This section describes the encoding of the Advanced SIMD one register and modified immediate instruction class. The encodings in this section are decoded from [Advanced SIMD shifts and immediate generation](#) on page F4-4551.

Decode fields		Instruction page
cmode	op	
0xx0	0	VMOV (immediate) - A1 on page F6-5658
0xx0	1	VMVN (immediate) - A1 on page F6-5705
0xx1	0	VORR (immediate) - A1 on page F6-5729
0xx1	1	VBIC (immediate) - A1 on page F6-5364
10x0	0	VMOV (immediate) - A3 on page F6-5659
10x0	1	VMVN (immediate) - A2 on page F6-5705
10x1	0	VORR (immediate) - A2 on page F6-5729
10x1	1	VBIC (immediate) - A2 on page F6-5364

Decode fields		Instruction page
cmode	op	
11xx	0	VMOV (immediate) - <i>A4</i> on page F6-5659
110x	1	VMVN (immediate) - <i>A3</i> on page F6-5706
1110	1	VMOV (immediate) - <i>A5</i> on page F6-5660
1111	1	Unallocated.

Advanced SIMD two registers and shift amount

This section describes the encoding of the Advanced SIMD two registers and shift amount instruction class. The encodings in this section are decoded from *Advanced SIMD shifts and immediate generation* on page F4-4551.

31	30	29	28	27	26	25	24	23	22	21	19	18	16	15	12	11	8	7	6	5	4	3	0
1	1	1	1	0	0	1	U	1	D	imm3H	imm3L	Vd	opc	L	Q	M	1	Vm					

This decode also imposes the constraint:

- imm3H:L != != 0000.

Decode fields					Instruction page
U	imm3L	opc	L	Q	
-	-	0000	-	-	VSHR
-	-	0001	-	-	VSRA
-	-	0010	-	-	VRSHR
-	-	0011	-	-	VRSRA
-	-	0111	-	-	VQSHL, VQSHLU (immediate) - VQSHL,quad,signed-result variant
-	-	1001	0	0	VQSHRN, VQSHRUN - Signed result variant
-	-	1001	0	1	VQRSHRN, VQRSHRUN - Signed result variant
-	-	1010	0	0	VSHLL
-	-	11xx	0	-	VCVT (between floating-point and fixed-point, Advanced SIMD)
-	000	1010	0	0	VMOVL
0	-	0101	-	-	VSHL (immediate)
0	-	1000	0	0	VSHRN
0	-	1000	0	1	VRSHRN
1	-	0100	-	-	VSRI
1	-	0101	-	-	VSLI

Decode fields					Instruction page
U	imm3L	opc	L	Q	
1	-	0110	-	-	VQSHL, VQSHLU (immediate) - VQSHLU,quad,unsigned-result variant
1	-	1000	0	0	VQSHRN, VQSHRUN - Unsigned result variant
1	-	1000	0	1	VQRSHRN, VQRSHRUN - Unsigned result variant

F4.1.23 Memory hints and barriers

This section describes the encoding of the Memory hints and barriers group. The encodings in this section are decoded from *Unconditional instructions* on page F4-4541.

Table F4-22 Encoding table for the Memory hints and barriers group

Decode fields		Decode group or instruction page
op0	op1	
00xx1	-	CONSTRAINED UNPREDICTABLE
01001	-	CONSTRAINED UNPREDICTABLE
01011	-	<i>Barriers</i> on page F4-4553
011x1	-	CONSTRAINED UNPREDICTABLE
0xxx0	-	<i>Preload (immediate)</i> on page F4-4554
1xxx0	0	<i>Preload (register)</i> on page F4-4554
1xxx1	0	CONSTRAINED UNPREDICTABLE
1xxxx	1	Unallocated.

The behavior of the CONSTRAINED UNPREDICTABLE encodings in this table is described in *CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instruction encodings* on page K1-8398.

Barriers

This section describes the encoding of the Barriers instruction class. The encodings in this section are decoded from *Memory hints and barriers* on page F4-4553.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	4	3	0

0100	0100	PSSBB
0101	-	DMB
0110	-	ISB
0111	-	SB
1xxx	-	CONSTRAINED UNPREDICTABLE

The behavior of the CONSTRAINED UNPREDICTABLE encodings in this table is described in [CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instruction encodings on page K1-8398](#).

Preload (immediate)

This section describes the encoding of the Preload (immediate) instruction class. The encodings in this section are decoded from [Memory hints and barriers on page F4-4553](#).

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11					0
1	1	1	1	0	1	0	D	U	R	0	1	Rn	(1)	(1)	(1)	(1)	imm12						

Decode fields			Instruction page
D	R	Rn	
0	0	-	Reserved hint, behaves as NOP .
0	1	-	PLI (immediate, literal)
1	-	1111	PLD (literal)
1	0	!= 1111	PLD, PLDW (immediate) - Preload write variant
1	1	!= 1111	PLD, PLDW (immediate) - Preload read variant

Preload (register)

This section describes the encoding of the Preload (register) instruction class. The encodings in this section are decoded from [Memory hints and barriers on page F4-4553](#).

Decode fields			Instruction page
D	o2	imm5:stype	
0	0	-	Reserved hint, behaves as NOP .
0	1	!= 0000011	PLI (register) - Shift or rotate by value variant
0	1	0000011	PLI (register) - Rotate right with extend variant
1	0	!= 0000011	PLD, PLDW (register) - Preload write, optional shift or rotate variant
1	0	0000011	PLD, PLDW (register) - Preload write, rotate right with extend variant
1	1	!= 0000011	PLD, PLDW (register) - Preload read, optional shift or rotate variant
1	1	0000011	PLD, PLDW (register) - Preload read, rotate right with extend variant

F4.1.24 Advanced SIMD element or structure load/store

This section describes the encoding of the Advanced SIMD element or structure load/store group. The encodings in this section are decoded from [Unconditional instructions](#) on page F4-4541.

This group has encodings in both the T32 and A32 instruction sets. For information about mappings between the encodings of this group, see [About the A32 Advanced SIMD and floating-point instructions and their encoding](#) on page F4-4562

Table F4-23 Encoding table for the Advanced SIMD element or structure load/store group

Decode fields		Decode group or instruction page

F4.2 About the A32 Advanced SIMD and floating-point instructions and their encoding

The Advanced SIMD and floating-point instructions are common to the T32 and A32 instruction sets. These instructions perform Advanced SIMD and floating-point operations on a common register file, the SIMD&FP register file. This means:

- In general, the instructions that load or store registers in this file, or move data between general-purpose registers and this register file, are common to the Advanced SIMD and floating-point instructions.
- There are distinct Advanced SIMD data-processing instructions and floating-point data-processing instructions.

All A32 Advanced SIMD and floating-point instructions have 32-bit encodings. Different groups of these instructions are decoded from different points in the 32-bit A32 instruction decode structure. [Table F4-24 on page F4-4562](#) shows these instruction groups, and where each group is decoded from the overall A32 decode structure:

Table F4-24 Advanced SIMD and floating-point instructions in the A32 decode structure

Advanced SIMD and floating-point instruction group	A32 decode is from
<i>Advanced SIMD and System register load/store and 64-bit move on page F4-4530</i>	<i>System register access, Advanced SIMD, floating-point, and Supervisor call on page F4-4523</i>
<i>Floating-point data-processing on page F4-4536</i>	<i>System register access, Advanced SIMD, floating-point, and Supervisor call on page F4-4523</i>
<i>Advanced SIMD and System register 32-bit move on page F4-4534</i>	<i>System register access, Advanced SIMD, floating-point, and Supervisor call on page F4-4523</i>
<i>Advanced SIMD data-processing on page F4-4543</i>	<i>Unconditional instructions on page F4-4541</i>
<i>Advanced SIMD element or structure load/store on page F4-4555</i>	<i>Unconditional instructions on page F4-4541</i>

Chapter F5

T32 and A32 Base Instruction Set Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- *Alphabetical list of T32 and A32 base instruction set instructions on page F5-4564.*
- *Encoding and use of banked register transfer instructions on page F5-5282.*

F5.1 Alphabetical list of T32 and A32 base instruction set instructions

This section lists every instruction in the T32 and A32 base instruction sets. For details of the format used see [Format of instruction descriptions on page F1-4344](#).

This section is formatted so that each instruction description starts on a new page.

F5.1.1 ADC, ADCS (immediate)

Add with Carry (immediate) adds an immediate value and the Carry flag value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

ADC variant

Applies when `S == 0`.

`ADC{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

ADCS variant

Applies when `S == 1`.

`ADCS{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

Decode for all variants of this encoding

`d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);`

T1

ADC variant

Applies when `S == 0`.

`ADC{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

ADCS variant

Applies when `S == 1`.

```
ADCS{<c>}{<q>} {<Rd>}, <Rn>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = T32ExpandImm(i:imm3:imm8);  
if d == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:
- For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
 - For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.
- For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
- <Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
- For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.
- For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F1-4362](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations();  
  (result, nzcV) = AddWithCarry(R[n], imm32, PSTATE.C);  
  if d == 15 then // Can only occur for A32 encoding  
    if setflags then  
      ALUExceptionReturn(result);  
    else  
      ALUWritePC(result);  
  else  
    R[d] = result;  
    if setflags then  
      PSTATE.<N,Z,C,V> = nzcV;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.2 ADC, ADCS (register)

Add with Carry (register) adds a register value, the Carry flag value, and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The ADC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The ADCS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

ADCS, rotate right with extend variant

Applies when S == 1 && imm3 == 000 && imm2 == 00 && stype == 11.

ADCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

ADCS, shift or rotate by value variant

Applies when S == 1 && !(imm3 == 000 && imm2 == 00 && stype == 11).

ADCS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 ADCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setFlags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the ADC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253. For the ADCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.								
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.								

In T32 assembly:

- Outside an IT block, if ADCS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ADCS <Rd>, <Rn> had been written.
- Inside an IT block, if ADC<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ADC<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], shifted, PSTATE.C);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
  
```

```
else
  R[d] = result;
  if setflags then
    PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.3 ADC, ADCS (register-shifted register)

Add with Carry (register-shifted register) adds a register value, the Carry flag value, and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

Flag setting variant

Applies when S == 1.

ADCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

ADC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
 - LSL when stype = 00
 - LSR when stype = 01
 - ASR when stype = 10
 - ROR when stype = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcw) = AddWithCarry(R[n], shifted, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcw;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.4 ADD, ADDS (immediate)

Add (immediate) adds an immediate value to a register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The ADDS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

ADD variant

Applies when $S == 0$ && $Rn != 11x1$.

ADD{<c>}{<q>} {<Rd>}, {<Rn>}, #<const>

ADDS variant

Applies when $S == 1$ && $Rn != 1101$.

ADDS{<c>}{<q>} {<Rd>}, {<Rn>}, #<const>

Decode for all variants of this encoding

```
if Rn == '1111' && S == '0' then SEE "ADR";
if Rn == '1101' then SEE "ADD (SP plus immediate)";
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);
```

T1

T1 variant

ADD<c>{<q>} <Rd>, <Rn>, #<imm3> // Inside IT block
 ADDS{<q>} <Rd>, <Rn>, #<imm3> // Outside IT block

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); setflags = !InITBlock(); imm32 = ZeroExtend(imm3, 32);

T2

T2 variant

ADD<c>{<q>} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> can be represented in T1
 ADD<c>{<q>} {<Rdn>}, <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> cannot be represented in T1
 ADDS{<q>} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> can be represented in T1
 ADDS{<q>} {<Rdn>}, <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> cannot be represented in T1

Decode for this encoding

d = UInt(Rdn); n = UInt(Rdn); setflags = !InITBlock(); imm32 = ZeroExtend(imm8, 32);

T3

ADD variant

Applies when S == 0.

ADD<c>.W {<Rd>}, <Rn>, #<const> // Inside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or T2
 ADD{<c>}{<q>} {<Rd>}, <Rn>, #<const>

ADDS variant

Applies when S == 1 && Rd != 1111.

ADDS.W {<Rd>}, <Rn>, #<const> // Outside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or T2
 ADDS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

if Rd == '1111' && S == '1' then SEE "CMN (immediate)";
 if Rn == '1101' then SEE "ADD (SP plus immediate)";
 d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = T32ExpandImm(i:imm3:imm8);
 if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

T4

T4 variant

```
ADD{<c>}{<q>} {<Rd>}, <Rn>, #<imm12> // <imm12> cannot be represented in T1, T2, or T3  
ADDW{<c>}{<q>} {<Rd>}, <Rn>, #<imm12> // <imm12> can be represented in T1, T2, or T3
```

Decode for this encoding

```
if Rn == '1111' then SEE "ADR";  
if Rn == '1101' then SEE "ADD (SP plus immediate)";  
d = UInt(Rd); n = UInt(Rn); setflags = FALSE; imm32 = ZeroExtend(i:imm3:imm8, 32);  
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rdn>	Is the general-purpose source and destination register, encoded in the "Rdn" field.
<imm8>	Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used: <ul style="list-style-type: none">For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253.For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. Arm deprecates use of this instruction. For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADDS (SP plus immediate) . If the PC is used, see ADR . For encoding T1: is the general-purpose source register, encoded in the "Rn" field. For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see ADD, ADDS (SP plus immediate) .
<imm3>	Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.
<imm12>	Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
<const>	For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F1-4364 for the range of values. For encoding T3: an immediate value. See Modified immediate constants in T32 instructions on page F1-4362 for the range of values.

When multiple encodings of the same length are available for an instruction, encoding T3 is preferred to encoding T4 (if encoding T4 is required, use the ADDW syntax). Encoding T1 is preferred to encoding T2 if <Rd> is specified and encoding T2 is preferred to encoding T1 if <Rd> is omitted.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], imm32, '0');
    if d == 15 then // Can only occur for A32 encoding
      if setflags then
        ALUExceptionReturn(result);
      else
        ALUWritePC(result);
    else
      R[d] = result;
      if setflags then
        PSTATE.<N,Z,C,V> = nzcvc;
  else
    if ConditionPassed() then
      EncodingSpecificOperations();
      (result, nzcvc) = AddWithCarry(R[n], imm32, '0');
      R[d] = result;
      if setflags then
        PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.5 ADD, ADDS (register)

Add (register) adds a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The ADDS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

ADD, shift or rotate by value variant

Applies when S == 0 && !(imm3 == 000 && imm2 == 00 && stype == 11).

ADD<c>.W {<Rd>}, <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 ADD{<c>}.W {<Rd>}, <Rn>, <Rm> // <Rd> == <Rn>, and <Rd>, <Rn>, <Rm> can be represented in T2
 ADD{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

ADDS, rotate right with extend variant

Applies when $S == 1$ && $imm3 == 000$ && $Rd != 1111$ && $imm2 == 00$ && $styp == 11$.

ADDS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

ADDS, shift or rotate by value variant

Applies when $S == 1$ && $!(imm3 == 000 \&\& imm2 == 00 \&\& styp == 11)$ && $Rd != 1111$.

ADDS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1 or T2
ADDS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE "CMN (register)";
if Rn == '1101' then SEE "ADD (SP plus register)";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rdn> Is the general-purpose source and destination register, encoded in the "DN:Rdn" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is a simple branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

The assembler language allows <Rdn> to be specified once or twice in the assembler syntax. When used inside an IT block, and <Rdn> and <Rm> are in the range R0 to R7, <Rdn> must be specified once so that encoding T2 is preferred to encoding T1. In all other cases there is no difference in behavior when <Rdn> is specified once or twice.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used:

- For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. Arm deprecates use of this instruction.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field.

When used inside an IT block, <Rd> must be specified. When used outside an IT block, <Rd> is optional, and:

- If omitted, this register is the same as <Rn>.
- If present, encoding T1 is preferred to encoding T2.

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used. If the SP is used, see [ADD, ADDS \(SP plus register\)](#).

For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.

For encoding T3: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see [ADD, ADDS \(SP plus register\)](#).

<Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T1 and T3: is the second general-purpose source register, encoded in the "Rm" field.

For encoding T2: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used.

<shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

LSL when stype = 00

LSR when stype = 01

ASR when stype = 10

ROR when stype = 11

<amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Inside an IT block, if `ADD<c> <Rd>, <Rn>, <Rd>` cannot be assembled using encoding T1, it is assembled using encoding T2 as though `ADD<c> <Rd>, <Rn>` had been written. To prevent this happening, use the `.W` qualifier.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzc;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.6 ADD, ADDS (register-shifted register)

Add (register-shifted register) adds a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
!=1111				0	0	0	0	1	0	0	S	Rn	Rd	Rs	0	stype	1	Rm			
cond																					

Flag setting variant

Applies when S == 1.

ADDS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

ADD{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcw) = AddWithCarry(R[n], shifted, '0');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcw;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.7 ADD, ADDS (SP plus immediate)

Add to SP (immediate) adds an immediate value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- The ADDS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

ADD variant

Applies when `S == 0`.

`ADD{<c>}{<q>} {<Rd>}, SP, #<const>`

ADDS variant

Applies when `S == 1`.

`ADDS{<c>}{<q>} {<Rd>}, SP, #<const>`

Decode for all variants of this encoding

`d = UInt(Rd); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);`

T1

T1 variant

`ADD{<c>}{<q>} <Rd>, SP, #<imm8>`

Decode for this encoding

`d = UInt(Rd); setflags = FALSE; imm32 = ZeroExtend(imm8:'00', 32);`

T2

15	14	13	12	11	10	9	8	7	6							0
1	0	1	1	0	0	0	0	0		imm7						

T2 variant

ADD{<c>}{<q>} {SP,} SP, #<imm7>

Decode for this encoding

d = 13; setflags = FALSE; imm32 = ZeroExtend(imm7:'00', 32);

T3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11		8	7					0
1	1	1	1	0	i	0	1	0	0	0	S	1	1	0	1	0	imm3		Rd		imm8						

ADD variant

Applies when S == 0.

ADD{<c>}.W {<Rd>}, SP, #<const> // <Rd>, <const> can be represented in T1 or T2
 ADD{<c>}{<q>} {<Rd>}, SP, #<const>

ADDS variant

Applies when S == 1 && Rd != 1111.

ADDS{<c>}{<q>} {<Rd>}, SP, #<const>

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE "CMN (immediate)";
d = UInt(Rd); setflags = (S == '1'); imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 && !setflags then UNPREDICTABLE;
```

T4

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11		8	7					0
1	1	1	1	0	i	1	0	0	0	0	0	1	1	0	1	0	imm3		Rd		imm8						

T4 variant

ADD{<c>}{<q>} {<Rd>}, SP, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
 ADDW{<c>}{<q>} {<Rd>}, SP, #<imm12> // <imm12> can be represented in T1, T2, or T3

Decode for this encoding

```
d = UInt(Rd); setflags = FALSE; imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
SP,	Is the stack pointer.
<imm7>	Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the "imm7" field as <imm7>/4.
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. Arm deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none">• For the ADD variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253.• For the ADDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. For encoding T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.
<imm8>	Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the "imm8" field as <imm8>/4.
<imm12>	Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
<const>	For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F1-4364 for the range of values. For encoding T3: an immediate value. See Modified immediate constants in T32 instructions on page F1-4362 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcV) = AddWithCarry(SP, imm32, '0');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcV;
```

F5.1.8 ADD, ADDS (SP plus register)

Add to SP (register) adds an optionally-shifted register value to the SP value, and writes the result to the destination register.

If the destination register is not the PC, the ADDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The ADD variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The ADDS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.								

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(SP, shifted, '0');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.9 ADD (immediate, to PC)

ADD to PC adds an immediate value to the $\text{Align}(\text{PC}, 4)$ value to form a PC-relative address, and writes the result to the destination register. Arm recommends that, where possible, software avoids using this alias

This instruction is a pseudo-instruction of the [ADR](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [ADR](#).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of [ADR](#) gives the operational pseudocode for this instruction.

and is never the preferred disassembly.

ADD{<c>}{<q>} <Rd>, PC, #<imm12>

is equivalent to

ADR{<c>}{<q>} <Rd>, <label>

and is never the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

For encoding T1 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<label> For encoding A1: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label.

If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset.

If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`.

Permitted values of the size of the offset are any of the constants described in [Modified immediate constants in A32 instructions on page F1-4364](#).

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T3: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label.

If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset.

If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`.

Permitted values of the size of the offset are 0-4095.

<imm8> Is an unsigned immediate, a multiple of 4, in the range 0 to 1020, encoded in the "imm8" field as `<imm8>/4`.

<imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.

<const> An immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.

Operation for all encodings

The description of [ADR](#) gives the operational pseudocode for this instruction.

F5.1.10 ADR

Form PC-relative address adds an immediate value to the PC value to form a PC-relative address, and writes the result to the destination register.

This instruction is used by the pseudo-instructions [ADD \(immediate, to PC\)](#) and [SUB \(immediate, from PC\)](#). The pseudo-instruction is never the preferred disassembly.

A1

A1 variant

ADR{<c>}{<q>} <Rd>, <label>

Decode for this encoding

d = UInt(Rd); imm32 = A32ExpandImm(imm12); add = TRUE;

A2

A2 variant

ADR{<c>}{<q>} <Rd>, <label>

Decode for this encoding

d = UInt(Rd); imm32 = A32ExpandImm(imm12); add = FALSE;

T1

T1 variant

ADR{<c>}{<q>} <Rd>, <label>

Decode for this encoding

d = UInt(Rd); imm32 = ZeroExtend(imm8:'00', 32); add = TRUE;

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	0
1	1	1	1	0	i	1	0	1	0	1	0	1	1	1	1	0	imm3	Rd	imm8			

T2 variant

ADR{<c>}{<q>} <Rd>, <label>

Decode for this encoding

```
d = UInt(Rd); imm32 = ZeroExtend(i:imm3:imm8, 32); add = FALSE;
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

T3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	0
1	1	1	1	0	i	1	0	0	0	0	0	1	1	1	1	0	imm3	Rd	imm8			

T3 variant

ADR{<c>}.W <Rd>, <label> // <Rd>, <label> can be presented in T1
 ADR{<c>}{<q>} <Rd>, <label>

Decode for this encoding

```
d = UInt(Rd); imm32 = ZeroExtend(i:imm3:imm8, 32); add = TRUE;
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Alias conditions

Alias or pseudo-instruction	of variant	is preferred when
ADD (immediate, to PC)	-	Never
SUB (immediate, from PC)	T2	i:imm3:imm8 == '000000000000'
SUB (immediate, from PC)	A2	imm12 == '000000000000'

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> For encoding A1 and A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

For encoding T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.

<label> For encoding A1 and A2: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label.

If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset.

If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`.

Permitted values of the size of the offset are any of the constants described in *Modified immediate constants in A32 instructions* on page F1-4364.

For encoding T1: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label. Permitted values of the size of the offset are multiples of 4 in the range 0 to 1020.

For encoding T2 and T3: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label.

If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset.

If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`.

Permitted values of the size of the offset are 0-4095.

The instruction aliases permit the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax* on page F2-4377.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if d == 15 then // Can only occur for A32 encodings
        ALUWritePC(result);
    else
        R[d] = result;
```

F5.1.11 AND, ANDS (immediate)

Bitwise AND (immediate) performs a bitwise AND of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

AND variant

Applies when `S == 0`.

AND{<c>}{<q>} {<Rd>}, <Rn>, #<const>

ANDS variant

Applies when `S == 1`.

ANDS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

AND variant

Applies when `S == 0`.

AND{<c>}{<q>} {<Rd>}, <Rn>, #<const>

ANDS variant

Applies when S == 1 && Rd != 1111.

ANDS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE "TST (immediate)";
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the AND variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253. For the ANDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
<const>	For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F1-4364 for the range of values. For encoding T1: an immediate value. See Modified immediate constants in T32 instructions on page F1-4362 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  result = R[n] AND imm32;
  if d == 15 then // Can only occur for A32 encoding
    if setflags then
      ALUExceptionReturn(result);
    else
      ALUWritePC(result);
  else
    R[d] = result;
    if setflags then
      PSTATE.N = result<31>;
      PSTATE.Z = IsZeroBit(result);
```

```
PSTATE.C = carry;  
// PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.12 AND, ANDS (register)

Bitwise AND (register) performs a bitwise AND of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ANDS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The AND variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The ANDS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

ANDS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 ANDS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE "TST (register)";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setFlags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if (d == 15 && !setFlags) || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the AND variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253. For the ANDS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.								
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.								

In T32 assembly:

- Outside an IT block, if ANDS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ANDS <Rd>, <Rn> had been written.
- Inside an IT block, if AND<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though AND<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
  
```

```
else
  R[d] = result;
  if setflags then
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.13 AND, ANDS (register-shifted register)

Bitwise AND (register-shifted register) performs a bitwise AND of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

Flag setting variant

Applies when S == 1.

ANDS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

AND{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
 - LSL when stype = 00
 - LSR when stype = 01
 - ASR when stype = 10
 - ROR when stype = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.14 ASR (immediate)

Arithmetic Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

A1

is equivalent to

MOV{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>

and is always the preferred disassembly.

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. Arm deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.
- <imm> For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as <imm> modulo 32.
For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as <imm> modulo 32.

Operation for all encodings

The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

F5.1.15 ASR (register)

Arithmetic Shift Right (register) shifts a register value right by a variable number of bits, shifting in copies of its sign bit, and writes the result to the destination register. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the [MOV, MOVS \(register-shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register-shifted register\)](#).
- The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

and is always the preferred disassembly.

Assembler symbols

<C> See [Standard assembler syntax fields on page F1-4348](#).

<Q> See [Standard assembler syntax fields on page F1-4348](#).

<Rdm> Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rm> Is the first general-purpose source register, encoded in the "Rm" field.

<Rs> Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

F5.1.16 ASRS (immediate)

Arithmetic Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in copies of its sign bit, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

A1

MOVS, shift or rotate by value variant

ASRS{<c>}{<q>} {<Rd>}, <Rm>, #<imm>

is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, ASR #<imm>

and is always the preferred disassembly.

T2

T2 variant

ASRS{<q>} {<Rd>}, <Rm>, #<imm> // Outside IT block

is equivalent to

MOVS{<q>} <Rd>, <Rm>, ASR #<imm>

and is the preferred disassembly when !InITBlock().

T3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	6	5	4	3	0

I1 = NOT(J1 EOR S); I2 = NOT(J2 EOR S); imm32 = SignExtend(S:I1:I2:imm10:imm11:'0', 32);
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related encodings: [Branches and miscellaneous control](#) on page F3-4464.

Assembler symbols

- <c> For encoding A1, T2 and T4: see [Standard assembler syntax fields](#) on page F1-4348.
 For encoding T1: see [Standard assembler syntax fields](#) on page F1-4348. Must not be AL or omitted.
 For encoding T3: see [Standard assembler syntax fields](#) on page F1-4348. <c> must not be AL or omitted.
- <q> See [Standard assembler syntax fields](#) on page F1-4348.
- <label> For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset.
 Permitted offsets are multiples of 4 in the range –33554432 to 33554428.
 For encoding T1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets imm32 to that offset. Permitted offsets are even numbers in the range –256 to 254.

For encoding T2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets `imm32` to that offset. Permitted offsets are even numbers in the range `-2048` to `2046`.

For encoding T3: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets `imm32` to that offset.

Permitted offsets are even numbers in the range `-1048576` to `1048574`.

For encoding T4: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the B instruction to this label, then selects an encoding that sets `imm32` to that offset.

Permitted offsets are even numbers in the range `-16777216` to `16777214`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    BranchWritePC(PC + imm32, BranchType_DIR);
```

F5.1.19 BFC

Bit Field Clear clears any number of adjacent bits at any position in a register, without affecting the other bits in the register.

A1

A1 variant

BFC{<c>}{<q>} <Rd>, #<lsb>, #<width>

Decode for this encoding

```
d = UInt(Rd); msbit = UInt(msb); lsb = UInt(lsb);
if d == 15 then UNPREDICTABLE;
```

T1

T1 variant

BFC{<c>}{<q>} <Rd>, #<lsb>, #<width>

Decode for this encoding

```
d = UInt(Rd); msbit = UInt(msb); lsb = UInt(imm3:imm2);
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <lsb> For encoding A1: is the least significant bit to be cleared, in the range 0 to 31, encoded in the "lsb" field.
For encoding T1: is the least significant bit that is to be cleared, in the range 0 to 31, encoded in the "imm3:imm2" field.
- <width> Is the number of bits to be cleared, in the range 1 to 32-<lsb>, encoded in the "msb" field as <lsb>+<width>-1.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if msbit >= lsbit then
        R[d]<msbit:lsbit> = Replicate('0', msbit-lsbit+1);
        // Other bits of R[d] are unchanged
    else
        UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $msbit < lsbit$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.20 BFI

Bit Field Insert copies any number of low order bits from a register into the same number of adjacent bits at any position in the destination register.

A1

A1 variant

BFI{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

```
if Rn == '1111' then SEE "BFC";
d = UInt(Rd); n = UInt(Rn); msbit = UInt(msb); lsb = UInt(lsb);
if d == 15 then UNPREDICTABLE;
```

T1

T1 variant

BFI{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

```
if Rn == '1111' then SEE "BFC";
d = UInt(Rd); n = UInt(Rn); msbit = UInt(msb); lsb = UInt(imm3:imm2);
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the general-purpose source register, encoded in the "Rn" field.
- <lsb> For encoding A1: is the least significant destination bit, in the range 0 to 31, encoded in the "lsb" field.
 For encoding T1: is the least significant destination bit, in the range 0 to 31, encoded in the "imm3:imm2" field.

<width> Is the number of bits to be copied, in the range 1 to 32-<lsb>, encoded in the "msb" field as <lsb>+<width>-1.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if msbit >= lsbit then
        R[d]<msbit:lsbit> = R[n]<(msbit-lsbit):0>;
        // Other bits of R[d] are unchanged
    else
        UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $msbit < lsbit$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.21 BIC, BICS (immediate)

Bitwise Bit Clear (immediate) performs a bitwise AND of a register value and the complement of an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

BIC variant

Applies when `S == 0`.

`BIC{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

BICS variant

Applies when `S == 1`.

`BICS{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

BIC variant

Applies when `S == 0`.

`BIC{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

BICS variant

Applies when S == 1.

BICS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setFlags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:
- For the BIC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
 - For the BICS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.
- For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
- <Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
- For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.
- For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F1-4362](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  result = R[n] AND NOT(imm32);
  if d == 15 then // Can only occur for A32 encoding
    if setFlags then
      ALUExceptionReturn(result);
    else
      ALUWritePC(result);
  else
    R[d] = result;
    if setFlags then
      PSTATE.N = result<31>;
      PSTATE.Z = IsZeroBit(result);
```

```
PSTATE.C = carry;  
// PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.22 BIC, BICS (register)

Bitwise Bit Clear (register) performs a bitwise AND of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the BICS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The BIC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The BICS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

1	1	1	0	1	0	1	0	0	0	1	S	Rn	(0)	imm3	Rd	imm2	stype	Rm						

BIC, rotate right with extend variant

Applies when S == 0 && imm3 == 000 && imm2 == 00 && stype == 11.

BIC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

BIC, shift or rotate by value variant

Applies when S == 0 && !(imm3 == 000 && imm2 == 00 && stype == 11).

BIC<c>.W {<Rd>}, <Rn>, <Rm> // Inside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 BIC{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

BICS, rotate right with extend variant

Applies when S == 1 && imm3 == 000 && imm2 == 00 && stype == 11.

BICS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

BICS, shift or rotate by value variant

Applies when S == 1 && !(imm3 == 000 && imm2 == 00 && stype == 11).

BICS.W {<Rd>}, <Rn>, <Rm> // Outside IT block, and <Rd>, <Rn>, <Rm> can be represented in T1
 BICS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none">For the BIC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253.For the BICS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.								
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table><tr><td>LSL</td><td>when stype = 00</td></tr><tr><td>LSR</td><td>when stype = 01</td></tr><tr><td>ASR</td><td>when stype = 10</td></tr><tr><td>ROR</td><td>when stype = 11</td></tr></table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.								

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND NOT(shifted);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.23 BIC, BICS (register-shifted register)

Bitwise Bit Clear (register-shifted register) performs a bitwise AND of a register value and the complement of a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0				
!=1111				0	0	0	1	1	1	0	S	Rn			Rd			Rs			0	stype	1	Rm	
cond																									

Flag setting variant

Applies when S == 1.

BICS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

BIC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<Rs>	Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] AND NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.24 BKPT

Breakpoint causes a Breakpoint Instruction exception.

Breakpoint is always unconditional, even when inside an IT block.

A1

31	28	27	26	25	24	23	22	21	20	19				8	7	6	5	4	3	0
!=1111										imm12					0 1 1 1			imm4		
cond																				

A1 variant

BKPT{<q>} {#}<imm>

Decode for this encoding

```
imm16 = imm12:imm4;
if cond != '1110' then UNPREDICTABLE; // BKPT must be encoded with AL condition
```

CONSTRAINED UNPREDICTABLE behavior

If cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

15	14	13	12	11	10	9	8	7												0
1 0 1 1 1 1 1 0										imm8										

T1 variant

BKPT{<q>} {#}<imm>

Decode for this encoding

```
imm16 = ZeroExtend(imm8, 16);
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<q> See [Standard assembler syntax fields on page F1-4348](#). An BKPT instruction must be unconditional.

- <imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value:
- Is recorded in the Comment field of ESR_ELx.ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
 - Is ignored otherwise.
- For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. This value:
- Is recorded in the Comment field of ESR_ELx.ISS if the Software Breakpoint Instruction exception is taken to an exception level that is using AArch64.
 - Is ignored otherwise.

Operation for all encodings

```
EncodingSpecificOperations();  
AArch32.SoftwareBreakpoint(imm16);
```

F5.1.25 BL, BLX (immediate)

Branch with Link calls a subroutine at a PC-relative address, and setting LR to the return address.

Branch with Link and Exchange Instruction Sets (immediate) calls a subroutine at a PC-relative address, setting LR to the return address, and changes the instruction set from A32 to T32, or from T32 to A32.

A1

A1 variant

BL{<c>}{<q>} <label>

Decode for this encoding

imm32 = SignExtend(imm24:'00', 32); targetInstrSet = InstrSet_A32;

A2

A2 variant

BLX{<c>}{<q>} <label>

Decode for this encoding

imm32 = SignExtend(imm24:H:'0', 32); targetInstrSet = InstrSet_T32;

T1

T1 variant

BL{<c>}{<q>} <label>

Decode for this encoding

T2 variant

BLX{<c>}{<q>} <label>

Decode for this encoding

```
if H == '1' then UNDEFINED;
I1 = NOT(J1 EOR S); I2 = NOT(J2 EOR S); imm32 = SignExtend(S:I1:I2:imm10H:imm10L:'00', 32);
targetInstrSet = InstrSet_A32;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> For encoding A1, T1 and T2: see [Standard assembler syntax fields on page F1-4348](#).
 For encoding A2: see [Standard assembler syntax fields on page F1-4348](#). <c> must be AL or omitted.
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <label> For encoding A1: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding that sets imm32 to that offset.
 Permitted offsets are multiples of 4 in the range –33554432 to 33554428.
 For encoding A2: the label of the instruction that is to be branched to. The assembler calculates the required value of the offset from the PC value of the BLX instruction to this label, then selects an encoding with imm32 set to that offset.
 Permitted offsets are even numbers in the range –33554432 to 33554430.
 For encoding T1: the label of the instruction that is to be branched to.
 The assembler calculates the required value of the offset from the PC value of the BL instruction to this label, then selects an encoding with imm32 set to that offset.
 Permitted offsets are even numbers in the range –16777216 to 16777214.
 For encoding T2: the label of the instruction that is to be branched to.
 The assembler calculates the required value of the offset from the Align(PC, 4) value of the BLX instruction to this label, then selects an encoding with imm32 set to that offset.
 Permitted offsets are multiples of 4 in the range –16777216 to 16777212.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  if CurrentInstrSet() == InstrSet_A32 then
    LR = PC - 4;
  else
    LR = PC<31:1> : '1';
  if targetInstrSet == InstrSet_A32 then
    targetAddress = Align(PC,4) + imm32;
```

```
else  
    targetAddress = PC + imm32;  
    SelectInstrSet(targetInstrSet);  
    BranchWritePC(targetAddress, BranchType_DIRCALL);
```

F5.1.26 BLX (register)

Branch with Link and Exchange (register) calls a subroutine at an address specified in the register, and if necessary changes to the instruction set indicated by bit[0] of the register value. If the value in bit[0] is 0, the instruction set after the branch will be A32. If the value in bit[0] is 1, the instruction set after the branch will be T32.

A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	0	
!=1111				0	0	0	1	0	0	1	0	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	0	0	1	1	Rm
cond																												

A1 variant

BLX{<c>}{<q>} <Rm>

Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	3	2	1	0
0	1	0	0	0	1	1	1	1	1	Rm	(0)	(0)	(0)

T1 variant

BLX{<c>}{<q>} <Rm>

Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rm> Is the general-purpose register holding the address to be branched to, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    target = R[m];
    if CurrentInstrSet() == InstrSet_A32 then
        next_instr_addr = PC - 4;
```

```
    LR = next_instr_addr;  
else  
    next_instr_addr = PC - 2;  
    LR = next_instr_addr<31:1> : '1';  
    BXWritePC(target, BranchType_INDCALL);
```

F5.1.27 BX

Branch and Exchange causes a branch to an address and instruction set specified by a register.

A1

A1 variant

BX{<c>}{<q>} <Rm>

Decode for this encoding

m = UInt(Rm);

T1

T1 variant

BX{<c>}{<q>} <Rm>

Decode for this encoding

m = UInt(Rm);
 if InITBlock() && !LastInITBlock() then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rm> For encoding A1: is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The PC can be used.

For encoding T1: is the general-purpose register holding the address to be branched to, encoded in the "Rm" field. The PC can be used.

————— Note —————

If <Rm> is the PC at a non word-aligned address, it results in UNPREDICTABLE behavior because the address passed to the BXWritePC() pseudocode function has bits<1:0> = '10'.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    BXWritePC(R[m], BranchType_INDIR);
```

F5.1.28 BXJ

Branch and Exchange, previously Branch and Exchange Jazelle.

In Armv8, BXJ behaves as a BX instruction, see [BX](#). This means it causes a branch to an address and instruction set specified by a register.

A1

A1 variant

BXJ{<c>}{<q>} <Rm>

Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE;
```

T1

T1 variant

BXJ{<c>}{<q>} <Rm>

Decode for this encoding

```
m = UInt(Rm);
if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rm> Is the general-purpose register holding the address to be branched to, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    BXWritePC(R[m], BranchType_INDIR);
```

F5.1.29 CBNZ, CBZ

Compare and Branch on Nonzero and Compare and Branch on Zero compare the value in a register with zero, and conditionally branch forward a constant value. They do not affect the condition flags.

T1

15	14	13	12	11	10	9	8	7				3	2	0
1	0	1	1	op	0	i	1	imm5					Rn	

CBNZ variant

Applies when `op == 1`.

CBNZ{<q>} <Rn>, <label>

CBZ variant

Applies when `op == 0`.

CBZ{<q>} <Rn>, <label>

Decode for all variants of this encoding

```
n = UInt(Rn); imm32 = ZeroExtend(i:imm5:'0', 32); nonzero = (op == '1');
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rn> Is the general-purpose register to be tested, encoded in the "Rn" field.

<label> Is the program label to be conditionally branched to. Its offset from the PC, a multiple of 2 and in the range 0 to 126, is encoded as "i:imm5" times 2.

Operation

```
EncodingSpecificOperations();
if nonzero != IsZero(R[n]) then
    CBWritePC(PC + imm32);
```

F5.1.30 CLREX

Clear-Exclusive clears the local monitor of the executing PE.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

cond																									

A1 variant

CLZ{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm);
 if d == 15 || m == 15 then UNPREDICTABLE;

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	1	0	1	1		Rn	1	1	1	1		Rd	1	0	0	0		Rm

T1 variant

CLZ{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); n = UInt(Rn);
 if m != n || d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If m != n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes with the additional decode: m = UInt(Rn);.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field.
For encoding T1: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = CountLeadingZeroBits(R[m]);
    R[d] = result<31:0>;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.32 CMN (immediate)

Compare Negative (immediate) adds a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

CMN{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn); imm32 = A32ExpandImm(imm12);

T1

T1 variant

CMN{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn); imm32 = T32ExpandImm(i:imm3:imm8);
 if n == 15 then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
 For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.
 For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F1-4362](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
(result, nzcvc) = AddWithCarry(R[n], imm32, '0');
PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.33 CMN (register)

Compare Negative (register) adds a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0
!=1111				0	0	0	1	0	1	1	1	Rn	(0)	(0)	(0)	(0)	imm5	stype	0	Rm		
cond																						

Rotate right with extend variant

Applies when imm5 == 00000 && stype == 11.

CMN{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm5 == 00000 && stype == 11).

CMN{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = DecodeImmShift(stype, imm5);

T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
0	1	0	0	0	0	1	0	1	1	Rm	Rn		

T1 variant

CMN{<c>}{<q>} <Rn>, <Rm>

Decode for this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = (SRTType_LSL, 0);

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	1	1	0	0	0	1	Rn	(0)	imm3	1	1	1	1	imm2	stype	Rm					

Rotate right with extend variant

Applies when imm3 == 000 && imm2 == 00 && stype == 11.

CMN{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when `!(imm3 == 000 && imm2 == 00 && stype == 11)`.

`CMN{<c>}.W <Rn>, <Rm> // <Rn>, <Rm>` can be represented in T1
`CMN{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}`

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: LSL when stype = 00 LSR when stype = 01 ASR when stype = 10 ROR when stype = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
(result, nzcvc) = AddWithCarry(R[n], shifted, '0');
PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.34 CMN (register-shifted register)

Compare Negative (register-shifted register) adds a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

CMN{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>

Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
shift_t = DecodeRegShift(stype);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <type> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
 - LSL when stype = 00
 - LSR when stype = 01
 - ASR when stype = 10
 - ROR when stype = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
  EncodingSpecificOperations();
  shift_n = UInt(R[s]<7:0>);
  shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
  (result, nzcV) = AddWithCarry(R[n], shifted, '0');
  PSTATE.<N,Z,C,V> = nzcV;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.35 CMP (immediate)

Compare (immediate) subtracts an immediate value from a register value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

CMP{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn); imm32 = A32ExpandImm(imm12);

T1

T1 variant

CMP{<c>}{<q>} <Rn>, #<imm8>

Decode for this encoding

n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);

T2

T2 variant

CMP{<c>}.W <Rn>, #<const> // <Rd>, <const> can be represented in T1

CMP{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn); imm32 = T32ExpandImm(i:imm3:imm8);
 if n == 15 then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1: is a general-purpose source register, encoded in the "Rn" field. For encoding T2: is the general-purpose source register, encoded in the "Rn" field.
<imm8>	Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
<const>	For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F1-4364 for the range of values. For encoding T2: an immediate value. See Modified immediate constants in T32 instructions on page F1-4362 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], NOT(imm32), '1');
    PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.36 CMP (register)

Compare (register) subtracts an optionally-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

A1

Rotate right with extend variant

Applies when imm5 == 00000 && stype == 11.

CMP{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm5 == 00000 && stype == 11).

CMP{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = DecodeImmShift(stype, imm5);

T1

T1 variant

CMP{<c>}{<q>} <Rn>, <Rm> // <Rn> and <Rm> both from R0-R7

Decode for this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = (SRTYPE_LSL, 0);

T2

T2 variant

CMP{<c>}{<q>} <Rn>, <Rm> // <Rn> and <Rm> not both from R0-R7

Decode for this encoding

```
n = UInt(N:Rn); m = UInt(Rm);
(shift_t, shift_n) = (SRTType_LSL, 0);
if n < 8 && m < 8 then UNPREDICTABLE;
if n == 15 || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n < 8$ && $m < 8$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The condition flags become UNKNOWN.

T3

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	1	1	1	0	1	1	Rn	(0)	imm3	1	1	1	1	imm2	stype	Rm					

Rotate right with extend variant

Applies when $imm3 == 000$ && $imm2 == 00$ && $stype == 11$.

CMP{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when $!(imm3 == 000$ && $imm2 == 00$ && $stype == 11)$.

CMP{<c>}.W <Rn>, <Rm> // <Rn>, <Rm> can be represented in T1 or T2
 CMP{<c>}{<q>} <Rn>, <Rm>, <shift> #<amount>

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
 For encoding T1 and T3: is the first general-purpose source register, encoded in the "Rn" field.
 For encoding T2: is the first general-purpose source register, encoded in the "N:Rn" field.

<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1, T2 and T3: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: LSL when stype = 00 LSR when stype = 01 ASR when stype = 10 ROR when stype = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T3: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(R[n], NOT(shifted), '1');
    PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.37 CMP (register-shifted register)

Compare (register-shifted register) subtracts a register-shifted register value from a register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	8	7	6	5	4	3	0

cond

A1 variant

CMP{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>

Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
shift_t = DecodeRegShift(stype);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <type> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
 - LSL when stype = 00
 - LSR when stype = 01
 - ASR when stype = 10
 - ROR when stype = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
  EncodingSpecificOperations();
  shift_n = UInt(R[s]<7:0>);
  shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
  (result, nzcvc) = AddWithCarry(R[n], NOT(shifted), '1');
  PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.38 CPS, CPSID, CPSIE

Change PE State changes one or more of the `PSTATE`.{A, I, F} interrupt mask bits and, optionally, the `PSTATE.M` mode field, without changing any other `PSTATE` bits.

CPS is treated as NOP if executed in User mode unless it is defined as being `CONSTRAINED UNPREDICTABLE` elsewhere in this section.

The PE checks whether the value being written to `PSTATE.M` is legal. See *Illegal changes to `PSTATE.M`* on page G1-6039.

A1

Change mode variant

Applies when `imod == 00 && M == 1`.

`CPS{<q>} #<mode>` // Cannot be conditional

Interrupt disable variant

Applies when `imod == 11 && M == 0`.

`CPSID{<q>} <iflags>` // Cannot be conditional

Interrupt disable and change mode variant

Applies when `imod == 11 && M == 1`.

`CPSID{<q>} <iflags>` , #<mode> // Cannot be conditional

Interrupt enable variant

Applies when `imod == 10 && M == 0`.

`CPSIE{<q>} <iflags>` // Cannot be conditional

Interrupt enable and change mode variant

Applies when `imod == 10 && M == 1`.

`CPSIE{<q>} <iflags>` , #<mode> // Cannot be conditional

Decode for all variants of this encoding

```
if mode != '00000' && M == '0' then UNPREDICTABLE;
if (imod<1> == '1' && A:I:F == '000') || (imod<1> == '0' && A:I:F != '000') then UNPREDICTABLE;
enable = (imod == '10'); disable = (imod == '11'); changemode = (M == '1');
affectA = (A == '1'); affectI = (I == '1'); affectF = (F == '1');
if (imod == '00' && M == '0') || imod == '01' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `imod == '01'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If `imod == '00' && M == '0'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If `mode != '00000' && M == '0'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: `changemode = TRUE`.
- The instruction executes as described, and the value specified by `mode` is ignored. There are no additional side-effects.

If `imod<1> == '1' && A:I:F == '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction behaves as if `imod<1> == '0'`.
- The instruction behaves as if `A:I:F` has an UNKNOWN nonzero value.

If `imod<1> == '0' && A:I:F != '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction behaves as if `imod<1> == '1'`.
- The instruction behaves as if `A:I:F == '000'`.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	1	1	0	1	1	0	0	1	1	im	(0)	A	I	F

Interrupt disable variant

Applies when `im == 1`.

`CPSID{<q>} <iflags>` // Not permitted in IT block

Interrupt enable variant

Applies when `im == 0`.

`CPSIE{<q>} <iflags>` // Not permitted in IT block

Decode for all variants of this encoding

```
if A:I:F == '000' then UNPREDICTABLE;
enable = (im == '0'); disable = (im == '1'); changemode = FALSE;
affectA = (A == '1'); affectI = (I == '1'); affectF = (F == '1');
if InITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If A:I:F == '000', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	0

Change mode variant

Applies when imod == 00 && M == 1.

CPS{<q>} #<mode> // Not permitted in IT block

Interrupt disable variant

Applies when imod == 11 && M == 0.

CPSID.W <iflags> // Not permitted in IT block

Interrupt disable and change mode variant

Applies when imod == 11 && M == 1.

CPSID{<q>} <iflags>, #<mode> // Not permitted in IT block

Interrupt enable variant

Applies when imod == 10 && M == 0.

CPSIE.W <iflags> // Not permitted in IT block

Interrupt enable and change mode variant

Applies when imod == 10 && M == 1.

CPSIE{<q>} <iflags>, #<mode> // Not permitted in IT block

Decode for all variants of this encoding

```

if imod == '00' && M == '0' then SEE "Hint instructions";
if mode != '00000' && M == '0' then UNPREDICTABLE;
if (imod<1> == '1' && A:I:F == '000') || (imod<1> == '0' && A:I:F != '000') then UNPREDICTABLE;
enable = (imod == '10'); disable = (imod == '11'); changemode = (M == '1');
affectA = (A == '1'); affectI = (I == '1'); affectF = (F == '1');
if imod == '01' || InITBlock() then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If imod == '01', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If mode != '00000' && M == '0', then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.
- The instruction executes with the additional decode: changemode = TRUE.
- The instruction executes as described, and the value specified by mode is ignored. There are no additional side-effects.

If `imod<1> == '1' && A:I:F == '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction behaves as if `imod<1> == '0'`.
- The instruction behaves as if `A:I:F` has an UNKNOWN nonzero value.

If `imod<1> == '0' && A:I:F != '000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction behaves as if `imod<1> == '1'`.
- The instruction behaves as if `A:I:F == '000'`.

Notes for all encodings

Hint instructions: In encoding T2, if the `imod` field is `00` and the `M` bit is `0`, a hint instruction is encoded. To determine which hint instruction, see [Branches and miscellaneous control](#) on page F3-4464.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

<code>i</code>	Sets the I bit in the instruction, causing the specified effect on <code>PSTATE.I</code> , the IRQ interrupt mask bit.						
<code>f</code>	Sets the F bit in the instruction, causing the specified effect on <code>PSTATE.F</code> , the FIQ interrupt mask bit.						
<code><mode></code>	Is the number of the mode to change to, in the range 0 to 31, encoded in the "mode" field.						

Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
  EncodingSpecificOperations();
  if PSTATE.EL != EL0 then
    if enable then
      if affectA then PSTATE.A = '0';
      if affectI then PSTATE.I = '0';
      if affectF then PSTATE.F = '0';
    if disable then
      if affectA then PSTATE.A = '1';
      if affectI then PSTATE.I = '1';
      if affectF then PSTATE.F = '1';
    if changemode then
      // AArch32.WriteModeByInstr() sets PSTATE.IL to 1 if this is an illegal mode change.
  
```

```
        AArch32.WriteModeByInstr(mode);
else
    EncodingSpecificOperations();
    if PSTATE.EL != EL0 then
        if enable then
            if affectA then PSTATE.A = '0';
            if affectI then PSTATE.I = '0';
            if affectF then PSTATE.F = '0';
        if disable then
            if affectA then PSTATE.A = '1';
            if affectI then PSTATE.I = '1';
            if affectF then PSTATE.F = '1';
        if changemode then
            // AArch32.WriteModeByInstr() sets PSTATE.IL to 1 if this is an illegal mode change.
            AArch32.WriteModeByInstr(mode);
```

F5.1.39 CRC32

CRC32 performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x04C11DB7 is used for the CRC calculation.

In Armv8-A, this is an OPTIONAL instruction, and in Armv8.1 it is mandatory for all implementations to implement it.

———— **Note** —————

[ID_ISAR5](#).CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

A1

CRC32B variant

Applies when `sz == 00`.

CRC32B{<q>} <Rd>, <Rn>, <Rm>

CRC32H variant

Applies when `sz == 01`.

CRC32H{<q>} <Rd>, <Rn>, <Rm>

CRC32W variant

Applies when `sz == 10`.

CRC32W{<q>} <Rd>, <Rn>, <Rm>

Decode for all variants of this encoding

```

if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if cond != '1110' then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If `size == 64`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: `size = 32`;

If `cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

C

CRC32B variant

Applies when `sz == 00`.

CRC32B{<q>} <Rd>, <Rn>, <Rm>

CRC32H variant

Applies when `sz == 01`.

CRC32H{<q>} <Rd>, <Rn>, <Rm>

CRC32W variant

Applies when `sz == 10`.

CRC32W{<q>} <Rd>, <Rn>, <Rm>

Decode for all variants of this encoding

```

if InITBlock() then UNPREDICTABLE;
if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If `size == 64`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: `size = 32;`

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <q> See [Standard assembler syntax fields on page F1-4348](#). An CRC32 instruction must be unconditional.
- <Rd> Is the general-purpose accumulator output register, encoded in the "Rd" field.
- <Rn> Is the general-purpose accumulator input register, encoded in the "Rn" field.

<Rm> Is the general-purpose data source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();

    acc = R[n];           // accumulator
    val = R[m]<size-1:0>; // input value
    poly = (if crc32c then 0x1EDC6F41 else 0x04C11DB7)<31:0>;
    tempacc = BitReverse(acc):Zeros(size);
    tempval = BitReverse(val):Zeros(32);
    // Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
    R[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.40 CRC32C

CRC32C performs a cyclic redundancy check (CRC) calculation on a value held in a general-purpose register. It takes an input CRC value in the first source operand, performs a CRC on the input value in the second source operand, and returns the output CRC value. The second source operand can be 8, 16, or 32 bits. To align with common usage, the bit order of the values is reversed as part of the operation, and the polynomial 0x1EDC6F41 is used for the CRC calculation.

In Armv8-A, this is an OPTIONAL instruction, and in Armv8.1 it is mandatory for all implementations to implement it.

———— **Note** —————

[ID_ISAR5](#).CRC32 indicates whether this instruction is supported in the T32 and A32 instruction sets.

A1

CRC32CB variant

Applies when `sz == 00`.

CRC32CB{<q>} <Rd>, <Rn>, <Rm>

CRC32CH variant

Applies when `sz == 01`.

CRC32CH{<q>} <Rd>, <Rn>, <Rm>

CRC32CW variant

Applies when `sz == 10`.

CRC32CW{<q>} <Rd>, <Rn>, <Rm>

Decode for all variants of this encoding

```

if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
if cond != '1110' then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If `size == 64`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: `size = 32`.

If `cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

CRC32CB variant

Applies when `sz == 00`.

CRC32CB{<q>} <Rd>, <Rn>, <Rm>

CRC32CH variant

Applies when `sz == 01`.

CRC32CH{<q>} <Rd>, <Rn>, <Rm>

CRC32CW variant

Applies when `sz == 10`.

CRC32CW{<q>} <Rd>, <Rn>, <Rm>

Decode for all variants of this encoding

```

if InITBlock() then UNPREDICTABLE;
if ! HaveCRCExt() then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
size = 8 << UInt(sz);
crc32c = (C == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if size == 64 then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If `size == 64`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: `size = 32;`

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

    tempval = BitReverse(val):Zeros(32);
    // Poly32Mod2 on a bitstring does a polynomial Modulus over {0,1} operation
    R[d] = BitReverse(Poly32Mod2(tempacc EOR tempval, poly));
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.41 CSDB

Consumption of Speculative Data Barrier is a memory barrier that controls speculative execution and data value prediction.

No instruction other than branch instructions and instructions that write to the PC appearing in program order after the CSDB can be speculatively executed using the results of any:

- Data value predictions of any instructions.
- PSTATE.{N,Z,C,V} predictions of any instructions other than conditional branch instructions and conditional instructions that write to the PC appearing in program order before the CSDB that have not been architecturally resolved.

———— **Note** ————

For purposes of the definition of CSDB, PSTATE.{N,Z,C,V} is not considered a data value. This definition permits:

- Control flow speculation before and after the CSDB.
- Speculative execution of conditional data processing instructions after the CSDB, unless they use the results of data value or PSTATE.{N,Z,C,V} predictions of instructions appearing in program order before the CSDB that have not been architecturally resolved.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<option> Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "option" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
```

F5.1.43 DCPS1

Debug Change PE State to EL1 allows the debugger to move the PE into EL1 from EL0 or to a specific mode at the current Exception level.

DCPS1 is UNDEFINED if any of:

- The PE is in Non-debug state.
- EL2 is implemented, EL2 is implemented and enabled in the current Security state, and any of:
 - EL2 is using AArch32 and HCR.TGE is set to 1.
 - EL2 is using AArch64 and HCR_EL2.TGE is set to 1.

When the PE executes DCPS1 at EL0, EL1 or EL3:

- If EL3 or EL1 is using AArch32, the PE enters SVC mode and LR_svc, SPSR_svc, DLR, and DSPSR become UNKNOWN. If DCPS1 is executed in Monitor mode, SCR.NS is cleared to 0.
- If EL1 is using AArch64, the PE enters EL1 using AArch64, selects SP_EL1, and ELR_EL1, ESR_EL1, SPSR_EL1, DLR_EL0 and DSPSR_EL0 become UNKNOWN.

When the PE executes DCPS1 at EL2 the PE does not change mode, and ELR_hyp, HSR, SPSR_hyp, DLR and DSPSR become UNKNOWN.

For more information on the operation of this instruction, see [DCPS<n> on page H2-7366](#).

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . Must be AL or omitted. For encoding T1: see Standard assembler syntax fields on page F1-4348 .						
<q>	See Standard assembler syntax fields on page F1-4348 .						
<option>	Specifies an optional limitation on the barrier operation. Values are: <table> <tr> <td>SY</td> <td>Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Can be omitted. This option is referred to as the full system barrier. Encoded as option = 0b1111.</td> </tr> <tr> <td>ST</td> <td>Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. SYST is a synonym for ST. Encoded as option = 0b1110.</td> </tr> <tr> <td>LD</td> <td>Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1101.</td> </tr> </table>	SY	Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Can be omitted. This option is referred to as the full system barrier. Encoded as option = 0b1111.	ST	Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. SYST is a synonym for ST. Encoded as option = 0b1110.	LD	Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1101.
SY	Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Can be omitted. This option is referred to as the full system barrier. Encoded as option = 0b1111.						
ST	Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. SYST is a synonym for ST. Encoded as option = 0b1110.						
LD	Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1101.						

ISH	Inner Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b1011.
ISHST	Inner Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b1010.
ISHLD	Inner Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1001.
NSH	Non-shareable is the required shareability domain, reads and writes are the required access, both before and after the barrier instruction. Encoded as option = 0b0111.
NSHST	Non-shareable is the required shareability domain, writes are the required access type both before and after the barrier instruction. Encoded as option = 0b0110.
NSHLD	Non-shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0101.
OSH	Outer Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b0011.
OSHST	Outer Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b0010.
OSHLD	Outer Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0001.

For more information on whether an access is before or after a barrier instruction, see [Data Memory Barrier \(DMB\) on page E2-4300](#). All other encodings of option are reserved. All unsupported and reserved options must execute as a full system DMB operation, but software must not rely on this behavior.

————— **Note** —————

The instruction supports the following alternative <option> values, but Arm recommends that software does not use these alternative values:

- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST as an alias for NSHST.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    case option of
        when '0001' domain = MBRReqDomain_OuterShareable; types = MBRReqTypes_Reads;
        when '0010' domain = MBRReqDomain_OuterShareable; types = MBRReqTypes_Writes;
        when '0011' domain = MBRReqDomain_OuterShareable; types = MBRReqTypes_All;
        when '0101' domain = MBRReqDomain_Nonshareable; types = MBRReqTypes_Reads;

        if HCR.BSU == '10' && domain != MBRReqDomain_FullSystem then

```

```
domain = MReqDomain_OuterShareable;  
if HCR.BSU == '01' && domain == MReqDomain_Nonshareable then  
    domain = MReqDomain_InnerShareable;
```

```
DataMemoryBarrier(domain, types);
```

F5.1.47 DSB

Data Synchronization Barrier is a memory barrier that ensures the completion of memory accesses, see [Data Synchronization Barrier \(DSB\) on page E2-4301](#).

An AArch32 DSB instruction does not require the completion of any AArch64 TLB maintenance instructions, regardless of the nXS qualifier, appearing in program order before the AArch32 DSB.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). Must be AL or omitted.
 For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <option> Specifies an optional limitation on the barrier operation. Values are:
 - SY Full system is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Can be omitted. This option is referred to as the full system barrier. Encoded as option = 0b1111.
 - ST Full system is the required shareability domain, writes are the required access type, both before and after the barrier instruction. SYST is a synonym for ST. Encoded as option = 0b1110.

LD	Full system is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1101.
ISH	Inner Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b1011.
ISHST	Inner Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b1010.
ISHLD	Inner Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b1001.
NSH	Non-shareable is the required shareability domain, reads and writes are the required access, both before and after the barrier instruction. Encoded as option = 0b0111.
NSHST	Non-shareable is the required shareability domain, writes are the required access type both before and after the barrier instruction. Encoded as option = 0b0110.
NSHLD	Non-shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0101.
OSH	Outer Shareable is the required shareability domain, reads and writes are the required access types, both before and after the barrier instruction. Encoded as option = 0b0011.
OSHST	Outer Shareable is the required shareability domain, writes are the required access type, both before and after the barrier instruction. Encoded as option = 0b0010.
OSHLD	Outer Shareable is the required shareability domain, reads are the required access type before the barrier instruction, and reads and writes are the required access types after the barrier instruction. Encoded as option = 0b0001.

For more information on whether an access is before or after a barrier instruction, see [Data Synchronization Barrier \(DSB\) on page E2-4301](#). All other encodings of option are reserved, other than the values 0b0000 and 0b0100. All unsupported and reserved options must execute as a full system DSB operation, but software must not rely on this behavior.

———— **Note** ————

The value 0b0000 is used to encode SSBB and the value 0b0100 is used to encode PSSBB.

The instruction supports the following alternative <option> values, but Arm recommends that software does not use these alternative values:

- SH as an alias for ISH.
- SHST as an alias for ISHST.
- UN as an alias for NSH.
- UNST as an alias for NSHST.

DataSynchronizationBarrier(domain, types, nXS);

```

F5.1.48 EOR, EORS (immediate)

Bitwise Exclusive OR (immediate) performs a bitwise Exclusive OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

EOR variant

Applies when `S == 0`.

`EOR{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

EORS variant

Applies when `S == 1`.

`EORS{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

EOR variant

Applies when `S == 0`.

`EOR{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

EORS variant

Applies when S == 1 && Rd != 1111.

EORS{<c>}{<q>} {<Rd>,} <Rn>, #<const>

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE "TEQ (immediate)";
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253. For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
<Rn>	For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
<const>	For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F1-4364 for the range of values. For encoding T1: an immediate value. See Modified immediate constants in T32 instructions on page F1-4362 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  result = R[n] EOR imm32;
  if d == 15 then // Can only occur for A32 encoding
    if setflags then
      ALUExceptionReturn(result);
    else
      ALUWritePC(result);
  else
    R[d] = result;
    if setflags then
      PSTATE.N = result<31>;
      PSTATE.Z = IsZeroBit(result);
```

```
PSTATE.C = carry;  
// PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.49 EOR, EORS (register)

Bitwise Exclusive OR (register) performs a bitwise Exclusive OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the EORS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The EOR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The EORS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the EOR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253. For the EORS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.								
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.								

In T32 assembly:

- Outside an IT block, if EORS <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EORS <Rd>, <Rn> had been written
- Inside an IT block, if EOR<c> <Rd>, <Rn>, <Rd> has <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though EOR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
  
```

```
else
  R[d] = result;
  if setflags then
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.50 EOR, EORS (register-shifted register)

Bitwise Exclusive OR (register-shifted register) performs a bitwise Exclusive OR of a register value and a register-shifted register value. It writes the result to the destination register, and can optionally update the condition flags based on the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0

cond																															

Flag setting variant

Applies when S == 1.

EORS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

EOR{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.51 ERET

Exception Return.

The PE branches to the address held in the register holding the preferred return address, and restores `PSTATE` from `SPSR_<current_mode>`.

The register holding the preferred return address is:

- `ELR_hyp`, when executing in Hyp mode.
- `LR`, when executing in a mode other than Hyp mode, User mode, or System mode.

The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state on page G1-6066*.

Exception Return is `CONSTRAINED UNPREDICTABLE` in User mode and System mode.

In Debug state, the T1 encoding of ERET executes the DRPS operation.

        // In AArch32 Debug state, all instructions are T32 and unconditional.
        PSTATE.IT = '00000000'; PSTATE.T = '1'; // PSTATE.J is RES0
        DLR = bits(32) UNKNOWN; DSPSR = bits(32) UNKNOWN;
        UpdateEDSCRFIELDS(); // Update EDSCR PE state flags
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

F5.1.52 ESB

Error Synchronization Barrier is an error synchronization event that might also update DISR and VDISR. This instruction can be used at all Exception levels and in Debug state.

In Debug state, this instruction behaves as if SError interrupts are masked at all Exception levels. See Error Synchronization Barrier in the ARM(R) Reliability, Availability, and Serviceability (RAS) Specification, Armv8, for Armv8-A architecture profile.

If the RAS Extension is not implemented, this instruction executes as a NOP.

T1 variant

HLT{<q>} {#}<imm>

Decode for this encoding

```
if EDSCR.HDE == '0' || !HaltingAllowed() then UNDEFINED;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<q> See [Standard assembler syntax fields on page F1-4348](#). An HLT instruction must be unconditional.

<imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is for assembly and disassembly only. It is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

For encoding T1: is a 6-bit unsigned immediate, in the range 0 to 63, encoded in the "imm6" field. This value is for assembly and disassembly only. It is ignored by the PE, but can be used by a debugger to store more information about the halting breakpoint.

Operation for all encodings

```
EncodingSpecificOperations();  
Halt(DebugHalt_HaltInstruction);
```

F5.1.54 HVC

Hypervisor Call causes a Hypervisor Call exception. For more information, see [Hypervisor Call \(HVC\) exception on page G1-6084](#). Software executing at EL1 can use this instruction to call the hypervisor to request a service.

The HVC instruction is UNDEFINED:

- When EL3 is implemented and using AArch64, and `SCR_EL3.HCE` is set to 0.
- In Non-secure EL1 modes when EL3 is implemented and using AArch32, and `SCR.HCE` is set to 0.
- When EL3 is not implemented and either `HCR_EL2.HCD` is set to 1 or `HCR.HCD` is set to 1.
- When EL2 is not implemented.
- In Secure state, if EL2 is not enabled in the current Security state.
- In User mode.

The HVC instruction is CONSTRAINED UNPREDICTABLE in Hyp mode when EL3 is implemented and using AArch32, and `SCR.HCE` is set to 0.

On executing an HVC instruction, the `HSR` reports the exception as a Hypervisor Call exception, using the EC value `0x12`, and captures the value of the immediate argument, see [Use of the HSR on page G5-6381](#).

A1

A1 variant

HVC{<q>} {#}<imm16>

Decode for this encoding

```
if cond != '1110' then UNPREDICTABLE;
imm16 = imm12:imm4;
```

CONSTRAINED UNPREDICTABLE behavior

If `cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

T1 variant

HVC{<q>} {#}<imm16>

Decode for this encoding

```
imm16 = imm4:imm12;  
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<q> See [Standard assembler syntax fields on page F1-4348](#). An HVC instruction must be unconditional.

<imm16> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. This value is for assembly and disassembly only. It is reported in the HSR but otherwise is ignored by hardware. An HVC handler might interpret imm16, for example to determine the required service.

For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. This value is for assembly and disassembly only. It is reported in the HSR but otherwise is ignored by hardware. An HVC handler might interpret imm16, for example to determine the required service.

Operation for all encodings

```
EncodingSpecificOperations();  
if !HaveEL(EL2) || PSTATE.EL == EL0 || (IsSecure() && !IsSecureEL2Enabled()) then  
    UNDEFINED;  
  
if HaveEL(EL3) then  
    if ELUsingAArch32(EL3) && SCR.HCE == '0' && PSTATE.EL == EL2 then  
        UNPREDICTABLE;  
    else  
        hvc_enable = SCR_GEN[].HCE;  
else  
    hvc_enable = if ELUsingAArch32(EL2) then NOT(HCR.HCD) else NOT(HCR_EL2.HCD);  
  
if hvc_enable == '0' then  
    UNDEFINED;  
else  
    AArch32.CallHypervisor(imm16);
```

CONSTRAINED UNPREDICTABLE behavior

If ELUsingAArch32(EL3) && SCR.HCE == '0' && PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

F5.1.55 ISB

Instruction Synchronization Barrier flushes the pipeline in the PE and is a context synchronization event. For more information, see [Instruction Synchronization Barrier \(ISB\)](#) on page E2-4300.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields](#) on page F1-4348. Must be AL or omitted.
 For encoding T1: see [Standard assembler syntax fields](#) on page F1-4348.
- <q> See [Standard assembler syntax fields](#) on page F1-4348.
- <option> Specifies an optional limitation on the barrier operation. Values are:
 - SY Full system barrier operation, encoded as option = 0b1111. Can be omitted.
 All other encodings of option are reserved. The corresponding instructions execute as full system barrier operations, but must not be relied upon by software.

Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    InstructionSynchronizationBarrier();
```

F5.1.56 IT

If-Then makes up to four following instructions (the IT block) conditional. The conditions for the instructions in the IT block are the same as, or the inverse of, the condition the IT instruction specifies for the first instruction in the block.

The IT instruction itself does not affect the condition flags, but the execution of the instructions in the IT block can change the condition flags.

16-bit instructions in the IT block, other than CMP, CMN and TST, do not set the condition flags. An IT instruction with the AL condition can change the behavior without conditional execution.

The architecture permits exception return to an instruction in the IT block only if the restoration of the CPSR restores PSTATE.IT to a state consistent with the conditions specified by the IT instruction. Any other exception return to an instruction in an IT block is UNPREDICTABLE. Any branch to a target instruction in an IT block is not permitted, and if such a branch is made it is UNPREDICTABLE what condition is used when executing that target instruction and any subsequent instruction in the IT block.

Many uses of the IT instruction are deprecated for performance reasons, and an implementation might include ITD controls that can disable those uses of IT, making them UNDEFINED.

For more information see [Conditional execution on page F1-4349](#) and [Conditional instructions on page F2-4377](#). The first of these sections includes more information about the ITD controls.

T1

15	14	13	12	11	10	9	8	7	4	3	0
1	0	1	1	1	1	1	1	firstcond	!=0000		
mask											

T1 variant

IT{<x>{<y>{<z>}}}{<q>} <cond>

Decode for this encoding

```
if mask == '0000' then SEE "Related encodings";
if firstcond == '1111' || (firstcond == '1110' && BitCount(mask) != 1) then UNPREDICTABLE;
if InITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If firstcond == '1111' || (firstcond == '1110' && BitCount(mask) != 1), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The '1111' condition is treated as being the same as the '1110' condition, meaning always, and the ITSTATE state machine is progressed in the same way as for any other cond_base value.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related encodings: [Miscellaneous 16-bit instructions on page F3-4423](#).

Assembler symbols

- <x> The condition for the second instruction in the IT block. If omitted, the "mask" field is set to 0b1000. If present it is encoded in the "mask[3]" field:
- | | |
|---|------------------|
| T | firstcond[0] |
| E | NOT firstcond[0] |
- <y> The condition for the third instruction in the IT block. If omitted and <x> is present, the "mask[2:0]" field is set to 0b100. If <y> is present it is encoded in the "mask[2]" field:
- | | |
|---|------------------|
| T | firstcond[0] |
| E | NOT firstcond[0] |
- <z> The condition for the fourth instruction in the IT block. If omitted and <y> is present, the "mask[1:0]" field is set to 0b10. If <z> is present, the "mask[0]" field is set to 1, and it is encoded in the "mask[1]" field:
- | | |
|---|------------------|
| T | firstcond[0] |
| E | NOT firstcond[0] |
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <cond> The condition for the first instruction in the IT block, encoded in the "firstcond" field. See [Table F1-1 on page F1-4349](#) for the range of conditions available, and the encodings.

The conditions specified in an IT instruction must match those specified in the syntax of the instructions in its IT block. When assembling to A32 code, assemblers check IT instruction syntax for validity but do not generate assembled instructions for them. See [Conditional instructions on page F2-4377](#).

Operation

```
EncodingSpecificOperations();  
AArch32.CheckITEnabled(mask);  
PSTATE.IT<7:0> = firstcond:mask;  
ShouldAdvanceIT = FALSE;
```

F5.1.57 LDA

Load-Acquire Word loads a word from memory and writes it to a register. The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page E2-4305

For more information about support for shared memory see *Synchronization and semaphores* on page E2-4331. For information about memory accesses see *Memory accesses* on page F1-4353.

A1

A1 variant

LDA{<c>}{<q>} <Rt>, [<Rn>]

t = UInt(Rt); n = UInt(Rn);
 if t == 15 || n == 15 then UNPREDICTABLE;

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	0	1	0	0	0	1	1	0	1	Rn	Rt	(1)	(1)	(1)	(1)	1	0	0	0	(1)	(1)	(1)	(1)		

T1 variant

LDAB{<c>}{<q>} <Rt>, [<Rn>]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn);
 if t == 15 || n == 15 then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields](#) on page F1-4348.
- <q> See [Standard assembler syntax fields](#) on page F1-4348.
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    R[t] = ZeroExtend(Mem0[address, 1], 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.59 LDAEX

Load-Acquire Exclusive Word loads a word from memory, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page E2-4305.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-4331. For information about memory accesses see *Memory accesses* on page F1-4353.

LDAEXB{<c>}{<q>} <Rt>, [<Rn>]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn);
 if t == 15 || n == 15 then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address, 1);
    R[t] = ZeroExtend(Mem0[address, 1], 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.61 LDAEXD

Load-Acquire Exclusive Doubleword loads a doubleword from memory, writes it to two registers and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor
- Causes the executing PE to indicate an active exclusive access in the local monitor.

The instruction also acts as a barrier instruction with the ordering requirements described in [Load-Acquire, Store-Release on page E2-4305](#).

For more information about support for shared memory see [Synchronization and semaphores on page E2-4331](#). For information about memory accesses see [Memory accesses on page F1-4353](#).

cond																											

A1 variant

LDAEXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
t = UInt(Rt); t2 = t + 1; n = UInt(Rn);
if Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: t<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side effects.

If Rt == '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	2	1	0
1	1	1	0	1	0	0	0	1	1	0	1	Rn	Rt	Rt2	1	1	1	1	(1)	(1)	(1)	(1)			

T1 variant

LDAEXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn);  
if t == 15 || t2 == 15 || t == t2 || n == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $t == t2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14. For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>. For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    address = R[n];  
    AArch32.SetExclusiveMonitors(address, 8);  
    value = MemO[address, 8];  
    // Extract words from 64-bit loaded value such that R[t] is  
    // loaded from address and R[t2] from address+4.  
    R[t] = if BigEndian(AccType_ORDERED) then value<63:32> else value<31:0>;  
    R[t2] = if BigEndian(AccType_ORDERED) then value<31:0> else value<63:32>;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.62 LDAEXH

Load-Acquire Exclusive Halfword loads a halfword from memory, zero-extends it to form a 32-bit word, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page E2-4305.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-4331. For information about memory accesses see *Memory accesses* on page F1-4353.

    R[t] = ZeroExtend(Mem0[address, 2], 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.64 LDC (immediate)

Load data to System register (immediate) calculates an address from a base register value and an immediate offset, loads a word from memory, and writes it to the **DBGDTRXint** System register. It can use offset, post-indexed, pre-indexed, or unindexed addressing. For information about memory accesses see [Memory accesses on page F1-4353](#).

In an implementation that includes EL2, the permitted LDC access to **DBGDTRXint** can be trapped to Hyp mode, meaning that an attempt to execute an LDC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [Trapping general Non-secure System register accesses to debug registers on page G1-6143](#).

For simplicity, the LDC pseudocode does not show this possible trap to Hyp mode.

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDC{<c>}{<q>} p14, c5, [<Rn>{, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 1$.

LDC{<c>}{<q>} p14, c5, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDC{<c>}{<q>} p14, c5, [<Rn>, #<+/-><imm>]!

Unindexed variant

Applies when $P == 0 \ \&\& \ U == 1 \ \&\& \ W == 0$.

LDC{<c>}{<q>} p14, c5, [<Rn>], <option>

Decode for all variants of this encoding

```

if Rn == '1111' then SEE "LDC (literal)";
if P == '0' && U == '0' && W == '0' then UNDEFINED;
n = UInt(Rn); cp = 14;
imm32 = ZeroExtend(imm8:'00', 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
    
```

T1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDC{<c>}{<q>} p14, c5, [<Rn>{, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

LDC{<c>}{<q>} p14, c5, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDC{<c>}{<q>} p14, c5, [<Rn>, #<+/-><imm>]!

Unindexed variant

Applies when P == 0 && U == 1 && W == 0.

LDC{<c>}{<q>} p14, c5, [<Rn>], <option>

Decode for all variants of this encoding

```
if Rn == '1111' then SEE "LDC (literal)";
if P == '0' && U == '0' && W == '0' then UNDEFINED;
n = UInt(Rn); cp = 14;
imm32 = ZeroExtend(imm8:'00', 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
```

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .				
<q>	See Standard assembler syntax fields on page F1-4348 .				
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see LDC (literal) .				
<option>	Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.				
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>-</td> <td>when U = 0</td> </tr> <tr> <td>+</td> <td>when U = 1</td> </tr> </table>	-	when U = 0	+	when U = 1
-	when U = 0				
+	when U = 1				
<imm>	Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.				

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
  address = if index then offset_addr else R[n];

  // System register write to DBGDTRTXint.
  AArch32.SysRegWriteM(cp, ThisInstr(), address);

  if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.65 LDC (literal)

Load data to System register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to the **DBGDTRTXint** System register. For information about memory accesses see [Memory accesses on page F1-4353](#).

In an implementation that includes EL2, the permitted LDC access to **DBGDTRTXint** can be trapped to Hyp mode, meaning that an attempt to execute an LDC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [Trapping general Non-secure System register accesses to debug registers on page G1-6143](#).

For simplicity, the LDC pseudocode does not show this possible trap to Hyp mode.

A1

A1 variant

Applies when $!(P == 0 \ \&\& \ U == 0 \ \&\& \ W == 0)$.

```
LDC{<c>}{<q>} p14, c5, <label>
LDC{<c>}{<q>} p14, c5, [PC, #+/-<imm>]
LDC{<c>}{<q>} p14, c5, [PC], <option>
```

Decode for this encoding

```
if P == '0' && U == '0' && W == '0' then UNDEFINED;
index = (P == '1'); add = (U == '1'); cp = 14; imm32 = ZeroExtend(imm8:'00', 32);
if W == '1' || (P == '0' && CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $W == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

T1 variant

Applies when $!(P == 0 \ \&\& \ U == 0 \ \&\& \ W == 0)$.

```
LDC{<c>}{<q>} p14, c5, <label>
LDC{<c>}{<q>} p14, c5, [PC, #+/-<imm>]
```

Decode for this encoding

```
if P == '0' && U == '0' && W == '0' then UNDEFINED;
index = (P == '1'); add = (U == '1'); cp = 14; imm32 = ZeroExtend(imm8:'00', 32);
if W == '1' || (P == '0' && CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $W == '1' || P == '0'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes as LDC (immediate) with writeback to the PC. The instruction is handled as described in *Using R15 by instruction on page K1-8387*.

Assembler symbols

<c>	See <i>Standard assembler syntax fields on page F1-4348</i> .
<q>	See <i>Standard assembler syntax fields on page F1-4348</i> .
<option>	Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.
<label>	The label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the $Align(PC, 4)$ value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020. If the offset is zero or positive, imm32 is equal to the offset and $add == TRUE$ (encoded as $U == 1$). If the offset is negative, imm32 is equal to minus the offset and $add == FALSE$ (encoded as $U == 0$).
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when $U = 0$ + when $U = 1$
<imm>	Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as $\langle imm \rangle / 4$.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see *Use of labels in UAL instruction syntax on page F2-4377*.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
offset_addr = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
address = if index then offset_addr else Align(PC,4);

// System register write to DBGDTRXint.
Arch32.SysRegWriteM(cp, ThisInstr(), address);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.66 LDM, LDMIA, LDMFD

Load Multiple (Increment After, Full Descending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the highest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

Armv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see [FEAT_LSMAOC](#). The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#). Related system instructions are [LDM \(User registers\)](#) and [LDM \(exception return\)](#).

This instruction is used by the alias [POP \(multiple registers\)](#). See [Alias conditions on page F5-4724](#) for details of when each alias is preferred.

A1

A1 variant

```
LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack
```

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If $\text{wback} \ \&\& \ \text{registers}\langle n \rangle == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

15	14	13	12	11	10	8	7					0
1	1	0	0	1	Rn	register_list						

T1 variant

LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

Decode for this encoding

```
n = UInt(Rn); registers = '00000000':register_list; wback = (registers<n> == '0');
if BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

T2

15	14	13	12	11	10	9	8	7	6	5	4	3					0	15	14	13					0
1	1	1	0	1	0	0	0	1	0	W	1	Rn	P	M	register_list										

T2 variant

LDM{IA}{<c>}.W <Rn>{!}, <registers> // Preferred syntax, if <Rn>, '!' and <registers> can be represented in T1
 LDMFD{<c>}.W <Rn>{!}, <registers> // Alternate syntax, Full Descending stack, if <Rn>, '!' and <registers> can be represented in T1
 LDM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 LDMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

Decode for this encoding

```
n = UInt(Rn); registers = P:M:register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<13> == '1' then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If `wback && registers<n> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If `BitCount(registers) == 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads a single register using the specified addressing modes.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If `registers<13> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

If `P == '1' && M == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Alias conditions

Alias	of variant	is preferred when
POP (multiple registers)	T2	<code>W == '1' && Rn == '1101' && BitCount(P:M:register_list) > 1</code>
POP (multiple registers)	A1	<code>W == '1' && Rn == '1101' && BitCount(register_list) > 1</code>

Assembler symbols

IA	Is an optional suffix for the Increment After form.
<C>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

- ! For encoding A1 and T2: the address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
For encoding T1: the address adjusted by the size of the data loaded is written back to the base register. It is omitted if <Rn> is included in <registers>, otherwise it must be present.
- <registers> For encoding A1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.
The PC can be in the list.
Arm deprecates using these instructions with both the LR and the PC in the list.
For encoding T1: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field.
For encoding T2: is a list of one or more registers to be loaded, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0.
If the PC is in the list:
- The LR must not be in the list.
 - The instruction must be either outside any IT block, or the last instruction in an IT block.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemS[address,4]; address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemS[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] + 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.67 LDM (exception return)

Load Multiple (exception return) loads multiple registers from consecutive memory locations using an address from a base register. The **SPSR** of the current mode is copied to the **CPSR**. An address adjusted by the size of the data loaded can optionally be written back to the base register.

The registers loaded include the PC. The word loaded for the PC is treated as an address and a branch occurs to that address.

The PE checks the encoding that is copied to the **CPSR** for an illegal return event. See *Illegal return events from AArch32 state on page G1-6066*.

Load Multiple (exception return) is:

- UNDEFINED in Hyp mode.
- UNPREDICTABLE in debug state, and in User mode and System mode.

A1

A1 variant

LDM{<amode>}{<c>}{<q>} <Rn>{!}, <registers_with_pc>^

Decode for this encoding

```
n = UInt(Rn); registers = register_list;
wback = (W == '1'); increment = (U == '1'); wordhigher = (P == U);
if n == 15 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback && registers<n> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all the loads using the specified addressing mode and the content of the register being written back is UNKNOWN. In addition, if an exception occurs during the execution of this instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<amode>	is one of:	
	DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
	FA	Full Ascending. For this instruction, a synonym for DA.
	DB	Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.

EA	Empty Ascending. For this instruction, a synonym for DB.
IA	Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
FD	Full Descending. For this instruction, a synonym for IA.
IB	Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
ED	Empty Descending. For this instruction, a synonym for IB.
<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
<registers_with_pc>	Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be loaded. The registers are loaded with the lowest-numbered register from the lowest memory address, through to the highest-numbered register from the highest memory address. The PC must be specified in the register list, and the instruction causes a branch to the address (data) loaded into the PC. See also Encoding of lists of general-purpose registers and the PC on page F1-4354 .

Instructions with similar syntax but without the PC included in the registers list are described in [LDM \(User registers\)](#).

Operation

```

if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elseif PSTATE.M IN {M32_User, M32_System} then
        UNPREDICTABLE; // UNDEFINED or NOP
    else
        length = 4*BitCount(registers) + 4;
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;

        for i = 0 to 14
            if registers<i> == '1' then
                R[i] = MemS[address,4]; address = address + 4;
        new_pc_value = MemS[address,4];

        if wback && registers<n> == '0' then R[n] = if increment then R[n]+length else R[n]-length;
        if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;

        AArch32.ExceptionReturn(new_pc_value, SPSR[]);
  
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User, M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.68 LDM (User registers)

In an EL1 mode other than System mode, Load Multiple (User registers) loads multiple User mode registers from consecutive memory locations using an address from a base register. The registers loaded cannot include the PC. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Load Multiple (User registers) is UNDEFINED in Hyp mode, and UNPREDICTABLE in User and System modes.

Armv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see [FEAT_LSMAOC](#).

A1

A1 variant

LDM{<amode>}{<c>}{<q>} <Rn>, <registers_without_pc>^

Decode for this encoding

```
n = UInt(Rn); registers = register_list; increment = (U == '1'); wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<amode> is one of:

DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
FA	Full Ascending. For this instruction, a synonym for DA.

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.69 LDMDA, LDMFA

Load Multiple Decrement After (Full Ascending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations end at this address, and the address just below the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

Armv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see [FEAT_LSMAOC](#). The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#). Related system instructions are [LDM \(User registers\)](#) and [LDM \(exception return\)](#).

A1

A1 variant

LDMDA{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 LDMFA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Ascending stack

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If $\text{wback} \ \&\& \ \text{registers}\langle n \rangle == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.
The PC can be in the list.
Arm deprecates using these instructions with both the LR and the PC in the list.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers) + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemS[address,4]; address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemS[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] - 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.70 LDMDB, LDMEA

Load Multiple Decrement Before (Empty Ascending) loads multiple registers from consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

Armv8.2 permits the deprecation of some Load Multiple ordering behaviors in AArch32 state, for more information see [FEAT_LSMAOC](#). The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#). Related system instructions are [LDM \(User registers\)](#) and [LDM \(exception return\)](#).

A1

A1 variant

LDMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 LDMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `wback && registers<n> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If `BitCount(registers) < 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

T1

T1 variant

```
LDMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax  
LDMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack
```

Decode for this encoding

```
n = UInt(Rn); registers = P:M:register_list; wback = (W == '1');  
if n == 15 || BitCount(registers) < 2 || (P == '1' && M == '1') then UNPREDICTABLE;  
if wback && registers<n> == '1' then UNPREDICTABLE;  
if registers<13> == '1' then UNPREDICTABLE;  
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `wback && registers<n> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If `BitCount(registers) < 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If `BitCount(registers) == 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads a single register using the specified addressing modes.
- The instruction executes as LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If `registers<13> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

If `P == '1' && M == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

Notes for all encodings

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

If $\text{wback} \ \&\& \ \text{registers}\langle n \rangle == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.
The PC can be in the list.
Arm deprecates using these instructions with both the LR and the PC in the list.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = MemS[address,4]; address = address + 4;
    if registers<15> == '1' then
        LoadWritePC(MemS[address,4]);
    if wback && registers<n> == '0' then R[n] = R[n] + 4*BitCount(registers);
    if wback && registers<n> == '1' then R[n] = bits(32) UNKNOWN;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.72 LDR (immediate)

Load Register (immediate) calculates an address from a base register value and an immediate offset, loads a word from memory, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses](#) on page F1-4353.

This instruction is used by the alias [POP \(single register\)](#). See [Alias conditions](#) on page F5-4739 for details of when each alias is preferred.

A1

Offset variant

Applies when P == 1 && W == 0.

LDR{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 0.

LDR{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDR{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE "LDR (literal)";
if P == '0' && W == '1' then SEE "LDR!";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if wback && n == t then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDR{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm5:'00', 32);
 index = TRUE; add = TRUE; wback = FALSE;

T2

T2 variant

LDR{<c>}{<q>} <Rt>, [SP{, #<+><imm>}]

Decode for this encoding

t = UInt(Rt); n = 13; imm32 = ZeroExtend(imm8:'00', 32);
 index = TRUE; add = TRUE; wback = FALSE;

T3

T3 variant

LDR{<c>}.W <Rt>, [<Rn> {, #<+><imm>}] // <Rt>, <Rn>, <imm> can be represented in T1 or T2
 LDR{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

if Rn == '1111' then SEE "LDR (literal)";
 t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32); index = TRUE; add = TRUE;
 wback = FALSE; if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;

T4

Offset variant

Applies when P == 1 && U == 0 && W == 0.

LDR{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

LDR{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDR{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!

Decode for all variants of this encoding

```
if Rn == '1111' then SEE "LDR (literal)";
if P == '1' && U == '1' && W == '0' then SEE "LDRT";
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn);
imm32 = ZeroExtend(imm8, 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
if (wback && n == t) || (t == 15 && InITBlock() && !LastInITBlock()) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Alias conditions

Alias	of variant	is preferred when
POP (single register)	A1 (post-indexed)	P == '0' && U == '1' && W == '0' && Rn == '1101' && imm12 == '00000000100'
POP (single register)	T4 (post-indexed)	Rn == '1101' && P == '0' && U == '1' && W == '1' && imm8 == '00000100'

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field.
- For encoding T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

<code><Rn></code>	<p>For encoding A1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDR (literal).</p> <p>For encoding T1: is the general-purpose base register, encoded in the "Rn" field.</p>
<code>+/-</code>	<p>Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:</p> <ul style="list-style-type: none"> - when U = 0 + when U = 1
<code>+</code>	Specifies the offset is added to the base register.
<code><imm></code>	<p>For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.</p> <p>For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <code><imm>/4</code>.</p> <p>For encoding T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 and encoded in the "imm8" field as <code><imm>/4</code>.</p> <p>For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.</p> <p>For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.</p>

Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,4];
    if wback then R[n] = offset_addr;
    if t == 15 then
      if address<1:0> == '00' then
        LoadWritePC(data);
      else
        UNPREDICTABLE;
    else
      R[t] = data;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,4];
    if wback then R[n] = offset_addr;
    if t == 15 then
      if address<1:0> == '00' then
        LoadWritePC(data);
      else
        UNPREDICTABLE;
    else
      R[t] = data;
  
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.73 LDR (literal)

Load Register (literal) calculates an address from the PC value and an immediate offset, loads a word from memory, and writes it to a register. For information about memory accesses see [Memory accesses](#) on page F1-4353.

A1

A1 variant

Applies when $!(P == 0 \ \&\& \ W == 1)$.

LDR{<c>}{<q>} <Rt>, <label> // Normal form
 LDR{<c>}{<q>} <Rt>, [PC, #{+/-}<imm>] // Alternative form

Decode for this encoding

```
if P == '0' && W == '1' then SEE "LDRT";
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if wback then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDR \(immediate\)](#). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

T1

T1 variant

LDR{<c>}{<q>} <Rt>, <label> // Normal form

Decode for this encoding

```
t = UInt(Rt); imm32 = ZeroExtend(imm8:'00', 32); add = TRUE;
```

T2

T2 variant

LDR{<c>}.W <Rt>, <label> // Preferred syntax, and <Rt>, <label> can be represented in T1
 LDR{<c>}{<q>} <Rt>, <label> // Preferred syntax
 LDR{<c>}{<q>} <Rt>, [PC, #<+/-><imm>] // Alternative syntax

Decode for this encoding

```
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
 For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
 For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The SP can be used. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- <label> For encoding A1 and T2: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095.
 If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`.
 If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
 For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are Multiples of four in the range 0 to 1020.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- <imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T2: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F2-4377](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,4];
    if t == 15 then
        if address<1:0> == '00' then
            LoadWritePC(data);
        else
            UNPREDICTABLE;
    else
        R[t] = data;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.74 LDR (register)

Load Register (register) calculates an address from a base register value and an offset register value, loads a word from memory, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses, see [Memory accesses](#) on page F1-4353.

The T32 form of LDR (register) does not support register writeback.

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

LDR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}]

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE "LDRT";
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = (SRTYPE_LSL, 0);

T2

T2 variant

LDR{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
 LDR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm2>}]

Decode for this encoding

if Rn == '1111' then SEE "LDR (literal)";
 t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
 if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
 if t == 15 && InITBlock() && !LastInITBlock() then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This branch is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
 For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
 For encoding T2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
 For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0

- + when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see *Shifts applied to a register on page F1-4351*.
- <imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    data = MemU[address,4];
    if wback then R[n] = offset_addr;
    if t == 15 then
      if address<1:0> == '00' then
        LoadWritePC(data);
      else
        UNPREDICTABLE;
    else
      R[t] = data;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = (R[n] + offset);
    address = offset_addr;
    data = MemU[address,4];
    if t == 15 then
      if address<1:0> == '00' then
        LoadWritePC(data);
      else
        UNPREDICTABLE;
    else
      R[t] = data;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.75 LDRB (immediate)

Load Register Byte (immediate) calculates an address from a base register value and an immediate offset, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses](#) on page F1-4353.

A1

Offset variant

Applies when P == 1 && W == 0.

LDRB{<c>}{<q>} <Rt>, [<Rn> {, #+/-}<imm>}]

Post-indexed variant

Applies when P == 0 && W == 0.

LDRB{<c>}{<q>} <Rt>, [<Rn>], #+/-<imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRB{<c>}{<q>} <Rt>, [<Rn>, #+/-<imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE "LDRB (literal)";
if P == '0' && W == '1' then SEE "LDRBT";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRB{<c>}{<q>} <Rt>, [<Rn> {, #+>}<imm>}]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm5, 32);
 index = TRUE; add = TRUE; wback = FALSE;

T2

T2 variant

LDRB{<c>}.W <Rt>, [<Rn> {, #<+><imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
 LDRB{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

if Rt == '1111' then SEE "PLD";
 if Rn == '1111' then SEE "LDRB (literal)";
 t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
 index = TRUE; add = TRUE; wback = FALSE;
 // Armv8-A removes UNPREDICTABLE for R13

T3

Offset variant

Applies when Rt != 1111 && P == 1 && U == 0 && W == 0.

LDRB{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

LDRB{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRB{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE "PLD, PLDW (immediate)";
 if Rn == '1111' then SEE "LDRB (literal)";
 if P == '1' && U == '1' && W == '0' then SEE "LDRBT";
 if P == '0' && W == '0' then UNDEFINED;
 t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
 index = (P == '1'); add = (U == '1'); wback = (W == '1');
 if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
 // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If `wback && n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRB (literal) . For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 5-bit unsigned immediate byte offset, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field. For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    R[t] = ZeroExtend(MemU[address,1], 32);
    if wback then R[n] = offset_addr;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
  
```

```
R[t] = ZeroExtend(MemU[address,1], 32);  
if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.76 LDRB (literal)

Load Register Byte (literal) calculates an address from the PC value and an immediate offset, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

A1 variant

Applies when $!(P == 0 \ \&\& \ W == 1)$.

LDRB{<c>}{<q>} <Rt>, <label> // Normal form
 LDRB{<c>}{<q>} <Rt>, [PC, #+/-<imm>] // Alternative form

Decode for this encoding

```
if P == '0' && W == '1' then SEE "LDRBT";
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDRB \(immediate\)](#). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

T1

T1 variant

LDRB{<c>}{<q>} <Rt>, <label> // Preferred syntax
 LDRB{<c>}{<q>} <Rt>, [PC, #+/-<imm>] // Alternative syntax

Decode for this encoding

```
if Rt == '1111' then SEE "PLD";
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <label> The label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095.
- If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`.
- If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when `U = 0`
 - + when `U = 1`
- <imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.
- For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F2-4377](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    R[t] = ZeroExtend(MemU[address,1], 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.77 LDRB (register)

Load Register Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can optionally be shifted. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

Offset variant

Applies when P == 1 && W == 0.

LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]

Post-indexed variant

Applies when P == 0 && W == 0.

LDRB{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}]

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE "LDRBT";
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

T2

T2 variant

```
LDRB{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
LDRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]
```

Decode for this encoding

```
if Rt == '1111' then SEE "PLD";
if Rn == '1111' then SEE "LDRB (literal)";
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see [Shifts applied to a register on page F1-4351](#).
- <imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    R[t] = ZeroExtend(MemU[address,1],32);
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.78 LDRBT

Load Register Byte Unprivileged loads a byte from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F1-4353](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1

A1 variant

LDRBT{<c>}{<q>} <Rt>, [<Rn>] {, #<+/->}<imm>}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 by instruction on page K1-8387](#).
- The instruction uses immediate offset addressing with the base register as PC, without writeback.

If $n == t$ && $n != 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1 variant

LDRBT{<c>}{<q>} <Rt>, [<Rn> {, #+}<imm>]

Decode for this encoding

```
if Rn == '1111' then SEE "LDRB (literal)";
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

	For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F1-4351 .
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    R[t] = ZeroExtend(MemU_unpriv[address,1],32);
    if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRB (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.79 LDRD (immediate)

Load Register Dual (immediate) calculates an address from a base register value and an immediate offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0				
!=1111				0 0 0			P	U	1	W	0	!=1111			Rt		imm4H			1	1	0	1	imm4L	
cond										Rn															

Offset variant

Applies when $P == 1$ && $W == 0$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0$ && $W == 0$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE "LDRD (literal)";
if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt); t2 = t+1; n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if wback && (n == t || n == t2) then UNPREDICTABLE;
if t2 == 15 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback$ && $(n == t || n == t2)$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If $P == '0'$ && $W == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

If $Rt<0> == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.
- The instruction executes with the additional decode: $t<0> = '0'$.
- The instruction executes with the additional decode: $t2 = t$.
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when $Rt == '1111'$.

T1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 1$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '0' then SEE "Related encodings";
if Rn == '1111' then SEE "LDRD (literal)";
t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if wback && (n == t || n == t2) then UNPREDICTABLE;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
  
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ (n == t \ || \ n == t2)$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

If $t == t2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related encodings: [Load/store dual](#), [load/store exclusive](#), [load-acquire/store-release](#), and [table branch](#) on page F3-4460.

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348.
<q>	See Standard assembler syntax fields on page F1-4348.
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14. For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. This register must be <R(t+1)>. For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRD (literal) .
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as <imm>/4.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        data = MemA(address, 8);
        if BigEndian(AccType_ATOMIC) then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA(address, 4);
        R[t2] = MemA(address+4, 4);
    if wback then R[n] = offset_addr;
  
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.80 LDRD (literal)

Load Register Dual (literal) calculates an address from the PC value and an immediate offset, loads two words from memory, and writes them to two registers. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

CONSTRAINED UNPREDICTABLE behavior

If $t == t2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

If $W == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses post-indexed addressing when $P == '0'$ and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related encodings: [Load/store dual](#), [load/store exclusive](#), [load-acquire/store-release](#), and [table branch on page F3-4460](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rt> For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.

For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.

<Rt2> For encoding A1: is the second general-purpose register to be transferred. This register must be <R(t+1)>.

For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.

<label> For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted.

If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.

For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are multiples of 4 in the range -1020 to 1020.

If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`.

If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.

- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
 - + when U = 1
- <imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
- For encoding T1: is the optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F2-4377](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian(AccType_ATOMIC) then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.81 LDRD (register)

Load Register Dual (register) calculates an address from a base register value and a register offset, loads two words from memory, and writes them to two registers. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F1-4353.

A1

Offset variant

Applies when $P == 1$ && $W == 0$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]

Post-indexed variant

Applies when $P == 0$ && $W == 0$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], {+/-}<Rm>

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

LDRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]!

Decode for all variants of this encoding

```

if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt); t2 = t+1; n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if t2 == 15 || m == 15 || m == t || m == t2 then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback$ && ($n == t$ || $n == t2$), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

If $P == '0'$ && $W == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

If $m == t$ || $m == t2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction loads register Rm with an UNKNOWN value.
- If Rt<0> == '1', then one of the following behaviors must occur:
- The instruction is UNDEFINED.
 - The instruction executes as NOP.
 - The instruction executes with the additional decode: t<0> = '0'.
 - The instruction executes with the additional decode: t2 = t.
 - The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when Rt == '1111'.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rt>	Is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.
<Rt2>	Is the second general-purpose register to be transferred. This register must be <R(t+1)>.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: <ul style="list-style-type: none">- when U = 0+ when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + R[m]) else (R[n] - R[m]);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        data = MemA[address,8];
        if BigEndian(AccType_ATOMIC) then
            R[t] = data<63:32>;
            R[t2] = data<31:0>;
        else
            R[t] = data<31:0>;
            R[t2] = data<63:32>;
    else
        R[t] = MemA[address,4];
        R[t2] = MemA[address+4,4];

    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.82 LDREX

Load Register Exclusive calculates an address from a base register value and an immediate offset, loads a word from memory, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see [Synchronization and semaphores on page E2-4331](#). For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

cond																											

A1 variant

LDREX{<c>}{<q>} <Rt>, [<Rn> {, {#}<imm>}]

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); imm32 = Zeros(32); // Zero offset
if t == 15 || n == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7							0
1	1	1	0	1	0	0	0	0	1	0	1	Rn	Rt	(1)	(1)	(1)	(1)	(1)									imm8

T1 variant

LDREX{<c>}{<q>} <Rt>, [<Rn> {, {#}<imm>}]

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
if t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.

<imm> For encoding A1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can only be 0 or omitted.
For encoding T1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    AArch32.SetExclusiveMonitors(address,4);
    R[t] = MemA[address,4];
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.83 LDREXB

Load Register Exclusive Byte derives an address from a base register value, loads a byte from memory, zero-extends it to form a 32-bit word, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see [Synchronization and semaphores on page E2-4331](#). For information about memory accesses see [Memory accesses on page F1-4353](#).

Decode for this encoding

t = UInt(Rt); n = UInt(Rn);
 if t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address,1);
    R[t] = ZeroExtend(MemA[address,1], 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.84 LDREXD

Load Register Exclusive Doubleword derives an address from a base register value, loads a 64-bit doubleword from memory, writes it to two registers and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see [Synchronization and semaphores on page E2-4331](#). For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	2	1	0		
!=1111				0	0	0	1	1	0	1	1	Rn	Rt	(1)	(1)	1	1	1	0	0	1	(1)	(1)	(1)	(1)		
cond																											

A1 variant

LDREXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
t = UInt(Rt); t2 = t + 1; n = UInt(Rn);
if Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If Rt<0> == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: t<0> = '0'.
- The instruction executes with the additional decode: t2 = t.
- The instruction executes as described, with no change to its behavior and no additional side effects.

If Rt == '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	2	1	0
1	1	1	0	1	0	0	0	1	1	0	1	Rn	Rt	Rt2	0	1	1	1	(1)	(1)	(1)	(1)			

T1 variant

LDREXD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn);  
if t == 15 || t2 == 15 || t == t2 || n == 15 then UNPREDICTABLE;  
// Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If $t == t2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The load instruction executes but the destination register takes an UNKNOWN value.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14. For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>. For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations();  
  address = R[n];  
  AArch32.SetExclusiveMonitors(address,8);  
  value = MemA[address,8];  
  // Extract words from 64-bit loaded value such that R[t] is  
  // loaded from address and R[t2] from address+4.  
  R[t] = if BigEndian(AccType_ATOMIC) then value<63:32> else value<31:0>;  
  R[t2] = if BigEndian(AccType_ATOMIC) then value<31:0> else value<63:32>;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.85 LDREXH

Load Register Exclusive Halfword derives an address from a base register value, loads a halfword from memory, zero-extends it to form a 32-bit word, writes it to a register and:

- If the address has the Shared Memory attribute, marks the physical address as exclusive access for the executing PE in a global monitor.
- Causes the executing PE to indicate an active exclusive access in the local monitor.

For more information about support for shared memory see [Synchronization and semaphores on page E2-4331](#). For information about memory accesses see [Memory accesses on page F1-4353](#).

T1 variant

LDREXH{<c>}{<q>} <Rt>, [<Rn>]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn);
 if t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    AArch32.SetExclusiveMonitors(address,2);
    R[t] = ZeroExtend(MemA[address,2], 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.86 LDRH (immediate)

Load Register Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

Offset variant

Applies when P == 1 && W == 0.

LDRH{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 0.

LDRH{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRH{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE "LDRH (literal)";
if P == '0' && W == '1' then SEE "LDRHT";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRH{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm5:'0', 32);
index = TRUE; add = TRUE; wback = FALSE;
```

T2

T2 variant

```
LDRH{<c>}.W <Rt>, [<Rn> {, #<+><imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
LDRH{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]
```

Decode for this encoding

```
if Rt == '1111' then SEE "PLD (immediate)";
if Rn == '1111' then SEE "LDRH (literal)";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = TRUE; add = TRUE; wback = FALSE;
// Armv8-A removes UNPREDICTABLE for R13
```

T3

Offset variant

Applies when Rt != 1111 && P == 1 && U == 0 && W == 0.

```
LDRH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]
```

Post-indexed variant

Applies when P == 0 && W == 1.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>
```

Pre-indexed variant

Applies when P == 1 && W == 1.

```
LDRH{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!
```

Decode for all variants of this encoding

```
if Rn == '1111' then SEE "LDRH (literal)";
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE "PLDW (immediate)";
if P == '1' && U == '1' && W == '0' then SEE "LDRHT";
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `wback && n == t`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRH (literal) . For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as <imm>/2. For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,2];
    if wback then R[n] = offset_addr;
    R[t] = ZeroExtend(data, 32);
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,2];
```

```
if wback then R[n] = offset_addr;  
R[t] = ZeroExtend(data, 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.87 LDRH (literal)

Load Register Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses](#) on page F1-4353.

A1

A1 variant

Applies when $!(P == 0 \ \&\& \ W == 1)$.

LDRH{<c>}{<q>} <Rt>, <label> // Normal form
 LDRH{<c>}{<q>} <Rt>, [PC, #+/-<imm>] // Alternative form

Decode for this encoding

```
if P == '0' && W == '1' then SEE "LDRHT";
t = UInt(Rt); imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDRH \(immediate\)](#). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 by instruction](#) on page K1-8387.

T1

T1 variant

LDRH{<c>}{<q>} <Rt>, <label> // Preferred syntax
 LDRH{<c>}{<q>} <Rt>, [PC, #+/-<imm>] // Alternative syntax

Decode for this encoding

```
if Rt == '1111' then SEE "PLD (literal)";
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <label> For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted.
- If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095.
- If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`.
- If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when `U = 0`
 - + when `U = 1`
- <imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
- For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F2-4377](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,2];
    R[t] = ZeroExtend(data, 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.88 LDRH (register)

Load Register Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

LDRH{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE "LDRHT";
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRTYPE_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
 index = TRUE; add = TRUE; wback = FALSE;
 (shift_t, shift_n) = (SRTYPE_LSL, 0);

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	0	0	0	0	0	1	1	!	1111	!	1111	0	0	0	0	0	0	imm2	Rm		
												Rn		Rt											

T2 variant

LDRH{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
 LDRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

Decode for this encoding

if Rn == '1111' then SEE "LDRH (literal)";
 if Rt == '1111' then SEE "PLDW (register)";
 t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
 index = TRUE; add = TRUE; wback = FALSE;
 (shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
 if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
 For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    data = MemU[address,2];
    if wback then R[n] = offset_addr;
    R[t] = ZeroExtend(data, 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.89 LDRHT

Load Register Halfword Unprivileged loads a halfword from memory, zero-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F1-4353](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0						
!=1111				0	0	0	0	U	1	1	1	Rn	Rt	imm4H		1	0	1	1	imm4L							
				cond																							

A1 variant

LDRHT{<c>}{<q>} <Rt>, [<Rn>] {, #<+/->imm}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 by instruction on page K1-8387](#).
- The instruction is treated as if bit[24] == '1' and bit[21] == '0'. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If $n == t$ && $n != 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

A2

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

T1 variant

LDRHT{<c>}{<q>} <Rt>, [<Rn> {, #+}<imm>]

Decode for this encoding

```
if Rn == '1111' then SEE "LDRH (literal)";
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- +/- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
 - + when U = 1
- For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
 - + when U = 1
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- + Specifies the offset is added to the base register.
- <imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
- For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    data = MemU_unpriv[address,2];
    if postindex then R[n] = offset_addr;
    R[t] = ZeroExtend(data, 32);
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRH (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.90 LDRSB (immediate)

Load Register Signed Byte (immediate) calculates an address from a base register value and an immediate offset, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

Offset variant

Applies when P == 1 && W == 0.

LDRSB{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 0.

LDRSB{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRSB{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE "LDRSB (literal)";
if P == '0' && W == '1' then SEE "LDRSBT";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRSB{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

```
if Rt == '1111' then SEE "PLI";
if Rn == '1111' then SEE "LDRSB (literal)";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = TRUE; add = TRUE; wback = FALSE;
// Armv8-A removes UNPREDICTABLE for R13
```

T2

Offset variant

Applies when Rt != 1111 && P == 1 && U == 0 && W == 0.

LDRSB{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

LDRSB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRSB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!

Decode for all variants of this encoding

```
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE "PLI";
if Rn == '1111' then SEE "LDRSB (literal)";
if P == '1' && U == '1' && W == '0' then SEE "LDRSBT";
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348.
<q>	See Standard assembler syntax fields on page F1-4348.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRSB (literal) .
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    R[t] = SignExtend(MemU[address,1], 32);
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.91 LDRSB (literal)

Load Register Signed Byte (literal) calculates an address from the PC value and an immediate offset, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

A1 variant

Applies when $!(P == 0 \ \&\& \ W == 1)$.

LDRSB{<c>}{<q>} <Rt>, <label> // Normal form
 LDRSB{<c>}{<q>} <Rt>, [PC, #+/-<imm>] // Alternative form

Decode for this encoding

```
if P == '0' && W == '1' then SEE "LDRSBT";
t = UInt(Rt); imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDRSB \(immediate\)](#). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

T1

T1 variant

LDRSB{<c>}{<q>} <Rt>, <label> // Preferred syntax
 LDRSB{<c>}{<q>} <Rt>, [PC, #+/-<imm>] // Alternative syntax

Decode for this encoding

```
if Rt == '1111' then SEE "PLI";
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <label> For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Any value in the range -255 to 255 is permitted.
- If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values of the offset are -4095 to 4095.
- If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`, encoded as `U == 1`. If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`, encoded as `U == 0`.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when `U = 0`
 - + when `U = 1`
- <imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
- For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F2-4377](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    R[t] = SignExtend(MemU[address,1], 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.92 LDRSB (register)

Load Register Signed Byte (register) calculates an address from a base register value and an offset register value, loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDRSB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

LDRSB{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDRSB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE "LDRSBT";
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRTYPE_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRSB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
 index = TRUE; add = TRUE; wback = FALSE;
 (shift_t, shift_n) = (SRTYPE_LSL, 0);

T2

T2 variant

LDRSB{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
 LDRSB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

Decode for this encoding

if Rt == '1111' then SEE "PLI";
 if Rn == '1111' then SEE "LDRSB (literal)";
 t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
 index = TRUE; add = TRUE; wback = FALSE;
 (shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
 if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
 For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    R[t] = SignExtend(MemU[address,1], 32);
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.93 LDRSBT

Load Register Signed Byte Unprivileged loads a byte from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F1-4353](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0	
!=1111				0	0	0	0	U	1	1	1	Rn	Rt	imm4H			1	1	0	1	imm4L	
cond																						

A1 variant

LDRSBT{<C>}{<q>} <Rt>, [<Rn>] {, #<+/-><imm>}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 by instruction on page K1-8387](#).
- The instruction is treated as if bit[24] == '1' and bit[21] == '0'. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If $n == t$ && $n != 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

A2

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

cond																									

A2 variant

LDRSBT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm); postindex = TRUE; add = (U == '1');
register_form = TRUE;
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == t$ && $n != 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

1	1	1	1	1	0	0	1	0	0	0	1	!=1111	Rt	1	1	1	0	imm8					
Rn																							

T1 variant

LDRSBT{<c>}{<q>} <Rt>, [<Rn> {, #<+>}<imm>}]

Decode for this encoding

```
if Rn == '1111' then SEE "LDRSB (literal)";
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    R[t] = SignExtend(MemU_unpriv[address,1], 32);
    if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRSB (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.94 LDRSH (immediate)

Load Register Signed Halfword (immediate) calculates an address from a base register value and an immediate offset, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

Offset variant

Applies when P == 1 && W == 0.

LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 0.

LDRSH{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRSH{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE "LDRSH (literal)";
if P == '0' && W == '1' then SEE "LDRSHT";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

```

if Rn == '1111' then SEE "LDRSH (literal)";
if Rt == '1111' then SEE "Related instructions";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = TRUE; add = TRUE; wback = FALSE;
// Armv8-A removes UNPREDICTABLE for R13
  
```

T2

Offset variant

Applies when Rt != 1111 && P == 1 && U == 0 && W == 0.

LDRSH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

LDRSH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

LDRSH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!

Decode for all variants of this encoding

```

if Rn == '1111' then SEE "LDRSH (literal)";
if Rt == '1111' && P == '1' && U == '0' && W == '0' then SEE "Related instructions";
if P == '1' && U == '1' && W == '0' then SEE "LDRSHT";
if P == '0' && W == '0' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if (t == 15 && W == '1') || (wback && n == t) then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
  
```

CONSTRAINED UNPREDICTABLE behavior

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related instructions: [Load/store single on page F3-4476](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. For PC use see LDRSH (literal) .
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    data = MemU[address,2];
    if wback then R[n] = offset_addr;
    R[t] = SignExtend(data, 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.95 LDRSH (literal)

Load Register Signed Halfword (literal) calculates an address from the PC value and an immediate offset, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

A1 variant

Applies when $!(P == 0 \ \&\& \ W == 1)$.

LDRSH{<c>}{<q>} <Rt>, <label> // Normal form
 LDRSH{<c>}{<q>} <Rt>, [PC, #+/-<imm>] // Alternative form

Decode for this encoding

```
if P == '0' && W == '1' then SEE "LDRSH";
t = UInt(Rt); imm32 = ZeroExtend(imm4H:imm4L, 32);
add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 || wback then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: wback = FALSE;
- The instruction treats bit[24] as the P bit, and bit[21] as the writeback (W) bit, and uses the same addressing mode as described in [LDRSH \(immediate\)](#). The instruction uses post-indexed addressing when P == '0' and uses pre-indexed addressing otherwise. The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

T1

T1 variant

LDRSH{<c>}{<q>} <Rt>, <label> // Preferred syntax
 LDRSH{<c>}{<q>} <Rt>, [PC, #+/-<imm>] // Alternative syntax

Decode for this encoding

```
if Rt == '1111' then SEE "Related instructions";
t = UInt(Rt); imm32 = ZeroExtend(imm12, 32); add = (U == '1');
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related instructions: [Load, signed \(literal\)](#) on page F3-4484.

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348.
<q>	See Standard assembler syntax fields on page F1-4348.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<label>	<p>For encoding A1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the instruction to this label. Any value in the range -255 to 255 is permitted.</p> <p>If the offset is zero or positive, <code>imm32</code> is equal to the offset and <code>add == TRUE</code>, encoded as <code>U == 1</code>. If the offset is negative, <code>imm32</code> is equal to minus the offset and <code>add == FALSE</code>, encoded as <code>U == 0</code>.</p> <p>For encoding T1: the label of the literal data item that is to be loaded into <Rt>. The assembler calculates the required value of the offset from the <code>Align(PC, 4)</code> value of the instruction to this label. Permitted values of the offset are -4095 to 4095.</p> <p>If the offset is zero or positive, <code>imm32</code> is equal to the offset and <code>add == TRUE</code>, encoded as <code>U == 1</code>.</p> <p>If the offset is negative, <code>imm32</code> is equal to minus the offset and <code>add == FALSE</code>, encoded as <code>U == 0</code>.</p>
+/-	<p>Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:</p> <p>- when <code>U = 0</code></p> <p>+ when <code>U = 1</code></p>
<imm>	<p>For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.</p> <p>For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.</p>

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax](#) on page F2-4377.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    base = Align(PC,4);
    address = if add then (base + imm32) else (base - imm32);
    data = MemU[address,2];
    R[t] = SignExtend(data, 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.96 LDRSH (register)

Load Register Signed Halfword (register) calculates an address from a base register value and an offset register value, loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

LDRSH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

LDRSH{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

LDRSH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE "LDRSHT";
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRTYPE_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is <arm-defined-word>unknown</arm-defined-word>. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

T1

T1 variant

LDRSH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
 index = TRUE; add = TRUE; wback = FALSE;
 (shift_t, shift_n) = (SRTYPE_LSL, 0);

T2

T2 variant

LDRSH{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
 LDRSH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

Decode for this encoding

if Rn == '1111' then SEE "LDRSH (literal)";
 if Rt == '1111' then SEE "Related instructions";
 t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
 index = TRUE; add = TRUE; wback = FALSE;
 (shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
 if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related instructions: [Load/store, signed \(register offset\)](#) on page F3-4481.

Assembler symbols

- <c> See [Standard assembler syntax fields](#) on page F1-4348.
- <q> See [Standard assembler syntax fields](#) on page F1-4348.
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant.
 For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.

<imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    data = MemU[address,2];
    if wback then R[n] = offset_addr;
    R[t] = SignExtend(data, 32);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.97 LDRSHT

Load Register Signed Halfword Unprivileged loads a halfword from memory, sign-extends it to form a 32-bit word, and writes it to a register. For information about memory accesses see [Memory accesses on page F1-4353](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRSHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 by instruction on page K1-8387](#).
- The instruction is treated as if bit[24] == '1' and bit[21] == '0'. The instruction uses immediate offset addressing with the base register as PC, without writeback.

If $n == t$ && $n != 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- +/- For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
 - + when U = 1
- For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
 - + when U = 1
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- + Specifies the offset is added to the base register.
- <imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.
- For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then R[m] else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    data = MemU_unpriv[address,2];
    if postindex then R[n] = offset_addr;
    R[t] = SignExtend(data, 32);
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as LDRSH (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.98 LDRT

Load Register Unprivileged loads a word from memory, and writes it to a register. For information about memory accesses see [Memory accesses on page F1-4353](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

LDRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1

A1 variant

LDRT{<c>}{<q>} <Rt>, [<Rn>] {, #<+/-><imm>}

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rdm> Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rm> Is the first general-purpose source register, encoded in the "Rm" field.

<Rs> Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

F5.1.101 LSLS (immediate)

Logical Shift Left, setting flags (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.
- <imm> For encoding A1 and T2: is the shift amount, in the range 1 to 32, encoded in the "imm5" field as <imm> modulo 32.
For encoding T3: is the shift amount, in the range 1 to 32, encoded in the "imm3:imm2" field as <imm> modulo 32.

Operation for all encodings

The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

F5.1.104 LSR (register)

Logical Shift Right (register) shifts a register value right by a variable number of bits, shifting in zeros, and writes the result to the destination register. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the [MOV, MOVS \(register-shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register-shifted register\)](#).
- The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

and is always the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rdm> Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.

<Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<Rm> Is the first general-purpose source register, encoded in the "Rm" field.

<Rs> Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

F5.1.105 LSRS (immediate)

Logical Shift Right, setting flags (immediate) shifts a register value right by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

A1

MOVS, shift or rotate by value variant

LSRS{<c>}{<q>} {<Rd>}, <Rm>, #<imm>

is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, LSR #<imm>

and is always the preferred disassembly.

T2

T2 variant

LSRS{<q>} {<Rd>}, <Rm>, #<imm> // Outside IT block

is equivalent to

MOVS{<q>} <Rd>, <Rm>, LSR #<imm>

and is the preferred disassembly when !InITBlock().

T3

MOVS, shift or rotate by value variant

LSRS.W {<Rd>,} <Rm>, #<imm> // Outside IT block, and <Rd>, <Rm>, <imm> can be represented in T2 is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, LSR #<imm>

and is always the preferred disassembly.

LSRS{<c>}{<q>} {<Rd>,} <Rm>, #<imm>

is equivalent to

MOVS{<c>}{<q>} <Rd>, <Rm>, LSR #<imm>

and is always the preferred disassembly.

Assembler symbols

Assembler symbols

<C>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rdm>	Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the first general-purpose source register, encoded in the "Rm" field.
<Rs>	Is the second general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

F5.1.107 MCR

Move to System register from general-purpose register or execute a System instruction. This instruction copies the value of a general-purpose register to a System register, or executes a System instruction.

The System register and System instruction descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-4278](#) and [General behavior of System registers on page G8-6438](#).

In an implementation that includes EL2, MCR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-6126](#).

Because of the range of possible traps to Hyp mode, the MCR pseudocode does not show these possible traps.

A1

A1 variant

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

Decode for this encoding

```
t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

T1

T1 variant

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

Decode for this encoding

```
t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

- <q> See *Standard assembler syntax fields* on page F1-4348.
- <coproc> Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:
- p14 when coproc<0> = 0
 - p15 when coproc<0> = 1
- <opc1> Is the opc1 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc1" field.
- <Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.
- <CRn> Is the CRn parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRn" field.
- <CRm> Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.
- <opc2> Is the opc2 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc2" field.

The possible values of { <coproc>, <opc1>, <CRn>, <CRm>, <opc2> } encode the entire System register and System instruction encoding space. Not all of this space is allocated, and the System register and System instruction descriptions identify the allocated encodings.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    AArch32.SysRegWrite(cp, ThisInstr(), R[t]);
```

F5.1.108 MCRR

Move to System register from two general-purpose registers. This instruction copies the values of two general-purpose registers to a System register.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-4278](#) and [General behavior of System registers on page G8-6438](#).

In an implementation that includes EL2, MCRR accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MCRR instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-6126](#).

Because of the range of possible traps to Hyp mode, the MCRR pseudocode does not show these possible traps.

A1

A1 variant

MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

T1

T1 variant

MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348.
<q>	See Standard assembler syntax fields on page F1-4348.
<coproc>	Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values: p14 when coproc<0> = 0 p15 when coproc<0> = 1
<opc1>	Is the opc1 parameter within the System register encoding space, in the range 0 to 15, encoded in the "opc1" field.
<Rt>	Is the first general-purpose register that is transferred into, encoded in the "Rt" field.
<Rt2>	Is the second general-purpose register that is transferred into, encoded in the "Rt2" field.
<CRm>	Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

The possible values of { <coproc>, <opc1>, <CRm> } encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify the allocated encodings.

For the permitted uses of these instructions, as described in this manual, <Rt2> transfers bits[63:32] of the selected System register, while <Rt> transfers bits[31:0].

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    value = R[t2]:R[t];
    AArch32.SysRegWrite64(cp, ThisInstr(), value);
```

F5.1.109 MLA, MLAS

Multiply Accumulate multiplies two register values, and adds a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

In an A32 instruction, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

Flag setting variant

Applies when S == 1.

MLAS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

Not flag setting variant

Applies when S == 0.

MLA{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra); setflags = (S == '1');
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

T1

T1 variant

MLA{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

Decode for this encoding

```
if Ra == '1111' then SEE "MUL";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra); setflags = FALSE;
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- <Ra> Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
    operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
    addend = SInt(R[a]); // addend = UInt(R[a]) produces the same final results
    result = operand1 * operand2 + addend;
    R[d] = result<31:0>;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result<31:0>);
        // PSTATE.C, PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.110 MLS

Multiply and Subtract multiplies two register values, and subtracts the product from a third register value. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0

T1 variant

MLS{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- <Ra> Is the third general-purpose source register holding the minuend, encoded in the "Ra" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
addend = SInt(R[a]); // addend = UInt(R[a]) produces the same final results
result = addend - operand1 * operand2;
R[d] = result<31:0>;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.111 MOV, MOVS (immediate)

Move (immediate) writes an immediate value to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The MOV variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
 - The PE checks SPSR_<current_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. Arm deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253. For the MOVS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding A2, T1, T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.
<imm8>	Is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
<imm16>	For encoding A2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. For encoding T3: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.
<const>	For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F1-4364 for the range of values. For encoding T2: an immediate value. See Modified immediate constants in T32 instructions on page F1-4362 for the range of values.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    result = imm32;
    if d == 15 then          // Can only occur for encoding A1
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
  
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.112 MOV, MOVS (register)

Move (register) copies a value from a register to the destination register.

If the destination register is not the PC, the MOVS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The MOV variant of the instruction is a branch. In the T32 instruction set (encoding T1) this is a simple branch, and in the A32 instruction set it is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- The MOVS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is used by the aliases [ASRS \(immediate\)](#), [ASR \(immediate\)](#), [LSLS \(immediate\)](#), [LSL \(immediate\)](#), [LSRS \(immediate\)](#), [LSR \(immediate\)](#), [RORS \(immediate\)](#), [ROR \(immediate\)](#), [RRXS](#), and [RRX](#). See [Alias conditions on page F5-4843](#) for details of when each alias is preferred.

A1

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .				
<q>	See Standard assembler syntax fields on page F1-4348 .				
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used: <ul style="list-style-type: none"> For the MOV variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253. Arm deprecates use of the instruction if <Rn> is the PC. For the MOVS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. Arm deprecates use of the instruction if <Rn> is not the LR, or if the optional shift or RRX argument is specified. For encoding T1: is the general-purpose destination register, encoded in the "D:Rd" field. If the PC is used: <ul style="list-style-type: none"> The instruction causes a branch to the address moved to the PC. This is a simple branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253. The instruction must either be outside an IT block or the last instruction of an IT block. For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field.				
<Rm>	For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used. Arm deprecates use of the instruction if <Rd> is the PC. For encoding T2 and T3: is the general-purpose source register, encoded in the "Rm" field.				
<shift>	For encoding A1 and T3: is the type of shift to be applied to the source register, encoded in the "stype" field. It can have the following values: <table> <tbody> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> </tbody> </table>	LSL	when stype = 00	LSR	when stype = 01
LSL	when stype = 00				
LSR	when stype = 01				

ASR when stype = 10

ROR when stype = 11

For encoding T2: is the type of shift to be applied to the source register, encoded in the "op" field. It can have the following values:

LSL when op = 00

LSR when op = 01

ASR when op = 10

<amount> For encoding A1: is the shift amount, in the range 0 to 31 (when <shift> = LSL), or 1 to 31 (when <shift> = ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32.

For encoding T3: is the shift amount, in the range 0 to 31 (when <shift> = LSL) or 1 to 31 (when <shift> = ROR), or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = shifted;
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
  
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.113 MOV, MOVS (register-shifted register)

Move (register-shifted register) copies a register-shifted register value to the destination register. It can optionally update the condition flags based on the value.

This instruction is used by the aliases [ASRS \(register\)](#), [ASR \(register\)](#), [LSLS \(register\)](#), [LSL \(register\)](#), [LSRS \(register\)](#), [LSR \(register\)](#), [RORS \(register\)](#), and [ROR \(register\)](#). See *Alias conditions* on page F5-4848 for details of when each alias is preferred.

A1

Flag setting variant

Applies when S == 1.

MOV{<c>}{<q>} <Rd>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

MOV{<c>}{<q>} <Rd>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

T1

Arithmetic shift right variant

Applies when op == 0100.

MOV<c>{<q>} <Rdm>, <Rdm>, ASR <Rs> // Inside IT block
 MOVS{<q>} <Rdm>, <Rdm>, ASR <Rs> // Outside IT block

Logical shift left variant

Applies when op == 0010.

MOV<c>{<q>} <Rdm>, <Rdm>, LSL <Rs> // Inside IT block
 MOVS{<q>} <Rdm>, <Rdm>, LSL <Rs> // Outside IT block

Logical shift right variant

Applies when op == 0011.

MOV<c>{<q>} <Rdm>, <Rdm>, LSR <Rs> // Inside IT block
 MOVS{<q>} <Rdm>, <Rdm>, LSR <Rs> // Outside IT block

Rotate right variant

Applies when op == 0111.

```
MOV<c>{<q>} <Rdm>, <Rdm>, ROR <Rs> // Inside IT block
MOVS{<q>} <Rdm>, <Rdm>, ROR <Rs> // Outside IT block
```

Decode for all variants of this encoding

```
if !(op IN {'0010', '0011', '0100', '0111'}) then SEE "Related encodings";
d = UInt(Rdm); m = UInt(Rdm); s = UInt(Rs);
setflags = !InITBlock(); shift_t = DecodeRegShift(op<2>:op<0>);
```

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	0	stype	S		Rm		1	1	1	1	Rd		0	0	0		Rs	

Flag setting variant

Applies when S == 1.

```
MOV<c>.W <Rd>, <Rm>, <shift> <Rs> // Outside IT block, and <Rd>, <Rm>, <shift>, <Rs> can be represented in
T1
MOVS{<c>}{<q>} <Rd>, <Rm>, <shift> <Rs>
```

Not flag setting variant

Applies when S == 0.

```
MOV<c>.W <Rd>, <Rm>, <shift> <Rs> // Inside IT block, and <Rd>, <Rm>, <shift>, <Rs> can be represented in
T1
MOV{<c>}{<q>} <Rd>, <Rm>, <shift> <Rs>
```

Decode for all variants of this encoding

```
d = UInt(Rd); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

Related encodings: In encoding T1, for an op field value that is not described above, see [Data-processing \(two low registers\) on page F3-4417](#).

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Alias conditions

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rdm>	Is the general-purpose source register and the destination register, encoded in the "Rdm" field.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

LSL	when stype = 00
LSR	when stype = 01
ASR	when stype = 10
ROR	when stype = 11

<Rs> Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (result, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.114 MOV_T

Move Top writes an immediate value to the top halfword of the destination register. It does not affect the contents of the bottom halfword.

A1

A1 variant

MOV_T{<c>}{<q>} <Rd>, #<imm16>

Decode for this encoding

d = UInt(Rd); imm16 = imm4:imm12;
 if d == 15 then UNPREDICTABLE;

T1

T1 variant

MOV_T{<c>}{<q>} <Rd>, #<imm16>

Decode for this encoding

d = UInt(Rd); imm16 = imm4:i:imm3:imm8;
 if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <imm16> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field.
 For encoding T1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:i:imm3:imm8" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
R[d]<31:16> = imm16;
// R[d]<15:0> unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.115 MRC

Move to general-purpose register from System register. This instruction copies the value of a System register to a general-purpose register.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-4278](#) and [General behavior of System registers on page G8-6438](#).

In an implementation that includes EL2, MRC accesses to system control registers can be trapped to Hyp mode, meaning that an attempt to execute an MRC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-6126](#).

Because of the range of possible traps to Hyp mode, the MRC pseudocode does not show these possible traps.

A1

A1 variant

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

Decode for this encoding

```
t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
// Armv8-A removes UNPREDICTABLE for R13
```

T1

T1 variant

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

Decode for this encoding

```
t = UInt(Rt); cp = if coproc<0> == '0' then 14 else 15;
// Armv8-A removes UNPREDICTABLE for R13
```

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<coproc> Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values:

p14 when coproc<0> = 0

	p15	when coproc<0> = 1
<opc1>	Is the opc1 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc1" field.	
<Rt>	Is the general-purpose register to be transferred or APSR_nzcv (encoded as 0b1111), encoded in the "Rt" field. If APSR_nzcv is used, bits [31:28] of the transferred value are written to the PSTATE condition flags.	
<CRn>	Is the CRn parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRn" field.	
<CRm>	Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.	
<opc2>	Is the opc2 parameter within the System register encoding space, in the range 0 to 7, encoded in the "opc2" field.	

The possible values of { <coproc>, <opc1>, <CRn>, <CRm>, <opc2> } encode the entire System register and System instruction encoding space. Not all of this space is allocated, and the System register and System instruction descriptions identify the allocated encodings.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    bits(32) value = AArch32.SysRegRead(cp, ThisInstr());
    if t != 15 then
        R[t] = value;
    elseif AArch32.SysRegReadCanWriteAPSR(cp, ThisInstr()) then
        PSTATE.<N,Z,C,V> = value<31:28>;
        // value<27:0> are not used.
    else
        UNPREDICTABLE;
```

F5.1.116 MRRC

Move to two general-purpose registers from System register. This instruction copies the value of a System register to two general-purpose registers.

The System register descriptions identify valid encodings for this instruction. Other encodings are UNDEFINED. For more information see [About the AArch32 System register interface on page E1-4278](#) and [General behavior of System registers on page G8-6438](#).

In an implementation that includes EL2, MRRC accesses to System registers can be trapped to Hyp mode, meaning that an attempt to execute an MRRC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [EL2 configurable controls on page G1-6126](#).

Because of the range of possible traps to Hyp mode, the MRRC pseudocode does not show these possible traps.

A1

A1 variant

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

T1

T1 variant

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

Decode for this encoding

```
t = UInt(Rt); t2 = UInt(Rt2); cp = if coproc<0> == '0' then 14 else 15;
if t == 15 || t2 == 15 || t == t2 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If $t == t2$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<coproc>	Is the System register encoding space, encoded in the "coproc<0>" field. It can have the following values: p14 when coproc<0> = 0 p15 when coproc<0> = 1
<opc1>	Is the opc1 parameter within the System register encoding space, in the range 0 to 15, encoded in the "opc1" field.
<Rt>	Is the first general-purpose register that is transferred into, encoded in the "Rt" field.
<Rt2>	Is the second general-purpose register that is transferred into, encoded in the "Rt2" field.
<CRm>	Is the CRm parameter within the System register encoding space, in the range c0 to c15, encoded in the "CRm" field.

The possible values of { <coproc>, <opc1>, <CRm> } encode the entire System register encoding space. Not all of this space is allocated, and the System register descriptions identify the allocated encodings.

For the permitted uses of these instructions, as described in this manual, <Rt2> transfers bits[63:32] of the selected System register, while <Rt> transfers bits[31:0].

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    value = AArch32.SysRegRead64(cp, ThisInstr());
    R[t] = value<31:0>;
    R[t2] = value<63:32>;
```

F5.1.117 MRS

Move Special register to general-purpose register moves the value of the *The Application Program Status Register, APSR* on page E1-4255, *CPSR*, or *SPSR*_{current_mode} into a general-purpose register.

Arm recommends the APSR form when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see *The Application Program Status Register, APSR* on page E1-4255.

An MRS that accesses the *SPSR* is UNPREDICTABLE if executed in User mode or System mode.

An MRS that is executed in User mode and accesses the *CPSR* returns an UNKNOWN value for the *CPSR*. {E, A, I, F, M} fields.

Decode for this encoding

```
d = UInt(Rd); read_spsr = (R == '1');
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields](#) on page F1-4348.
- <q> See [Standard assembler syntax fields](#) on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.

<spec_reg> Is the special register to be accessed, encoded in the "R" field. It can have the following values:

CPSR|APSR when R = 0
SPSR when R = 1

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
if read_spsr then
    if PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;
    else
        R[d] = SPSR[];
else
    // CPSR has same bit assignments as SPSR, but with the IT, J, SS, IL, and T bits masked out.
    bits(32) mask = '11111000 11101111 00000011 11011111';
    psr_val = GetPSRFromPSTATE(AArch32_NonDebugState) AND mask;
    if PSTATE.EL == EL0 then
        // If accessed from User mode return UNKNOWN values for E, A, I, F bits, bits<9:6>,
        // and for the M field, bits<4:0>
        psr_val<22> = bits(1) UNKNOWN;
        psr_val<9:6> = bits(4) UNKNOWN;
        psr_val<4:0> = bits(5) UNKNOWN;
    R[d] = psr_val;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User, M32_System} && read_spsr, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

F5.1.118 MRS (Banked register)

Move to Register from Banked or Special register moves the value from the Banked general-purpose register or SPSR of the specified mode, or the value of *ELR_hyp* on page G1-6034, to a general-purpose register.

MRS (Banked register) is UNPREDICTABLE if executed in User mode.

When EL3 is using AArch64, if an MRS (Banked register) instruction that is executed in a Secure EL1 mode would access SPSR_mon, SP_mon, or LR_mon, it is trapped to EL3.

The effect of using an MRS (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see *Usage restrictions on the banked register transfer instructions* on page F5-5283.

```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.

F5.1.119 MSR (Banked register)

Move to Banked or Special register from general-purpose register moves the value of a general-purpose register to the Banked general-purpose register or *SPSR* of the specified mode, or to *ELR_hyp* on page G1-6034.

MSR (Banked register) is UNPREDICTABLE if executed in User mode.

When EL3 is using AArch64, if an MSR (Banked register) instruction that is executed in a Secure EL1 mode would access *SPSR_mon*, *SP_mon*, or *LR_mon*, it is trapped to EL3.

The effect of using an MSR (Banked register) instruction with a register argument that is not valid for the current mode is UNPREDICTABLE. For more information see *Usage restrictions on the banked register transfer instructions* on page F5-5283.

                    Rmode[m,M32_Svc] = R[n];
                when '1010x' // Access the Abort mode registers
                    m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                    Rmode[m,M32_Abort] = R[n];
                when '1011x' // Access the Undefined mode registers
                    m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                    Rmode[m,M32_Undef] = R[n];
                when '1110x' // Access Monitor registers
                    if !ELUsingAArch32(EL3) then AArch64.MonitorModeTrap();
                    m = 14 - UInt(SYSm<0>); // LR when SYSm<0> == 0, otherwise SP
                    Rmode[m,M32_Monitor] = R[n];
                when '11110' // Access ELR_hyp register
                    ELR_hyp = R[n];
                when '11111' // Access SP_hyp register
                    Rmode[13,M32_Hyp] = R[n];
            end case
        end if
    end if
end if
  
```

CONSTRAINED UNPREDICTABLE behavior

If `PSTATE.EL == EL0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

F5.1.120 MSR (immediate)

Move immediate value to Special register moves selected bits of an immediate value to the corresponding bits in the *The Application Program Status Register, APSR* on page E1-4255, *CPSR*, or *SPSR*_*<current_mode>*.

Because of the Do-Not-Modify nature of its reserved bits, the immediate form of MSR is normally only useful at the Application level for writing to APSR_nzcvq (CPSR_f).

If an MSR (immediate) moves selected bits of an immediate value to the *CPSR*, the PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M* on page G1-6039.

An MSR (immediate) executed in User mode:

- Is CONSTRAINED UNPREDICTABLE if it attempts to update the *SPSR*.
- Otherwise, does not update any *CPSR* field that is accessible only at EL1 or higher,

An MSR (immediate) executed in System mode is CONSTRAINED UNPREDICTABLE if it attempts to update the *SPSR*.

The *CPSR.E* bit is writable from any mode using an MSR instruction. Arm deprecates using this to change its value.

!=1111	0	0	1	1	0	R	1	0	mask	(1)	(1)	(1)	(1)	imm12
cond														

A1 variant

Applies when !(R == 0 && mask == 0000).

MSR{<c>}{<q>} <spec_reg>, #<imm>

Decode for this encoding

```
if mask == '0000' && R == '0' then SEE "Related encodings";
imm32 = A32ExpandImm(imm12); write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If mask == '0000' && R == '1', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related encodings: *Move Special Register and Hints (immediate)* on page F4-4510.

Assembler symbols

<c> See *Standard assembler syntax fields* on page F1-4348.

<q> See *Standard assembler syntax fields* on page F1-4348.

<spec_reg> Is one of:

- APSR_<bits>.

- CPSR_<fields>.
- SPSR_<fields>.

For CPSR and SPSR, <fields> is a sequence of one or more of the following:

- c mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.
- x mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.
- s mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.
- f mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, <bits> is one of nzcvcq, g, or nzcvcqg. These map to the following CPSR_<fields> values:

- APSR_nzcvcq is the same as CPSR_f (mask == '1000').
- APSR_g is the same as CPSR_s (mask == '0100').
- APSR_nzcvcqg is the same as CPSR_fs (mask == '1100').

Arm recommends the APSR_<bits> forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see [The Application Program Status Register, APSR on page E1-4255](#).

<imm> Is an immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User, M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriteByInstr(imm32, mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(imm32, mask);
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User, M32_System} && write_spsr, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

F5.1.121 MSR (register)

Move general-purpose register to Special register moves selected bits of a general-purpose register to the *The Application Program Status Register, APSR* on page E1-4255, CPSR or SPSR_<current_mode>.

Because of the Do-Not-Modify nature of its reserved bits, a read-modify-write sequence is normally required when the MSR instruction is being used at Application level and its destination is not APSR_nzcvq (CPSR_f).

If an MSR (register) moves selected bits of an immediate value to the CPSR, the PE checks whether the value being written to PSTATE.M is legal. See *Illegal changes to PSTATE.M* on page G1-6039.

An MSR (register) executed in User mode:

- Is UNPREDICTABLE if it attempts to update the SPSR.
- Otherwise, does not update any CPSR field that is accessible only at EL1 or higher.

An MSR (register) executed in System mode is UNPREDICTABLE if it attempts to update the SPSR.

The CPSR.E bit is writable from any mode using an MSR instruction. Arm deprecates using this to change its value.

T1 variant

MSR{<c>}{<q>} <spec_reg>, <Rn>

Decode for this encoding

```
n = UInt(Rn); write_spsr = (R == '1');
if mask == '0000' then UNPREDICTABLE;
if n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If mask == '0000', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<spec_reg> Is one of:

- APSR_<bits>.
- CPSR_<fields>.
- SPSR_<fields>.

For CPSR and SPSR, <fields> is a sequence of one or more of the following:

c mask<0> = '1' to enable writing of bits<7:0> of the destination PSR.

x mask<1> = '1' to enable writing of bits<15:8> of the destination PSR.

s mask<2> = '1' to enable writing of bits<23:16> of the destination PSR.

f mask<3> = '1' to enable writing of bits<31:24> of the destination PSR.

For APSR, <bits> is one of nzcvg, g, or nzcvgq. These map to the following CPSR_<fields> values:

- APSR_nzcvg is the same as CPSR_f (mask == '1000').
- APSR_g is the same as CPSR_s (mask == '0100').
- APSR_nzcvgq is the same as CPSR_fs (mask == '1100').

Arm recommends the APSR_<bits> forms when only the N, Z, C, V, Q, and GE[3:0] bits are being written. For more information, see [The Application Program Status Register, APSR on page E1-4255](#).

<Rn> Is the general-purpose source register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if write_spsr then
        if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
        else
            SPSRWriteByInstr(R[n], mask);
    else
        // Attempts to change to an illegal mode will invoke the Illegal Execution state mechanism
        CPSRWriteByInstr(R[n], mask);
```

CONSTRAINED UNPREDICTABLE behavior

If write_spsr && PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.

F5.1.122 MUL, MULS

Multiply multiplies two register values. The least significant 32 bits of the result are written to the destination register. These 32 bits do not depend on whether the source register values are considered to be signed values or unsigned values.

Optionally, it can update the condition flags based on the result. In the T32 instruction set, this option is limited to only a few forms of the instruction. Use of this option adversely affects performance on many implementations.

if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rdm>	Is the second general-purpose source register holding the multiplier and the destination register, encoded in the "Rdm" field.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field. If omitted, <Rd> is used.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand1 = SInt(R[n]); // operand1 = UInt(R[n]) produces the same final results
operand2 = SInt(R[m]); // operand2 = UInt(R[m]) produces the same final results
result = operand1 * operand2;
R[d] = result<31:0>;
if setFlags then
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result<31:0>);
    // PSTATE.C, PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.123 MVN, MVNS (immediate)

Bitwise NOT (immediate) writes the bitwise inverse of an immediate value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

MVN variant

Applies when `S == 0`.

`MVN{<c>}{<q>} <Rd>, #<const>`

MVNS variant

Applies when `S == 1`.

`MVNS{<c>}{<q>} <Rd>, #<const>`

Decode for all variants of this encoding

```
d = UInt(Rd); setflags = (S == '1');
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

MVN variant

Applies when `S == 0`.

`MVN{<c>}{<q>} <Rd>, #<const>`

MVNS variant

Applies when `S == 1`.

```
MVNS{<c>}{<q>} <Rd>, #<const>
```

Decode for all variants of this encoding

```
d = UInt(Rd); setflags = (S == '1');  
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);  
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. Arm deprecates using the PC as the destination register, but if the PC is used:
- For the MVN variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
 - For the MVNS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.
- For encoding T1: is the general-purpose destination register, encoded in the "Rd" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.
- For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F1-4362](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations();  
  result = NOT(imm32);  
  if d == 15 then // Can only occur for A32 encoding  
    if setflags then  
      ALUExceptionReturn(result);  
    else  
      ALUWritePC(result);  
  else  
    R[d] = result;  
    if setflags then  
      PSTATE.N = result<31>;  
      PSTATE.Z = IsZeroBit(result);  
      PSTATE.C = carry;  
      // PSTATE.V unchanged
```

F5.1.124 MVN, MVNS (register)

Bitwise NOT (register) writes the bitwise inverse of a register value to the destination register.

If the destination register is not the PC, the MVNS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The MVN variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- The MVNS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = NOT(shifted);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
            PSTATE.C = carry;
            // PSTATE.V unchanged
  
```

F5.1.125 MVN, MVNS (register-shifted register)

Bitwise NOT (register-shifted register) writes the bitwise inverse of a register-shifted register value to the destination register. It can optionally update the condition flags based on the result.

A1

Flag setting variant

Applies when S == 1.

MVNS{<c>}{<q>} <Rd>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

MVN{<c>}{<q>} <Rd>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONstrained UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> Is the general-purpose source register, encoded in the "Rm" field.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

LSL	when stype = 00
LSR	when stype = 01
ASR	when stype = 10
ROR	when stype = 11
- <Rs> Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
  EncodingSpecificOperations();
  shift_n = UInt(R[s]<7:0>);
```

```
(shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);  
result = NOT(shifted);  
R[d] = result;  
if setflags then  
    PSTATE.N = result<31>;  
    PSTATE.Z = IsZeroBit(result);  
    PSTATE.C = carry;  
    // PSTATE.V unchanged
```

F5.1.126 NOP

No Operation does nothing. This instruction can be used for instruction alignment purposes.

———— **Note** ————

The timing effects of including a NOP instruction in a program are not guaranteed. It can increase execution time, leave it unchanged, or even reduce it. Therefore, NOP instructions are not suitable for timing loops.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See *Standard assembler syntax fields* on page F1-4348.

<q> See *Standard assembler syntax fields* on page F1-4348.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    // Do nothing
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.127 ORN, ORNS (immediate)

Bitwise OR NOT (immediate) performs a bitwise (inclusive) OR of a register value and the complement of an immediate value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

T1

Flag setting variant

Applies when S == 1.

ORNS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Not flag setting variant

Applies when S == 0.

ORN{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```

if Rn == '1111' then SEE "MVN (immediate)";
d = UInt(Rd); n = UInt(Rn); setFlags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
  
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
- <Rn> Is the general-purpose source register, encoded in the "Rn" field.
- <const> An immediate value. See [Modified immediate constants in T32 instructions on page F1-4362](#) for the range of values.

Operation

```

if ConditionPassed() then
  EncodingSpecificOperations();
  result = R[n] OR NOT(imm32);
  R[d] = result;
  if setFlags then
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
  
```

```
PSTATE.C = carry;  
// PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.128 ORN, ORNS (register)

Bitwise OR NOT (register) performs a bitwise (inclusive) OR of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

T1

ORN, rotate right with extend variant

Applies when $S == 0$ && $imm3 == 000$ && $imm2 == 00$ && $stype == 11$.

ORN{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

ORN, shift or rotate by value variant

Applies when $S == 0$ && $!(imm3 == 000$ && $imm2 == 00$ && $stype == 11)$.

ORN{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

ORNS, rotate right with extend variant

Applies when $S == 1$ && $imm3 == 000$ && $imm2 == 00$ && $stype == 11$.

ORNS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, RRX

ORNS, shift or rotate by value variant

Applies when $S == 1$ && $!(imm3 == 000$ && $imm2 == 00$ && $stype == 11)$.

ORNS{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
if Rn == '1111' then SEE "MVN (register)";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:

LSL	when stype = 00
LSR	when stype = 01
ASR	when stype = 10
ROR	when stype = 11

<amount> Is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR NOT(shifted);
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.129 ORR, ORRS (immediate)

Bitwise OR (immediate) performs a bitwise (inclusive) OR of a register value and an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

ORR variant

Applies when `S == 0`.

`ORR{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

ORRS variant

Applies when `S == 1`.

`ORRS{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

Decode for all variants of this encoding

`d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');`
`(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);`

T1

ORR variant

Applies when `S == 0`.

`ORR{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

ORRS variant

Applies when S == 1.

ORRS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
if Rn == '1111' then SEE "MOV (immediate)";
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1');
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.

For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F1-4362](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] OR imm32;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.N = result<31>;
            PSTATE.Z = IsZeroBit(result);
```

```
PSTATE.C = carry;  
// PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.130 ORR, ORRS (register)

Bitwise OR (register) performs a bitwise (inclusive) OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the ORRS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The ORR variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The ORRS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related encodings: [Data-processing \(shifted register\) on page F3-4428](#)

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none"> For the ORR variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253. For the ORRS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.								
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.								

In T32 assembly:

- Outside an IT block, if ORRS <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORRS <Rd>, <Rn> had been written.
- Inside an IT block, if ORR<c> <Rd>, <Rn>, <Rd> is written with <Rd> and <Rn> both in the range R0-R7, it is assembled using encoding T1 as though ORR<c> <Rd>, <Rn> had been written.

To prevent either of these happening, use the .W qualifier.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] ORR shifted;
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
  
```

```
        ALUExceptionReturn(result);
    else
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.131 ORR, ORRS (register-shifted register)

Bitwise OR (register-shifted register) performs a bitwise (inclusive) OR of a register value and a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
!=1111				0	0	0	1	1	0	0	S	Rn	Rd	Rs	0	stype	1	Rm			
cond																					

Flag setting variant

Applies when S == 1.

ORR{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

ORR{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.								
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<Rs>	Is the general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] OR shifted;
    R[d] = result;
    if setflags then
        PSTATE.N = result<31>;
        PSTATE.Z = IsZeroBit(result);
        PSTATE.C = carry;
        // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.132 PKHBT, PKHTB

Pack Halfword combines one halfword of its first operand with the other halfword of its shifted second operand.

A1

PKHBT variant

Applies when tb == 0.

PKHBT{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, LSL #<imm>}

PKHTB variant

Applies when tb == 1.

PKHTB{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ASR #<imm>}

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); tbform = (tb == '1');
(shift_t, shift_n) = DecodeImmShift(tb:'0', imm5);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

PKHBT variant

Applies when tb == 0.

PKHBT{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, LSL #<imm>} // tbform == FALSE

PKHTB variant

Applies when tb == 1.

PKHTB{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ASR #<imm>} // tbform == TRUE

Decode for all variants of this encoding

```
if S == '1' || T == '1' then UNDEFINED;
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); tbform = (tb == '1');
(shift_t, shift_n) = DecodeImmShift(tb:'0', imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.
<imm>	For encoding A1: the shift to apply to the value read from <Rm>, encoded in the "imm5" field. For PKHBT, it is one of: omitted No shift, encoded as 0b00000. 1-31 Left shift by specified number of bits, encoded as a binary number. For PKHTB, it is one of: omitted Instruction is a pseudo-instruction and is assembled as though PKHBT{<c>}{<q>} <Rd>, <Rm>, <Rn> had been written. 1-32 Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as 0b00000. Other shift amounts are encoded as binary numbers.

Note

An assembler can permit <imm> = 0 to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

For encoding T1: the shift to apply to the value read from <Rm>, encoded in the "imm3:imm2" field.

For PKHBT, it is one of:

omitted	No shift, encoded as 0b00000.
1-31	Left shift by specified number of bits, encoded as a binary number.
For PKHTB, it is one of:	
omitted	Instruction is a pseudo-instruction and is assembled as though PKHBT{<c>}{<q>} <Rd>, <Rm>, <Rn> had been written.
1-32	Arithmetic right shift by specified number of bits. A shift by 32 bits is encoded as 0b00000. Other shift amounts are encoded as binary numbers.

Note

An assembler can permit <imm> = 0 to mean the same thing as omitting the shift, but this is not standard UAL and must not be used for disassembly.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand2 = Shift(R[m], shift_t, shift_n, PSTATE.C); // PSTATE.C ignored
R[d]<15:0> = if tbform then operand2<15:0> else R[n]<15:0>;
R[d]<31:16> = if tbform then R[n]<31:16> else operand2<31:16>;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.

- The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.133 PLD, PLDW (immediate)

Preload Data (immediate) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-4310](#).

A1

Preload read variant

Applies when R == 1.

PLD{<c>}{<q>} [<Rn> {, #<+/-><imm>}]

Preload write variant

Applies when R == 0.

PLDW{<c>}{<q>} [<Rn> {, #<+/-><imm>}]

Decode for all variants of this encoding

```
if Rn == '1111' then SEE "PLD (literal)";
n = UInt(Rn); imm32 = ZeroExtend(imm12, 32); add = (U == '1'); is_pldw = (R == '0');
```

T1

Preload read variant

Applies when W == 0.

PLD{<c>}{<q>} [<Rn> {, #<+><imm>}]

Preload write variant

Applies when W == 1.

PLDW{<c>}{<q>} [<Rn> {, #<+><imm>}]

Decode for all variants of this encoding

```
if Rn == '1111' then SEE "PLD (literal)";
n = UInt(Rn); imm32 = ZeroExtend(imm12, 32); add = TRUE; is_pldw = (W == '1');
```

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0			15	14	13	12	11	10	9	8	7	0		
1	1	1	1	1	0	0	0	0	0	W	1	!	1111	1	1	1	1	1	1	0	0	imm8					

Rn

Preload read variant

Applies when W == 0.

PLD{<c>}{<q>} [<Rn> {, #-<imm>}]

Preload write variant

Applies when W == 1.

PLDW{<c>}{<q>} [<Rn> {, #-<imm>}]

Decode for all variants of this encoding

```
if Rn == '1111' then SEE "PLD (literal)";
n = UInt(Rn); imm32 = ZeroExtend(imm8, 32); add = FALSE; is_pldw = (W == '1');
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). Must be AL or omitted.
For encoding T1 and T2: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field. If the PC is used, see [PLD \(literal\)](#).
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the offset is added to the base register.
- <imm> For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  address = if add then (R[n] + imm32) else (R[n] - imm32);
  if is_pldw then
    Hint_PreloadDataForWrite(address);
```

```
else  
    Hint_PreloadData(address);
```

F5.1.134 PLD (literal)

Preload Data (literal) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The effect of a PLD instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-4310](#).

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11					0

A1 variant

PLD{<c>}{<q>} <label> // Normal form
 PLD{<c>}{<q>} [PC, #<+/-><imm>] // Alternative form

Decode for this encoding

imm32 = ZeroExtend(imm12, 32); add = (U == '1');

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11					0
1	1	1	1	1	0	0	0	U	0	(0)	1	1	1	1	1	1	1	1	1	1	imm12				

T1 variant

PLD{<c>}{<q>} <label> // Preferred syntax
 PLD{<c>}{<q>} [PC, #<+/-><imm>] // Alternative syntax

Decode for this encoding

imm32 = ZeroExtend(imm12, 32); add = (U == '1');

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). Must be AL or omitted.
 For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <label> The label of the literal data item that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the Align(PC, 4) value of the instruction to this label. The offset must be in the range -4095 to 4095.
 If the offset is zero or positive, imm32 is equal to the offset and add == TRUE.
 If the offset is negative, imm32 is equal to minus the offset and add == FALSE.

+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field. For encoding T1: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F2-4377](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
address = if add then (Align(PC,4) + imm32) else (Align(PC,4) - imm32);
Hint_PreloadData(address);
```

F5.1.135 PLD, PLDW (register)

Preload Data (register) signals the memory system that data memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into the data cache.

The PLD instruction signals that the likely memory access is a read, and the PLDW instruction signals that it is a write.

The effect of a PLD or PLDW instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-4310](#).

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0
1	1	1	1	0	1	1	1	U	R	0	1	Rn	(1)	(1)	(1)	(1)	imm5	stype	0	Rm				

Preload read, optional shift or rotate variant

Applies when $R == 1 \ \&\& \ !(imm5 == 00000 \ \&\& \ stype == 11)$.

PLD{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]

Preload read, rotate right with extend variant

Applies when $R == 1 \ \&\& \ imm5 == 00000 \ \&\& \ stype == 11$.

PLD{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]

Preload write, optional shift or rotate variant

Applies when $R == 0 \ \&\& \ !(imm5 == 00000 \ \&\& \ stype == 11)$.

PLDW{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]

Preload write, rotate right with extend variant

Applies when $R == 0 \ \&\& \ imm5 == 00000 \ \&\& \ stype == 11$.

PLDW{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm); add = (U == '1'); is_pldw = (R == '0');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
if m == 15 || (n == 15 && is_pldw) then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	6	5	4	3	0

Rn

Preload read variant

Applies when $W == 0$.

PLD{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]

Preload write variant

Applies when W == 1.

PLDW{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]

Decode for all variants of this encoding

```
if Rn == '1111' then SEE "PLD (literal)";
n = UInt(Rn); m = UInt(Rm); add = TRUE; is_pldw = (W == '1');
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). <c> must be AL or omitted.
For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used.
For encoding T1: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 - + when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <shift> Is the type of shift to be applied to the index register, encoded in the "stype" field. It can have the following values:
 - LSL when stype = 00
 - LSR when stype = 01
 - ASR when stype = 10
 - ROR when stype = 11
- <amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.
For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
address = if add then (R[n] + offset) else (R[n] - offset);
if is_pldw then
  Hint_PreloadDataForWrite(address);
```

```
else  
    Hint_PreloadData(address);
```

F5.1.136 PLI (immediate, literal)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as pre-loading the cache line containing the specified address into the instruction cache.

The effect of a PLI instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-4310](#).

A1

A1 variant

PLI{<c>}{<q>} [<Rn> {, #<+/-><imm>}]
 PLI{<c>}{<q>} <label> // Normal form
 PLI{<c>}{<q>} [PC, #<+/-><imm>] // Alternative form

Decode for this encoding

n = UInt(Rn); imm32 = ZeroExtend(imm12, 32); add = (U == '1');

T1

T1 variant

PLI{<c>}{<q>} [<Rn> {, #<+><imm>}]

Decode for this encoding

if Rn == '1111' then SEE "encoding T3";
 n = UInt(Rn); imm32 = ZeroExtend(imm12, 32); add = TRUE;

T2

T2 variant

PLI{<c>}{<q>} [<Rn> {, #-<imm>}]

Decode for this encoding

if Rn == '1111' then SEE "encoding T3";
 n = UInt(Rn); imm32 = ZeroExtend(imm8, 32); add = FALSE;

T3

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11						0
1	1	1	1	1	0	0	1	U	0	0	1	1	1	1	1	1	1	1	1	imm12						

T3 variant

PLI{<c>}{<q>} <label> // Preferred syntax
 PLI{<c>}{<q>} [PC, #<+/-><imm>] // Alternative syntax

Decode for this encoding

n = 15; imm32 = ZeroExtend(imm12, 32); add = (U == '1');

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). Must be AL or omitted.
 For encoding T1, T2 and T3: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <label> The label of the instruction that is likely to be accessed in the near future. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. The offset must be in the range `-4095` to `4095`.
 If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`.
 If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <+/-> Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
 - when U = 0
 + when U = 1
- + Specifies the offset is added to the base register.
- <imm> For encoding A1: is the optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
 For encoding T1: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.
 For encoding T2: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.
 For encoding T3: is a 12-bit unsigned immediate byte offset, in the range 0 to 4095, encoded in the "imm12" field.

For the literal forms of the instruction, encoding T3 is used, or Rn is encoded as `0b1111` in encoding A1, to indicate that the PC is the base register.

The alternative literal syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F2-4377](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
base = if n == 15 then Align(PC,4) else R[n];
address = if add then (base + imm32) else (base - imm32);
Hint_PreloadInstr(address);
```

F5.1.137 PLI (register)

Preload Instruction signals the memory system that instruction memory accesses from a specified address are likely in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as pre-loading the cache line containing the specified address into the instruction cache.

The effect of a PLI instruction is IMPLEMENTATION DEFINED. For more information, see [Preloading caches on page E2-4310](#).

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0
1	1	1	1	0	1	1	0	U	1	0	1	Rn	(1)	(1)	(1)	(1)	imm5	stype	0	Rm				

Rotate right with extend variant

Applies when imm5 == 00000 && stype == 11.

PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> , RRX]

Shift or rotate by value variant

Applies when !(imm5 == 00000 && stype == 11).

PLI{<c>}{<q>} [<Rn>, {+/-}<Rm> {, <shift> #<amount>}]

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm); add = (U == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
if m == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	0	0	1	0	0	0	1	!=1111	Rn	1	1	1	1	0	0	0	0	0	0	imm2	Rm		

T1 variant

PLI{<c>}{<q>} [<Rn>, {+}<Rm> {, LSL #<amount>}]

Decode for this encoding

```
if Rn == '1111' then SEE "PLI (immediate, literal)";
n = UInt(Rn); m = UInt(Rm); add = TRUE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . <c> must be AL or omitted. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the index register, encoded in the "stype" field. It can have the following values: LSL when stype = 00 LSR when stype = 01 ASR when stype = 10 ROR when stype = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T1: is the shift amount, in the range 0 to 3, defaulting to 0 and encoded in the "imm2" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    address = if add then (R[n] + offset) else (R[n] - offset);
    Hint_PreloadInstr(address);
```

F5.1.138 POP

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

The registers loaded can include the PC, causing a branch to a loaded address. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

T1

15	14	13	12	11	10	9	8	7											0
1	0	1	1	1	1	0	P	register_list											

T1 variant

```
POP{<c>}{<q>} <registers> // Preferred syntax
LDM{<c>}{<q>} SP!, <registers> // Alternate syntax
```

Decode for this encoding

```
registers = P:'0000000':register_list; UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
if registers<15> == '1' && InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <registers> Is a list of one or more registers to be loaded, separated by commas and surrounded by { and }.
- The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the PC. If the PC is in the list, the "P" field is set to 1, otherwise this field defaults to 0.
- If the PC is in the list, the instruction must be either outside any IT block, or the last instruction in an IT block.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = SP;
    for i = 0 to 14
        if registers<i> == '1' then
            R[i] = if UnalignedAllowed then MemU[address,4] else MemA[address,4];
            address = address + 4;
    if registers<15> == '1' then
        if UnalignedAllowed then
            if address<1:0> == '00' then
                LoadWritePC(MemU[address,4]);
            else
                UNPREDICTABLE;
        else
            LoadWritePC(MemA[address,4]);
    if registers<13> == '0' then SP = SP + 4*BitCount(registers);
    if registers<13> == '1' then SP = bits(32) UNKNOWN;
```

F5.1.139 POP (multiple registers)

Pop Multiple Registers from Stack loads multiple general-purpose registers from the stack, loading from consecutive memory locations starting at the address in SP, and updates SP to point just above the loaded data

This instruction is an alias of the [LDM](#), [LDMIA](#), [LDMFD](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LDM](#), [LDMIA](#), [LDMFD](#).
- The description of [LDM](#), [LDMIA](#), [LDMFD](#) gives the operational pseudocode for this instruction.

A1

A1 variant

POP{<c>}{<q>} <registers>

is equivalent to

LDM{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when $\text{BitCount}(\text{register_list}) > 1$.

T2

T2 variant

POP{<c>}.W <registers> // All registers in R0-R7, PC

is equivalent to

LDM{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when $\text{BitCount}(\text{P:M:register_list}) > 1$.

POP{<c>}{<q>} <registers>

is equivalent to

LDM{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when $\text{BitCount}(\text{P:M:register_list}) > 1$.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<registers> For encoding A1: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

If the SP is in the list, the value of the SP after such an instruction is UNKNOWN.

The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

Arm deprecates the use of this instruction with both the LR and the PC in the list.

For encoding T2: is a list of two or more registers to be loaded, separated by commas and surrounded by { and }. The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain one of the LR or the PC. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0. If the PC is in the list, the "P" field is set to 1, otherwise it defaults to 0.

The PC can be in the list. If it is, the instruction branches to the address loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#). If the PC is in the list:

- The LR must not be in the list.
- The instruction must be either outside any IT block, or the last instruction in an IT block.

Operation for all encodings

The description of [LDM, LDMIA, LDMFD](#) gives the operational pseudocode for this instruction.

F5.1.140 POP (single register)

Pop Single Register from Stack loads a single general-purpose register from the stack, loading from the address in SP, and updates SP to point just above the loaded data

This instruction is an alias of the [LDR \(immediate\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LDR \(immediate\)](#).
- The description of [LDR \(immediate\)](#) gives the operational pseudocode for this instruction.

A1

Post-indexed variant

POP{<c>}{<q>} <single_register_list>

is equivalent to

LDR{<c>}{<q>} <Rt>, [SP], #4

and is always the preferred disassembly.

T4

Post-indexed variant

POP{<c>}{<q>} <single_register_list>

is equivalent to

LDR{<c>}{<q>} <Rt>, [SP], #4

and is always the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<single_register_list>

Is the general-purpose register <Rt> to be loaded surrounded by { and }.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, provided the instruction is either outside an IT block or the last instruction of an IT block. If the PC is used, the instruction branches to the address (data) loaded to the PC. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC](#) on page E1-4253.

Operation for all encodings

The description of [LDR \(immediate\)](#) gives the operational pseudocode for this instruction.

F5.1.141 PSSBB

Physical Speculative Store Bypass Barrier is a memory barrier which prevents speculative loads from bypassing earlier stores to the same physical address.

The semantics of the Physical Speculative Store Bypass Barrier are:

- When a load to a location appears in program order after the PSSBB, then the load does not speculatively read an entry earlier in the coherence order for that location than the entry generated by the latest store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store appears in program order before the PSSBB.
- When a load to a location appears in program order before the PSSBB, then the load does not speculatively read data from any store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store appears in program order after the PSSBB.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

T1 variant

PSSBB{<q>}

Decode for this encoding

if InITBlock() then UNPREDICTABLE;

Assembler symbols

<q> See [Standard assembler syntax fields on page F1-4348](#).

Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations();  
    SpeculativeStoreBypassBarrierToPA();
```

F5.1.142 PUSH

Push Multiple Registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data.

The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

T1

15	14	13	12	11	10	9	8	7											0
1	0	1	1	0	1	0	M	register_list											

T1 variant

```
PUSH{<c>}{<q>} <registers> // Preferred syntax
STMDB{<c>}{<q>} SP!, <registers> // Alternate syntax
```

Decode for this encoding

```
registers = '0':M:'000000':register_list; UnalignedAllowed = FALSE;
if BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `BitCount(registers) < 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers loaded.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }.
- The registers in the list must be in the range R0-R7, encoded in the "register_list" field, and can optionally include the LR. If the LR is in the list, the "M" field is set to 1, otherwise this field defaults to 0.

Operation

```
if ConditionPassed() then
  EncodingSpecificOperations();
  address = SP - 4*BitCount(registers);
  for i = 0 to 14
    if registers<i> == '1' then
      if i == 13 && i != LowestSetBit(registers) then // Only possible for encoding A1
```

```
MemA[address,4] = bits(32) UNKNOWN;
else
  if UnalignedAllowed then
    MemU[address,4] = R[i];
  else
    MemA[address,4] = R[i];
  address = address + 4;
if registers<15> == '1' then // Only possible for encoding A1 or A2
  if UnalignedAllowed then
    MemU[address,4] = PCStoreValue();
  else
    MemA[address,4] = PCStoreValue();
SP = SP - 4*BitCount(registers);
```

F5.1.143 PUSH (multiple registers)

Push multiple registers to Stack stores multiple general-purpose registers to the stack, storing to consecutive memory locations ending just below the address in SP, and updates SP to point to the start of the stored data

This instruction is an alias of the [STMDB](#), [STMFD](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [STMDB](#), [STMFD](#).
- The description of [STMDB](#), [STMFD](#) gives the operational pseudocode for this instruction.

A1

A1 variant

PUSH{<c>}{<q>} <registers>

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when `BitCount(register_list) > 1`.

T1

T1 variant

PUSH{<c>}.W <registers> // All registers in R0-R7, LR

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when `BitCount(M:register_list) > 1`.

PUSH{<c>}{<q>} <registers>

is equivalent to

STMDB{<c>}{<q>} SP!, <registers>

and is the preferred disassembly when `BitCount(M:register_list) > 1`.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<registers> For encoding A1: is a list of two or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

The SP and PC can be in the list. However:

- Arm deprecates the use of instructions that include the PC in the list.
- If the SP is in the list, and it is not the lowest-numbered register in the list, the instruction stores an UNKNOWN value for the SP.

For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The lowest-numbered register is stored to the lowest memory address, through to the highest-numbered register to the highest memory address. See also [Encoding of lists of general-purpose registers and the PC](#) on page F1-4354.

The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

The description of [STMDB](#), [STMTD](#) gives the operational pseudocode for this instruction.

F5.1.144 PUSH (single register)

Push Single Register to Stack stores a single general-purpose register to the stack, storing to the 32-bit word below the address in SP, and updates SP to point to the start of the stored data

This instruction is an alias of the [STR \(immediate\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [STR \(immediate\)](#).
- The description of [STR \(immediate\)](#) gives the operational pseudocode for this instruction.

A1

Pre-indexed variant

PUSH{<c>}{<q>} <single_register_list>

is equivalent to

STR{<c>}{<q>} <Rt>, [SP, #-4]!

and is always the preferred disassembly.

T4

Pre-indexed variant

PUSH{<c>}{<q>} <single_register_list> // Standard syntax

is equivalent to

STR{<c>}{<q>} <Rt>, [SP, #-4]!

and is always the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<single_register_list>

Is the general-purpose register <Rt> to be stored surrounded by { and }.

<Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.

For encoding T4: is the general-purpose register to be transferred, encoded in the "Rt" field.

Operation for all encodings

The description of [STR \(immediate\)](#) gives the operational pseudocode for this instruction.

F5.1.145 QADD

Saturating Add adds two register values, saturates the result to the 32-bit signed integer range -2^{31} to $(2^{31} - 1)$, and writes the result to the destination register. If saturation occurs, it sets `PSTATE.Q` to 1.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  sum1 = SInt(R[n]<7:0>) + SInt(R[m]<7:0>);
```

```
sum2 = SInt(R[n]<15:8>) + SInt(R[m]<15:8>);  
sum3 = SInt(R[n]<23:16>) + SInt(R[m]<23:16>);  
sum4 = SInt(R[n]<31:24>) + SInt(R[m]<31:24>);  
R[d]<7:0> = SignedSat(sum1, 8);  
R[d]<15:8> = SignedSat(sum2, 8);  
R[d]<23:16> = SignedSat(sum3, 8);  
R[d]<31:24> = SignedSat(sum4, 8);
```

F5.1.148 QASX

Saturating Add and Subtract with Exchange exchanges the two halfwords of the second operand, performs one 16-bit integer addition and one 16-bit subtraction, saturates the results to the 16-bit signed integer range $-2^{15} \leq x \leq 2^{15} - 1$, and writes the results to the destination register.

A1

A1 variant

QASX{<c>}{<q>} {<Rd>}, {<Rn>}, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
 if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;

T1

T1 variant

QASX{<c>}{<q>} {<Rd>}, {<Rn>}, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
 if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
diff = SInt(R[n]<15:0>) - SInt(R[m]<31:16>);
sum  = SInt(R[n]<31:16>) + SInt(R[m]<15:0>);
R[d]<15:0> = SignedSat(diff, 16);
R[d]<31:16> = SignedSat(sum, 16);
```

F5.1.149 QDADD

Saturating Double and Add adds a doubled register value to another register value, and writes the result to the destination register. Both the doubling and the addition have their results saturated to the 32-bit signed integer range $-2^{31} \leq x \leq 2^{31} - 1$. If saturation occurs in either operation, it sets `PSTATE.Q` to 1.

cond																															

A1 variant

RBIT{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm);
 if d == 15 || m == 15 then UNPREDICTABLE;

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	0	1	0	0	1	Rn	1	1	1	1	Rd	1	0	1	0	Rm			

T1 variant

RBIT{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); n = UInt(Rn);
 if m != n || d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If m != n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: m = UInt(Rn);.
- The instruction executes with the additional decode: m = UInt(Rm);.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field.
For encoding T1: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
bits(32) result;
for i = 0 to 31
    result<31-i> = R[m]<i>;
R[d] = result;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.156 REV

Byte-Reverse Word reverses the byte order in a 32-bit register.

A1

A1 variant

REV{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm);
 if d == 15 || m == 15 then UNPREDICTABLE;

T1

T1 variant

REV{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm);

T2

T2 variant

REV{<c>}.W <Rd>, <Rm> // <Rd>, <Rm> can be represented in T1
 REV{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); n = UInt(Rn);
 if m != n || d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If m != n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.
- The instruction executes with the additional decode: $m = \text{UInt}(\text{Rn});$.
- The instruction executes with the additional decode: $m = \text{UInt}(\text{Rm});$.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field.
For encoding T2: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    bits(32) result;
    result<31:24> = R[m]<7:0>;
    result<23:16> = R[m]<15:8>;
    result<15:8> = R[m]<23:16>;
    result<7:0> = R[m]<31:24>;
    R[d] = result;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.157 REV16

Byte-Reverse Packed Halfword reverses the byte order in each 16-bit halfword of a 32-bit register.

A1

A1 variant

REV16{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm);
 if d == 15 || m == 15 then UNPREDICTABLE;

T1

T1 variant

REV16{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm);

T2

T2 variant

REV16{<c>}.W <Rd>, <Rm> // <Rd>, <Rm> can be represented in T1
 REV16{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); n = UInt(Rn);
 if m != n || d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If m != n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.
- The instruction executes with the additional decode: $m = \text{UInt}(\text{Rn});$.
- The instruction executes with the additional decode: $m = \text{UInt}(\text{Rm});$.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field.
For encoding T2: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    bits(32) result;
    result<31:24> = R[m]<23:16>;
    result<23:16> = R[m]<31:24>;
    result<15:8>  = R[m]<7:0>;
    result<7:0>  = R[m]<15:8>;
    R[d] = result;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.158 REVSH

Byte-Reverse Signed Halfword reverses the byte order in the lower 16-bit halfword of a 32-bit register, and sign-extends the result to 32 bits.

A1

A1 variant

REVSH{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm);
 if d == 15 || m == 15 then UNPREDICTABLE;

T1

T1 variant

REVSH{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm);

T2

T2 variant

REVSH{<c>}.W <Rd>, <Rm> // <Rd>, <Rm> can be represented in T1
 REVSH{<c>}{<q>} <Rd>, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); n = UInt(Rn);
 if m != n || d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If m != n, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.
- The instruction executes with the additional decode: $m = \text{UInt}(\text{Rn})$;
- The instruction executes with the additional decode: $m = \text{UInt}(\text{Rm})$;
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> For encoding A1 and T1: is the general-purpose source register, encoded in the "Rm" field.
For encoding T2: is the general-purpose source register, encoded in the "Rm" field. It must be encoded with an identical value in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    bits(32) result;
    result<31:8> = SignExtend(R[m]<7:0>, 24);
    result<7:0> = R[m]<15:8>;
    R[d] = result;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.159 RFE, RFEDA, RFEDB, RFEIA, RFEIB

Return From Exception loads two consecutive memory locations using an address in a base register:

- The word loaded from the lower address is treated as an instruction address. The PE branches to it.
- The word loaded from the higher address is used to restore [PSTATE](#). This word must be in the format of an SPSR.

An address adjusted by the size of the data loaded can optionally be written back to the base register.

The PE checks the value of the word loaded from the higher address for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).

RFE is UNDEFINED in Hyp mode and CONSTRAINED UNPREDICTABLE in User mode.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

T2 variant

RFE{IA}{<c>}{<q>} <Rn>{!} // Outside or last in IT block, preferred syntax
 RFEFD{<c>}{<q>} <Rn>{!} // Outside or last in IT block, alternate syntax, Full Descending stack

Decode for this encoding

```
n = UInt(Rn); wback = (W == '1'); increment = TRUE; wordhigher = FALSE;
if n == 15 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- IA For encoding A1: is an optional suffix to indicate the Increment After variant.
 For encoding T2: is an optional suffix for the Increment After form.
- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). <c> must be AL or omitted.
 For encoding T1 and T2: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.

RFEFA, RFEFA, RFEFD, and RFEED are pseudo-instructions for RFEDA, RFEDB, RFEIA, and RFEIB respectively, referring to their use for popping data from Full Ascending, Empty Ascending, Full Descending, and Empty Descending stacks.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  if PSTATE.EL == EL2 then
    UNDEFINED;
  elseif PSTATE.EL == EL0 then
    UNPREDICTABLE; // UNDEFINED or NOP
```

```
else
  address = if increment then R[n] else R[n]-8;
  if wordhigher then address = address+4;
  new_pc_value = MemA[address,4];
  spsr = MemA[address+4,4];
  if wback then R[n] = if increment then R[n]+8 else R[n]-8;
  AArch32.ExceptionReturn(new_pc_value, spsr);
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

F5.1.160 ROR (immediate)

Rotate Right (immediate) provides the value of the contents of a register rotated by a constant value. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	7	6	5	4	3	0

								S													styp					

MOV, shift or rotate by value variant

Applies when !(imm3 == 000 && imm2 == 00).

ROR{<c>}{<q>} {<Rd>}, <Rm>, #<imm>

is equivalent to

MOV{<c>}{<q>} <Rd>, <Rm>, ROR #<imm>

and is always the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. Arm deprecates using the PC as the destination register, but if the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

For encoding T3: is the general-purpose destination register, encoded in the "Rd" field.

<Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.

For encoding T3: is the general-purpose source register, encoded in the "Rm" field.

<imm> For encoding A1: is the shift amount, in the range 1 to 31, encoded in the "imm5" field.
For encoding T3: is the shift amount, in the range 1 to 31, encoded in the "imm3:imm2" field.

Operation for all encodings

The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

F5.1.161 ROR (register)

Rotate Right (register) provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The variable number of bits is read from the bottom byte of a register

This instruction is an alias of the [MOV, MOVS \(register-shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register-shifted register\)](#).
- The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

A1

Not flag setting variant

ROR{<c>}{<q>} {<Rd>}, <Rm>, <Rs>

is equivalent to

MOV{<c>}{<q>} <Rd>, <Rm>, ROR <Rs>

and is always the preferred disassembly.

T1

Rotate right variant

ROR<c>{<q>} {<Rdm>}, <Rdm>, <Rs> // Inside IT block

is equivalent to

MOV<c>{<q>} <Rdm>, <Rdm>, ROR <Rs>

and is the preferred disassembly when InITBlock().

T2

Not flag setting variant

ROR<c>.W {<Rd>}, <Rm>, <Rs> // Inside IT block, and <Rd>, <Rm>, <shift>, <Rs> can be represented in T1

is equivalent to

MOV{<c>}{<q>} <Rd>, <Rm>, ROR <Rs>

and is always the preferred disassembly.

ROR{<C>}{<Q>} {<Rd>}, <Rm>, <Rs>

is equivalent to

MOV{<C>}{<Q>} <Rd>, <Rm>, ROR <Rs>

and is always the preferred disassembly.

Assembler symbols

- <C> See [Standard assembler syntax fields on page F1-4348](#).
- <Q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rdm> Is the first general-purpose source register and the destination register, encoded in the "Rdm" field.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> Is the first general-purpose source register, encoded in the "Rm" field.
- <Rs> Is the second general-purpose source register holding a rotate amount in its bottom 8 bits, encoded in the "Rs" field.

Operation for all encodings

The description of [MOV, MOVS \(register-shifted register\)](#) gives the operational pseudocode for this instruction.

F5.1.162 RORS (immediate)

Rotate Right, setting flags (immediate) provides the value of the contents of a register rotated by a constant value. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

If the destination register is not the PC, this instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. Arm deprecates any use of these encodings. However, when the destination register is the PC:

- The PE branches to the address written to the PC, and restores [PSTATE](#) from SPSR_<current_mode>.
- The PE checks SPSR_<current_mode> for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
- The instruction is UNDEFINED in Hyp mode.
- The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

This instruction is an alias of the [MOV, MOVS \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOV, MOVS \(register\)](#).
- The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

<C> See [Standard assembler syntax fields](#) on page F1-4348.

- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. Arm deprecates using the PC as the destination register, but if the PC is used, the instruction performs an exception return, that restores [PSTATE](#) from SPSR_<current_mode>.
For encoding T3: is the general-purpose destination register, encoded in the "Rd" field.
- <Rm> For encoding A1: is the general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T3: is the general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

The description of [MOV, MOVS \(register\)](#) gives the operational pseudocode for this instruction.

F5.1.166 RSB, RSBS (immediate)

Reverse Subtract (immediate) subtracts a register value from an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

RSB variant

Applies when `S == 0`.

`RSB{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

RSBS variant

Applies when `S == 1`.

`RSBS{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

Decode for all variants of this encoding

`d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);`

T1

T1 variant

`RSB{<c>}{<q>} {<Rd>}, <Rn>, #0 // Inside IT block`

`RSBS{<c>}{<q>} {<Rd>}, <Rn>, #0 // Outside IT block`

Decode for this encoding

`d = UInt(Rd); n = UInt(Rn); setflags = !InITBlock(); imm32 = Zeros(32); // immediate = #0`

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	0
1	1	1	1	0	i	0	1	1	1	0	S	Rn	0	imm3	Rd	imm8				

RSB variant

Applies when S == 0.

RSB<c>.W {<Rd>}, <Rn>, #0 // Inside IT block

RSB{<c>}{<q>} {<Rd>}, <Rn>, #<const>

RSBS variant

Applies when S == 1.

RSBS.W {<Rd>}, <Rn>, #0 // Outside IT block

RSBS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = T32ExpandImm(i:imm3:imm8);
if d == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- For the RSBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

For encoding T1 and T2: is the general-purpose source register, encoded in the "Rn" field.

<const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.

For encoding T2: an immediate value. See [Modified immediate constants in T32 instructions on page F1-4362](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
(result, nzcvc) = AddWithCarry(NOT(R[n]), imm32, '1');
if d == 15 then // Can only occur for A32 encoding
    if setflags then
        ALUExceptionReturn(result);
    else
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.167 RSB, RSBS (register)

Reverse Subtract (register) subtracts a register value from an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the RSBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The RSBS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See *Standard assembler syntax fields* on page F1-4348.

<q> See *Standard assembler syntax fields* on page F1-4348.

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the RSB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- For the RSBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

	For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: LSL when stype = 00 LSR when stype = 01 ASR when stype = 10 ROR when stype = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(NOT(R[n]), shifted, '1');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.168 RSB, RSBS (register-shifted register)

Reverse Subtract (register-shifted register) subtracts a register value from a register-shifted register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

A1

31	28 27 26 25 24	23 22 21 20	19	16 15	12 11	8	7 6 5 4	3	0	
!=1111	0 0 0 0	0 1 1	S	Rn	Rd	Rs	0	stype	1	Rm
cond										

Flag setting variant

Applies when S == 1.

RSBS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

RSB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcw) = AddWithCarry(NOT(R[n]), shifted, '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcw;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.169 RSC, RSCS (immediate)

Reverse Subtract with Carry (immediate) subtracts a register value and the value of NOT (Carry flag) from an immediate value, and writes the result to the destination register.

If the destination register is not the PC, the RSCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSC variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- The RSCS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

RSC variant

Applies when `S == 0`.

`RSC{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

RSCS variant

Applies when `S == 1`.

`RSCS{<c>}{<q>} {<Rd>}, <Rn>, #<const>`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);
```

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> Is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the RSC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- For the RSCS variant, the instruction performs an exception return, that restores `PSTATE` from `SPSR_<current_mode>`.

<Rn> Is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

<const> An immediate value. See *Modified immediate constants in A32 instructions* on page F1-4364 for the range of values.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
(result, nzcvc) = AddWithCarry(NOT(R[n]), imm32, PSTATE.C);
if d == 15 then
    if setflags then
        ALUExceptionReturn(result);
    else
        ALUWritePC(result);
else
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.170 RSC, RSCS (register)

Reverse Subtract with Carry (register) subtracts a register value and the value of NOT (Carry flag) from an optionally-shifted register value, and writes the result to the destination register.

If the destination register is not the PC, the RSCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The RSC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The RSCS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcw) = AddWithCarry(NOT(R[n]), shifted, PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcw;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.172 SADD16

Signed Add 16 performs two 16-bit signed integer additions, and writes the results to the destination register. It sets [PSTATE.GE](#) according to the results of the additions.

A1

A1 variant

SADD16{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

SADD16{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the **CONSTRAINED UNPREDICTABLE** behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).

PSTATE.GE<1:0> = if diff >= 0 then '11' else '00';
PSTATE.GE<3:2> = if sum  >= 0 then '11' else '00';
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.175 SB

Speculation Barrier is a barrier that controls speculation.

The semantics of the Speculation Barrier are that the execution, until the barrier completes, of any instruction that appears later in the program order than the barrier:

- Cannot be performed speculatively to the extent that such speculation can be observed through side-channels as a result of control flow speculation or data value speculation.
- Can be speculatively executed as a result of predicting that a potentially exception generating instruction has not generated an exception.

In particular, any instruction that appears later in the program order than the barrier cannot cause a speculative allocation into any caching structure where the allocation of that entry could be indicative of any data value present in memory or in the registers.

The SB instruction:

- Cannot be speculatively executed as a result of control flow speculation or data value speculation.
- Can be speculatively executed as a result of predicting that a potentially exception generating instruction has not generated an exception. The potentially exception generating instruction can complete once it is known not to be speculative, and all data values generated by instructions appearing in program order before the SB instruction have their predicted values confirmed.

When the prediction of the instruction stream is not informed by data taken from the register outputs of the speculative execution of instructions appearing in program order after an uncompleted SB instruction, the SB instruction has no effect on the use of prediction resources to predict the instruction stream that is being fetched.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<q> See *Standard assembler syntax fields* on page F1-4348.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    SpeculationBarrier();
```

F5.1.176 SBC, SBCS (immediate)

Subtract with Carry (immediate) subtracts an immediate value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SBCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The SBC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The SBCS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

A1

SBC variant

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:
- For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
 - For the SBCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.
- For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
- <Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
- For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.
- For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F1-4362](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations();  
  (result, nzc) = AddWithCarry(R[n], NOT(imm32), PSTATE.C);  
  if d == 15 then // Can only occur for A32 encoding  
    if setflags then  
      ALUExceptionReturn(result);  
    else  
      ALUWritePC(result);  
  else  
    R[d] = result;  
    if setflags then  
      PSTATE.<N,Z,C,V> = nzc;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.177 SBC, SBCS (register)

Subtract with Carry (register) subtracts an optionally-shifted register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SBCS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. ARM deprecates any use of these encodings. However, when the destination register is the PC:

- The SBC variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The SBCS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rdn>	Is the first general-purpose source register and the destination register, encoded in the "Rdn" field.								
<Rd>	For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used: <ul style="list-style-type: none">For the SBC variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253.For the SBCS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. For encoding T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.								
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T2: is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table><tr><td>LSL</td><td>when stype = 00</td></tr><tr><td>LSR</td><td>when stype = 01</td></tr><tr><td>ASR</td><td>when stype = 10</td></tr><tr><td>ROR</td><td>when stype = 11</td></tr></table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.								

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzc;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.178 SBC, SBCS (register-shifted register)

Subtract with Carry (register-shifted register) subtracts a register-shifted register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

SBCS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

SBC{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.								
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcw) = AddWithCarry(R[n], NOT(shifted), PSTATE.C);
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcw;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.179 SBFX

Signed Bit Field Extract extracts any number of adjacent bits at any position from a register, sign-extends them to 32 bits, and writes the result to the destination register.

A1

A1 variant

SBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn);
lsbit = UInt(lsb); widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1

T1 variant

SBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn);
lsbit = UInt(imm3:imm2); widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the general-purpose source register, encoded in the "Rn" field.
- <lsb> For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field.
 For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field.

<width> Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "width1" field as <width>-1.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsb + widthminus1;
    if msbit <= 31 then
        R[d] = SignExtend(R[n]<msbit:lsb>, 32);
    else
        UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `msbit > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Operational information

If `CPSR.DIT` is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.180 SDIV

Signed Divide divides a 32-bit signed integer register value by a 32-bit signed integer register value, and writes the result to the destination register. The condition flags are not affected.

A1

31	28 27	26	25	24 23	22	21	20 19	16 15	12 11	8	7	6	5	4	3	0			
!=1111	0	1	1	1	0	0	0	1	Rd	(1)	(1)	(1)	(1)	Rm	0	0	0	1	Rn
cond										Ra									

A1 variant

SDIV{<C>}{<q>} {<Rd>,<Rn>,<Rm>}

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes as described, and the register specified by Ra becomes UNKNOWN.

T1

15	14	13	12 11	10	9	8	7	6	5	4	3	0	15	12 11	8	7	6	5	4	3	0	
1	1	1	1	1	0	1	1	1	0	0	1	Rn	(1)	(1)	(1)	(1)	Rd	1	1	1	1	Rm
Ra												Ra										

T1 variant

SDIV{<C>}{<q>} {<Rd>,<Rn>,<Rm>}

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction executes as described, and the register specified by Ra becomes UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register holding the dividend, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the divisor, encoded in the "Rm" field.

Overflow

If the signed integer division $0x80000000 / 0xFFFFFFFF$ is performed, the pseudocode produces the intermediate integer result $+2^{31}$, that overflows the 32-bit signed integer range. No indication of this overflow case is produced, and the 32-bit result written to <Rd> must be the bottom 32 bits of the binary representation of $+2^{31}$. So the result of the division is $0x80000000$.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if SInt(R[m]) == 0 then
        result = 0;
    else
        result = RoundTowardsZero(Real(SInt(R[n])) / Real(SInt(R[m])));
    R[d] = result<31:0>;
```

F5.1.181 SEL

Select Bytes selects each byte of its result from either its first operand or its second operand, according to the values of the `PSTATE.GE` flags.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

set_bigend = (E == '1');
if InITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the **CONSTRAINED UNPREDICTABLE** behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<q> See [Standard assembler syntax fields on page F1-4348](#).

<endian_specifier> Is the endianness to be selected, and the value to be set in [PSTATE.E](#), encoded in the "E" field. It can have the following values:

LE	when E = 0
BE	when E = 1

Operation for all encodings

```
EncodingSpecificOperations();
AArch32.CheckSETENDEnabled();
PSTATE.E = if set_bigend then '1' else '0';
```

F5.1.183 SETPAN

Set Privileged Access Never writes a new value to `PSTATE.PAN`.

This instruction is available only in privileged mode and it is a NOP when executed in User mode.

A1

(FEAT_PAN)

A1 variant

SETPAN{<q>} #<imm> // Cannot be conditional

Decode for this encoding

```
if !HavePANExt() then UNDEFINED;
value = imm1;
```

T1

(FEAT_PAN)

T1 variant

SETPAN{<q>} #<imm> // Not permitted in IT block

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HavePANExt() then UNDEFINED;
value = imm1;
```

Assembler symbols

<q> See *Standard assembler syntax fields* on page F1-4348.

<imm> Is the unsigned immediate 0 or 1, encoded in the "imm1" field.

Operation for all encodings

```
EncodingSpecificOperations();
if PSTATE.EL != EL0 then
    PSTATE.PAN = value;
```

F5.1.184 SEV

Send Event is a hint instruction. It causes an event to be signaled to all PEs in the multiprocessor system. For more information, see *Wait For Event and Send Event* on page G1-6104.

A1

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

SEVL{<c>}.W

Decode for this encoding

// No additional decoding required

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields](#) on page F1-4348.

<q> See [Standard assembler syntax fields](#) on page F1-4348.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    SendEventLocal();
```

F5.1.186 SHADD16

Signed Halving Add 16 performs two signed 16-bit integer additions, halves the results, and writes the results to the destination register.

A1

A1 variant

SHADD16{<c>}{<q>} {<Rd>}, {<Rn>}, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

SHADD16{<c>}{<q>} {<Rd>}, {<Rn>}, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum1 = SInt(R[n]<15:0>) + SInt(R[m]<15:0>);
```

```
sum2 = SInt(R[n]<31:16>) + SInt(R[m]<31:16>);  
R[d]<15:0> = sum1<16:1>;  
R[d]<31:16> = sum2<16:1>;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.187 SHADD8

Signed Halving Add 8 performs four signed 8-bit integer additions, halves the results, and writes the results to the destination register.

A1

A1 variant

SHADD8{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

SHADD8{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.192 SMC

Secure Monitor Call causes a Secure Monitor Call exception. For more information see [Secure Monitor Call \(SMC\) exception on page G1-6083](#).

SMC is available only for software executing at EL1 or higher. It is UNDEFINED in User mode.

If the values of `HCR.TSC` and `SCR.SCD` are both 0, execution of an SMC instruction at EL1 or higher generates a Secure Monitor Call exception that is taken to EL3. When EL3 is using AArch32 this exception is taken to Monitor mode. When EL3 is using AArch64, it is the `SCR_EL3.SMD` bit, rather than the `SCR.SCD` bit, that can change the effect of executing an SMC instruction.

If the value of `HCR.TSC` is 1, execution of an SMC instruction in a Non-secure EL1 mode generates an exception that is taken to EL2, regardless of the value of `SCR.SCD`. When EL2 is using AArch32, this is a Hyp Trap exception that is taken to Hyp mode. For more information see [Traps to Hyp mode of Non-secure EL1 execution of SMC instructions on page G1-6133](#).

If the value of `HCR.TSC` is 0 and the value of `SCR.SCD` is 1, the SMC instruction is:

- UNDEFINED in Non-secure state.
- CONSTRAINED UNPREDICTABLE if executed in Secure state at EL1 or higher.

T1 variant

SMC{<c>}{<q>} {#}<imm4>

Decode for this encoding

// imm4 is for assembly/disassembly only and is ignored by hardware
 if `InITBlock()` && `!LastInITBlock()` then UNPREDICTABLE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <imm4> Is a 4-bit unsigned immediate value, in the range 0 to 15, encoded in the "imm4" field. This is ignored by the PE. The Secure Monitor Call exception handler (Secure Monitor code) can use this value to determine what service is being requested, but Arm does not recommend this.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();

    AArch32.CheckForSMCUnDefOrTrap();

    if !ELUsingAArch32(EL3) then
        if SCR_EL3.SMD == '1' then
            // SMC disabled.
            UNDEFINED;
        else
            if SCR.SCD == '1' then
                // SMC disabled
                if IsSecure() then
                    // Executes either as a NOP or UNALLOCATED.
                    c = ConstrainUnpredictable(Unpredictable_SMD);
                    assert c IN {Constraint_NOP, Constraint_UNDEF};
                    if c == Constraint_NOP then EndOfInstruction();
                    UNDEFINED;
            if !ELUsingAArch32(EL3) then
                AArch64.CallSecureMonitor(Zeros(16));
            else
                AArch32.TakeSMCException();
```

CONSTRAINED UNPREDICTABLE behavior

If SCR.SCD == '1' && IsSecure(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

F5.1.193 SMLABB, SMLABT, SMLATB, SMLATT

Signed Multiply Accumulate (halfwords) performs a signed multiply accumulate operation. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is added to a 32-bit accumulate value and the result is written to the destination register.

If overflow occurs during the addition of the accumulate value, the instruction sets `PSTATE.Q` to 1. It is not possible for overflow to occur during the multiplication.

A1

SMLABB variant

Applies when `M == 0` && `N == 0`.

SMLABB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>

SMLABT variant

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand in the bottom or top half (selected by <x>), encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field.
<Ra>	Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
operand1 = if n_high then R[n]<31:16> else R[n]<15:0>;
operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;
result = SInt(operand1) * SInt(operand2) + SInt(R[a]);
R[d] = result<31:0>;
if result != SInt(result<31:0>) then // Signed overflow
  PSTATE.Q = '1';
```

F5.1.194 SMLAD, SMLADX

Signed Multiply Accumulate Dual performs two signed 16 x 16-bit multiplications. It adds the products to a 32-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets `PSTATE.Q` to 1 if the accumulate operation overflows. Overflow cannot occur during the multiplications.

A1

SMLAD variant

Applies when `M == 0`.

`SMLAD{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

SMLADX variant

Applies when `M == 1`.

T1 variant

SMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); setFlags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $dHi == dLo$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<RdLo>	Is the general-purpose source register holding the lower 32 bits of the addend, and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
<RdHi>	Is the general-purpose source register holding the upper 32 bits of the addend, and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = SInt(R[n]) * SInt(R[m]) + SInt(R[dHi]:R[dLo]);
    R[dHi] = result<63:32>;
    R[dLo] = result<31:0>;
    if setflags then
        PSTATE.N = result<63>;
        PSTATE.Z = IsZeroBit(result<63:0>);
    // PSTATE.C, PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.196 SMLALBB, SMLALBT, SMLALTB, SMLALTT

Signed Multiply Accumulate Long (halfwords) multiplies two signed 16-bit values to produce a 32-bit value, and accumulates this with a 64-bit value. The multiply acts on two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is sign-extended and accumulated with a 64-bit accumulate value.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo 2^{64} .

A1

SMLALBB variant

Applies when $M == 0 \ \&\& \ N == 0$.

SMLALBB{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

SMLALBT variant

n_high = (N == '1'); m_high = (M == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If dHi == dLo, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<RdLo> Is the general-purpose source register holding the lower 32 bits of the addend, and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.

<RdHi>	Is the general-purpose source register holding the upper 32 bits of the addend, and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
<Rn>	For encoding A1: is the first general-purpose source register holding the multiplicand in the bottom or top half (selected by <x>), encoded in the "Rn" field. For encoding T1: is the first general-purpose source register holding the multiplicand in the bottom or top half (selected by <x>), encoded in the "Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field. For encoding T1: is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <x>), encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand1 = if n_high then R[n]<31:16> else R[n]<15:0>;
operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;
result = SInt(operand1) * SInt(operand2) + SInt(R[dHi]:R[dLo]);
R[dHi] = result<63:32>;
R[dLo] = result<31:0>;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.197 SMLALD, SMLALDX

Signed Multiply Accumulate Long Dual performs two signed 16 x 16-bit multiplications. It adds the products to a 64-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo 2^{64} .

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0

 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.198 SMLAWB, SMLAWT

Signed Multiply Accumulate (word by halfword) performs a signed multiply accumulate operation. The multiply acts on a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are added to a 32-bit accumulate value and the result is written to the destination register. The bottom 16 bits of the 48-bit product are ignored.

If overflow occurs during the addition of the accumulate value, the instruction sets `PSTATE.Q` to 1. No overflow can occur during the multiplication.

A1

SMLAWB variant

Applies when `M == 0`.

`SMLAWB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

SMLAWT variant

Applies when `M == 1`.

`SMLAWT{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra); m_high = (M == '1');
if d == 15 || n == 15 || m == 15 || a == 15 then UNPREDICTABLE;
```

T1

SMLAWB variant

Applies when `M == 0`.

`SMLAWB{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

SMLAWT variant

Applies when `M == 1`.

`SMLAWT{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

Decode for all variants of this encoding

```
if Ra == '1111' then SEE "SMULWB, SMULWT";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra); m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field.
<Ra>	Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;
result = SInt(R[n]) * SInt(operand2) + (SInt(R[a]) << 16);
R[d] = result<47:16>;
if (result >> 16) != SInt(R[d]) then // Signed overflow
    PSTATE.Q = '1';
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.199 SMLSD, SMLSDX

Signed Multiply Subtract Dual performs two signed 16 x 16-bit multiplications. It adds the difference of the products to a 32-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

This instruction sets `PSTATE.Q` to 1 if the accumulate operation overflows. Overflow cannot occur during the multiplications or subtraction.

A1

SMLSD variant

Applies when `M == 0`.

`SMLSD{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

SMLSDX variant

Applies when `M == 1`.

`SMLSDX{<c>}{<q>} <Rd>, <Rn>, <Rm>, <Ra>`

Decode for all variants of this encoding

```
if Ra == '1111' then SEE "SMUSD";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra); m_swap = (M == '1');

<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.
<Ra>	Is the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = if m_swap then ROR(R[m],16) else R[m];
    product1 = SInt(R[n]<15:0>) * SInt(operand2<15:0>);
    product2 = SInt(R[n]<31:16>) * SInt(operand2<31:16>);
    result = product1 - product2 + SInt(R[a]);
    R[d] = result<31:0>;
    if result != SInt(result<31:0>) then // Signed overflow
        PSTATE.Q = '1';
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.200 SMLS LD, SMLS LD X

Signed Multiply Subtract Long Dual performs two signed 16 x 16-bit multiplications. It adds the difference of the products to a 64-bit accumulate operand.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

Overflow is possible during this instruction, but only as a result of the 64-bit addition. This overflow is not detected if it occurs. Instead, the result wraps around modulo 2^{64} .

A1

SMLS LD variant

Applies when M == 0.

SMLS LD{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

SMLS LD X variant

Applies when M == 1.

SMLS LD X{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for all variants of this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); m_swap = (M == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If dHi == dLo, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

T1

SMLS LD variant

Applies when M == 0.

SMLS LD{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

SMLS LD X variant

Applies when M == 1.

SMLSIDX{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for all variants of this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); m_swap = (M == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $dHi == dLo$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<RdLo>	Is the general-purpose source register holding the lower 32 bits of the addend, and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.

Applies when `M == 0`.

`SMUAD{<c>}{<q>} {<Rd>}, <Rn>, <Rm>`

SMUADX variant

Applies when `M == 1`.

`SMUADX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	1	0	0	1	0	Rn	1	1	1	1	Rd	0	0	0	M	Rm			

SMUAD variant

Applies when `M == 0`.

`SMUAD{<c>}{<q>} {<Rd>}, <Rn>, <Rm>`

SMUADX variant

Applies when `M == 1`.

`SMUADX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>`

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = if m_swap then ROR(R[m],16) else R[m];
    product1 = SInt(R[n]<15:0>) * SInt(operand2<15:0>);
    product2 = SInt(R[n]<31:16>) * SInt(operand2<31:16>);
    result = product1 + product2;
    R[d] = result<31:0>;
    if result != SInt(result<31:0>) then // Signed overflow
        PSTATE.Q = '1';
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.205 SMULBB, SMULBT, SMULTB, SMULTT

Signed Multiply (halfwords) multiplies two signed 16-bit quantities, taken from either the bottom or the top half of their respective source registers. The other halves of these source registers are ignored. The 32-bit product is written to the destination register. No overflow is possible during this instruction.

A1

SMULBB variant

Applies when M == 0 && N == 0.

SMULBB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULBT variant

Applies when M == 1 && N == 0.

SMULBT{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULTB variant

Applies when M == 0 && N == 1.

SMULTB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULTT variant

Applies when M == 1 && N == 1.

SMULTT{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
n_high = (N == '1'); m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

SMULBB variant

Applies when N == 0 && M == 0.

SMULBB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULBT variant

Applies when N == 0 && M == 1.

SMULBT{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULTB variant

Applies when N == 1 && M == 0.

SMULTB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULTT variant

Applies when N == 1 && M == 1.

SMULTT{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
n_high = (N == '1'); m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand in the bottom or top half (selected by <x>), encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
operand1 = if n_high then R[n]<31:16> else R[n]<15:0>;
operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;
result = SInt(operand1) * SInt(operand2);
R[d] = result<31:0>;
// Signed overflow cannot occur
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.206 SMULL, SMULLS

Signed Multiply Long multiplies two 32-bit signed values to produce a 64-bit result.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

31	28 27	26	25	24 23	22	21	20 19	16 15	12 11	8	7	6	5	4	3	0															
!=1111				0 0 0 0				1	1	0	S	RdHi				RdLo				Rm				1 0 0 1				Rn			
cond																															

Flag setting variant

Applies when S == 1.

SMULLS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Not flag setting variant

Applies when S == 0.

SMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for all variants of this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If dHi == dLo, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

T1

15	14	13	12 11	10	9	8	7	6	5	4	3	0	15	12 11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	1	1	0	0	0	Rn	RdLo	RdHi	0	0	0	0	Rm		

T1 variant

SMULL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); setflags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $dHi == dLo$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<RdLo>	Is the general-purpose destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
<RdHi>	Is the general-purpose destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = SInt(R[n]) * SInt(R[m]);
    R[dHi] = result<63:32>;
    R[dLo] = result<31:0>;
    if setflags then
        PSTATE.N = result<63>;
        PSTATE.Z = IsZeroBit(result<63:0>);
        // PSTATE.C, PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.207 SMULWB, SMULWT

Signed Multiply (word by halfword) multiplies a signed 32-bit quantity and a signed 16-bit quantity. The signed 16-bit quantity is taken from either the bottom or the top half of its source register. The other half of the second source register is ignored. The top 32 bits of the 48-bit product are written to the destination register. The bottom 16 bits of the 48-bit product are ignored. No overflow is possible during this instruction.

A1

SMULWB variant

Applies when M == 0.

SMULWB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULWT variant

Applies when M == 1.

SMULWT{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

SMULWB variant

Applies when M == 0.

SMULWB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMULWT variant

Applies when M == 1.

SMULWT{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); m_high = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier in the bottom or top half (selected by <y>), encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = if m_high then R[m]<31:16> else R[m]<15:0>;
    product = SInt(R[n]) * SInt(operand2);
    R[d] = product<47:16>;
    // Signed overflow cannot occur
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.208 SMUSD, SMUSDX

Signed Multiply Subtract Dual performs two signed 16 x 16-bit multiplications. It subtracts one of the products from the other, and writes the result to the destination register.

Optionally, the instruction can exchange the halfwords of the second operand before performing the arithmetic. This produces top x bottom and bottom x top multiplication.

Overflow cannot occur.

A1

SMUSD variant

Applies when M == 0.

SMUSD{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMUSDX variant

Applies when M == 1.

SMUSDX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

SMUSD variant

Applies when M == 0.

SMUSD{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

SMUSDX variant

Applies when M == 1.

SMUSDX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); m_swap = (M == '1');
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand2 = if m_swap then ROR(R[m],16) else R[m];
    product1 = SInt(R[n]<15:0>) * SInt(operand2<15:0>);
    product2 = SInt(R[n]<31:16>) * SInt(operand2<31:16>);
    result = product1 - product2;
    R[d] = result<31:0>;
    // Signed overflow cannot occur
```

F5.1.209 SRS, SRSDA, SRSDB, SRSIA, SRSIB

Store Return State stores the LR_<current_mode> and SPSR_<current_mode> to the stack of a specified mode. For information about memory accesses see [Memory accesses on page F1-4353](#).

SRS is UNDEFINED in Hyp mode.

SRS is CONSTRAINED UNPREDICTABLE if it is executed in User or System mode, or if the specified mode is any of the following:

- Not implemented.
- A mode that [Table G1-5 on page G1-6026](#) does not show.
- Hyp mode.
- Monitor mode, if the SRS instruction is executed in Non-secure state.

If EL3 is using AArch64 and an SRS instruction that is executed in a Secure EL1 mode specifies Monitor mode, it is trapped to EL3.

See [Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-2530](#).

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	0

T2 variant

SRS{IA}{<c>}{<q>} SP{!}, #<mode>

Decode for this encoding

wback = (W == '1'); increment = TRUE; wordhigher = FALSE;

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *SRS (T32)* on page K1-8399 and *SRS (A32)* on page K1-8399.

Assembler symbols

- IA For encoding A1: is an optional suffix to indicate the Increment After variant.
For encoding T2: is an optional suffix for the Increment After form.
- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). <c> must be AL or omitted.
For encoding T1 and T2: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <mode> Is the number of the mode whose Banked SP is used as the base register, encoded in the "mode" field. For details of PE modes and their numbers see [AArch32 state PE mode descriptions on page G1-6026](#).

SRSFA, SRSEA, SRSFD, and SRSED are pseudo-instructions for SRSIB, SRSIA, SRSDB, and SRSDA respectively, referring to their use for pushing data onto Full Ascending, Empty Ascending, Full Descending, and Empty Descending stacks.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then          // UNDEFINED at EL2
      UNDEFINED;

      // Check for UNPREDICTABLE cases. The definition of UNPREDICTABLE does not permit these
      // to be security holes
      if PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;
      elseif mode == M32_Hyp then      // Check for attempt to access Hyp mode SP
        UNPREDICTABLE;
      elseif mode == M32_Monitor then  // Check for attempt to access Monitor mode SP
        if !HaveEL(EL3) || !IsSecure() then
          UNPREDICTABLE;
        elseif !ELUsingAArch32(EL3) then
          AArch64.MonitorModeTrap();
      elseif BadMode(mode) then
        UNPREDICTABLE;

      base = Rmode[13,mode];
      address = if increment then base else base-8;
      if wordhigher then address = address+4;
      MemA[address,4] = LR;
      MemA[address+4,4] = SPSR[];
      if wback then Rmode[13,mode] = if increment then base+8 else base-8;
    else
      if ConditionPassed() then
        EncodingSpecificOperations();
        if PSTATE.EL == EL2 then          // UNDEFINED at EL2
          UNDEFINED;

          // Check for UNPREDICTABLE cases. The definition of UNPREDICTABLE does not permit these
          // to be security holes
          if PSTATE.M IN {M32_User,M32_System} then
            UNPREDICTABLE;
          elseif mode == M32_Hyp then      // Check for attempt to access Hyp mode SP
            UNPREDICTABLE;
          elseif mode == M32_Monitor then  // Check for attempt to access Monitor mode SP
            if !HaveEL(EL3) || !IsSecure() then
              UNPREDICTABLE;
            elseif !ELUsingAArch32(EL3) then
              AArch64.MonitorModeTrap();
          elseif BadMode(mode) then
            UNPREDICTABLE;

          base = Rmode[13,mode];
          address = if increment then base else base-8;
          if wordhigher then address = address+4;
          MemA[address,4] = LR;
          MemA[address+4,4] = SPSR[];
          if wback then Rmode[13,mode] = if increment then base+8 else base-8;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If mode == M32_Hyp, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.

If `mode == M32_Monitor && (!HaveEL(EL3) || !IsSecure())`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

If `BadMode(mode)`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction stores to the stack of the mode in which it is executed.
- The instruction stores to an UNKNOWN address, and if the instruction specifies writeback then any general-purpose register that can be accessed from the current Exception level without a privilege violation becomes UNKNOWN.

F5.1.210 SSAT

Signed Saturate saturates an optionally-shifted signed value to a selectable signed range.

This instruction sets `PSTATE.Q` to 1 if the operation saturates.

A1

31	28	27	26	25	24	23	22	21	20	16	15	12	11	7	6	5	4	3	0		
=1111				0	1	1	0	1	0	1	sat_imm		Rd		imm5		sh	0	1	Rn	
cond																					

Arithmetic shift right variant

Applies when `sh == 1`.

SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>

Logical shift left variant

Applies when `sh == 0`.

SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); saturate_to = UInt(sat_imm)+1;
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm5);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	0
1	1	1	1	0	(0)	1	1	0	0	sh	0	Rn	0	imm3	Rd	imm2	(0)	sat_imm					

Arithmetic shift right variant

Applies when `sh == 1 && !(imm3 == 000 && imm2 == 00)`.

SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>

Logical shift left variant

Applies when `sh == 0`.

SSAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}

Decode for all variants of this encoding

```
if sh == '1' && (imm3:imm2) == '0000' then SEE "SSAT16";
d = UInt(Rd); n = UInt(Rn); saturate_to = UInt(sat_imm)+1;
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm3:imm2);
if d == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<imm>	Is the bit position for saturation, in the range 1 to 32, encoded in the "sat_imm" field as <imm>-1.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<amount>	For encoding A1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field. For encoding A1: is the shift amount, in the range 1 to 32 encoded in the "imm5" field as <amount> modulo 32. For encoding T1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm3:imm2" field. For encoding T1: is the shift amount, in the range 1 to 31 encoded in the "imm3:imm2" field as <amount>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    operand = Shift(R[n], shift_t, shift_n, PSTATE.C); // PSTATE.C ignored
    (result, sat) = SignedSatQ(SInt(operand), saturate_to);
    R[d] = SignExtend(result, 32);
    if sat then
        PSTATE.Q = '1';
```

F5.1.211 SSAT16

Signed Saturate 16 saturates two signed 16-bit values to a selected signed range.

This instruction sets `PSTATE.Q` to 1 if the operation saturates.

A1

A1 variant

SSAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>

Decode for this encoding

$d = \text{UInt}(Rd)$; $n = \text{UInt}(Rn)$; $\text{saturate_to} = \text{UInt}(\text{sat_imm})+1$;
 if $d == 15 \ || \ n == 15$ then UNPREDICTABLE;

T1

T1 variant

SSAT16{<c>}{<q>} <Rd>, #<imm>, <Rn>

Decode for this encoding

$d = \text{UInt}(Rd)$; $n = \text{UInt}(Rn)$; $\text{saturate_to} = \text{UInt}(\text{sat_imm})+1$;
 if $d == 15 \ || \ n == 15$ then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <imm> Is the bit position for saturation, in the range 1 to 16, encoded in the "sat_imm" field as <imm>-1.
- <Rn> Is the general-purpose source register, encoded in the "Rn" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result1, sat1) = SignedSatQ(SInt(R[n]<15:0>), saturate_to);
    (result2, sat2) = SignedSatQ(SInt(R[n]<31:16>), saturate_to);
    R[d]<15:0> = SignExtend(result1, 16);
    R[d]<31:16> = SignExtend(result2, 16);
    if sat1 || sat2 then
        PSTATE.Q = '1';
```

F5.1.212 SSAX

Signed Subtract and Add with Exchange exchanges the two halfwords of the second operand, performs one 16-bit integer subtraction and one 16-bit addition, and writes the results to the destination register. It sets `PSTATE.GE` according to the results.

A1

A1 variant

SSAX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
 if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;

T1

T1 variant

SSAX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
 if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum = SInt(R[n]<15:0>) + SInt(R[m]<31:16>);
    diff = SInt(R[n]<31:16>) - SInt(R[m]<15:0>);
    R[d]<15:0> = sum<15:0>;
    R[d]<31:16> = diff<15:0>;
    PSTATE.GE<1:0> = if sum >= 0 then '11' else '00';
    PSTATE.GE<3:2> = if diff >= 0 then '11' else '00';
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.213 SSBB

Speculative Store Bypass Barrier is a memory barrier which prevents speculative loads from bypassing earlier stores to the same virtual address under certain conditions.

The semantics of the Speculative Store Bypass Barrier are:

- When a load to a location appears in program order after the SSBB, then the load does not speculatively read an entry earlier in the coherence order for that location than the entry generated by the latest store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store uses the same virtual address as the load.
 - The store appears in program order before the SSBB.
- When a load to a location appears in program order before the SSBB, then the load does not speculatively read data from any store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store uses the same virtual address as the load.
 - The store appears in program order after the SSBB.

PSTATE.GE<3> = if diff4 >= 0 then '1' else '0';
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.216 STC

Store data to System register calculates an address from a base register value and an immediate offset, and stores a word from the **DBGDTRRXint** System register to memory. It can use offset, post-indexed, pre-indexed, or unindexed addressing. For information about memory accesses, see [Memory accesses on page F1-4353](#).

In an implementation that includes EL2, the permitted STC access to **DBGDTRRXint** can be trapped to Hyp mode, meaning that an attempt to execute an STC instruction in a Non-secure mode other than Hyp mode, that would be permitted in the absence of the Hyp trap controls, generates a Hyp Trap exception. For more information, see [Trapping general Non-secure System register accesses to debug registers on page G1-6143](#).

For simplicity, the STC pseudocode does not show this possible trap to Hyp mode.

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

STC{<c>}{<q>} p14, c5, [<Rn>{, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 1$.

STC{<c>}{<q>} p14, c5, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

STC{<c>}{<q>} p14, c5, [<Rn>, #<+/-><imm>]!

Unindexed variant

Applies when $P == 0 \ \&\& \ U == 1 \ \&\& \ W == 0$.

STC{<c>}{<q>} p14, c5, [<Rn>], <option>

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then UNDEFINED;
n = UInt(Rn); cp = 14;
imm32 = ZeroExtend(imm8:'00', 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == 15 \ \&\& \ wback$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	0
1	1	1	0	1	1	0	P	U	0	W	0	Rn	0	1	0	1	1	1	1	0	imm8		

Offset variant

Applies when P == 1 && W == 0.

STC{<c>}{<q>} p14, c5, [<Rn>{, #<+/-><imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

STC{<c>}{<q>} p14, c5, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

STC{<c>}{<q>} p14, c5, [<Rn>, #<+/-><imm>]!

Unindexed variant

Applies when P == 0 && U == 1 && W == 0.

STC{<c>}{<q>} p14, c5, [<Rn>], <option>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then UNDEFINED;
n = UInt(Rn); cp = 14;
imm32 = ZeroExtend(imm8:'00', 32); index = (P == '1'); add = (U == '1'); wback = (W == '1');
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> For the offset or unindexed variant: is the general-purpose base register, encoded in the "Rn" field. The PC can be used, but this is deprecated.

- For the offset, post-indexed or pre-indexed variant: is the general-purpose base register, encoded in the "Rn" field.
- <option> Is an 8-bit immediate, in the range 0 to 255 enclosed in { }, encoded in the "imm8" field. The value of this field is ignored when executing this instruction.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
 - + when U = 1
- <imm> Is the immediate offset used for forming the address, a multiple of 4 in the range 0-1020, defaulting to 0 and encoded in the "imm8" field, as <imm>/4.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];

    // System register read from DBGDTRRXint.
    MemA[address,4] = AArch32.SysRegRead(cp, ThisInstr());
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.217 STL

Store-Release Word stores a word from a register to memory. The instruction also has memory ordering semantics as described in [Load-Acquire, Store-Release](#) on page E2-4305.

- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,4) then
        Mem0[address, 4] = R[t];
        R[d] = ZeroExtend('0');
```

```
else  
    R[d] = ZeroExtend('1');
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.220 STLEXB

Store-Release Exclusive Byte stores a byte from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page E2-4305.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-4331. For information about memory accesses see *Memory accesses* on page F1-4353.

A1

A1 variant

STLEXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

T1

T1 variant

STLEXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,1) then
        Mem0[address, 1] = R[t]<7:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.221 STLEXD

Store-Release Exclusive Doubleword stores a doubleword from two registers to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page E2-4305.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-4331. For information about memory accesses see *Memory accesses* on page F1-4353.

A1

A1 variant

STLEXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); t2 = t+1; n = UInt(Rn);
if d == 15 || Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

If $Rt<0> == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: $Rt<0> = '0'$.
- The instruction executes with the additional decode: $t2 = t$.
- The instruction executes as described, with no change to its behavior and no additional side effects.

If $Rt == '1110'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction is handled as described in *Using R15 by instruction* on page K1-8387.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	0
1	1	1	0	1	0	0	0	1	1	0	0	Rn	Rt	Rt2	1	1	1	1	Rd				

T1 variant

STLEXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn);
if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .				
<q>	See Standard assembler syntax fields on page F1-4348 .				
<Rd>	Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is: <table> <tr> <td>0</td> <td>If the operation updates memory.</td> </tr> <tr> <td>1</td> <td>If the operation fails to update memory.</td> </tr> </table>	0	If the operation updates memory.	1	If the operation fails to update memory.
0	If the operation updates memory.				
1	If the operation fails to update memory.				
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14. For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.				
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>. For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.				
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.				

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian(AccType_ORDERED) then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address, 8) then
        Mem0[address, 8] = value;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.222 STLEXH

Store-Release Exclusive Halfword stores a halfword from a register to memory if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

The instruction also has memory ordering semantics as described in *Load-Acquire, Store-Release* on page E2-4305.

For more information about support for shared memory see *Synchronization and semaphores* on page E2-4331. For information about memory accesses see *Memory accesses* on page F1-4353.

A1

A1 variant

STLEXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

T1

T1 variant

STLEXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated
- <Rd> is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,2) then
        Mem0[address, 2] = R[t]<15:0>;
        R[d] = ZeroExtend('0');
```

```
else  
    R[d] = ZeroExtend('1');
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.224 STM, STMIA, STMEA

Store Multiple (Increment After, Empty Ascending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations start at this address, and the address just above the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

Armv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see [FEAT_LSMAOC](#). For details of related system instructions see [STM \(User registers\)](#).

A1

A1 variant

STM{IA}{<C>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 STMEA{<C>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If n == 15 && wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

T1

T1 variant

STM{IA}{<c>}{<q>} <Rn>!, <registers> // Preferred syntax
 STMEA{<c>}{<q>} <Rn>!, <registers> // Alternate syntax, Empty Ascending stack

Decode for this encoding

```
n = UInt(Rn); registers = '0000000':register_list; wback = TRUE;
if BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If n == 15 && wback, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

T2

T2 variant

STM{IA}{<c>}.W <Rn>{!}, <registers> // Preferred syntax, if <Rn>, '!' and <registers> can be represented in T1
 STMEA{<c>}.W <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack, if <Rn>, '!' and <registers> can be represented in T1
 STM{IA}{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 STMEA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Ascending stack

Decode for this encoding

```
n = UInt(Rn); registers = P:M:register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 2 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
if registers<13> == '1' then UNPREDICTABLE;
if registers<15> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.

- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If `BitCount(registers) == 1`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If `wback && registers<n> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored for the base register is UNKNOWN.

If `registers<13> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

If `registers<15> == '1'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

If `n == 15 && wback`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction executes with writeback to the PC. The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- | | |
|-----|--|
| IA | Is an optional suffix for the Increment After form. |
| <c> | See Standard assembler syntax fields on page F1-4348 . |
| <q> | See Standard assembler syntax fields on page F1-4348 . |

- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.
The PC can be in the list. However, Arm deprecates the use of instructions that include the PC in the list.
If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.
For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }. The registers in the list must be in the range R0-R7, encoded in the "register_list" field. If the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.
For encoding T2: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.
The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemS[address,4] = bits(32) UNKNOWN; // Only possible for encodings T1 and A1
            else
                MemS[address,4] = R[i];
                address = address + 4;
    if registers<15> == '1' then // Only possible for encoding A1
        MemS[address,4] = PCStoreValue();
    if wback then R[n] = R[n] + 4*BitCount(registers);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.225 STM (User registers)

In an EL1 mode other than System mode, Store Multiple (User registers) stores multiple User mode registers to consecutive memory locations using an address from a base register. The PE reads the base register value normally, using the current mode to determine the correct Banked version of the register. This instruction cannot writeback to the base register.

Store Multiple (User registers) is UNDEFINED in Hyp mode, and CONSTRAINED UNPREDICTABLE in User or System modes.

Armv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see [FEAT_LSMAOC](#).

A1

A1 variant

STM{<amode>}{<c>}{<q>} <Rn>, <registers>^

Decode for this encoding

```
n = UInt(Rn); registers = register_list; increment = (U == '1'); wordhigher = (P == U);
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<amode>	is one of:	
	DA	Decrement After. The consecutive memory addresses end at the address in the base register. Encoded as P = 0, U = 0.
	ED	Empty Descending. For this instruction, a synonym for DA.
	DB	Decrement Before. The consecutive memory addresses end one word below the address in the base register. Encoded as P = 1, U = 0.
	FD	Full Descending. For this instruction, a synonym for DB.
	IA	Increment After. The consecutive memory addresses start at the address in the base register. This is the default. Encoded as P = 0, U = 1.
	EA	Empty Ascending. For this instruction, a synonym for IA.

IB	Increment Before. The consecutive memory addresses start one word above the address in the base register. Encoded as P = 1, U = 1.
FA	Full Ascending. For this instruction, a synonym for IB.
<C>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
<registers>	Is a list of one or more registers, separated by commas and surrounded by { and }. It specifies the set of registers to be stored by the STM instruction. The registers are stored with the lowest-numbered register to the lowest memory address, through to the highest-numbered register to the highest memory address. See also Encoding of lists of general-purpose registers and the PC on page F1-4354 .

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if PSTATE.EL == EL2 then
        UNDEFINED;
    elseif PSTATE.M IN {M32_User,M32_System} then
        UNPREDICTABLE;
    else
        length = 4*BitCount(registers);
        address = if increment then R[n] else R[n]-length;
        if wordhigher then address = address+4;
        for i = 0 to 14
            if registers<i> == '1' then // Store User mode register
                MemS[address,4] = Rmode[i, M32_User];
                address = address + 4;
            if registers<15> == '1' then
                MemS[address,4] = PCStoreValue();
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.M IN {M32_User,M32_System}, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.226 STMDA, STMED

Store Multiple Decrement After (Empty Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end at this address, and the address just below the lowest of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

Armv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see [FEAT_LSMAOC](#). For details of related system instructions see [STM \(User registers\)](#).

A1

A1 variant

STMDA{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 STMED{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Empty Descending stack

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction targets an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If $n == 15 \ \&\& \ wback$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
 <q> See [Standard assembler syntax fields on page F1-4348](#).

- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }.
The PC can be in the list. However, Arm deprecates the use of instructions that include the PC in the list.
If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers) + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemS[address,4] = bits(32) UNKNOWN;
            else
                MemS[address,4] = R[i];
                address = address + 4;
        if registers<15> == '1' then
            MemS[address,4] = PCStoreValue();
    if wback then R[n] = R[n] - 4*BitCount(registers);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.227 STMDB, STMFD

Store Multiple Decrement Before (Full Descending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations end just below this address, and the address of the first of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

Armv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see [FEAT_LSMAOC](#). For details of related system instructions see [STM \(User registers\)](#).

This instruction is used by the alias [PUSH \(multiple registers\)](#). See [Alias conditions on page F5-5104](#) for details of when each alias is preferred.

A1

A1 variant

STMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 STMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If BitCount(registers) < 1, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

T1

T1 variant

STMDB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 STMFD{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Descending stack

Decode for this encoding

```
n = UInt(Rn); registers = P:M:register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 2 then UNPREDICTABLE;
if wback && registers<n> == '1' then UNPREDICTABLE;
```

```
if registers<13> == '1' then UNPREDICTABLE;  
if registers<15> == '1' then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If $\text{wback} \ \&\& \ \text{registers}\langle n \rangle == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored for the base register is UNKNOWN.

If $\text{BitCount}(\text{registers}) == 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If $\text{registers}\langle 13 \rangle == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The store instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

If $\text{registers}\langle 15 \rangle == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Alias conditions

Alias	of variant	is preferred when
PUSH (multiple registers)	T1	$W == '1' \ \&\& \ Rn == '1101' \ \&\& \ \text{BitCount}(M:\text{register_list}) > 1$
PUSH (multiple registers)	A1	$W == '1' \ \&\& \ Rn == '1101' \ \&\& \ \text{BitCount}(\text{register_list}) > 1$

Assembler symbols

<C>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
!	The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
<registers>	<p>For encoding A1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.</p> <p>The PC can be in the list. However, Arm deprecates the use of instructions that include the PC in the list.</p> <p>If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.</p> <p>For encoding T1: is a list of one or more registers to be stored, separated by commas and surrounded by { and }.</p> <p>The registers in the list must be in the range R0-R12, encoded in the "register_list" field, and can optionally contain the LR. If the LR is in the list, the "M" field is set to 1, otherwise it defaults to 0.</p>

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] - 4*BitCount(registers);
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemS[address,4] = bits(32) UNKNOWN; // Only possible for encoding A1
            else
                MemS[address,4] = R[i];
                address = address + 4;
    if registers<15> == '1' then // Only possible for encoding A1
        MemS[address,4] = PCStoreValue();
    if wback then R[n] = R[n] - 4*BitCount(registers);
  
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.228 STMIB, STMFA

Store Multiple Increment Before (Full Ascending) stores multiple registers to consecutive memory locations using an address from a base register. The consecutive memory locations start just above this address, and the address of the last of those locations can optionally be written back to the base register.

The lowest-numbered register is loaded from the lowest memory address, through to the highest-numbered register from the highest memory address. See also [Encoding of lists of general-purpose registers and the PC on page F1-4354](#).

Armv8.2 permits the deprecation of some Store Multiple ordering behaviors in AArch32 state, for more information see [FEAT_LSMAOC](#). For details of related system instructions see [STM \(User registers\)](#).

A1

A1 variant

STMIB{<c>}{<q>} <Rn>{!}, <registers> // Preferred syntax
 STMFA{<c>}{<q>} <Rn>{!}, <registers> // Alternate syntax, Full Ascending stack

Decode for this encoding

```
n = UInt(Rn); registers = register_list; wback = (W == '1');
if n == 15 || BitCount(registers) < 1 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15. If the instruction specifies writeback, the modification to the base address on writeback might differ from the number of registers stored.

If $n == 15 \ \&\& \ wback$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
 <q> See [Standard assembler syntax fields on page F1-4348](#).

- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- ! The address adjusted by the size of the data loaded is written back to the base register. If specified, it is encoded in the "W" field as 1, otherwise this field defaults to 0.
- <registers> Is a list of one or more registers to be stored, separated by commas and surrounded by { and }.
The PC can be in the list. However, Arm deprecates the use of instructions that include the PC in the list.
If base register writeback is specified, and the base register is not the lowest-numbered register in the list, such an instruction stores an UNKNOWN value for the base register.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + 4;
    for i = 0 to 14
        if registers<i> == '1' then
            if i == n && wback && i != LowestSetBit(registers) then
                MemS[address,4] = bits(32) UNKNOWN;
            else
                MemS[address,4] = R[i];
                address = address + 4;
        if registers<15> == '1' then
            MemS[address,4] = PCStoreValue();
    if wback then R[n] = R[n] + 4*BitCount(registers);
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.229 STR (immediate)

Store Register (immediate) calculates an address from a base register value and an immediate offset, and stores a word from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F1-4353](#).

This instruction is used by the alias [PUSH \(single register\)](#). See [Alias conditions on page F5-5110](#) for details of when each alias is preferred.

A1

Offset variant

Applies when $P == 1$ && $W == 0$.

STR{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0$ && $W == 0$.

STR{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

STR{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```
if P == '0' && W == '1' then SEE "STRT";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if wback && (n == 15 || n == t) then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $wback$ && $n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback$ && $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

T1 variant

STR{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm5:'00', 32);
 index = TRUE; add = TRUE; wback = FALSE;

T2

T2 variant

STR{<c>}{<q>} <Rt>, [SP{, #<+><imm>}]

Decode for this encoding

t = UInt(Rt); n = 13; imm32 = ZeroExtend(imm8:'00', 32);
 index = TRUE; add = TRUE; wback = FALSE;

T3

T3 variant

STR{<c>}.W <Rt>, [<Rn> {, #<+><imm>}] // <Rt>, <Rn>, <imm> can be represented in T1 or T2
 STR{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

if Rn == '1111' then UNDEFINED;
 t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
 index = TRUE; add = TRUE; wback = FALSE;
 if t == 15 then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

T4

Offset variant

Applies when $P == 1 \ \&\& \ U == 0 \ \&\& \ W == 0$.

STR{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 1$.

STR{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

STR{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!

Decode for all variants of this encoding

```

if P == '1' && U == '1' && W == '0' then SEE "STRT";
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Alias conditions

Alias	of variant	is preferred when
PUSH (single register)	A1 (pre-indexed)	$P == '1' \ \&\& \ U == '0' \ \&\& \ W == '1' \ \&\& \ Rn == '1101' \ \&\& \ imm12 == '00000000100'$
PUSH (single register)	T4 (pre-indexed)	$Rn == '1101' \ \&\& \ P == '1' \ \&\& \ U == '0' \ \&\& \ W == '1' \ \&\& \ imm8 == '0000100'$

Assembler symbols

<C>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding T1, T2, T3 and T4: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding T1, T3 and T4: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 124, defaulting to 0 and encoded in the "imm5" field as <imm>/4. For encoding T2: is the optional positive unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 and encoded in the "imm8" field as <imm>/4. For encoding T3: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field. For encoding T4: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```

if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,4] = if t == 15 then PCStoreValue() else R[t];
    if wback then R[n] = offset_addr;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,4] = R[t];
    if wback then R[n] = offset_addr;
  
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.230 STR (register)

Store Register (register) calculates an address from a base register value and an offset register value, stores a word from a register to memory. The offset register value can optionally be shifted. For information about memory accesses see [Memory accesses](#) on page F1-4353.

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

STR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

STR{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}]

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

STR{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE "STRT";
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
if m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback \ \&\& \ n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

15	14	13	12	11	10	9	8	6	5	3	2	0
0	1	0	1	0	0	0	Rm	Rn	Rt			

T1 variant

STR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	0	0	0	0	1	0	0	!=1111	Rt		0	0	0	0	0	0	0	imm2	Rm		

Rn

T2 variant

STR{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
 STR{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).

- <Rt> For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated.
For encoding T1 and T2: is the general-purpose register to be transferred, encoded in the "Rt" field.
- <Rn> For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.
For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
- +/- Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
+ when U = 1
- + Specifies the index register is added to the base register.
- <Rm> Is the general-purpose index register, encoded in the "Rm" field.
- <shift> The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see [Shifts applied to a register on page F1-4351](#).
- <imm> If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    if t == 15 then // Only possible for encoding A1
        data = PCStoreValue();
    else
        data = R[t];
    MemU[address,4] = data;
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.231 STRB (immediate)

Store Register Byte (immediate) calculates an address from a base register value and an immediate offset, and stores a byte from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

Offset variant

Applies when $P == 1$ && $W == 0$.

STRB{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0$ && $W == 0$.

STRB{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

STRB{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE "STRBT";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If $wback$ && $n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback$ && $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

T1 variant

STRB{<C>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm5, 32);
 index = TRUE; add = TRUE; wback = FALSE;

T2

T2 variant

STRB{<C>}.W <Rt>, [<Rn> {, #<+><imm>}] // <Rt>, <Rn>, <imm> can be represented in T1
 STRB{<C>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

if Rn == '1111' then UNDEFINED;
 t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm12, 32);
 index = TRUE; add = TRUE; wback = FALSE;
 if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

T3

Offset variant

Applies when P == 1 && U == 0 && W == 0.

STRB{<C>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

STRB{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

STRB{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!

Decode for all variants of this encoding

```
if P == '1' && U == '1' && W == '0' then SEE "STRBT";
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding T1, T2 and T3: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.

<imm> For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field.

For encoding T1: is an optional 5-bit unsigned immediate byte offset, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field.

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,1] = R[t]<7:0>;
    if wback then R[n] = offset_addr;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,1] = R[t]<7:0>;
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.232 STRB (register)

Store Register Byte (register) calculates an address from a base register value and an offset register value, and stores a byte from a register to memory. The offset register value can optionally be shifted. For information about memory accesses see [Memory accesses](#) on page F1-4353.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	7	6	5	4	3	0
!=1111				0	1	1	P	U	1	W	0	Rn	Rt	imm5	stype	0	Rm			
cond																				

Offset variant

Applies when $P == 1$ && $W == 0$.

STRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]

Post-indexed variant

Applies when $P == 0$ && $W == 0$.

STRB{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}]

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

STRB{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>{, <shift>}]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE "STRBT";
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If $wback$ && $n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback$ && $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

15	14	13	12	11	10	9	8	6	5	3	2	0
0	1	0	1	0	1	0	Rm	Rn	Rt			

T1 variant

STRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>]

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, 0);
```

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0

 STRB{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q>	See Standard assembler syntax fields on page F1-4348 .
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F1-4351 .
<imm>	If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if index then offset_addr else R[n];
    MemU[address,1] = R[t]<7:0>;
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.233 STRBT

Store Register Byte Unprivileged stores a byte from a register to memory. For information about memory accesses see [Memory accesses on page F1-4353](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRBT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1

A1 variant

STRBT{<c>}{<q>} <Rt>, [<Rn>] {, #<+/-><imm>}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm12, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 by instruction on page K1-8387](#).
- The instruction is treated as if bit[24] == 1 and bit[21] == 0. The instruction uses immediate offset addressing with the base register as PC, without writeback.

T1 variant

STRBT{<c>}{<q>} <Rt>, [<Rn> {, #+}<imm>]

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;  
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;  
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);  
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<C>	See Standard assembler syntax fields on page F1-4348 .
<Q>	See Standard assembler syntax fields on page F1-4348 .
<Rt>	For encoding A1: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding A2 and T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F1-4351 .
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
  if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
  EncodingSpecificOperations();
  offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
  offset_addr = if add then (R[n] + offset) else (R[n] - offset);
  address = if postindex then R[n] else offset_addr;
  MemU_unpriv[address,1] = R[t]<7:0>;
  if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as STRB (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.234 STRD (immediate)

Store Register Dual (immediate) calculates an address from a base register value and an immediate offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt); t2 = t+1; n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
if t2 == 15 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15 \ || \ t2 == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If $wback \ \&\& \ (n == t \ || \ n == t2)$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback \ \&\& \ n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

If $Rt < 0 > == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: $t < 0 > = '0'$.
- The instruction executes with the additional decode: $t2 = t$.
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when $Rt == '1111'$.

If $P == '0'$ && $W == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as an LDRD using one of offset, post-indexed, or pre-indexed addressing.

T1

Offset variant

Applies when $P == 1$ && $W == 0$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0$ && $W == 1$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '0' then SEE "Related encodings";
t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if wback && (n == t || n == t2) then UNPREDICTABLE;
if n == 15 || t == 15 || t2 == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
  
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$ || $t2 == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If `wback && (n == t || n == t2)`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If `wback && n == 15`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Notes for all encodings

For more information about the CONstrained UNpredictable behavior of this instruction, see [Appendix K1 Architectural Constraints on UNpredictable Behaviors](#).

<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is the unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0 if omitted, and encoded in the "imm8" field as <imm>/4.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
```

```
address = if index then offset_addr else R[n];
if address == Align(address, 8) then
  bits(64) data;
  if BigEndian(AccType_ATOMIC) then
    data<63:32> = R[t];
    data<31:0> = R[t2];
  else
    data<31:0> = R[t];
    data<63:32> = R[t2];
  MemA[address,8] = data;
else
  MemA[address,4] = R[t];
  MemA[address+4,4] = R[t2];
if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.235 STRD (register)

Store Register Dual (register) calculates an address from a base register value and a register offset, and stores two words from two registers to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>], {+/-}<Rm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

STRD{<c>}{<q>} <Rt>, <Rt2>, [<Rn>, {+/-}<Rm>]!

Decode for all variants of this encoding

```

if Rt<0> == '1' then UNPREDICTABLE;
t = UInt(Rt); t2 = t+1; n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if P == '0' && W == '1' then UNPREDICTABLE;
if t2 == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t || n == t2) then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15 \ || \ t2 == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If $wback \ \&\& \ (n == t \ || \ n == t2)$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback \ \&\& \ n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

If $Rt_{<0>} == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: $t_{<0>} = '0'$.
- The instruction executes with the additional decode: $t_2 = t$.
- The instruction executes as described, with no change to its behavior and no additional side-effects. This does not apply when $Rt == '1111'$.

If $P == '0'$ && $W == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: $P = '1'$; $W = '0'$.
- The instruction executes with the additional decode: $P = '1'$; $W = '1'$.
- The instruction executes with the additional decode: $P = '0'$; $W = '0'$.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<C>	See <i>Standard assembler syntax fields</i> on page F1-4348.				
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.				
<Rt>	Is the first general-purpose register to be transferred, encoded in the "Rt" field. This register must be even-numbered and not R14.				
<Rt2>	Is the second general-purpose register to be transferred. This register must be <R(t+1)>.				
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated.				
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: <table style="margin-left: 2em;"> <tr> <td>-</td> <td>when U = 0</td> </tr> <tr> <td>+</td> <td>when U = 1</td> </tr> </table>	-	when U = 0	+	when U = 1
-	when U = 0				
+	when U = 1				
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.				

Operation

```

if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + R[m]) else (R[n] - R[m]);
    address = if index then offset_addr else R[n];
    if address == Align(address, 8) then
        bits(64) data;
        if BigEndian(AccType_ATOMIC) then
  
```

```
        data<63:32> = R[t];  
        data<31:0> = R[t2];  
    else  
        data<31:0> = R[t];  
        data<63:32> = R[t2];  
        MemA[address,8] = data;  
    else  
        MemA[address,4] = R[t];  
        MemA[address+4,4] = R[t2];  
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.236 STREX

Store Register Exclusive calculates an address from a base register value and an immediate offset, stores a word from a register to the calculated address if the PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see [Synchronization and semaphores](#) on page E2-4331. For information about memory accesses see [Memory accesses](#) on page F1-4353.

A1

A1 variant

STREX{<c>}{<q>} <Rd>, <Rt>, [<Rn> {, {#}<imm>}]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn); imm32 = Zeros(32); // Zero offset
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

T1

T1 variant

STREX{<c>}{<q>} <Rd>, <Rt>, [<Rn> {, #<imm>}]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rd>	Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is: 0 If the operation updates memory. 1 If the operation fails to update memory.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
<imm>	For encoding A1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can only be 0 or omitted. For encoding T1: the immediate offset added to the value of <Rn> to calculate the address. <imm> can be omitted, meaning an offset of 0. Values are multiples of 4 in the range 0-1020.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non word-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n] + imm32;
    if AArch32.ExclusiveMonitorsPass(address,4) then
        MemA[address,4] = R[t];
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.237 STREXB

Store Register Exclusive Byte derives an address from a base register value, stores a byte from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see [Synchronization and semaphores on page E2-4331](#). For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

A1 variant

STREXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

T1

T1 variant

STREXB{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,1) then
        MemA[address,1] = R[t]<7:0>;
        R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.238 STREXD

Store Register Exclusive Doubleword derives an address from a base register value, stores a 64-bit doubleword from two registers to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see [Synchronization and semaphores on page E2-4331](#). For information about memory accesses see [Memory accesses on page F1-4353](#).

A1

A1 variant

STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); t2 = t+1; n = UInt(Rn);
if d == 15 || Rt<0> == '1' || t2 == 15 || n == 15 then UNPREDICTABLE;
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

If $Rt<0> == '1'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes with the additional decode: $Rt<0> = '0'$.
- The instruction executes with the additional decode: $t2 = t$.
- The instruction executes as described, with no change to its behavior and no additional side effects.

If $Rt == '1110'$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction is handled as described in [Using R15 by instruction on page K1-8387](#).

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	0
1	1	1	0	1	0	0	0	1	1	0	0	Rn	Rt	Rt2	0	1	1	1	Rd				

T1 variant

STREXD{<c>}{<q>} <Rd>, <Rt>, <Rt2>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); t2 = UInt(Rt2); n = UInt(Rn);
if d == 15 || t == 15 || t2 == 15 || n == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t || d == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rd>	Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is: 0 If the operation updates memory. 1 If the operation fails to update memory. <Rd> must not be the same as <Rn>, <Rt>, or <Rt2>.
<Rt>	For encoding A1: is the first general-purpose register to be transferred, encoded in the "Rt" field. <Rt> must be even-numbered and not R14. For encoding T1: is the first general-purpose register to be transferred, encoded in the "Rt" field.
<Rt2>	For encoding A1: is the second general-purpose register to be transferred. <Rt2> must be <R(t+1)>. For encoding T1: is the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non doubleword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    // Create doubleword to store such that R[t] will be stored at address and R[t2] at address+4.
    value = if BigEndian(AccType_ATOMIC) then R[t]:R[t2] else R[t2]:R[t];
    if AArch32.ExclusiveMonitorsPass(address,8) then
        MemA[address,8] = value; R[d] = ZeroExtend('0');
    else
        R[d] = ZeroExtend('1');
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.239 STREXH

Store Register Exclusive Halfword derives an address from a base register value, stores a halfword from a register to the derived address if the executing PE has exclusive access to the memory at that address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed.

For more information about support for shared memory see [Synchronization and semaphores on page E2-4331](#). For information about memory accesses see [Memory accesses on page F1-4353](#).

STREXH{<c>}{<q>} <Rd>, <Rt>, [<Rn>]

Decode for this encoding

```
d = UInt(Rd); t = UInt(Rt); n = UInt(Rn);
if d == 15 || t == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if d == n || d == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $d == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $d == n$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction performs the store to an UNKNOWN address.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> Is the destination general-purpose register into which the status result of the store exclusive is written, encoded in the "Rd" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Rt> Is the general-purpose register to be transferred, encoded in the "Rt" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Rd> is not updated.

A non halfword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch32.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch32.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n];
    if AArch32.ExclusiveMonitorsPass(address,2) then
        MemA[address,2] = R[t]<15:0>;
        R[d] = ZeroExtend('0');
```

```
else  
    R[d] = ZeroExtend('1');
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.240 STRH (immediate)

Store Register Halfword (immediate) calculates an address from a base register value and an immediate offset, and stores a halfword from a register to memory. It can use offset, post-indexed, or pre-indexed addressing. For information about memory accesses see *Memory accesses* on page F1-4353.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0	
!=1111				0	0	0	P	U	1	W	0	Rn	Rt	imm4H	1	0	1	1	imm4L			
cond																						

Offset variant

Applies when $P == 1$ && $W == 0$.

STRH{<c>}{<q>} <Rt>, [<Rn> {, #<+/-><imm>}]

Post-indexed variant

Applies when $P == 0$ && $W == 0$.

STRH{<c>}{<q>} <Rt>, [<Rn>], #<+/-><imm>

Pre-indexed variant

Applies when $P == 1$ && $W == 1$.

STRH{<c>}{<q>} <Rt>, [<Rn>, #<+/-><imm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE "STRHT";
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm4H:imm4L, 32);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
if t == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If $wback$ && $n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback$ && $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes without writeback of the base address.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

Rn																					

Offset variant

Applies when P == 1 && U == 0 && W == 0.

STRH{<c>}{<q>} <Rt>, [<Rn> {, #-<imm>}]

Post-indexed variant

Applies when P == 0 && W == 1.

STRH{<c>}{<q>} <Rt>, [<Rn>], #{+/-}<imm>

Pre-indexed variant

Applies when P == 1 && W == 1.

STRH{<c>}{<q>} <Rt>, [<Rn>, #{+/-}<imm>]!

Decode for all variants of this encoding

```
if P == '1' && U == '1' && W == '0' then SEE "STRHT";
if Rn == '1111' || (P == '0' && W == '0') then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); imm32 = ZeroExtend(imm8, 32);
index = (P == '1'); add = (U == '1'); wback = (W == '1');
if t == 15 || (wback && n == t) then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If wback && n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding A1, T1, T2, T3: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the offset is added to the base register.

<imm> For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field.

For encoding T1: is the optional positive unsigned immediate byte offset, a multiple of 2, in the range 0 to 62, defaulting to 0 and encoded in the "imm5" field as <imm>/2.

For encoding T2: is an optional 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

For encoding T3: is an 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm8" field.

Operation for all encodings

```
if CurrentInstrSet() == InstrSet_A32 then
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,2] = R[t]<15:0>;
    if wback then R[n] = offset_addr;
else
  if ConditionPassed() then
    EncodingSpecificOperations();
    offset_addr = if add then (R[n] + imm32) else (R[n] - imm32);
    address = if index then offset_addr else R[n];
    MemU[address,2] = R[t]<15:0>;
    if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.241 STRH (register)

Store Register Halfword (register) calculates an address from a base register value and an offset register value, and stores a halfword from a register to memory. The offset register value can be shifted left by 0, 1, 2, or 3 bits. For information about memory accesses see *Memory accesses* on page F1-4353.

A1

Offset variant

Applies when $P == 1 \ \&\& \ W == 0$.

STRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]

Post-indexed variant

Applies when $P == 0 \ \&\& \ W == 0$.

STRH{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Pre-indexed variant

Applies when $P == 1 \ \&\& \ W == 1$.

STRH{<c>}{<q>} <Rt>, [<Rn>, {+/-}<Rm>]!

Decode for all variants of this encoding

```

if P == '0' && W == '1' then SEE "STRHT";
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = (P == '1'); add = (U == '1'); wback = (P == '0') || (W == '1');
(shift_t, shift_n) = (SRTYPE_LSL, 0);
if t == 15 || m == 15 then UNPREDICTABLE;
if wback && (n == 15 || n == t) then UNPREDICTABLE;
  
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If $wback \ \&\& \ n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $wback \ \&\& \ n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes without writeback of the base address.
- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

T1

15	14	13	12	11	10	9	8	6	5	3	2	0

STRH{<c>}.W <Rt>, [<Rn>, {+}<Rm>] // <Rt>, <Rn>, <Rm> can be represented in T1
 STRH{<c>}{<q>} <Rt>, [<Rn>, {+}<Rm>{, LSL #<imm>}]

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm);
index = TRUE; add = TRUE; wback = FALSE;
(shift_t, shift_n) = (SRTYPE_LSL, UInt(imm2));
if t == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	For encoding A1: is the general-purpose base register, encoded in the "Rn" field. The PC can be used in the offset variant, but this is deprecated. For encoding T1 and T2: is the general-purpose base register, encoded in the "Rn" field.
+/-	Specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
+	Specifies the index register is added to the base register.
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<imm>	If present, the size of the left shift to apply to the value from <Rm>, in the range 1-3. <imm> is encoded in imm2. If absent, no shift is specified and imm2 is encoded as 0b00.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
offset = Shift(R[m], shift_t, shift_n, PSTATE.C);
offset_addr = if add then (R[n] + offset) else (R[n] - offset);
address = if index then offset_addr else R[n];
MemU[address,2] = R[t]<15:0>;
if wback then R[n] = offset_addr;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.242 STRHT

Store Register Halfword Unprivileged stores a halfword from a register to memory. For information about memory accesses see [Memory accesses on page F1-4353](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRHT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or a register value.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0	
!=1111				0	0	0	0	U	1	1	0	Rn	Rt	imm4H	1	0	1	1	imm4L			
cond																						

A1 variant

STRHT{<c>}{<q>} <Rt>, [<Rn>] {, #<+/->{<imm>}}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm4H:imm4L, 32);
if t == 15 || n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If $n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 by instruction on page K1-8387](#).
- The instruction is treated as if $\text{bit}[24] == 1$ and $\text{bit}[21] == 0$. The instruction uses immediate offset addressing with the base register as PC, without writeback.

A2

A2 variant

STRHT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm); postindex = TRUE; add = (U == '1');
register_form = TRUE;
if t == 15 || n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

If n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 by instruction on page K1-8387](#).
- The instruction is treated as if bit[24] == 1 and bit[21] == 0. The instruction uses immediate offset addressing with the base register as PC, without writeback.

T1

T1 variant

STRHT{<c>}{<q>} <Rt>, [<Rn> {, #+}<imm>}]

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If $t == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rt>	Is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 if omitted, and encoded in the "imm4H:imm4L" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```
if ConditionPassed() then
  if PSTATE.EL == EL2 then UNPREDICTABLE; // Hyp mode
  EncodingSpecificOperations();
  offset = if register_form then R[m] else imm32;
  offset_addr = if add then (R[n] + offset) else (R[n] - offset);
  address = if postindex then R[n] else offset_addr;
```

```
MemU_unpriv[address,2] = R[t]<15:0>;  
if postindex then R[n] = offset_addr;
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as STRH (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.243 STRT

Store Register Unprivileged stores a word from a register to memory. For information about memory accesses see [Memory accesses on page F1-4353](#).

The memory access is restricted as if the PE were running in User mode. This makes no difference if the PE is actually running in User mode.

STRT is UNPREDICTABLE in Hyp mode.

The T32 instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an immediate offset, and leaves the base register unchanged.

The A32 instruction uses a post-indexed addressing mode, that uses a base register value as the address for the memory access, and calculates a new address from a base register value and an offset and writes it back to the base register. The offset can be an immediate value or an optionally-shifted register value.

A1

A1 variant

STRT{<c>}{<q>} <Rt>, [<Rn>] {, #<+/-><imm>}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); postindex = TRUE; add = (U == '1');
register_form = FALSE; imm32 = ZeroExtend(imm12, 32);
if n == 15 || n == t then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $n == t$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If $n == 15$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 by instruction on page K1-8387](#).
- The instruction is treated as if $\text{bit}[24] == 1$ and $\text{bit}[21] == 0$. The instruction uses immediate offset addressing with the base register as PC, without writeback.

A2

A2 variant

STRT{<c>}{<q>} <Rt>, [<Rn>], {+/-}<Rm>{, <shift>}

Decode for this encoding

```
t = UInt(Rt); n = UInt(Rn); m = UInt(Rm); postindex = TRUE; add = (U == '1');
register_form = TRUE; (shift_t, shift_n) = DecodeImmShift(stype, imm5);
if n == 15 || n == t || m == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If n == t, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction executes but the value stored is UNKNOWN.

If n == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction uses post-indexed addressing with the base register as PC. This is handled as described in [Using R15 by instruction on page K1-8387](#).
- The instruction is treated as if bit[24] == 1 and bit[21] == 0. The instruction uses immediate offset addressing with the base register as PC, without writeback.

T1

T1 variant

STRT{<c>}{<q>} <Rt>, [<Rn> {, #<+><imm>}]

Decode for this encoding

```
if Rn == '1111' then UNDEFINED;
t = UInt(Rt); n = UInt(Rn); postindex = FALSE; add = TRUE;
register_form = FALSE; imm32 = ZeroExtend(imm8, 32);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If t == 15, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rt>	For encoding A1 and A2: is the general-purpose register to be transferred, encoded in the "Rt" field. The PC can be used, but this is deprecated. For encoding T1: is the general-purpose register to be transferred, encoded in the "Rt" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.
+/-	For encoding A1: specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1 For encoding A2: specifies the index register is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: - when U = 0 + when U = 1
<Rm>	Is the general-purpose index register, encoded in the "Rm" field.
<shift>	The shift to apply to the value read from <Rm>. If absent, no shift is applied. Otherwise, see Shifts applied to a register on page F1-4351 .
+	Specifies the offset is added to the base register.
<imm>	For encoding A1: is the 12-bit unsigned immediate byte offset, in the range 0 to 4095, defaulting to 0 if omitted, and encoded in the "imm12" field. For encoding T1: is an optional 8-bit unsigned immediate byte offset, in the range 0 to 255, defaulting to 0 and encoded in the "imm8" field.

Operation for all encodings

```

if ConditionPassed() then
    if PSTATE.EL == EL2 then UNPREDICTABLE;           // Hyp mode
    EncodingSpecificOperations();
    offset = if register_form then Shift(R[m], shift_t, shift_n, PSTATE.C) else imm32;
    offset_addr = if add then (R[n] + offset) else (R[n] - offset);
    address = if postindex then R[n] else offset_addr;
    if t == 15 then // Only possible for encodings A1 and A2
        data = PCStoreValue();
    else
        data = R[t];
    MemU_unpriv[address,4] = data;
    if postindex then R[n] = offset_addr;
  
```

CONSTRAINED UNPREDICTABLE behavior

If PSTATE.EL == EL2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes as STR (immediate).

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

F5.1.244 SUB (immediate, from PC)

Subtract from PC subtracts an immediate value from the `Align(PC, 4)` value to form a PC-relative address, and writes the result to the destination register. Arm recommends that, where possible, software avoids using this alias

This instruction is an alias of the [ADR](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [ADR](#).
- The description of [ADR](#) gives the operational pseudocode for this instruction.

A2

A2 variant

`SUB{<c>}{<q>} <Rd>, PC, #<const>`

is equivalent to

`ADR{<c>}{<q>} <Rd>, <label>`

and is the preferred disassembly when `imm12 == '000000000000'`.

T2

T2 variant

`SUB{<c>}{<q>} <Rd>, PC, #<imm12>`

is equivalent to

`ADR{<c>}{<q>} <Rd>, <label>`

and is the preferred disassembly when `i:imm3:imm8 == '000000000000'`.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> For encoding A2: is the general-purpose destination register, encoded in the "Rd" field. If the PC is used, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).

For encoding T2: is the general-purpose destination register, encoded in the "Rd" field.

<label> For encoding A2: the label of an instruction or literal data item whose address is to be loaded into <Rd>. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label.

If the offset is zero or positive, encoding A1 is used, with `imm32` equal to the offset.

If the offset is negative, encoding A2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding A2 indicates that the required offset is minus the value of `imm32`.

Permitted values of the size of the offset are any of the constants described in *Modified immediate constants in A32 instructions* on page F1-4364.

For encoding T2: the label of an instruction or literal data item whose address is to be loaded into `<Rd>`. The assembler calculates the required value of the offset from the `Align(PC, 4)` value of the ADR instruction to this label.

If the offset is zero or positive, encoding T3 is used, with `imm32` equal to the offset.

If the offset is negative, encoding T2 is used, with `imm32` equal to the size of the offset. That is, the use of encoding T2 indicates that the required offset is minus the value of `imm32`.

Permitted values of the size of the offset are 0-4095.

- `<imm12>` Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
- `<const>` An immediate value. See *Modified immediate constants in A32 instructions* on page F1-4364 for the range of values.

Operation for all encodings

The description of [ADR](#) gives the operational pseudocode for this instruction.

F5.1.245 SUB, SUBS (immediate)

Subtract (immediate) subtracts an immediate value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The SUBS variant of the instruction performs an exception return without the use of the stack. In this case:
 - The PE branches to the address written to the PC, and restores PSTATE from SPSR_<current_mode>.
 - The PE checks SPSR_<current_mode> for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode, except for encoding T5 with <imm8> set to zero, which is the encoding for the ERET instruction, see ERET.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

```
if Rn == '1111' && S == '0' then SEE "ADR";
if Rn == '1101' then SEE "SUB (SP minus immediate)";
d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = A32ExpandImm(imm12);
```

T1

15	14	13	12 11	10	9	8	6	5	3	2	0
0	0	0	1	1	1	1	imm3	Rn	Rd		

T1 variant

SUB<c>{<q>} <Rd>, <Rn>, #<imm3> // Inside IT block

SUBS{<q>} <Rd>, <Rn>, #<imm3> // Outside IT block

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); setflags = !InITBlock(); imm32 = ZeroExtend(imm3, 32);

T2

T2 variant

SUB<c>{<q>} <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> can be represented in T1
 SUB<c>{<q>} {<Rdn>}, <Rdn>, #<imm8> // Inside IT block, and <Rdn>, <imm8> cannot be represented in T1
 SUBS{<q>} <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> can be represented in T1
 SUBS{<q>} {<Rdn>}, <Rdn>, #<imm8> // Outside IT block, and <Rdn>, <imm8> cannot be represented in T1

Decode for this encoding

d = UInt(Rdn); n = UInt(Rdn); setflags = !InITBlock(); imm32 = ZeroExtend(imm8, 32);

T3

SUB variant

Applies when S == 0.

SUB<c>.W {<Rd>}, <Rn>, #<const> // Inside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or T2
 SUB{<c>}{<q>} {<Rd>}, <Rn>, #<const>

SUBS variant

Applies when S == 1 && Rd != 1111.

SUBS.W {<Rd>}, <Rn>, #<const> // Outside IT block, and <Rd>, <Rn>, <const> can be represented in T1 or T2
 SUBS{<c>}{<q>} {<Rd>}, <Rn>, #<const>

Decode for all variants of this encoding

if Rd == '1111' && S == '1' then SEE "CMP (immediate)";
 if Rn == '1101' then SEE "SUB (SP minus immediate)";
 d = UInt(Rd); n = UInt(Rn); setflags = (S == '1'); imm32 = T32ExpandImm(i:imm3:imm8);
 if (d == 15 && !setflags) || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

T4

T4 variant

SUB{<c>}{<q>} {<Rd>}, <Rn>, #<imm12> // <imm12> cannot be represented in T1, T2, or T3
 SUBW{<c>}{<q>} {<Rd>}, <Rn>, #<imm12> // <imm12> can be represented in T1, T2, or T3

Decode for this encoding

```
if Rn == '1111' then SEE "ADR";
if Rn == '1101' then SEE "SUB (SP minus immediate)";
d = UInt(Rd); n = UInt(Rn); setflags = FALSE; imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

T5

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	0
1	1	1	1	0	0	1	1	1	1	0	1	Rn	1	0	(0)	0	(1)	(1)	(1)	(1)	imm8		

T5 variant

Applies when !(Rn == 1110 && imm8 == 00000000).

SUBS{<c>}{<q>} PC, LR, #<imm8>

Decode for this encoding

```
if Rn == '1110' && IsZero(imm8) then SEE "ERET";
d = 15; n = UInt(Rn); setflags = TRUE; imm32 = ZeroExtend(imm8, 32);
if n != 14 then UNPREDICTABLE;
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *SUBS PC, LR and related instructions (A32)* on page K1-8400 and *SUBS PC, LR and related instructions (T32)* on page K1-8399.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rdn> Is the general-purpose source and destination register, encoded in the "Rdn" field.
- <imm8> For encoding T2: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
 For encoding T5: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field.
 If <Rn> is the LR, and zero is used, see [ERET](#).
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. If the PC is used:
 - For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
 - For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. Arm deprecates use of this instruction unless <Rn> is the LR.
 For encoding T1, T3 and T4: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.

<Rn>	For encoding A1 and T4: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus immediate) . If the PC is used, see ADR . For encoding T1: is the general-purpose source register, encoded in the "Rn" field. For encoding T3: is the general-purpose source register, encoded in the "Rn" field. If the SP is used, see SUB, SUBS (SP minus immediate) .
<imm3>	Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "imm3" field.
<imm12>	Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
<const>	For encoding A1: an immediate value. See Modified immediate constants in A32 instructions on page F1-4364 for the range of values. For encoding T3: an immediate value. See Modified immediate constants in T32 instructions on page F1-4362 for the range of values.

In the T32 instruction set, `MOVS{<c>}{<q>} PC, LR` is a pseudo-instruction for `SUBS{<c>}{<q>} PC, LR, #0`.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(R[n], NOT(imm32), '1');
    if d == 15 then
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.246 SUB, SUBS (register)

Subtract (register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. However, when the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if (d == 15 && !setflags) || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>. Arm deprecates using the PC as the destination register, but if the PC is used:
- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
 - For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.
- For encoding T1 and T2: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the same as <Rn>.
- <Rn> For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. If the SP is used, see [SUB, SUBS \(SP minus register\)](#).
 For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.
 For encoding T2: is the first general-purpose source register, encoded in the "Rn" field. If the SP is used, see [SUB, SUBS \(SP minus register\)](#).
- <Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
 For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
- | | |
|-----|-----------------|
| LSL | when stype = 00 |
| LSR | when stype = 01 |
| ASR | when stype = 10 |
| ROR | when stype = 11 |
- <amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.
 For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcv) = AddWithCarry(R[n], NOT(shifted), '1');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
  
```

```
if setflags then
    PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1 and this instruction does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.247 SUB, SUBS (register-shifted register)

Subtract (register-shifted register) subtracts a register-shifted register value from a register value, and writes the result to the destination register. It can optionally update the condition flags based on the result.

Flag setting variant

Applies when S == 1.

SUBS{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Not flag setting variant

Applies when S == 0.

SUB{<c>}{<q>} {<Rd>}, <Rn>, <Rm>, <shift> <Rs>

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
setflags = (S == '1'); shift_t = DecodeRegShift(stype);
if d == 15 || n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .								
<q>	See Standard assembler syntax fields on page F1-4348 .								
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.								
<Rn>	Is the first general-purpose source register, encoded in the "Rn" field.								
<Rm>	Is the second general-purpose source register, encoded in the "Rm" field.								
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: <table style="margin-left: 20px;"> <tr> <td>LSL</td> <td>when stype = 00</td> </tr> <tr> <td>LSR</td> <td>when stype = 01</td> </tr> <tr> <td>ASR</td> <td>when stype = 10</td> </tr> <tr> <td>ROR</td> <td>when stype = 11</td> </tr> </table>	LSL	when stype = 00	LSR	when stype = 01	ASR	when stype = 10	ROR	when stype = 11
LSL	when stype = 00								
LSR	when stype = 01								
ASR	when stype = 10								
ROR	when stype = 11								
<Rs>	Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.								

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzcvc) = AddWithCarry(R[n], NOT(shifted), '1');
    R[d] = result;
    if setflags then
        PSTATE.<N,Z,C,V> = nzcvc;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.248 SUB, SUBS (SP minus immediate)

Subtract from SP (immediate) subtracts an immediate value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see *Pseudocode description of operations on the AArch32 general-purpose registers and the PC* on page E1-4253.
- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See *Illegal return events from AArch32 state* on page G1-6066.
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

Decode for this encoding

```
d = UInt(Rd); setflags = FALSE; imm32 = ZeroExtend(i:imm3:imm8, 32);
if d == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- SP, Is the stack pointer.
- <imm7> Is the unsigned immediate, a multiple of 4, in the range 0 to 508, encoded in the "imm7" field as <imm7>/4.

- <Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. If the PC is used:
- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC](#) on page E1-4253.
 - For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>. Arm deprecates use of this instruction unless <Rn> is the LR.
- For encoding T2 and T3: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.
- <imm12> Is a 12-bit unsigned immediate, in the range 0 to 4095, encoded in the "i:imm3:imm8" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions](#) on page F1-4364 for the range of values.
- For encoding T2: an immediate value. See [Modified immediate constants in T32 instructions](#) on page F1-4362 for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (result, nzcvc) = AddWithCarry(SP, NOT(imm32), '1');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzcvc;
```

F5.1.249 SUB, SUBS (SP minus register)

Subtract from SP (register) subtracts an optionally-shifted register value from the SP value, and writes the result to the destination register.

If the destination register is not the PC, the SUBS variant of the instruction updates the condition flags based on the result.

The field descriptions for <Rd> identify the encodings where the PC is permitted as the destination register. If the destination register is the PC:

- The SUB variant of the instruction is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- The SUBS variant of the instruction performs an exception return without the use of the stack. Arm deprecates use of this instruction. However, in this case:
 - The PE branches to the address written to the PC, and restores `PSTATE` from `SPSR_<current_mode>`.
 - The PE checks `SPSR_<current_mode>` for an illegal return event. See [Illegal return events from AArch32 state on page G1-6066](#).
 - The instruction is UNDEFINED in Hyp mode.
 - The instruction is CONSTRAINED UNPREDICTABLE in User mode and System mode.

SUB, rotate right with extend variant

Applies when $S == 0$ && $imm5 == 00000$ && $stype == 11$.

`SUB{<c>}{<q>} {<Rd>}, SP, <Rm> , RRX`

SUB, shift or rotate by value variant

Applies when $S == 0$ && $!(imm5 == 00000 \ \&\& \ stype == 11)$.

`SUB{<c>}{<q>} {<Rd>}, SP, <Rm> {, <shift> #<amount>}`

SUBS, rotate right with extend variant

Applies when $S == 1$ && $imm5 == 00000$ && $stype == 11$.

`SUBS{<c>}{<q>} {<Rd>}, SP, <Rm> , RRX`

SUBS, shift or rotate by value variant

Applies when $S == 1$ && $!(imm5 == 00000 \ \&\& \ stype == 11)$.

`SUBS{<c>}{<q>} {<Rd>}, SP, <Rm> {, <shift> #<amount>}`

Decode for all variants of this encoding

```
d = UInt(Rd); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm5);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	12	11	8	7	6	5	4	3	0
1	1	1	0	1	0	1	1	1	0	1	S	1	1	0	1	(0)	imm3		Rd		imm2	stype			Rm	

SUB, rotate right with extend variant

Applies when $S == 0$ && $imm3 == 000$ && $imm2 == 00$ && $stype == 11$.

SUB{<c>}{<q>} {<Rd>}, SP, <Rm>, RRX

SUB, shift or rotate by value variant

Applies when $S == 0$ && $!(imm3 == 000 \&\& imm2 == 00 \&\& stype == 11)$.

SUB{<c>}.W {<Rd>}, SP, <Rm> // <Rd>, <Rm> can be represented in T1 or T2
 SUB{<c>}{<q>} {<Rd>}, SP, <Rm> {, <shift> #<amount>}

SUBS, rotate right with extend variant

Applies when $S == 1$ && $imm3 == 000$ && $Rd != 1111$ && $imm2 == 00$ && $stype == 11$.

SUBS{<c>}{<q>} {<Rd>}, SP, <Rm>, RRX

SUBS, shift or rotate by value variant

Applies when $S == 1$ && $!(imm3 == 000 \&\& imm2 == 00 \&\& stype == 11) \&\& Rd != 1111$.

SUBS{<c>}{<q>} {<Rd>}, SP, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

```
if Rd == '1111' && S == '1' then SEE "CMP (register)";
d = UInt(Rd); m = UInt(Rm); setflags = (S == '1');
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if (d == 15 && !setflags) || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rd> For encoding A1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP. Arm deprecates using the PC as the destination register, but if the PC is used:

- For the SUB variant, the instruction is a branch to the address calculated by the operation. This is an interworking branch, see [Pseudocode description of operations on the AArch32 general-purpose registers and the PC on page E1-4253](#).
- For the SUBS variant, the instruction performs an exception return, that restores PSTATE from SPSR_<current_mode>.

For encoding T1: is the general-purpose destination register, encoded in the "Rd" field. If omitted, this register is the SP.

- <Rm> For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated.
For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.
- <shift> Is the type of shift to be applied to the second source register, encoded in the "styp" field. It can have the following values:
- | | |
|-----|-----------------|
| LSL | when stype = 00 |
| LSR | when stype = 01 |
| ASR | when stype = 10 |
| ROR | when stype = 11 |
- <amount> For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32.
For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shifted = Shift(R[m], shift_t, shift_n, PSTATE.C);
    (result, nzc) = AddWithCarry(SP, NOT(shifted), '1');
    if d == 15 then // Can only occur for A32 encoding
        if setflags then
            ALUExceptionReturn(result);
        else
            ALUWritePC(result);
    else
        R[d] = result;
        if setflags then
            PSTATE.<N,Z,C,V> = nzc;
```

F5.1.250 SVC

Supervisor Call causes a Supervisor Call exception. For more information, see [Supervisor Call \(SVC\) exception on page G1-6082](#).

———— **Note** —————

SVC was previously called SWI, Software Interrupt, and this name is still found in some documentation.

Software can use this instruction as a call to an operating system to provide a service.

In the following cases, the Supervisor Call exception generated by the SVC instruction is taken to Hyp mode:

- If the SVC is executed in Hyp mode.
- If `HCR.TGE` is set to 1, and the SVC is executed in Non-secure User mode. For more information, see [Supervisor Call exception, when the value of HCR.TGE is 1 on page G1-6059](#)

In these cases, the `HSR` identifies that the exception entry was caused by a Supervisor Call exception, EC value `0x11`, see [Use of the HSR on page G5-6381](#). The immediate field in the `HSR`:

- If the SVC is unconditional:
 - For the T32 instruction, is the zero-extended value of the `imm8` field.
 - For the A32 instruction, is the least-significant 16 bits the `imm24` field.
- If the SVC is conditional, is UNKNOWN.

A1

A1 variant

SVC{<c>}{<q>} {#}<imm>

Decode for this encoding

`imm32 = ZeroExtend(imm24, 32);`

T1

T1 variant

SVC{<c>}{<q>} {#}<imm>

Decode for this encoding

`imm32 = ZeroExtend(imm8, 32);`

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<imm> For encoding A1: is a 24-bit unsigned immediate, in the range 0 to 16777215, encoded in the "imm24" field. This value is for assembly and disassembly only. SVC handlers in some systems interpret imm24 in software, for example to determine the required service.

For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. This value is for assembly and disassembly only. SVC handlers in some systems interpret imm8 in software, for example to determine the required service.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
AArch32.CheckForSVCTrap(imm32<15:0>);
AArch32.CallSupervisor(imm32<15:0>);
```

F5.1.251 SXTAB

Signed Extend and Add Byte extracts an 8-bit value from a register, sign-extends it to 32 bits, adds the result to the value in another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

A1

A1 variant

SXTAB{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ROR #<amount>}

Decode for this encoding

```
if Rn == '1111' then SEE "SXTB";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

SXTAB{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ROR #<amount>}

Decode for this encoding

```
if Rn == '1111' then SEE "SXTB";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <amount> Is the rotate amount, encoded in the "rotate" field. It can have the following values:
 (omitted) when rotate = 00

8	when rotate = 01
16	when rotate = 10
24	when rotate = 11

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d] = R[n] + SignExtend(rotated<7:0>, 32);
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.252 SXTAB16

Signed Extend and Add Byte 16 extracts two 8-bit values from a register, sign-extends them to 16 bits each, adds the results to two 16-bit values from another register, and writes the final results to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit values.

A1

A1 variant

SXTAB16{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ROR #<amount>}

Decode for this encoding

```
if Rn == '1111' then SEE "SXTB16";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

SXTAB16{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ROR #<amount>}

Decode for this encoding

```
if Rn == '1111' then SEE "SXTB16";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <amount> Is the rotate amount, encoded in the "rotate" field. It can have the following values:
 (omitted) when rotate = 00

8	when rotate = 01
16	when rotate = 10
24	when rotate = 11

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d]<15:0> = R[n]<15:0> + SignExtend(rotated<7:0>, 16);
    R[d]<31:16> = R[n]<31:16> + SignExtend(rotated<23:16>, 16);
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.253 SXTAH

Signed Extend and Add Halfword extracts a 16-bit value from a register, sign-extends it to 32 bits, adds the result to a value from another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 16-bit value.

A1

A1 variant

SXTAH{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ROR #<amount>}

Decode for this encoding

```
if Rn == '1111' then SEE "SXTAH";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

SXTAH{<c>}{<q>} {<Rd>}, <Rn>, <Rm> {, ROR #<amount>}

Decode for this encoding

```
if Rn == '1111' then SEE "SXTAH";
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); rotation = UInt(rotate:'000');
if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <amount> Is the rotate amount, encoded in the "rotate" field. It can have the following values:
 (omitted) when rotate = 00

8	when rotate = 01
16	when rotate = 10
24	when rotate = 11

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d] = R[n] + SignExtend(rotated<15:0>, 32);
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.254 SXTB

Signed Extend Byte extracts an 8-bit value from a register, sign-extends it to 32 bits, and writes the result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 8-bit value.

A1

A1 variant

SXTB{<c>}{<q>} {<Rd>}, <Rm> {, ROR #<amount>}

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); rotation = UInt(rotate:'000');
 if d == 15 || m == 15 then UNPREDICTABLE;

T1

T1 variant

SXTB{<c>}{<q>} {<Rd>}, <Rm>

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); rotation = 0;

T2

T2 variant

SXTB{<c>}.W {<Rd>}, <Rm> // <Rd>, <Rm> can be represented in T1
 SXTB{<c>}{<q>} {<Rd>}, <Rm> {, ROR #<amount>}

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); rotation = UInt(rotate:'000');
 if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .

Decode for this encoding

d = UInt(Rd); m = UInt(Rm); rotation = UInt(rotate:'000');
 if d == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<Rm>	Is the general-purpose source register, encoded in the "Rm" field.
<amount>	Is the rotate amount, encoded in the "rotate" field. It can have the following values: (omitted) when rotate = 00 8 when rotate = 01 16 when rotate = 10 24 when rotate = 11

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d] = SignExtend(rotated<15:0>, 32);
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.257 TBB, TBH

Table Branch Byte or Halfword causes a PC-relative forward branch using a table of single byte or halfword offsets. A base register provides a pointer to the table, and a second register supplies an index into the table. The branch length is twice the value returned from the table.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	13	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	0	0	1	1	0	1	Rn	(1)	(1)	(1)	(1)	(0)	(0)	(0)	(0)	0	0	0	H	Rm		

Byte variant

Applies when H == 0.

TBB{<c>}{<q>} [<Rn>, <Rm>] // Outside or last in IT block

Halfword variant

Applies when H == 1.

TBH{<c>}{<q>} [<Rn>, <Rm>, LSL #1] // Outside or last in IT block

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm); is_tbh = (H == '1');
if m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if InITBlock() && !LastInITBlock() then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See *Standard assembler syntax fields* on page F1-4348.

<q> See *Standard assembler syntax fields* on page F1-4348.

<Rn> Is the general-purpose base register holding the address of the table of branch lengths, encoded in the "Rn" field. The PC can be used. If it is, the table immediately follows this instruction.

<Rm> For the byte variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a single byte in the table. The offset in the table is the value of the index.

For the halfword variant: is the general-purpose index register, encoded in the "Rm" field. This register contains an integer pointing to a halfword in the table. The offset in the table is twice the value of the index.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if is_tbh then
        halfwords = UInt(MemU[R[n]+LSL(R[m],1), 2]);
    else
```

```
halfwords = UInt(MemU[R[n]+R[m], 1]);  
BranchWritePC(PC + 2*halfwords, BranchType_INDIR);
```

F5.1.258 TEQ (immediate)

Test Equivalence (immediate) performs a bitwise exclusive OR operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

TEQ{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn);
 (imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);

T1

T1 variant

TEQ{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

n = UInt(Rn);
 (imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
 if n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
 For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.
 For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F1-4362](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
result = R[n] EOR imm32;
PSTATE.N = result<31>;
PSTATE.Z = IsZeroBit(result);
PSTATE.C = carry;
// PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.259 TEQ (register)

Test Equivalence (register) performs a bitwise exclusive OR operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0
!=1111				0	0	0	1	0	0	1	1	Rn	(0)	(0)	(0)	(0)	imm5	stype	0	Rm		
cond																						

Rotate right with extend variant

Applies when imm5 == 00000 && stype == 11.

TEQ{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm5 == 00000 && stype == 11).

TEQ{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = DecodeImmShift(stype, imm5);

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	1	0	1	0	0	0	1	Rn	(0)	imm3	1	1	1	1	imm2	stype	Rm				

Rotate right with extend variant

Applies when imm3 == 000 && imm2 == 00 && stype == 11.

TEQ{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm3 == 000 && imm2 == 00 && stype == 11).

TEQ{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
 if n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1: is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: LSL when stype = 00 LSR when stype = 01 ASR when stype = 10 ROR when stype = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.260 TEQ (register-shifted register)

Test Equivalence (register-shifted register) performs a bitwise exclusive OR operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	8	7	6	5	4	3	0	
!=1111				0	0	0	1	0	0	1	1	Rn	(0)	(0)	(0)	(0)	Rs	0	stype	1	Rm			
cond																								

A1 variant

TEQ{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>

Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
shift_t = DecodeRegShift(stype);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <type> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
 - LSL when stype = 00
 - LSR when stype = 01
 - ASR when stype = 10
 - ROR when stype = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    shift_n = UInt(R[s]<7:0>);
    (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
    result = R[n] EOR shifted;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.261 TSB CSYNC

Trace Synchronization Barrier. This instruction is a barrier that synchronizes the trace operations of instructions.

If `FEAT_TRF` is not implemented, this instruction executes as a NOP.

A1

(FEAT_TRF)

31	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
!=1111				0	0	1	1	0	0	1	0	0	0	0	0	(1)	(1)	(1)	(1)	(0)	(0)	(0)	(0)	0	0	0	1	0	0	1	0
cond																															

A1 variant

TSB{<c>}{<q>} CSYNC

Decode for this encoding

```
if !HaveSelfHostedTrace() then EndOfInstruction(); // Instruction executes as NOP
if cond != '1110' then UNPREDICTABLE;           // ESB must be encoded with AL condition
```

CONSTRAINED UNPREDICTABLE behavior

If `cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes unconditionally.
- The instruction executes conditionally.

T1

(FEAT_TRF)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	1	1	1	0	1	0	(1)	(1)	(1)	(1)	1	0	(0)	0	(0)	0	0	0	0	0	0	1	0	0	1	0

T1 variant

TSB{<c>}{<q>} CSYNC

Decode for this encoding

```
if !HaveSelfHostedTrace() then EndOfInstruction(); // Instruction executes as NOP
if InITBlock() then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.

- The instruction executes unconditionally.
- The instruction executes conditionally.

Assembler symbols

<c> See [Standard assembler syntax fields](#) on page F1-4348.

<q> See [Standard assembler syntax fields](#) on page F1-4348.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    TraceSynchronizationBarrier();
```

F5.1.262 TST (immediate)

Test (immediate) performs a bitwise AND operation on a register value and an immediate value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

TST{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

```
n = UInt(Rn);
(imm32, carry) = A32ExpandImm_C(imm12, PSTATE.C);
```

T1

T1 variant

TST{<c>}{<q>} <Rn>, #<const>

Decode for this encoding

```
n = UInt(Rn);
(imm32, carry) = T32ExpandImm_C(i:imm3:imm8, PSTATE.C);
if n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> For encoding A1: is the general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
For encoding T1: is the general-purpose source register, encoded in the "Rn" field.
- <const> For encoding A1: an immediate value. See [Modified immediate constants in A32 instructions on page F1-4364](#) for the range of values.
For encoding T1: an immediate value. See [Modified immediate constants in T32 instructions on page F1-4362](#) for the range of values.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = R[n] AND imm32;
    PSTATE.N = result<31>;
    PSTATE.Z = IsZeroBit(result);
    PSTATE.C = carry;
    // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.263 TST (register)

Test (register) performs a bitwise AND operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	14	13	12	11	7	6	5	4	3	0
!=1111				0	0	0	1	0	0	0	1	Rn	(0)	(0)	(0)	(0)	imm5	stype	0	Rm		
cond																						

Rotate right with extend variant

Applies when imm5 == 00000 && stype == 11.

TST{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when !(imm5 == 00000 && stype == 11).

TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}

Decode for all variants of this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = DecodeImmShift(stype, imm5);

T1

15	14	13	12	11	10	9	8	7	6	5	3	2	0
0	1	0	0	0	0	1	0	0	0	Rm	Rn		

T1 variant

TST{<c>}{<q>} <Rn>, <Rm>

Decode for this encoding

n = UInt(Rn); m = UInt(Rm);
 (shift_t, shift_n) = (SRTType_LSL, 0);

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	0	1	0	0	0	0	1	Rn	(0)	imm3	1	1	1	1	imm2	stype	Rm					

Rotate right with extend variant

Applies when imm3 == 000 && imm2 == 00 && stype == 11.

TST{<c>}{<q>} <Rn>, <Rm>, RRX

Shift or rotate by value variant

Applies when `!(imm3 == 000 && imm2 == 00 && stype == 11)`.

`TST{<c>}.W <Rn>, <Rm> // <Rn>, <Rm>` can be represented in T1
`TST{<c>}{<q>} <Rn>, <Rm> {, <shift> #<amount>}`

Decode for all variants of this encoding

```
n = UInt(Rn); m = UInt(Rm);
(shift_t, shift_n) = DecodeImmShift(stype, imm3:imm2);
if n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Rn>	For encoding A1: is the first general-purpose source register, encoded in the "Rn" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the first general-purpose source register, encoded in the "Rn" field.
<Rm>	For encoding A1: is the second general-purpose source register, encoded in the "Rm" field. The PC can be used, but this is deprecated. For encoding T1 and T2: is the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values: LSL when stype = 00 LSR when stype = 01 ASR when stype = 10 ROR when stype = 11
<amount>	For encoding A1: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR) encoded in the "imm5" field as <amount> modulo 32. For encoding T2: is the shift amount, in the range 1 to 31 (when <shift> = LSL or ROR) or 1 to 32 (when <shift> = LSR or ASR), encoded in the "imm3:imm2" field as <amount> modulo 32.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
(shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
result = R[n] AND shifted;
PSTATE.N = result<31>;
PSTATE.Z = IsZeroBit(result);
PSTATE.C = carry;
// PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.264 TST (register-shifted register)

Test (register-shifted register) performs a bitwise AND operation on a register value and a register-shifted register value. It updates the condition flags based on the result, and discards the result.

A1

A1 variant

TST{<c>}{<q>} <Rn>, <Rm>, <type> <Rs>

Decode for this encoding

```
n = UInt(Rn); m = UInt(Rm); s = UInt(Rs);
shift_t = DecodeRegShift(stype);
if n == 15 || m == 15 || s == 15 then UNPREDICTABLE;
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.
- <type> Is the type of shift to be applied to the second source register, encoded in the "stype" field. It can have the following values:
 - LSL when stype = 00
 - LSR when stype = 01
 - ASR when stype = 10
 - ROR when stype = 11
- <Rs> Is the third general-purpose source register holding a shift amount in its bottom 8 bits, encoded in the "Rs" field.

Operation

```
if ConditionPassed() then
  EncodingSpecificOperations();
  shift_n = UInt(R[s]<7:0>);
  (shifted, carry) = Shift_C(R[m], shift_t, shift_n, PSTATE.C);
  result = R[n] AND shifted;
  PSTATE.N = result<31>;
  PSTATE.Z = IsZeroBit(result);
  PSTATE.C = carry;
  // PSTATE.V unchanged
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.265 UADD16

Unsigned Add 16 performs two 16-bit unsigned integer additions, and writes the results to the destination register. It sets `PSTATE.GE` according to the results of the additions.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

PSTATE.GE<1> = if sum2 >= 0x100 then '1' else '0';  
PSTATE.GE<2> = if sum3 >= 0x100 then '1' else '0';  
PSTATE.GE<3> = if sum4 >= 0x100 then '1' else '0';
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.267 UASX

Unsigned Add and Subtract with Exchange exchanges the two halfwords of the second operand, performs one unsigned 16-bit integer addition and one unsigned 16-bit subtraction, and writes the results to the destination register. It sets `PSTATE.GE` according to the results.

A1

A1 variant

UASX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
 if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;

T1

T1 variant

UASX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
 if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
diff = UInt(R[n]<15:0>) - UInt(R[m]<31:16>);
sum  = UInt(R[n]<31:16>) + UInt(R[m]<15:0>);
R[d]<15:0> = diff<15:0>;
R[d]<31:16> = sum<15:0>;
PSTATE.GE<1:0> = if diff >= 0 then '11' else '00';
PSTATE.GE<3:2> = if sum  >= 0x10000 then '11' else '00';
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.268 UBFX

Unsigned Bit Field Extract extracts any number of adjacent bits at any position from a register, zero-extends them to 32 bits, and writes the result to the destination register.

A1

31	28	27	26	25	24	23	22	21	20	16	15	12	11	7	6	5	4	3	0	
!=1111						0	1	1	1	1	widthm1	Rd	lsb	1	0	1	Rn			
cond																				

A1 variant

UBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn);
lsbit = UInt(lsb); widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	0
1	1	1	1	0	(0)	1	1	1	1	0	0	Rn	0	imm3	Rd	imm2	(0)	widthm1					

T1 variant

UBFX{<c>}{<q>} <Rd>, <Rn>, #<lsb>, #<width>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn);
lsbit = UInt(imm3:imm2); widthminus1 = UInt(widthm1);
if d == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the general-purpose source register, encoded in the "Rn" field.
- <lsb> For encoding A1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "lsb" field.
 For encoding T1: is the bit number of the least significant bit in the field, in the range 0 to 31, encoded in the "imm3:imm2" field.

<width> Is the width of the field, in the range 1 to 32-<lsb>, encoded in the "width1" field as <width>-1.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    msbit = lsb + widthminus1;
    if msbit <= 31 then
        R[d] = ZeroExtend(R[n]<msbit:lsb>, 32);
    else
        UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `msbit > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Operational information

If `CPSR.DIT` is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.269 UDF

Permanently Undefined generates an Undefined Instruction exception.

The encodings for UDF used in this section are defined as permanently UNDEFINED in the Armv8-A architecture. However:

- With the T32 instruction set, Arm deprecates using the UDF instruction in an IT block.
- In the A32 instruction set, UDF is not conditional.

A1

A1 variant

UDF{<c>}{<q>} {#}<imm>

Decode for this encoding

```
imm32 = ZeroExtend(imm12:imm4, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

T1

T1 variant

UDF{<c>}{<q>} {#}<imm>

Decode for this encoding

```
imm32 = ZeroExtend(imm8, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

T2

T2 variant

UDF{<c>}.W {#}<imm> // <imm> can be represented in T1
 UDF{<c>}{<q>} {#}<imm>

Decode for this encoding

```
imm32 = ZeroExtend(imm4:imm12, 32);
// imm32 is for assembly and disassembly only, and is ignored by hardware.
```

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). <c> must be AL or omitted.
For encoding T1 and T2: see [Standard assembler syntax fields on page F1-4348](#). Arm deprecates using any <c> value other than AL.
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <imm> For encoding A1: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm12:imm4" field. The PE ignores the value of this constant.
For encoding T1: is a 8-bit unsigned immediate, in the range 0 to 255, encoded in the "imm8" field. The PE ignores the value of this constant.
For encoding T2: is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm4:imm12" field. The PE ignores the value of this constant.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    UNDEFINED;
```

F5.1.270 UDIV

Unsigned Divide divides a 32-bit unsigned integer register value by a 32-bit unsigned integer register value, and writes the result to the destination register. The condition flags are not affected.

See [Divide instructions on page F2-4387](#) for more information about this instruction.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0	
!=1111				0	1	1	1	0	0	1	1	Rd	(1)	(1)	(1)	(1)	Rm	0	0	0	1	Rn
cond											Ra											

A1 variant

UDIV{<C>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
 if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE;

CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction performs a divide and the register specified by Ra becomes UNKNOWN.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	1	1	0	1	1	Rn	(1)	(1)	(1)	(1)	Rd	1	1	1	1	Rm	
													Ra										

T1 variant

UDIV{<C>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm); a = UInt(Ra);
 if d == 15 || n == 15 || m == 15 || a != 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

CONSTRAINED UNPREDICTABLE behavior

If Ra != '1111', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction executes as described, with no change to its behavior and no additional side effects.
- The instruction performs a divide and the register specified by Ra becomes UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register holding the dividend, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the divisor, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if UInt(R[m]) == 0 then
        result = 0;
    else
        result = RoundTowardsZero(Real(UInt(R[n])) / Real(UInt(R[m])));
    R[d] = result<31:0>;
```

F5.1.271 UHADD16

Unsigned Halving Add 16 performs two unsigned 16-bit integer additions, halves the results, and writes the results to the destination register.

A1

A1 variant

UHADD16{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

UHADD16{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum1 = UInt(R[n]<15:0>) + UInt(R[m]<15:0>);
```

```
sum2 = UInt(R[n]<31:16>) + UInt(R[m]<31:16>);  
R[d]<15:0> = sum1<16:1>;  
R[d]<31:16> = sum2<16:1>;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.272 UHADD8

Unsigned Halving Add 8 performs four unsigned 8-bit integer additions, halves the results, and writes the results to the destination register.

A1

A1 variant

UHADD8{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;
```

T1

T1 variant

UHADD8{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

```
d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    sum1 = UInt(R[n]<7:0>) + UInt(R[m]<7:0>);
```

```
sum2 = UInt(R[n]<15:8>) + UInt(R[m]<15:8>);  
sum3 = UInt(R[n]<23:16>) + UInt(R[m]<23:16>);  
sum4 = UInt(R[n]<31:24>) + UInt(R[m]<31:24>);  
R[d]<7:0> = sum1<8:1>;  
R[d]<15:8> = sum2<8:1>;  
R[d]<23:16> = sum3<8:1>;  
R[d]<31:24> = sum4<8:1>;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.273 UHASX

Unsigned Halving Add and Subtract with Exchange exchanges the two halfwords of the second operand, performs one unsigned 16-bit integer addition and one unsigned 16-bit subtraction, halves the results, and writes the results to the destination register.

A1

A1 variant

UHASX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
 if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;

T1

T1 variant

UHASX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
 if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Rd> Is the general-purpose destination register, encoded in the "Rd" field.
- <Rn> Is the first general-purpose source register, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
diff = UInt(R[n]<15:0>) - UInt(R[m]<31:16>);
sum  = UInt(R[n]<31:16>) + UInt(R[m]<15:0>);
R[d]<15:0> = diff<16:1>;
R[d]<31:16> = sum<16:1>;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.274 UHSAX

Unsigned Halving Subtract and Add with Exchange exchanges the two halfwords of the second operand, performs one unsigned 16-bit integer subtraction and one unsigned 16-bit addition, halves the results, and writes the results to the destination register.

A1

A1 variant

UHSAX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
 if d == 15 || n == 15 || m == 15 then UNPREDICTABLE;

T1

T1 variant

UHSAX{<c>}{<q>} {<Rd>}, <Rn>, <Rm>

Decode for this encoding

d = UInt(Rd); n = UInt(Rn); m = UInt(Rm);
 if d == 15 || n == 15 || m == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).

UMAAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm);
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $dHi == dLo$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <RdLo> Is the general-purpose source register holding the first addend and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
- <RdHi> Is the general-purpose source register holding the second addend and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
- <Rn> Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Rm> Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    result = UInt(R[n]) * UInt(R[m]) + UInt(R[dHi]) + UInt(R[dLo]);
    R[dHi] = result<63:32>;
    R[dLo] = result<31:0>;
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.278 UMLAL, UMLALS

Unsigned Multiply Accumulate Long multiplies two unsigned 32-bit values to produce a 64-bit value, and accumulates this with a 64-bit value.

In A32 instructions, the condition flags can optionally be updated based on the result. Use of this option adversely affects performance on many implementations.

A1

31	28 27	26	25	24 23	22	21	20 19	16 15	12 11	8	7	6	5	4	3	0
!=1111	0	0	0	0	1	0	1	S	RdHi	RdLo	Rm	1	0	0	1	Rn
cond																

Flag setting variant

Applies when S == 1.

UMLALS{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Not flag setting variant

Applies when S == 0.

UMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for all variants of this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); setFlags = (S == '1');
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If dHi == dLo, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

T1

15	14	13	12 11	10	9	8	7	6	5	4	3	0	15	12 11	8	7	6	5	4	3	0
1	1	1	1	1	0	1	1	1	1	1	0	Rn	RdLo	RdHi	0	0	0	0	Rm		

T1 variant

UMLAL{<c>}{<q>} <RdLo>, <RdHi>, <Rn>, <Rm>

Decode for this encoding

```
dLo = UInt(RdLo); dHi = UInt(RdHi); n = UInt(Rn); m = UInt(Rm); setFlags = FALSE;
if dLo == 15 || dHi == 15 || n == 15 || m == 15 then UNPREDICTABLE;
// Armv8-A removes UNPREDICTABLE for R13
if dHi == dLo then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $dHi == dLo$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<RdLo>	Is the general-purpose source register holding the lower 32 bits of the addend, and the destination register for the lower 32 bits of the result, encoded in the "RdLo" field.
<RdHi>	Is the general-purpose source register holding the upper 32 bits of the addend, and the destination register for the upper 32 bits of the result, encoded in the "RdHi" field.
<Rn>	Is the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Rm>	Is the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation for all encodings

```

```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.288 USAT

Unsigned Saturate saturates an optionally-shifted signed value to a selected unsigned range.

This instruction sets `PSTATE.Q` to 1 if the operation saturates.

A1

31	28	27	26	25	24	23	22	21	20	16	15	12	11	7	6	5	4	3	0				
=1111				0	1	1	0	1	1	1	sat_imm			Rd		imm5			sh	0	1	Rn	
cond																							

Arithmetic shift right variant

Applies when `sh == 1`.

USAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>

Logical shift left variant

Applies when `sh == 0`.

USAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}

Decode for all variants of this encoding

```
d = UInt(Rd); n = UInt(Rn); saturate_to = UInt(sat_imm);
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm5);
if d == 15 || n == 15 then UNPREDICTABLE;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	14	12	11	8	7	6	5	4	0
1	1	1	1	0	(0)	1	1	1	0	sh	0	Rn	0	imm3	Rd	imm2	(0)	sat_imm					

Arithmetic shift right variant

Applies when `sh == 1 && !(imm3 == 000 && imm2 == 00)`.

USAT{<c>}{<q>} <Rd>, #<imm>, <Rn>, ASR #<amount>

Logical shift left variant

Applies when `sh == 0`.

USAT{<c>}{<q>} <Rd>, #<imm>, <Rn> {, LSL #<amount>}

Decode for all variants of this encoding

```
if sh == '1' && (imm3:imm2) == '0000' then SEE "USAT16";
d = UInt(Rd); n = UInt(Rn); saturate_to = UInt(sat_imm);
(shift_t, shift_n) = DecodeImmShift(sh:'0', imm3:imm2);
if d == 15 || n == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Rd>	Is the general-purpose destination register, encoded in the "Rd" field.
<imm>	Is the bit position for saturation, in the range 0 to 31, encoded in the "sat_imm" field.
<Rn>	Is the general-purpose source register, encoded in the "Rn" field.
<amount>	For encoding A1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm5" field. For encoding A1: is the shift amount, in the range 1 to 32 encoded in the "imm5" field as <amount> modulo 32. For encoding T1: is the optional shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm3:imm2" field. For encoding T1: is the shift amount, in the range 1 to 31 encoded in the "imm3:imm2" field as <amount>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
operand = Shift(R[n], shift_t, shift_n, PSTATE.C); // PSTATE.C ignored
(result, sat) = UnsignedSatQ(SInt(operand), saturate_to);
R[d] = ZeroExtend(result, 32);
if sat then
    PSTATE.Q = '1';
```

F5.1.289 USAT16

Unsigned Saturate 16 saturates two signed 16-bit values to a selected unsigned range.

This instruction sets `PSTATE.Q` to 1 if the operation saturates.

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

    EncodingSpecificOperations();
    rotated = ROR(R[m], rotation);
    R[d]<15:0> = R[n]<15:0> + ZeroExtend(rotated<7:0>, 16);
    R[d]<31:16> = R[n]<31:16> + ZeroExtend(rotated<23:16>, 16);
```

Operational information

If CPSR.DIT is 1, this instruction has passed its condition execution check, and does not use R15 as either its source or destination:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F5.1.295 UXTAH

Unsigned Extend and Add Halfword extracts a 16-bit value from a register, zero-extends it to 32 bits, adds the result to a value from another register, and writes the final result to the destination register. The instruction can specify a rotation by 0, 8, 16, or 24 bits before extracting the 16-bit value.

F5.1.299 WFE

Wait For Event is a hint instruction that indicates that the PE can enter a low-power state and remain there until a wakeup event occurs. Wakeup events include the event signaled as a result of executing the SEV instruction on any PE in the multiprocessor system. For more information, see *Wait For Event and Send Event* on page G1-6104.

As described in *Wait For Event and Send Event* on page G1-6104, the execution of a WFE instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level, see:

- *Traps to Undefined mode of EL0 execution of WFE and WFI instructions* on page G1-6120.
- *Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions* on page G1-6136.
- *Traps to Monitor mode of the execution of WFE and WFI instructions in modes other than Monitor mode* on page G1-6148.

```

F5.1.301 YIELD

YIELD is a hint instruction. Software with a multithreading capability can use a YIELD instruction to indicate to the PE that it is performing a task, for example a spin-lock, that could be swapped out to improve overall system performance. The PE can use this hint to suspend and resume multiple software threads if it supports the capability.

For more information about the recommended use of this instruction see [The Yield instruction on page F2-4393](#).

F5.2 Encoding and use of banked register transfer instructions

Software executing at EL1 or higher can use the MRS (banked register) and MSR (banked register) instructions to transfer values between the general-purpose registers and Special-purpose registers. One particular use of these instructions is for a hypervisor to save or restore the register values of a Guest OS. The following sections give more information about these instructions:

- [Register arguments in the banked register transfer instructions](#) on page F5-5282.
- [Usage restrictions on the banked register transfer instructions](#) on page F5-5283.
- [Encoding the register argument in the banked register transfer instructions](#) on page F5-5284.
- [Pseudocode support for the banked register transfer instructions](#) on page F5-5285.

For descriptions of the instructions see [MRS \(Banked register\)](#) on page F5-4858 and [MSR \(Banked register\)](#) on page F5-4862.

F5.2.1 Register arguments in the banked register transfer instructions

Figure F5-1 on page F5-5282 shows the banked general-purpose registers and Special-purpose registers:

		Associated PE mode							
		User or System	Hyp	Supervisor	Abort	Undefined	Monitor	IRQ	FIQ
General-purpose registers	R8_usr								R8_fiq
	R9_usr								R9_fiq
	R10_usr								R10_fiq
	R11_usr								R11_fiq
	R12_usr								R12_fiq
	SP_usr	SP_hyp	SP_svc	SP_abt	SP_und	SP_mon	SP_irq	SP_fiq	
LR_usr		LR_svc	LR_abt	LR_und	LR_mon	LR_irq	LR_fiq		
Special-purpose registers	SPSR_hyp	SPSR_svc	SPSR_abt	SPSR_und	SPSR_mon	SPSR_irq	SPSR_fiq		
	ELR_hyp								

For the general-purpose registers, if no other register is shown, the *current mode register* is the `_usr` register. So, for example, the full set of current mode registers, including the registers that are not banked:

- For Hyp mode, is {R0_usr - R12_usr, SP_hyp, LR_usr, SPSR_hyp, ELR_hyp}.
- For Abort mode, is {R0_usr - R12_usr, SP_abt, LR_abt, SPSR_abt}.

Figure F5-1 Banking of general-purpose and Special-purpose registers

Figure F5-1 on page F5-5282 is based on Figure G1-2 on page G1-6029, that shows the complete set of general-purpose registers and Special-purpose registers accessible in each mode.

———— **Note** ————

- System mode uses the same set of registers as User mode. Neither of these modes can access an **SPSR**, except that System mode can use the MRS (banked register) and MSR (banked register) instructions to access some **SPSRs**, as described in [Usage restrictions on the banked register transfer instructions](#) on page F5-5283.
- General-purpose registers R0-R7, that are not banked, cannot be accessed using the MRS (banked register) and MSR (banked register) instructions.
- In addition to the registers shown in Figure F5-1 on page F5-5282, the **DLR** and **DSPSR** are AArch32 System registers that map onto the AArch64 Special-purpose registers **DLR_EL0** and **DSPSR_EL0**. However, **DLR** and **DSPSR** are not accessible using the MRS (banked register) and MSR (banked register) instructions.

Software using an MRS (banked register) or MSR (banked register) instruction specifies one of these registers using a name shown in Figure F5-1 on page F5-5282, or an alternative name for SP or LR. These registers can be grouped as follows:

R8-R12 Each of these registers has two banked copies, `_usr` and `_fiq`, for example R8_usr and R8_fiq.

SP	There is a banked copy of SP for every mode except System mode. For example, SP_svc is the SP for Supervisor mode.
LR	There is a banked copy of LR for every mode except System mode and Hyp mode. For example, LR_svc is the LR for Supervisor mode.
SPSR	There is a banked copy of SPSR for every mode except System mode and User mode.
ELR_hyp	Except for the operations provided by MRS (banked register) and MSR (banked register), ELR_hyp is accessible only from Hyp mode. It is not banked.

F5.2.2 Usage restrictions on the banked register transfer instructions

MRS (banked register) and MSR (banked register) instructions are CONSTRAINED UNPREDICTABLE if any of the following applies:

- The instruction is executed in User mode.
- The instruction accesses a banked register that is not implemented, or that either:
 - Is not accessible from the current Privilege level and Security state.
 - Can be accessed from the current mode by using a different instruction.

[MSR \(banked register\) and MRS \(banked register\) on page K1-8406](#) describes the permitted CONSTRAINED UNPREDICTABLE behavior.

An MRS (banked register) instruction or an MSR (banked register) instruction executed:

- At Non-secure EL1 cannot access any Hyp mode banked registers.
- At Non-secure EL1 or EL2 cannot access any Monitor mode banked registers.
- In a Secure mode other than Monitor mode cannot access any Hyp banked registers.

This means that the banked registers that MRS (banked register) and MSR (banked register) instructions cannot access are:

From Monitor mode

- The current mode registers R8_usr-R12_usr, SP_mon, LR_mon, and SPSR_mon.

From Hyp mode

- The Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The current mode registers R8_usr-R12_usr, SP_hyp, LR_usr, and SPSR_hyp.

———— Note —————

MRS (banked register) and MSR (banked register) instructions can access the current mode register [ELR_hyp](#).

From FIQ mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and [ELR_hyp](#).
- The current mode registers R8_fiq-R12_fiq, SP_fiq, LR_fiq, and SPSR_fiq.

From System mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and [ELR_hyp](#).
- The current mode registers R8_usr-R12_usr, SP_usr, and LR_usr.

From Supervisor mode, Abort mode, Undefined mode, and IRQ mode

- From Non-secure EL1, the Monitor mode registers SP_mon, LR_mon, and SPSR_mon.
- The Hyp mode registers SP_hyp, SPSR_hyp, and [ELR_hyp](#).
- The current mode registers R8_usr-R12_usr, SP_<current_mode>, LR_<current_mode>, and SPSR_<current_mode>.

If EL3 is using AArch64, all MRS (banked register) and MSR (banked register) accesses to the Monitor mode registers from Secure EL1 modes are trapped to EL3. See [Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32](#) on page D1-2530.

For more information, see:

- [Encoding the register argument in the banked register transfer instructions](#) on page F5-5284.
- [Pseudocode support for the banked register transfer instructions](#) on page F5-5285.
- [MRS \(Banked register\)](#) on page F5-4858.
- [MSR \(Banked register\)](#) on page F5-4862.

———— **Note** —————

CONSTRAINED UNPREDICTABLE behavior must not give access to registers that are not accessible from the current Privilege level and Security state.

F5.2.3 Encoding the register argument in the banked register transfer instructions

The MRS (banked register) and MSR (banked register) instructions include a 5-bit field, SYSm, and an R bit, that together encode the register argument for the instruction.

When the R bit is set to 0, the argument is a register other than a banked copy of the SPSR, and [Table F5-1](#) on page F5-5284 shows how the SYSm field defines the required register argument. In this table, CONST. UNPREDICTABLE indicates that behavior is CONSTRAINED UNPREDICTABLE.

Table F5-1 Banked register encodings when R==0

SYSm<2:0>	SYSm<4:3>			
	0b00	0b01	0b10	0b11
0b000	R8_usr	R8_fiq	LR_irq	CONST. UNPREDICTABLE
0b001	R9_usr	R9_fiq	SP_irq	CONST. UNPREDICTABLE
0b010	R10_usr	R10_fiq	LR_svc	CONST. UNPREDICTABLE
0b011	R11_usr	R11_fiq	SP_svc	CONST. UNPREDICTABLE
0b100	R12_usr	R12_fiq	LR_abt	LR_mon
0b101	SP_usr	SP_fiq	SP_abt	SP_mon
0b110	LR_usr	LR_fiq	LR_und	ELR_hyp
0b111	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	SP_und	SP_hyp

When the R bit is set to 1, the argument is a banked copy of the SPSR, and [Table F5-2](#) on page F5-5284 shows how the SYSm field defines the required register argument. In this table, CONST. UNPREDICTABLE indicates that behavior is CONSTRAINED UNPREDICTABLE.

Table F5-2 Banked register encodings when R==1

SYSm<2:0>	SYSm<4:3>			
	0b00	0b01	0b10	0b11
0b000	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	SPSR_irq	CONST. UNPREDICTABLE
0b001	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE
0b010	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	SPSR_svc	CONST. UNPREDICTABLE

Table F5-2 Banked register encodings when R=1 (continued)

SYSm<2:0>	SYSm<4:3>			
	0b00	0b01	0b10	0b11
0b011	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE
0b100	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	SPSR_abt	SPSR_mon
0b101	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE
0b110	CONST. UNPREDICTABLE	SPSR_fiq	SPSR_und	SPSR_hyp
0b111	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE	CONST. UNPREDICTABLE

F5.2.4 Pseudocode support for the banked register transfer instructions

The pseudocode functions `BankedRegisterAccessValid()` and `SPSRAccessValid()` check the validity of MRS (banked register) and MSR (banked register) accesses. That is, they filter the accesses that are CONSTRAINED UNPREDICTABLE either because:

- They attempt to access a register that *Usage restrictions on the banked register transfer instructions on page F5-5283* shows is not accessible.
- They use an SYSm<4:0> encoding that *Encoding the register argument in the banked register transfer instructions on page F5-5284* shows as CONSTRAINED UNPREDICTABLE.

`BankedRegisterAccessValid()` applies to accesses to the banked general-purpose registers, or to `ELR_hyp`, and `SPSRAccessValid()` applies to accesses to the `SPSRs`.

Chapter F6

T32 and A32 Advanced SIMD and Floating-point Instruction Descriptions

This chapter describes each instruction. It contains the following sections:

- [Alphabetical list of Advanced SIMD and floating-point instructions on page F6-5288.](#)

———— **Note** —————

Some headings in this chapter use the term *floating-point register*. This is an abbreviated description, and means a register in the Advanced SIMD and floating-point register file.

F6.1 Alphabetical list of Advanced SIMD and floating-point instructions

This section lists every Advanced SIMD and floating-point instruction in the T32 and A32 instruction sets. For details of the format used see [Format of instruction descriptions on page F1-4344](#).

This section is formatted so that each instruction description starts on a new page.

F6.1.1 AESD

AES single round decryption.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	0	1	M	0	Vm			

A1 variant

AESD.<dt> <Qd>, <Qm>

Decode for this encoding

```
if !HaveAESEExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	1	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	0	1	M	0	Vm			

T1 variant

AESD.<dt> <Qd>, <Qm>

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveAESEExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when size = 00

The following encodings are reserved:

- size = 01.
- size = 1x.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    op1 = Q[d>>1]; op2 = Q[m>>1];
    Q[d>>1] = AESInvSubBytes(AESInvShiftRows(op1 EOR op2));
```

Operational information

If CPSR.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.2 AESE

AES single round encryption.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	0	0	M	0	0	Vm		

A1 variant

AESE.<dt> <Qd>, <Qm>

Decode for this encoding

```
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	1	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	0	0	M	0	0	Vm		

T1 variant

AESE.<dt> <Qd>, <Qm>

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveAESExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when size = 00

The following encodings are reserved:

- size = 01.
- size = 1x.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    op1 = Q[d>>1]; op2 = Q[m>>1];
    Q[d>>1] = AESSubBytes(AESShiftRows(op1 EOR op2));
```

Operational information

If CPSR.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.3 AESIMC

AES inverse mix columns.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	1	1	M	0	Vm			

A1 variant

AESIMC.<dt> <Qd>, <Qm>

Decode for this encoding

```
if !HaveAEEExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	1	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	1	1	M	0	Vm			

T1 variant

AESIMC.<dt> <Qd>, <Qm>

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveAEEExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when size = 00

The following encodings are reserved:

- size = 01.
- size = 1x.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    Q[d>>1] = AESInvMixColumns(Q[m>>1]);
```

Operational information

If CPSR.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.4 AESMC

AES mix columns.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	1	0	M	0	0	Vm		

A1 variant

AESMC.<dt> <Qd>, <Qm>

Decode for this encoding

```
if !HaveAEEExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	1	1	1	1	D	1	1	size	0	0	Vd	0	0	1	1	1	0	M	0	0	Vm		

T1 variant

AESMC.<dt> <Qd>, <Qm>

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveAEEExt() then UNDEFINED;
if size != '00' then UNDEFINED;
if Vd<0> == '1' || Vm<0> == '1' then UNDEFINED;
d = UInt(D:Vd); m = UInt(M:Vm);
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<dt> Is the data type, encoded in the "size" field. It can have the following values:

8 when size = 00

The following encodings are reserved:

- size = 01.
- size = 1x.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckCryptoEnabled32();
    Q[d>>1] = AESMixColumns(Q[m>>1]);
```

Operational information

If CPSR.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.5 FLDM*X (FLDMDBX, FLDMIAX)

FLDMDBX is the Decrement Before variant of this instruction, and FLDMIAX is the Increment After variant. FLDM*X loads multiple SIMD&FP registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register.

Arm deprecates use of FLDMDBX and FLDMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

FLDMDBX{<c>}{<q>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VLDR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FLDM*X".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If regs > 16 || (d+regs) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

T1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

FLDMDDBX{<c>}{<q>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

FLDMIAX{<c>}{<q>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VLDR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FLDM*X".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;

```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If regs > 16 || (d+regs) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related encodings: See [Advanced SIMD and floating-point 64-bit move on page F3-4444](#) for the T32 instruction set, or [Advanced SIMD and floating-point 64-bit move on page F4-4531](#) for the A32 instruction set.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).

- <Rn> Is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.
- ! Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
- <dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            S[d+r] = MemA[address,4]; address = address+4;
        else
            word1 = MemA[address,4]; word2 = MemA[address+4,4]; address = address+8;
            // Combine the word-aligned words in the correct order for current endianness.
            D[d+r] = if BigEndian(AccType_ATOMIC) then word1:word2 else word2:word1;
    if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

F6.1.6 FSTMDBX, FSTMIAX

FSTMX stores multiple SIMD&FP registers from the Advanced SIMD and floating-point register file to consecutive locations in using an address from a general-purpose register.

Arm deprecates use of FSTMDBX and FSTMIAX, except for disassembly purposes, and reassembly of disassembled code.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

FSTMDBX{<c>}{<q>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

FSTMIAX{<c>}{<q>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VSTR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FSTDBMX, FSTMIAX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VSTM with the same addressing mode but stores no registers.

If regs > 16 || (d+regs) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

FSTMDBX{<c>}{<q>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

FSTMIAX{<c>}{<q>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VSTR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FSTDBMX, FSTMIAX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;

```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VSTM with the same addressing mode but stores no registers.

If regs > 16 || (d+regs) > 16, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Related encodings: See [Advanced SIMD and floating-point 64-bit move on page F3-4444](#) for the T32 instruction set, or [Advanced SIMD and floating-point 64-bit move on page F4-4531](#) for the A32 instruction set.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used. However, Arm deprecates use of the PC.
- ! Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
- <dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list plus one. The list must contain at least one register, all registers must be in the range D0-D15, and must not contain more than 16 registers.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            MemA[address,4] = S[d+r]; address = address+4;
        else
            // Store as two word-aligned words in the correct order for current endianness.
            MemA[address,4] = if BigEndian(AccType_ATOMIC) then D[d+r]<63:32> else D[d+r]<31:0>;
            MemA[address+4,4] = if BigEndian(AccType_ATOMIC) then D[d+r]<31:0> else D[d+r]<63:32>;
            address = address+8;
    if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

| U16 | when U = 1, size = 01 |
| U32 | when U = 1, size = 10 |
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Elem[Din[n+r],e,esize];
      op2 = Elem[Din[m+r],e,esize];
      absdiff = Abs(Int(op1,unsigned) - Int(op2,unsigned));
      if long_destination then
        Elem[Q[d>1],e,2*esize] = absdiff<2*esize-1:0>;
      else
        Elem[D[d+r],e,esize] = absdiff<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.

— The values of the NZCV flags.

F6.1.21 VABDL (integer)

Vector Absolute Difference Long (integer) subtracts the elements of one vector from the corresponding elements of another vector, and places the absolute values of the results in the elements of the destination vector.

Operand elements are all integers of the same length, and the result elements are double the length of the operands.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

A1 variant

VABDL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>

```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check and is operating only on integer vector elements, then the following apply:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.23 VACGE

Vector Absolute Compare Greater Than or Equal takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is greater than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operands and result can be quadword or doubleword vectors. They must all be the same size.

The operand vector elements are floating-point numbers. The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

This instruction is used by the pseudo-instruction VACLE. The pseudo-instruction is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VACGT{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
or_equal = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VACGT{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VACGT{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
or_equal = (op == '0');
case sz of
  when '0' esize = 32; elements = 2;
  when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
  
```

CONSTRAINED UNPREDICTABLE behavior

If sz == '1' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values: F32 when sz = 0 F16 when sz = 1
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = FPAbs(Elem[D[n+r],e,esize]); op2 = FPAbs(Elem[D[m+r],e,esize]);
      if or_equal then
        test_passed = FPCompareGE(op1, op2, StandardFPSCRValue());
      else
        test_passed = FPCompareGT(op1, op2, StandardFPSCRValue());
      Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
  
```

F6.1.26 VACLT

Vector Absolute Compare Less Than takes the absolute value of each element in a vector, and compares it with the absolute value of the corresponding element of a second vector. If the first is less than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

This instruction is a pseudo-instruction of the [VACGT](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VACGT](#).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of [VACGT](#) gives the operational pseudocode for this instruction.

VACLT{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

is equivalent to

VACGT{<c>}{<q>}.<dt> <Qd>, <Qm>, <Qn>

and is never the preferred disassembly.

Assembler symbols

<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values: F32 when sz = 0 F16 when sz = 1
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

Operation for all encodings

The description of [VACGT](#) gives the operational pseudocode for this instruction.

Operational information

The description of [VACGT](#) gives the operational pseudocode for this instruction.

F6.1.27 VADD (floating-point)

Vector Add (floating-point) adds corresponding elements in two vectors, and places the results in the destination vector.

Depending on settings in the CPACR, NSACR, HCPTR, and FPFXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-6112.

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	0	1	0	0	D	0	sz	Vn	Vd	1	1	0	1	N	Q	M	0	Vm		

64-bit SIMD vector variant

Applies when Q == 0.

VADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
advsimd = TRUE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

A2

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0
!	=1111	1	1	1	0	0	D	1	1	Vn	Vd	1	0	size	N	0	M	0	Vm				

cond

Half-precision scalar variant

Applies when size == 01.

VADD{<c>}{<q>}.F16 {<Sd>, } <Sn>, <Sm>

Single-precision scalar variant

Applies when size == 10.

VADD{<c>}{<q>}.F32 {<Sd>, } <Sn>, <Sm>

Double-precision scalar variant

Applies when size == 11.

VADD{<c>}{<q>}.F64 {<Dd>, } <Dn>, <Dm>

Decode for all variants of this encoding

```

if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;

<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = Elem[D[n+r],e,esize] + Elem[D[m+r],e,esize];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.29 VADDHN

Vector Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are truncated. For rounded results, see [VRADDHN](#).

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

A1 variant

VADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

T1

T1 variant

VADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-4434](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-4543](#) for the A32 instruction set.

Assembler symbols

<c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).

- <q> See *Standard assembler syntax fields* on page F1-4348.
- <dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
- I16 when size = 00
 - I32 when size = 01
 - I64 when size = 10
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        result = Elem[Qin[n>>1],e,2*esize] + Elem[Qin[m>>1],e,2*esize];
        Elem[D[d],e,esize] = result<2*esize-1:esize>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.30 VADDL

Vector Add Long adds corresponding elements in two doubleword vectors, and places the results in a quadword vector. Before adding, it sign-extends or zero-extends the elements of both operands.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-4434](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-4543](#) for the A32 instruction set.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).

<dt>	Is the data type for the elements of the second operand vector, encoded in the "U:size" field. It can have the following values: S8 when U = 0, size = 00 S16 when U = 0, size = 01 S32 when U = 0, size = 10 U8 when U = 1, size = 00 U16 when U = 1, size = 01 U32 when U = 1, size = 10
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        if is_vaddw then
            op1 = Int(Elem[Qin[n>>1],e,2*esize], unsigned);
        else
            op1 = Int(Elem[Din[n],e,esize], unsigned);
        result = op1 + Int(Elem[Din[m],e,esize], unsigned);
        Elem[Q[d>>1],e,2*esize] = result<2*esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.31 VADDW

Vector Add Wide adds corresponding elements in one quadword and one doubleword vector, and places the results in a quadword vector. Before adding, it sign-extends or zero-extends the elements of the doubleword operand.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

A1 variant

VADDW{<c>}{<q>}.<dt> {<Qd>}, <Qn>, <Dm>

Decode for this encoding

```

if size == '11' then SEE "Related encodings";
if Vd<0> == '1' || (op == '1' && Vn<0> == '1') then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size); elements = 64 DIV esize; is_vaddw = (op == '1');
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
  
```

T1

T1 variant

VADDW{<c>}{<q>}.<dt> {<Qd>}, <Qn>, <Dm>

Decode for this encoding

```

if size == '11' then SEE "Related encodings";
if Vd<0> == '1' || (op == '1' && Vn<0> == '1') then UNDEFINED;
unsigned = (U == '1');
esize = 8 << UInt(size); elements = 64 DIV esize; is_vaddw = (op == '1');
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
  
```

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-4434](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-4543](#) for the A32 instruction set.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).

<dt>	Is the data type for the elements of the second operand vector, encoded in the "U:size" field. It can have the following values: S8 when U = 0, size = 00 S16 when U = 0, size = 01 S32 when U = 0, size = 10 U8 when U = 1, size = 00 U16 when U = 1, size = 01 U32 when U = 1, size = 10
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        if is_vaddw then
            op1 = Int(Elem[Qin[n>>1],e,2*esize], unsigned);
        else
            op1 = Int(Elem[Din[n],e,esize], unsigned);
        result = op1 + Int(Elem[Din[m],e,esize], unsigned);
        Elem[Q[d>>1],e,2*esize] = result<2*esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.32 VAND (immediate)

Vector Bitwise AND (immediate) performs a bitwise AND between a register value and an immediate value, and returns the result into the destination vector

This instruction is a pseudo-instruction of the **VBIC (immediate)** instruction. This means that:

- The encodings in this description are named to match the encodings of **VBIC (immediate)**.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of **VBIC (immediate)** gives the operational pseudocode for this instruction.

A1

Applies when Q == 1.

VAND{<c>}{<q>}.I16 {<Qd>}, <Qd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.I16 <Qd>, #~<imm>

and is never the preferred disassembly.

T2

64-bit SIMD vector variant

Applies when Q == 0.

VAND{<c>}{<q>}.I32 {<Dd>}, <Dd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.I32 <Dd>, #~<imm>

and is never the preferred disassembly.

128-bit SIMD vector variant

Applies when Q == 1.

VAND{<c>}{<q>}.I32 {<Qd>}, <Qd>, #<imm>

is equivalent to

VBIC{<c>}{<q>}.I32 <Qd>, #~<imm>

and is never the preferred disassembly.

Assembler symbols

- <c> For encoding A1 and A2: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
For encoding T1 and T2: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <imm> Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see [Modified immediate constants in T32 and A32 Advanced SIMD instructions on page F1-4365](#).

Operation for all encodings

The description of [VBIC \(immediate\)](#) gives the operational pseudocode for this instruction.

F6.1.33 VAND (register)

Vector Bitwise AND (register) performs a bitwise AND operation between two registers, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VAND{<c>}{<q>}{.<dt>} {<Dd>}, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VAND{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
 d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

T1

64-bit SIMD vector variant

Applies when Q == 0.

VAND{<c>}{<q>}{.<dt>} {<Dd>}, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VAND{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
 d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

Assembler symbols

<c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.

For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).

<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] AND D[m+r];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.34 VBIC (immediate)

Vector Bitwise Bit Clear (immediate) performs a bitwise AND between a register value and the complement of an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

This instruction is used by the pseudo-instruction VAND (immediate). The pseudo-instruction is never the preferred disassembly.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VBIC{<c>}{<q>}.I32 {<Dd>}, <Dd>, #<imm>

128-bit SIMD vector variant

Applies when Q == 1.

VBIC{<c>}{<q>}.I32 {<Qd>}, <Qd>, #<imm>

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;

cmode

64-bit SIMD vector variant

Applies when Q == 0.

VBIC{<c>}{<q>}.I16 {<Dd>}, <Dd>, #<imm>

128-bit SIMD vector variant

Applies when Q == 1.

VBIC{<c>}{<q>}.I16 {<Qd>}, <Qd>, #<imm>

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
d = UInt(D:Vd); regs = if Q == '0' then 1 else 2;
```

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-4442 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-4551 for the A32 instruction set.

Assembler symbols

- <c> For encoding A1 and A2: see *Standard assembler syntax fields* on page F1-4348. This encoding must be unconditional.
For encoding T1 and T2: see *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <imm> Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F1-4365.

The I8, I64, and F32 data types are permitted as pseudo-instructions, if the immediate can be represented by this instruction, and are encoded using a permitted encoding of the I16 or I32 data type.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[d+r] AND NOT(imm64);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.35 VBIC (register)

Vector Bitwise Bit Clear (register) performs a bitwise AND between a register value and the complement of a register value, and places the result in the destination register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

Assembler symbols

<c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.

For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).

<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] AND NOT(D[m+r]);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.36 VBIF

Vector Bitwise Insert if False inserts each bit from the first source register into the destination register if the corresponding bit of the second source register is 0, otherwise leaves the bit in the destination register unchanged.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VBIF{<c>}{<q>}{.<dt>} {<Dd>}, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VBIF{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

```
enumeration VBitOps {VBitOps_VBIF, VBitOps_VBIT, VBitOps_VBSL};
```

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if op == '00' then SEE "VEOR";
if op == '01' then operation = VBitOps_VBSL;
if op == '10' then operation = VBitOps_VBIT;

```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VBIF{<c>}{<q>}{.<dt>} {<Dd>}, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VBIF{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

```
enumeration VBitOps {VBitOps_VBIF, VBitOps_VBIT, VBitOps_VBSL};
```

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
```

```

if op == '00' then SEE "VEOR";
if op == '01' then operation = VBitOps_VBSL;
if op == '10' then operation = VBitOps_VBIT;
if op == '11' then operation = VBitOps_VBIF;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
  
```

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        case operation of
            when VBitOps_VBIF D[d+r] = (D[d+r] AND D[m+r]) OR (D[n+r] AND NOT(D[m+r]));
            when VBitOps_VBIT D[d+r] = (D[n+r] AND D[m+r]) OR (D[d+r] AND NOT(D[m+r]));
            when VBitOps_VBSL D[d+r] = (D[n+r] AND D[d+r]) OR (D[m+r] AND NOT(D[d+r]));
  
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.37 VBIT

Vector Bitwise Insert if True inserts each bit from the first source register into the destination register if the corresponding bit of the second source register is 1, otherwise leaves the bit in the destination register unchanged.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.39 VCADD

Vector Complex Add.

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following computation on the corresponding complex number element pairs from the two source registers:

- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 90 or 270 degrees.
- The rotated complex number is added to the complex number from the first source register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

  result2 = FPAAdd(Elem[operand1,e*2+1,esize],element3,StandardFPSCRValue());
  
```

```
Elem[D[d+r],e*2,esize] = result1;  
Elem[D[d+r],e*2+1,esize] = result2;
```

F6.1.40 VCEQ (immediate #0)

Vector Compare Equal to Zero takes each element in a vector, and compares it with zero. If it is equal to zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements are the same type, and are integers or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
  
```

CONSTRAINED UNPREDICTABLE behavior

If F == '1' && size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

- <C> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt> Is the data type for the elements of the operands, encoded in the "F:size" field. It can have the following values:
- | | |
|-----|-----------------------|
| I8 | when F = 0, size = 00 |
| I16 | when F = 0, size = 01 |
| I32 | when F = 0, size = 10 |
| F16 | when F = 1, size = 01 |
| F32 | when F = 1, size = 10 |
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      if floating_point then
        bits(esize) zero = FPZero('0');
        test_passed = FCompareEQ(Elem[D[m+r],e,esize], zero, StandardFPSCRValue());
      else
        test_passed = (Elem[D[m+r],e,esize] == Zeros(esize));
      Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
  
```

F6.1.41 VCEQ (register)

Vector Compare Equal takes each element in a vector, and compares it with the corresponding element of a second vector. If they are equal, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements are the same type, and are integers or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

 For encoding T1 and T2: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt> For encoding A1 and T1: is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:
- | | |
|-----|-----------------------|
| S8 | when U = 0, size = 00 |
| S16 | when U = 0, size = 01 |
| S32 | when U = 0, size = 10 |
| U8 | when U = 1, size = 00 |
| U16 | when U = 1, size = 01 |
| U32 | when U = 1, size = 10 |
- For encoding A2 and T2: is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:
- | | |
|-----|-------------|
| F32 | when sz = 0 |
| F16 | when sz = 1 |
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

enumeration VCGTtype {VCGTtype_signed, VCGTtype_unsigned, VCGTtype_fp};

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Elem[D[n+r],e,esize]; op2 = Elem[D[m+r],e,esize];
      case vtype of
  
```

```
when VCGTtype_signed    test_passed = (SInt(op1) > SInt(op2));  
when VCGTtype_unsigned test_passed = (UInt(op1) > UInt(op2));  
when VCGTtype_fp        test_passed = FPCompareGT(op1, op2, StandardFPSCRValue());  
Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check and is operating only on integer vector elements, then the following apply:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.46 VCLE (immediate #0)

Vector Compare Less Than or Equal to Zero takes each element in a vector, and compares it with zero. If it is less than or equal to zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements are the same type, and are signed integers or floating-point numbers. The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

 - The values of the NZCV flags.

F6.1.47 VCLE (register)

Vector Compare Less Than or Equal takes each element in a vector, and compares it with the corresponding element of a second vector. If the first is less than or equal to the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

This instruction is a pseudo-instruction of the [VCGE \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VCGE \(register\)](#).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of [VCGE \(register\)](#) gives the operational pseudocode for this instruction.

Operation for all encodings

The description of [VCGE \(register\)](#) gives the operational pseudocode for this instruction.

Operational information

The description of [VCGE \(register\)](#) gives the operational pseudocode for this instruction.

F6.1.48 VCLS

Vector Count Leading Sign Bits counts the number of consecutive bits following the topmost bit, that are the same as the topmost bit, in each element in a vector, and places the results in a second vector. The count does not include the topmost bit itself.

The operand vector elements can be any one of 8-bit, 16-bit, or 32-bit signed integers.

The result vector elements are the same data type as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      if floating_point then
        bits(esize) zero = FPZero('0');
        test_passed = FCompareGT(zero, Elem[D[m+r],e,esize], StandardFPSCRValue());
      else
        test_passed = (SInt(Elem[D[m+r],e,esize]) < 0);
        Elem[D[d+r],e,esize] = if test_passed then Ones(esize) else Zeros(esize);
  
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check and is operating only on integer vector elements, then the following apply:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.50 VCLT (register)

Vector Compare Less Than takes each element in a vector, and compares it with the corresponding element of a second vector. If the first is less than the second, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

This instruction is a pseudo-instruction of the [VCGT \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VCGT \(register\)](#).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of [VCGT \(register\)](#) gives the operational pseudocode for this instruction.

Operational information

The description of [VCGT \(register\)](#) gives the operational pseudocode for this instruction.

F6.1.51 VCLZ

Vector Count Leading Zeros counts the number of consecutive zeros, starting from the most significant bit, in each element in a vector, and places the results in a second vector.

The operand vector elements can be any one of 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.

The result vector elements are the same data type as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.52 VCMLA

Vector Complex Multiply Accumulate.

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following computation on the corresponding complex number element pairs from the two source registers and the destination register:

- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 0, 90, 180, or 270 degrees.
- The two elements of the transformed complex number are multiplied by:
 - The real element of the complex number from the first source register, if the transformation was a rotation by 0 or 180 degrees.
 - The imaginary element of the complex number from the first source register, if the transformation was a rotation by 90 or 270 degrees.
- The complex number resulting from that multiplication is added to the complex number from the destination register.

The multiplication and addition operations are performed as a fused multiply-add, without any intermediate rounding.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

        element2 = Elem[operand1,e*2+1,esize];
        element3 = FPNeg(Elem[operand2,index*2,esize]);
        element4 = Elem[operand1,e*2+1,esize];
    result1 = FPMulAdd(Elem[operand3,e*2,esize],element2,element1,StandardFPSCRValue());
    result2 = FPMulAdd(Elem[operand3,e*2+1,esize],element4,element3,StandardFPSCRValue());
    Elem[D[d+r],e*2,esize] = result1;
    Elem[D[d+r],e*2+1,esize] = result2;
  
```

F6.1.54 VCOMP

Vector Compare compares two floating-point registers, or one floating-point register and zero. It writes the result to the FPSCR flags. These are normally transferred to the PSTATE.{N, Z, C, V} Condition flags by a subsequent VMRS instruction.

This instruction raises an Invalid Operation floating-point exception if either or both of the operands is a signaling NaN.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

Half-precision scalar variant

Applies when size == 01.

VCOMP{<c>}{<q>}.F16 <Sd>, <Sm>

Single-precision scalar variant

Applies when size == 10.

VCOMP{<c>}{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when size == 11.

VCOMP{<c>}{<q>}.F64 <Dd>, <Dm>

Decode for all variants of this encoding

```

if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;

```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    bits(4) nzcvc;
    case esize of
        when 16
            bits(16) op16 = if with_zero then FPZero('0') else S[m]<15:0>;
            nzcvc = FPCompare(S[d]<15:0>, op16, quiet_nan_exc, FPSCR[]);
        when 32
            bits(32) op32 = if with_zero then FPZero('0') else S[m];
            nzcvc = FPCompare(S[d], op32, quiet_nan_exc, FPSCR[]);
        when 64
            bits(64) op64 = if with_zero then FPZero('0') else D[m];
            nzcvc = FPCompare(D[d], op64, quiet_nan_exc, FPSCR[]);

    FPSCR<31:28> = nzcvc; // FPSCR.<N,Z,C,V> set to nzcvc
```

Operational information

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands is a NaN, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. An unordered comparison sets the FPSCR condition flags to N=0, Z=0, C=1, and V=1.

F6.1.55 VCMPE

Vector Compare, raising Invalid Operation on NaN compares two floating-point registers, or one floating-point register and zero. It writes the result to the FPSCR flags. These are normally transferred to the PSTATE.{N, Z, C, V} Condition flags by a subsequent VMRS instruction.

This instruction raises an Invalid Operation floating-point exception if either or both of the operands is any type of NaN.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    bits(4) nzcvc;
    case esize of
        when 16
            bits(16) op16 = if with_zero then FPZero('0') else S[m]<15:0>;
            nzcvc = FPCompare(S[d]<15:0>, op16, quiet_nan_exc, FPSCR[]);
        when 32
            bits(32) op32 = if with_zero then FPZero('0') else S[m];
            nzcvc = FPCompare(S[d], op32, quiet_nan_exc, FPSCR[]);
        when 64
            bits(64) op64 = if with_zero then FPZero('0') else D[m];
            nzcvc = FPCompare(D[d], op64, quiet_nan_exc, FPSCR[]);

    FPSCR<31:28> = nzcvc; // FPSCR.<N,Z,C,V> set to nzcvc
```

Operational information

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands is a NaN, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. An unordered comparison sets the FPSCR condition flags to N=0, Z=0, C=1, and V=1.

F6.1.56 VCNT

Vector Count Set Bits counts the number of bits that are one in each element in a vector, and places the results in a second vector.

The operand vector elements must be 8-bit fields.

The result vector elements are 8-bit integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

```
if ConditionPassed() then  
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();  
  for r = 0 to regs-1  
    for e = 0 to elements-1  
      Elem[D[d+r],e,esize] = BitCount(Elem[D[m+r],e,esize])<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.57 VCVT (from single-precision to BFloat16, Advanced SIMD)

Vector Convert from single-precision to BFloat16 converts each 32-bit element in a vector from single-precision floating-point to BFloat16 format, and writes the result into a second vector. The result vector elements are half the width of the source vector elements.

Unlike the BFloat16 multiplication instructions, this instruction uses the Round to Nearest rounding mode, and can generate a floating-point exception that causes cumulative exception bits in the [FPSCR](#) to be set.

A1

(FEAT_AA32BF16)

A1 variant

VCVT{<c>}{<q>}.BF16.F32 <Dd>, <Qm>

Decode for this encoding

```
if !HaveAArch32BF16Ext() then UNDEFINED;
if Vm<0> == '1' then UNDEFINED;

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();  
    for e = 0 to elements-1  
        if half_to_single then  
            Elem[Q[d>>1],e,32] = FPConvert(Elem[Din[m],e,16], StandardFPSCRValue());  
        else  
            Elem[D[d],e,16] = FPConvert(Elem[Qin[m>>1],e,32], StandardFPSCRValue());
```

F6.1.60 VCVT (between floating-point and integer, Advanced SIMD)

Vector Convert between floating-point and integer converts each element in a vector from floating-point to integer, or from integer to floating-point, and places the results in a second vector.

The vector elements are the same type, and are floating-point numbers or integers. Signed and unsigned integers are distinct.

The floating-point to integer operation uses the Round towards Zero rounding mode. The integer to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

64-bit SIMD vector variant

Applies when Q == 0.

VCVT{<c>}{<q>}.<dt1>.<dt2> <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VCVT{<c>}{<q>}.<dt1>.<dt2> <Qd>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
if size == '01' && InITBlock() then UNPREDICTABLE;
to_integer = (op<1> == '1'); unsigned = (op<0> == '1');
case size of
  when '01' esize = 16; elements = 4;
  when '10' esize = 32; elements = 2;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
  
```

CONSTRAINED UNPREDICTABLE behavior

If size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt1> Is the data type for the elements of the destination vector, encoded in the "size:op" field. It can have the following values:
 - F16 when size = 01, op = 0x
 - S16 when size = 01, op = 10
 - U16 when size = 01, op = 11
 - F32 when size = 10, op = 0x
 - S32 when size = 10, op = 10
 - U32 when size = 10, op = 11
- <dt2> Is the data type for the elements of the source vector, encoded in the "size:op" field. It can have the following values:
 - S16 when size = 01, op = 00
 - U16 when size = 01, op = 01
 - F16 when size = 01, op = 1x
 - S32 when size = 10, op = 00
 - U32 when size = 10, op = 01
 - F32 when size = 10, op = 1x
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(esize) result;
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[m+r],e,esize];
            if to_integer then
                result = FPToFixed(op1, 0, unsigned, StandardFPSCRValue(), FPRounding_ZERO);
            else
                result = FixedToFP(op1, 0, unsigned, StandardFPSCRValue(), FPRounding_TIEEVEN);
            Elem[D[d+r],e,esize] = result;
```

F6.1.61 VCVT (floating-point to integer, floating-point)

Convert floating-point to integer with Round towards Zero converts a value in a register from floating-point to a 32-bit integer, using the Round towards Zero rounding mode, and places the result in a second register.

[VCVT \(between floating-point and fixed-point, floating-point\)](#) describes conversions between floating-point and 16-bit integers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-4442](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-4551](#) for the A32 instruction set.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt1> Is the data type for the elements of the destination vector, encoded in the "op:U" field. It can have the following values:
 - F16 when op = 00, U = x
 - S16 when op = 01, U = 0
 - U16 when op = 01, U = 1
 - F32 when op = 10, U = x
 - S32 when op = 11, U = 0
 - U32 when op = 11, U = 1
- <dt2> Is the data type for the elements of the source vector, encoded in the "op:U" field. It can have the following values:
 - S16 when op = 00, U = 0
 - U16 when op = 00, U = 1
 - F16 when op = 01, U = x
 - S32 when op = 10, U = 0
 - U32 when op = 10, U = 1
 - F32 when op = 11, U = x
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
- <fbits> The number of fraction bits in the fixed point number, in the range 1 to 32 for 32-bit elements, or in the range 1 to 16 for 16-bit elements:
- (64 - <fbits>) is encoded in imm6.
- An assembler can permit an <fbits> value of 0. This is encoded as floating-point to integer or integer to floating-point instruction, see [VCVT \(between floating-point and integer, Advanced SIMD\)](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(esize) result;
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[m+r],e,esize];
            if to_fixed then
                result = FPToFixed(op1, frac_bits, unsigned, StandardFPSCRValue(),
                                   FPRounding_ZERO);
            else
                result = FixedToFP(op1, frac_bits, unsigned, StandardFPSCRValue(),
                                   FPRounding_TIEEVEN);
            Elem[D[d+r],e,esize] = result;
```

F6.1.64 VCVT (between floating-point and fixed-point, floating-point)

Convert between floating-point and fixed-point converts a value in a register from floating-point to fixed-point, or from fixed-point to floating-point. Software can specify the fixed-point value as either signed or unsigned.

The fixed-point value can be 16-bit or 32-bit. Conversions from fixed-point values take their operand from the low-order bits of the source register and ignore any remaining bits. Signed conversions to fixed-point values sign-extend the result value to the destination register width. Unsigned conversions to fixed-point values zero-extend the result value to the destination register width.

The floating-point to fixed-point operation uses the Round towards Zero rounding mode. The fixed-point to floating-point operation uses the Round to Nearest rounding mode.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-6112.

A1

Half-precision scalar variant

Applies when op == 0 && sf == 01.

VCVT{<c>}{<q>}.F16.<dt> <Sdm>, <Sdm>, #<fbits>

Half-precision scalar variant

Applies when op == 1 && sf == 01.

VCVT{<c>}{<q>}.<dt>.F16 <Sdm>, <Sdm>, #<fbits>

Single-precision scalar variant

Applies when op == 0 && sf == 10.

VCVT{<c>}{<q>}.F32.<dt> <Sdm>, <Sdm>, #<fbits>

Single-precision scalar variant

Applies when op == 1 && sf == 10.

VCVT{<c>}{<q>}.<dt>.F32 <Sdm>, <Sdm>, #<fbits>

Double-precision scalar variant

Applies when op == 0 && sf == 11.

```

F6.1.65 VCVTA (Advanced SIMD)

Vector Convert floating-point to integer with Round to Nearest with Ties to Away converts each element in a vector from floating-point to integer using the Round to Nearest with Ties to Away rounding mode, and places the results in a second vector.

The operand vector elements are floating-point numbers.

The result vector elements are integers, and the same size as the operand vector elements. Signed and unsigned integers are distinct.

Depending on settings in the CPACR, NSACR, HCPTR, and FPExc registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

- <Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    bits(16) hp;
    if convert_from_half then
        hp = S[m]<lowbit+15:lowbit>;
```

```
    if uses_double then
        D[d] = FPConvert(hp, FPSCR[]);
    else
        S[d] = FPConvert(hp, FPSCR[]);
else
    if uses_double then
        hp = FPConvert(D[m], FPSCR[]);
    else
        hp = FPConvert(S[m], FPSCR[]);
    S[d]<lowbit+15:lowbit> = hp;
```

F6.1.68 VCVTB (BFloat16)

Converts the single-precision value in a single-precision register to BFloat16 format and writes the result into the bottom half of a single precision register, preserving the top 16 bits of the destination register.

Unlike the BFloat16 multiplication instructions, this instruction honors all the control bits in the **FPSCR** that apply to single-precision arithmetic, including the rounding mode. This instruction can generate a floating-point exception which causes a cumulative exception bit in the **FPSCR** to be set, or a synchronous exception to be taken, depending on the enable bits in the **FPSCR**.

F6.1.69 VCVTM (Advanced SIMD)

Vector Convert floating-point to integer with Round towards -Infinity converts each element in a vector from floating-point to integer using the Round towards -Infinity rounding mode, and places the results in a second vector.

The operand vector elements are floating-point numbers.

The result vector elements are integers, and the same size as the operand vector elements. Signed and unsigned integers are distinct.

Depending on settings in the CPACR, NSACR, HCPTR, and FPFXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

```

F6.1.74 VCVTP (floating-point)

Convert floating-point to integer with Round towards +Infinity converts a value in a register from floating-point to a 32-bit integer using the Round towards +Infinity rounding mode, and places the result in a second register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

Half-precision scalar variant

Applies when size == 01.

VCVTP{<q>}.<dt>.F16 <Sd>, <Sm>

Single-precision scalar variant

Applies when size == 10.

VCVTP{<q>}.<dt>.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when size == 11.

VCVTP{<q>}.<dt>.F64 <Sd>, <Dm>

Decode for all variants of this encoding

```

if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM); unsigned = (op == '0');
d = UInt(Vd:D);
case size of
    when '01' esize = 16; m = UInt(Vm:M);
    when '10' esize = 32; m = UInt(Vm:M);
    when '11' esize = 64; m = UInt(M:Vm);
    
```

T1

Half-precision scalar variant

Applies when size == 01.

VCVTP{<q>}.<dt>.F16 <Sd>, <Sm>

Single-precision scalar variant

Applies when size == 10.

VCVTP{<q>}.<dt>.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when size == 11.

VCVTP{<q>}.<dt>.F64 <Sd>, <Dm>

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM); unsigned = (op == '0');
d = UInt(Vd:D);
case size of
  when '01' esize = 16; m = UInt(Vm:M);
  when '10' esize = 32; m = UInt(Vm:M);
  when '11' esize = 64; m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	Is the data type for the elements of the destination, encoded in the "op" field. It can have the following values: U32 when op = 0 S32 when op = 1
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
EncodingSpecificOperations(); CheckVFPEEnabled(TRUE);
case esize of
  when 16
    S[d] = FPToFixed(S[m]<15:0>, 0, unsigned, FPSCR[], rounding);
  when 32
    S[d] = FPToFixed(S[m], 0, unsigned, FPSCR[], rounding);
  when 64
    S[d] = FPToFixed(D[m], 0, unsigned, FPSCR[], rounding);
```

F6.1.75 VCVTR

Convert floating-point to integer converts a value in a register from floating-point to a 32-bit integer, using the rounding mode specified by the [FPSCR](#) and places the result in a second register.

[VCVT \(between floating-point and fixed-point, floating-point\)](#) describes conversions between floating-point and 16-bit integers.

Depending on settings in the [CPACR](#), [NSACR](#), [HCPTR](#), and [FPEXC](#) registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

    D[d] = FixedToFP(S[m], 0, unsigned, FPSCR[], rounding);
```

F6.1.76 VCVTT

Convert to or from a half-precision value in the top half of a single-precision register does one of the following:

- Converts the half-precision value in the top half of a single-precision register to single-precision and writes the result to a single-precision register.
- Converts the half-precision value in the top half of a single-precision register to double-precision and writes the result to a double-precision register.
- Converts the single-precision value in a single-precision register to half-precision and writes the result into the top half of a single-precision register, preserving the other half of the destination register.
- Converts the double-precision value in a double-precision register to half-precision and writes the result into the top half of a single-precision register, preserving the other half of the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

        hp = FPConvert(S[m], FPSCR[]);
    S[d]<lowbit+15:lowbit> = hp;
```

F6.1.77 VCVTT (BFloat16)

Converts the single-precision value in a single-precision register to BFloat16 format and writes the result in the top half of a single-precision register, preserving the bottom 16 bits of the register.

Unlike the BFloat16 multiplication instructions, this instruction honors all the control bits in the **FPSCR** that apply to single-precision arithmetic, including the rounding mode. This instruction can generate a floating-point exception which causes a cumulative exception bit in the **FPSCR** to be set, or a synchronous exception to be taken, depending on the enable bits in the **FPSCR**.

```

when 64
`D[d] = FPDiv(D[n], D[m], FPSCR[]);`

F6.1.79 VDOT (vector)

BF16 floating-point (BF16) dot product (vector). This instruction delimits the source vectors into pairs of 16-bit BF16 elements. Within each pair, the elements in the first source vector are multiplied by the corresponding elements in the second source vector. The resulting single-precision products are then summed and added destructively to the single-precision element in the destination vector which aligns with the pair of BF16 values in the first source vector. The instruction does not update the [FPSCR](#) exception status.

    bits(32) sum = BFAAdd(BFMu1(elt1_a, elt2_a), BFMu1(elt1_b, elt2_b));
    Elem[result, e, 32] = BFAAdd(Elem[result, e, 32], sum);
  D[d+r] = result;
  
```

F6.1.80 VDOT (by element)

BFloat16 floating-point indexed dot product (vector, by element). This instruction delimits the source vectors into pairs of 16-bit BFloat16 elements. Each pair of elements in the first source vector is multiplied by the indexed pair of elements in the second source vector. The resulting single-precision products are then summed and added destructively to the single-precision element in the destination vector which aligns with the pair of BFloat16 values in the first source vector. The instruction does not update the FPSCR exception status.

    Elem[result, e, 32] = BFAdd(Elem[result, e, 32], sum);  
  D[d+r] = result;
```

F6.1.81 VDUP (general-purpose register)

Duplicate general-purpose register to vector duplicates an element from a general-purpose register into every element of the destination vector.

The destination vector elements can be 8-bit, 16-bit, or 32-bit fields. The source element is the least significant 8, 16, or 32 bits of the general-purpose register. There is no distinction between data types.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 . Arm strongly recommends that any VDUP instruction is unconditional, see Conditional execution on page F1-4349 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<size>	The data size for the elements of the destination vector. It must be one of: 8 Encoded as [b, e] = 0b10. 16 Encoded as [b, e] = 0b01. 32 Encoded as [b, e] = 0b00.
<Qd>	The destination vector for a quadword operation.
<Dd>	The destination vector for a doubleword operation.
<Rt>	The Arm source register.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    scalar = R[t]<esize-1:0>;
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = scalar;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.82 VDUP (scalar)

Duplicate vector element to vector duplicates a single element of a vector into every element of the destination vector.

The scalar, and the destination vector elements, can be any one of 8-bit, 16-bit, or 32-bit fields. There is no distinction between data types.

For more information about scalars see [Advanced SIMD scalars on page F1-4374](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <size> The data size. It must be one of:
8 Encoded as imm4<0> = '1'. imm4<3:1> encodes the index [x] of the scalar.
16 Encoded as imm4<1:0> = '10'. imm4<3:2> encodes the index [x] of the scalar.
32 Encoded as imm4<2:0> = '100'. imm4<3> encodes the index [x] of the scalar.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm[x]> The scalar. For details of how [x] is encoded, see the description of <size>.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();  
  scalar = Elem[D[m],index,esize];  
  for r = 0 to regs-1  
    for e = 0 to elements-1  
      Elem[D[d+r],e,esize] = scalar;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.83 VEOR

Vector Bitwise Exclusive OR performs a bitwise Exclusive OR operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] EOR D[m+r];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.84 VEXT (byte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector.

The elements of the vectors are treated as being 8-bit fields. There is no distinction between data types.

The following figure shows the operation of VEXT doubleword operation for $imm = 3$.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

This instruction is used by the pseudo-instruction [VEXT \(multibyte elements\)](#). The pseudo-instruction is never the preferred disassembly.

<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
<imm>	For the 64-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to 7, encoded in the "imm4" field. For the 128-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to 15, encoded in the "imm4" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  if quadword_operation then
    Q[d>>1] = (Q[m>>1]:Q[n>>1])<position+127:position>;
  else
    D[d] = (D[m]:D[n])<position+63:position>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.85 VEXT (multibyte elements)

Vector Extract extracts elements from the bottom end of the second operand vector and the top end of the first, concatenates them and places the result in the destination vector

This instruction is a pseudo-instruction of the **VEXT (byte elements)** instruction. This means that:

- The encodings in this description are named to match the encodings of **VEXT (byte elements)**.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of **VEXT (byte elements)** gives the operational pseudocode for this instruction.

and is never the preferred disassembly.

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<size>	For the 64-bit SIMD vector variant: is the size of the operation, and can be one of 16 or 32. For the 128-bit SIMD vector variant: is the size of the operation, and can be one of 16, 32 or 64.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
<imm>	For the 64-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to (128/<size>)-1. For the 128-bit SIMD vector variant: is the location of the extracted result in the concatenation of the operands, as a number of bytes from the least significant end, in the range 0 to (64/<size>)-1.

Operation for all encodings

The description of [VEXT \(byte elements\)](#) gives the operational pseudocode for this instruction.

F6.1.86 VFMA

Vector Fused Multiply Accumulate multiplies corresponding elements of two vectors, and accumulates the results into the elements of the destination vector. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VFMA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VFMA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
advsimd = TRUE; op1_neg = (op == '1');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
regs = if Q == '0' then 1 else 2;
    
```

A2

            D[d] = FPMu1Add(D[d], op64, D[m], FPSCR[]);
  
```

F6.1.87 VFMAb, VFMA**T** (BFloat16, vector)

The Bfloat16 floating-point widening multiply-add long instruction widens the even-numbered (bottom) or odd-numbered (top) 16-bit elements in the first and second source vectors from Bfloat16 to single-precision format. The instruction then multiplies and adds these values to the overlapping single-precision elements of the destination vector.

Unlike other BFloat16 multiplication instructions, this performs a fused multiply-add, without intermediate rounding that uses the Round to Nearest rounding mode and can generate a floating-point exception that causes cumulative exception bits in the FPSCR to be set.

```

Assembler symbols

<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "Vm<2:0>" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Sn>	Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm<2:0>:M" field.
<index>	For the 64-bit SIMD vector variant: is the element index in the range 0 to 1, encoded in the "Vm<3>" field. For the 128-bit SIMD vector variant: is the element index in the range 0 to 3, encoded in the "M:Vm<3>" field.

Operation for all encodings

```

CheckAdvSIMDEnabled();
bits(datasize) operand1 ;
bits(datasize) operand2 ;
bits(64) operand3;
bits(64) result;
bits(esize DIV 2) element1;
bits(esize DIV 2) element2;

if Q=='0' then
  operand1 = S[n]<datasize-1:0>;
  operand2 = S[m]<datasize-1:0>;
else
  operand1 = D[n]<datasize-1:0>;
  operand2 = D[m]<datasize-1:0>;
  
```

```
element2 = Elem[operand2, index, esize DIV 2];
for r = 0 to regs-1
  operand3 = D[d+r];
  for e = 0 to 1
    element1 = Elem[operand1, 2*r+e, esize DIV 2];
    if sub_op then element1 = FPNeg(element1);
    Elem[result, e, esize] = FPMulAddH(Elem[operand3, e, esize], element1, element2,
StandardFPSCRValue());
  D[d+r] = result;
```

F6.1.91 VFMS

Vector Fused Multiply Subtract negates the elements of one vector and multiplies them with the corresponding elements of another vector, adds the products to the corresponding elements of the destination vector, and places the results in the destination vector. The instruction does not round the result of the multiply before the addition.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

```

F6.1.92 VFMSL (vector)

Vector Floating-point Multiply-Subtract Long from accumulator (vector). This instruction negates the values in the vector of one SIMD&FP register, multiplies these with the corresponding values in another vector, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

Depending on settings in the CPACR, NSACR, HCPTR, and FPFXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

———— **Note** —————

ID_ISAR6.FHM indicates whether this instruction is supported.

        D[d] = FPMu1Add(FPNeg(D[d]), op64, D[m], FPSCR[]);
```

F6.1.95 VFNMS

Vector Fused Negate Multiply Subtract multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the product, and writes the result back to the destination register. The instruction does not round the result of the multiply before the addition.

Depending on settings in the CPACR, NSACR, HCPTR, and FPFXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Int(Elem[D[n+r],e,esize], unsigned);
      op2 = Int(Elem[D[m+r],e,esize], unsigned);
      result = if add then op1+op2 else op1-op2;
      Elem[D[d+r],e,esize] = result<esize:1>;
  
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.97 VHSUB

Vector Halving Subtract subtracts the elements of the second operand from the corresponding elements of the first operand, shifts each result right one bit, and places the final results in the destination vector. The results of the halving operations are truncated. There is no rounding version.

The operand and result elements are all the same type, and can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    S[d] = S[m]<15:0> : S[d]<15:0>;
```

F6.1.99 VJCVT

Javascript Convert to signed fixed-point, rounding toward Zero. This instruction converts the double-precision floating-point value in the SIMD&FP source register to a 32-bit signed integer using the Round towards Zero rounding mode, and writes the result to the SIMD&FP destination register. If the result is too large to be accommodated as a signed 32-bit integer, then the result is the integer modulo 2^{32} , as held in a 32-bit signed integer.

This instruction can generate a floating-point exception. Depending on the settings in [FPSCR](#), the exception results in either a flag being set or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page E1-4268](#).

Depending on settings in the [CPACR](#), [NSACR](#), [HCPTR](#), and [FPEXC](#) registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

if n == 15 then UNPREDICTABLE;
    
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <c> For encoding A1, A2 and A3: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1, T2 and T3: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:

8	when size = 00
16	when size = 01
32	when size = 10
- <list> Is a list containing the single 64-bit name of the SIMD&FP register holding the element.
 The list must be { <Dd>[<index>] }.
 The register <Dd> is encoded in the "D:Vd" field.
 The permitted values and encoding of <index> depend on <size>:
 <size> == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

- <size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> When <size> == 8, <align> must be omitted, otherwise it is the optional alignment. Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-4312](#), and the encoding depends on <size>:
<size> == 8 Encoded in the "index_align<0>" field as 0.
<size> == 16 Encoded in the "index_align<1:0>" field as 0b00.
<size> == 32 Encoded in the "index_align<2:0>" field as 0b000.
Whenever <align> is present, the permitted values and encoding depend on <size>:
<size> == 16<align> is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as 0b01.
<size> == 32<align> is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as 0b011.
: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F1-4369](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F1-4369](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d],index] = MemU[address,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```

F6.1.101 VLD1 (single element to all lanes)

Load single 1-element structure and replicate to all lanes of one register loads one element from memory into every element of one or two vectors. For details of the addressing mode see [The Advanced SIMD addressing mode on page F1-4369](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0

wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If d+regs > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

```

CONSTRAINED UNPREDICTABLE behavior

If d+regs > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *VLD1 (single element to all lanes)* on page K1-8401.

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<size>	Is the data size, encoded in the "size" field. It can have the following values: 8 when size = 00 16 when size = 01 32 when size = 10 The encoding size = 11 is reserved.
<list>	Is a list containing the 64-bit names of the SIMD&FP registers. The list must be one of: { <Dd>[] } Encoded in the "T" field as 0.

- { <Dd>[], <Dd+1>[] }Encoded in the "T" field as 1.
 The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> When <size> == 8, <align> must be omitted, otherwise it is the optional alignment.
 Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-4312](#), and is encoded in the "a" field as 0.
 Whenever <align> is present, the permitted values and encoding depend on <size>:
 <size> == 16<align> is 16, meaning 16-bit alignment, encoded in the "a" field as 1.
 <size> == 32<align> is 32, meaning 32-bit alignment, encoded in the "a" field as 1.
 : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F1-4369](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F1-4369](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    bits(64) replicated_element = Replicate(MemU[address,ebytes]);
    for r = 0 to regs-1
        D[d+r] = replicated_element;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
  
```

F6.1.102 VLD1 (multiple single elements)

Load multiple single 1-element structures to one, two, three, or four registers loads elements from memory into one, two, three, or four registers, without de-interleaving. Every element of each register is loaded. For details of the addressing mode see *The Advanced SIMD addressing mode on page F1-4369*.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-6112*.

Related encodings: See *Advanced SIMD element or structure load/store* on page F3-4470 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-4555 for the A32 instruction set.

Assembler symbols

<c>	For encoding A1, A2, A3 and A4: see Standard assembler syntax fields on page F1-4348. This encoding must be unconditional. For encoding T1, T2, T3 and T4: see Standard assembler syntax fields on page F1-4348.								
<q>	See Standard assembler syntax fields on page F1-4348.								
<size>	Is the data size, encoded in the "size" field. It can have the following values: <table> <tr> <td>8</td> <td>when size = 00</td> </tr> <tr> <td>16</td> <td>when size = 01</td> </tr> <tr> <td>32</td> <td>when size = 10</td> </tr> <tr> <td>64</td> <td>when size = 11</td> </tr> </table>	8	when size = 00	16	when size = 01	32	when size = 10	64	when size = 11
8	when size = 00								
16	when size = 01								
32	when size = 10								
64	when size = 11								
<list>	Is a list containing the 64-bit names of the SIMD&FP registers.								

The list must be one of:

- { <Dd> } Single register. Selects the A1 and T1 encodings of the instruction.
- { <Dd>, <Dd+1> } Two single-spaced registers. Selects the A2 and T2 encodings of the instruction.
- { <Dd>, <Dd+1>, <Dd+2> } Three single-spaced registers. Selects the A3 and T3 encodings of the instruction.
- { <Dd>, <Dd+1>, <Dd+2>, <Dd+3> } Four single-spaced registers. Selects the A4 and T4 encodings of the instruction.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-4312](#), and is encoded in the "align" field as 0b00.

Whenever <align> is present, the permitted values are:

- 64 64-bit alignment, encoded in the "align" field as 0b01.
- 128 128-bit alignment, encoded in the "align" field as 0b10. Available only if <list> contains two or four registers.
- 256 256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F1-4369](#).

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F1-4369](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to regs-1
        for e = 0 to elements-1
            bits(ebytes*8) data;
            if ebytes != 8 then
                data = MemU[address,ebytes];
            else
                - = AArch32.CheckAlignment(address, ebytes, AccType_NORMAL, iswrite);
                data<31:0> = if BigEndian(AccType_NORMAL) then MemU[address+4,4] else MemU[address,4];
                data<63:32> = if BigEndian(AccType_NORMAL) then MemU[address,4] else MemU[address+4,4];
            Elem[D[d+r],e] = data;
            address = address + ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 8*regs;
  
```

F6.1.103 VLD2 (single 2-element structure to one lane)

Load single 2-element structure to one lane of two registers loads one 2-element structure from memory into corresponding elements of two registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see *The Advanced SIMD addressing mode on page F1-4369*.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-6112*.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *VLD2 (single 2-element structure to one lane)* on page K1-8401.

Assembler symbols

$<c>$	For encoding A1, A2 and A3: see <i>Standard assembler syntax fields</i> on page F1-4348. This encoding must be unconditional. For encoding T1, T2 and T3: see <i>Standard assembler syntax fields</i> on page F1-4348.
$<q>$	See <i>Standard assembler syntax fields</i> on page F1-4348.
$<size>$	Is the data size, encoded in the "size" field. It can have the following values: 8 when size = 00 16 when size = 01 32 when size = 10
$<list>$	Is a list containing the 64-bit names of the two SIMD&FP registers holding the element. The list must be one of: { <Dd>[<index>], <Dd+1>[<index>] } Single-spaced registers, encoded as "spacing" = 0. { <Dd>[<index>], <Dd+2>[<index>] } Double-spaced registers, encoded as "spacing" = 1. Not permitted when $<size> == 8$. The encoding of "spacing" depends on $<size>$: $<size> == 16$ "spacing" is encoded in the "index_align<1>" field.

- <size> == 32"spacing" is encoded in the "index_align<2>" field.
The register <Dd> is encoded in the "D:Vd" field.
The permitted values and encoding of <index> depend on <size>:
<size> == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
<size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
<size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-4312](#), and the encoding depends on <size>:
<size> == 8Encoded in the "index_align<0>" field as 0.
<size> == 16Encoded in the "index_align<0>" field as 0.
<size> == 32Encoded in the "index_align<1:0>" field as 0b00.
Whenever <align> is present, the permitted values and encoding depend on <size>:
<size> == 8<align> is 16, meaning 16-bit alignment, encoded in the "index_align<0>" field as 1.
<size> == 16<align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.
<size> == 32<align> is 64, meaning 64-bit alignment, encoded in the "index_align<1:0>" field as 0b01.
: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F1-4369](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F1-4369](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2],index] = MemU[address+ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 2*ebytes;
```

F6.1.104 VLD2 (single 2-element structure to all lanes)

Load single 2-element structure and replicate to all lanes of two registers loads one 2-element structure from memory into all lanes of two registers. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F1-4369.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. VLD2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]

Post-indexed variant

Applies when Rm == 1101.

VLD2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!

Post-indexed variant

Applies when Rm != 11x1.

VLD2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>

Decode for all variants of this encoding

```

pairs = 2; inc = 2;
if size == '11' then UNDEFINED;
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size); elements = 8 DIV ebytes;
d = UInt(D:Vd); d2 = d + inc; n = UInt(Rn); m = UInt(Rm);
wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d2+pairs > 32 then UNPREDICTABLE;

```

CONSTRAINED UNPREDICTABLE behavior

If $d2+pairs > 32$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly [VLD2 \(multiple 2-element structures\)](#) on page K1-8401.

Related encodings: See [Advanced SIMD element or structure load/store](#) on page F3-4470 for the T32 instruction set, or [Advanced SIMD element or structure load/store](#) on page F4-4555 for the A32 instruction set.

Assembler symbols

- <c> For encoding A1 and A2: see [Standard assembler syntax fields](#) on page F1-4348. This encoding must be unconditional.
For encoding T1 and T2: see [Standard assembler syntax fields](#) on page F1-4348.
- <q> See [Standard assembler syntax fields](#) on page F1-4348.
- <size> Is the data size, encoded in the "size" field. It can have the following values:
8 when size = 00
16 when size = 01
32 when size = 10
The encoding size = 11 is reserved.
- <list> Is a list containing the 64-bit names of the SIMD&FP registers.
The list must be one of:
{ <Dd>, <Dd+1> } Two single-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype" field as 0b1000.
{ <Dd>, <Dd+2> } Two double-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype" field as 0b1001.
{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> } Three single-spaced registers. Selects the A2 and T2 encodings of the instruction.
The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access](#) on page E2-4312, and is encoded in the "align" field as 0b00.
Whenever <align> is present, the permitted values are:
64 64-bit alignment, encoded in the "align" field as 0b01.
128 128-bit alignment, encoded in the "align" field as 0b10.
256 256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers.
: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode](#) on page F1-4369.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F1-4369](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for r = 0 to pairs-1
        for e = 0 to elements-1
            Elem[D[d+r], e] = MemU[address,ebytes];
            Elem[D[d2+r],e] = MemU[address+ebytes,ebytes];
            address = address + 2*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 16*pairs;
```

F6.1.106 VLD3 (single 3-element structure to one lane)

Load single 3-element structure to one lane of three registers loads one 3-element structure from memory into corresponding elements of three registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see *The Advanced SIMD addressing mode on page F1-4369*.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-6112*.

- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *VLD3 (single 3-element structure to one lane)* on page K1-8402.

Assembler symbols

$<c>$	For encoding A1, A2 and A3: see Standard assembler syntax fields on page F1-4348. This encoding must be unconditional. For encoding T1, T2 and T3: see Standard assembler syntax fields on page F1-4348.
$<q>$	See Standard assembler syntax fields on page F1-4348.
$<size>$	Is the data size, encoded in the "size" field. It can have the following values: 8 when size = 00 16 when size = 01 32 when size = 10
$<list>$	Is a list containing the 64-bit names of the three SIMD&FP registers holding the element. The list must be one of: { <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>] } Single-spaced registers, encoded as "spacing" = 0. { <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>] } Double-spaced registers, encoded as "spacing" = 1. Not permitted when $<size> == 8$.

The encoding of "spacing" depends on <size>:

<size> == 8"spacing" is encoded in the "index_align<0>" field.

<size> == 16"spacing" is encoded in the "index_align<1>" field, and "index_align<0>" is set to 0.

<size> == 32"spacing" is encoded in the "index_align<2>" field, and "index_align<1:0>" is set to 0b00.

The register <Dd> is encoded in the "D:Vd" field.

The permitted values and encoding of <index> depend on <size>:

<size> == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

<size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.

<size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F1-4369](#).

Alignment

Standard alignment rules apply, see [Alignment support on page B2-160](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n];
    Elem[D[d], index] = MemU[address, ebytes];
    Elem[D[d2], index] = MemU[address+ebytes, ebytes];
    Elem[D[d3], index] = MemU[address+2*ebytes, ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 3*ebytes;
```

F6.1.107 VLD3 (single 3-element structure to all lanes)

Load single 3-element structure and replicate to all lanes of three registers loads one 3-element structure from memory into all lanes of three registers. For details of the addressing mode see *The Advanced SIMD addressing mode* on page F1-4369.

Load multiple 3-element structures to three registers loads multiple 3-element structures from memory into three registers, with de-interleaving. For more information, see [Element and structure load/store instructions on page F2-4398](#). Every element of each register is loaded. For details of the addressing mode see [The Advanced SIMD addressing mode on page F1-4369](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *VLD3 (multiple 3-element structures)* on page K1-8402.

Related encodings: See *Advanced SIMD element or structure load/store* on page F3-4470 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-4555 for the A32 instruction set.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
 8 when size = 00
 16 when size = 01
 32 when size = 10
 The encoding size = 11 is reserved.
- <list> Is a list containing the 64-bit names of the SIMD&FP registers.
 The list must be one of:
 { <Dd>, <Dd+1>, <Dd+2> } Single-spaced registers, encoded in the "itype" field as 0b0100.
 { <Dd>, <Dd+2>, <Dd+4> } Double-spaced registers, encoded in the "itype" field as 0b0101.
 The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment.
 Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-4312](#), and is encoded in the "align" field as 0b00.
 Whenever <align> is present, the only permitted values is 64, meaning 64-bit alignment, encoded in the "align" field as 0b01.
 : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F1-4369](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about <Rn>, !, and <Rm>, see [The Advanced SIMD addressing mode on page F1-4369](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for e = 0 to elements-1
        Elem[D[d], e] = MemU[address,ebytes];
        Elem[D[d2],e] = MemU[address+ebytes,ebytes];
        Elem[D[d3],e] = MemU[address+2*ebytes,ebytes];
        address = address + 3*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 24;
  
```

F6.1.109 VLD4 (single 4-element structure to one lane)

Load single 4-element structure to one lane of four registers loads one 4-element structure from memory into corresponding elements of four registers. Elements of the registers that are not loaded are unchanged. For details of the addressing mode see *The Advanced SIMD addressing mode on page F1-4369*.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-6112*.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *VLD4 (single 4-element structure to one lane)* on page K1-8402.

Assembler symbols

<c>	For encoding A1, A2 and A3: see <i>Standard assembler syntax fields</i> on page F1-4348. This encoding must be unconditional. For encoding T1, T2 and T3: see <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<size>	Is the data size, encoded in the "size" field. It can have the following values: 8 when size = 00 16 when size = 01 32 when size = 10
<list>	Is a list containing the 64-bit names of the four SIMD&FP registers holding the element. The list must be one of: { <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>], <Dd+3>[<index>] } Single-spaced registers, encoded as "spacing" = 0. { <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>], <Dd+6>[<index>] } Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.

- The encoding of "spacing" depends on <size>:
 <size> == 16"spacing" is encoded in the "index_align<1>" field.
 <size> == 32"spacing" is encoded in the "index_align<2>" field.
- The register <Dd> is encoded in the "D:Vd" field.
- The permitted values and encoding of <index> depend on <size>:
 <size> == 8<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.
 <size> == 16<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.
 <size> == 32<index> is 0 or 1, encoded in the "index_align<3>" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment.
 Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-4312](#), and the encoding depends on <size>:
 <size> == 8Encoded in the "index_align<0>" field as 0.
 <size> == 16Encoded in the "index_align<0>" field as 0.
 <size> == 32Encoded in the "index_align<1:0>" field as 0b00.
- Whenever <align> is present, the permitted values and encoding depend on <size>:
 <size> == 8<align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.
 <size> == 16<align> is 64, meaning 64-bit alignment, encoded in the "index_align<0>" field as 1.
 <size> == 32<align> can be 64 or 128. 64-bit alignment is encoded in the "index_align<1:0>" field as 0b01, and 128-bit alignment is encoded in the "index_align<1:0>" field as 0b10.
- : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F1-4369](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F1-4369](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    Elem[D[d], index] = MemU[address,ebytes];
    Elem[D[d2], index] = MemU[address+ebytes,ebytes];
    Elem[D[d3], index] = MemU[address+2*ebytes,ebytes];
    Elem[D[d4], index] = MemU[address+3*ebytes,ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 4*ebytes;
  
```

F6.1.110 VLD4 (single 4-element structure to all lanes)

| 8 | when size = 00 |
| 16 | when size = 01 |
| 32 | when size = 1x |
- <list> Is a list containing the 64-bit names of four SIMD&FP registers.
 The list must be one of:
 { <Dd>[], <Dd+1>[], <Dd+2>[], <Dd+3>[] } Single-spaced registers, encoded in the "T" field as 0.
 { <Dd>[], <Dd+2>[], <Dd+4>[], <Dd+6>[] } Double-spaced registers, encoded in the "T" field as 1.
 The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment.
 Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-4312](#), and is encoded in the "a" field as 0.
 Whenever <align> is present, the permitted values and encoding depend on <size>:
 <size> == 8<align> is 32, meaning 32-bit alignment, encoded in the "a" field as 1.
 <size> == 16<align> is 64, meaning 64-bit alignment, encoded in the "a" field as 1.
 <size> == 32<align> can be 64 or 128. 64-bit alignment is encoded in the "a:size<0>" field as 0b10,
 and 128-bit alignment is encoded in the "a:size<0>" field as 0b11.
 : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F1-4369](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F1-4369](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    D[d] = Replicate(MemU[address,ebytes]);
    D[d2] = Replicate(MemU[address+ebytes,ebytes]);
    D[d3] = Replicate(MemU[address+2*ebytes,ebytes]);
    D[d4] = Replicate(MemU[address+3*ebytes,ebytes]);
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 4*ebytes;
  
```

F6.1.111 VLD4 (multiple 4-element structures)

Load multiple 4-element structures to four registers loads multiple 4-element structures from memory into four registers, with de-interleaving. For more information, see [Element and structure load/store instructions on page F2-4398](#). Every element of each register is loaded. For details of the addressing mode see [The Advanced SIMD addressing mode on page F1-4369](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	12	11	8	7	6	5	4	3	0
1	1	1	1	0	1	0	0	0	D	1	0	Rn	Vd	0	0	0	x	size	align	Rm			

itype

Offset variant

Applies when Rm == 1111.

VLD4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]

Post-indexed variant

Applies when Rm == 1101.

VLD4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!

Post-indexed variant

Applies when Rm != 11x1.

VLD4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>

Decode for all variants of this encoding

```

case itype of
  when '0000'
    inc = 1;
  when '0001'
    inc = 2;
  otherwise
    SEE "Related encodings";
if size == '11' then UNDEFINED;
alignment = if align == '00' then 1 else 4 << UInt(align);
ebytes = 1 << UInt(size); elements = 8 DIV ebytes;
d = UInt(D:Vd); d2 = d + inc; d3 = d2 + inc; d4 = d3 + inc; n = UInt(Rn); m = UInt(Rm);
wback = (m != 15); register_index = (m != 15 && m != 13);
if n == 15 || d4 > 31 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If d4 > 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

```

CONSTRAINED UNPREDICTABLE behavior

If $d4 > 31$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *VLD4 (multiple 4-element structures)* on page K1-8402.

Related encodings: See *Advanced SIMD element or structure load/store* on page F3-4470 for the T32 instruction set, or *Advanced SIMD element or structure load/store* on page F4-4555 for the A32 instruction set.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <size> Is the data size, encoded in the "size" field. It can have the following values:
 8 when size = 00
 16 when size = 01
 32 when size = 10
 The encoding size = 11 is reserved.
- <list> Is a list containing the 64-bit names of the SIMD&FP registers.
 The list must be one of:
 { <Dd>, <Dd+1>, <Dd+2>, <Dd+3> } Single-spaced registers, encoded in the "itype" field as 0b0000.
 { <Dd>, <Dd+2>, <Dd+4>, <Dd+6> } Double-spaced registers, encoded in the "itype" field as 0b0001.
 The register <Dd> is encoded in the "D:Vd" field.
- <Rn> Is the general-purpose base register, encoded in the "Rn" field.
- <align> Is the optional alignment.
 Whenever <align> is omitted, the standard alignment is used, see [Unaligned data access on page E2-4312](#), and is encoded in the "align" field as 0b00.
 Whenever <align> is present, the permitted values are:
 64 64-bit alignment, encoded in the "align" field as 0b01.
 128 128-bit alignment, encoded in the "align" field as 0b10.
 256 256-bit alignment, encoded in the "align" field as 0b11.
 : is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see [The Advanced SIMD addressing mode on page F1-4369](#).
- <Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see [The Advanced SIMD addressing mode on page F1-4369](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    address = R[n]; iswrite = FALSE;
    - = AArch32.CheckAlignment(address, alignment, AccType_VEC, iswrite);
    for e = 0 to elements-1
        E1em[D[d], e] = MemU[address,ebytes];
        E1em[D[d2],e] = MemU[address+ebytes,ebytes];
        E1em[D[d3],e] = MemU[address+2*ebytes,ebytes];
        E1em[D[d4],e] = MemU[address+3*ebytes,ebytes];
        address = address + 4*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 32;
  
```

F6.1.112 VLDM, VLDMDB, VLDMIA

Load Multiple SIMD&FP registers loads multiple registers from consecutive locations in the Advanced SIMD and floating-point register file using an address from a general-purpose register.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

This instruction is used by the alias VPOP. See [Alias conditions on page F6-5596](#) for details of when each alias is preferred.

A1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

VLDMDB{<c>}{<q>}{.<size>} <Rn>!, <dreglist>

Increment After variant

Applies when P == 0 && U == 1.

VLDM{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>
 VLDMIA{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```

if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VLDR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FLDM*X".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If regs > 16 || (d+regs) > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

A2

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

VLDMDB{<c>}{<q>}{.<size>} <Rn>!, <sreglist>

Increment After variant

Applies when P == 0 && U == 1.

VLDM{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>

if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d+regs) > 32 then UNPREDICTABLE;
    
```

CONSTRAINED UNPREDICTABLE behavior

If regs == 0, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If (d+regs) > 32, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

T1

Decrement Before variant

Applies when P == 1 && U == 0 && W == 1.

VLDMDB{<c>}{<q>}{.<size>} <Rn>!, <dreglist>

Increment After variant

Applies when $P == 0 \ \&\& \ U == 1$.

VLDM{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>
 VLDMIA{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VLDR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
single_regs = FALSE; add = (U == '1'); wback = (W == '1');
d = UInt(D:Vd); n = UInt(Rn); imm32 = ZeroExtend(imm8:'00', 32);
regs = UInt(imm8) DIV 2; // If UInt(imm8) is odd, see "FLDM*X".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If $regs == 0$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If $regs > 16 \ || \ (d+regs) > 32$, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

T2

Decrement Before variant

Applies when $P == 1 \ \&\& \ U == 0 \ \&\& \ W == 1$.

VLDMDB{<c>}{<q>}{.<size>} <Rn>!, <sreglist>

Increment After variant

Applies when $P == 0 \ \&\& \ U == 1$.

VLDM{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>
 VLDMIA{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VLDR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
```

```
single_regs = TRUE; add = (U == '1'); wback = (W == '1'); d = UInt(Vd:D); n = UInt(Rn);
imm32 = ZeroExtend(imm8:'00', 32); regs = UInt(imm8);
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d+regs) > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `regs == 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VLDM with the same addressing mode but loads no registers.

If `(d+regs) > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly [VLDM on page K1-8403](#).

Related encodings: See [Advanced SIMD and floating-point 64-bit move on page F3-4444](#) for the T32 instruction set, or [Advanced SIMD and floating-point 64-bit move on page F4-4531](#) for the A32 instruction set.

Alias conditions

Alias	is preferred when
VPOP	<code>P == '0' && U == '1' && W == '1' && Rn == '1101'</code>

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<size>	An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used.
!	Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
<reglist>	Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.
<dreglist>	Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            S[d+r] = MemA[address,4]; address = address+4;
        else
            word1 = MemA[address,4]; word2 = MemA[address+4,4]; address = address+8;
            // Combine the word-aligned words in the correct order for current endianness.
            D[d+r] = if BigEndian(AccType_ATOMIC) then word1:word2 else word2:word1;
    if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

F6.1.113 VLDR (immediate)

Load SIMD&FP register (immediate) loads a single register from the Advanced SIMD and floating-point register file, using an address from a general-purpose register, with an optional offset.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

Half-precision scalar variant

Applies when size == 01.

VLDR{<c>}{<q>}.16 <Sd>, [<Rn> {, #<+/-><imm>}]

Single-precision scalar variant

Applies when size == 10.

VLDR{<c>}{<q>}.32 <Sd>, [<Rn> {, #<+/-><imm>}]

Double-precision scalar variant

Applies when size == 11.

VLDR{<c>}{<q>}.64 <Dd>, [<Rn> {, #<+/-><imm>}]

Decode for all variants of this encoding

```

if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
esize = 8 << UInt(size); add = (U == '1');
imm32 = if esize == 16 then ZeroExtend(imm8:'0', 32) else ZeroExtend(imm8:'00', 32);
case size of
  when '01' d = UInt(Vd:D);
  when '10' d = UInt(Vd:D);
  when '11' d = UInt(D:Vd);
n = UInt(Rn);
    
```

CONSTRAINED UNPREDICTABLE behavior

If size == '01' && cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1

Half-precision scalar variant

Applies when size == 01.

VLDR{<c>}{<q>}.16 <Sd>, [<Rn> {, #<+/-><imm>}]

Single-precision scalar variant

Applies when size == 10.

VLDR{<c>}{<q>}.32 <Sd>, [<Rn> {, #<+/-><imm>}]

Double-precision scalar variant

Applies when size == 11.

VLDR{<c>}{<q>}.64 <Dd>, [<Rn> {, #<+/-><imm>}]

Decode for all variants of this encoding

```

if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock() then UNPREDICTABLE;
esize = 8 << UInt(size); add = (U == '1');
imm32 = if esize == 16 then ZeroExtend(imm8:'0', 32) else ZeroExtend(imm8:'00', 32);
case size of
  when '01' d = UInt(Vd:D);
  when '10' d = UInt(Vd:D);
  when '11' d = UInt(D:Vd);
n = UInt(Rn);
  
```

CONSTRAINED UNPREDICTABLE behavior

If size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<c>	See Standard assembler syntax fields on page F1-4348 .				
<q>	See Standard assembler syntax fields on page F1-4348 .				
.64	Is an optional data size specifier for 64-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.				
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.				
.32	Is an optional data size specifier for 32-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.				
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.				
<Rn>	Is the general-purpose base register, encoded in the "Rn" field.				
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values: <table> <tr> <td>-</td> <td>when U = 0</td> </tr> <tr> <td>+</td> <td>when U = 1</td> </tr> </table>	-	when U = 0	+	when U = 1
-	when U = 0				
+	when U = 1				

<imm> For the single-precision scalar or double-precision scalar variants: is the optional unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0, and encoded in the "imm8" field as <imm>/4.

For the half-precision scalar variant: is the optional unsigned immediate byte offset, a multiple of 2, in the range 0 to 510, defaulting to 0, and encoded in the "imm8" field as <imm>/2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    base = if n == 15 then Align(PC,4) else R[n];
    address = if add then (base + imm32) else (base - imm32);
    case esize of
        when 16
            S[d] = Zeros(16) : MemA[address,2];
        when 32
            S[d] = MemA[address,4];
        when 64
            word1 = MemA[address,4]; word2 = MemA[address+4,4];
            // Combine the word-aligned words in the correct order for current endianness.
            D[d] = if BigEndian(AccType_ATOMIC) then word1:word2 else word2:word1;
```

F6.1.114 VLDR (literal)

Load SIMD&FP register (literal) loads a single register from the Advanced SIMD and floating-point register file, using an address from the PC value and an immediate offset.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

Half-precision scalar variant

Applies when size == 01.

```
VLDR{<c>}{<q>}.16 <Sd>, <label>
VLDR{<c>}{<q>}.16 <Sd>, [PC, #{+/-}<imm>]
```

Single-precision scalar variant

Applies when size == 10.

```
VLDR{<c>}{<q>}.32 <Sd>, <label>
VLDR{<c>}{<q>}.32 <Sd>, [PC, #{+/-}<imm>]
```

Double-precision scalar variant

Applies when size == 11.

```
VLDR{<c>}{<q>}.64 <Dd>, <label>
VLDR{<c>}{<q>}.64 <Dd>, [PC, #{+/-}<imm>]
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
esize = 8 << UInt(size); add = (U == '1');
imm32 = if esize == 16 then ZeroExtend(imm8:'0', 32) else ZeroExtend(imm8:'00', 32);
case size of
    when '01' d = UInt(Vd:D);
    when '10' d = UInt(Vd:D);
    when '11' d = UInt(D:Vd);
n = UInt(Rn);
```

CONSTRAINED UNPREDICTABLE behavior

If size == '01' && cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1

Half-precision scalar variant

Applies when size == 01.

VLDR{<c>}{<q>}.16 <Sd>, <label>
 VLDR{<c>}{<q>}.16 <Sd>, [PC, #{+/-}<imm>]

Single-precision scalar variant

Applies when size == 10.

VLDR{<c>}{<q>}.32 <Sd>, <label>
 VLDR{<c>}{<q>}.32 <Sd>, [PC, #{+/-}<imm>]

Double-precision scalar variant

Applies when size == 11.

VLDR{<c>}{<q>}.64 <Dd>, <label>
 VLDR{<c>}{<q>}.64 <Dd>, [PC, #{+/-}<imm>]

Decode for all variants of this encoding

```

if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
if size == '01' && InITBlock() then UNPREDICTABLE;
esize = 8 << UInt(size); add = (U == '1');
imm32 = if esize == 16 then ZeroExtend(imm8:'0', 32) else ZeroExtend(imm8:'00', 32);
case size of
    when '01' d = UInt(Vd:D);
    when '10' d = UInt(Vd:D);
    when '11' d = UInt(D:Vd);
n = UInt(Rn);
    
```

CONSTRAINED UNPREDICTABLE behavior

If size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- .64 Is an optional data size specifier for 64-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- .32 Is an optional data size specifier for 32-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

- <label> The label of the literal data item to be loaded.
- For the single-precision scalar or double-precision scalar variants: the assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values are multiples of 4 in the range -1020 to 1020.
- For the half-precision scalar variant: the assembler calculates the required value of the offset from the `Align(PC, 4)` value of the instruction to this label. Permitted values are multiples of 2 in the range -510 to 510.
- If the offset is zero or positive, `imm32` is equal to the offset and `add == TRUE`.
- If the offset is negative, `imm32` is equal to minus the offset and `add == FALSE`.
- +/- Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in the "U" field. It can have the following values:
- when U = 0
 - + when U = 1
- <imm> For the single-precision scalar or double-precision scalar variants: is the optional unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0, and encoded in the "imm8" field as <imm>/4.
- For the half-precision scalar variant: is the optional unsigned immediate byte offset, a multiple of 2, in the range 0 to 510, defaulting to 0, and encoded in the "imm8" field as <imm>/2.

The alternative syntax permits the addition or subtraction of the offset and the immediate offset to be specified separately, including permitting a subtraction of 0 that cannot be specified using the normal syntax. For more information, see [Use of labels in UAL instruction syntax on page F2-4377](#).

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    base = if n == 15 then Align(PC,4) else R[n];
    address = if add then (base + imm32) else (base - imm32);
    case esize of
        when 16
            S[d] = Zeros(16) : MemA[address,2];
        when 32
            S[d] = MemA[address,4];
        when 64
            word1 = MemA[address,4]; word2 = MemA[address+4,4];
            // Combine the word-aligned words in the correct order for current endianness.
            D[d] = if BigEndian(AccType_ATOMIC) then word1:word2 else word2:word1;
  
```

F6.1.115 VMAX (floating-point)

Vector Maximum compares corresponding elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector.

The operand vector elements are floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMAX{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;

```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMAX{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
maximum = (op == '0');
case sz of
  when '0' esize = 32; elements = 2;
  when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
  
```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values: F32 when sz = 0 F16 when sz = 1
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Floating-point maximum and minimum

- $\max(+0.0, -0.0) = +0.0$
- If any input is a NaN, the corresponding result element is the default NaN.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for r = 0 to regs-1
  for e = 0 to elements-1
    op1 = Elem[D[n+r],e,esize]; op2 = Elem[D[m+r],e,esize];
    if maximum then
      Elem[D[d+r],e,esize] = FPMax(op1, op2, StandardFPSCRValue());
  
```

```
else  
    Elem[D[d+r],e,esize] = FMin(op1, op2, StandardFPSCRValue());
```

F6.1.116 VMAX (integer)

Vector Maximum compares corresponding elements in two vectors, and copies the larger of each pair into the corresponding element in the destination vector.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Int(Elem[D[n+r],e,esize], unsigned);
      op2 = Int(Elem[D[m+r],e,esize], unsigned);
      result = if maximum then Max(op1,op2) else Min(op1,op2);
      Elem[D[d+r],e,esize] = result<esize-1:0>;
  
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.117 VMAXNM

This instruction determines the floating-point maximum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point VMAX.

This instruction is not conditional.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMAXNM{<q>}.<dt> <Dd>, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMAXNM{<q>}.<dt> <Qd>, <Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
advsimd = TRUE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

A2

Half-precision scalar variant

Applies when size == 01.

VMAXNM{<q>}.F16 <Sd>, <Sn>, <Sm> // Cannot be conditional

Single-precision scalar variant

Applies when size == 10.

VMAXNM{<q>}.F32 <Sd>, <Sn>, <Sm> // Cannot be conditional

Double-precision scalar variant

Applies when size == 11.

VMAXNM{<q>}.F64 <Dd>, <Dn>, <Dm> // Cannot be conditional

Decode for all variants of this encoding

```

if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
advsimd = FALSE;
maximum = (op == '0');
case size of
    when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.
 VMAXNM{<q>}.<dt> <Dd>, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.
 VMAXNM{<q>}.<dt> <Qd>, <Qn>, <Qm>

Decode for all variants of this encoding

```

if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
advsimd = TRUE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T2

Half-precision scalar variant

Applies when size == 01.

VMAXNM{<q>}.F16 <Sd>, <Sn>, <Sm> // Not permitted in IT block

Single-precision scalar variant

Applies when size == 10.

VMAXNM{<q>}.F32 <Sd>, <Sn>, <Sm> // Not permitted in IT block

Double-precision scalar variant

Applies when size == 11.

VMAXNM{<q>}.F64 <Dd>, <Dn>, <Dm> // Not permitted in IT block

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
advsimd = FALSE;
maximum = (op == '0');
case size of
  when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<dt>	Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values: F32 when sz = 0 F16 when sz = 1
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

- <Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.
- <Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```

EncodingSpecificOperations(); CheckAdvSIMDorVFPEnabled(TRUE, advsimd);
if advsimd then // Advanced SIMD instruction
    for r = 0 to regs-1
        for e = 0 to elements-1
            op1 = Elem[D[n+r], e, esize]; op2 = Elem[D[m+r], e, esize];
            if maximum then

<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values: F32 when sz = 0 F16 when sz = 1
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Floating-point minimum

- $\min(+0.0, -0.0) = -0.0$
- If any input is a NaN, the corresponding result element is the default NaN.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Elem[D[n+r],e,esize]; op2 = Elem[D[m+r],e,esize];
      if maximum then
        Elem[D[d+r],e,esize] = FPMax(op1, op2, StandardFPSCRValue());
  
```

```
else  
    Elem[D[d+r],e,esize] = FMin(op1, op2, StandardFPSCRValue());
```

F6.1.119 VMIN (integer)

Vector Minimum compares corresponding elements in two vectors, and copies the smaller of each pair into the corresponding element in the destination vector.

The operand vector elements can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The result vector elements are the same size as the operand vector elements.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMIN{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
maximum = (op == '0'); unsigned = (U == '1');
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMIN{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
maximum = (op == '0'); unsigned = (U == '1');
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
  
```

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt> Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values:
- | | |
|-----|-----------------------|
| S8 | when U = 0, size = 00 |
| S16 | when U = 0, size = 01 |
| S32 | when U = 0, size = 10 |
| U8 | when U = 1, size = 00 |
| U16 | when U = 1, size = 01 |
| U32 | when U = 1, size = 10 |
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Int(Elem[D[n+r],e,esize], unsigned);
      op2 = Int(Elem[D[m+r],e,esize], unsigned);
      result = if maximum then Max(op1,op2) else Min(op1,op2);
      Elem[D[d+r],e,esize] = result<esize-1:0>;
  
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.120 VMINNM

This instruction determines the floating point minimum number.

It handles NaNs in consistence with the IEEE754-2008 specification. It returns the numerical operand when one operand is numerical and the other is a quiet NaN, but otherwise the result is identical to floating-point VMIN.

This instruction is not conditional.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMINNM{<q>}.<dt> <Dd>, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMINNM{<q>}.<dt> <Qd>, <Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
advsimd = TRUE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

A2

Half-precision scalar variant

Applies when size == 01.

VMINNM{<q>}.F16 <Sd>, <Sn>, <Sm> // Cannot be conditional

Single-precision scalar variant

Applies when size == 10.

VMINNM{<q>}.F32 <Sd>, <Sn>, <Sm> // Cannot be conditional

Double-precision scalar variant

Applies when size == 11.

VMINNM{<q>}.F64 <Dd>, <Dn>, <Dm> // Cannot be conditional

Decode for all variants of this encoding

```

if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
advsimd = FALSE;
maximum = (op == '0');
case size of
  when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);

```

T1

64-bit SIMD vector variant

Applies when Q == 0.
 VMINNM{<q>}.<dt> <Dd>, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.
 VMINNM{<q>}.<dt> <Qd>, <Qn>, <Qm>

Decode for all variants of this encoding

```

if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
advsimd = TRUE;
case sz of
  when '0' esize = 32; elements = 2;
  when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T2

Half-precision scalar variant

Applies when size == 01.

VMINNM{<q>}.F16 <Sd>, <Sn>, <Sm> // Not permitted in IT block

Single-precision scalar variant

Applies when size == 10.

VMINNM{<q>}.F32 <Sd>, <Sn>, <Sm> // Not permitted in IT block

Double-precision scalar variant

Applies when size == 11.

VMINNM{<q>}.F64 <Dd>, <Dn>, <Dm> // Not permitted in IT block

Decode for all variants of this encoding

```

if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
advsimd = FALSE;
maximum = (op == '0');
case size of
  when '01' esize = 16; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  when '10' esize = 32; d = UInt(Vd:D); n = UInt(Vn:N); m = UInt(Vm:M);
  when '11' esize = 64; d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);

```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<dt>	Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values: F32 when sz = 0 F16 when sz = 1
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

- <Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.
- <Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```

EncodingSpecificOperations(); CheckAdvSIMDorVFPEnabled(TRUE, advsimd);
if advsimd then // Advanced SIMD instruction
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Elem[D[n+r], e, esize]; op2 = Elem[D[m+r], e, esize];
      if maximum then
        Elem[D[d+r], e, esize] = FPMaXNum(op1, op2, StandardFPSCRValue());
      else
        Elem[D[d+r], e, esize] = FPMinNum(op1, op2, StandardFPSCRValue());
else // VFP instruction
  case esize of
    when 16
      if maximum then
        S[d] = Zeros(16) : FPMaXNum(S[n]<15:0>, S[m]<15:0>, FPSCR[]);
      else
        S[d] = Zeros(16) : FPMinNum(S[n]<15:0>, S[m]<15:0>, FPSCR[]);
    when 32
      if maximum then
        S[d] = FPMaXNum(S[n], S[m], FPSCR[]);
      else
        S[d] = FPMinNum(S[n], S[m], FPSCR[]);
    when 64
      if maximum then
        D[d] = FPMaXNum(D[n], D[m], FPSCR[]);
      else
        D[d] = FPMinNum(D[n], D[m], FPSCR[]);
  
```

F6.1.121 VMLA (floating-point)

Vector Multiply Accumulate multiplies corresponding elements in two vectors, and accumulates the results into the elements of the destination vector.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMLA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMLA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
advsimd = TRUE; add = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

A2

 U Optional in encoding T1/A1. Encoded as U = 1 in encoding T2/A2.
 I Available only in encoding T1/A1.
- <size> The data size for the elements of the operands. It must be one of:
 8 Encoded as size = 0b00.
 16 Encoded as size = 0b01.
 32 Encoded as size = 0b10.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      product = Int(Elem[Din[n+r],e,esize],unsigned) * Int(Elem[Din[m+r],e,esize],unsigned);
      addend = if add then product else -product;
      if long_destination then
        Elem[Q[d>>1],e,2*esize] = Elem[Qin[d>>1],e,2*esize] + addend;
      else
        Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + addend;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.

— The values of the NZCV flags.

F6.1.123 VMLA (by scalar)

Vector Multiply Accumulate multiplies elements of a vector by a scalar, and adds the products to corresponding elements of the destination vector.

For more information about scalars see [Advanced SIMD scalars on page F1-4374](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMLA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm[x]>

128-bit SIMD vector variant

Applies when Q == 1.

VMLA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Dm[x]>

Decode for all variants of this encoding

```

if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' && size == '01' && !HaveFP16Ext()) then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = FALSE; // "Don't care" value: TRUE produces same functionality
add = (op == '0'); floating_point = (F == '1'); long_destination = FALSE;
d = UInt(D:Vd); n = UInt(N:Vn); regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16; elements = 4; m = UInt(Vm<2:0>); index = UInt(M:Vm<3>);
if size == '10' then esize = 32; elements = 2; m = UInt(Vm); index = UInt(M);
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VMLA{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm[x]>

128-bit SIMD vector variant

Applies when Q == 1.

VMLA{<c>}{<q>}.<dt> <Qd>, <Qn>, <Dm[x]>

Decode for all variants of this encoding

```

if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' && size == '01' && !HaveFP16Ext()) then UNDEFINED;
if F == '1' && size == '01' && InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = FALSE; // "Don't care" value: TRUE produces same functionality
add = (op == '0'); floating_point = (F == '1'); long_destination = FALSE;
d = UInt(D:Vd); n = UInt(N:Vn); regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16; elements = 4; m = UInt(Vm<2:0>); index = UInt(M:Vm<3>);
if size == '10' then esize = 32; elements = 2; m = UInt(Vm); index = UInt(M);
  
```

CONSTRAINED UNPREDICTABLE behavior

If `F == '1' && size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-4434](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-4543](#) for the A32 instruction set.

 - The values of the NZCV flags.

F6.1.126 VMLS (floating-point)

Vector Multiply Subtract multiplies corresponding elements in two vectors, subtracts the products from corresponding elements of the destination vector, and places the results in the destination vector.

———— **Note** ————

Arm recommends that software does not use the VMLS instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMLS{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VMLS{<c>}{<q>}.<dt> <Qd>, <Qn>, <Qm>

Decode for all variants of this encoding

```

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
advsimd = TRUE; add = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;

      else
        Elem[D[d+r],e,esize] = Elem[Din[d+r],e,esize] + addend;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.

— The values of the NZCV flags.

F6.1.128 VMLS (by scalar)

Vector Multiply Subtract multiplies elements of a vector by a scalar, and either subtracts the products from corresponding elements of the destination vector.

For more information about scalars see [Advanced SIMD scalars on page F1-4374](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

128-bit SIMD vector variant

Applies when Q == 1.

VMLS{<c>}{<q>}.<dt> <Qd>, <Qn>, <Dm[x]>

Decode for all variants of this encoding

```

if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' && size == '01' && !HaveFP16Ext()) then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = FALSE; // "Don't care" value: TRUE produces same functionality
add = (op == '0'); floating_point = (F == '1'); long_destination = FALSE;
d = UInt(D:Vd); n = UInt(N:Vn); regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16; elements = 4; m = UInt(Vm<2:0>); index = UInt(M:Vm<3>);
if size == '10' then esize = 32; elements = 2; m = UInt(Vm); index = UInt(M);
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VMLS{<c>}{<q>}.<dt> <Dd>, <Dn>, <Dm[x]>

128-bit SIMD vector variant

Applies when Q == 1.

VMLS{<c>}{<q>}.<dt> <Qd>, <Qn>, <Dm[x]>

Decode for all variants of this encoding

```

if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' && size == '01' && !HaveFP16Ext()) then UNDEFINED;
if F == '1' && size == '01' && InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = FALSE; // "Don't care" value: TRUE produces same functionality
add = (op == '0'); floating_point = (F == '1'); long_destination = FALSE;
d = UInt(D:Vd); n = UInt(N:Vn); regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16; elements = 4; m = UInt(Vm<2:0>); index = UInt(M:Vm<3>);
if size == '10' then esize = 32; elements = 2; m = UInt(Vm); index = UInt(M);
  
```

CONSTRAINED UNPREDICTABLE behavior

If `F == '1' && size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-4434](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-4543](#) for the A32 instruction set.

```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.131 VMMLA

BFloat16 floating-point matrix multiply-accumulate. This instruction multiplies the 2x4 matrix of BF16 values in the first 128-bit source vector by the 4x2 BF16 matrix in the second 128-bit source vector. The resulting 2x2 single-precision matrix product is then added destructively to the 2x2 single-precision matrix in the 128-bit destination vector. This is equivalent to performing a 4-way dot product per destination element. The instruction does not update the FPSCR exception status.

———— Note ————

Arm expects that the VMMLA instruction will deliver a peak BF16 multiply throughput that is at least as high as can be achieved using two VDOT instructions, with a goal that it should have significantly higher throughput.

1	1	1	1	1	1	0	0	0	D	0	0	Vn	Vd	1	1	0	0	N	1	M	0	Vm			

T1 variant

VMMLA{<q>}.BF16 <Qd>, <Qn>, <Qm>

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveAArch32BF16Ext() then UNDEFINED;
if Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
integer d = UInt(D:Vd);
integer n = UInt(N:Vn);
integer m = UInt(M:Vm);
integer regs = 2;
```

Assembler symbols

- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

`CheckAdvSIMDEnabled();`

`bits(128) op1 = Q[n>>1];`

`bits(128) op2 = Q[m>>1];`

`bits(128) acc = Q[d>>1];`

`Q[d>>1] = BFMatMulAdd(acc, op1, op2);`

F6.1.132 VMOV (between two general-purpose registers and a doubleword floating-point register)

Copy two general-purpose registers to or from a SIMD&FP register copies two words from two general-purpose registers into a doubleword register in the Advanced SIMD and floating-point register file, or from a doubleword register in the Advanced SIMD and floating-point register file to two general-purpose registers.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

From general-purpose registers variant

Applies when op == 0.

VMOV{<c>}{<q>} <Dm>, <Rt>, <Rt2>

To general-purpose registers variant

Applies when op == 1.

VMOV{<c>}{<q>} <Rt>, <Rt2>, <Dm>

Decode for all variants of this encoding

```
to_arm_registers = (op == '1'); t = UInt(Rt); t2 = UInt(Rt2); m = UInt(M:Vm);
if t == 15 || t2 == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If to_arm_registers && t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

T1

From general-purpose registers variant

Applies when op == 0.

VMOV{<c>}{<q>} <Dm>, <Rt>, <Rt2>

To general-purpose registers variant

Applies when op == 1.

VMOV{<c>}{<q>} <Rt>, <Rt2>, <Dm>

Decode for all variants of this encoding

```
to_arm_registers = (op == '1'); t = UInt(Rt); t2 = UInt(Rt2); m = UInt(M:Vm);
if t == 15 || t2 == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If to_arm_registers && t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *VMOV (between two general-purpose registers and a doubleword floating-point register)* on page K1-8403.

Assembler symbols

- <Dm> Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "M:Vm" field.
- <Rt2> Is the second general-purpose register that <Dm>[63:32] will be transferred to or from, encoded in the "Rt2" field.
- <Rt> Is the first general-purpose register that <Dm>[31:0] will be transferred to or from, encoded in the "Rt" field.
- <c> See *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
  if to_arm_registers then
    R[t] = D[m]<31:0>;
    R[t2] = D[m]<63:32>;
  else
    D[m]<31:0> = R[t];
    D[m]<63:32> = R[t2];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.133 VMOV (between general-purpose register and half-precision)

Copy 16 bits of a general-purpose register to or from a 32-bit SIMD&FP register. This instruction transfers the value held in the bottom 16 bits of a 32-bit SIMD&FP register to the bottom 16 bits of a general-purpose register, or the value held in the bottom 16 bits of a general-purpose register to the bottom 16 bits of a 32-bit SIMD&FP register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-6112*.

From general-purpose register variant

Applies when op == 0.

VMOV{<c>}{<q>}.F16 <Sn>, <Rt>

To general-purpose register variant

Applies when `op == 1`.

`VMOV{<c>}{<q>}.F16 <Rt>, <Sn>`

Decode for all variants of this encoding

```
if !HaveFP16Ext() then UNDEFINED;
if InITBlock() then UNPREDICTABLE;
to_arm_register = (op == '1'); t = UInt(Rt); n = UInt(Vn:N);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<code><Rt></code>	Is the general-purpose register that <code><Sn></code> will be transferred to or from, encoded in the "Rt" field.
<code><Sn></code>	Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Vn:N" field.
<code><c></code>	See Standard assembler syntax fields on page F1-4348 .
<code><q></code>	See Standard assembler syntax fields on page F1-4348 .

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
  if to_arm_register then
    R[t] = Zeros(16) : S[n]<15:0>;
  else
    S[n] = Zeros(16) : R[t]<15:0>;
```

Operational information

If `CPSR.DIT` is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.134 VMOV (immediate)

Copy immediate value to a SIMD&FP register places an immediate constant into every element of the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPXCR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMOV{<c>}{<q>}.I32 <Dd>, #<imm>

128-bit SIMD vector variant

Notes for all encodings

Related encodings: See *Advanced SIMD one register and modified immediate* on page F3-4442 for the T32 instruction set, or *Advanced SIMD one register and modified immediate* on page F4-4551 for the A32 instruction set.

Assembler symbols

- <c> For encoding A1, A3, A4 and A5: see *Standard assembler syntax fields* on page F1-4348. This encoding must be unconditional.
 For encoding A2, T1, T2, T3, T4 and T5: see *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <dt> The data type, encoded in the "cmode" field. It can have the following values:

I32	when cmode = 110x
I8	when cmode = 1110
F32	when cmode = 1111
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <imm> For encoding A1, A3, A4, A5, T1, T3, T4 and T5: is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F1-4365.
 For encoding A2 and T2: is a signed floating-point constant with 3-bit exponent and normalized 4 bits of precision, encoded in "imm4H:imm4L". For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 floating-point instructions* on page F1-4366.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if single_register then
        S[d] = imm32;
    else
```

```
for r = 0 to regs-1
  D[d+r] = imm64;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.135 VMOV (register)

Copy between FP registers copies the contents of one FP register to another.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-6112.

```

```
else  
    d = UInt(D:Vd); m = UInt(M:Vm); regs = 1;
```

Assembler symbols

- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
- <Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then  
    EncodingSpecificOperations(); CheckAdvSIMDorVFPEnabled(TRUE, advsimd);  
    if single_register then  
        S[d] = S[m];  
    else  
        for r = 0 to regs-1  
            D[d+r] = D[m+r];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.136 VMOV (register, SIMD)

Copy between SIMD registers copies the contents of one SIMD register to another

This instruction is an alias of the [VORR \(register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VORR \(register\)](#).
- The description of [VORR \(register\)](#) gives the operational pseudocode for this instruction.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMOV{<c>}{<q>}{. <dt>} <Dd>, <Dm>

is equivalent to

VORR{<c>}{<q>}{. <dt>} <Dd>, <Dm>, <Dm>

and is the preferred disassembly when N:Vn == M:Vm.

128-bit SIMD vector variant

Applies when Q == 1.

VMOV{<c>}{<q>}{. <dt>} <Qd>, <Qm>

is equivalent to

$VORR\{<c>\}\{<q>\}\{.<dt>\} <Qd>, <Qm>, <Qm>$

and is the preferred disassembly when $N:Vn == M:Vm$.

Assembler symbols

$<c>$	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
$<q>$	See Standard assembler syntax fields on page F1-4348 .
$<dt>$	An optional data type. $<dt>$ must not be F64, but it is otherwise ignored.
$<Qd>$	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as $<Qd>*2$.
$<Qm>$	Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as $<Qm>*2$.
$<Dd>$	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
$<Dm>$	Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

Operation for all encodings

The description of [VORR \(register\)](#) gives the operational pseudocode for this instruction.

F6.1.137 VMOV (general-purpose register to scalar)

Copy a general-purpose register to a vector element copies a byte, halfword, or word from a general-purpose register into an Advanced SIMD scalar.

On a Floating-point-only system, this instruction transfers one word to the upper or lower half of a double-precision floating-point register from a general-purpose register. This is an identical operation to the Advanced SIMD single word transfer.

For more information about scalars see [Advanced SIMD scalars on page F1-4374](#).

Depending on settings in the CPACR, NSACR, HCPTR, and FPFXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

    when '0x10' UNDEFINED;
d = UInt(D:Vd); t = UInt(Rt);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<size>	The data size. It must be one of: 8 Encoded as <code>opc1<1> = 1</code> . [x] is encoded in <code>opc1<0></code> , <code>opc2</code> . 16 Encoded as <code>opc1<1> = 0</code> , <code>opc2<0> = 1</code> . [x] is encoded in <code>opc1<0></code> , <code>opc2<1></code> . 32 Encoded as <code>opc1<1> = 0</code> , <code>opc2 = 0b00</code> . [x] is encoded in <code>opc1<0></code> . omitted Equivalent to 32.
<Dd[x]>	The scalar. The register <Dd> is encoded in D:Vd. For details of how [x] is encoded, see the description of <size>.
<Rt>	The source general-purpose register.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDorVFPEnabled(TRUE, advsimd);
    Elem[D[d],index,esize] = R[t]<size-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.138 VMOV (between general-purpose register and single-precision)

Copy a general-purpose register to or from a 32-bit SIMD&FP register. This instruction transfers the value held in a 32-bit SIMD&FP register to a general-purpose register, or the value held in a general-purpose register to a 32-bit SIMD&FP register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

To general-purpose register variant

Applies when op == 1.

VMOV{<c>}{<q>} <Rt>, <Sn>

Decode for all variants of this encoding

```
to_arm_register = (op == '1'); t = UInt(Rt); n = UInt(Vn:N);
if t == 15 then UNPREDICTABLE; // Armv8-A removes UNPREDICTABLE for R13
```

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

- <Rt> Is the general-purpose register that <Sn> will be transferred to or from, encoded in the "Rt" field.
- <Sn> Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Vn:N" field.
- <c> See [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations();
    CheckVFPEnabled(TRUE);
    if to_arm_register then
        R[t] = S[n];
    else
        S[n] = R[t];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.139 VMOV (scalar to general-purpose register)

Copy a vector element to a general-purpose register with sign or zero extension copies a byte, halfword, or word from an Advanced SIMD scalar to a general-purpose register. Bytes and halfwords can be either zero-extended or sign-extended.

On a Floating-point-only system, this instruction transfers one word from the upper or lower half of a double-precision floating-point register to a general-purpose register. This is an identical operation to the Advanced SIMD single word transfer.

For more information about scalars see [Advanced SIMD scalars on page F1-4374](#).

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

[x] is encoded in opc1<0>. omitted Equivalent to 32.
<Rt>	The destination general-purpose register.
<Dn[x]>	The scalar. For details of how [x] is encoded see the description of <dt>.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDorVFPEnabled(TRUE, advsimd);
    if unsigned then
        R[t] = ZeroExtend(Elem[D[n], index, esize], 32);
    else
        R[t] = SignExtend(Elem[D[n], index, esize], 32);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.140 VMOV (between two general-purpose registers and two single-precision registers)

Copy two general-purpose registers to a pair of 32-bit SIMD&FP registers transfers the contents of two consecutively numbered single-precision Floating-point registers to two general-purpose registers, or the contents of two general-purpose registers to a pair of single-precision Floating-point registers. The general-purpose registers do not have to be contiguous.

Depending on settings in the CPACR, NSACR, HCPTR, and FPFXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

31	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0		
I=1111				1	1	0	0	0	1	0	op	Rt2		Rt		1	0	1	0	0	0	M	1	Vm	
cond																									

From general-purpose registers variant

Applies when op == 0.

VMOV{<c>}{<q>} <Sm>, <Sm1>, <Rt>, <Rt2>

To general-purpose registers variant

Applies when op == 1.

VMOV{<c>}{<q>} <Rt>, <Rt2>, <Sm>, <Sm1>

Decode for all variants of this encoding

```
to_arm_registers = (op == '1'); t = UInt(Rt); t2 = UInt(Rt2); m = UInt(Vm:M);
if t == 15 || t2 == 15 || m == 31 then UNPREDICTABLE;
if to_arm_registers && t == t2 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If to_arm_registers && t == t2, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The value in the destination register is UNKNOWN.

If m == 31, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0

```

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-4442](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-4551](#) for the A32 instruction set.

Assembler symbols

<c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields* on page F1-4348.

<q> See *Standard assembler syntax fields* on page F1-4348.

<dt> Is the data type for the elements of the operand, encoded in the "U:imm3H" field. It can have the following values:

S8 when U = 0, imm3H = 001

S16 when U = 0, imm3H = 010

S32 when U = 0, imm3H = 100

U8 when U = 1, imm3H = 001

U16 when U = 1, imm3H = 010

U32 when U = 1, imm3H = 100

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for e = 0 to elements-1
    result = Int(Elem[Din[m],e,esize], unsigned);
    Elem[Q[d>1],e,2*esize] = result<2*esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.142 VMOVN

Vector Move and Narrow copies the least significant half of each element of a quadword vector into the corresponding elements of a doubleword vector.

The operand vector elements can be any one of 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

This instruction is used by the pseudo-instructions VRSHRN (zero) and VSHRN (zero). The pseudo-instruction is never the preferred disassembly.

d = UInt(D:Vd); m = UInt(M:Vm);
```

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).

- <dt> Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:
- I16 when size = 00
 - I32 when size = 01
 - I64 when size = 10
- The encoding size = 11 is reserved.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for e = 0 to elements-1
    Elem[D[d],e,esize] = Elem[Qin[m>>1],e,2*esize]<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.143 VMOVX

Vector Move extraction. This instruction copies the upper 16 bits of the 32-bit source SIMD&FP register into the lower 16 bits of the 32-bit destination SIMD&FP register, while clearing the remaining bits to zero.

Depending on settings in the CPACR, NSACR, HCPTR, and FPXCR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

T1 variant

VMOVX{<q>}.F16 <Sd>, <Sm>

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !HaveFP16Ext() then UNDEFINED;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
d = UInt(Vd:D); m = UInt(Vm:M);
```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    S[d] = Zeros(16) : S[m]<31:16>;
```

F6.1.144 VMRS

Move SIMD&FP Special register to general-purpose register moves the value of an Advanced SIMD and floating-point System register to a general-purpose register. When the specified System register is the **FPSCR**, a form of the instruction transfers the **FPSCR**.{N, Z, C, V} condition flags to the **APSR**.{N, Z, C, V} condition flags.

Depending on settings in the **CPACR**, **NSACR**, **HCPTR**, and **FPEXC** registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support on page G1-6112*.

When these settings permit the execution of Advanced SIMD and floating-point instructions, if the specified floating-point System register is not the **FPSCR**, the instruction is UNDEFINED if executed in User mode.

In an implementation that includes EL2, when **HCR.TID0** is set to 1, any VMRS access to **FPSID** from a Non-secure EL1 mode that would be permitted if **HCR.TID0** was set to 0 generates a Hyp Trap exception. For more information, see *ID group 0, Primary device identification registers on page G1-6135*.

For simplicity, the VMRS pseudocode does not show the possible trap to Hyp mode.

```

CONSTRAINED UNPREDICTABLE behavior

If !(reg IN {'000x', '0101', '011x', '1000'}), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction transfers an UNKNOWN value to the specified target register. When the Rt field holds the value 0b1111, the specified target register is the APSR.{N, Z, C, V} bits, and these bits become UNKNOWN. Otherwise, the specified target register is the register specified by the Rt field, R0 - R14.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<Rt> Is the general-purpose destination register, encoded in the "Rt" field. Is one of:

R0-R14 General-purpose register.

APSR_nzcv Permitted only when <spec_reg> is FPSCR. Encoded as 0b1111. The instruction transfers the FPSCR.{N, Z, C, V} condition flags to the APSR.{N, Z, C, V} condition flags.

<spec_reg> Is the source Advanced SIMD and floating-point System register, encoded in the "reg" field. It can have the following values:

FPSID when reg = 0000

FPSCR when reg = 0001

MVFR2 when reg = 0101

MVFR1 when reg = 0110

MVFR0 when reg = 0111

FPEXC when reg = 1000

The following encodings are UNPREDICTABLE:

- reg = 001x.
- reg = 0100.
- reg = 1001.
- reg = 101x.
- reg = 11xx.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations();
  if reg == '0001' then // FPSCR
    CheckVFPEnabled(TRUE);
    if t == 15 then
```

```
        PSTATE.<N,Z,C,V> = FPSR.<N,Z,C,V>;
    else
        R[t] = FPSCR;
    elsif PSTATE.EL == EL0 then
        UNDEFINED; // Non-FPSCR registers accessible only at PL1 or above
    else
        CheckVFPEnabled(FALSE); // Non-FPSCR registers are not affected by FPEXC.EN
        AArch32.CheckAdvSIMDorFPRegisterTraps(reg);
        case reg of
            when '0000' R[t] = FPSID;
            when '0101' R[t] = MVFR2;
            when '0110' R[t] = MVFR1;
            when '0111' R[t] = MVFR0;
            when '1000' R[t] = FPEXC;
            otherwise Unreachable(); // Dealt with above or in encoding-specific pseudocode
```

F6.1.145 VMSR

Move general-purpose register to SIMD&FP Special register moves the value of a general-purpose register to a floating-point System register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

When these settings permit the execution of Advanced SIMD and floating-point instructions:

- If the specified floating-point System register is FPSID or FPEXC, the instruction is UNDEFINED if executed in User mode.
- If the specified floating-point System register is the FPSID and the instruction is executed in a mode other than User mode, the instruction is ignored.

```

F6.1.147 VMUL (integer and polynomial)

Vector Multiply multiplies corresponding elements in two vectors.

For information about multiplying polynomials, see *Polynomial arithmetic over {0, 1}* on page A1-50.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support* on page G1-6112.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt> Is the data type for the elements of the operands, encoded in the "op:size" field. It can have the following values:
- | | |
|-----|------------------------|
| I8 | when op = 0, size = 00 |
| I16 | when op = 0, size = 01 |
| I32 | when op = 0, size = 10 |
| P8 | when op = 1, size = 00 |
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Elem[Din[n+r],e,esize]; op1val = Int(op1, unsigned);
      op2 = Elem[Din[m+r],e,esize]; op2val = Int(op2, unsigned);
      if polynomial then
        product = PolynomialMult(op1,op2);
      else
        product = (op1val*op2val)<2*esize-1:0>;
      if long_destination then
        Elem[Q[d>1],e,2*esize] = product;
      else
        Elem[D[d+r],e,esize] = product<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.

— The values of the NZCV flags.

F6.1.148 VMUL (by scalar)

Vector Multiply multiplies each element in a vector by a scalar, and places the results in a second vector.

For more information about scalars see [Advanced SIMD scalars on page F1-4374](#).

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

64-bit SIMD vector variant

Applies when Q == 0.

VMUL{<c>}{<q>}.<dt> {<Dd>}, <Dn>, <Dm>[<index>]

128-bit SIMD vector variant

Applies when Q == 1.

VMUL{<c>}{<q>}.<dt> {<Qd>}, <Qn>, <Dm>[<index>]

Decode for all variants of this encoding

```

if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' && size == '01' && !HaveFP16Ext()) then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
unsigned = FALSE; // "Don't care" value: TRUE produces same functionality
floating_point = (F == '1'); long_destination = FALSE;
d = UInt(D:Vd); n = UInt(N:Vn); regs = if Q == '0' then 1 else 2;
if size == '01' then esize = 16; elements = 4; m = UInt(Vm<2:0>); index = UInt(M:Vm<3>);
if size == '10' then esize = 32; elements = 2; m = UInt(Vm); index = UInt(M);
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VMUL{<c>}{<q>}.<dt> {<Dd>}, <Dn>, <Dm>[<index>]

128-bit SIMD vector variant

Applies when Q == 1.

VMUL{<c>}{<q>}.<dt> {<Qd>}, <Qn>, <Dm>[<index>]

Decode for all variants of this encoding

```
if size == '11' then SEE "Related encodings";  
if F == '1' && size == '01' && InITBlock() then UNPREDICTABLE;  
if size == '00' || (F == '1' && size == '01' && !HaveFP16Ext()) then UNDEFINED;  
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;  
unsigned = FALSE; // "Don't care" value: TRUE produces same functionality  
floating_point = (F == '1'); long_destination = FALSE;  
d = UInt(D:Vd); n = UInt(N:Vn); regs = if Q == '0' then 1 else 2;  
if size == '01' then esize = 16; elements = 4; m = UInt(Vm<2:0>); index = UInt(M:Vm<3>);  
if size == '10' then esize = 32; elements = 2; m = UInt(Vm); index = UInt(M);
```

CONSTRAINED UNPREDICTABLE behavior

If F == '1' && size == '01' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-4434](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-4543](#) for the A32 instruction set.

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	Is the data type for the scalar and the elements of the operand vector, encoded in the "F:size" field. It can have the following values: I16 when F = 0, size = 01 I32 when F = 0, size = 10 F16 when F = 1, size = 01 F32 when F = 1, size = 10
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register. When <dt> is I16 or F16, this is encoded in the "Vm<2:0>" field. Otherwise it is encoded in the "Vm" field.
<index>	Is the element index. When <dt> is I16 or F16, this is in the range 0 to 3 and is encoded in the "M:Vm<3>" field. Otherwise it is in the range 0 to 1 and is encoded in the "M" field.

Operation for all encodings

```
if ConditionPassed() then  
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();  
  op2 = Elem[Din[m],index,esize]; op2val = Int(op2, unsigned);
```

```
for r = 0 to regs-1
  for e = 0 to elements-1
    op1 = Elem[Din[n+r],e,esize]; op1val = Int(op1, unsigned);
    if floating_point then
      Elem[D[d+r],e,esize] = FPMul(op1, op2, StandardFPSCRValue());
    else
      if long_destination then
        Elem[Q[d>>1],e,2*esize] = (op1val*op2val)<2*esize-1:0>;
      else
        Elem[D[d+r],e,esize] = (op1val*op2val)<esize-1:0>;
```

F6.1.149 VMULL (integer and polynomial)

Vector Multiply Long multiplies corresponding elements in two vectors. The destination vector elements are twice as long as the elements that are multiplied.

For information about multiplying polynomials see *Polynomial arithmetic over {0, 1}* on page A1-50.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-6112.

```

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-4442](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-4551](#) for the A32 instruction set.

Assembler symbols

- <c> For encoding A1, A2 and A3: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1, T2 and T3: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <imm> Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions* on page F1-4365.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = NOT(imm64);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.152 VMVN (register)

Vector Bitwise NOT (register) takes a value from a register, inverts the value of each bit, and places the result in the destination register. The registers can be either doubleword or quadword.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

            else // VFP instruction
                case esize of
                    when 16 S[d] = Zeros(16) : FPNeg(S[m]<15:0>);
                    when 32 S[d] = FPNeg(S[m]);
                    when 64 D[d] = FPNeg(D[m]);
  
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check and is operating only on integer vector elements, then the following apply:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.154 VNMLA

Vector Negate Multiply Accumulate multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the negation of the product, and writes the result back to the destination register.

Note

Arm recommends that software does not use the VNMLA instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the CPACR, NSACR, HCPTR, and FPEXC registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

```

CONSTRAINED UNPREDICTABLE behavior

If size == '01' && cond != '1110', then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1

Half-precision scalar variant

Applies when size == 01.

VNMLS{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>

Single-precision scalar variant

Applies when size == 10.

VNMLS{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>

Double-precision scalar variant

Applies when size == 11.

        when VFPNegMu1_VNMUL D[d] = FPNeg(product64);
```

F6.1.156 VNMUL

Vector Negate Multiply multiplies together two floating-point register values, and writes the negation of the result to the destination register.

Depending on settings in the CPACR, NSACR, HCPTR, and FPExc registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

F6.1.157 VORN (immediate)

Vector Bitwise OR NOT (immediate) performs a bitwise OR between a register value and the complement of an immediate value, and returns the result into the destination vector

This instruction is a pseudo-instruction of the [VORR \(immediate\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VORR \(immediate\)](#).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of [VORR \(immediate\)](#) gives the operational pseudocode for this instruction.

128-bit SIMD vector variant

Applies when Q == 1.

VORN{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
 d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

Assembler symbols

<c>	For encoding A1: see <i>Standard assembler syntax fields</i> on page F1-4348. This encoding must be unconditional. For encoding T1: see <i>Standard assembler syntax fields</i> on page F1-4348.
<q>	See <i>Standard assembler syntax fields</i> on page F1-4348.
<dt>	An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] OR NOT(D[m+r]);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.159 VORR (immediate)

Vector Bitwise OR (immediate) performs a bitwise OR between a register value and an immediate value, and returns the result into the destination vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

This instruction is used by the pseudo-instruction [VORN \(immediate\)](#). The pseudo-instruction is never the preferred disassembly.

VORR{<c>}{<q>}{.<dt>} {<Dd>}, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VORR{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	0	1	1	1	1	0	D	1	0	Vn	Vd	0	0	0	1	N	Q	M	1	Vm			

64-bit SIMD vector variant

Applies when Q == 0.

VORR{<c>}{<q>}{.<dt>} {<Dd>}, <Dn>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VORR{<c>}{<q>}{.<dt>} {<Qd>}, <Qn>, <Qm>

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

Alias conditions

Alias or pseudo-instruction	is preferred when
VMOV (register, SIMD)	N:Vn == M:Vm
VRSHR (zero)	Never
VSHR (zero)	Never

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] OR D[m+r];
  
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.161 VPADAL

Vector Pairwise Add and Accumulate Long adds adjacent pairs of elements of a vector, and accumulates the results into the elements of the destination vector.

The vectors can be doubleword or quadword. The operand elements can be 8-bit, 16-bit, or 32-bit integers. The result elements are twice the length of the operand elements.

The following figure shows the operation of VPADAL doubleword operation for data type S16.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

64-bit SIMD vector variant

Applies when Q == 0.

VPADAL{<c>}{<q>}.<dt> <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VPADAL{<c>}{<q>}.<dt> <Qd>, <Qm>

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
unsigned = (op == '1');
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
```

Assembler symbols

<c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.

For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<dt> Is the data type for the elements of the vectors, encoded in the "op:size" field. It can have the following values:

S8 when op = 0, size = 00

S16 when op = 0, size = 01

S32 when op = 0, size = 10

U8 when op = 1, size = 00

U16 when op = 1, size = 01

U32 when op = 1, size = 10

The following encodings are reserved:

- op = 0, size = 11.
- op = 1, size = 11.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  h = elements DIV 2;

  for r = 0 to regs-1
    for e = 0 to h-1
      op1 = Elem[D[m+r],2*e,esize]; op2 = Elem[D[m+r],2*e+1,esize];
      result = Int(op1, unsigned) + Int(op2, unsigned);
      Elem[D[d+r],e,2*esize] = Elem[D[d+r],e,2*esize] + result;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.162 VPADD (floating-point)

Vector Pairwise Add (floating-point) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The operands and result are doubleword vectors.

The operand and result elements are floating-point numbers.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	16	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	0	0	1	1	0	D	0	sz	Vn	Vd	1	1	0	1	N	Q	M	0	Vm			

A1 variant

VPADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

Decode for this encoding

```

if Q == '1' then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
    
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	0	15	12	11	10	9	8	7	6	5	4	3	0
1	1	1	1	1	1	1	0	D	0	sz	Vn	Vd	1	1	0	1	N	Q	M	0	Vm				

T1 variant

VPADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

Decode for this encoding

```

if Q == '1' then UNDEFINED;
if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
    
```

CONSTRAINED UNPREDICTABLE behavior

If sz == '1' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.

- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

<C>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values: F32 when sz = 0 F16 when sz = 1
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(64) dest;
    h = elements DIV 2;

    for e = 0 to h-1
        Elem[dest,e,esize] = FPAdd(Elem[D[n],2*e,esize], Elem[D[n],2*e+1,esize],
StandardFPSCRValue());
        Elem[dest,e+h,esize] = FPAdd(Elem[D[m],2*e,esize], Elem[D[m],2*e+1,esize],
StandardFPSCRValue());

    D[d] = dest;
```

F6.1.163 VPADD (integer)

Vector Pairwise Add (integer) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The operands and result are doubleword vectors.

The operand and result elements must all be the same type, and can be 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.

The following figure shows the operation of VPADD doubleword operation for data type I16.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

op

T1 variant

VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

Decode for this encoding

```
if size == '11' then UNDEFINED;
maximum = (op == '0'); unsigned = (U == '1');
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	Is the data type for the elements of the operands, encoded in the "U:size" field. It can have the following values: S8 when U = 0, size = 00 S16 when U = 0, size = 01 S32 when U = 0, size = 10 U8 when U = 1, size = 00 U16 when U = 1, size = 01 U32 when U = 1, size = 10
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(64) dest;
    h = elements DIV 2;

    for e = 0 to h-1
        op1 = Int(Elem[D[n],2*e,esize], unsigned);
        op2 = Int(Elem[D[n],2*e+1,esize], unsigned);
        result = if maximum then Max(op1,op2) else Min(op1,op2);
        Elem[dest,e,esize] = result<esize-1:0>;
        op1 = Int(Elem[D[m],2*e,esize], unsigned);
        op2 = Int(Elem[D[m],2*e+1,esize], unsigned);
        result = if maximum then Max(op1,op2) else Min(op1,op2);
        Elem[dest,e+h,esize] = result<esize-1:0>;

    D[d] = dest;
  
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.167 VPMIN (floating-point)

Vector Pairwise Minimum compares adjacent pairs of elements in two doubleword vectors, and copies the smaller of each pair into the corresponding element in the destination doubleword vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

A1 variant

VPMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

Decode for this encoding

```

if sz == '1' && !HaveFP16Ext() then UNDEFINED;
maximum = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
    
```

T1

T1 variant

VPMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>

Decode for this encoding

```

if sz == '1' && !HaveFP16Ext() then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
maximum = (op == '0');
case sz of
    when '0' esize = 32; elements = 2;
    when '1' esize = 16; elements = 4;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
    
```

CONSTRAINED UNPREDICTABLE behavior

If sz == '1' && InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler symbols

- <c> For encoding A1: see *Standard assembler syntax fields* on page F1-4348. This encoding must be unconditional.
 For encoding T1: see *Standard assembler syntax fields* on page F1-4348.
- <q> See *Standard assembler syntax fields* on page F1-4348.
- <dt> Is the data type for the elements of the vectors, encoded in the "sz" field. It can have the following values:
 F32 when sz = 0
 F16 when sz = 1
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    bits(64) dest;
    h = elements DIV 2;

    for e = 0 to h-1
        op1 = Elem[D[n],2*e,esize]; op2 = Elem[D[n],2*e+1,esize];
        Elem[dest,e,esize] = if maximum then FPMax(op1,op2,StandardFPSCRValue()) else
FPMin(op1,op2,StandardFPSCRValue());
        op1 = Elem[D[m],2*e,esize]; op2 = Elem[D[m],2*e+1,esize];
        Elem[dest,e+h,esize] = if maximum then FPMax(op1,op2,StandardFPSCRValue()) else
FPMin(op1,op2,StandardFPSCRValue());

    D[d] = dest;
  
```

F6.1.168 VPMIN (integer)

Vector Pairwise Minimum compares adjacent pairs of elements in two doubleword vectors, and copies the smaller of each pair into the corresponding element in the destination doubleword vector.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode.  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.169 VPOP

Pop SIMD&FP registers from Stack loads multiple consecutive Advanced SIMD and floating-point register file registers from the stack

This instruction is an alias of the [VLDM](#), [VLDMDB](#), [VLDMIA](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VLDM](#), [VLDMDB](#), [VLDMIA](#).
- The description of [VLDM](#), [VLDMDB](#), [VLDMIA](#) gives the operational pseudocode for this instruction.

A1

Increment After variant

VPOP{<c>}{<q>}{.<size>} <dreglist>

is equivalent to

VLDM{<c>}{<q>}{.<size>} SP!, <dreglist>

and is always the preferred disassembly.

A2

Increment After variant

VPOP{<c>}{<q>}{.<size>} <sreglist>

is equivalent to

VLDM{<c>}{<q>}{.<size>} SP!, <sreglist>

and is always the preferred disassembly.

T1

Increment After variant

VPOP{<c>}{<q>}{.<size>} <dreglist>

is equivalent to

VLDM{<c>}{<q>}{.<size>} SP!, <dreglist>

and is always the preferred disassembly.

T2

Increment After variant

VPOP{<c>}{<q>}{.<size>} <sreglist>

is equivalent to

VLDM{<c>}{<q>}{.<size>} SP!, <sreglist>

and is always the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<size> An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.

<sreglist> Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.

<dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

The description of [VLDM](#), [VLDMDB](#), [VLDMIA](#) gives the operational pseudocode for this instruction.

F6.1.170 VPUSH

Push SIMD&FP registers to Stack stores multiple consecutive registers from the Advanced SIMD and floating-point register file to the stack

This instruction is an alias of the [VSTM](#), [VSTMDB](#), [VSTMIA](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [VSTM](#), [VSTMDB](#), [VSTMIA](#).
- The description of [VSTM](#), [VSTMDB](#), [VSTMIA](#) gives the operational pseudocode for this instruction.

A1

Decrement Before variant

VPUSH{<c>}{<q>}{.<size>} <dreglist>

is equivalent to

VSTMDB{<c>}{<q>}{.<size>} SP!, <dreglist>

and is always the preferred disassembly.

A2

Decrement Before variant

VPUSH{<c>}{<q>}{.<size>} <sreglist>

is equivalent to

VSTMDB{<c>}{<q>}{.<size>} SP!, <sreglist>

and is always the preferred disassembly.

T1

Decrement Before variant

VPUSH{<c>}{<q>}{.<size>} <dreglist>

is equivalent to

VSTMDB{<c>}{<q>}{.<size>} SP!, <dreglist>

and is always the preferred disassembly.

T2

Decrement Before variant

VPUSH{<c>}{<q>}{.<size>} <sreglist>

is equivalent to

VSTMDB{<c>}{<q>}{.<size>} SP!, <sreglist>

and is always the preferred disassembly.

Assembler symbols

<c> See [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<size> An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.

<sreglist> Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.

<dreglist> Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation for all encodings

The description of [VSTM](#), [VSTMDB](#), [VSTMIA](#) gives the operational pseudocode for this instruction.

F6.1.171 VQABS

Vector Saturating Absolute takes the absolute value of each element in a vector, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, `FPSCR.QC`, is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-4251](#).

Depending on settings in the `CPACR`, `NSACR`, and `HCPTTR` registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be `UNDEFINED`, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-4434](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-4543](#) for the A32 instruction set.

Assembler symbols

- <c> For encoding A1 and A2: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1 and T2: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
 - S16 when size = 01
 - S32 when size = 10
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> For encoding A1 and T1: is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
For encoding A2 and T2: is the 64-bit name of the second SIMD&FP source register, encoded in the "Vm<2:0>" field when <dt> is S16, otherwise the "Vm" field.
- <index> Is the element index in the range 0 to 3, encoded in the "M:Vm<3>" field when <dt> is S16, otherwise in range 0 to 1, encoded in the "M" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    if scalar_form then op2 = SInt(Elem[Din[m],index,esize]);
    for e = 0 to elements-1
        if !scalar_form then op2 = SInt(Elem[Din[m],e,esize]);
        op1 = SInt(Elem[Din[n],e,esize]);
        // The following only saturates if both op1 and op2 equal -(2^(esize-1))
        (product, sat1) = SignedSatQ(2*op1*op2, 2*esize);
        if add then
            result = SInt(Elem[Qin[d>>1],e,2*esize]) + SInt(product);
        else
            result = SInt(Elem[Qin[d>>1],e,2*esize]) - SInt(product);
        (Elem[Q[d>>1],e,2*esize], sat2) = SignedSatQ(result, 2*esize);
    if sat1 || sat2 then FPSCR.QC = '1';
```

F6.1.174 VQDMLSL

Vector Saturating Doubling Multiply Subtract Long multiplies corresponding elements in two doubleword vectors, subtracts double the products from corresponding elements of a quadword vector, and places the results in the same quadword vector.

The second operand can be a scalar instead of a vector. For more information about scalars see *Advanced SIMD scalars* on page F1-4374.

If any of the results overflow, they are saturated. The cumulative saturation bit, FPSCR.QC, is set if saturation occurs. For details see *Pseudocode description of saturation* on page E1-4251.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-6112.

```

F6.1.177 VQMOVN, VQMOVUN

Vector Saturating Move and Narrow copies each element of the operand vector to the corresponding element of the destination vector.

The operand is a quadword vector. The elements can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result is a doubleword vector. The elements are half the length of the operand vector elements. If the operand is unsigned, the results are unsigned. If the operand is signed, the results can be signed or unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, `FPSCR.QC`, is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-4251](#).

Depending on settings in the `CPACR`, `NSACR`, and `HCPTTR` registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

This instruction is used by the pseudo-instructions `VQRSHRN (zero)`, `VQRSHRUN (zero)`, `VQSHRN (zero)`, and `VQSHRUN (zero)`. The pseudo-instruction is never the preferred disassembly.

Assembler symbols

<c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.

For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<dt> For the signed result variant: is the data type for the elements of the operand, encoded in the "op<0>:size" field. It can have the following values:

S16	when op<0> = 0, size = 00
S32	when op<0> = 0, size = 01
S64	when op<0> = 0, size = 10
U16	when op<0> = 1, size = 00
U32	when op<0> = 1, size = 01
U64	when op<0> = 1, size = 10

The following encodings are reserved:

- op<0> = 0, size = 11.
- op<0> = 1, size = 11.

For the unsigned result variant: is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:

S16	when size = 00
S32	when size = 01
S64	when size = 10

The encoding size = 11 is reserved.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for e = 0 to elements-1
    operand = Int(Elem[Qin[m>>1],e,2*esize], src_unsigned);
    (Elem[D[d],e,esize], sat) = SatQ(operand, esize, dest_unsigned);
    if sat then FPSCR.QC = '1';
```

F6.1.178 VQNEG

Vector Saturating Negate negates each element in a vector, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, `FPSCR.QC`, is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-4251](#).

Depending on settings in the `CPACR`, `NSACR`, and `HCPTR` registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

    if sat then FPSCR.QC = '1';
```

F6.1.181 VQRDMULH

Vector Saturating Rounding Doubling Multiply Returning High Half multiplies corresponding elements in two vectors, doubles the results, and places the most significant half of the final results in the destination vector. The results are rounded. For truncated results see [VQDMULH](#).

The second operand can be a scalar instead of a vector. For more information about scalars see [Advanced SIMD scalars](#) on page F1-4374.

If any of the results overflow, they are saturated. The cumulative saturation bit, `FPSCR.QC`, is set if saturation occurs. For details see [Pseudocode description of saturation](#) on page E1-4251.

Depending on settings in the `CPACR`, `NSACR`, and `HCPTR` registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support](#) on page G1-6112.

```

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-4434](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-4543](#) for the A32 instruction set.

Assembler symbols

- <c> For encoding A1 and A2: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
 For encoding T1 and T2: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
 - S16 when size = 01
 - S32 when size = 10
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm[x]> Is the 64-bit name of the second SIMD&FP source register holding the scalar. If <dt> is S16, Dm is restricted to D0-D7. Dm is encoded in "Vm<2:0>", and x is encoded in "M:Vm<3>". If <dt> is S32, Dm is restricted to D0-D15. Dm is encoded in "Vm", and x is encoded in "M".
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  round_const = 1 << (esize-1);
  if scalar_form then op2 = SInt(Elem[D[m],index,esize]);
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = SInt(Elem[D[n+r],e,esize]);
      if !scalar_form then op2 = SInt(Elem[D[m+r],e,esize]);
      (result, sat) = SignedSatQ((2*op1*op2 + round_const) >> esize, esize);
      Elem[D[d+r],e,esize] = result;
      if sat then FPSCR.QC = '1';
```

F6.1.182 VQRSHL

Vector Saturating Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

For truncated results see [VQSHL \(register\)](#).

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, [FPSCR.QC](#), is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-4251](#).

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

Notes for all encodings

Related encodings: See [Advanced SIMD one register and modified immediate on page F3-4442](#) for the T32 instruction set, or [Advanced SIMD one register and modified immediate on page F4-4551](#) for the A32 instruction set.

Assembler symbols

<c>	For encoding A1: see Standard assembler syntax fields on page F1-4348 . This encoding must be unconditional. For encoding T1: see Standard assembler syntax fields on page F1-4348 .
<q>	See Standard assembler syntax fields on page F1-4348 .
<type>	Is the data type for the elements of the vectors, encoded in the "U" field. It can have the following values: S when U = 0 U when U = 1

<size>	Is the data size for the elements of the vectors, encoded in the "L:imm6<5:3>" field. It can have the following values: 8 when L = 0, imm6<5:3> = 001 16 when L = 0, imm6<5:3> = 01x 32 when L = 0, imm6<5:3> = 1xx 64 when L = 1, imm6<5:3> = xxx
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qm>	Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.
<imm>	Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            operand = Int(Elem[D[m+r],e,esize], src_unsigned);
            (result, sat) = SatQ(operand << shift_amount, esize, dest_unsigned);
            Elem[D[d+r],e,esize] = result;
            if sat then FPSCR.QC = '1';
```

F6.1.187 VQSHL (register)

Vector Saturating Shift Left (register) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

The results are truncated. For rounded results, see [VQRSHL](#).

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, [FPSCR.QC](#), is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-4251](#).

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

and is never the preferred disassembly.

Assembler symbols

<c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.

For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).

<q> See [Standard assembler syntax fields on page F1-4348](#).

<dt> Is the data type for the elements of the operand, encoded in the "op<0>:size" field. It can have the following values:

S16	when op<0> = 0, size = 00
S32	when op<0> = 0, size = 01
S64	when op<0> = 0, size = 10
U16	when op<0> = 1, size = 00

U32 when $op<0> = 1$, size = 01

U64 when $op<0> = 1$, size = 10

The following encodings are reserved:

- $op<0> = 0$, size = 11.
- $op<0> = 1$, size = 11.

$<Dd>$ Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

$<Qm>$ Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as $<Qm>*2$.

Operation for all encodings

The description of [VQMOVN](#), [VQMOVUN](#) gives the operational pseudocode for this instruction.

F6.1.189 VQSHRN, VQSHRUN

Vector Saturating Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the truncated results in a doubleword vector.

For rounded results, see [VQRSHRN](#), [VQRSHRUN](#).

The operand elements must all be the same size, and can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result elements are half the width of the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, [FPSCR.QC](#), is set if saturation occurs. For details see [Pseudocode description of saturation on page E1-4251](#).

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

| U8 | when U = 1, size = 00 |
| U16 | when U = 1, size = 01 |
| U32 | when U = 1, size = 10 |
| U64 | when U = 1, size = 11 |
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      diff = Int(Elem[D[n+r],e,esize], unsigned) - Int(Elem[D[m+r],e,esize], unsigned);
      (Elem[D[d+r],e,esize], sat) = SatQ(diff, esize, unsigned);
      if sat then FPSCR.QC = '1';
  
```

F6.1.192 VRADDHN

Vector Rounding Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are rounded. For truncated results, see [VADDHN](#).

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

A1

A1 variant

VRADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

T1

T1 variant

VRADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
esize = 8 << UInt(size); elements = 64 DIV esize;
d = UInt(D:Vd); n = UInt(N:Vn); m = UInt(M:Vm);
```

Notes for all encodings

Related encodings: See [Advanced SIMD data-processing on page F3-4434](#) for the T32 instruction set, or [Advanced SIMD data-processing on page F4-4543](#) for the A32 instruction set.

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
- For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).

- <q> See *Standard assembler syntax fields* on page F1-4348.
- <dt> Is the data type for the elements of the operands, encoded in the "size" field. It can have the following values:
- I16 when size = 00
 - I32 when size = 01
 - I64 when size = 10
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
- <Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();
    round_const = 1 << (esize-1);
    for e = 0 to elements-1
        result = Elem[Qin[n>>1],e,2*esize] + Elem[Qin[m>>1],e,2*esize] + round_const;
        Elem[D[d],e,esize] = result<2*esize-1:esize>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.193 VRECPE

Vector Reciprocal Estimate finds an approximate reciprocal of each element in the operand vector, and places the results in the destination vector.

The operand and result elements are the same type, and can be floating-point numbers or unsigned integers.

For details of the operation performed by this instruction see *Floating-point reciprocal square root estimate and step* on page E1-4276.

Depending on settings in the CPACR, NSACR, and HCPTR registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support* on page G1-6112.

case op of
    when '10' container_size = 16;
    when '01' container_size = 32;
    when '00' container_size = 64;
integer containers = 64 DIV container_size;
integer elements_per_container = container_size DIV esize;

d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

```

Assembler symbols

- <c> For encoding A1: see [Standard assembler syntax fields on page F1-4348](#). This encoding must be unconditional.
For encoding T1: see [Standard assembler syntax fields on page F1-4348](#).
- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt> Is the data type for the elements of the operand, encoded in the "size" field. It can have the following values:
 - 8 when size = 00
 - 16 when size = 01
 - 32 when size = 10
 The encoding size = 11 is reserved.
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckAdvSIMDEnabled();

    bits(64) result;
    integer element;
    integer rev_element;
    for r = 0 to regs-1
        element = 0;
        for c = 0 to containers-1
            rev_element = element + elements_per_container - 1;
            for e = 0 to elements_per_container-1
                Elem[result, rev_element, esize] = Elem[D[m+r], element, esize];
                element = element + 1;
                rev_element = rev_element - 1;
            D[d+r] = result;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.198 VRHADD

Vector Rounding Halving Add adds corresponding elements in two vectors of integers, shifts each result right one bit, and places the final results in the destination vector.

The operand and result elements are all the same type, and can be any one of:

- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The results of the halving operations are rounded. For truncated results, see [VHADD](#).

Depending on settings in the [CPACR](#), [NSACR](#), and [HCPTR](#) registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see [Enabling Advanced SIMD and floating-point support on page G1-6112](#).

- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

if ConditionPassed() then
  EncodingSpecificOperations(); CheckAdvSIMDEnabled();
  for r = 0 to regs-1
    for e = 0 to elements-1
      op1 = Int(Elem[D[n+r],e,esize], unsigned);
      op2 = Int(Elem[D[m+r],e,esize], unsigned);
      result = op1 + op2 + 1;
      Elem[D[d+r],e,esize] = result<esize:1>;
  
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

F6.1.199 VRINTA (Advanced SIMD)

Vector Round floating-point to integer towards Nearest with Ties to Away rounds a vector of floating-point values to integral floating-point values of the same size using the Round to Nearest with Ties to Away rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VRINTA{<q>}.<dt> <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VRINTA{<q>}.<dt> <Qd>, <Qm>

Decode for all variants of this encoding

```

if op<2> != op<0> then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
// Rounding encoded differently from other VCVT and VRINT instructions
rounding = FPDecodeRM(op<2>:NOT(op<1>)); exact = FALSE;
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VRINTA{<q>}.<dt> <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VRINTA{<q>}.<dt> <Qd>, <Qm>

Decode for all variants of this encoding

```

if op<2> != op<0> then SEE "Related encodings";
if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
    
```

```

if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
// Rounding encoded differently from other VCVT and VRINT instructions
rounding = FPDecodeRM(op<2>:NOT(op<1>)); exact = FALSE;
case size of
  when '01' esize = 16; elements = 4;
  when '10' esize = 32; elements = 2;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See [Advanced SIMD two registers misc on page F3-4437](#) for the T32 instruction set, or [Advanced SIMD two registers misc on page F4-4547](#) for the A32 instruction set.

Assembler symbols

- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt> Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:
- | | |
|-----|----------------|
| F16 | when size = 01 |
| F32 | when size = 10 |
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for r = 0 to regs-1
  for e = 0 to elements-1
    op1 = Elem[D[m+r],e,esize];
    result = FPRoundInt(op1, StandardFPSCRValue(), rounding, exact);
    Elem[D[d+r],e,esize] = result;

```

F6.1.200 VRINTA (floating-point)

Round floating-point to integer to Nearest with Ties to Away rounds a floating-point value to an integral floating-point value of the same size using the Round to Nearest with Ties to Away rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

Assembler symbols

<q>	See Standard assembler syntax fields on page F1-4348 .
<dt>	Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values: F16 when size = 01 F32 when size = 10
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qm>	Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for r = 0 to regs-1
  for e = 0 to elements-1
    op1 = Elem[D[m+r],e,esize];
    result = FPRoundInt(op1, StandardFPSCRValue(), rounding, exact);
    Elem[D[d+r],e,esize] = result;
  
```

F6.1.204 VRINTN (floating-point)

Round floating-point to integer to Nearest rounds a floating-point value to an integral floating-point value of the same size using the Round to Nearest rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A1

Half-precision scalar variant

Applies when size == 01.

VRINTN{<q>}.F16 <Sd>, <Sm>

Single-precision scalar variant

Applies when size == 10.

VRINTN{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when size == 11.

VRINTN{<q>}.F64 <Dd>, <Dm>

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM); exact = FALSE;
case size of
    when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

Half-precision scalar variant

Applies when size == 01.

VRINTN{<q>}.F16 <Sd>, <Sm>

Single-precision scalar variant

Applies when size == 10.

VRINTN{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when size == 11.

VRINTN{<q>}.F64 <Dd>, <Dm>

Decode for all variants of this encoding

```

if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM); exact = FALSE;
case size of
  when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
  when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
  when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
  
```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<q>	See Standard assembler syntax fields on page F1-4348 .
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
case esize of
  when 16
    S[d] = Zeros(16) : FPRoundInt(S[m]<15:0>, FPSCR[], rounding, exact);
  when 32
    S[d] = FPRoundInt(S[m], FPSCR[], rounding, exact);
  when 64
    D[d] = FPRoundInt(D[m], FPSCR[], rounding, exact);
  
```

F6.1.205 VRINTP (Advanced SIMD)

Vector Round floating-point to integer towards +Infinity rounds a vector of floating-point values to integral floating-point values of the same size using the Round towards +Infinity rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A1

64-bit SIMD vector variant

Applies when Q == 0.

VRINTP{<q>}.<dt> <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VRINTP{<q>}.<dt> <Qd>, <Qm>

Decode for all variants of this encoding

```

if op<2> != op<0> then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
// Rounding encoded differently from other VCVT and VRINT instructions
rounding = FPDecodeRM(op<2>:NOT(op<1>)); exact = FALSE;
case size of
    when '01' esize = 16; elements = 4;
    when '10' esize = 32; elements = 2;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;
    
```

T1

64-bit SIMD vector variant

Applies when Q == 0.

VRINTP{<q>}.<dt> <Dd>, <Dm>

128-bit SIMD vector variant

Applies when Q == 1.

VRINTP{<q>}.<dt> <Qd>, <Qm>

Decode for all variants of this encoding

```

if op<2> != op<0> then SEE "Related encodings";
if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
    
```

```

if (size == '01' && !HaveFP16Ext()) || size IN {'00', '11'} then UNDEFINED;
// Rounding encoded differently from other VCVT and VRINT instructions
rounding = FPDecodeRM(op<2>:NOT(op<1>)); exact = FALSE;
case size of
  when '01' esize = 16; elements = 4;
  when '10' esize = 32; elements = 2;
d = UInt(D:Vd); m = UInt(M:Vm); regs = if Q == '0' then 1 else 2;

```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

Related encodings: See [Advanced SIMD two registers misc on page F3-4437](#) for the T32 instruction set, or [Advanced SIMD two registers misc on page F4-4547](#) for the A32 instruction set.

Assembler symbols

- <q> See [Standard assembler syntax fields on page F1-4348](#).
- <dt> Is the data type for the elements of the vectors, encoded in the "size" field. It can have the following values:
- | | |
|-----|----------------|
| F16 | when size = 01 |
| F32 | when size = 10 |
- <Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
- <Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
- <Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

EncodingSpecificOperations(); CheckAdvSIMDEnabled();
for r = 0 to regs-1
  for e = 0 to elements-1
    op1 = Elem[D[m+r],e,esize];
    result = FPRoundInt(op1, StandardFPSCRValue(), rounding, exact);
    Elem[D[d+r],e,esize] = result;

```

F6.1.206 VRINTP (floating-point)

Round floating-point to integer towards +Infinity rounds a floating-point value to an integral floating-point value of the same size using the Round towards +Infinity rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A1

Half-precision scalar variant

Applies when size == 01.

VRINTP{<q>}.F16 <Sd>, <Sm>

Single-precision scalar variant

Applies when size == 10.

VRINTP{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when size == 11.

VRINTP{<q>}.F64 <Dd>, <Dm>

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM); exact = FALSE;
case size of
    when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
    when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
    when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
```

T1

Half-precision scalar variant

Applies when size == 01.

VRINTP{<q>}.F16 <Sd>, <Sm>

Single-precision scalar variant

Applies when size == 10.

VRINTP{<q>}.F32 <Sd>, <Sm>

Double-precision scalar variant

Applies when size == 11.

VRINTP{<q>}.F64 <Dd>, <Dm>

Decode for all variants of this encoding

```

if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !HaveFP16Ext()) then UNDEFINED;
rounding = FPDecodeRM(RM); exact = FALSE;
case size of
  when '01' esize = 16; d = UInt(Vd:D); m = UInt(Vm:M);
  when '10' esize = 32; d = UInt(Vd:D); m = UInt(Vm:M);
  when '11' esize = 64; d = UInt(D:Vd); m = UInt(M:Vm);
  
```

CONSTRAINED UNPREDICTABLE behavior

If InITBlock(), then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Notes for all encodings

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#).

Assembler symbols

<q>	See Standard assembler syntax fields on page F1-4348 .
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation for all encodings

```

EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
case esize of
  when 16
    S[d] = Zeros(16) : FPRoundInt(S[m]<15:0>, FPSCR[], rounding, exact);
  when 32
    S[d] = FPRoundInt(S[m], FPSCR[], rounding, exact);
  when 64
    D[d] = FPRoundInt(D[m], FPSCR[], rounding, exact);
  
```

F6.1.207 VRINTR

Round floating-point to integer rounds a floating-point value to an integral floating-point value of the same size using the rounding mode specified in the FPSCR. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A1

Half-precision scalar variant

Applies when size == 01.

VRINTR{<c>}{<q>}.F16 <Sd>, <Sm>
