFE, RFEDA, RFEDB, RFEIA, RFEIB on page F5-4952
Subtract (exception return) ^a	SUB, SUBS (immediate) on page F5-5161^a
Move (exception return) ^a	MOV, MOV_S (register) on page F5-4841^a
Hypervisor Call	HVC on page F5-4698
Exception Return	ERET on page F5-4692
Load Multiple (exception return)	LDM (exception return) on page F5-4726
Store Return State	SRS, SRSDA, SRSDB, SRSIA, SRSIB on page F5-5058

a. The A32 instruction set includes other instruction forms that can be used for an exception return, that have previously been described as variants of SUBS PC, LR. Arm deprecates any use of these instruction forms.

F2.9.1 Debug state

Table F2-16 on page F2-4396 shows the Debug state instructions that are implemented in the T32 instruction set:

Table F2-16 T32 Debug state instructions

Mnemonic	Instruction	See	Note
DCPS n	Debug switch to EL n	DCPS1 on page F5-4671 DCPS2 on page F5-4673 DCPS3 on page F5-4675	-
ERET	Debug restore PE state (DRPS)	ERET on page F5-4692	When executed in Debug state, the T1 encoding of ERET performs the DRPS operation

F2.10 System register access instructions

The System register encoding space is indexed using the parameters {coproc, opc1, CRn, CRm, opc2}, see [The AArch32 System register interface on page G1-6109](#). This encoding space provides System registers and System instructions. In Armv8, the only permitted values of coproc are 0b1110 and 0b1111, and the following instructions give access to this encoding space:

- Instructions that transfer data between general-purpose registers and System registers. See:
 - [MCR on page F5-4829](#).
 - [MCRR on page F5-4831](#).
 - [MRC on page F5-4852](#).
 - [MRRC on page F5-4854](#).
- Instructions that load or store from memory to a System register. See:
 - [LDC \(immediate\) on page F5-4718](#).
 - [LDC \(literal\) on page F5-4720](#).
 - [STC on page F5-5074](#).

Note

The System register encoding space with coproc==0b101x is redefined to provide some of the Advanced SIMD and floating-point functionality. That is, to:

- Initiate a floating-point data-processing operation, see [Floating-point data-processing instructions on page F2-4412](#).
- Transfer data between general-purpose registers and the Advanced SIMD and floating-point registers, see [Advanced SIMD and floating-point register transfer instructions on page F2-4400](#).
- Load or store data to the Advanced SIMD and floating-point registers, see [Advanced SIMD and floating-point load/store instructions on page F2-4398](#).

System register access instructions are part of the instruction stream executed by the PE, and therefore any System register access instruction that cannot be executed by the implementation causes an Undefined Instruction exception. In Armv8-A and Armv8-R, the instruction encodings in the System register access instruction encoding space are unallocated, and generate Undefined Instruction exceptions, except for:

- The instructions summarized in this section that access the coproc==0b111x encoding space.
- The instructions in the coproc==0b101x encoding space that are redefined to provide Advanced SIMD and floating-point functionality, as summarized in the Note in this section.

F2.11 Advanced SIMD and floating-point load/store instructions

Table F2-17 on page F2-4398 summarizes the SIMD and floating-point register file load/store instructions in the Advanced SIMD and floating-point instruction sets.

Advanced SIMD also provides instructions for loading and storing multiple elements, or structures of elements, see *Element and structure load/store instructions* on page F2-4398.

Table F2-17 SIMD and floating-point register file load/store instructions

Instruction	See	Operation
Vector Load Multiple	<i>VLDM, VLDMDB, VLDMIA</i> on page F6-5593	Load 1-16 consecutive 64-bit registers, Advanced SIMD and floating-point. Load 1-16 consecutive 32-bit registers, floating-point only.
Vector Load Register	<i>VLDR (immediate)</i> on page F6-5598 <i>VLDR (literal)</i> on page F6-5601	Load one 64-bit register, Advanced SIMD and floating-point. Load one 32-bit register, floating-point only.
Vector Store Multiple	<i>VSTM, VSTMDB, VSTMIA</i> on page F6-5956	Store 1-16 consecutive 64-bit registers, Advanced SIMD and floating-point. Store 1-16 consecutive 32-bit registers, floating-point only.
Vector Store Register	<i>VSTR</i> on page F6-5961	Store one 64-bit register, Advanced SIMD and floating-point. Store one 32-bit register, floating-point only.

F2.11.1 Element and structure load/store instructions

Table F2-18 on page F2-4398 shows the element and structure load/store instructions available in the Advanced SIMD instruction set. Loading and storing structures of more than one element automatically de-interleaves or interleaves the elements, see Figure F2-1 on page F2-4399 for an example of de-interleaving. Interleaving is the inverse process.

Table F2-18 Element and structure load/store instructions

Instruction	See
Load single element	
Multiple elements	<i>VLD1 (multiple single elements)</i> on page F6-5548
To one lane	<i>VLD1 (single element to one lane)</i> on page F6-5540
To all lanes	<i>VLD1 (single element to all lanes)</i> on page F6-5545
Load 2-element structure	
Multiple structures	<i>VLD2 (multiple 2-element structures)</i> on page F6-5564
To one lane	<i>VLD2 (single 2-element structure to one lane)</i> on page F6-5555
To all lanes	<i>VLD2 (single 2-element structure to all lanes)</i> on page F6-5561
Load 3-element structure	
Multiple structures	<i>VLD3 (multiple 3-element structures)</i> on page F6-5578
To one lane	<i>VLD3 (single 3-element structure to one lane)</i> on page F6-5569
To all lanes	<i>VLD3 (single 3-element structure to all lanes)</i> on page F6-5575

Table F2-18 Element and structure load/store instructions (continued)

Instruction	See
Load 4-element structure	
Multiple structures	<i>VLD4 (multiple 4-element structures)</i> on page F6-5590
To one lane	<i>VLD4 (single 4-element structure to one lane)</i> on page F6-5581
To all lanes	<i>VLD4 (single 4-element structure to all lanes)</i> on page F6-5587
Store single element	
Multiple elements	<i>VST1 (multiple single elements)</i> on page F6-5919
From one lane	<i>VST1 (single element from one lane)</i> on page F6-5914
Store 2-element structure	
Multiple structures	<i>VST2 (multiple 2-element structures)</i> on page F6-5932
From one lane	<i>VST2 (single 2-element structure from one lane)</i> on page F6-5926
Store 3-element structure	
Multiple structures	<i>VST3 (multiple 3-element structures)</i> on page F6-5943
From one lane	<i>VST3 (single 3-element structure from one lane)</i> on page F6-5937
Store 4-element structure	
Multiple structures	<i>VST4 (multiple 4-element structures)</i> on page F6-5953
From one lane	<i>VST4 (single 4-element structure from one lane)</i> on page F6-5946

Figure F2-1 on page F2-4399 shows the de-interleaving of a VLD3.16 (multiple 3-element structures) instruction:

Figure F2-1 De-interleaving an array of 3-element structures

Figure F2-1 on page F2-4399 shows the VLD3.16 instruction operating to three 64-bit registers that comprise four 16-bit elements:

- Different instructions in this group would produce similar figures, but operate on different numbers of registers. For example, VLD4 and VST4 instructions operate on four registers.
- Different element sizes would produce similar figures but with 8-bit or 32-bit elements.
- These instructions operate only on doubleword (64-bit) registers.

F2.12 Advanced SIMD and floating-point register transfer instructions

Table F2-19 on page F2-4400 summarizes the SIMD and floating-point register file transfer instructions in the Advanced SIMD and floating-point instruction sets. These instructions transfer data between the general-purpose registers and the registers in the SIMD and floating-point register file.

Advanced SIMD vectors, and single-precision and double-precision floating-point registers, are all views of the same register file. For details, see *The SIMD and floating-point register file* on page E1-4260.

Table F2-19 SIMD and floating-point register file transfer instructions

Instruction	See
Copy element from general-purpose register to every element of an Advanced SIMD vector	<i>VDUP (general-purpose register)</i> on page F6-5489
Copy byte, halfword, or word from general-purpose register to a register in the SIMD and floating-point register file	<i>VMOV (general-purpose register to scalar)</i> on page F6-5669
Copy byte, halfword, or word from a register in the SIMD and floating-point register file to a general-purpose register	<i>VMOV (scalar to general-purpose register)</i> on page F6-5673
Copy from half-precision floating-point register to general-purpose register, or from general-purpose register to half-precision floating-point register Only supported if FEAT_FP16 is implemented	<i>VMOV (between general-purpose register and half-precision)</i> on page F6-5656
Copy from single-precision floating-point register to general-purpose register, or from general-purpose register to single-precision floating-point register	<i>VMOV (between general-purpose register and single-precision)</i> on page F6-5671
Copy two words from general-purpose registers to consecutive single-precision floating-point registers, or from consecutive single-precision floating-point registers to general-purpose registers	<i>VMOV (between two general-purpose registers and two single-precision registers)</i> on page F6-5675
Copy two words from general-purpose registers to a doubleword register in the SIMD and floating-point register file, or from a doubleword register in the SIMD and floating-point register file to general-purpose registers	<i>VMOV (between two general-purpose registers and a doubleword floating-point register)</i> on page F6-5654
Copy from an Advanced SIMD and floating-point System Register to a general-purpose register	<i>VMRS</i> on page F6-5684
Copy from a general-purpose register to an Advanced SIMD and floating-point System Register	<i>VMSR</i> on page F6-5687

F2.13 Advanced SIMD data-processing instructions

Advanced SIMD data-processing instructions process registers containing vectors of elements of the same type packed together, enabling the same operation to be performed on multiple items in parallel.

Instructions operate on vectors held in 64-bit or 128-bit registers. [Figure F2-2 on page F2-4401](#) shows an operation on two 64-bit operand vectors, generating a 64-bit vector result.

————— **Note** —————

[Figure F2-2 on page F2-4401](#) and other similar figures show 64-bit vectors that consist of four 16-bit elements, and 128-bit vectors that consist of four 32-bit elements. Other element sizes produce similar figures, but with 1, 2, 8, or 16 operations performed in parallel instead of 4.

Figure F2-2 Advanced SIMD instruction operating on 64-bit registers

Many Advanced SIMD instructions have variants that produce vectors of elements double the size of the inputs. In this case, the number of elements in the result vector is the same as the number of elements in the operand vectors, but each element, and the whole vector, is double the size.

[Figure F2-3 on page F2-4401](#) shows an example of an Advanced SIMD instruction operating on 64-bit registers, and generating a 128-bit result.

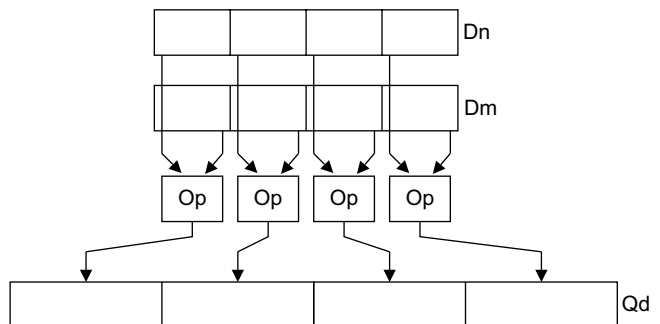

Figure F2-3 Advanced SIMD instruction producing wider result

There are also Advanced SIMD instructions that have variants that produce vectors containing elements half the size of the inputs. [Figure F2-4 on page F2-4402](#) shows an example of an Advanced SIMD instruction operating on one 128-bit register, and generating a 64-bit result.

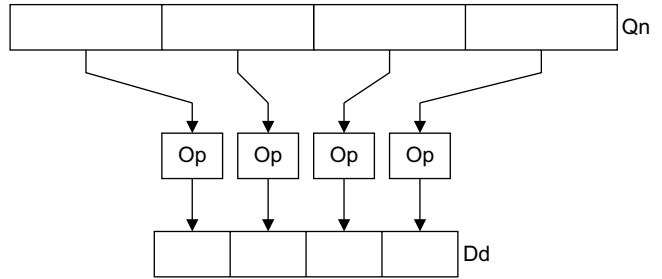

Figure F2-4 Advanced SIMD instruction producing narrower result

Some Advanced SIMD instructions do not conform to these standard patterns. Their operation patterns are described in the individual instruction descriptions.

Advanced SIMD instructions that perform floating-point arithmetic use the Arm standard floating-point arithmetic defined in *Advanced SIMD and floating-point support* on page A1-52.

The following sections summarize the Advanced SIMD data-processing instructions:

- [Advanced SIMD parallel addition and subtraction](#) on page F2-4402.
- [Bitwise Advanced SIMD data-processing instructions](#) on page F2-4403.
- [Advanced SIMD comparison instructions](#) on page F2-4404.
- [Advanced SIMD shift instructions](#) on page F2-4405.
- [Advanced SIMD multiply instructions](#) on page F2-4406.
- [Advanced SIMD dot product instructions](#) on page F2-4407.
- [Miscellaneous Advanced SIMD data-processing instructions](#) on page F2-4409.
- [Advanced SIMD BFloat16 instructions](#) on page F2-4408.
- [Advanced SIMD matrix multiply instructions](#) on page F2-4408.
- [The Cryptographic Extension in AArch32 state](#) on page F2-4410.

F2.13.1 Advanced SIMD parallel addition and subtraction

Table F2-20 on page F2-4402 shows the Advanced SIMD parallel add and subtract instructions.

Table F2-20 Advanced SIMD parallel add and subtract instructions

Instruction	See
Vector Add	VADD (integer) on page F6-5351 VADD (floating-point) on page F6-5347
Vector Add and Narrow, returning High Half	VADDHN on page F6-5353
Vector Add Long	VADDL on page F6-5355
Vector Add Wide	VADDW on page F6-5357
Vector Halving Add	VHADD on page F6-5530
Vector Halving Subtract	VHSUB on page F6-5533
Vector Pairwise Add and Accumulate Long	VPADAL on page F6-5734

Vector Fused Multiply Subtract	<i>VFMS</i> on page F6-5514
Vector Floating-Point Multiply-Subtract Long	<i>FMSL (vector)</i> on page F6-5518 <i>FMSL (by scalar)</i> on page F6-5521
Vector Saturating Doubling Multiply Accumulate Long	<i>VQDMLAL</i> on page F6-5760
Vector Saturating Doubling Multiply Subtract Long	<i>VQDMLSL</i> on page F6-5763
Vector Saturating Doubling Multiply Returning High Half	<i>VQDMULH</i> on page F6-5766
Vector Saturating Doubling Multiply Long	<i>VQDMULL</i> on page F6-5769
Vector Saturating Rounding Doubling Multiply Accumulate Returning High Half	<i>VQRDMLAH</i> on page F6-5776
Vector Saturating Rounding Doubling Multiply Subtract Returning High Half	<i>VQRDMLSH</i> on page F6-5780
Vector Saturating Rounding Doubling Multiply Returning High Half	<i>VQRDMULH</i> on page F6-5784

Advanced SIMD multiply instructions can operate on vectors of:

- 8-bit, 16-bit, or 32-bit unsigned integers.
- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit polynomials over {0, 1}. *VMUL* and *VMULL* are the only instructions that operate on polynomials. *VMULL* produces a 16-bit polynomial over {0, 1}.
- Single-precision (32-bit) or half-precision (16-bit) floating-point numbers.

They can also act on one vector and one scalar.

Long instructions have doubleword (64-bit) operands, and produce quadword (128-bit) results. Other Advanced SIMD multiply instructions can have either doubleword or quadword operands, and produce results of the same size.

Floating-point multiply instructions can operate on:

- Half-precision (16-bit) floating-point numbers.
- Single-precision (32-bit) floating-point numbers.
- Double-precision (64-bit) floating-point numbers.

F2.13.6 Advanced SIMD dot product instructions

[FEAT_DotProd](#) provides SIMD instructions that perform the dot product of the four 8-bit subelements of the 32-bit elements of one vector with the four 8-bit subelements of a second vector. It provides two forms of the instructions, each with signed and unsigned versions:

Vector form The dot product is calculated for each element of the first vector with the corresponding element of the second vector.

Indexed form The dot product is calculated for each element of the first vector with the element of the second vector that is indicated by the index argument to the instruction.

———— **Note** ————

That is, a single element from the second vector is used, and the dot product is calculated between each element of the first vector and this single element from the second vector.

[Table F2-25 on page F2-4407](#) shows the Advanced SIMD dot product instructions.

Table F2-25 Advanced SIMD dot product instructions

Mnemonic	Instruction	See
VSDOT	Signed dot product (vector form)	<i>VSDOT (vector)</i> on page F6-5877
VUDOT	Unsigned dot product (vector form)	<i>VUDOT (vector)</i> on page F6-5990
VSDOT	Signed dot product (indexed form)	<i>VSDOT (by element)</i> on page F6-5875
VSUDOT	Mixed sign integer dot product by indexed quadruplet ^a	<i>VSUDOT (by element)</i> on page F6-5976
VUDOT	Unsigned dot product (indexed form)	<i>VUDOT (by element)</i> on page F6-5988
VUSDOT	Mixed sign integer dot product (vector format) ^a	<i>VUSDOT (vector)</i> on page F6-5996
	Mixed sign integer dot product by indexed quadruplet ^a	<i>VUSDOT (by element)</i> on page F6-5994

a. This instruction is only supported when [FEAT_AA32I8MM](#) is implemented.

F2.13.7 Advanced SIMD complex number arithmetic instructions

[FEAT_FCMA](#) provides AArch32 Advanced SIMD instructions that perform arithmetic on complex numbers held in element pairs in vector registers, where the less significant element of the pair contains the real component and the more significant element contains the imaginary component.

These instructions provide single-precision versions. If [FEAT_FP16](#) is implemented they also provide half-precision versions, otherwise the half-precision encodings are UNDEFINED.

Table F2-26 on page F2-4408 shows the FEAT_FCMA AArch32 Advanced SIMD instructions.

Table F2-26 Advanced SIMD complex number arithmetic instructions

Mnemonic	Instruction	See
VCADD	Floating-point complex add	<i>VCADD</i> on page F6-5375
VCMLA	Floating-point complex multiply accumulate (vector form)	<i>VCMLA</i> on page F6-5413
VCMLA	Floating-point complex multiply accumulate (indexed form)	<i>VCMLA (by element)</i> on page F6-5416

A pair of VCMLA instructions can be used to perform a complex number multiplication. In *Complex multiplication* on page K10-8512, this is demonstrated for the similar AArch64 instruction FCMLA. The usage of VCMLA in this manner is identical.

F2.13.8 Advanced SIMD BFloat16 instructions

When FEAT_AA32BF16 is implemented, BFloat16 instructions are available in AArch32 state.

Table F2-27 on page F2-4408 shows the Advanced SIMD BFloat16 instructions.

Table F2-27 BFloat16 Advanced SIMD instructions

Mnemonic	Instruction	See
VDOT	BFloat16 floating-point vector dot product (vector and by scalar formats)	<i>VDOT (vector)</i> on page F6-5485 <i>VDOT (by element)</i> on page F6-5487
VMMLA	BFloat16 floating-point matrix multiply-accumulate	<i>VMMLA</i> on page F6-5652
VFMA, VFMA, VFMA	BFloat16 floating-point widening multiply-add long (vector and by scalar formats)	<i>VFMA, VFMA, VFMA (BFloat16, vector)</i> on page F6-5504 <i>VFMA, VFMA, VFMA (BFloat16, by scalar)</i> on page F6-5506
VCVT	BFloat16 convert from single-precision to BF16 format	<i>VCVT (from single-precision to BFloat16, Advanced SIMD)</i> on page F6-5429

F2.13.9 Advanced SIMD matrix multiply instructions

When FEAT_AA32I8MM is implemented, these instructions are available in AArch32 state. They include integer and mixed sign dot product instructions.

The matrix multiply-accumulate instructions delimit source and destination vectors into segments. Within each segment:

- The first source vector matrix is organized in row-by-row order.
- The second source vector matrix elements are organized in a column-by-column order.
- The destination vector matrix is organized in row-by-row order.

One matrix multiplication is performed per segment.

Table F2-28 on page F2-4408 shows the Advanced SIMD matrix multiply instructions.

Table F2-28 Matrix multiply Advanced SIMD instructions

Mnemonic	Instruction	See
VSMMLA	Widening 8-bit signed integer matrix multiply-accumulate into 2x2 matrix	<i>VSMMLA</i> on page F6-5904

Chapter F3

T32 Instruction Set Encoding

This chapter describes the encoding of the T32 instruction set. It contains the following sections:

- [T32 instruction set encoding on page F3-4416.](#)
- [About the T32 Advanced SIMD and floating-point instructions and their encoding on page F3-4491.](#)

In this chapter:

- In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
- In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.

F3.1 T32 instruction set encoding

The T32 instruction stream is a sequence of halfword-aligned halfwords. Each T32 instruction is either a single 16-bit halfword in that stream, or a 32-bit instruction consisting of two consecutive halfwords in that stream.

If the value of bits[15:11] of the halfword being decoded is one of the following, the halfword is the first halfword of a 32-bit instruction:

- 0b11101.
- 0b11110.
- 0b11111.

Otherwise, the halfword is a 16-bit instruction.

The T32 instruction encoding is:

Table F3-1 Main encoding table for the T32 instruction set

Decode fields		Decode group or instruction page
op0	op1

111	!= 00	<i>32-bit on page F3-4427</i>

F3.1.1 16-bit

This section describes the encoding of the 16-bit group. The encodings in this section are decoded from [T32 instruction set encoding on page F3-4416](#).

This decode also imposes the constraint:

- $op0 < 5:3 > \neq 111$.

Table F3-2 Encoding table for the 16-bit group

F3.1.11 Advanced SIMD and System register load/store and 64-bit move

This section describes the encoding of the Advanced SIMD and System register load/store and 64-bit move group. The encodings in this section are decoded from *System register access, Advanced SIMD, and floating-point* on page F3-4433.

This group has encodings in both the T32 and A32 instruction sets. For information about mappings between the encodings of this group, see *About the T32 Advanced SIMD and floating-point instructions and their encoding* on page F3-4491

F3.1.15 Load/store dual, load/store exclusive, load-acquire/store-release, and table branch

This section describes the encoding of the Load/store dual, load/store exclusive, load-acquire/store-release, and table branch group. The encodings in this section are decoded from *32-bit* on page F3-4427.

This decode also imposes the constraint:

- $op0 < 1 > == 1$.

Table F3-16 Encoding table for the Load/store dual, load/store exclusive, load-acquire/store-release, and table branch group

Decode fields				Decode group or instruction page
op0	op1	op2	op3

F3.1.18 Advanced SIMD element or structure load/store

This section describes the encoding of the Advanced SIMD element or structure load/store group. The encodings in this section are decoded from *32-bit* on page F3-4427.

This group has encodings in both the T32 and A32 instruction sets. For information about mappings between the encodings of this group, see *About the T32 Advanced SIMD and floating-point instructions and their encoding* on page F3-4491

Table F3-19 Encoding table for the Advanced SIMD element or structure load/store group

Decode fields		Decode group or instruction page

Load/store, unsigned (register offset)

This section describes the encoding of the Load/store, unsigned (register offset) instruction class. The encodings in this section are decoded from [Load/store single](#) on page F3-4476.

Decode fields			Instruction page
size	L	Rt	
00	0	-	STRB (register)
00	1	!= 1111	LDRB (register)
00	1	1111	PLD, PLDW (register) - Preload read variant
01	0	-	STRH (register)
01	1	!= 1111	LDRH (register)
01	1	1111	PLD, PLDW (register) - Preload write variant
10	0	-	STR (register)
10	1	-	LDR (register)
11	-	-	Unallocated.

Load/store, unsigned (immediate, post-indexed)

This section describes the encoding of the Load/store, unsigned (immediate, post-indexed) instruction class. The encodings in this section are decoded from [Load/store single](#) on page F3-4476.

Decode fields		Instruction page
size	L	
00	0	STRB (immediate)
00	1	LDRB (immediate)
01	0	STRH (immediate)
01	1	LDRH (immediate)
10	0	STR (immediate)
10	1	LDR (immediate)
11	-	Unallocated.

Load/store, unsigned (negative immediate)

This section describes the encoding of the Load/store, unsigned (negative immediate) instruction class. The encodings in this section are decoded from [Load/store single on page F3-4476](#).

Decode fields			Instruction page
size	L	Rt	
00	0	-	STRB (immediate)
00	1	!= 1111	LDRB (immediate)
00	1	1111	PLD, PLDW (immediate) - Preload read variant
01	0	-	STRH (immediate)
01	1	!= 1111	LDRH (immediate)
01	1	1111	PLD, PLDW (immediate) - Preload write variant
10	0	-	STR (immediate)
10	1	-	LDR (immediate)
11	-	-	Unallocated.

Load/store, unsigned (unprivileged)

This section describes the encoding of the Load/store, unsigned (unprivileged) instruction class. The encodings in this section are decoded from [Load/store single on page F3-4476](#).

Decode fields		Instruction page
size	L	
00	0	STRBT
00	1	LDRBT
01	0	STRHT
01	1	LDRHT
10	0	STRT
10	1	LDRT
11	-	Unallocated.

Load/store, unsigned (immediate, pre-indexed)

This section describes the encoding of the Load/store, unsigned (immediate, pre-indexed) instruction class. The encodings in this section are decoded from *Load/store single* on page F3-4476.

Decode fields		Instruction page
size	L	
00	0	STRB (immediate)
00	1	LDRB (immediate)
01	0	STRH (immediate)
01	1	LDRH (immediate)
10	0	STR (immediate)
10	1	LDR (immediate)
11	-	Unallocated.

Load/store, unsigned (positive immediate)

This section describes the encoding of the Load/store, unsigned (positive immediate) instruction class. The encodings in this section are decoded from *Load/store single* on page F3-4476.

Decode fields			Instruction page
size	L	Rt	
00	0	-	STRB (immediate)
00	1	!= 1111	LDRB (immediate)
00	1	1111	PLD, PLDW (immediate) - Preload read variant
01	0	-	STRH (immediate)
01	1	!= 1111	LDRH (immediate)
01	1	1111	PLD, PLDW (immediate) - Preload write variant
10	0	-	STR (immediate)
10	1	-	LDR (immediate)

Load, unsigned (literal)

This section describes the encoding of the Load, unsigned (literal) instruction class. The encodings in this section are decoded from *Load/store single* on page F3-4476.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11				0

F3.2 About the T32 Advanced SIMD and floating-point instructions and their encoding

The Advanced SIMD and floating-point instructions are common to the T32 and A32 instruction sets. These instructions perform Advanced SIMD and floating-point operations on a common register file, the SIMD&FP register file. This means:

- In general, the instructions that load or store registers in this file, or move data between general-purpose registers and this register file, are common to the Advanced SIMD and floating-point instructions.
- There are distinct Advanced SIMD data-processing instructions and floating-point data-processing instructions.

All T32 Advanced SIMD and floating-point instructions have 32-bit encodings. Different groups of these instructions are decoded from different points in the 32-bit T32 instruction decode structure. [Table F3-23 on page F3-4491](#) shows these instruction groups, and where each group is decoded from the overall T32 decode structure:

Table F3-23 Advanced SIMD and floating-point instructions in the T32 decode structure

Advanced SIMD and floating-point instruction group	T32 decode is from
<i>Advanced SIMD and System register load/store and 64-bit move on page F3-4444</i>	<i>System register access, Advanced SIMD, and floating-point on page F3-4433</i>
<i>Floating-point data-processing on page F3-4449</i>	<i>System register access, Advanced SIMD, and floating-point on page F3-4433</i>
<i>Advanced SIMD and System register 32-bit move on page F3-4447</i>	<i>System register access, Advanced SIMD, and floating-point on page F3-4433</i>
<i>Advanced SIMD data-processing on page F3-4434</i>	<i>System register access, Advanced SIMD, and floating-point on page F3-4433</i>
<i>Advanced SIMD element or structure load/store on page F3-4470</i>	<i>32-bit on page F3-4427</i>

Chapter F4

A32 Instruction Set Encoding

This chapter describes the encoding of the A32 instruction set. It contains the following sections:

- [A32 instruction set encoding on page F4-4494.](#)
- [About the A32 Advanced SIMD and floating-point instructions and their encoding on page F4-4562.](#)

In this chapter:

- In the decode tables, an entry of - for a field value means the value of the field does not affect the decoding.
- In the decode diagrams, a shaded field indicates that the bits in that field are not used in that level of decode.

F4.1 A32 instruction set encoding

The A32 instruction stream is a sequence of word-aligned words. Each A32 instruction is either a single 32-bit word in that stream.

Most A32 instructions can be conditional, with a condition determined by bits[31:28] of the instruction, the cond field. For more information see *The Condition code field in A32 instruction encodings* on page F1-4349. This applies to all instructions except those with the cond field equal to 0b111.

The behavior of an attempt to execute an unallocated instruction is described in *UNDEFINED, UNPREDICTABLE, and CONSTRAINED UNPREDICTABLE instruction set space* on page F1-4356.

For more information on A32 instruction encodings see *Chapter F1 About the T32 and A32 Instruction Descriptions*.

The A32 instruction encoding is:

Table F4-1 Main encoding table for the A32 instruction set

F4.1.15 Advanced SIMD and System register load/store and 64-bit move

This section describes the encoding of the Advanced SIMD and System register load/store and 64-bit move group. The encodings in this section are decoded from *System register access, Advanced SIMD, floating-point, and Supervisor call on page F4-4523*.

This group has encodings in both the T32 and A32 instruction sets. For information about mappings between the encodings of this group, see *About the A32 Advanced SIMD and floating-point instructions and their encoding on page F4-4562*.

Table F4-14 Encoding table for the Advanced SIMD and System register load/store and 64-bit move group

Decode fields		Decode group or instruction page
op0	op1
