Logical Shift Left (register) shifts a register value left by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is left-shifted.

This instruction is an alias of the [LSLV](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LSLV](#).
- The description of [LSLV](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0`.

LSL <Wd>, <Wn>, <Wm>

is equivalent to

LSLV <Wd>, <Wn>, <Wm>

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1`.

LSL <Xd>, <Xn>, <Xm>

is equivalent to

LSLV <Xd>, <Xn>, <Xm>

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

Operation

The description of [LSLV](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.179 LSL (immediate)

Logical Shift Left (immediate) shifts a register value left by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the [UBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [UBFM](#).
- The description of [UBFM](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when $sf == 0 \ \&\& \ N == 0 \ \&\& \ imms \neq 011111$.

LSL <Wd>, <Wn>, #<shift>

is equivalent to

UBFM <Wd>, <Wn>, #(-<shift> MOD 32), #(31-<shift>)

and is the preferred disassembly when $imms + 1 == immr$.

64-bit variant

Applies when $sf == 1 \ \&\& \ N == 1 \ \&\& \ imms \neq 111111$.

LSL <Xd>, <Xn>, #<shift>

is equivalent to

UBFM <Xd>, <Xn>, #(-<shift> MOD 64), #(63-<shift>)

and is the preferred disassembly when $imms + 1 == immr$.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

<shift> For the 32-bit variant: is the shift amount, in the range 0 to 31.

For the 64-bit variant: is the shift amount, in the range 0 to 63.

Operation

The description of [UBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.180 LSLV

Logical Shift Left Variable shifts a register value left by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is left-shifted.

This instruction is used by the alias [LSL \(register\)](#). The alias is always the preferred disassembly.

32-bit variant

Applies when sf == 0.

LSLV <Wd>, <Wn>, <Wm>

64-bit variant

Applies when sf == 1.

LSLV <Xd>, <Xn>, <Xm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
ShiftType shift_type = DecodeShift(op2);
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

Operation

```
bits(datasize) result;
bits(datasize) operand2 = X[m];

result = ShiftReg(n, shift_type, UInt(operand2) MOD datasize);
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.181 LSR (register)

Logical Shift Right (register) shifts a register value right by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is an alias of the [LSRV](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LSRV](#).
- The description of [LSRV](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0`.

LSR <Wd>, <Wn>, <Wm>

is equivalent to

LSRV <Wd>, <Wn>, <Wm>

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1`.

LSR <Xd>, <Xn>, <Xm>

is equivalent to

LSRV <Xd>, <Xn>, <Xm>

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

Operation

The description of [LSRV](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.182 LSR (immediate)

Logical Shift Right (immediate) shifts a register value right by an immediate number of bits, shifting in zeros, and writes the result to the destination register.

This instruction is an alias of the [UBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [UBFM](#).
- The description of [UBFM](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when $sf == 0 \ \&\& \ N == 0 \ \&\& \ imms == 011111$.

LSR <Wd>, <Wn>, #<shift>

is equivalent to

UBFM <Wd>, <Wn>, #<shift>, #31

and is always the preferred disassembly.

64-bit variant

Applies when $sf == 1 \ \&\& \ N == 1 \ \&\& \ imms == 111111$.

LSR <Xd>, <Xn>, #<shift>

is equivalent to

UBFM <Xd>, <Xn>, #<shift>, #63

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

<shift> For the 32-bit variant: is the shift amount, in the range 0 to 31, encoded in the "immr" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, encoded in the "immr" field.

Operation

The description of [UBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.183 LSRV

Logical Shift Right Variable shifts a register value right by a variable number of bits, shifting in zeros, and writes the result to the destination register. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is used by the alias [LSR \(register\)](#). The alias is always the preferred disassembly.

32-bit variant

Applies when sf == 0.

LSRV <Wd>, <Wn>, <Wm>

64-bit variant

Applies when sf == 1.

LSRV <Xd>, <Xn>, <Xm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
ShiftType shift_type = DecodeShift(op2);
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

Operation

```
bits(datasize) result;
bits(datasize) operand2 = X[m];

result = ShiftReg(n, shift_type, UInt(operand2) MOD datasize);
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.184 MADD

Multiply-Add multiplies two register values, adds a third register value, and writes the result to the destination register.

This instruction is used by the alias [MUL](#). See [Alias conditions on page C6-1217](#) for details of when each alias is preferred.

32-bit variant

Applies when sf == 0.

MADD <Wd>, <Wn>, <Wm>, <Wa>

64-bit variant

Applies when sf == 1.

MADD <Xd>, <Xn>, <Xm>, <Xa>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
integer destsize = if sf == '1' then 64 else 32;
```

Alias conditions

Alias	is preferred when
MUL	Ra == '11111'

Assembler symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn>	Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Wm>	Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
<Wa>	Is the 32-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn>	Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Xa> Is the 64-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation

```
bits(destsize) operand1 = X[n];  
bits(destsize) operand2 = X[m];  
bits(destsize) operand3 = X[a];
```

```
integer result;
```

```
result = UInt(operand3) + (UInt(operand1) * UInt(operand2));
```

```
X[d] = result<destsize-1:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.186 MOV (to/from SP)

Move between register and stack pointer : Rd = Rn

This instruction is an alias of the [ADD \(immediate\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [ADD \(immediate\)](#).
- The description of [ADD \(immediate\)](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when sf == 0.

MOV <Wd|WSP>, <Wn|WSP>

is equivalent to

ADD <Wd|WSP>, <Wn|WSP>, #0

and is the preferred disassembly when (Rd == '11111' || Rn == '11111').

64-bit variant

Applies when sf == 1.

MOV <Xd|SP>, <Xn|SP>

is equivalent to

ADD <Xd|SP>, <Xn|SP>, #0

and is the preferred disassembly when (Rd == '11111' || Rn == '11111').

Assembler symbols

<Wd|WSP> Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

<Wn|WSP> Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

<Xd|SP> Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.

Operation

The description of [ADD \(immediate\)](#) gives the operational pseudocode for this instruction.

C6.2.187 MOV (inverted wide immediate)

Move (inverted wide immediate) moves an inverted 16-bit immediate value to a register.

This instruction is an alias of the [MOVN](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOVN](#).
- The description of [MOVN](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0` && `hw == 0x`.

MOV <Wd>, #<imm>

is equivalent to

MOVN <Wd>, #<imm16>, LSL #<shift>

and is the preferred disassembly when `!(IsZero(imm16) && hw != '00') && !IsOnes(imm16)`.

64-bit variant

Applies when `sf == 1`.

MOV <Xd>, #<imm>

is equivalent to

MOVN <Xd>, #<imm16>, LSL #<shift>

and is the preferred disassembly when `!(IsZero(imm16) && hw != '00')`.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<imm> For the 32-bit variant: is a 32-bit immediate, the bitwise inverse of which can be encoded in "imm16:hw", but excluding 0xffff0000 and 0x0000ffff

For the 64-bit variant: is a 64-bit immediate, the bitwise inverse of which can be encoded in "imm16:hw".

<shift> For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16.

For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16.

Operation

The description of [MOVN](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.188 MOV (wide immediate)

Move (wide immediate) moves a 16-bit immediate value to a register.

This instruction is an alias of the [MOVZ](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MOVZ](#).
- The description of [MOVZ](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0` && `hw == 0x`.

MOV <Wd>, #<imm>

is equivalent to

MOVZ <Wd>, #<imm16>, LSL #<shift>

and is the preferred disassembly when `!(IsZero(imm16) && hw != '00')`.

64-bit variant

Applies when `sf == 1`.

MOV <Xd>, #<imm>

is equivalent to

MOVZ <Xd>, #<imm16>, LSL #<shift>

and is the preferred disassembly when `!(IsZero(imm16) && hw != '00')`.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<imm> For the 32-bit variant: is a 32-bit immediate which can be encoded in "imm16:hw".
 For the 64-bit variant: is a 64-bit immediate which can be encoded in "imm16:hw".

<shift> For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16.
 For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16.

Operation

The description of [MOVZ](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.190 MOV (register)

Move (register) copies the value in a source register to the destination register.

This instruction is an alias of the [ORR \(shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [ORR \(shifted register\)](#).
- The description of [ORR \(shifted register\)](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0`.

MOV <Wd>, <Wm>

is equivalent to

ORR <Wd>, WZR, <Wm>

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1`.

MOV <Xd>, <Xm>

is equivalent to

ORR <Xd>, XZR, <Xm>

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wm> Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xm> Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

Operation

The description of [ORR \(shifted register\)](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.191 MOVK

Move wide with keep moves an optionally-shifted 16-bit immediate value into a register, keeping other bits unchanged.

32-bit variant

Applies when `sf == 0` && `hw == 0x`.

MOVK <Wd>, #<imm>{, LSL #<shift>}

64-bit variant

Applies when `sf == 1`.

MOVK <Xd>, #<imm>{, LSL #<shift>}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer datasize = if sf == '1' then 64 else 32;
integer pos;
```

```
if sf == '0' && hw<1> == '1' then UNDEFINED;
pos = UInt(hw:'0000');
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <imm> Is the 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.
- <shift> For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16.
 For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16.

Operation

```
bits(datasize) result;

result = X[d];
result<pos+15:pos> = imm16;
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.

- The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.192 MOVN

Move wide with NOT moves the inverse of an optionally-shifted 16-bit immediate value to a register.

This instruction is used by the alias [MOV \(inverted wide immediate\)](#). See [Alias conditions on page C6-1232](#) for details of when each alias is preferred.

32-bit variant

Applies when `sf == 0` && `hw == 0x`.

MOVN <Wd>, #<imm>{, LSL #<shift>}

64-bit variant

Applies when `sf == 1`.

MOVN <Xd>, #<imm>{, LSL #<shift>}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer datasize = if sf == '1' then 64 else 32;
integer pos;

if sf == '0' && hw<1> == '1' then UNDEFINED;
pos = UInt(hw:'0000');
```

Alias conditions

Alias	of variant	is preferred when
MOV (inverted wide immediate)	64-bit	! (IsZero(imm16) && hw != '00')
MOV (inverted wide immediate)	32-bit	! (IsZero(imm16) && hw != '00') && ! IsOnes(imm16)

Assembler symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<imm>	Is the 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.
<shift>	For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16. For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16.

Operation

```
bits(datasize) result;  
  
result = Zeros();  
  
result<pos+15:pos> = imm16;  
result = NOT(result);  
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.193 MOVZ

Move wide with zero moves an optionally-shifted 16-bit immediate value to a register.

This instruction is used by the alias [MOV \(wide immediate\)](#). See [Alias conditions on page C6-1234](#) for details of when each alias is preferred.

32-bit variant

Applies when `sf == 0` && `hw == 0x`.

MOVZ <Wd>, #<imm>{, LSL #<shift>}

64-bit variant

Applies when `sf == 1`.

MOVZ <Xd>, #<imm>{, LSL #<shift>}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer datasize = if sf == '1' then 64 else 32;
integer pos;
```

```
if sf == '0' && hw<1> == '1' then UNDEFINED;
pos = UInt(hw:'0000');
```

Alias conditions

Alias	is preferred when
MOV (wide immediate)	<code>!(IsZero(imm16) && hw != '00')</code>

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <imm> Is the 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.
- <shift> For the 32-bit variant: is the amount by which to shift the immediate left, either 0 (the default) or 16, encoded in the "hw" field as <shift>/16.
 For the 64-bit variant: is the amount by which to shift the immediate left, either 0 (the default), 16, 32 or 48, encoded in the "hw" field as <shift>/16.

Operation

```
bits(datasize) result;
```

```
result = Zeros();
```

```
result<pos+15:pos> = imm16;  
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.194 MRS

Move System Register allows the PE to read an AArch64 System register into a general-purpose register.

Encoding

MRS <Xt>, (<systemreg>|S<op0>_<op1>_<Cn>_<Cm>_<op2>)

Decode for this encoding

```
AArch64.CheckSystemAccess('1':o0, op1, CRn, CRm, op2, Rt, L);
```

```
integer t = UInt(Rt);
```

```
integer sys_op0 = 2 + UInt(o0);
```

```
integer sys_op1 = UInt(op1);
```

```
integer sys_op2 = UInt(op2);
```

```
integer sys_crn = UInt(CRn);
```

```
integer sys_crm = UInt(CRm);
```

Assembler symbols

<Xt> Is the 64-bit name of the general-purpose destination register, encoded in the "Rt" field.

<systemreg> Is a System register name, encoded in the "o0:op1:CRn:CRm:op2".

The System register names are defined in [Chapter D13 AArch64 System Register Descriptions](#).

<op0> Is an unsigned immediate, encoded in the "o0" field. It can have the following values:

2 when o0 = 0

3 when o0 = 1

<op1> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.

<Cn> Is a name 'Cn', with 'n' in the range 0 to 15, encoded in the "CRn" field.

<Cm> Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.

<op2> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

Operation

```
X[t] = AArch64.SysRegRead(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2);
```

C6.2.195 MSR (immediate)

Move immediate value to Special Register moves an immediate value to selected bits of the PSTATE. For more information, see [PSTATE](#).

The bits that can be written by this instruction are:

- PSTATE.D, PSTATE.A, PSTATE.I, PSTATE.F, and PSTATE.SP.
- If [FEAT_SSBS](#) is implemented, PSTATE.SSBS.
- If [FEAT_PAN](#) is implemented, PSTATE.PAN.
- If [FEAT_UAO](#) is implemented, PSTATE.UAO.
- If [FEAT_DIT](#) is implemented, PSTATE.DIT.
- If [FEAT_MTE](#) is implemented, PSTATE.TCO.

    if !ELUsingAArch32(EL1) && ((EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') || SCTLR_EL1.UMA == '0')
then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        AArch64.SystemAccessTrap(EL1, 0x18);

```

Assembler symbols

<pstatefield> Is a PSTATE field name, encoded in the "op1:op2" field. It can have the following values:

SPSe1 when op1 = 000, op2 = 101

DAIFFSet when op1 = 011, op2 = 110

DAIFFClr when op1 = 011, op2 = 111

When FEAT_UAO is implemented, the following value is also valid:

UAO when op1 = 000, op2 = 011

When FEAT_PAN is implemented, the following value is also valid:

PAN when op1 = 000, op2 = 100

When FEAT_SSBS is implemented, the following value is also valid:

SSBS when op1 = 011, op2 = 001

When FEAT_DIT is implemented, the following value is also valid:

DIT when op1 = 011, op2 = 010

When FEAT_MTE is implemented, the following value is also valid:

TCO when op1 = 011, op2 = 100

See [PSTATE on page C4-293](#) when op1 = 000, op2 = 00x.

See [PSTATE on page C4-293](#) when op1 = 000, op2 = 010.

The following encodings are reserved:

- op1 = 000, op2 = 11x.
- op1 = 001, op2 = xxx.
- op1 = 010, op2 = xxx.
- op1 = 011, op2 = 000.

- op1 = 011, op2 = 011.
- op1 = 011, op2 = 101.
- op1 = 1xx, op2 = xxx.

<imm> Is a 4-bit unsigned immediate, in the range 0 to 15, encoded in the "CRm" field.

Operation

```
case field of
  when PSTATEField_SSBS
    PSTATE.SSBS = CRm<0>;
  when PSTATEField_SP
    PSTATE.SP = CRm<0>;
  when PSTATEField_DAIFFSet
    PSTATE.D = PSTATE.D OR CRm<3>;
    PSTATE.A = PSTATE.A OR CRm<2>;
    PSTATE.I = PSTATE.I OR CRm<1>;
    PSTATE.F = PSTATE.F OR CRm<0>;
  when PSTATEField_DAIFFClr
    PSTATE.D = PSTATE.D AND NOT(CRm<3>);
    PSTATE.A = PSTATE.A AND NOT(CRm<2>);
    PSTATE.I = PSTATE.I AND NOT(CRm<1>);
    PSTATE.F = PSTATE.F AND NOT(CRm<0>);

    PSTATE.DIT = CRm<0>;
  when PSTATEField_TCO
    PSTATE.TCO = CRm<0>;
```

C6.2.196 MSR (register)

Move general-purpose register to System Register allows the PE to write an AArch64 System register from a general-purpose register.

Encoding

MSR (<systemreg>|S<op0>_<op1>_<Cn>_<Cm>_<op2>), <Xt>

Decode for this encoding

```
AArch64.CheckSystemAccess('1':o0, op1, CRn, CRm, op2, Rt, L);
```

```
integer t = UInt(Rt);
```

```
integer sys_op0 = 2 + UInt(o0);
```

```
integer sys_op1 = UInt(op1);
```

```
integer sys_op2 = UInt(op2);
```

```
integer sys_crn = UInt(CRn);
```

```
integer sys_crm = UInt(CRm);
```

Assembler symbols

<systemreg> Is a System register name, encoded in the "o0:op1:CRn:CRm:op2".

The System register names are defined in [Chapter D13 AArch64 System Register Descriptions](#).

<op0> Is an unsigned immediate, encoded in the "o0" field. It can have the following values:

2 when o0 = 0

3 when o0 = 1

<op1> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.

<Cn> Is a name 'Cn', with 'n' in the range 0 to 15, encoded in the "CRn" field.

<Cm> Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.

<op2> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

<Xt> Is the 64-bit name of the general-purpose source register, encoded in the "Rt" field.

Operation

```
AArch64.SysRegWrite(sys_op0, sys_op1, sys_crn, sys_crm, sys_op2, X[t]);
```

C6.2.197 MSUB

Multiply-Subtract multiplies two register values, subtracts the product from a third register value, and writes the result to the destination register.

This instruction is used by the alias **MNEG**. See *Alias conditions on page C6-1241* for details of when each alias is preferred.

32-bit variant

Applies when sf == 0.

MSUB <Wd>, <Wn>, <Wm>, <Wa>

64-bit variant

Applies when sf == 1.

MSUB <Xd>, <Xn>, <Xm>, <Xa>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
integer destsize = if sf == '1' then 64 else 32;
```

Alias conditions

Alias	is preferred when
MNEG	Ra == '11111'

Assembler symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn>	Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Wm>	Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
<Wa>	Is the 32-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn>	Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

<Xa> Is the 64-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.

Operation

```
bits(destsize) operand1 = X[n];  
bits(destsize) operand2 = X[m];  
bits(destsize) operand3 = X[a];
```

```
integer result;
```

```
result = UInt(operand3) - (UInt(operand1) * UInt(operand2));  
X[d] = result<destsize-1:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.198 MUL

Multiply : $Rd = Rn * Rm$

This instruction is an alias of the [MADD](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [MADD](#).
- The description of [MADD](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when $sf == 0$.

MUL <Wd>, <Wn>, <Wm>

is equivalent to

MADD <Wd>, <Wn>, <Wm>, WZR

and is always the preferred disassembly.

64-bit variant

Applies when $sf == 1$.

MUL <Xd>, <Xn>, <Xm>

is equivalent to

MADD <Xd>, <Xn>, <Xm>, XZR

and is always the preferred disassembly.

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation

The description of [MADD](#) gives the operational pseudocode for this instruction.

C6.2.199 MVN

Bitwise NOT writes the bitwise inverse of a register value to the destination register.

This instruction is an alias of the [ORN \(shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [ORN \(shifted register\)](#).
- The description of [ORN \(shifted register\)](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0`.

MVN <Wd>, <Wm>{, <shift> #<amount>}

is equivalent to

ORN <Wd>, WZR, <Wm>{, <shift> #<amount>}

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1`.

MVN <Xd>, <Xm>{, <shift> #<amount>}

is equivalent to

ORN <Xd>, XZR, <Xm>{, <shift> #<amount>}

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wm> Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xm> Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

<shift> Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

LSL when shift = 00

LSR when shift = 01

ASR when shift = 10

ROR when shift = 11

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

Operation

The description of [ORN \(shifted register\)](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.200 NEG (shifted register)

Negate (shifted register) negates an optionally-shifted register value, and writes the result to the destination register.

This instruction is an alias of the [SUB \(shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SUB \(shifted register\)](#).
- The description of [SUB \(shifted register\)](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0`.

NEG <Wd>, <Wm>{, <shift> #<amount>}

is equivalent to

SUB <Wd>, WZR, <Wm> {, <shift> #<amount>}

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1`.

NEG <Xd>, <Xm>{, <shift> #<amount>}

is equivalent to

SUB <Xd>, XZR, <Xm> {, <shift> #<amount>}

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wm> Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xm> Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

<shift> Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

LSL when shift = 00

LSR when shift = 01

ASR when shift = 10

The encoding shift = 11 is reserved.

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

Operation

The description of [SUB \(shifted register\)](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.201 NEGS

Negate, setting flags, negates an optionally-shifted register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is an alias of the [SUBS \(shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SUBS \(shifted register\)](#).
- The description of [SUBS \(shifted register\)](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0`.

NEGS <Wd>, <Wm>{, <shift> #<amount>}

is equivalent to

SUBS <Wd>, WZR, <Wm> {, <shift> #<amount>}

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1`.

NEGS <Xd>, <Xm>{, <shift> #<amount>}

is equivalent to

SUBS <Xd>, XZR, <Xm> {, <shift> #<amount>}

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wm> Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xm> Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

<shift> Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

LSL when shift = 00

LSR when shift = 01

ASR when shift = 10

The encoding shift = 11 is reserved.

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

Operation

The description of [SUBS \(shifted register\)](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.202 NGC

Negate with Carry negates the sum of a register value and the value of NOT (Carry flag), and writes the result to the destination register.

This instruction is an alias of the [SBC](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SBC](#).
- The description of [SBC](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0`.

NGC <Wd>, <Wm>

is equivalent to

SBC <Wd>, WZR, <Wm>

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1`.

NGC <Xd>, <Xm>

is equivalent to

SBC <Xd>, XZR, <Xm>

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wm> Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xm> Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

Operation

The description of [SBC](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.203 NGCS

Negate with Carry, setting flags, negates the sum of a register value and the value of NOT (Carry flag), and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is an alias of the [SBCS](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SBCS](#).
- The description of [SBCS](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0`.

NGCS <Wd>, <Wm>

is equivalent to

SBCS <Wd>, WZR, <Wm>

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1`.

NGCS <Xd>, <Xm>

is equivalent to

SBCS <Xd>, XZR, <Xm>

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wm> Is the 32-bit name of the general-purpose source register, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xm> Is the 64-bit name of the general-purpose source register, encoded in the "Rm" field.

Operation

The description of [SBCS](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.204 NOP

No Operation does nothing, other than advance the value of the program counter by 4. This instruction can be used for instruction alignment purposes.

———— **Note** —————

The timing effects of including a NOP instruction in a program are not guaranteed. It can increase execution time, leave it unchanged, or even reduce it. Therefore, NOP instructions are not suitable for timing loops.

Encoding

NOP

Decode for this encoding

// Empty.

Operation

// do nothing

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.205 ORN (shifted register)

Bitwise OR NOT (shifted register) performs a bitwise (inclusive) OR of a register value and the complement of an optionally-shifted register value, and writes the result to the destination register.

This instruction is used by the alias *MVN*. See *Alias conditions on page C6-1255* for details of when each alias is preferred.

32-bit variant

Applies when `sf == 0`.

ORN <Wd>, <Wn>, <Wm>{, <shift> #<amount>}

64-bit variant

Applies when `sf == 1`.

ORN <Xd>, <Xn>, <Xm>{, <shift> #<amount>}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
if sf == '0' && imm6<5> == '1' then UNDEFINED;
```

```
ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
```

Alias conditions

Alias	is preferred when
<i>MVN</i>	Rn == '11111'

Assembler symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn>	Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
<Wm>	Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn>	Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
<shift>	Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values: <div style="margin-left: 20px;">LSL when shift = 00</div>

LSR when shift = 01
ASR when shift = 10
ROR when shift = 11

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.
 For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

Operation

```
bits(datasize) operand1 = X[n];  
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);  
  
operand2 = NOT(operand2);  
  
result = operand1 OR operand2;  
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.206 ORR (immediate)

Bitwise OR (immediate) performs a bitwise (inclusive) OR of a register value and an immediate register value, and writes the result to the destination register.

This instruction is used by the alias [MOV \(bitmask immediate\)](#). See [Alias conditions on page C6-1257](#) for details of when each alias is preferred.

32-bit variant

Applies when `sf == 0 && N == 0`.

ORR <wd|WSP>, <Wn>, #<imm>

64-bit variant

Applies when `sf == 1`.

ORR <Xd|SP>, <Xn>, #<imm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
bits(datasize) imm;
if sf == '0' && N != '0' then UNDEFINED;
(imm, -) = DecodeBitMasks(N, imms, immr, TRUE);
```

Alias conditions

Alias	is preferred when
MOV (bitmask immediate)	<code>Rn == '11111' && ! MoveWidePreferred(sf, N, imms, immr)</code>

Assembler symbols

<wd WSP>	Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
<Wn>	Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
<Xd SP>	Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
<Xn>	Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
<imm>	For the 32-bit variant: is the bitmask immediate, encoded in "imms:immr". For the 64-bit variant: is the bitmask immediate, encoded in "N:imms:immr".

Operation

```
bits(datasize) result;  
bits(datasize) operand1 = X[n];
```

```
result = operand1 OR imm;  
if d == 31 then  
    SP[] = result;  
else  
    X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.207 ORR (shifted register)

Bitwise OR (shifted register) performs a bitwise (inclusive) OR of a register value and an optionally-shifted register value, and writes the result to the destination register.

This instruction is used by the alias [MOV \(register\)](#). See *Alias conditions* on page C6-1259 for details of when each alias is preferred.

32-bit variant

Applies when sf == 0.

ORR <Wd>, <Wn>, <Wm>{, <shift> #<amount>}

64-bit variant

Applies when sf == 1.

ORR <Xd>, <Xn>, <Xm>{, <shift> #<amount>}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
if sf == '0' && imm6<5> == '1' then UNDEFINED;
```

```
ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
```

Alias conditions

Alias	is preferred when
MOV (register)	shift == '00' && imm6 == '000000' && Rn == '11111'

Assembler symbols

<code><Wd></code>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<code><Wn></code>	Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
<code><Wm></code>	Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
<code><Xd></code>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<code><Xn></code>	Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
<code><Xm></code>	Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
<code><shift></code>	Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values: LSL when shift = 00

LSR when shift = 01
ASR when shift = 10
ROR when shift = 11

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.
 For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

Operation

```
bits(datasize) operand1 = X[n];  
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);  
  
result = operand1 OR operand2;  
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.208 PACDA, PACDZA

Pointer Authentication Code for Data address, using key A. This instruction computes and inserts a pointer authentication code for a data address, using a modifier and key A.

The address is in the general-purpose register that is specified by <Xd>.

The modifier is:

- In the general-purpose register or stack pointer that is specified by <Xn|SP> for PACDA.
- The value zero, for PACDZA.

Integer

(FEAT_PAuth)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4				0	
1	1	0	1	1	0	1	0	1	1	0	0	0	0	0	1	0	0	Z	0	1	0											

PACDA variant

Applies when Z == 0.

PACDA <Xd>, <Xn|SP>

PACDZA variant

Applies when Z == 1 && Rn == 11111.

PACDZA <Xd>

Decode for all variants of this encoding

```
boolean source_is_sp = FALSE;
integer d = UInt(Rd);
integer n = UInt(Rn);

if !HavePACExt() then
    UNDEFINED;

if Z == '0' then // PACDA
    if n == 31 then source_is_sp = TRUE;
else // PACDZA
    if n != 31 then UNDEFINED;
```

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the general-purpose source register or stack pointer, encoded in the "Rn" field.

Operation

```
if source_is_sp then
    X[d] = AddPACDA(X[d], SP[]);
else
    X[d] = AddPACDA(X[d], X[n]);
```

C6.2.209 PACDB, PACDZB

Pointer Authentication Code for Data address, using key B. This instruction computes and inserts a pointer authentication code for a data address, using a modifier and key B.

The address is in the general-purpose register that is specified by <Xd>.

The modifier is:

- In the general-purpose register or stack pointer that is specified by <Xn|SP> for PACDB.
- The value zero, for PACDZB.

Integer

(FEAT_PAAuth)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4				0	
1	1	0	1	1	0	1	0	1	1	0	0	0	0	0	1	0	0	Z	0	1	1											

PACDB variant

Applies when Z == 0.

PACDB <Xd>, <Xn|SP>

PACDZB variant

Applies when Z == 1 && Rn == 11111.

PACDZB <Xd>

Decode for all variants of this encoding

```
boolean source_is_sp = FALSE;
integer d = UInt(Rd);
integer n = UInt(Rn);

if !HavePACExt() then
    UNDEFINED;

if Z == '0' then // PACDB
    if n == 31 then source_is_sp = TRUE;
else // PACDZB
    if n != 31 then UNDEFINED;
```

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the general-purpose source register or stack pointer, encoded in the "Rn" field.

Operation

```
if source_is_sp then
    X[d] = AddPACDB(X[d], SP[]);
else
    X[d] = AddPACDB(X[d], X[n]);
```

C6.2.210 PACGA

Pointer Authentication Code, using Generic key. This instruction computes the pointer authentication code for an address in the first source register, using a modifier in the second source register, and the Generic key. The computed pointer authentication code is returned in the upper 32 bits of the destination register.

Integer

(FEAT_PAuth)

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0
1	0	0	1	1	0	1	0	1	1	0	Rm	0	0	1	1	0	0	Rn	Rd			

Encoding

PACGA <Xd>, <Xn>, <Xm|SP>

Decode for this encoding

```
boolean source_is_sp = FALSE;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if !HavePACExt() then
    UNDEFINED;

if m == 31 then source_is_sp = TRUE;
```

Assembler symbols

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Xm|SP> Is the 64-bit name of the second general-purpose source register or stack pointer, encoded in the "Rm" field.

Operation

```
if source_is_sp then
    X[d] = AddPACGA(X[n], SP[]);
else
    X[d] = AddPACGA(X[n], X[m]);
```

C6.2.211 PACIA, PACIA1716, PACIASP, PACIAZ, PACIZA

Pointer Authentication Code for Instruction address, using key A. This instruction computes and inserts a pointer authentication code for an instruction address, using a modifier and key A.

The address is:

- In the general-purpose register that is specified by <Xd> for PACIA and PACIZA.
- In X17, for PACIA1716.
- In X30, for PACIASP and PACIAZ.

The modifier is:

- In the general-purpose register or stack pointer that is specified by <Xn|SP> for PACIA.
- The value zero, for PACIZA and PACIAZ.
- In X16, for PACIA1716.
- In SP, for PACIASP.

Integer

(FEAT_PAuth)

PACIA variant

Applies when Z == 0.

PACIA <Xd>, <Xn|SP>

PACIZA variant

Applies when Z == 1 && Rn == 11111.

PACIZA <Xd>

Decode for all variants of this encoding

```

boolean source_is_sp = FALSE;
integer d = UInt(Rd);
integer n = UInt(Rn);

if !HavePACExt() then
    UNDEFINED;

if Z == '0' then // PACIA
    if n == 31 then source_is_sp = TRUE;
else // PACIZA
    if n != 31 then UNDEFINED;
    
```

System

(FEAT_PAuth)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11		8	7		5	4	3	2	1	0

																						CRm			op2																		

PACIA1716 variant

Applies when CRm == 0001 && op2 == 000.

PACIA1716

PACIASP variant

Applies when CRm == 0011 && op2 == 001.

PACIASP

PACIAZ variant

Applies when CRm == 0011 && op2 == 000.

PACIAZ

Decode for all variants of this encoding

```
integer d;
integer n;
boolean source_is_sp = FALSE;

case CRm:op2 of
  when '0011 000' // PACIAZ
    d = 30;
    n = 31;
  when '0011 001' // PACIASP
    d = 30;
    source_is_sp = TRUE;
    if HaveBTIExt() then
      // Check for branch target compatibility between PSTATE.BTYPE
      // and implicit branch target of PACIASP instruction.
      SetBTypeCompatible(BTypeCompatible_PACIXSP());

  when '0001 000' // PACIA1716
    d = 17;
    n = 16;
  when '0001 010' SEE "PACIB";
  when '0001 100' SEE "AUTIA";

  when '0011 01x' SEE "PACIB";
  when '0011 10x' SEE "AUTIA";
  when '0011 11x' SEE "AUTIB";
  when '0000 111' SEE "XPACLRI";
  otherwise SEE "HINT";
```

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the general-purpose source register or stack pointer, encoded in the "Rn" field.

Operation for all encodings

```
if HavePACExt() then
  if source_is_sp then
    X[d] = AddPACIA(X[d], SP[]);
```

```
else  
    X[d] = AddPACIA(X[d], X[n]);
```

C6.2.212 PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZB

Pointer Authentication Code for Instruction address, using key B. This instruction computes and inserts a pointer authentication code for an instruction address, using a modifier and key B.

The address is:

- In the general-purpose register that is specified by <Xd> for PACIB and PACIZB.
- In X17, for PACIB1716.
- In X30, for PACIBSP and PACIBZ.

The modifier is:

- In the general-purpose register or stack pointer that is specified by <Xn|SP> for PACIB.
- The value zero, for PACIZB and PACIBZ.
- In X16, for PACIB1716.
- In SP, for PACIBSP.

Integer

(FEAT_PAuth)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9			5	4			0
1	1	0	1	1	0	1	0	1	1	0	0	0	0	0	1	0	0	Z	0	0	1			Rn					Rd

PACIB variant

Applies when Z == 0.

PACIB <Xd>, <Xn|SP>

PACIZB variant

Applies when Z == 1 && Rn == 11111.

PACIZB <Xd>

Decode for all variants of this encoding

```
boolean source_is_sp = FALSE;
integer d = UInt(Rd);
integer n = UInt(Rn);

if !HavePACExt() then
    UNDEFINED;

if Z == '0' then // PACIB

```

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn|SP> Is the 64-bit name of the general-purpose source register or stack pointer, encoded in the "Rn" field.

Operation for all encodings

```
if HavePACExt() then
  if source_is_sp then
    X[d] = AddPACIB(X[d], SP[]);
```

```
else  
    X[d] = AddPACIB(X[d], X[n]);
```

C6.2.213 PRFM (immediate)

Prefetch Memory (immediate) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFM instruction is IMPLEMENTATION DEFINED. For more information, see [Prefetch memory on page C3-235](#).

For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

Encoding

PRFM (<prfop>|<imm5>), [<Xn|SP>{, #<pimm>}]

Decode for this encoding

bits(64) offset = LSL(ZeroExtend(imm12, 64), 3);

Assembler symbols

- <prfop> Is the prefetch operation, defined as <type><target><policy>.
- <type> is one of:
- PLD Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.
 - PLI Preload instructions, encoded in the "Rt<4:3>" field as 0b01.
 - PST Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.
- <target> is one of:
- L1 Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.
 - L2 Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.
 - L3 Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.
- <policy> is one of:
- KEEP Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.
 - STRM Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.
- For more information on these prefetch operations, see [Prefetch memory on page C3-235](#).
- For other encodings of the "Rt" field, use <imm5>.
- <imm5> Is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using <prfop>.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <pimm> Is the optional positive immediate byte offset, a multiple of 8 in the range 0 to 32760, defaulting to 0 and encoded in the "imm12" field as <pimm>/8.

Shared decode for all encodings

```
integer n = UInt(Rn);  
integer t = UInt(Rt);
```

Operation

```
bits(64) address;  
  
if HaveMTE2Ext() then  
    SetTagCheckedInstruction(FALSE);  
  
if n == 31 then  
    address = SP[];  
else  
    address = X[n];  
  
address = address + offset;  
  
Prefetch(address, t<4:0>);
```

C6.2.214 PRFM (literal)

Prefetch Memory (literal) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFM instruction is IMPLEMENTATION DEFINED. For more information, see [Prefetch memory on page C3-235](#).

For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

Encoding

PRFM (<prfop>|<imm5>), <label>

Decode for this encoding

```
integer t = UInt(Rt);
bits(64) offset;

offset = SignExtend(imm19:'00', 64);
```

Assembler symbols

- <prfop> Is the prefetch operation, defined as <type><target><policy>.
- <type> is one of:
- PLD Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.
 - PLI Preload instructions, encoded in the "Rt<4:3>" field as 0b01.
 - PST Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.
- <target> is one of:
- L1 Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.
 - L2 Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.
 - L3 Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.
- <policy> is one of:
- KEEP Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.
 - STRM Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.
- For more information on these prefetch operations, see [Prefetch memory on page C3-235](#).
- For other encodings of the "Rt" field, use <imm5>.
- <imm5> Is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using <prfop>.
- <label> Is the program label from which the data is to be loaded. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.

Operation

```
bits(64) address = PC[] + offset;  
  
if HaveMTE2Ext() then  
    SetTagCheckedInstruction(FALSE);  
  
Prefetch(address, t<4:0>);
```

C6.2.215 PRFM (register)

Prefetch Memory (register) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFM instruction is IMPLEMENTATION DEFINED. For more information, see [Prefetch memory on page C3-235](#).

For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

Encoding

PRFM (<prfop>|#<imm5>), [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]

Decode for this encoding

```
if option<1> == '0' then UNDEFINED; // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then 3 else 0;
```

Assembler symbols

- <prfop> Is the prefetch operation, defined as <type><target><policy>.
- <type> is one of:
- PLD Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.
 - PLI Preload instructions, encoded in the "Rt<4:3>" field as 0b01.
 - PST Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.
- <target> is one of:
- L1 Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.
 - L2 Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.
 - L3 Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.
- <policy> is one of:
- KEEP Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.
 - STRM Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.
- For more information on these prefetch operations, see [Prefetch memory on page C3-235](#).
- For other encodings of the "Rt" field, use <imm5>.
- <imm5> Is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using <prfop>.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <Wm> When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.

<Xm>	When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.
<extend>	Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values: UXTW when option = 010 LSL when option = 011 SXTW when option = 110 SXTX when option = 111
<amount>	Is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values: #0 when S = 0 #3 when S = 1

Shared decode for all encodings

```
integer n = UInt(Rn);  
integer t = UInt(Rt);  
integer m = UInt(Rm);
```

Operation

```
bits(64) offset = ExtendReg(m, extend_type, shift);  
bits(64) address;  
  
if HaveMTE2Ext() then  
    SetTagCheckedInstruction(FALSE);  
  
if n == 31 then  
    address = SP[];  
else  
    address = X[n];  
  
address = address + offset;  
  
Prefetch(address, t<4:0>);
```

C6.2.216 PRFUM

Prefetch Memory (unscaled offset) signals the memory system that data memory accesses from a specified address are likely to occur in the near future. The memory system can respond by taking actions that are expected to speed up the memory accesses when they do occur, such as preloading the cache line containing the specified address into one or more caches.

The effect of an PRFUM instruction is IMPLEMENTATION DEFINED. For more information, see [Prefetch memory on page C3-235](#).

For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

Encoding

PRFUM (<prfop>|#<imm5>), [<Xn|SP>{, #<simm>}]

Decode for this encoding

bits(64) offset = [SignExtend](#)(imm9, 64);

Assembler symbols

- <prfop> Is the prefetch operation, defined as <type><target><policy>.
- <type> is one of:
- PLD Prefetch for load, encoded in the "Rt<4:3>" field as 0b00.
 - PLI Preload instructions, encoded in the "Rt<4:3>" field as 0b01.
 - PST Prefetch for store, encoded in the "Rt<4:3>" field as 0b10.
- <target> is one of:
- L1 Level 1 cache, encoded in the "Rt<2:1>" field as 0b00.
 - L2 Level 2 cache, encoded in the "Rt<2:1>" field as 0b01.
 - L3 Level 3 cache, encoded in the "Rt<2:1>" field as 0b10.
- <policy> is one of:
- KEEP Retained or temporal prefetch, allocated in the cache normally. Encoded in the "Rt<0>" field as 0.
 - STRM Streaming or non-temporal prefetch, for data that is used only once. Encoded in the "Rt<0>" field as 1.
- For more information on these prefetch operations, see [Prefetch memory on page C3-235](#).
- For other encodings of the "Rt" field, use <imm5>.
- <imm5> Is the prefetch operation encoding as an immediate, in the range 0 to 31, encoded in the "Rt" field. This syntax is only for encodings that are not accessible using <prfop>.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <simm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);  
integer t = UInt(Rt);
```

Operation

```
bits(64) address;  
  
if HaveMTE2Ext() then  
    SetTagCheckedInstruction(FALSE);  
  
if n == 31 then  
    address = SP[];  
else  
    address = X[n];  
  
address = address + offset;  
  
Prefetch(address, t<4:0>);
```

C6.2.217 PSB CSYNC

Profiling Synchronization Barrier. This instruction is a barrier that ensures that all existing profiling data for the current PE has been formatted, and profiling buffer addresses have been translated such that all writes to the profiling buffer have been initiated. A following DSB instruction completes when the writes to the profiling buffer have completed.

If the Statistical Profiling Extension is not implemented, this instruction executes as a NOP.

System

(FEAT_SPE)

Encoding

PSB CSYNC

Decode for this encoding

```
if !HaveStatisticalProfiling() then EndOfInstruction();
```

Operation

```
ProfilingSynchronizationBarrier();
```

C6.2.218 PSSBB

Physical Speculative Store Bypass Barrier is a memory barrier which prevents speculative loads from bypassing earlier stores to the same physical address.

The semantics of the Physical Speculative Store Bypass Barrier are:

- When a load to a location appears in program order after the PSSBB, then the load does not speculatively read an entry earlier in the coherence order for that location than the entry generated by the latest store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store appears in program order before the PSSBB.
- When a load to a location appears in program order before the PSSBB, then the load does not speculatively read data from any store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store appears in program order after the PSSBB.

This instruction is an alias of the [DSB](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [DSB](#).
- The description of [DSB](#) gives the operational pseudocode for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	8	7	6	5	4	3	2	1	0												
1	1	0	1	0	1	0	1	0	0	0	0	0	0	1	1	0	0	1	1	0	1	0	0	1	0	0	1	1	1	1	1										
																						CRm			opc																

Encoding

PSSBB

is equivalent to

DSB #4

and is always the preferred disassembly.

Operation

The description of [DSB](#) gives the operational pseudocode for this instruction.

C6.2.219 RBIT

Reverse Bits reverses the bit order in a register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4				0
sf	1	0	1	1	0	1	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0				Rn					Rd

32-bit variant

Applies when sf == 0.

RBIT <Wd>, <Wn>

64-bit variant

Applies when sf == 1.

RBIT <Xd>, <Xn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize = if sf == '1' then 64 else 32;
```

Assembler symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn>	Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn>	Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

```
bits(datasize) operand = X[n];
bits(datasize) result;

for i = 0 to datasize-1
  result<datasize-1-i> = operand<i>;

X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.

- The values of the NZCV flags.

C6.2.220 RET

Return from subroutine branches unconditionally to an address in a register, with a hint that this is a subroutine return.

Encoding

RET {<Xn>}

Decode for this encoding

integer n = `UInt`(Rn);

Assembler symbols

<Xn> Is the 64-bit name of the general-purpose register holding the address to be branched to, encoded in the "Rn" field. Defaults to X30 if absent.

Operation

`bits(64) target = X[n];`

`// Value in BTypeNext will be used to set PSTATE.BTYPE`
`BTypeNext = '00';`

`BranchTo(target, BranchType_RET, FALSE);`

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.221 RETAA, RETAB

Return from subroutine, with pointer authentication. This instruction authenticates the address that is held in LR, using SP as the modifier and the specified key, branches to the authenticated address, with a hint that this instruction is a subroutine return.

Key A is used for RETAA, and key B is used for RETAB.

If the authentication passes, the PE continues execution at the target of the branch. If the authentication fails, a Translation fault is generated.

The authenticated address is not written back to LR.

Integer

(FEAT_PAuth)

RETAA variant

Applies when M == 0.

RETAA

RETAB variant

Applies when M == 1.

RETAB

Decode for all variants of this encoding

```
boolean use_key_a = (M == '0');
```

```
if !HavePACExt() then
    UNDEFINED;
```

Operation

```
bits(64) target = X[30];
```

```
bits(64) modifier = SP[];
```

```
if use_key_a then
    target = AuthIA(target, modifier, TRUE);
else
    target = AuthIB(target, modifier, TRUE);
```

```
// Value in BTypeNext will be used to set PSTATE.BTYPE
BTypeNext = '00';
```

```
BranchTo(target, BranchType_RET, FALSE);
```

C6.2.222 REV

Reverse Bytes reverses the byte order in a register.

This instruction is used by the pseudo-instruction [REV64](#). The pseudo-instruction is never the preferred disassembly.

32-bit variant

Applies when `sf == 0` && `opc == 10`.

REV <Wd>, <Wn>

64-bit variant

Applies when `sf == 1` && `opc == 11`.

REV <Xd>, <Xn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize = if sf == '1' then 64 else 32;

integer container_size;
case opc of
  when '00'
    Unreachable();
  when '01'
    container_size = 16;
  when '10'
    container_size = 32;
  when '11'
    if sf == '0' then UNDEFINED;
    container_size = 64;
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

```
bits(datasize) operand = X[n];
bits(datasize) result;

integer containers = datasize DIV container_size;
integer elements_per_container = container_size DIV 8;
integer index = 0;
```

```
integer rev_index;  
for c = 0 to containers-1  
    rev_index = index + ((elements_per_container - 1) * 8);  
    for e = 0 to elements_per_container-1  
        result<rev_index+7:rev_index> = operand<index+7:index>;  
        index = index + 8;  
        rev_index = rev_index - 8;
```

X[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.223 REV16

Reverse bytes in 16-bit halfwords reverses the byte order in each 16-bit halfword of a register.

32-bit variant

Applies when sf == 0.

REV16 <Wd>, <Wn>

64-bit variant

Applies when sf == 1.

REV16 <Xd>, <Xn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize = if sf == '1' then 64 else 32;

integer container_size;
case opc of
  when '00'
    Unreachable();
  when '01'
    container_size = 16;
  when '10'
    container_size = 32;
  when '11'
    if sf == '0' then UNDEFINED;
    container_size = 64;
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

```
bits(datasize) operand = X[n];
bits(datasize) result;

integer containers = datasize DIV container_size;
integer elements_per_container = container_size DIV 8;
integer index = 0;
integer rev_index;
for c = 0 to containers-1
  rev_index = index + ((elements_per_container - 1) * 8);
```

```
for e = 0 to elements_per_container-1
  result<rev_index+7:rev_index> = operand<index+7:index>;
  index = index + 8;
  rev_index = rev_index - 8;
```

X[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.224 REV32

Reverse bytes in 32-bit words reverses the byte order in each 32-bit word of a register.

Encoding

REV32 <Xd>, <Xn>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer datasize = if sf == '1' then 64 else 32;

integer container_size;
case opc of
  when '00'
    Unreachable();
  when '01'
    container_size = 16;
  when '10'
    container_size = 32;
  when '11'
    if sf == '0' then UNDEFINED;
    container_size = 64;
```

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

```
bits(datasize) operand = X[n];
bits(datasize) result;

integer containers = datasize DIV container_size;
integer elements_per_container = container_size DIV 8;
integer index = 0;
integer rev_index;
for c = 0 to containers-1
  rev_index = index + ((elements_per_container - 1) * 8);
  for e = 0 to elements_per_container-1
    result<rev_index+7:rev_index> = operand<index+7:index>;
    index = index + 8;
    rev_index = rev_index - 8;

X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.225 REV64

Reverse Bytes reverses the byte order in a 64-bit general-purpose register.

When assembling for Armv8.2, an assembler must support this pseudo-instruction. It is OPTIONAL whether an assembler supports this pseudo-instruction when assembling for an architecture earlier than Armv8.2.

This instruction is a pseudo-instruction of the [REV](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [REV](#).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of [REV](#) gives the operational pseudocode for this instruction.

64-bit variant

REV64 <Xd>, <Xn>

is equivalent to

REV <Xd>, <Xn>

and is never the preferred disassembly.

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

The description of [REV](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.226 RMIF

Performs a rotation right of a value held in a general purpose register by an immediate value, and then inserts a selection of the bottom four bits of the result of the rotation into the PSTATE flags, under the control of a second immediate mask.

Integer

(FEAT_FlagM)

Encoding

RMIF <Xn>, #<shift>, #<mask>

Decode for this encoding

```
if !HaveFlagManipulateExt() then UNDEFINED;
integer lsb = UInt(imm6);
integer n = UInt(Rn);
```

Assembler symbols

- <Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- <shift> Is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,
- <mask> Is the flag bit mask, an immediate in the range 0 to 15, which selects the bits that are inserted into the NZCV condition flags, encoded in the "mask" field.

Operation

```
bits(4) tmp;
bits(64) tmpreg = X[n];
tmp = (tmpreg:tmpreg)<lsb+3:lsb>;
if mask<3> == '1' then PSTATE.N = tmp<3>;
if mask<2> == '1' then PSTATE.Z = tmp<2>;
if mask<1> == '1' then PSTATE.C = tmp<1>;
if mask<0> == '1' then PSTATE.V = tmp<0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.227 ROR (immediate)

Rotate right (immediate) provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left.

This instruction is an alias of the [EXTR](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [EXTR](#).
- The description of [EXTR](#) gives the operational pseudocode for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	16	15	10	9	5	4	0
sf	0	0	1	0	0	1	1	1	N	0	Rm	imms	Rn	Rd				

32-bit variant

Applies when $sf == 0 \ \&\& \ N == 0 \ \&\& \ imms == 0xxxxx$.

ROR <Wd>, <Ws>, #<shift>

is equivalent to

EXTR <Wd>, <Ws>, <Ws>, #<shift>

and is the preferred disassembly when $Rn == Rm$.

64-bit variant

Applies when $sf == 1 \ \&\& \ N == 1$.

ROR <Xd>, <Xs>, #<shift>

is equivalent to

EXTR <Xd>, <Xs>, <Xs>, #<shift>

and is the preferred disassembly when $Rn == Rm$.

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Ws> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xs> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" and "Rm" fields.
- <shift> For the 32-bit variant: is the amount by which to rotate, in the range 0 to 31, encoded in the "imms" field.
 For the 64-bit variant: is the amount by which to rotate, in the range 0 to 63, encoded in the "imms" field.

Operation

The description of [EXTR](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.228 ROR (register)

Rotate Right (register) provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is an alias of the [RORV](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [RORV](#).
- The description of [RORV](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0`.

ROR <Wd>, <Wn>, <Wm>

is equivalent to

RORV <Wd>, <Wn>, <Wm>

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1`.

ROR <Xd>, <Xn>, <Xm>

is equivalent to

RORV <Xd>, <Xn>, <Xm>

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.

<Xm> Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

Operation

The description of [RORV](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.229 RORV

Rotate Right Variable provides the value of the contents of a register rotated by a variable number of bits. The bits that are rotated off the right end are inserted into the vacated bit positions on the left. The remainder obtained by dividing the second source register by the data size defines the number of bits by which the first source register is right-shifted.

This instruction is used by the alias [ROR \(register\)](#). The alias is always the preferred disassembly.

32-bit variant

Applies when sf == 0.

RORV <Wd>, <Wn>, <Wm>

64-bit variant

Applies when sf == 1.

RORV <Xd>, <Xn>, <Xm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
ShiftType shift_type = DecodeShift(op2);
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register holding a shift amount from 0 to 31 in its bottom 5 bits, encoded in the "Rm" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register holding a shift amount from 0 to 63 in its bottom 6 bits, encoded in the "Rm" field.

Operation

```
bits(datasize) result;
bits(datasize) operand2 = X[m];

result = ShiftReg(n, shift_type, UInt(operand2) MOD datasize);
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.230 SB

Speculation Barrier is a barrier that controls speculation.

The semantics of the Speculation Barrier are that the execution, until the barrier completes, of any instruction that appears later in the program order than the barrier:

- Cannot be performed speculatively to the extent that such speculation can be observed through side-channels as a result of control flow speculation or data value speculation.
- Can be speculatively executed as a result of predicting that a potentially exception generating instruction has not generated an exception.

In particular, any instruction that appears later in the program order than the barrier cannot cause a speculative allocation into any caching structure where the allocation of that entry could be indicative of any data value present in memory or in the registers.

The SB instruction:

- Cannot be speculatively executed as a result of control flow speculation or data value speculation.
- Can be speculatively executed as a result of predicting that a potentially exception generating instruction has not generated an exception. The potentially exception generating instruction can complete once it is known not to be speculative, and all data values generated by instructions appearing in program order before the SB instruction have their predicted values confirmed.

When the prediction of the instruction stream is not informed by data taken from the register outputs of the speculative execution of instructions appearing in program order after an uncompleted SB instruction, the SB instruction has no effect on the use of prediction resources to predict the instruction stream that is being fetched.

Encoding

SB

Decode for this encoding

if !HaveSBExt() then UNDEFINED;

Operation

SpeculationBarrier();

C6.2.231 SBC

Subtract with Carry subtracts a register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register.

This instruction is used by the alias [NGC](#). See [Alias conditions on page C6-1299](#) for details of when each alias is preferred.

32-bit variant

Applies when `sf == 0`.

SBC <Wd>, <Wn>, <Wm>

64-bit variant

Applies when `sf == 1`.

SBC <Xd>, <Xn>, <Xm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
```

Alias conditions

Alias	is preferred when
NGC	Rn == '11111'

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];

operand2 = NOT(operand2);
```

```
(result, -) = AddWithCarry(operand1, operand2, PSTATE.C);
```

```
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.232 SBCS

Subtract with Carry, setting flags, subtracts a register value and the value of NOT (Carry flag) from a register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias **NGCS**. See *Alias conditions* on page C6-1301 for details of when each alias is preferred.

32-bit variant

Applies when `sf == 0`.

SBCS <Wd>, <Wn>, <Wm>

64-bit variant

Applies when `sf == 1`.

SBCS <Xd>, <Xn>, <Xm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
```

Alias conditions

Alias	is preferred when
NGCS	Rn == '11111'

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
bits(4) nzc;
```

```
operand2 = NOT(operand2);  
  
(result, nzcvc) = AddWithCarry(operand1, operand2, PSTATE.C);  
  
PSTATE.<N,Z,C,V> = nzcvc;  
  
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.233 SBFIZ

Signed Bitfield Insert in Zeros copies a bitfield of $\langle\text{width}\rangle$ bits from the least significant bits of the source register to bit position $\langle\text{lsb}\rangle$ of the destination register, setting the destination bits below the bitfield to zero, and the bits above the bitfield to a copy of the most significant bit of the bitfield.

This instruction is an alias of the [SBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SBFM](#).
- The description of [SBFM](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when $\text{sf} == 0 \ \&\& \ N == 0$.

SBFIZ $\langle\text{Wd}\rangle$, $\langle\text{Wn}\rangle$, $\#\langle\text{lsb}\rangle$, $\#\langle\text{width}\rangle$

is equivalent to

SBFM $\langle\text{Wd}\rangle$, $\langle\text{Wn}\rangle$, $\#(-\langle\text{lsb}\rangle \text{ MOD } 32)$, $\#(\langle\text{width}\rangle-1)$

and is the preferred disassembly when $\text{UInt}(\text{imms}) < \text{UInt}(\text{immr})$.

64-bit variant

Applies when $\text{sf} == 1 \ \&\& \ N == 1$.

SBFIZ $\langle\text{Xd}\rangle$, $\langle\text{Xn}\rangle$, $\#\langle\text{lsb}\rangle$, $\#\langle\text{width}\rangle$

is equivalent to

SBFM $\langle\text{Xd}\rangle$, $\langle\text{Xn}\rangle$, $\#(-\langle\text{lsb}\rangle \text{ MOD } 64)$, $\#(\langle\text{width}\rangle-1)$

and is the preferred disassembly when $\text{UInt}(\text{imms}) < \text{UInt}(\text{immr})$.

Assembler symbols

$\langle\text{Wd}\rangle$ Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

$\langle\text{Wn}\rangle$ Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

$\langle\text{Xd}\rangle$ Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

$\langle\text{Xn}\rangle$ Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

$\langle\text{lsb}\rangle$ For the 32-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 31.
For the 64-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 63.

$\langle\text{width}\rangle$ For the 32-bit variant: is the width of the bitfield, in the range 1 to $32-\langle\text{lsb}\rangle$.
For the 64-bit variant: is the width of the bitfield, in the range 1 to $64-\langle\text{lsb}\rangle$.

Operation

The description of [SBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.234 SBFM

Signed Bitfield Move is usually accessed via one of its aliases, which are always preferred for disassembly.

If $\langle imms \rangle$ is greater than or equal to $\langle immr \rangle$, this copies a bitfield of $(\langle imms \rangle - \langle immr \rangle + 1)$ bits starting from bit position $\langle immr \rangle$ in the source register to the least significant bits of the destination register.

If $\langle imms \rangle$ is less than $\langle immr \rangle$, this copies a bitfield of $(\langle imms \rangle + 1)$ bits from the least significant bits of the source register to bit position $(regsize - \langle immr \rangle)$ of the destination register, where $regsize$ is the destination register size of 32 or 64 bits.

In both cases the destination bits below the bitfield are set to zero, and the bits above the bitfield are set to a copy of the most significant bit of the bitfield.

This instruction is used by the aliases [ASR \(immediate\)](#), [SBFIZ](#), [SBFX](#), [SXTB](#), [SXTH](#), and [SXTW](#). See *Alias conditions* on page C6-1306 for details of when each alias is preferred.

32-bit variant

Applies when $sf == 0 \ \&\& \ N == 0$.

SBFM $\langle Wd \rangle$, $\langle Wn \rangle$, $\# \langle immr \rangle$, $\# \langle imms \rangle$

64-bit variant

Applies when $sf == 1 \ \&\& \ N == 1$.

SBFM $\langle Xd \rangle$, $\langle Xn \rangle$, $\# \langle immr \rangle$, $\# \langle imms \rangle$

Decode for all variants of this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;

integer R;
integer S;
bits(datasize) wmask;
bits(datasize) tmask;

if sf == '1' && N != '1' then UNDEFINED;
if sf == '0' && (N != '0' || immr<5> != '0' || imms<5> != '0') then UNDEFINED;

R = UInt(immr);
S = UInt(imms);
(wmask, tmask) = DecodeBitMasks(N, imms, immr, FALSE);

```

Alias conditions

Alias	of variant	is preferred when
ASR (immediate)	32-bit	<code>imms == '011111'</code>
ASR (immediate)	64-bit	<code>imms == '111111'</code>
SBFIZ	-	<code>UInt(imms) < UInt(immr)</code>
SBFX	-	<code>BFXPreferred(sf, opc<1>, imms, immr)</code>
SXTB	-	<code>immr == '000000' && imms == '000111'</code>
SXTH	-	<code>immr == '000000' && imms == '001111'</code>
SXTW	-	<code>immr == '000000' && imms == '011111'</code>

Assembler symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn>	Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn>	Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
<immr>	For the 32-bit variant: is the right rotate amount, in the range 0 to 31, encoded in the "immr" field. For the 64-bit variant: is the right rotate amount, in the range 0 to 63, encoded in the "immr" field.
<imms>	For the 32-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 31, encoded in the "imms" field. For the 64-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 63, encoded in the "imms" field.

Operation

```
bits(datasize) src = X[n];

// perform bitfield move on low bits
bits(datasize) bot = ROR(src, R) AND wmask;

// determine extension bits (sign, zero or dest register)
bits(datasize) top = Replicate(src<S>);

// combine extension bits and result bits
X[d] = (top AND NOT(tmask)) OR (bot AND tmask);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.235 SBFX

Signed Bitfield Extract copies a bitfield of <width> bits starting from bit position <lsb> in the source register to the least significant bits of the destination register, and sets destination bits above the bitfield to a copy of the most significant bit of the bitfield.

This instruction is an alias of the [SBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SBFM](#).
- The description of [SBFM](#) gives the operational pseudocode for this instruction.

31	30	29	28	27	26	25	24	23	22	21	16	15	10	9	5	4	0	
sf	0	0	1	0	0	1	1	0	N	immr	imms	Rn	Rd					
opc																		

32-bit variant

Applies when $sf == 0 \ \&\& \ N == 0$.

SBFX <Wd>, <Wn>, #<lsb>, #<width>

is equivalent to

SBFM <Wd>, <Wn>, #<lsb>, #(<lsb>+<width>-1)

and is the preferred disassembly when $BFXPreferred(sf, opc<1>, imms, immr)$.

64-bit variant

Applies when $sf == 1 \ \&\& \ N == 1$.

SBFX <Xd>, <Xn>, #<lsb>, #<width>

is equivalent to

SBFM <Xd>, <Xn>, #<lsb>, #(<lsb>+<width>-1)

and is the preferred disassembly when $BFXPreferred(sf, opc<1>, imms, immr)$.

Assembler symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn>	Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn>	Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
<lsb>	For the 32-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 31. For the 64-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 63.
<width>	For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<lsb>. For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<lsb>.

Operation

The description of [SBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.236 SDIV

Signed Divide divides a signed integer register value by another signed integer register value, and writes the result to the destination register. The condition flags are not affected.

32-bit variant

Applies when sf == 0.

SDIV <Wd>, <Wn>, <Wm>

64-bit variant

Applies when sf == 1.

SDIV <Xd>, <Xn>, <Xm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
integer result;

if IsZero(operand2) then
    result = 0;
else
    result = RoundTowardsZero(Real(Int(operand1, FALSE)) / Real(Int(operand2, FALSE)));

X[d] = result<datasize-1:0>;
```

C6.2.237 SETF8, SETF16

Set the PSTATE.NZV flags based on the value in the specified general-purpose register. SETF8 treats the value as an 8 bit value, and SETF16 treats the value as an 16 bit value.

The PSTATE.C flag is not affected by these instructions.

Integer

(FEAT_FlagM)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9					5	4	3	2	1	0
0	0	1	1	1	0	1	0	0	0	0	0	0	0	0	0	0	sz	0	0	1	0					Rn	0	1	1	0	1	

sf

SETF8 variant

Applies when `sz == 0`.

SETF8 <Wn>

SETF16 variant

Applies when `sz == 1`.

SETF16 <Wn>

Decode for all variants of this encoding

```
if !HaveFlagManipulateExt() then UNDEFINED;
integer msb = if sz == '1' then 15 else 7;
integer n = UInt(Rn);
```

Assembler symbols

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

```
bits(32) tmpreg = X[n];
PSTATE.N = tmpreg<msb>;
PSTATE.Z = if (tmpreg<msb:0> == Zeros(msb + 1)) then '1' else '0';
PSTATE.V = tmpreg<msb+1> EOR tmpreg<msb>;
//PSTATE.C unchanged;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.238 SEV

Send Event is a hint instruction. It causes an event to be signaled to all PEs in the multiprocessor system. For more information, see [Wait for Event mechanism and Send event on page D1-2536](#).

Encoding

SEV

Decode for this encoding

// Empty.

Operation

`SendEvent();`

C6.2.239 SEVL

Send Event Local is a hint instruction that causes an event to be signaled locally without requiring the event to be signaled to other PEs in the multiprocessor system. It can prime a wait-loop which starts with a WFE instruction.

Encoding

SEVL

Decode for this encoding

// Empty.

Operation

`SendEventLocal();`

C6.2.240 SMADDL

Signed Multiply-Add Long multiplies two 32-bit register values, adds a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias [SMULL](#). See [Alias conditions on page C6-1314](#) for details of when each alias is preferred.

Encoding

SMADDL <Xd>, <Wn>, <Wm>, <Xa>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
```

Alias conditions

Alias	is preferred when
SMULL	Ra == '11111'

Assembler symbols

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- <Xa> Is the 64-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation

```
bits(32) operand1 = X[n];
bits(32) operand2 = X[m];
bits(64) operand3 = X[a];

integer result;

result = Int(operand3, FALSE) + (Int(operand1, FALSE) * Int(operand2, FALSE));

X[d] = result<63:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.241 SMC

Secure Monitor Call causes an exception to EL3.

SMC is available only for software executing at EL1 or higher. It is UNDEFINED in EL0.

If the values of [HCR_EL2.TSC](#) and [SCR_EL3.SMD](#) are both 0, execution of an SMC instruction at EL1 or higher generates a Secure Monitor Call exception, recording it in [ESR_ELx](#), using the EC value 0x17, that is taken to EL3.

If the value of [HCR_EL2.TSC](#) is 1 and EL2 is enabled in the current Security state, execution of an SMC instruction at EL1 generates an exception that is taken to EL2, regardless of the value of [SCR_EL3.SMD](#). For more information, see [Traps to EL2 of EL1 execution of SMC instructions on page D1-2523](#).

If the value of [HCR_EL2.TSC](#) is 0 and the value of [SCR_EL3.SMD](#) is 1, the SMC instruction is UNDEFINED.

Encoding

SMC #<imm>

Decode for this encoding

// Empty.

Assembler symbols

<imm> Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

Operation

```
AArch64.CheckForSMCDefOrTrap(imm16);
AArch64.CallSecureMonitor(imm16);
```

C6.2.242 SMNEGL

Signed Multiply-Negate Long multiplies two 32-bit register values, negates the product, and writes the result to the 64-bit destination register.

This instruction is an alias of the [SMSUBL](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SMSUBL](#).
- The description of [SMSUBL](#) gives the operational pseudocode for this instruction.

Encoding

SMNEGL <Xd>, <Wn>, <Wm>

is equivalent to

SMSUBL <Xd>, <Wn>, <Wm>, XZR

and is always the preferred disassembly.

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation

The description of [SMSUBL](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.243 SMSUBL

Signed Multiply-Subtract Long multiplies two 32-bit register values, subtracts the product from a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias [SMNEGL](#). See [Alias conditions on page C6-1318](#) for details of when each alias is preferred.

Encoding

SMSUBL <Xd>, <Wn>, <Wm>, <Xa>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
```

Alias conditions

Alias	is preferred when
SMNEGL	Ra == '11111'

Assembler symbols

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- <Xa> Is the 64-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.

Operation

```
bits(32) operand1 = X[n];
bits(32) operand2 = X[m];
bits(64) operand3 = X[a];

integer result;

result = Int(operand3, FALSE) - (Int(operand1, FALSE) * Int(operand2, FALSE));
X[d] = result<63:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.244 SMULH

Signed Multiply High multiplies two 64-bit register values, and writes bits[127:64] of the 128-bit result to the 64-bit destination register.

Encoding

SMULH <Xd>, <Xn>, <Xm>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
```

Assembler symbols

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation

```
bits(64) operand1 = X[n];
bits(64) operand2 = X[m];

integer result;

result = Int(operand1, FALSE) * Int(operand2, FALSE);

X[d] = result<127:64>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.245 SMULL

Signed Multiply Long multiplies two 32-bit register values, and writes the result to the 64-bit destination register.

This instruction is an alias of the [SMADDL](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SMADDL](#).
- The description of [SMADDL](#) gives the operational pseudocode for this instruction.

Encoding

SMULL <Xd>, <Wn>, <Wm>

is equivalent to

SMADDL <Xd>, <Wn>, <Wm>, XZR

and is always the preferred disassembly.

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation

The description of [SMADDL](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.246 SSBB

Speculative Store Bypass Barrier is a memory barrier which prevents speculative loads from bypassing earlier stores to the same virtual address under certain conditions.

The semantics of the Speculative Store Bypass Barrier are:

- When a load to a location appears in program order after the SSBB, then the load does not speculatively read an entry earlier in the coherence order for that location than the entry generated by the latest store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store uses the same virtual address as the load.
 - The store appears in program order before the SSBB.
- When a load to a location appears in program order before the SSBB, then the load does not speculatively read data from any store satisfying all of the following conditions:
 - The store is to the same location as the load.
 - The store uses the same virtual address as the load.
 - The store appears in program order after the SSBB.

This instruction is an alias of the [DSB](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [DSB](#).
- The description of [DSB](#) gives the operational pseudocode for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	8	7	6	5	4	3	2	1	0												
1	1	0	1	0	1	0	1	0	0	0	0	0	0	1	1	0	0	1	1	0	0	0	0	1	0	0	1	1	1	1	1										
																						CRm			opc																

Encoding

SSBB

is equivalent to

DSB #0

and is always the preferred disassembly.

Operation

The description of [DSB](#) gives the operational pseudocode for this instruction.

C6.2.247 ST2G

Store Allocation Tags stores an Allocation Tag to two Tag granules of memory. The address used for the store is calculated from the base register and an immediate signed offset scaled by the Tag granule. The Allocation Tag is calculated from the Logical Address Tag in the source register.

This instruction generates an Unchecked access.

Post-index

(FEAT_MTE)

31	30	29	28	27	26	25	24	23	22	21	20					12	11	10	9			5	4	0
1	1	0	1	1	0	0	1	1	0	1	imm9				0	1	Xn		Xt					

Encoding

ST2G <Xt|SP>, [<Xn|SP>], #<simm>

Decode for this encoding

```
if !HaveMTEExt() then UNDEFINED;
integer n = UInt(Xn);
integer t = UInt(Xt);
bits(64) offset = LSL(SignExtend(imm9, 64), LOG2_TAG_GRANULE);
boolean writeback = TRUE;
boolean postindex = TRUE;
```

Pre-index

(FEAT_MTE)

31	30	29	28	27	26	25	24	23	22	21	20					12	11	10	9			5	4	0
1	1	0	1	1	0	0	1	1	0	1	imm9				1	1	Xn		Xt					

Encoding

ST2G <Xt|SP>, [<Xn|SP>], #<simm>!

Decode for this encoding

```
if !HaveMTEExt() then UNDEFINED;
integer n = UInt(Xn);
integer t = UInt(Xt);
bits(64) offset = LSL(SignExtend(imm9, 64), LOG2_TAG_GRANULE);
boolean writeback = TRUE;
boolean postindex = FALSE;
```

Signed offset

(FEAT_MTE)

1	1	0	1	1	0	0	1	1	0	1	imm9				1	0	Xn		Xt					

Encoding

ST2G <Xt|SP>, [<Xn|SP>{, #<sim>}]

Decode for this encoding

```
if !HaveMTEExt() then UNDEFINED;
integer n = UInt(Xn);
integer t = UInt(Xt);
bits(64) offset = LSL(SignExtend(imm9, 64), LOG2_TAG_GRANULE);
boolean writeback = FALSE;
boolean postindex = FALSE;
```

Assembler symbols

<Xt|SP> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Xt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Xn" field.

<sim> Is the optional signed immediate offset, a multiple of 16 in the range -4096 to 4080, defaulting to 0 and encoded in the "imm9" field.

Operation for all encodings

```
bits(64) address;
bits(64) data = if t == 31 then SP[] else X[t];
bits(4) tag = AArch64.AllocationTagFromAddress(data);

SetTagCheckedInstruction(FALSE);

if n == 31 then
    CheckSPAAlignment();
    address = SP[];
else
    address = X[n];

if !postindex then
    address = address + offset;

AArch64.MemTag[address, AccType_NORMAL] = tag;
AArch64.MemTag[address+TAG_GRANULE, AccType_NORMAL] = tag;

if writeback then
    if postindex then
        address = address + offset;

    if n == 31 then
        SP[] = address;
    else
        X[n] = address;
```

C6.2.248 ST64B

Single-copy Atomic 64-byte Store without Return stores eight 64-bit doublewords from consecutive registers, Xt to X(t+7), to a memory location. The data that is stored is atomic and is required to be 64-byte-aligned.

Integer

(FEAT_LS64)

Encoding

ST64B <Xt>, [<Xn|SP> {,#0}]

Decode for this encoding

```

if !HaveFeatLS64() then UNDEFINED;
if Rt<4:3> == '11' || Rt<0> == '1' then UNDEFINED;

integer n = UInt(Rn);
integer t = UInt(Rt);
boolean tag_checked = n != 31;
  
```

Assembler symbols

<Xt> Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.
 <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```

CheckLDST64BEnabled();

bits(512) data;
bits(64) address;
bits(64) value;
acctype = AccType_ATOMICLS64;

if HaveMTE2Ext() then
  SetTagCheckedInstruction(tag_checked);

for i = 0 to 7
  value = X[t+i];
  if BigEndian(acctype) then value = BigEndianReverse(value);
  data<63+64*i:64*i> = value;

if n == 31 then
  CheckSPAlignment();
  address = SP[];
else
  address = X[n];

MemStore64B(address, data, acctype);
  
```

C6.2.249 ST64BV

Single-copy Atomic 64-byte Store with Return stores eight 64-bit doublewords from consecutive registers, Xt to X(t+7), to a memory location, and writes the status result of the store to a register. The data that is stored is atomic and is required to be 64-byte aligned.

Integer

(FEAT_LS64_V)

Encoding

ST64BV <Xs>, <Xt>, [<Xn|SP>]

Decode for this encoding

```

if !HaveFeatLS64() then UNDEFINED;
if Rt<4:3> == '11' || Rt<0> == '1' then UNDEFINED;

integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs);
boolean tag_checked = n != 31;
  
```

Assembler symbols

- <Xs> Is the 64-bit name of the general-purpose register into which the status result of this instruction is written, encoded in the "Rs" field.
- The value returned is:
- 0 If the operation updates memory.
 - 1 If the operation fails to update memory.
- 0xFFFFFFFFFFFFFFFF If the memory location accessed does not support this instruction.
- If XZR is used, then the return value is ignored.
- <Xt> Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```

CheckST64BVEnabled();

bits(512) data;
bits(64) address;
bits(64) value;
bits(64) status;
acctype = AccType_ATOMICLS64;

if HaveMTE2Ext() then
  SetTagCheckedInstruction(tag_checked);

for i = 0 to 7
  value = X[t+i];
  if BigEndian(acctype) then value = BigEndianReverse(value);
  data<63+64*i:64*i> = value;
  
```

```
if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

status = MemStore64WithRet(address, data, acctype);

if s != 31 then X[s] = status;
```

C6.2.250 ST64BV0

Single-copy Atomic 64-byte EL0 Store with Return stores eight 64-bit doublewords from consecutive registers, Xt to X(t+7), to a memory location, with the bottom 32 bits taken from `ACCDATA_EL1`, and writes the status result of the store to a register. The data that is stored is atomic and is required to be 64-byte aligned.

Integer

(FEAT_LS64_V)

Encoding

ST64BV0 <Xs>, <Xt>, [<Xn|SP>]

Decode for this encoding

```

if !HaveFeatLS64() then UNDEFINED;
if Rt<4:3> == '11' || Rt<0> == '1' then UNDEFINED;

integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs);
boolean tag_checked = n != 31;
  
```

Assembler symbols

- <Xs> Is the 64-bit name of the general-purpose register into which the status result of this instruction is written, encoded in the "Rs" field.
- The value returned is:
- 0 If the operation updates memory.
 - 1 If the operation fails to update memory.
- 0xFFFFFFFFFFFFFFFF If the memory location accessed does not support this instruction.
- If XZR is used, then the return value is ignored.
- <Xt> Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```

CheckST64BV0Enabled();

bits(512) data;
bits(64) address;
bits(64) value;
bits(64) status;
acctype = AccType_ATOMICLS64;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

bits(64) Xt = X[t];
value<31:0> = ACCDATA_EL1<31:0>;
value<63:32> = Xt<63:32>;
if BigEndian(acctype) then value = BigEndianReverse(value);
  
```

```
data<63:0> = value;
for i = 1 to 7
    value = X[t+i];
    if BigEndian(acctype) then value = BigEndianReverse(value);
    data<63+64*i:64*i> = value;

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

status = MemStore64BWithRet(address, data, acctype);

if s != 31 then X[s] = status;
```

C6.2.251 STADDB, STADDLB

Atomic add on byte in memory, without return, atomically loads an 8-bit byte from memory, adds the value held in a register to it, and stores the result back to memory.

- STADDB does not have release semantics.
- STADDLB stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDADDB, LDADDAB, LDADDALB, LDADDLB instruction. This means that:

- The encodings in this description are named to match the encodings of LDADDB, LDADDAB, LDADDALB, LDADDLB.
- The description of LDADDB, LDADDAB, LDADDALB, LDADDLB gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

No memory ordering variant

Applies when R == 0.

STADDB <Ws>, [<Xn|SP>]

is equivalent to

LDADDB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STADDLB <Ws>, [<Xn|SP>]

is equivalent to

LDADDLB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDADDB, LDADDAB, LDADDALB, LDADDLB gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.252 STADDH, STADDLH

Atomic add on halfword in memory, without return, atomically loads a 16-bit halfword from memory, adds the value held in a register to it, and stores the result back to memory.

- STADDH does not have release semantics.
- STADDLH stores to memory with release semantics, as described in [Load-Acquire, Load-AcquirePC, and Store-Release](#) on page B2-152.

For information about memory accesses see [Load/store addressing modes](#) on page C1-202.

This instruction is an alias of the LDADDH, LDADDAH, LDADDALH, LDADDLH instruction. This means that:

- The encodings in this description are named to match the encodings of LDADDH, LDADDAH, LDADDALH, LDADDLH.
- The description of LDADDH, LDADDAH, LDADDALH, LDADDLH gives the operational pseudocode for this instruction.

is equivalent to

LDADDL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xs> Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDADD](#), [LDADDA](#), [LDADDAL](#), [LDADDL](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.254 STCLRB, STCLRLB

Atomic bit clear on byte in memory, without return, atomically loads an 8-bit byte from memory, performs a bitwise AND with the complement of the value held in a register on it, and stores the result back to memory.

- STCLRB does not have release semantics.
- STCLRLB stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDCLRB, LDCLRAB, LDCLRALB, LDCLRLB instruction. This means that:

- The encodings in this description are named to match the encodings of LDCLRB, LDCLRAB, LDCLRALB, LDCLRLB.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDEORB, LDEORAB, LDEORALB, LDEORLB gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.258 STEORH, STEORLH

Atomic exclusive OR on halfword in memory, without return, atomically loads a 16-bit halfword from memory, performs an exclusive OR with the value held in a register on it, and stores the result back to memory.

- STEORH does not have release semantics.
- STEORLH stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDEORH, LDEORAH, LDEORALH, LDEORLH instruction. This means that:

- The encodings in this description are named to match the encodings of LDEORH, LDEORAH, LDEORALH, LDEORLH.
- The description of LDEORH, LDEORAH, LDEORALH, LDEORLH gives the operational pseudocode for this instruction.

Integer

size				A							opc					Rt							

No memory ordering variant

Applies when R == 0.

STEORH <Ws>, [<Xn|SP>]

is equivalent to

LDEORH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STEORLH <Ws>, [<Xn|SP>]

is equivalent to

LDEORLH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDEORH, LDEORAH, LDEORALH, LDEORLH gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.259 STEOR, STEORL

Atomic exclusive OR on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, performs an exclusive OR with the value held in a register on it, and stores the result back to memory.

- STEOR does not have release semantics.
- STEORL stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDEOR, LDEORA, LDEORAL, LDEORL instruction. This means that:

- The encodings in this description are named to match the encodings of LDEOR, LDEORA, LDEORAL, LDEORL.
- The description of LDEOR, LDEORA, LDEORAL, LDEORL gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

32-bit LDEOR alias variant

Applies when size == 10 && R == 0.

STEOR <Ws>, [<Xn|SP>]

is equivalent to

LDEOR <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

32-bit LDEORL alias variant

Applies when size == 10 && R == 1.

STEORL <Ws>, [<Xn|SP>]

is equivalent to

LDEORL <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDEOR alias variant

Applies when size == 11 && R == 0.

STEOR <Xs>, [<Xn|SP>]

is equivalent to

LDEOR <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDEORL alias variant

Applies when `size == 11 && R == 1`.

STEORL <Xs>, [<Xn|SP>]

is equivalent to

LDEORL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xs> Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDEOR](#), [LDEORA](#), [LDEORAL](#), [LDEORL](#) gives the operational pseudocode for this instruction.

Operational information

If `PSTATE.DIT` is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.260 STG

Store Allocation Tag stores an Allocation Tag to memory. The address used for the store is calculated from the base register and an immediate signed offset scaled by the Tag granule. The Allocation Tag is calculated from the Logical Address Tag in the source register.

This instruction generates an Unchecked access.

Post-index

1	1	0	1	1	0	0	1	0	0	1	imm9				1	0	Xn				Xt					

Encoding

STG <Xt|SP>, [<Xn|SP>{, #<sim>}]

Decode for this encoding

```
if !HaveMTEExt() then UNDEFINED;
integer n = UInt(Xn);
integer t = UInt(Xt);
bits(64) offset = LSL(SignExtend(imm9, 64), LOG2_TAG_GRANULE);
boolean writeback = FALSE;
boolean postindex = FALSE;
```

Assembler symbols

- <Xt|SP> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Xt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Xn" field.
- <sim> Is the optional signed immediate offset, a multiple of 16 in the range -4096 to 4080, defaulting to 0 and encoded in the "imm9" field.

Operation for all encodings

```
bits(64) address;

SetTagCheckedInstruction(FALSE);

if n == 31 then
  CheckSPAlignment();
  address = SP[];
else
  address = X[n];

if !postindex then
  address = address + offset;

bits(64) data = if t == 31 then SP[] else X[t];
bits(4) tag = AArch64.AllocationTagFromAddress(data);
AArch64.MemTag[address, AccType_NORMAL] = tag;

if writeback then
  if postindex then
    address = address + offset;

  if n == 31 then
    SP[] = address;
  else
    X[n] = address;
```

C6.2.261 STGM

Store Tag Multiple writes a naturally aligned block of N Allocation Tags, where the size of N is identified in GMID_EL1.BS, and the Allocation Tag written to address A is taken from the source register at $4*A<7:4>+3:4*A<7:4>$.

This instruction is UNDEFINED at EL0.

This instruction generates an Unchecked access.

If `ID_AA64PFR1_EL1` != 0b0010, this instruction is UNDEFINED.

Integer

(FEAT_MTE2)

Encoding

STGM <Xt>, [<Xn|SP>]

Decode for this encoding

```
if !HaveMTE2Ext() then UNDEFINED;
integer t = UInt(Xt);
integer n = UInt(Xn);
```

Assembler symbols

<Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Xt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Xn" field.

Operation

```
if PSTATE.EL == EL0 then
    UNDEFINED;

bits(64) data = X[t];
bits(64) address;

if n == 31 then
    CheckSPAAlignment();
    address = SP[];
else
    address = X[n];

integer size = 4 * (2 ^ (UInt(GMID_EL1.BS)));
address = Align(address, size);
integer count = size >> LOG2_TAG_GRANULE;
integer index = UInt(address<LOG2_TAG_GRANULE+3:LOG2_TAG_GRANULE>);

for i = 0 to count-1
    bits(4) tag = data<(index*4)+3:index*4>;
    AArch64.MemTag[address, AccType_NORMAL] = tag;
    address = address + TAG_GRANULE;
    index = index + 1;
```

C6.2.262 STGP

Store Allocation Tag and Pair of registers stores an Allocation Tag and two 64-bit doublewords to memory, from two registers. The address used for the store is calculated from the base register and an immediate signed offset scaled by the Tag granule. The Allocation Tag is calculated from the Logical Address Tag in the base register.

This instruction generates an Unchecked access.

Post-index

(FEAT_MTE)

Encoding

STGP <Xt1>, <Xt2>, [<Xn|SP>], #<imm>

Decode for this encoding

```

if !HaveMTEExt() then UNDEFINED;
integer n = UInt(Xn);
integer t = UInt(Xt);
integer t2 = UInt(Xt2);
bits(64) offset = LSL(SignExtend(simm7, 64), LOG2_TAG_GRANULE);
boolean writeback = TRUE;
boolean postindex = TRUE;
    
```

Pre-index

(FEAT_MTE)

Encoding

    SP[] = address;  
else  
    X[n] = address;
```

C6.2.263 STLLRB

Store LORelease Register Byte stores a byte from a 32-bit register to a memory location. The instruction also has memory ordering semantics as described in *LoadLOAcquire, StoreLORelease* on page B2-153. For information about memory accesses, see *Load/store addressing modes* on page C1-202.

No offset

(FEAT_LOR)

Encoding

STLLRB <Wt>, [<Xn|SP>{, #0}]

Decode for this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);

boolean tag_checked = n != 31;
```

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(8) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

data = X[t];
Mem[address, 1, AccType_LIMITEDORDERED] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.264 STLLRH

Store LORelease Register Halfword stores a halfword from a 32-bit register to a memory location. The instruction also has memory ordering semantics as described in *LoadLOAcquire, StoreLORelease* on page B2-153. For information about memory accesses, see *Load/store addressing modes* on page C1-202.

No offset

(FEAT_LOR)

Encoding

STLLRH <Wt>, [<Xn|SP>{, #0}]

Decode for this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);

boolean tag_checked = n != 31;
```

Assembler symbols

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
 <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(16) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

data = X[t];
Mem[address, 2, AccType_LIMITEDORDERED] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.265 STLLR

Store LORelease Register stores a 32-bit word or a 64-bit doubleword to a memory location, from a register. The instruction also has memory ordering semantics as described in *LoadLOAcquire, StoreLORelease* on page B2-153. For information about memory accesses, see *Load/store addressing modes* on page C1-202.

No offset

(FEAT_LOR)

32-bit variant

Applies when size == 10.

STLLR <Wt>, [<Xn|SP>{,#0}]

64-bit variant

Applies when size == 11.

STLLR <Xt>, [<Xn|SP>{,#0}]

Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);

integer elsize = 8 << UInt(size);
boolean tag_checked = n != 31;
```

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(elsize) data;
constant integer dbytes = elsize DIV 8;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

data = X[t];
Mem[address, dbytes, AccType_LIMITEDORDERED] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.266 STLR

Store-Release Register stores a 32-bit word or a 64-bit doubleword to a memory location, from a register. The instruction also has memory ordering semantics as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152. For information about memory accesses, see *Load/store addressing modes* on page C1-202.

32-bit variant

Applies when size == 10.

STLR <Wt>, [<Xn|SP>{,#0}]

64-bit variant

Applies when size == 11.

STLR <Xt>, [<Xn|SP>{,#0}]

Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);

integer elsize = 8 << UInt(size);
boolean tag_checked = n != 31;
```

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(elsize) data;
constant integer dbytes = elsize DIV 8;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

data = X[t];
Mem[address, dbytes, AccType_ORDERED] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.267 STLRB

Store-Release Register Byte stores a byte from a 32-bit register to a memory location. The instruction also has memory ordering semantics as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152. For information about memory accesses, see *Load/store addressing modes* on page C1-202.

Encoding

STLRB <Wt>, [<Xn|SP>{,#0}]

Decode for this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);

boolean tag_checked = n != 31;
```

Assembler symbols

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(8) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

data = X[t];
Mem[address, 1, AccType_ORDERED] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.268 STLRH

Store-Release Register Halfword stores a halfword from a 32-bit register to a memory location. The instruction also has memory ordering semantics as described in *Load-Acquire*, *Load-AcquirePC*, and *Store-Release* on page B2-152. For information about memory accesses, see *Load/store addressing modes* on page C1-202.

Encoding

STLRH <Wt>, [<Xn|SP>{, #0}]

Decode for this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);

boolean tag_checked = n != 31;
```

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(16) data;

if HaveMTE2Ext() then
  SetTagCheckedInstruction(tag_checked);

if n == 31 then
  CheckSPAlignment();
  address = SP[];
else
  address = X[n];

data = X[t];
Mem[address, 2, AccType_ORDERED] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.269 STLUR

Store-Release Register (unscaled) calculates an address from a base register value and an immediate offset, and stores a 32-bit word or a 64-bit doubleword to the calculated address, from a register.

The instruction has memory ordering semantics as described in [Load-Acquire, Load-AcquirePC, and Store-Release on page B2-152](#)

For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

Unscaled offset

(FEAT_LRCPC2)

32-bit variant

Applies when size == 10.

STLUR <Wt>, [<Xn|SP>{, #<simmm>}]

64-bit variant

Applies when size == 11.

STLUR <Xt>, [<Xn|SP>{, #<simmm>}]

Decode for all variants of this encoding

```
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <simmm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

integer datasize = 8 << scale;
boolean tag_checked = n != 31;
```

Operation

```
bits(64) address;
bits(datasize) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);
```

```
if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = X[t];
Mem[address, datasize DIV 8, AccType_ORDERED] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.270 STLURB

Store-Release Register Byte (unscaled) calculates an address from a base register value and an immediate offset, and stores a byte to the calculated address, from a 32-bit register.

The instruction has memory ordering semantics as described in [Load-Acquire, Load-AcquirePC, and Store-Release on page B2-152](#)

For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

Unscaled offset

(FEAT_LRCPC2)

Encoding

STLURB <Wt>, [<Xn|SP>{, #<sim>}]

Decode for this encoding

bits(64) offset = [SignExtend](#)(imm9, 64);

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <sim> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

boolean tag_checked = n != 31;
```

Operation

```
bits(64) address;
bits(8) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;
```

```
data = X[t];  
Mem[address, 1, AccType_ORDERED] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.271 STLURH

Store-Release Register Halfword (unscaled) calculates an address from a base register value and an immediate offset, and stores a halfword to the calculated address, from a 32-bit register.

The instruction has memory ordering semantics as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152

For information about memory accesses, see *Load/store addressing modes* on page C1-202.

Unscaled offset

(FEAT_LRCPC2)

Encoding

STLURH <Wt>, [<Xn|SP>{, #<imm>}]

Decode for this encoding

bits(64) offset = [SignExtend](#)(imm9, 64);

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

boolean tag_checked = n != 31;
```

Operation

```
bits(64) address;
bits(16) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;
```

```
data = X[t];  
Mem[address, 2, AccType_ORDERED] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.272 STLXP

Store-Release Exclusive Pair of registers stores two 32-bit words or two 64-bit doublewords to a memory location if the PE has exclusive access to the memory address, from two registers, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See [Synchronization and semaphores on page B2-179](#). For information on single-copy atomicity and alignment requirements, see [Requirements for single-copy atomicity on page B2-128](#) and [Alignment of data accesses on page B2-160](#). If a 64-bit pair Store-Exclusive succeeds, it causes a single-copy atomic update of the 128-bit memory location being updated. The instruction also has memory ordering semantics, as described in [Load-Acquire, Load-AcquirePC, and Store-Release on page B2-152](#). For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

32-bit variant

Applies when `sz == 0`.

STLXP <Ws>, <Wt1>, <Wt2>, [<Xn|SP>{,#0}]

64-bit variant

Applies when `sz == 1`.

STLXP <Ws>, <Xt1>, <Xt2>, [<Xn|SP>{,#0}]

Decode for all variants of this encoding

```

integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs); // ignored by all loads and store-release

integer elsize = 32 << UInt(sz);
integer datasize = elsize * 2;
boolean tag_checked = n != 31;

boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;
if s == t || (s == t2) then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rt_unknown = TRUE; // store UNKNOWN value
    when Constraint_UNDEF UNDEFINED;
    when Constraint_NOP EndOfInstruction();
if s == n && n != 31 then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rn_unknown = TRUE; // address is UNKNOWN
    when Constraint_UNDEF UNDEFINED;
    when Constraint_NOP EndOfInstruction();
  
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly [STLXP on page K1-8419](#).

Assembler symbols

<Ws>	Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is: 0 If the operation updates memory. 1 If the operation fails to update memory.
<Xt1>	Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.
<Xt2>	Is the 64-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Wt1>	Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.
<Wt2>	Is the 32-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Xn SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

Accessing an address that is not aligned to the size of the data being accessed causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch64.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch64.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation

```

bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
elseif rn_unknown then
    address = bits(64) UNKNOWN;
else
    address = X[n];

if rt_unknown then
    data = bits(datasize) UNKNOWN;
else
    bits(datasize DIV 2) e1 = X[t];
    bits(datasize DIV 2) e2 = X[t2];
    data = if BigEndian(AccType_ORDEREDATOMIC) then e1:e2 else e2:e1;
bit status = '1';
// Check whether the Exclusives monitors are set to include the
// physical memory locations corresponding to virtual address
// range [address, address+dbytes-1].
if AArch64.ExclusiveMonitorsPass(address, dbytes) then
    // This atomic write will be rejected if it does not refer
  
```

```
// to the same physical locations after address translation.  
Mem[address, dbytes, AccType_ORDEREDATOMIC] = data;  
status = ExclusiveMonitorsStatus();  
X[s] = ZeroExtend(status, 32);
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.273 STLXR

Store-Release Exclusive Register stores a 32-bit word or a 64-bit doubleword to memory if the PE has exclusive access to the memory address, from two registers, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See [Synchronization and semaphores on page B2-179](#). The memory access is atomic. The instruction also has memory ordering semantics as described in [Load-Acquire, Load-AcquirePC, and Store-Release on page B2-152](#). For information about memory accesses see [Load/store addressing modes on page C1-202](#).

32-bit variant

Applies when size == 10.

STLXR <Ws>, <Wt>, [<Xn|SP>{,#0}]

64-bit variant

Applies when size == 11.

STLXR <Ws>, <Xt>, [<Xn|SP>{,#0}]

Decode for all variants of this encoding

```

integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs); // ignored by all loads and store-release

integer  elsize = 8 << UInt(size);
boolean  tag_checked = n != 31;

boolean  rt_unknown = FALSE;
boolean  rn_unknown = FALSE;
if s == t then
    Constraint c = ConstrainUnpredictable();
    assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
    case c of
        when Constraint_UNKNOWN rt_unknown = TRUE; // store UNKNOWN value
        when Constraint_UNDEF   UNDEFINED;
        when Constraint_NOP     EndOfInstruction();
if s == n && n != 31 then
    Constraint c = ConstrainUnpredictable();
    assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
    case c of
        when Constraint_UNKNOWN rn_unknown = TRUE; // address is UNKNOWN
        when Constraint_UNDEF   UNDEFINED;
        when Constraint_NOP     EndOfInstruction();

```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly [STLXR on page K1-8420](#).

Assembler symbols

<Ws>	Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is: 0 If the operation updates memory. 1 If the operation fails to update memory.
<Xt>	Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Wt>	Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

Accessing an address that is not aligned to the size of the data being accessed causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch64.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch64.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation

```
bits(64) address;  
bits(elsize) data;  
constant integer dbytes = elsize DIV 8;  
  
if HaveMTE2Ext() then  
    SetTagCheckedInstruction(tag_checked);  
  
if n == 31 then  
    CheckSPAlignment();  
    address = SP[];  
elseif rn_unknown then  
    address = bits(64) UNKNOWN;  
else  
    address = X[n];  
  
if rt_unknown then  
    data = bits(elsize) UNKNOWN;  
else  
    data = X[t];  
  
bit status = '1';  
// Check whether the Exclusives monitors are set to include the  
// physical memory locations corresponding to virtual address  
// range [address, address+dbytes-1].  
if AArch64.ExclusiveMonitorsPass(address, dbytes) then  
    // This atomic write will be rejected if it does not refer  
    // to the same physical locations after address translation.  
    Mem[address, dbytes, AccType_ORDEREDATOMIC] = data;  
    status = ExclusiveMonitorsStatus();  
X[s] = ZeroExtend(status, 32);
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.274 STLXRB

Store-Release Exclusive Register Byte stores a byte from a 32-bit register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See [Synchronization and semaphores on page B2-179](#). The memory access is atomic. The instruction also has memory ordering semantics as described in [Load-Acquire, Load-AcquirePC, and Store-Release on page B2-152](#). For information about memory accesses see [Load/store addressing modes on page C1-202](#).

Encoding

STLXRB <Ws>, <Wt>, [<Xn|SP>{, #0}]

Decode for this encoding

```

integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs); // ignored by all loads and store-release

boolean tag_checked = n != 31;

boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;
if s == t then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rt_unknown = TRUE; // store UNKNOWN value
    when Constraint_UNDEF   UNDEFINED;
    when Constraint_NOP     EndOfInstruction();
if s == n && n != 31 then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rn_unknown = TRUE; // address is UNKNOWN
    when Constraint_UNDEF   UNDEFINED;
    when Constraint_NOP     EndOfInstruction();
  
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly [STLXRB on page K1-8420](#).

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

If AArch64.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation

```

bits(64) address;
bits(8) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
elseif rn_unknown then
    address = bits(64) UNKNOWN;
else
    address = X[n];

if rt_unknown then
    data = bits(8) UNKNOWN;
else
    data = X[t];

bit status = '1';
// Check whether the Exclusives monitors are set to include the
// physical memory locations corresponding to virtual address
// range [address, address+dbytes-1].
if AArch64.ExclusiveMonitorsPass(address, 1) then
    // This atomic write will be rejected if it does not refer
    // to the same physical locations after address translation.
    Mem[address, 1, AccType_ORDEREDATOMIC] = data;
    status = ExclusiveMonitorsStatus();
X[s] = ZeroExtend(status, 32);
  
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.275 STLXRH

Store-Release Exclusive Register Halfword stores a halfword from a 32-bit register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See [Synchronization and semaphores on page B2-179](#). The memory access is atomic. The instruction also has memory ordering semantics as described in [Load-Acquire, Load-AcquirePC, and Store-Release on page B2-152](#). For information about memory accesses see [Load/store addressing modes on page C1-202](#).

Encoding

STLXRH <Ws>, <Wt>, [<Xn|SP>{,#0}]

Decode for this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs); // ignored by all loads and store-release

boolean tag_checked = n != 31;

boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;
if s == t then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rt_unknown = TRUE; // store UNKNOWN value
    when Constraint_UNDEF   UNDEFINED;
    when Constraint_NOP     EndOfInstruction();
if s == n && n != 31 then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rn_unknown = TRUE; // address is UNKNOWN
    when Constraint_UNDEF   UNDEFINED;
    when Constraint_NOP     EndOfInstruction();
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly [STLXRH on page K1-8420](#).

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

A non halfword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If AArch64.ExclusiveMonitorsPass() returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If AArch64.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation

```

bits(64) address;
bits(16) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
elseif rn_unknown then
    address = bits(64) UNKNOWN;
else
    address = X[n];

if rt_unknown then
    data = bits(16) UNKNOWN;
else
    data = X[t];

bit status = '1';
// Check whether the Exclusives monitors are set to include the
// physical memory locations corresponding to virtual address
// range [address, address+dbytes-1].
if AArch64.ExclusiveMonitorsPass(address, 2) then
    // This atomic write will be rejected if it does not refer
    // to the same physical locations after address translation.
    Mem[address, 2, AccType_ORDEREDATOMIC] = data;
    status = ExclusiveMonitorsStatus();
X[s] = ZeroExtend(status, 32);
  
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.276 STNP

Store Pair of Registers, with non-temporal hint, calculates an address from a base register value and an immediate offset, and stores two 32-bit words or two 64-bit doublewords to the calculated address, from two registers. For information about memory accesses, see *Load/store addressing modes* on page C1-202. For information about Non-temporal pair instructions, see *Load/store non-temporal pair* on page C3-227.

32-bit variant

Applies when `opc == 00`.

STNP <Wt1>, <Wt2>, [<Xn|SP>{, #<imm>}]

64-bit variant

Applies when `opc == 10`.

STNP <Xt1>, <Xt2>, [<Xn|SP>{, #<imm>}]

Decode for all variants of this encoding

// Empty.

Assembler symbols

- <Wt1> Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.
- <Wt2> Is the 32-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.
- <Xt1> Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.
- <Xt2> Is the 64-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> For the 32-bit variant: is the optional signed immediate byte offset, a multiple of 4 in the range -256 to 252, defaulting to 0 and encoded in the "imm7" field as <imm>/4.
 For the 64-bit variant: is the optional signed immediate byte offset, a multiple of 8 in the range -512 to 504, defaulting to 0 and encoded in the "imm7" field as <imm>/8.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2);
if opc<0> == '1' then UNDEFINED;
integer scale = 2 + UInt(opc<1>);
integer datasize = 8 << scale;
bits(64) offset = LSL(SignExtend(imm7, 64), scale);
boolean tag_checked = n != 31;
```

Operation

```
bits(64) address;
bits(datasize) data1;
bits(datasize) data2;
constant integer dbytes = datasize DIV 8;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data1 = X[t];
data2 = X[t2];
Mem[address, dbytes, AccType_STREAM] = data1;
Mem[address+dbytes, dbytes, AccType_STREAM] = data2;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.277 STP

Store Pair of Registers calculates an address from a base register value and an immediate offset, and stores two 32-bit words or two 64-bit doublewords to the calculated address, from two registers. For information about memory accesses, see [Load/store addressing modes](#) on page C1-202.

Post-index

32-bit variant

Applies when `opc == 00`.

STP <Wt1>, <Wt2>, [<Xn|SP>], #<imm>

64-bit variant

Applies when `opc == 10`.

Decode for all variants of this encoding

```
boolean wback = TRUE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

Unsigned offset

32-bit variant

Applies when size == 10.

STR <Wt>, [<Xn|SP>{, #<pimm>}]

64-bit variant

Applies when size == 11.

STR <Xt>, [<Xn|SP>{, #<pimm>}]

Decode for all variants of this encoding

```
boolean wback = FALSE;
boolean postindex = FALSE;
integer scale = UInt(size);
bits(64) offset = LSL(ZeroExtend(imm12, 64), scale);
```

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <sim> Is the signed immediate byte offset, in the range -256 to 255, encoded in the "imm9" field.
- <pimm> For the 32-bit variant: is the optional positive immediate byte offset, a multiple of 4 in the range 0 to 16380, defaulting to 0 and encoded in the "imm12" field as <pimm>/4.
 For the 64-bit variant: is the optional positive immediate byte offset, a multiple of 8 in the range 0 to 32760, defaulting to 0 and encoded in the "imm12" field as <pimm>/8.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

integer datasize = 8 << scale;
boolean tag_checked = wback || n != 31;

boolean rt_unknown = FALSE;

if wback && n == t && n != 31 then
  c = ConstrainUnpredictable();
  assert c IN {Constraint_NONE, Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_NONE   rt_unknown = FALSE; // value stored is original value
    when Constraint_UNKNOWN rt_unknown = TRUE;  // value stored is UNKNOWN
    when Constraint_UNDEF   UNDEFINED;
    when Constraint_NOP     EndOfInstruction();
```

Operation for all encodings

```
bits(64) address;
bits(datasize) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

if !postindex then
    address = address + offset;

if rt_unknown then
    data = bits(datasize) UNKNOWN;
else
    data = X[t];
Mem[address, datasize DIV 8, AccType_NORMAL] = data;

if wback then
    if postindex then
        address = address + offset;
    if n == 31 then
        SP[] = address;
    else
        X[n] = address;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.279 STR (register)

Store Register (register) calculates an address from a base register value and an offset register value, and stores a 32-bit word or a 64-bit doubleword to the calculated address, from a register. For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

The instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an offset register value. The offset can be optionally shifted and extended.

32-bit variant

Applies when size == 10.

STR <Wt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]

64-bit variant

Applies when size == 11.

STR <Xt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}]

Decode for all variants of this encoding

```
integer scale = UInt(size);
if option<1> == '0' then UNDEFINED; // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

Assembler symbols

<Wt>	Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.								
<Xt>	Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.								
<Xn SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.								
<Wm>	When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.								
<Xm>	When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.								
<extend>	Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values: <table style="margin-left: 20px; border-collapse: collapse;"> <tr><td>UXTW</td><td>when option = 010</td></tr> <tr><td>LSL</td><td>when option = 011</td></tr> <tr><td>SXTW</td><td>when option = 110</td></tr> <tr><td>SXTX</td><td>when option = 111</td></tr> </table>	UXTW	when option = 010	LSL	when option = 011	SXTW	when option = 110	SXTX	when option = 111
UXTW	when option = 010								
LSL	when option = 011								
SXTW	when option = 110								
SXTX	when option = 111								
<amount>	For the 32-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values: <table style="margin-left: 20px; border-collapse: collapse;"> <tr><td>#0</td><td>when S = 0</td></tr> </table>	#0	when S = 0						
#0	when S = 0								

#2 when S = 1

For the 64-bit variant: is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

#0 when S = 0

#3 when S = 1

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);

integer datasize = 8 << scale;
```

Operation

```
bits(64) offset = ExtendReg(m, extend_type, shift);
bits(64) address;
bits(datasize) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(TRUE);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = X[t];
Mem[address, datasize DIV 8, AccType_NORMAL] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.280 STRB (immediate)

Store Register Byte (immediate) stores the least significant byte of a 32-bit register to memory. The address that is used for the store is calculated from a base register and an immediate offset. For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

Post-index

Encoding

STRB <Wt>, [<Xn|SP>], #<imm>

Decode for this encoding

```
boolean wback = TRUE;
boolean postindex = TRUE;
bits(64) offset = SignExtend(imm9, 64);
```

Pre-index

Encoding

STRB <Wt>, [<Xn|SP>], #<imm>!

Decode for this encoding

```
boolean wback = TRUE;
boolean postindex = FALSE;
bits(64) offset = SignExtend(imm9, 64);
```

Unsigned offset

Encoding

STRB <Wt>, [<Xn|SP>{, #<pimm>}]

Decode for this encoding

```
boolean wback = FALSE;
boolean postindex = FALSE;
bits(64) offset = LSL(ZeroExtend(imm12, 64), 0);
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *STRB (immediate)* on page K1-8421.

Assembler symbols

<wt>	Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<sim>	Is the signed immediate byte offset, in the range -256 to 255, encoded in the "imm9" field.
<pimm>	Is the optional positive immediate byte offset, in the range 0 to 4095, defaulting to 0 and encoded in the "imm12" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

boolean tag_checked = wback || n != 31;

boolean rt_unknown = FALSE;

if wback && n == t && n != 31 then
  c = ConstrainUnpredictable();
  assert c IN {Constraint_NONE, Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_NONE   rt_unknown = FALSE; // value stored is original value
    when Constraint_UNKNOWN rt_unknown = TRUE;  // value stored is UNKNOWN
    when Constraint_UNDEF   UNDEFINED;
    when Constraint_NOP     EndOfInstruction();
```

Operation for all encodings

```
bits(64) address;
bits(8) data;

if HaveMTE2Ext() then
  SetTagCheckedInstruction(tag_checked);

if n == 31 then
  CheckSPAlignment();
  address = SP[];
else
  address = X[n];

if !postindex then
  address = address + offset;

if rt_unknown then
  data = bits(8) UNKNOWN;
else
  data = X[t];
Mem[address, 1, AccType_NORMAL] = data;

if wback then
  if postindex then
    address = address + offset;
  if n == 31 then
    SP[] = address;
```

```
else  
    X[n] = address;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.281 STRB (register)

Store Register Byte (register) calculates an address from a base register value and an offset register value, and stores a byte from a 32-bit register to the calculated address. For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

The instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an offset register value. The offset can be optionally shifted and extended.

Extended register variant

Applies when option != 011.

STRB <Wt>, [<Xn|SP>, (<Wm>|<Xm>), <extend> {<amount>}]

Shifted register variant

Applies when option == 011.

STRB <Wt>, [<Xn|SP>, <Xm>{, LSL <amount>}]

Decode for all variants of this encoding

```
if option<1> == '0' then UNDEFINED; // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
```

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <Wm> When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.
- <Xm> When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.
- <extend> Is the index extend specifier, encoded in the "option" field. It can have the following values:
 - UXTW when option = 010
 - SXTW when option = 110
 - SXTX when option = 111
- <amount> Is the index shift amount, it must be #0, encoded in "S" as 0 if omitted, or as 1 if present.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);
```

Operation

```
bits(64) offset = ExtendReg(m, extend_type, 0);
bits(64) address;
bits(8) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(TRUE);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = X[t];
Mem[address, 1, AccType_NORMAL] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.282 STRH (immediate)

Store Register Halfword (immediate) stores the least significant halfword of a 32-bit register to memory. The address that is used for the store is calculated from a base register and an immediate offset. For information about memory accesses, see [Load/store addressing modes](#) on page C1-202.

Post-index

Encoding

STRH <Wt>, [<Xn|SP>], #<imm>

Decode for this encoding

```
boolean wback = TRUE;
boolean postindex = TRUE;
bits(64) offset = SignExtend(imm9, 64);
```

Pre-index

Encoding

STRH <Wt>, [<Xn|SP>], #<imm>!

Decode for this encoding

```
boolean wback = TRUE;
boolean postindex = FALSE;
bits(64) offset = SignExtend(imm9, 64);
```

Unsigned offset

Encoding

STRH <Wt>, [<Xn|SP>{, #<pimm>}]

Decode for this encoding

```
boolean wback = FALSE;
boolean postindex = FALSE;
bits(64) offset = LSL(ZeroExtend(imm12, 64), 1);
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly *STRH (immediate)* on page K1-8421.

Assembler symbols

<wt>	Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
<Xn SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
<sim>	Is the signed immediate byte offset, in the range -256 to 255, encoded in the "imm9" field.
<pimm>	Is the optional positive immediate byte offset, a multiple of 2 in the range 0 to 8190, defaulting to 0 and encoded in the "imm12" field as <pimm>/2.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

boolean tag_checked = wback || n != 31;

boolean rt_unknown = FALSE;

if wback && n == t && n != 31 then
    c = ConstrainUnpredictable();
    assert c IN {Constraint_NONE, Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
    case c of
        when Constraint_NONE    rt_unknown = FALSE; // value stored is original value
        when Constraint_UNKNOWN  rt_unknown = TRUE;  // value stored is UNKNOWN
        when Constraint_UNDEF    UNDEFINED;
        when Constraint_NOP      EndOfInstruction();
```

Operation for all encodings

```
bits(64) address;
bits(16) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

if !postindex then
    address = address + offset;

if rt_unknown then
    data = bits(16) UNKNOWN;
else
    data = X[t];
Mem[address, 2, AccType_NORMAL] = data;

if wback then
    if postindex then
        address = address + offset;
    if n == 31 then
        SP[] = address;
```

```
else  
    X[n] = address;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.283 STRH (register)

Store Register Halfword (register) calculates an address from a base register value and an offset register value, and stores a halfword from a 32-bit register to the calculated address. For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

The instruction uses an offset addressing mode, that calculates the address used for the memory access from a base register value and an offset register value. The offset can be optionally shifted and extended.

Encoding

STRH <Wt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}}

Decode for this encoding

```
if option<1> == '0' then UNDEFINED; // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then 1 else 0;
```

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <Wm> When option<0> is set to 0, is the 32-bit name of the general-purpose index register, encoded in the "Rm" field.
- <Xm> When option<0> is set to 1, is the 64-bit name of the general-purpose index register, encoded in the "Rm" field.
- <extend> Is the index extend/shift specifier, defaulting to LSL, and which must be omitted for the LSL option when <amount> is omitted. encoded in the "option" field. It can have the following values:

UXTW	when option = 010
LSL	when option = 011
SXTW	when option = 110
SXTX	when option = 111
- <amount> Is the index shift amount, optional only when <extend> is not LSL. Where it is permitted to be optional, it defaults to #0. It is encoded in the "S" field. It can have the following values:

#0	when S = 0
#1	when S = 1

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer m = UInt(Rm);
```

Operation

```
bits(64) offset = ExtendReg(m, extend_type, shift);
bits(64) address;
bits(16) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(TRUE);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = X[t];
Mem[address, 2, AccType_NORMAL] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.284 STSETB, STSETLB

Atomic bit set on byte in memory, without return, atomically loads an 8-bit byte from memory, performs a bitwise OR with the value held in a register on it, and stores the result back to memory.

- STSETB does not have release semantics.
- STSETLB stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDSETB, LDSETAB, LDSETALB, LDSETLB instruction. This means that:

- The encodings in this description are named to match the encodings of LDSETB, LDSETAB, LDSETALB, LDSETLB.
- The description of LDSETB, LDSETAB, LDSETALB, LDSETLB gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	12	11	10	9	5	4	0		
0	0	1	1	1	0	0	0	0	R	1	Rs	0	0	1	1	0	0	Rn	1	1	1	1	1
size				A								opc				Rt							

No memory ordering variant

Applies when R == 0.

STSETB <Ws>, [<Xn|SP>]

is equivalent to

LDSETB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STSETLB <Ws>, [<Xn|SP>]

is equivalent to

LDSETLB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDSETB, LDSETAB, LDSETALB, LDSETLB gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.285 STSETH, STSETLH

Atomic bit set on halfword in memory, without return, atomically loads a 16-bit halfword from memory, performs a bitwise OR with the value held in a register on it, and stores the result back to memory.

- STSETH does not have release semantics.
- STSETLH stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDSETH, LDSETAH, LDSETALH, LDSETLH instruction. This means that:

- The encodings in this description are named to match the encodings of LDSETH, LDSETAH, LDSETALH, LDSETLH.
- The description of LDSETH, LDSETAH, LDSETALH, LDSETLH gives the operational pseudocode for this instruction.

size				A							opc				Rt								

No memory ordering variant

Applies when R == 0.

STSETH <Ws>, [<Xn|SP>]

is equivalent to

LDSETH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STSETLH <Ws>, [<Xn|SP>]

is equivalent to

LDSETLH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of LDSETH, LDSETAH, LDSETALH, LDSETLH gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.286 STSET, STSETL

Atomic bit set on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, performs a bitwise OR with the value held in a register on it, and stores the result back to memory.

- STSET does not have release semantics.
- STSETL stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDSET, LDSETA, LDSETAL, LDSETL instruction. This means that:

- The encodings in this description are named to match the encodings of LDSET, LDSETA, LDSETAL, LDSETL.
- The description of LDSET, LDSETA, LDSETAL, LDSETL gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

32-bit LDSET alias variant

Applies when size == 10 && R == 0.

STSET <Ws>, [<Xn|SP>]

is equivalent to

LDSET <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

32-bit LDSETL alias variant

Applies when size == 10 && R == 1.

STSETL <Ws>, [<Xn|SP>]

is equivalent to

LDSETL <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDSET alias variant

Applies when size == 11 && R == 0.

STSET <Xs>, [<Xn|SP>]

is equivalent to

LDSET <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDSETL alias variant

Applies when size == 11 && R == 1.

STSETL <Xs>, [<Xn|SP>]

is equivalent to

LDSETL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xs> Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDSET](#), [LDSETA](#), [LDSETAL](#), [LDSETL](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.287 STSMAXB, STSMAXB

Atomic signed maximum on byte in memory, without return, atomically loads an 8-bit byte from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as signed numbers.

- STSMAXB does not have release semantics.
- STSMAXB stores to memory with release semantics, as described in [Load-Acquire](#), [Load-AcquirePC](#), and [Store-Release](#) on page B2-152.

For information about memory accesses see [Load/store addressing modes](#) on page C1-202.

This instruction is an alias of the [LDSMAXB](#), [LDSMAXAB](#), [LDSMAXALB](#), [LDSMAXLB](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LDSMAXB](#), [LDSMAXAB](#), [LDSMAXALB](#), [LDSMAXLB](#).

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDSMAXB](#), [LDSMAXAB](#), [LDSMAXALB](#), [LDSMAXLB](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.288 STSMAXH, STSMAXLH

Atomic signed maximum on halfword in memory, without return, atomically loads a 16-bit halfword from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as signed numbers.

- STSMAXH does not have release semantics.
- STSMAXLH stores to memory with release semantics, as described in [Load-Acquire](#), [Load-AcquirePC](#), and [Store-Release](#) on page B2-152.

For information about memory accesses see [Load/store addressing modes](#) on page C1-202.

This instruction is an alias of the [LDSMAXH](#), [LDSMAXAH](#), [LDSMAXALH](#), [LDSMAXLH](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LDSMAXH](#), [LDSMAXAH](#), [LDSMAXALH](#), [LDSMAXLH](#).
- The description of [LDSMAXH](#), [LDSMAXAH](#), [LDSMAXALH](#), [LDSMAXLH](#) gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

No memory ordering variant

Applies when R == 0.

STSMAXH <Ws>, [<Xn|SP>]

is equivalent to

LDSMAXH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STSMAXLH <Ws>, [<Xn|SP>]

is equivalent to

LDSMAXLH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDSMAXH](#), [LDSMAXAH](#), [LDSMAXALH](#), [LDSMAXLH](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.289 STSMAX, STSMAXL

Atomic signed maximum on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as signed numbers.

- STSMAX does not have release semantics.
- STSMAXL stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDSMAX, LDSMAXA, LDSMAXAL, LDSMAXL instruction. This means that:

- The encodings in this description are named to match the encodings of LDSMAX, LDSMAXA, LDSMAXAL, LDSMAXL.
- The description of LDSMAX, LDSMAXA, LDSMAXAL, LDSMAXL gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

32-bit LDSMAX alias variant

Applies when size == 10 && R == 0.

STSMAX <Ws>, [<Xn|SP>]

is equivalent to

LDSMAX <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

32-bit LDSMAXL alias variant

Applies when size == 10 && R == 1.

STSMAXL <Ws>, [<Xn|SP>]

is equivalent to

LDSMAXL <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDSMAX alias variant

Applies when size == 11 && R == 0.

STSMAX <Xs>, [<Xn|SP>]

is equivalent to

LDSMAX <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDSMAXL alias variant

Applies when size == 11 && R == 1.

STSMAXL <Xs>, [<Xn|SP>]

is equivalent to

LDSMAXL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xs> Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDSMAX](#), [LDSMAXA](#), [LDSMAXAL](#), [LDSMAXL](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.290 STSMINB, STSMINLB

Atomic signed minimum on byte in memory, without return, atomically loads an 8-bit byte from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as signed numbers.

- STSMINB does not have release semantics.
- STSMINLB stores to memory with release semantics, as described in [Load-Acquire](#), [Load-AcquirePC](#), and [Store-Release](#) on page B2-152.

For information about memory accesses see [Load/store addressing modes](#) on page C1-202.

This instruction is an alias of the [LDSMINB](#), [LDSMINAB](#), [LDSMINALB](#), [LDSMINLB](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LDSMINB](#), [LDSMINAB](#), [LDSMINALB](#), [LDSMINLB](#).
- The description of [LDSMINB](#), [LDSMINAB](#), [LDSMINALB](#), [LDSMINLB](#) gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

No memory ordering variant

Applies when R == 0.

STSMINB <Ws>, [<Xn|SP>]

is equivalent to

LDSMINB <Ws>, WZR, [<Xn|SP>]

Release variant

Applies when R == 1.

STSMINLB <Ws>, [<Xn|SP>]

is equivalent to

LDSMINLB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDSMINB](#), [LDSMINAB](#), [LDSMINALB](#), [LDSMINLB](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.291 STSMINH, STSMINLH

Atomic signed minimum on halfword in memory, without return, atomically loads a 16-bit halfword from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as signed numbers.

- STSMINH does not have release semantics.
- STSMINLH stores to memory with release semantics, as described in [Load-Acquire](#), [Load-AcquirePC](#), and [Store-Release](#) on page B2-152.

For information about memory accesses see [Load/store addressing modes](#) on page C1-202.

This instruction is an alias of the [LDSMINH](#), [LDSMINAH](#), [LDSMINALH](#), [LDSMINLH](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LDSMINH](#), [LDSMINAH](#), [LDSMINALH](#), [LDSMINLH](#).
- The description of [LDSMINH](#), [LDSMINAH](#), [LDSMINALH](#), [LDSMINLH](#) gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

No memory ordering variant

Applies when R == 0.

STSMINH <Ws>, [<Xn|SP>]

is equivalent to

LDSMINH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STSMINLH <Ws>, [<Xn|SP>]

is equivalent to

LDSMINLH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDSMINH](#), [LDSMINAH](#), [LDSMINALH](#), [LDSMINLH](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.292 STSMIN, STSMINL

Atomic signed minimum on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as signed numbers.

- STSMIN does not have release semantics.
- STSMINL stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDSMIN, LDSMINA, LDSMINAL, LDSMINL instruction. This means that:

- The encodings in this description are named to match the encodings of LDSMIN, LDSMINA, LDSMINAL, LDSMINL.
- The description of LDSMIN, LDSMINA, LDSMINAL, LDSMINL gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

32-bit LDSMIN alias variant

Applies when size == 10 && R == 0.

STSMIN <Ws>, [<Xn|SP>]

is equivalent to

LDSMIN <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

32-bit LDSMINL alias variant

Applies when size == 10 && R == 1.

STSMINL <Ws>, [<Xn|SP>]

is equivalent to

LDSMINL <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDSMIN alias variant

Applies when size == 11 && R == 0.

STSMIN <Xs>, [<Xn|SP>]

is equivalent to

LDSMIN <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDSMINL alias variant

Applies when size == 11 && R == 1.

STSMINL <Xs>, [<Xn|SP>]

is equivalent to

LDSMINL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xs> Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDSMIN](#), [LDSMINA](#), [LDSMINAL](#), [LDSMINL](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.293 STTR

Store Register (unprivileged) stores a word or doubleword from a register to memory. The address that is used for the store is calculated from a base register and an immediate offset.

Memory accesses made by the instruction behave as if the instruction was executed at EL0 if the *Effective value* of PSTATE.UAO is 0 and either:

- The instruction is executed at EL1.
- The instruction is executed at EL2 when the *Effective value* of HCR_EL2.{E2H, TGE} is {1, 1}.

Otherwise, the memory access operates with the restrictions determined by the Exception level at which the instruction is executed. For information about memory accesses, see *Load/store addressing modes* on page C1-202.

32-bit variant

Applies when size == 10.

STTR <Wt>, [<Xn|SP>{, #<simmm>}]

64-bit variant

Applies when size == 11.

STTR <Xt>, [<Xn|SP>{, #<simmm>}]

Decode for all variants of this encoding

```
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <simmm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

unpriv_at_e11 = PSTATE.EL == EL1 && !(EL2Enabled() && HaveNVExt() && HCR_EL2.<NV,NV1> == '11');
unpriv_at_e12 = PSTATE.EL == EL2 && HaveVirtHostExt() && HCR_EL2.<E2H,TGE> == '11';

user_access_override = HaveUA0Ext() && PSTATE.UAO == '1';
if !user_access_override && (unpriv_at_e11 || unpriv_at_e12) then
    acctype = AccType_UNPRIV;
else
    acctype = AccType_NORMAL;
```

```
integer datasize = 8 << scale;  
boolean tag_checked = n != 31;
```

Operation

```
bits(64) address;  
bits(datasize) data;  
  
if HaveMTE2Ext() then  
    SetTagCheckedInstruction(tag_checked);  
  
if n == 31 then  
    CheckSPAlignment();  
    address = SP[];  
else  
    address = X[n];  
  
address = address + offset;  
  
data = X[t];  
Mem[address, datasize DIV 8, acctype] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.294 STTRB

Store Register Byte (unprivileged) stores a byte from a 32-bit register to memory. The address that is used for the store is calculated from a base register and an immediate offset.

Memory accesses made by the instruction behave as if the instruction was executed at EL0 if the *Effective value* of PSTATE.UAO is 0 and either:

- The instruction is executed at EL1.
- The instruction is executed at EL2 when the *Effective value* of HCR_EL2.{E2H, TGE} is {1, 1}.

Otherwise, the memory access operates with the restrictions determined by the Exception level at which the instruction is executed. For information about memory accesses, see *Load/store addressing modes on page C1-202*.

Encoding

STTRB <Wt>, [<Xn|SP>{, #<simmm>}]

Decode for this encoding

bits(64) offset = SignExtend(imm9, 64);

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <simmm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

unpriv_at_el1 = PSTATE.EL == EL1 && !(EL2Enabled() && HaveNVExt() && HCR_EL2.<NV,NV1> == '11');
unpriv_at_el2 = PSTATE.EL == EL2 && HaveVirtHostExt() && HCR_EL2.<E2H,TGE> == '11';

user_access_override = HaveUAOExt() && PSTATE.UAO == '1';
if !user_access_override && (unpriv_at_el1 || unpriv_at_el2) then
    acctype = AccType_UNPRIV;
else
    acctype = AccType_NORMAL;

boolean tag_checked = n != 31;
```

Operation

```
bits(64) address;
bits(8) data;

if HaveMTE2Ext() then
```

```
SetTagCheckedInstruction(tag_checked);  
  
if n == 31 then  
    CheckSPAlignment();  
    address = SP[];  
else  
    address = X[n];  
  
address = address + offset;  
  
data = X[t];  
Mem[address, 1, acctype] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.295 STTRH

Store Register Halfword (unprivileged) stores a halfword from a 32-bit register to memory. The address that is used for the store is calculated from a base register and an immediate offset.

Memory accesses made by the instruction behave as if the instruction was executed at EL0 if the *Effective value* of PSTATE.UAO is 0 and either:

- The instruction is executed at EL1.
- The instruction is executed at EL2 when the *Effective value* of HCR_EL2.{E2H, TGE} is {1, 1}.

Otherwise, the memory access operates with the restrictions determined by the Exception level at which the instruction is executed. For information about memory accesses, see *Load/store addressing modes on page C1-202*.

Encoding

STTRH <Wt>, [<Xn|SP>{, #<sim>}]

Decode for this encoding

bits(64) offset = SignExtend(imm9, 64);

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <sim> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

unpriv_at_el1 = PSTATE.EL == EL1 && !(EL2Enabled() && HaveNVExt() && HCR_EL2.<NV,NV1> == '11');
unpriv_at_el2 = PSTATE.EL == EL2 && HaveVirtHostExt() && HCR_EL2.<E2H,TGE> == '11';

user_access_override = HaveUAOExt() && PSTATE.UAO == '1';
if !user_access_override && (unpriv_at_el1 || unpriv_at_el2) then
    acctype = AccType_UNPRIV;
else
    acctype = AccType_NORMAL;

boolean tag_checked = n != 31;
```

Operation

```
bits(64) address;
bits(16) data;

if HaveMTE2Ext() then
```

```
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = X[t];
Mem[address, 2, acctype] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.296 STUMAXB, STUMAXB, STUMAXB

Atomic unsigned maximum on byte in memory, without return, atomically loads an 8-bit byte from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as unsigned numbers.

- STUMAXB does not have release semantics.
- STUMAXB stores to memory with release semantics, as described in [Load-Acquire](#), [Load-AcquirePC](#), and [Store-Release](#) on page B2-152.

For information about memory accesses see [Load/store addressing modes](#) on page C1-202.

This instruction is an alias of the LDUMAXB, LDUMAXB, LDUMAXB, LDUMAXB instruction. This means that:

- The encodings in this description are named to match the encodings of LDUMAXB, LDUMAXB, LDUMAXB, LDUMAXB.
- The description of LDUMAXB, LDUMAXB, LDUMAXB, LDUMAXB gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

No memory ordering variant

Applies when R == 0.

STUMAXB <Ws>, [<Xn|SP>]

is equivalent to

LDUMAXB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STUMAXB <Ws>, [<Xn|SP>]

is equivalent to

LDUMAXB <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDUMAXB](#), [LDUMAXB](#), [LDUMAXB](#), [LDUMAXB](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.297 STUMAXH, STUMAXLH

Atomic unsigned maximum on halfword in memory, without return, atomically loads a 16-bit halfword from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as unsigned numbers.

- STUMAXH does not have release semantics.
- STUMAXLH stores to memory with release semantics, as described in [Load-Acquire](#), [Load-AcquirePC](#), and [Store-Release](#) on page B2-152.

For information about memory accesses see [Load/store addressing modes](#) on page C1-202.

This instruction is an alias of the [LDUMAXH](#), [LDUMAXAH](#), [LDUMAXALH](#), [LDUMAXLH](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LDUMAXH](#), [LDUMAXAH](#), [LDUMAXALH](#), [LDUMAXLH](#).
- The description of [LDUMAXH](#), [LDUMAXAH](#), [LDUMAXALH](#), [LDUMAXLH](#) gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

No memory ordering variant

Applies when R == 0.

STUMAXH <Ws>, [<Xn|SP>]

is equivalent to

LDUMAXH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STUMAXLH <Ws>, [<Xn|SP>]

is equivalent to

LDUMAXLH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDUMAXH](#), [LDUMAXAH](#), [LDUMAXALH](#), [LDUMAXLH](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.298 STUMAX, STUMAXL

Atomic unsigned maximum on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, compares it against the value held in a register, and stores the larger value back to memory, treating the values as unsigned numbers.

- STUMAX does not have release semantics.
- STUMAXL stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDUMAX, LDUMAXA, LDUMAXAL, LDUMAXL instruction. This means that:

- The encodings in this description are named to match the encodings of LDUMAX, LDUMAXA, LDUMAXAL, LDUMAXL.
- The description of LDUMAX, LDUMAXA, LDUMAXAL, LDUMAXL gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

32-bit LDUMAX alias variant

Applies when size == 10 && R == 0.

STUMAX <Ws>, [<Xn|SP>]

is equivalent to

LDUMAX <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

32-bit LDUMAXL alias variant

Applies when size == 10 && R == 1.

STUMAXL <Ws>, [<Xn|SP>]

is equivalent to

LDUMAXL <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDUMAX alias variant

Applies when size == 11 && R == 0.

STUMAX <Xs>, [<Xn|SP>]

is equivalent to

LDUMAX <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDUMAXL alias variant

Applies when `size == 11 && R == 1`.

STUMAXL <Xs>, [<Xn|SP>]

is equivalent to

LDUMAXL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xs> Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDUMAX](#), [LDUMAXA](#), [LDUMAXAL](#), [LDUMAXL](#) gives the operational pseudocode for this instruction.

Operational information

If `PSTATE.DIT` is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.299 STUMINB, STUMINLB

Atomic unsigned minimum on byte in memory, without return, atomically loads an 8-bit byte from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as unsigned numbers.

- STUMINB does not have release semantics.
- STUMINLB stores to memory with release semantics, as described in [Load-Acquire](#), [Load-AcquirePC](#), and [Store-Release](#) on page B2-152.

For information about memory accesses see [Load/store addressing modes](#) on page C1-202.

This instruction is an alias of the [LDUMINB](#), [LDUMINAB](#), [LDUMINALB](#), [LDUMINLB](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [LDUMINB](#), [LDUMINAB](#), [LDUMINALB](#), [LDUMINLB](#).
- The description of [LDUMINB](#), [LDUMINAB](#), [LDUMINALB](#), [LDUMINLB](#) gives the operational pseudocode for this instruction.

STUMINH <Ws>, [<Xn|SP>]

is equivalent to

LDUMINH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Release variant

Applies when R == 1.

STUMINLH <Ws>, [<Xn|SP>]

is equivalent to

LDUMINLH <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDUMINH](#), [LDUMINAH](#), [LDUMINALH](#), [LDUMINLH](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.301 STUMIN, STUMINL

Atomic unsigned minimum on word or doubleword in memory, without return, atomically loads a 32-bit word or 64-bit doubleword from memory, compares it against the value held in a register, and stores the smaller value back to memory, treating the values as unsigned numbers.

- STUMIN does not have release semantics.
- STUMINL stores to memory with release semantics, as described in *Load-Acquire, Load-AcquirePC, and Store-Release* on page B2-152.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

This instruction is an alias of the LDUMIN, LDUMINA, LDUMINAL, LDUMINL instruction. This means that:

- The encodings in this description are named to match the encodings of LDUMIN, LDUMINA, LDUMINAL, LDUMINL.
- The description of LDUMIN, LDUMINA, LDUMINAL, LDUMINL gives the operational pseudocode for this instruction.

Integer

(FEAT_LSE)

32-bit LDUMIN alias variant

Applies when size == 10 && R == 0.

STUMIN <Ws>, [<Xn|SP>]

is equivalent to

LDUMIN <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

32-bit LDUMINL alias variant

Applies when size == 10 && R == 1.

STUMINL <Ws>, [<Xn|SP>]

is equivalent to

LDUMINL <Ws>, WZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDUMIN alias variant

Applies when size == 11 && R == 0.

STUMIN <Xs>, [<Xn|SP>]

is equivalent to

LDUMIN <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

64-bit LDUMINL alias variant

Applies when size == 11 && R == 1.

STUMINL <Xs>, [<Xn|SP>]

is equivalent to

LDUMINL <Xs>, XZR, [<Xn|SP>]

and is always the preferred disassembly.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xs> Is the 64-bit name of the general-purpose register holding the data value to be operated on with the contents of the memory location, encoded in the "Rs" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

The description of [LDUMIN](#), [LDUMINA](#), [LDUMINAL](#), [LDUMINL](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.302 STUR

Store Register (unscaled) calculates an address from a base register value and an immediate offset, and stores a 32-bit word or a 64-bit doubleword to the calculated address, from a register. For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

32-bit variant

Applies when size == 10.

STUR <Wt>, [<Xn|SP>{, #<sim>}]

64-bit variant

Applies when size == 11.

STUR <Xt>, [<Xn|SP>{, #<sim>}]

Decode for all variants of this encoding

```
integer scale = UInt(size);
bits(64) offset = SignExtend(imm9, 64);
```

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <sim> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

integer datasize = 8 << scale;
boolean tag_checked = n != 31;
```

Operation

```
bits(64) address;
bits(datasize) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
```

```
address = X[n];  
address = address + offset;  
data = X[t];  
Mem[address, datasize DIV 8, AccType_NORMAL] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.303 STURB

Store Register Byte (unscaled) calculates an address from a base register value and an immediate offset, and stores a byte to the calculated address, from a 32-bit register. For information about memory accesses, see [Load/store addressing modes](#) on page C1-202.

Encoding

STURB <Wt>, [<Xn|SP>{, #<sim>}]

Decode for this encoding

bits(64) offset = [SignExtend](#)(imm9, 64);

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <sim> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

boolean tag_checked = n != 31;
```

Operation

```
bits(64) address;
bits(8) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

data = X[t];
Mem[address, 1, AccType_NORMAL] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.304 STURH

Store Register Halfword (unscaled) calculates an address from a base register value and an immediate offset, and stores a halfword to the calculated address, from a 32-bit register. For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

Encoding

STURH <Wt>, [<Xn|SP>{, #<sim>}]

Decode for this encoding

bits(64) offset = [SignExtend](#)(imm9, 64);

Assembler symbols

- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <sim> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);

boolean tag_checked = n != 31;
```

Operation

```
bits(64) address;
bits(16) data;

if HaveMTE2Ext() then
  SetTagCheckedInstruction(tag_checked);

if n == 31 then
  CheckSPAlignment();
  address = SP[];
else
  address = X[n];

address = address + offset;

data = X[t];
Mem[address, 2, AccType_NORMAL] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.305 STXP

Store Exclusive Pair of registers stores two 32-bit words or two 64-bit doublewords from two registers to a memory location if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See [Synchronization and semaphores on page B2-179](#). For information on single-copy atomicity and alignment requirements, see [Requirements for single-copy atomicity on page B2-128](#) and [Alignment of data accesses on page B2-160](#). If a 64-bit pair Store-Exclusive succeeds, it causes a single-copy atomic update of the 128-bit memory location being updated. For information about memory accesses, see [Load/store addressing modes on page C1-202](#).

32-bit variant

Applies when `sz == 0`.

STXP <Ws>, <Wt1>, <Wt2>, [<Xn|SP>{,#0}]

64-bit variant

Applies when `sz == 1`.

STXP <Ws>, <Xt1>, <Xt2>, [<Xn|SP>{,#0}]

Decode for all variants of this encoding

```

integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2); // ignored by load/store single register
integer s = UInt(Rs); // ignored by all loads and store-release

integer elsize = 32 << UInt(sz);
integer datasize = elsize * 2;
boolean tag_checked = n != 31;

boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;
if s == t || (s == t2) then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rt_unknown = TRUE; // store UNKNOWN value
    when Constraint_UNDEF UNDEFINED;
    when Constraint_NOP EndOfInstruction();
if s == n && n != 31 then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rn_unknown = TRUE; // address is UNKNOWN
    when Constraint_UNDEF UNDEFINED;
    when Constraint_NOP EndOfInstruction();
  
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly [STXP on page K1-8422](#).

Assembler symbols

<Ws>	Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is: 0 If the operation updates memory. 1 If the operation fails to update memory.
<Xt1>	Is the 64-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.
<Xt2>	Is the 64-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Wt1>	Is the 32-bit name of the first general-purpose register to be transferred, encoded in the "Rt" field.
<Wt2>	Is the 32-bit name of the second general-purpose register to be transferred, encoded in the "Rt2" field.
<Xn SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

Accessing an address that is not aligned to the size of the data being accessed causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch64.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch64.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation

```

bits(64) address;
bits(datasize) data;
constant integer dbytes = datasize DIV 8;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
elseif rn_unknown then
    address = bits(64) UNKNOWN;
else
    address = X[n];

if rt_unknown then
    data = bits(datasize) UNKNOWN;
else
    bits(datasize DIV 2) e1 = X[t];
    bits(datasize DIV 2) e2 = X[t2];
    data = if BigEndian(AccType_ATOMIC) then e1:e12 else e12:e11;
bit status = '1';
// Check whether the Exclusives monitors are set to include the
// physical memory locations corresponding to virtual address
// range [address, address+dbytes-1].
if AArch64.ExclusiveMonitorsPass(address, dbytes) then
    // This atomic write will be rejected if it does not refer
  
```

```
// to the same physical locations after address translation.  
Mem[address, dbytes, AccType_ATOMIC] = data;  
status = ExclusiveMonitorsStatus();  
X[s] = ZeroExtend(status, 32);
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.306 STXR

Store Exclusive Register stores a 32-bit word or a 64-bit doubleword from a register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See [Synchronization and semaphores](#) on page B2-179. For information about memory accesses see [Load/store addressing modes](#) on page C1-202.

32-bit variant

Applies when size == 10.

STXR <Ws>, <Wt>, [<Xn|SP>{, #0}]

64-bit variant

Applies when size == 11.

STXR <Ws>, <Xt>, [<Xn|SP>{, #0}]

Decode for all variants of this encoding

```

integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs); // ignored by all loads and store-release

integer ewidth = 8 << UInt(size);
boolean tag_checked = n != 31;

boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;
if s == t then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rt_unknown = TRUE; // store UNKNOWN value
    when Constraint_UNDEF UNDEFINED;
    when Constraint_NOP EndOfInstruction();
if s == n && n != 31 then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rn_unknown = TRUE; // address is UNKNOWN
    when Constraint_UNDEF UNDEFINED;
    when Constraint_NOP EndOfInstruction();
  
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly [STXR](#) on page K1-8422.

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

0 If the operation updates memory.

- 1 If the operation fails to update memory.
- <Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

Accessing an address that is not aligned to the size of the data being accessed causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch64.ExclusiveMonitorsPass()` returns TRUE, the exception is generated.
- Otherwise, it is IMPLEMENTATION DEFINED whether the exception is generated.

If `AArch64.ExclusiveMonitorsPass()` returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation

```
bits(64) address;
bits(elsize) data;
constant integer dbytes = elsize DIV 8;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
elseif rn_unknown then
    address = bits(64) UNKNOWN;
else
    address = X[n];

if rt_unknown then
    data = bits(elsize) UNKNOWN;
else
    data = X[t];

bit status = '1';
// Check whether the Exclusives monitors are set to include the
// physical memory locations corresponding to virtual address
// range [address, address+dbytes-1].
if AArch64.ExclusiveMonitorsPass(address, dbytes) then
    // This atomic write will be rejected if it does not refer
    // to the same physical locations after address translation.
    Mem[address, dbytes, AccType_ATOMIC] = data;
    status = ExclusiveMonitorsStatus();
X[s] = ZeroExtend(status, 32);
```

Operational information

If `PSTATE.DIT` is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.307 STXRB

Store Exclusive Register Byte stores a byte from a register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See [Synchronization and semaphores on page B2-179](#). The memory access is atomic.

For information about memory accesses see [Load/store addressing modes on page C1-202](#).

Encoding

STXRB <Ws>, <Wt>, [<Xn|SP>{, #0}]

Decode for this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs); // ignored by all loads and store-release

boolean tag_checked = n != 31;

boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;
if s == t then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rt_unknown = TRUE; // store UNKNOWN value
    when Constraint_UNDEF UNDEFINED;
    when Constraint_NOP EndOfInstruction();
if s == n && n != 31 then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rn_unknown = TRUE; // address is UNKNOWN
    when Constraint_UNDEF UNDEFINED;
    when Constraint_NOP EndOfInstruction();
```

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly [STXRB on page K1-8422](#).

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

If AArch64.ExclusiveMonitorsPass() returns FALSE and the memory address, if accessed, would generate a synchronous Data Abort exception, it is IMPLEMENTATION DEFINED whether the exception is generated.

Operation

```
bits(64) address;
bits(8) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
elseif rn_unknown then
    address = bits(64) UNKNOWN;
else
    address = X[n];

if rt_unknown then
    data = bits(8) UNKNOWN;
else
    data = X[t];

bit status = '1';
// Check whether the Exclusives monitors are set to include the
// physical memory locations corresponding to virtual address
// range [address, address+dbytes-1].
if AArch64.ExclusiveMonitorsPass(address, 1) then
    // This atomic write will be rejected if it does not refer
    // to the same physical locations after address translation.
    Mem[address, 1, AccType_ATOMIC] = data;
    status = ExclusiveMonitorsStatus();
X[s] = ZeroExtend(status, 32);
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.308 STXRH

Store Exclusive Register Halfword stores a halfword from a register to memory if the PE has exclusive access to the memory address, and returns a status value of 0 if the store was successful, or of 1 if no store was performed. See *Synchronization and semaphores* on page B2-179. The memory access is atomic.

For information about memory accesses see *Load/store addressing modes* on page C1-202.

Encoding

STXRH <Ws>, <Wt>, [<Xn|SP>{, #0}]

Decode for this encoding

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer s = UInt(Rs); // ignored by all loads and store-release

boolean tag_checked = n != 31;

boolean rt_unknown = FALSE;
boolean rn_unknown = FALSE;
if s == t then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rt_unknown = TRUE; // store UNKNOWN value
    when Constraint_UNDEF   UNDEFINED;
    when Constraint_NOP     EndOfInstruction();
if s == n && n != 31 then
  Constraint c = ConstrainUnpredictable();
  assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
  case c of
    when Constraint_UNKNOWN rn_unknown = TRUE; // address is UNKNOWN
    when Constraint_UNDEF   UNDEFINED;
    when Constraint_NOP     EndOfInstruction();
```

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register into which the status result of the store exclusive is written, encoded in the "Rs" field. The value returned is:

- 0 If the operation updates memory.
- 1 If the operation fails to update memory.

<Wt> Is the 32-bit name of the general-purpose register to be transferred, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Aborts and alignment

If a synchronous Data Abort exception is generated by the execution of this instruction:

- Memory is not updated.
- <Ws> is not updated.

A non halfword-aligned memory address causes an Alignment fault Data Abort exception to be generated, subject to the following rules:

- If `AArch64.ExclusiveMonitorsPass()` returns `TRUE`, the exception is generated.
- Otherwise, it is `IMPLEMENTATION DEFINED` whether the exception is generated.

If `AArch64.ExclusiveMonitorsPass()` returns `FALSE` and the memory address, if accessed, would generate a synchronous Data Abort exception, it is `IMPLEMENTATION DEFINED` whether the exception is generated.

Operation

```
bits(64) address;
bits(16) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
elseif rn_unknown then
    address = bits(64) UNKNOWN;
else
    address = X[n];

if rt_unknown then
    data = bits(16) UNKNOWN;
else
    data = X[t];

bit status = '1';
// Check whether the Exclusives monitors are set to include the
// physical memory locations corresponding to virtual address
// range [address, address+dbytes-1].
if AArch64.ExclusiveMonitorsPass(address, 2) then
    // This atomic write will be rejected if it does not refer
    // to the same physical locations after address translation.
    Mem[address, 2, AccType_ATOMIC] = data;
    status = ExclusiveMonitorsStatus();
X[s] = ZeroExtend(status, 32);
```

Operational information

If `PSTATE.DIT` is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C6.2.309 STZ2G

Store Allocation Tags, Zeroing stores an Allocation Tag to two Tag granules of memory, zeroing the associated data locations. The address used for the store is calculated from the base register and an immediate signed offset scaled by the Tag granule. The Allocation Tag is calculated from the Logical Address Tag in the source register.

This instruction generates an Unchecked access.

Post-index

```

C6.2.310 STZG

Store Allocation Tag, Zeroing stores an Allocation Tag to memory, zeroing the associated data location. The address used for the store is calculated from the base register and an immediate signed offset scaled by the Tag granule. The Allocation Tag is calculated from the Logical Address Tag in the source register.

This instruction generates an Unchecked access.

Encoding

STZGM <Xt>, [<Xn|SP>]

Decode for this encoding

```
if !HaveMTE2Ext() then UNDEFINED;
integer t = UInt(Xt);
integer n = UInt(Xn);
```

Assembler symbols

<Xt> Is the 64-bit name of the general-purpose register to be transferred, encoded in the "Xt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Xn" field.

Operation

```
if PSTATE.EL == EL0 then
    UNDEFINED;

bits(64) data = X[t];
bits(4) tag = data<3:0>;
bits(64) address;
if n == 31 then
    CheckSPAAlignment();
    address = SP[];
else
    address = X[n];

integer size = 4 * (2 ^ (UInt(DCZID_EL0.BS)));
address = Align(address, size);
integer count = size >> LOG2_TAG_GRANULE;

for i = 0 to count-1
    AArch64.MemTag[address, AccType_NORMAL] = tag;
    Mem[address, TAG_GRANULE, AccType_NORMAL] = Zeros(8 * TAG_GRANULE);
    address = address + TAG_GRANULE;
```

C6.2.312 SUB (extended register)

Subtract (extended register) subtracts a sign or zero-extended register value, followed by an optional left shift amount, from a register value, and writes the result to the destination register. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword.

32-bit variant

Applies when sf == 0.

SUB <Wd|WSP>, <Wn|WSP>, <Wm>{, <extend> {#<amount>}}

64-bit variant

Applies when sf == 1.

SUB <Xd|SP>, <Xn|SP>, <R><m>{, <extend> {#<amount>}}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
ExtendType extend_type = DecodeRegExtend(option);
integer shift = UInt(imm3);
if shift > 4 then UNDEFINED;
```

Assembler symbols

- <Wd|WSP> Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- <Wn|WSP> Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- <Xd|SP> Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- <Xn|SP> Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
- <R> Is a width specifier, encoded in the "option" field. It can have the following values:
 - W when option = 00x
 - W when option = 010
 - X when option = x11
 - W when option = 10x
 - W when option = 110
- <m> Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.

<extend> For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB	when option = 000
UXTH	when option = 001
LSL UXTW	when option = 010
UXTX	when option = 011
SXTB	when option = 100
SXTH	when option = 101
SXTW	when option = 110
SXTX	when option = 111

If "Rd" or "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.

For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:

UXTB	when option = 000
UXTH	when option = 001
UXTW	when option = 010
LSL UXTX	when option = 011
SXTB	when option = 100
SXTH	when option = 101
SXTW	when option = 110
SXTX	when option = 111

If "Rd" or "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.

<amount> Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

Operation

```

bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = ExtendReg(m, extend_type, shift);

operand2 = NOT(operand2);
(result, -) = AddWithCarry(operand1, operand2, '1');

if d == 31 then
    SP[] = result;
else
    X[d] = result;
  
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.313 SUB (immediate)

Subtract (immediate) subtracts an optionally-shifted immediate value from a register value, and writes the result to the destination register.

32-bit variant

Applies when sf == 0.

SUB <Wd|WSP>, <Wn|WSP>, #<imm>{, <shift>}

64-bit variant

Applies when sf == 1.

SUB <Xd|SP>, <Xn|SP>, #<imm>{, <shift>}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
bits(datasize) imm;

case sh of
  when '0' imm = ZeroExtend(imm12, datasize);
  when '1' imm = ZeroExtend(imm12:Zeros(12), datasize);
```

Assembler symbols

- <Wd|WSP> Is the 32-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- <Wn|WSP> Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- <Xd|SP> Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Rd" field.
- <Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- <imm> Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.
- <shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "sh" field. It can have the following values:
 - LSL #0 when sh = 0
 - LSL #12 when sh = 1

Operation

```
bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2;

operand2 = NOT(imm);
(result, -) = AddWithCarry(operand1, operand2, '1');
```

```
if d == 31 then
    SP[] = result;
else
    X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.314 SUB (shifted register)

Subtract (shifted register) subtracts an optionally-shifted register value from a register value, and writes the result to the destination register.

This instruction is used by the alias [NEG \(shifted register\)](#). See [Alias conditions on page C6-1457](#) for details of when each alias is preferred.

32-bit variant

Applies when sf == 0.

SUB <Wd>, <Wn>, <Wm>{, <shift> #<amount>}

64-bit variant

Applies when sf == 1.

SUB <Xd>, <Xn>, <Xm>{, <shift> #<amount>}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
```

```
if shift == '11' then UNDEFINED;
if sf == '0' && imm6<5> == '1' then UNDEFINED;
```

```
ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
```

Alias conditions

Alias	is preferred when
NEG (shifted register)	Rn == '11111'

Assembler symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn>	Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
<Wm>	Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn>	Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

- <shift> Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:
- LSL when shift = 00
 - LSR when shift = 01
 - ASR when shift = 10
- The encoding shift = 11 is reserved.
- <amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.
- For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

Operation

```
bits(datasize) result;  
bits(datasize) operand1 = X[n];  
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);  
  
operand2 = NOT(operand2);  
(result, -) = AddWithCarry(operand1, operand2, '1');  
  
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.315 SUBG

Subtract with Tag subtracts an immediate value scaled by the Tag granule from the address in the source register, modifies the Logical Address Tag of the address using an immediate value, and writes the result to the destination register. Tags specified in GCR_EL1.Exclude are excluded from the possible outputs when modifying the Logical Address Tag.

Integer

(FEAT_MTE)

Encoding

SUBG <Xd|SP>, <Xn|SP>, #<uimm6>, #<uimm4>

Decode for this encoding

```
if !HaveMTEExt() then UNDEFINED;
integer d = UInt(Xd);
integer n = UInt(Xn);
bits(64) offset = LSL(ZeroExtend(uimm6, 64), LOG2_TAG_GRANULE);
```

Assembler symbols

- <Xd|SP> Is the 64-bit name of the destination general-purpose register or stack pointer, encoded in the "Xd" field.
- <Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Xn" field.
- <uimm6> Is an unsigned immediate, a multiple of 16 in the range 0 to 1008, encoded in the "uimm6" field.
- <uimm4> Is an unsigned immediate, in the range 0 to 15, encoded in the "uimm4" field.

Operation

```
bits(64) operand1 = if n == 31 then SP[] else X[n];
bits(4) start_tag = AArch64.AllocationTagFromAddress(operand1);
bits(16) exclude = GCR_EL1.Exclude;
bits(64) result;
bits(4) rtag;

if AArch64.AllocationTagAccessIsEnabled(AccType_NORMAL) then
    rtag = AArch64.ChooseNonExcludedTag(start_tag, uimm4, exclude);
else
    rtag = '0000';

(result, -) = AddWithCarry(operand1, NOT(offset), '1');

result = AArch64.AddressWithAllocationTag(result, AccType_NORMAL, rtag);

if d == 31 then
    SP[] = result;
else
    X[d] = result;
```

C6.2.316 SUBP

Subtract Pointer subtracts the 56-bit address held in the second source register from the 56-bit address held in the first source register, sign-extends the result to 64-bits, and writes the result to the destination register.

Integer

(FEAT_MTE)

Encoding

SUBP <Xd>, <Xn|SP>, <Xm|SP>

Decode for this encoding

```
if !HaveMTEExt() then UNDEFINED;
integer d = UInt(Xd);
integer n = UInt(Xn);
integer m = UInt(Xm);
```

Assembler symbols

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Xd" field.
- <Xn|SP> Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Xn" field.
- <Xm|SP> Is the 64-bit name of the second general-purpose source register or stack pointer, encoded in the "Xm" field.

Operation

```
bits(64) operand1 = if n == 31 then SP[] else X[n];
bits(64) operand2 = if m == 31 then SP[] else X[m];
operand1 = SignExtend(operand1<55:0>, 64);
operand2 = SignExtend(operand2<55:0>, 64);

bits(64) result;

operand2 = NOT(operand2);
(result, -) = AddWithCarry(operand1, operand2, '1');

X[d] = result;
```

C6.2.317 SUBPS

Subtract Pointer, setting Flags subtracts the 56-bit address held in the second source register from the 56-bit address held in the first source register, sign-extends the result to 64-bits, and writes the result to the destination register. It updates the condition flags based on the result of the subtraction.

This instruction is used by the alias *CMPP*. See *Alias conditions on page C6-1461* for details of when each alias is preferred.

Integer

(FEAT_MTE)

Encoding

SUBPS <Xd>, <Xn|SP>, <Xm|SP>

Decode for this encoding

```
if !HaveMTEExt() then UNDEFINED;
integer d = UInt(Xd);
integer n = UInt(Xn);
integer m = UInt(Xm);
```

Alias conditions

Alias	is preferred when
<i>CMPP</i>	S == '1' && Xd == '11111'

Assembler symbols

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Xd" field.
- <Xn|SP> Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Xn" field.
- <Xm|SP> Is the 64-bit name of the second general-purpose source register or stack pointer, encoded in the "Xm" field.

Operation

```
bits(64) operand1 = if n == 31 then SP[] else X[n];
bits(64) operand2 = if m == 31 then SP[] else X[m];
operand1 = SignExtend(operand1<55:0>, 64);
operand2 = SignExtend(operand2<55:0>, 64);

bits(64) result;
bits(4) nzc;

operand2 = NOT(operand2);
(result, nzc) = AddWithCarry(operand1, operand2, '1');
```

```
PSTATE.<N,Z,C,V> = nzcv;  
X[d] = result;
```

C6.2.318 SUBS (extended register)

Subtract (extended register), setting flags, subtracts a sign or zero-extended register value, followed by an optional left shift amount, from a register value, and writes the result to the destination register. The argument that is extended from the <Rm> register can be a byte, halfword, word, or doubleword. It updates the condition flags based on the result.

This instruction is used by the alias [CMP \(extended register\)](#). See [Alias conditions](#) for details of when each alias is preferred.

32-bit variant

Applies when sf == 0.

SUBS <Wd>, <Wn|WSP>, <Wm>{, <extend> {#<amount>}}

64-bit variant

Applies when sf == 1.

SUBS <Xd>, <Xn|SP>, <R><m>{, <extend> {#<amount>}}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
ExtendType extend_type = DecodeRegExtend(option);
integer shift = UInt(imm3);
if shift > 4 then UNDEFINED;
```

Alias conditions

Alias	is preferred when
CMP (extended register)	Rd == '11111'

Assembler symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn WSP>	Is the 32-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.
<Wm>	Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn SP>	Is the 64-bit name of the first source general-purpose register or stack pointer, encoded in the "Rn" field.

- <R> Is a width specifier, encoded in the "option" field. It can have the following values:
- | | |
|---|-------------------|
| W | when option = 00x |
| W | when option = 010 |
| X | when option = x11 |
| W | when option = 10x |
| W | when option = 110 |
- <m> Is the number [0-30] of the second general-purpose source register or the name ZR (31), encoded in the "Rm" field.
- <extend> For the 32-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:
- | | |
|----------|-------------------|
| UXTB | when option = 000 |
| UXTH | when option = 001 |
| LSL UXTW | when option = 010 |
| UXTX | when option = 011 |
| SXTB | when option = 100 |
| SXTH | when option = 101 |
| SXTW | when option = 110 |
| SXTX | when option = 111 |
- If "Rn" is '11111' (WSP) and "option" is '010' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTW when "option" is '010'.
- For the 64-bit variant: is the extension to be applied to the second source operand, encoded in the "option" field. It can have the following values:
- | | |
|----------|-------------------|
| UXTB | when option = 000 |
| UXTH | when option = 001 |

| SXTH | when option = 101 |
| SXTW | when option = 110 |
| SXTX | when option = 111 |
- If "Rn" is '11111' (SP) and "option" is '011' then LSL is preferred, but may be omitted when "imm3" is '000'. In all other cases <extend> is required and must be UXTX when "option" is '011'.
- <amount> Is the left shift amount to be applied after extension in the range 0 to 4, defaulting to 0, encoded in the "imm3" field. It must be absent when <extend> is absent, is required when <extend> is LSL, and is optional when <extend> is present but not LSL.

Operation

```

bits(datasize) result;
bits(datasize) operand1 = if n == 31 then SP[] else X[n];
bits(datasize) operand2 = ExtendReg(m, extend_type, shift);
bits(4) nzcvc;

operand2 = NOT(operand2);
(result, nzcvc) = AddWithCarry(operand1, operand2, '1');

PSTATE.<N,Z,C,V> = nzcvc;

X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.319 SUBS (immediate)

Subtract (immediate), setting flags, subtracts an optionally-shifted immediate value from a register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the alias [CMP \(immediate\)](#). See [Alias conditions on page C6-1466](#) for details of when each alias is preferred.

32-bit variant

Applies when sf == 0.

SUBS <Wd>, <Wn|WSP>, #<imm>{, <shift>}

64-bit variant

Applies when sf == 1.

SUBS <Xd>, <Xn|SP>, #<imm>{, <shift>}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;
bits(datasize) imm;

case sh of
  when '0' imm = ZeroExtend(imm12, datasize);
  when '1' imm = ZeroExtend(imm12:Zeros(12), datasize);
```

Alias conditions

Alias	is preferred when
CMP (immediate)	Rd == '11111'

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn|WSP> Is the 32-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn|SP> Is the 64-bit name of the source general-purpose register or stack pointer, encoded in the "Rn" field.
- <imm> Is an unsigned immediate, in the range 0 to 4095, encoded in the "imm12" field.
- <shift> Is the optional left shift to apply to the immediate, defaulting to LSL #0 and encoded in the "sh" field. It can have the following values:
 - LSL #0 when sh = 0
 - LSL #12 when sh = 1

Operation

```
bits(datasize) result;  
bits(datasize) operand1 = if n == 31 then SP[] else X[n];  
bits(datasize) operand2;  
bits(4) nzcvc;  
  
operand2 = NOT(imm);  
(result, nzcvc) = AddWithCarry(operand1, operand2, '1');  
  
PSTATE.<N,Z,C,V> = nzcvc;  
  
X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.320 SUBS (shifted register)

Subtract (shifted register), setting flags, subtracts an optionally-shifted register value from a register value, and writes the result to the destination register. It updates the condition flags based on the result.

This instruction is used by the aliases [CMP \(shifted register\)](#) and [NEGS](#). See [Alias conditions on page C6-1468](#) for details of when each alias is preferred.

32-bit variant

Applies when sf == 0.

SUBS <Wd>, <Wn>, <Wm>{, <shift> #<amount>}

64-bit variant

Applies when sf == 1.

SUBS <Xd>, <Xn>, <Xm>{, <shift> #<amount>}

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
```

```
if shift == '11' then UNDEFINED;
if sf == '0' && imm6<5> == '1' then UNDEFINED;
```

```
ShiftType shift_type = DecodeShift(shift);
integer shift_amount = UInt(imm6);
```

Alias conditions

Alias	is preferred when
CMP (shifted register)	Rd == '11111'
NEGS	Rn == '11111' && Rd != '11111'

Assembler symbols

<Wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Wn>	Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
<Wm>	Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn>	Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
<Xm>	Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

<shift> Is the optional shift type to be applied to the second source operand, defaulting to LSL and encoded in the "shift" field. It can have the following values:

LSL	when shift = 00
LSR	when shift = 01
ASR	when shift = 10

The encoding shift = 11 is reserved.

<amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.

For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field.

Operation

```
bits(datasize) result;
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = ShiftReg(m, shift_type, shift_amount);
bits(4) nzcvc;

operand2 = NOT(operand2);
(result, nzcvc) = AddWithCarry(operand1, operand2, '1');

PSTATE.<N,Z,C,V> = nzcvc;

X[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.321 SVC

Supervisor Call causes an exception to be taken to EL1.

On executing an SVC instruction, the PE records the exception as a Supervisor Call exception in [ESR_ELx](#) on page K15-8606, using the EC value 0x15, and the value of the immediate argument.

31	30	29	28	27	26	25	24	23	22	21	20					5	4	3	2	1	0	
1	1	0	1	0	1	0	0	0	0	0		imm16						0	0	0	0	1

Encoding

SVC #<imm>

Decode for this encoding

// Empty.

Assembler symbols

<imm> Is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field.

Operation

```
AArch64.CheckForSVCTrap(imm16);  
AArch64.CallSupervisor(imm16);
```

C6.2.322 SWPB, SWPAB, SWPALB, SWPLB

Swap byte in memory atomically loads an 8-bit byte from a memory location, and stores the value held in a register back to the same memory location. The value initially loaded from memory is returned in the destination register.

- If the destination register is not WZR, SWPAB and SWPALB load from memory with acquire semantics.
- SWPLB and SWPALB store to memory with release semantics.
- SWPB has neither acquire nor release semantics.

For more information about memory ordering semantics see [Load-Acquire, Load-AcquirePC, and Store-Release on page B2-152](#).

For information about memory accesses see [Load/store addressing modes on page C1-202](#).

Integer

(FEAT_LSE)

SWPAB variant

Applies when A == 1 && R == 0.

SWPAB <Ws>, <Wt>, [<Xn|SP>]

SWPALB variant

Applies when A == 1 && R == 1.

SWPALB <Ws>, <Wt>, [<Xn|SP>]

SWPB variant

Applies when A == 0 && R == 0.

SWPB <Ws>, <Wt>, [<Xn|SP>]

SWPLB variant

Applies when A == 0 && R == 1.

SWPLB <Ws>, <Wt>, [<Xn|SP>]

Decode for all variants of this encoding

```
if !HaveAtomicExt() then UNDEFINED;
```

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer s = UInt(Rs);
```

```
AccType ldacctype = if A == '1' && Rt != '11111' then AccType_ORDEREDATOMICRW else AccType_ATOMICRW;
```

```
AccType stacctype = if R == '1' then AccType_ORDEREDATOMICRW else AccType_ATOMICRW;
```

```
boolean tag_checked = n != 31;
```

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register to be stored, encoded in the "Rs" field.

<Wt> Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.
<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;  
bits(8) data;  
bits(8) store_value;  
  
if HaveMTE2Ext() then  
    SetTagCheckedInstruction(tag_checked);  
  
if n == 31 then  
    CheckSPAlignment();  
    address = SP[];  
else  
    address = X[n];  
  
store_value = X[s];  
data = MemAtomic(address, MemAtomicOp_SWP, store_value, ldacctype, stacctype);  
X[t] = ZeroExtend(data, 32);
```

C6.2.323 SWPH, SWPAH, SWPALH, SWPLH

Swap halfword in memory atomically loads a 16-bit halfword from a memory location, and stores the value held in a register back to the same memory location. The value initially loaded from memory is returned in the destination register.

- If the destination register is not WZR, SWPAH and SWPALH load from memory with acquire semantics.
- SWPLH and SWPALH store to memory with release semantics.
- SWPH has neither acquire nor release semantics.

For more information about memory ordering semantics see [Load-Acquire](#), [Load-AcquirePC](#), and [Store-Release](#) on page B2-152.

For information about memory accesses see [Load/store addressing modes](#) on page C1-202.

Integer

(FEAT_LSE)

SWPAH variant

Applies when A == 1 && R == 0.

SWPAH <Ws>, <Wt>, [<Xn|SP>]

SWPALH variant

Applies when A == 1 && R == 1.

SWPALH <Ws>, <Wt>, [<Xn|SP>]

SWPH variant

Applies when A == 0 && R == 0.

SWPH <Ws>, <Wt>, [<Xn|SP>]

SWPLH variant

Applies when A == 0 && R == 1.

SWPLH <Ws>, <Wt>, [<Xn|SP>]

Decode for all variants of this encoding

```

if !HaveAtomicExt() then UNDEFINED;

integer t = UInt(Rt);
integer n = UInt(Rn);
integer s = UInt(Rs);

AccType ldacctype = if A == '1' && Rt != '1111' then AccType_ORDEREDATOMICRW else AccType_ATOMICRW;
AccType stacctype = if R == '1' then AccType_ORDEREDATOMICRW else AccType_ATOMICRW;
boolean tag_checked = n != 31;
  
```

Assembler symbols

- <Ws> Is the 32-bit name of the general-purpose register to be stored, encoded in the "Rs" field.
- <Wt> Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(16) data;
bits(16) store_value;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAAlignment();
    address = SP[];
else
    address = X[n];

store_value = X[s];
data = MemAtomic(address, MemAtomicOp_SWP, store_value, ldacctype, stacctype);
X[t] = ZeroExtend(data, 32);
```

C6.2.324 SWP, SWPA, SWPAL, SWPL

Swap word or doubleword in memory atomically loads a 32-bit word or 64-bit doubleword from a memory location, and stores the value held in a register back to the same memory location. The value initially loaded from memory is returned in the destination register.

- If the destination register is not one of WZR or XZR, SWPA and SWPAL load from memory with acquire semantics.
- SWPL and SWPAL store to memory with release semantics.
- SWP has neither acquire nor release semantics.

For more information about memory ordering semantics see [Load-Acquire, Load-AcquirePC, and Store-Release on page B2-152](#).

For information about memory accesses see [Load/store addressing modes on page C1-202](#).

Integer

(FEAT_LSE)

31 30 29 28 27 26 25 24 23 22 21 20				16 15 14 13 12 11 10 9				5 4		0

AccType stacctype = if R == '1' then AccType_ORDEREDATOMICRW else AccType_ATOMICRW;
boolean tag_checked = n != 31;
```

Assembler symbols

<Ws> Is the 32-bit name of the general-purpose register to be stored, encoded in the "Rs" field.

<Wt> Is the 32-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.

<Xs> Is the 64-bit name of the general-purpose register to be stored, encoded in the "Rs" field.

<Xt> Is the 64-bit name of the general-purpose register to be loaded, encoded in the "Rt" field.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

Operation

```
bits(64) address;
bits(datasize) data;
bits(datasize) store_value;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

store_value = X[s];
data = MemAtomic(address, MemAtomicOp_SWP, store_value, ldacctype, stacctype);
X[t] = ZeroExtend(data, regsize);
```

C6.2.325 SXTB

Signed Extend Byte extracts an 8-bit value from a register, sign-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the [SBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SBFM](#).
- The description of [SBFM](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when $sf == 0 \ \&\& \ N == 0$.

SXTB <Wd>, <Wn>

is equivalent to

SBFM <Wd>, <Wn>, #0, #7

and is always the preferred disassembly.

64-bit variant

Applies when $sf == 1 \ \&\& \ N == 1$.

SXTB <Xd>, <Wn>

is equivalent to

SBFM <Xd>, <Xn>, #0, #7

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

The description of [SBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.326 SXTB

Sign Extend Halfword extracts a 16-bit value, sign-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the [SBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SBFM](#).
- The description of [SBFM](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when $sf == 0 \ \&\& \ N == 0$.

SXTB <Wd>, <Wn>

is equivalent to

SBFM <Wd>, <Wn>, #0, #15

and is always the preferred disassembly.

64-bit variant

Applies when $sf == 1 \ \&\& \ N == 1$.

SXTB <Xd>, <Wn>

is equivalent to

SBFM <Xd>, <Xn>, #0, #15

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

The description of [SBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.327 SXTW

Sign Extend Word sign-extends a word to the size of the register, and writes the result to the destination register.

This instruction is an alias of the [SBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [SBFM](#).
- The description of [SBFM](#) gives the operational pseudocode for this instruction.

64-bit variant

SXTW <Xd>, <Wn>

is equivalent to

SBFM <Xd>, <Xn>, #0, #31

and is always the preferred disassembly.

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

The description of [SBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.328 SYS

System instruction. For more information, see *op0=0b01, cache maintenance, TLB maintenance, and address translation instructions* on page C5-399 for the encodings of System instructions.

This instruction is used by the aliases [AT](#), [CFP](#), [CPP](#), [DC](#), [DVP](#), [IC](#), and [TLBI](#). See *Alias conditions* on page C6-1482 for details of when each alias is preferred.

Encoding

SYS #<op1>, <Cn>, <Cm>, #<op2>{, <Xt>}

Decode for this encoding

```
AArch64.CheckSystemAccess('01', op1, CRn, CRm, op2, Rt, L);
```

```
integer t = UInt(Rt);
```

```
integer sys_op1 = UInt(op1);
```

```
integer sys_op2 = UInt(op2);
```

```
integer sys_crn = UInt(CRn);
```

```
integer sys_crm = UInt(CRm);
```

Alias conditions

Alias	is preferred when
AT	CRn == '0111' && CRm == '100x' && SysOp(op1, '0111', CRm, op2) == Sys_AT
CFP	op1 == '011' && CRn == '0111' && CRm == '0011' && op2 == '100'
CPP	op1 == '011' && CRn == '0111' && CRm == '0011' && op2 == '111'
DC	CRn == '0111' && SysOp(op1, '0111', CRm, op2) == Sys_DC
DVP	op1 == '011' && CRn == '0111' && CRm == '0011' && op2 == '101'
IC	CRn == '0111' && SysOp(op1, '0111', CRm, op2) == Sys_IC
TLBI	CRn == '1000' && SysOp(op1, '1000', CRm, op2) == Sys_TLBI

Assembler symbols

- <op1> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.
- <Cn> Is a name 'Cn', with 'n' in the range 0 to 15, encoded in the "CRn" field.
- <Cm> Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.
- <op2> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

<Xt> Is the 64-bit name of the optional general-purpose source register, defaulting to '11111', encoded in the "Rt" field.

Operation

`AArch64.SysInstr(1, sys_op1, sys_crn, sys_crm, sys_op2, X[t]);`

C6.2.329 SYSL

System instruction with result. For more information, see *op0==0b01, cache maintenance, TLB maintenance, and address translation instructions* on page C5-399 for the encodings of System instructions.

Encoding

SYSL <Xt>, #<op1>, <Cn>, <Cm>, #<op2>

Decode for this encoding

```
AArch64.CheckSystemAccess('01', op1, CRn, CRm, op2, Rt, L);
```

```
integer t = UInt(Rt);
```

```
integer sys_op1 = UInt(op1);
```

```
integer sys_op2 = UInt(op2);
```

```
integer sys_crn = UInt(CRn);
```

```
integer sys_crm = UInt(CRm);
```

Assembler symbols

<Xt> Is the 64-bit name of the general-purpose destination register, encoded in the "Rt" field.

<op1> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.

<Cn> Is a name 'Cn', with 'n' in the range 0 to 15, encoded in the "CRn" field.

<Cm> Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.

<op2> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

Operation

```
// No architecturally defined instructions here.
```

```
X[t] = AArch64.SysInstrWithResult(1, sys_op1, sys_crn, sys_crm, sys_op2);
```

C6.2.330 TBNZ

Test bit and Branch if Nonzero compares the value of a bit in a general-purpose register with zero, and conditionally branches to a label at a PC-relative offset if the comparison is not equal. It provides a hint that this is not a subroutine call or return. This instruction does not affect condition flags.

Encoding

TBNZ <R><t>, #<imm>, <label>

Decode for this encoding

```
integer t = UInt(Rt);
integer datasize = if b5 == '1' then 64 else 32;
integer bit_pos = UInt(b5:b40);
bits(64) offset = SignExtend(imm14:'00', 64);
```

Assembler symbols

- <R> Is a width specifier, encoded in the "b5" field. It can have the following values:
 - W when b5 = 0
 - X when b5 = 1

In assembler source code an 'X' specifier is always permitted, but a 'W' specifier is only permitted when the bit number is less than 32.
- <t> Is the number [0-30] of the general-purpose register to be tested or the name ZR (31), encoded in the "Rt" field.
- <imm> Is the bit number to be tested, in the range 0 to 63, encoded in "b5:b40".
- <label> Is the program label to be conditionally branched to. Its offset from the address of this instruction, in the range +/-32KB, is encoded as "imm14" times 4.

Operation

```
bits(datasize) operand = X[t];
if operand<bit_pos> == op then
    BranchTo(PC[] + offset, BranchType_DIR, TRUE);
```

C6.2.331 TBZ

Test bit and Branch if Zero compares the value of a test bit with zero, and conditionally branches to a label at a PC-relative offset if the comparison is equal. It provides a hint that this is not a subroutine call or return. This instruction does not affect condition flags.

Encoding

TBZ <R><t>, #<imm>, <label>

Decode for this encoding

```
integer t = UInt(Rt);
integer datasize = if b5 == '1' then 64 else 32;
integer bit_pos = UInt(b5:b40);
bits(64) offset = SignExtend(imm14:'00', 64);
```

Assembler symbols

- <R> Is a width specifier, encoded in the "b5" field. It can have the following values:
- | | |
|---|-------------|
| W | when b5 = 0 |
| X | when b5 = 1 |
- In assembler source code an 'X' specifier is always permitted, but a 'W' specifier is only permitted when the bit number is less than 32.
- <t> Is the number [0-30] of the general-purpose register to be tested or the name ZR (31), encoded in the "Rt" field.
- <imm> Is the bit number to be tested, in the range 0 to 63, encoded in "b5:b40".
- <label> Is the program label to be conditionally branched to. Its offset from the address of this instruction, in the range +/-32KB, is encoded as "imm14" times 4.

Operation

```
bits(datasize) operand = X[t];
if operand<bit_pos> == op then
  BranchTo(PC[] + offset, BranchType_DIR, TRUE);
```

C6.2.332 TLBI

TLB Invalidate operation. For more information, see *op0==0b01, cache maintenance, TLB maintenance, and address translation instructions* on page C5-399.

This instruction is an alias of the **SYS** instruction. This means that:

- The encodings in this description are named to match the encodings of **SYS**.
- The description of **SYS** gives the operational pseudocode for this instruction.

Encoding

TLBI <tlbi_op>{, <Xt>}

is equivalent to

SYS #<op1>, C8, <Cm>, #<op2>{, <Xt>}

and is the preferred disassembly when SysOp(op1, '1000', CRm, op2) == Sys_TLBI.

Assembler symbols

<op1> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op1" field.

<Cm> Is a name 'Cm', with 'm' in the range 0 to 15, encoded in the "CRm" field.

<op2> Is a 3-bit unsigned immediate, in the range 0 to 7, encoded in the "op2" field.

<tlbi_op> Is a TLBI instruction name, as listed for the TLBI system instruction group, encoded in the "op1:CRm:op2" field. It can have the following values:

VMALLE1IS	when op1 = 000, CRm = 0011, op2 = 000
VAE1IS	when op1 = 000, CRm = 0011, op2 = 001
ASIDE1IS	when op1 = 000, CRm = 0011, op2 = 010
VAAE1IS	when op1 = 000, CRm = 0011, op2 = 011
VALE1IS	when op1 = 000, CRm = 0011, op2 = 101
VAALE1IS	when op1 = 000, CRm = 0011, op2 = 111
VMALLE1	when op1 = 000, CRm = 0111, op2 = 000
VAE1	when op1 = 000, CRm = 0111, op2 = 001
ASIDE1	when op1 = 000, CRm = 0111, op2 = 010
VAAE1	when op1 = 000, CRm = 0111, op2 = 011
VALE1	when op1 = 000, CRm = 0111, op2 = 101
VAALE1	when op1 = 000, CRm = 0111, op2 = 111
IPAS2E1IS	when op1 = 100, CRm = 0000, op2 = 001
IPAS2LE1IS	when op1 = 100, CRm = 0000, op2 = 101
ALLE2IS	when op1 = 100, CRm = 0011, op2 = 000
VAE2IS	when op1 = 100, CRm = 0011, op2 = 001
ALLE1IS	when op1 = 100, CRm = 0011, op2 = 100

VALE2IS when op1 = 100, CRm = 0011, op2 = 101
VMALLS12E1IS when op1 = 100, CRm = 0011, op2 = 110
IPAS2E1 when op1 = 100, CRm = 0100, op2 = 001
IPAS2LE1 when op1 = 100, CRm = 0100, op2 = 101
ALLE2 when op1 = 100, CRm = 0111, op2 = 000
VAE2 when op1 = 100, CRm = 0111, op2 = 001
ALLE1 when op1 = 100, CRm = 0111, op2 = 100
VALE2 when op1 = 100, CRm = 0111, op2 = 101
VMALLS12E1 when op1 = 100, CRm = 0111, op2 = 110
ALLE3IS when op1 = 110, CRm = 0011, op2 = 000
VAE3IS when op1 = 110, CRm = 0011, op2 = 001
VALE3IS when op1 = 110, CRm = 0011, op2 = 101
ALLE3 when op1 = 110, CRm = 0111, op2 = 000
VAE3 when op1 = 110, CRm = 0111, op2 = 001
VALE3 when op1 = 110, CRm = 0111, op2 = 101

When FEAT_TLBIOS is implemented, the following values are also valid:

VMALLE10S when op1 = 000, CRm = 0001, op2 = 000
VAE10S when op1 = 000, CRm = 0001, op2 = 001
ASIDE10S when op1 = 000, CRm = 0001, op2 = 010

RVALE30S when op1 = 110, CRm = 0101, op2 = 101
RVAE3 when op1 = 110, CRm = 0110, op2 = 001
RVALE3 when op1 = 110, CRm = 0110, op2 = 101

<Xt> Is the 64-bit name of the optional general-purpose source register, defaulting to '11111', encoded in the "Rt" field.

Operation

The description of [SYS](#) gives the operational pseudocode for this instruction.

C6.2.333 TSB CSYNC

Trace Synchronization Barrier. This instruction is a barrier that synchronizes the trace operations of instructions.

If `FEAT_TRF` is not implemented, this instruction executes as a NOP.

System

(FEAT_TRF)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	8	7	5	4	3	2	1	0					
1	1	0	1	0	1	0	1	0	0	0	0	0	0	1	1	0	0	1	0	0	0	1	0	0	1	1	1	1	1				
																					CRm		op2										

Encoding

TSB CSYNC

Decode for this encoding

```
if !HaveSelfHostedTrace() then EndOfInstruction();
```

Operation

```
TraceSynchronizationBarrier();
```

C6.2.334 TST (immediate)

Test bits (immediate) , setting the condition flags and discarding the result : Rn AND imm

This instruction is an alias of the [ANDS \(immediate\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [ANDS \(immediate\)](#).
- The description of [ANDS \(immediate\)](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when sf == 0 && N == 0.

TST <Wn>, #<imm>

is equivalent to

ANDS WZR, <Wn>, #<imm>

and is always the preferred disassembly.

64-bit variant

Applies when sf == 1.

TST <Xn>, #<imm>

is equivalent to

ANDS XZR, <Xn>, #<imm>

and is always the preferred disassembly.

Assembler symbols

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

<imm> For the 32-bit variant: is the bitmask immediate, encoded in "imms:immr".
For the 64-bit variant: is the bitmask immediate, encoded in "N:imms:immr".

Operation

The description of [ANDS \(immediate\)](#) gives the operational pseudocode for this instruction.

C6.2.335 TST (shifted register)

Test (shifted register) performs a bitwise AND operation on a register value and an optionally-shifted register value. It updates the condition flags based on the result, and discards the result.

This instruction is an alias of the [ANDS \(shifted register\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [ANDS \(shifted register\)](#).
- The description of [ANDS \(shifted register\)](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when `sf == 0`.

TST <Wn>, <Wm>{, <shift> #<amount>}

is equivalent to

ANDS WZR, <Wn>, <Wm>{, <shift> #<amount>}

and is always the preferred disassembly.

64-bit variant

Applies when `sf == 1`.

TST <Xn>, <Xm>{, <shift> #<amount>}

is equivalent to

ANDS XZR, <Xn>, <Xm>{, <shift> #<amount>}

and is always the preferred disassembly.

Assembler symbols

- <Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- <Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.
- <shift> Is the optional shift to be applied to the final source, defaulting to LSL and encoded in the "shift" field. It can have the following values:

LSL	when shift = 00
LSR	when shift = 01
ASR	when shift = 10
ROR	when shift = 11
- <amount> For the 32-bit variant: is the shift amount, in the range 0 to 31, defaulting to 0 and encoded in the "imm6" field.
 For the 64-bit variant: is the shift amount, in the range 0 to 63, defaulting to 0 and encoded in the "imm6" field,

Operation

The description of [ANDS \(shifted register\)](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.336 UBFIZ

Unsigned Bitfield Insert in Zeros copies a bitfield of $\langle width \rangle$ bits from the least significant bits of the source register to bit position $\langle lsb \rangle$ of the destination register, setting the destination bits above and below the bitfield to zero.

This instruction is an alias of the [UBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [UBFM](#).
- The description of [UBFM](#) gives the operational pseudocode for this instruction.

32-bit variant

Applies when $sf == 0 \ \&\& \ N == 0$.

UBFIZ $\langle Wd \rangle$, $\langle Wn \rangle$, $\# \langle lsb \rangle$, $\# \langle width \rangle$

is equivalent to

UBFM $\langle Wd \rangle$, $\langle Wn \rangle$, $\#(-\langle lsb \rangle \text{ MOD } 32)$, $\#(\langle width \rangle - 1)$

and is the preferred disassembly when $UInt(imms) < UInt(immr)$.

64-bit variant

Applies when $sf == 1 \ \&\& \ N == 1$.

UBFIZ $\langle Xd \rangle$, $\langle Xn \rangle$, $\# \langle lsb \rangle$, $\# \langle width \rangle$

is equivalent to

UBFM $\langle Xd \rangle$, $\langle Xn \rangle$, $\#(-\langle lsb \rangle \text{ MOD } 64)$, $\#(\langle width \rangle - 1)$

and is the preferred disassembly when $UInt(imms) < UInt(immr)$.

Assembler symbols

$\langle Wd \rangle$ Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

$\langle Wn \rangle$ Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

$\langle Xd \rangle$ Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

$\langle Xn \rangle$ Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

$\langle lsb \rangle$ For the 32-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 31.
 For the 64-bit variant: is the bit number of the lsb of the destination bitfield, in the range 0 to 63.

$\langle width \rangle$ For the 32-bit variant: is the width of the bitfield, in the range 1 to $32 - \langle lsb \rangle$.
 For the 64-bit variant: is the width of the bitfield, in the range 1 to $64 - \langle lsb \rangle$.

Operation

The description of [UBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.337 UBFM

Unsigned Bitfield Move is usually accessed via one of its aliases, which are always preferred for disassembly.

If $\langle imms \rangle$ is greater than or equal to $\langle immr \rangle$, this copies a bitfield of $(\langle imms \rangle - \langle immr \rangle + 1)$ bits starting from bit position $\langle immr \rangle$ in the source register to the least significant bits of the destination register.

If $\langle imms \rangle$ is less than $\langle immr \rangle$, this copies a bitfield of $(\langle imms \rangle + 1)$ bits from the least significant bits of the source register to bit position $(regsize - \langle immr \rangle)$ of the destination register, where $regsize$ is the destination register size of 32 or 64 bits.

In both cases the destination bits below and above the bitfield are set to zero.

This instruction is used by the aliases [LSL \(immediate\)](#), [LSR \(immediate\)](#), [UBFIZ](#), [UBFX](#), [UXTB](#), and [UXTH](#). See [Alias conditions on page C6-1497](#) for details of when each alias is preferred.

32-bit variant

Applies when $sf == 0 \ \&\& \ N == 0$.

UBFM $\langle Wd \rangle, \langle Wn \rangle, \# \langle immr \rangle, \# \langle imms \rangle$

64-bit variant

Applies when $sf == 1 \ \&\& \ N == 1$.

UBFM $\langle Xd \rangle, \langle Xn \rangle, \# \langle immr \rangle, \# \langle imms \rangle$

Decode for all variants of this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);
integer datasize = if sf == '1' then 64 else 32;

integer R;
bits(datasize) wmask;
bits(datasize) tmask;

if sf == '1' && N != '1' then UNDEFINED;
if sf == '0' && (N != '0' || immr<5> != '0' || imms<5> != '0') then UNDEFINED;

R = UInt(immr);
(wmask, tmask) = DecodeBitMasks(N, imms, immr, FALSE);
  
```

Alias conditions

Alias	of variant	is preferred when
LSL (immediate)	32-bit	$imms \neq '011111' \ \&\& \ imms + 1 == immr$
LSL (immediate)	64-bit	$imms \neq '111111' \ \&\& \ imms + 1 == immr$
LSR (immediate)	32-bit	$imms == '011111'$
LSR (immediate)	64-bit	$imms == '111111'$
UBFIZ	-	$UInt(imms) < UInt(immr)$
UBFX	-	$BFXPreferred(sf, opc < 1, imms, immr)$
UXTB	-	$immr == '000000' \ \&\& \ imms == '000111'$
UXTH	-	$immr == '000000' \ \&\& \ imms == '001111'$

Assembler symbols

<wd>	Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
<wn>	Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
<Xd>	Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
<Xn>	Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
<immr>	For the 32-bit variant: is the right rotate amount, in the range 0 to 31, encoded in the "immr" field. For the 64-bit variant: is the right rotate amount, in the range 0 to 63, encoded in the "immr" field.
<imms>	For the 32-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 31, encoded in the "imms" field. For the 64-bit variant: is the leftmost bit number to be moved from the source, in the range 0 to 63, encoded in the "imms" field.

Operation

```
bits(datasize) src = X[n];

// perform bitfield move on low bits
bits(datasize) bot = ROR(src, R) AND wmask;

// combine extension bits and result bits
X[d] = bot AND tmask;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.

— The values of the NZCV flags.

C6.2.338 UBFX

Unsigned Bitfield Extract copies a bitfield of <width> bits starting from bit position <lsb> in the source register to the least significant bits of the destination register, and sets destination bits above the bitfield to zero.

This instruction is an alias of the [UBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [UBFM](#).
- The description of [UBFM](#) gives the operational pseudocode for this instruction.

31	30	29	28	27	26	25	24	23	22	21	16	15	10	9	5	4	0	
sf	1	0	1	0	0	1	1	0	N	immr	imms	Rn	Rd					
opc																		

32-bit variant

Applies when $sf == 0 \ \&\& \ N == 0$.

UBFX <Wd>, <Wn>, #<lsb>, #<width>

is equivalent to

UBFM <Wd>, <Wn>, #<lsb>, #(<lsb>+<width>-1)

and is the preferred disassembly when $BFXPreferred(sf, opc<1>, imms, immr)$.

64-bit variant

Applies when $sf == 1 \ \&\& \ N == 1$.

UBFX <Xd>, <Xn>, #<lsb>, #<width>

is equivalent to

UBFM <Xd>, <Xn>, #<lsb>, #(<lsb>+<width>-1)

and is the preferred disassembly when $BFXPreferred(sf, opc<1>, imms, immr)$.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.

<lsb> For the 32-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 31.
 For the 64-bit variant: is the bit number of the lsb of the source bitfield, in the range 0 to 63.

<width> For the 32-bit variant: is the width of the bitfield, in the range 1 to 32-<lsb>.
 For the 64-bit variant: is the width of the bitfield, in the range 1 to 64-<lsb>.

Operation

The description of [UBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.339 UDF

Permanently Undefined generates an Undefined Instruction exception (ESR_ELx.EC = 0b000000). The encodings for UDF used in this section are defined as permanently UNDEFINED in the Armv8-A architecture.

Encoding

UDF #<imm>

Decode for this encoding

```
// The imm16 field is ignored by hardware.
UNDEFINED;
```

Assembler symbols

<imm> is a 16-bit unsigned immediate, in the range 0 to 65535, encoded in the "imm16" field. The PE ignores the value of this constant.

Operation

```
// No operation.
```

C6.2.340 UDIV

Unsigned Divide divides an unsigned integer register value by another unsigned integer register value, and writes the result to the destination register. The condition flags are not affected.

32-bit variant

Applies when sf == 0.

UDIV <Wd>, <Wn>, <Wm>

64-bit variant

Applies when sf == 1.

UDIV <Xd>, <Xn>, <Xm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if sf == '1' then 64 else 32;
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register, encoded in the "Rm" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register, encoded in the "Rm" field.

Operation

```
bits(datasize) operand1 = X[n];
bits(datasize) operand2 = X[m];
integer result;

if IsZero(operand2) then
    result = 0;
else
    result = RoundTowardsZero(Rea1(Int(operand1, TRUE)) / Rea1(Int(operand2, TRUE)));

X[d] = result<datasize-1:0>;
```

C6.2.341 UMADDL

Unsigned Multiply-Add Long multiplies two 32-bit register values, adds a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias [UMULL](#). See *Alias conditions* on page C6-1503 for details of when each alias is preferred.

Encoding

UMADDL <Xd>, <Wn>, <Wm>, <Xa>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
```

Alias conditions

Alias	is preferred when
UMULL	Ra == '11111'

Assembler symbols

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- <Xa> Is the 64-bit name of the third general-purpose source register holding the addend, encoded in the "Ra" field.

Operation

```
bits(32) operand1 = X[n];
bits(32) operand2 = X[m];
bits(64) operand3 = X[a];
```

integer result;

```
result = Int(operand3, TRUE) + (Int(operand1, TRUE) * Int(operand2, TRUE));
```

```
X[d] = result<63:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.342 UMNEGL

Unsigned Multiply-Negate Long multiplies two 32-bit register values, negates the product, and writes the result to the 64-bit destination register.

This instruction is an alias of the [UMSUBL](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [UMSUBL](#).
- The description of [UMSUBL](#) gives the operational pseudocode for this instruction.

Encoding

UMNEGL <Xd>, <Wn>, <Wm>

is equivalent to

UMSUBL <Xd>, <Wn>, <Wm>, XZR

and is always the preferred disassembly.

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation

The description of [UMSUBL](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.343 UMSUBL

Unsigned Multiply-Subtract Long multiplies two 32-bit register values, subtracts the product from a 64-bit register value, and writes the result to the 64-bit destination register.

This instruction is used by the alias [UMNEGL](#). See [Alias conditions on page C6-1506](#) for details of when each alias is preferred.

Encoding

UMSUBL <Xd>, <Wn>, <Wm>, <Xa>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
```

Alias conditions

Alias	is preferred when
UMNEGL	Ra == '11111'

Assembler symbols

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.
- <Xa> Is the 64-bit name of the third general-purpose source register holding the minuend, encoded in the "Ra" field.

Operation

```
bits(32) operand1 = X[n];
bits(32) operand2 = X[m];
bits(64) operand3 = X[a];

integer result;

result = Int(operand3, TRUE) - (Int(operand1, TRUE) * Int(operand2, TRUE));
X[d] = result<63:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.344 UMULH

Unsigned Multiply High multiplies two 64-bit register values, and writes bits[127:64] of the 128-bit result to the 64-bit destination register.

Encoding

UMULH <Xd>, <Xn>, <Xm>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
```

Assembler symbols

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.
- <Xm> Is the 64-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation

```
bits(64) operand1 = X[n];
bits(64) operand2 = X[m];

integer result;

result = Int(operand1, TRUE) * Int(operand2, TRUE);

X[d] = result<127:64>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.345 UMULL

Unsigned Multiply Long multiplies two 32-bit register values, and writes the result to the 64-bit destination register.

This instruction is an alias of the [UMADDL](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [UMADDL](#).
- The description of [UMADDL](#) gives the operational pseudocode for this instruction.

Encoding

UMULL <Xd>, <Wn>, <Wm>

is equivalent to

UMADDL <Xd>, <Wn>, <Wm>, XZR

and is always the preferred disassembly.

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the first general-purpose source register holding the multiplicand, encoded in the "Rn" field.

<Wm> Is the 32-bit name of the second general-purpose source register holding the multiplier, encoded in the "Rm" field.

Operation

The description of [UMADDL](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.346 UXTB

Unsigned Extend Byte extracts an 8-bit value from a register, zero-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the [UBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [UBFM](#).
- The description of [UBFM](#) gives the operational pseudocode for this instruction.

32-bit variant

UXTB <Wd>, <Wn>

is equivalent to

UBFM <Wd>, <Wn>, #0, #7

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

The description of [UBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.347 UXTH

Unsigned Extend Halfword extracts a 16-bit value from a register, zero-extends it to the size of the register, and writes the result to the destination register.

This instruction is an alias of the [UBFM](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [UBFM](#).
- The description of [UBFM](#) gives the operational pseudocode for this instruction.

32-bit variant

UXTH <Wd>, <Wn>

is equivalent to

UBFM <Wd>, <Wn>, #0, #15

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

The description of [UBFM](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C6.2.348 WFE

Wait For Event is a hint instruction that indicates that the PE can enter a low-power state and remain there until a wakeup event occurs. Wakeup events include the event signaled as a result of executing the SEV instruction on any PE in the multiprocessor system. For more information, see [Wait for Event mechanism and Send event on page D1-2536](#).

As described in [Wait for Event mechanism and Send event on page D1-2536](#), the execution of a WFE instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level. See:

- [Traps to EL1 of EL0 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2514](#).
- [Traps to EL2 of EL0 and EL1 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2524](#).
- [Traps to EL3 of EL2, EL1, and EL0 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2533](#).

Encoding

WFE

Decode for this encoding

// Empty.

Operation

`Hint_WFE(-1, WFxType_WFE);`

C6.2.349 WFET

Wait For Event with Timeout is a hint instruction that indicates that the PE can enter a low-power state and remain there until either a local timeout event or a wakeup event occurs. Wakeup events include the event signaled as a result of executing the SEV instruction on any PE in the multiprocessor system. For more information, see [Wait for Event mechanism and Send event on page D1-2536](#).

As described in [Wait for Event mechanism and Send event on page D1-2536](#), the execution of a WFET instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level. See:

- [Traps to EL1 of EL0 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2514](#).
- [Traps to EL2 of EL0 and EL1 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2524](#).
- [Traps to EL3 of EL2, EL1, and EL0 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2533](#).

System

(FEAT_WFXT)

Encoding

WFET <Xt>

Decode for this encoding

```
if !HaveFeatWFXT() then UNDEFINED;
integer d = UInt(Rd);
```

Assembler symbols

<Xt> Is the 64-bit name of the general-purpose source register, encoded in the "Rd" field.

Operation

```
bits(64) operand = X[d];
integer localtimeout = UInt(operand);

if Halted() && ConstrainUnpredictableBool() then
  EndOfInstruction();

Hint_WFE(localtimeout, WFxType_WFET);
```

C6.2.350 WFI

Wait For Interrupt is a hint instruction that indicates that the PE can enter a low-power state and remain there until a wakeup event occurs. For more information, see *Wait For Interrupt* on page D1-2540.

As described in *Wait For Interrupt* on page D1-2540, the execution of a WFI instruction that would otherwise cause entry to a low-power state can be trapped to a higher Exception level. See:

- *Traps to EL1 of EL0 execution of WFE, WFI, WFET, and WFIT instructions* on page D1-2514.
- *Traps to EL2 of EL0 and EL1 execution of WFE, WFI, WFET, and WFIT instructions* on page D1-2524.
- *Traps to EL3 of EL2, EL1, and EL0 execution of WFE, WFI, WFET, and WFIT instructions* on page D1-2533.

Decode for this encoding

```
if !HaveFeatWFxT() then UNDEFINED;
integer d = UInt(Rd);
```

Assembler symbols

<Xt> Is the 64-bit name of the general-purpose source register, encoded in the "Rd" field.

Operation

```
bits(64) operand = X[d];
integer localtimeout = UInt(operand);

if Halted() && ConstrainUnpredictableBool() then
  EndOfInstruction();

Hint_WFI(localtimeout, WFxType_WFIT);
```

C6.2.352 XAFLAG

Convert floating-point condition flags from external format to Arm format. This instruction converts the state of the PSTATE.{N,Z,C,V} flags from an alternative representation required by some software to a form representing the result of an Arm floating-point scalar compare instruction.

System

(FEAT_FlagM2)

Encoding

XAFLAG

Decode for this encoding

if !HaveFlagFormatExt() then UNDEFINED;

Operation

bit N = NOT(PSTATE.C) AND NOT(PSTATE.Z);
 bit Z = PSTATE.Z AND PSTATE.C;
 bit C = PSTATE.C OR PSTATE.Z;
 bit V = NOT(PSTATE.C) AND PSTATE.Z;

PSTATE.N = N;
 PSTATE.Z = Z;
 PSTATE.C = C;
 PSTATE.V = V;

C6.2.353 XPACD, XPACI, XPACLRI

Strip Pointer Authentication Code. This instruction removes the pointer authentication code from an address. The address is in the specified general-purpose register for XPACI and XPACD, and is in LR for XPACLRI.

The XPACD instruction is used for data addresses, and XPACI and XPACLRI are used for instruction addresses.

Integer

(FEAT_PAuth)

XPACD variant

Applies when D == 1.

XPACD <Xd>

XPACI variant

Applies when D == 0.

XPACI <Xd>

Decode for all variants of this encoding

```
boolean data = (D == '1');
integer d = UInt(Rd);

if !HavePACExt() then
    UNDEFINED;
```

System

(FEAT_PAuth)

Encoding

XPACLRI

Decode for this encoding

```
integer d = 30;
boolean data = FALSE;
```

Assembler symbols

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

Operation for all encodings

```
if HavePACExt() then  
    X[d] = Strip(X[d], data);
```

C6.2.354 YIELD

YIELD is a hint instruction. Software with a multithreading capability can use a YIELD instruction to indicate to the PE that it is performing a task, for example a spin-lock, that could be swapped out to improve overall system performance. The PE can use this hint to suspend and resume multiple software threads if it supports the capability.

For more information about the recommended use of this instruction, see [The YIELD instruction on page B1-122](#).

Encoding

YIELD

Decode for this encoding

// Empty.

Operation

`Hint_Yield();`

Chapter C7

A64 Advanced SIMD and Floating-point Instruction Descriptions

This chapter describes the A64 Advanced SIMD and floating-point instructions.

It contains the following sections:

- [About the A64 SIMD and floating-point instructions on page C7-1522.](#)
- [Alphabetical list of A64 Advanced SIMD and floating-point instructions on page C7-1524.](#)

C7.1 About the A64 SIMD and floating-point instructions

[Alphabetical list of A64 Advanced SIMD and floating-point instructions on page C7-1524](#) gives full descriptions of the A64 instructions that are in the following instruction groups:

- Loads and store instructions associated with the SIMD and floating-point registers.
- Data processing instructions with SIMD and floating-point registers.

[A64 instruction set encoding on page C4-284](#) in the A64 Instruction Encodings chapter provides an overview of the instruction encodings as part of an instruction class within a functional group.

The rest of this section is a general description of the SIMD and floating-point instructions. It contains the following subsections:

- [Register size on page C7-1522](#).
- [Data types on page C7-1523](#).
- [Condition flags and related instructions on page C7-1523](#).

C7.1.1 Register size

A64 provides a comprehensive set of packed Single Instruction Multiple Data (SIMD) and scalar operations using data held in the 32 entry 128-bit wide SIMD and floating-point register file.

Each SIMD and floating-point register can be used to hold:

- A single scalar value of the floating-point or integer type.
- A 64-bit wide vector containing one or more elements.
- A 128-bit wide vector containing two or more elements.

Where the entire 128-bit wide register is not fully utilized, the vector or scalar quantity is held in the least significant bits of the register, with the most significant bits being cleared to zero on a write, see [Vector formats on page A1-41](#).

The following instructions can insert data into individual elements within a SIMD and floating-point register without clearing the remaining bits to zero:

- Insert vector element from another vector element or general-purpose register, `INS`.
- Load structure into a single lane, for example `LD3`.
- All second-part narrowing operations, for example `SHRN2`.

C7.1.2 Output element control

When `FEAT_AFP` is implemented, the `FPCR.NEP` bit controls how output elements are determined for the scalar Advanced SIMD instructions for elements other than the lowest element of the vector.

If `FPCR.NEP == 1`, the following instructions determine output elements as follows:

- The 3-input floating-point scalar versions of `FMLA (by element)` and `FMLS (by element)` take output elements other than the lowest element from the `<Hd>`, `<Sd>`, or `<Dd>` register.
- The 3-input floating-point `FMADD`, `FMSUB`, `FNMADD`, and `FNMSUB` instructions take output elements other than the lowest element from the `<Ha>`, `<Sa>`, or `<Da>` register.
- The 2-input floating-point scalar versions of `FCMGE (register)`, `FCMGT (register)`, `FCMEQ (register)`, `FACGE`, `FACGT`, take output elements other than the lowest element from the `<Hm>`, `<Sm>`, or `<Dm>` register.
- The 2-input floating-point scalar versions of `FMULX`, `FRECPS`, `FRSQRTS`, `FABD`, `FMUL (by element)`, `FMUL (scalar)`, `FDIV (scalar)`, `FADD (scalar)`, `FSUB (scalar)`, `FMAX (scalar)`, `FMIN (scalar)`, `FMAXNM (scalar)`, `FMINNM (scalar)`, `FNMUL (scalar)`, take output elements other than the lowest element from the `<Hn>`, `<Sn>`, or `<Dn>` register.
- For 1-input floating-point scalar versions of the instructions `FCVTNS (vector)`, `FCVTMS (vector)`, `FCVTAS (vector)`, `FCVTPS (vector)`, `SCVTF (vector, integer)`, `UCVTF (vector, integer)`, `FCVTZS (vector, integer)`, `FCVTZU (vector, integer)`, `FCVTNU (vector)`, `FCVTMU (vector)`, `FCVTAU (vector)`, `FCVTPU (vector)`, `SCVTF (vector, fixed-point)`, `UCVTF (vector, fixed-point)`, `FCVTZS (vector, fixed-point)`, `FCVTZU (vector, fixed-point)`, `SCVTF (scalar, integer)`, `UCVTF (scalar, integer)`, `SCVTF (scalar, fixed-point)`, `UCVTF (scalar, fixed-point)`, `BFCVT`, `FCVT`, `FCVTXN`, `FRECPE`, `FRECPX`, `FRSQRTS`, `FABS (scalar)`,

[FNEG](#) (scalar), [FSQRT](#) (scalar), [FRINTN](#) (scalar), [FRINTP](#) (scalar), [FRINTM](#) (scalar), [FRINTZ](#) (scalar), [FRINTA](#) (scalar), [FRINTI](#) (scalar), [FRINTX](#) (scalar), [FRINT32Z](#) (scalar), [FRINT32X](#) (scalar), [FRINT64Z](#) (scalar), [FRINT64X](#) (scalar), take output elements other than the lowest element from the <Hd>, <Sd>, or <Dd> register.

C7.1.3 Data types

The A64 instruction set provides support for arithmetic, conversion, and bitwise operations on:

- Half-precision, single-precision, and double-precision floating-points.
- Signed and unsigned integers.
- Polynomials over {0, 1}.
- When [FEAT_FCMA](#) is implemented, complex numbers.

For all AArch64 floating-point operations, including SIMD operations, the rounding mode and exception trap handling are controlled by the [FPCR](#).

Note

- AArch32 Advanced SIMD operations always use Arm standard floating-point arithmetic, regardless of the rounding mode specified by the AArch64 [FPCR](#) or the AArch32 [FPSCR](#).
- In AArch64 state, floating-point multiply-add operations are always performed as fused operations, but AArch32 state provides both fused and chained multiply-add instructions.

In addition to operations that consume and produce values of the same width and type, the A64 instruction set supports SIMD and scalar operations that produce a wider or narrower vector result:

- Where a SIMD operation narrows a 128-bit vector to a 64-bit vector, the A64 instruction set provides a second-part operation, for example [SHRN2](#), that can pack the result of a second operation into the upper part of the same destination register.
- Where a SIMD operation widens a 64-bit vector to a 128-bit vector, the A64 instruction set provides a second-part operation, for example [SMLAL2](#), that can extract the source from the upper 64 bits of the source registers.

All SIMD operations that could produce side-effects that are not limited to the destination SIMD and floating-point register, for example a potential update of [FPSR.Q](#) or [FPSR.IDC](#), have a dedicated scalar variant to support the use of SIMD with loops requiring specialised head or tail handling, or both.

C7.1.4 Condition flags and related instructions

The A64 instruction set provides support for flag setting and conditional operations on the SIMD and floating-point register file:

- Floating-point [FCSEL](#) and [FCCMP](#) instructions are equivalent to the integer [CSEL](#) and [CCMP](#) instructions.
- Floating-point [FCMP](#), [FCMPE](#), [FCCMP](#), and [FCCMP](#) instructions set the [PSTATE](#).{N, Z, C, V} flags based on the result of the floating-point comparison.
- Floating-point [FJCVTZS](#) instruction sets the [PSTATE.Z](#) flag if the result of the conversion, when converted back to a double-precision floating-point number, gives precisely the same value as the original. Other [PSTATE](#) flags are cleared by this instruction.
- Floating-point and integer instructions provide a means of producing either a scalar or a vector mask based on a comparison in a SIMD and floating-point register, for example [FCMEQ](#).

Note

[FCMP](#) and [FCMPE](#) differ from the A32/T32 [VCMP](#) and [VCMPE](#) instructions, which use the dedicated [FPSCR.NZCV](#) field for the result. A64 instructions store the result of an [FCMP](#) or [FCMPE](#) operation in the [PSTATE](#).{N, Z, C, V} field.

If [FEAT_FlagM2](#) is implemented, base instructions [XAFLAG](#) and [AXFLAG](#) convert between the [PSTATE](#) condition flag format used by the [FCMP](#) instruction and an alternative format. See [Table C6-1](#) on [page C6-874](#).

C7.2 Alphabetical list of A64 Advanced SIMD and floating-point instructions

This section lists every section in the Advanced SIMD and floating-point categories of the A64 instruction set. For details of the format used, see [Structure of the A64 assembler language on page C1-195](#).

C7.2.1 ABS

Absolute value (vector). This instruction calculates the absolute value of each vector element in the source SIMD&FP register, puts the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

ABS <V><d>, <V><n>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size != '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean neg = (U == '1');
```

Vector

Encoding

ABS <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean neg = (U == '1');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

D when size = 11

The following encodings are reserved:

- size = 0x.

- size = 10.
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
integer element;

for e = 0 to elements-1
    element = SInt(Elem[operand, e, esize]);
    if neg then
        element = -element;
    else
        element = Abs(element);
    Elem[result, e, esize] = element<size-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.2 ADD (vector)

Add (vector). This instruction adds corresponding elements in the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

ADD <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size != '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean sub_op = (U == '1');
```

Vector

Encoding

ADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean sub_op = (U == '1');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

D when size = 11

The following encodings are reserved:

- size = 0x.

- size = 10.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    if sub_op then
        Elem[result, e, esize] = element1 - element2;
    else
        Elem[result, e, esize] = element1 + element2;

V[d] = result;
    
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.3 ADDHN, ADDHN2

Add returning High Narrow. This instruction adds each vector element in the first source SIMD&FP register to the corresponding vector element in the second source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register.

The results are truncated. For rounded results, see [RADDHN](#), [RADDHN2](#).

The ADDHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the ADDHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

ADDHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean round = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8H | when size = 00 |
| 4S | when size = 01 |
| 2D | when size = 10 |
- The encoding size = 11 is reserved.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n];
bits(2*datasize) operand2 = V[m];
bits(datasize) result;
integer round_const = if round then 1 << (esize - 1) else 0;
bits(2*esize) element1;
bits(2*esize) element2;
bits(2*esize) sum;

for e = 0 to elements-1
    element1 = Elem[operand1, e, 2*esize];
    element2 = Elem[operand2, e, 2*esize];
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    sum = sum + round_const;
    Elem[result, e, esize] = sum<2*esize-1:esize>;

Vpart[d, part] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.4 ADDP (scalar)

Add Pair of elements (scalar). This instruction adds two vector elements in the source SIMD&FP register and writes the scalar result into the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9			5	4			0
0	1	0	1	1	1	1	0	size	1	1	0	0	0	1	1	0	1	1	1	0				Rn					Rd

Encoding

ADDP <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size != '11' then UNDEFINED;

integer esize = 8 << UInt(size);
integer datasize = esize * 2;
```

Assembler symbols

- <V> Is the destination width specifier, encoded in the "size" field. It can have the following values:
- D when size = 11
- The following encodings are reserved:
- size = 0x.
 - size = 10.
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <T> Is the source arrangement specifier, encoded in the "size" field. It can have the following values:
- 2D when size = 11
- The following encodings are reserved:
- size = 0x.
 - size = 10.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
V[d] = Reduce(ReduceOp_ADD, operand, esize);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.5 ADDP (vector)

Add Pairwise (vector). This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements from the concatenated vector, adds each pair of values together, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

ADDP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1
 - 2D when size = 11, Q = 1
 The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
bits(esize) element1;
bits(esize) element2;
```

```
for e = 0 to elements-1
  element1 = Elem[concat, 2*e, esize];
  element2 = Elem[concat, (2*e)+1, esize];
  Elem[result, e, esize] = element1 + element2;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.6 ADDV

Add across Vector. This instruction adds every vector element in the source SIMD&FP register together, and writes the scalar result to the destination SIMD&FP register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4				0
0	Q	0	0	1	1	1	0	size	1	1	0	0	0	1	1	0	1	1	1	0	0				Rn						Rd

Encoding

ADDV <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '100' then UNDEFINED;
if size == '11' then UNDEFINED;

integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

- <V> Is the destination width specifier, encoded in the "size" field. It can have the following values:
- | | |
|---|----------------|
| B | when size = 00 |
| H | when size = 01 |
| S | when size = 10 |
- The encoding size = 11 is reserved.
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 4S | when size = 10, Q = 1 |
- The following encodings are reserved:
- size = 10, Q = 0.
 - size = 11, Q = x.

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
V[d] = Reduce(ReduceOp_ADD, operand, esize);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.7 AESD

AES single round decryption.

Encoding

AESD <Vd>.16B, <Vn>.16B

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HaveAESExt() then UNDEFINED;
```

Assembler symbols

<Vd> Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.

<Vn> Is the name of the second SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) operand1 = V[d];
bits(128) operand2 = V[n];
bits(128) result;
result = operand1 EOR operand2;
result = AESInvSubBytes(AESInvShiftRows(result));
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.8 AESE

AES single round encryption.

Encoding

AESE <Vd>.16B, <Vn>.16B

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HaveAEEExt() then UNDEFINED;
```

Assembler symbols

<Vd> Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.
 <Vn> Is the name of the second SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) operand1 = V[d];
bits(128) operand2 = V[n];
bits(128) result;
result = operand1 EOR operand2;
result = AESSubBytes(AESShiftRows(result));

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.9 AESIMC

AES inverse mix columns.

Encoding

AESIMC <Vd>.16B, <Vn>.16B

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HaveAESExt() then UNDEFINED;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) operand = V[n];
bits(128) result;
result = AESInvMixColumns(operand);
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.10 AESMC

AES mix columns.

Encoding

AESMC <Vd>.16B, <Vn>.16B

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HaveAESEExt() then UNDEFINED;
```

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
 <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) operand = V[n];
bits(128) result;
result = AESMixColumns(operand);
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.11 AND (vector)

Bitwise AND (vector). This instruction performs a bitwise AND between the two source SIMD&FP registers, and writes the result to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

AND <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|-----|------------|
| 8B | when Q = 0 |
| 16B | when Q = 1 |
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

result = operand1 AND operand2;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.

— The values of the NZCV flags.

C7.2.12 BCAX

Bit Clear and Exclusive OR performs a bitwise AND of the 128-bit vector in a source SIMD&FP register and the complement of the vector in another source SIMD&FP register, then performs a bitwise exclusive OR of the resulting vector and the vector in a third source SIMD&FP register, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when [FEAT_SHA3](#) is implemented.

Advanced SIMD

(FEAT_SHA3)

Encoding

BCAX <Vd>.16B, <Vn>.16B, <Vm>.16B, <Va>.16B

Decode for this encoding

```
if !HaveSHA3Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
- <Va> Is the name of the third SIMD&FP source register, encoded in the "Ra" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) Vm = V[m];
bits(128) Vn = V[n];
bits(128) Va = V[a];
V[d] = Vn EOR (Vm AND NOT(Va));
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.

— The values of the NZCV flags.

C7.2.13 BFCVT

Floating-point convert from single-precision to BFloat16 format (scalar) converts the single-precision floating-point value in the 32-bit SIMD&FP source register to BFloat16 format and writes the result in the 16-bit SIMD&FP destination register.

Unlike the BFloat16 multiplication instructions, this instruction honors all the control bits in the [FPCR](#) that apply to single-precision arithmetic, including the rounding mode. This instruction can generate a floating-point exception that causes a cumulative exception bit in the [FPSR](#) to be set, or a synchronous exception to be taken, depending on the enable bits in the [FPCR.ID_AA64ISARI_EL1.BF16](#).BF16 indicates whether this instruction is supported.

Single-precision to BFloat16

(FEAT_BF16)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	5 4			0
0	0	0	1	1	1	1	0	0	1	1	0	0	0	1	1	0	1	0	0	0	0	Rn			Rd	

Encoding

BFCVT <Hd>, <Sn>

Decode for this encoding

```
if !HaveBF16Ext() then UNDEFINED;
integer n = UInt(Rn);
integer d = UInt(Rd);
```

Assembler symbols

<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();

bits(32) operand = V[n];
FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[d] else Zeros();

Elem[result, 0, 16] = FPConvertBF(operand, fpcr);

V[d] = result;
```

C7.2.14 BFCVTN, BFCVTN2

Floating-point convert from single-precision to BFloat16 format (vector) reads each single-precision element in the SIMD&FP source vector, converts each value to BFloat16 format, and writes the results in the lower or upper half of the SIMD&FP destination vector. The result elements are half the width of the source elements.

The BFCVTN instruction writes the half-width results to the lower half of the destination vector and clears the upper half to zero, while the BFCVTN2 instruction writes the results to the upper half of the destination vector without affecting the other bits in the register.

Unlike the BFloat16 multiplication instructions, this instruction honors all of the control bits in the **FPCR** that apply to single-precision arithmetic, including the rounding mode. It can also generate a floating-point exception that causes cumulative exception bits in the **FPSR** to be set, or a synchronous exception to be taken, depending on the enable bits in the **FPCR**.

Vector single-precision to BFloat16

(FEAT_BF16)

Encoding

BFCVTN{2} <Vd>.<Ta>, <Vn>.4S

Decode for this encoding

```
if !HaveBF16Ext() then UNDEFINED;
integer n = UInt(Rn);
integer d = UInt(Rd);
integer part = UInt(Q);
integer elements = 64 DIV 16;
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
 [present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

4H when Q = 0
 8H when Q = 1

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(128) operand = V[n];
bits(64) result;

for e = 0 to elements-1
    Elem[result, e, 16] = FPConvertBF(Elem[operand, e, 32], FPCR[]);
```

```
Vpart[d, part] = result;
```

C7.2.15 BFDOT (by element)

BFloat16 floating-point dot product (vector, by element). This instruction delimits the source vectors into pairs of 16-bit BF16 elements. Each pair of elements in the first source vector is multiplied by the specified pair of elements in the second source vector. The resulting single-precision products are then summed and added destructively to the single-precision element of the destination vector that aligns with the pair of BF16 values in the first source vector. The instruction ignores the [FPCR](#) and does not update the [FPSR](#) exception status.

The BF16 pair within the second source vector is specified using an immediate index. The index range is from 0 to 3 inclusive. [ID_AA64ISARI_EL1.BF16](#) indicates whether this instruction is supported.

Vector

(FEAT_BF16)

Encoding

BFDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.#H[<index>]

Decode for this encoding

```

if !HaveBF16Ext() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(M:Rm);
integer d = UInt(Rd);
integer i = UInt(H:L);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 32;
    
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 2S when Q = 0
 - 4S when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 4H when Q = 0
 - 8H when Q = 1
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.
- <index> Is the immediate index of a pair of 16-bit elements in the range 0 to 3, encoded in the "H:L" fields.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(128) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
    
```

for e = 0 to elements-1

```
bits(16) elt1_a = Elem[operand1, 2*e+0, 16];
bits(16) elt1_b = Elem[operand1, 2*e+1, 16];
bits(16) elt2_a = Elem[operand2, 2*i+0, 16];
bits(16) elt2_b = Elem[operand2, 2*i+1, 16];

bits(32) sum = Elem[operand3, e, 32];
sum = BFDotAdd(sum, elt1_a, elt1_b, elt2_a, elt2_b, FPCR[]);
Elem[result, e, 32] = sum;

V[d] = result;
```

C7.2.16 BFDOT (vector)

BFLOAT16 floating-point dot product (vector). This instruction delimits the source vectors into pairs of 16-bit BF16 elements. Within each pair, the elements in the first source vector are multiplied by the corresponding elements in the second source vector. The resulting single-precision products are then summed and added destructively to the single-precision element of the destination vector that aligns with the pair of BF16 values in the first source vector. The instruction ignores the **FPCR** and does not update the **FPSR** exception status.

Vector

```

C7.2.17 BFMLALB, BFMLALT (by element)

BFLOAT16 floating-point widening multiply-add long (by element) widens the even-numbered (bottom) or odd-numbered (top) 16-bit elements in the first source vector, and the indexed element in the second source vector from Bfloat16 to single-precision format. The instruction then multiplies and adds these values to the overlapping single-precision elements of the destination vector.

This performs a fused multiply-add without intermediate rounding that honors all of the control bits in the [FPCR](#) that apply to single-precision arithmetic, including the rounding mode. It can also generate a floating-point exception that causes cumulative exception bits in the [FPSR](#) to be set, or a synchronous exception to be taken, depending on the enable bits in the [FPCR.ID_AA64ISAR1_EL1.BF16](#) indicates whether this instruction is supported.

Vector

(FEAT_BF16)

Encoding

BFMLAL<bt> <Vd>.4S, <Vn>.8H, <Vm>.H[<index>]

Decode for this encoding

```
if !HaveBF16Ext() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt('0':Rm);
integer d = UInt(Rd);
integer index = UInt(H:L:M);

integer elements = 128 DIV 32;
integer sel = UInt(Q);
```

Assembler symbols

- <bt> Is the bottom or top element specifier, encoded in the "Q" field. It can have the following values:

B	when Q = 0
T	when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, in the range V0 to V15, encoded in the "Rm" field.
- <index> Is the element index, in the range 0 to 7, encoded in the "H:L:M" fields.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(128) result;
bits(128) operand1 = V[n];
bits(128) operand2 = V[m];
bits(128) operand3 = V[d];
bits(32) element2 = Elem[operand2, index, 16]:Zeros(16);
```

```
for e = 0 to elements-1
  bits(32) element1 = Elem[operand1, 2*e+se1, 16]:Zeros(16);
  bits(32) addend = Elem[operand3, e, 32];
  Elem[result, e, 32] = BFMu1Add(addend, element1, element2, FPCR[]);

V[d] = result;
```

C7.2.18 BFMLALB, BFMLALT (vector)

BFloat16 floating-point widening multiply-add long (vector) widens the even-numbered (bottom) or odd-numbered (top) 16-bit elements in the first and second source vectors from Bfloat16 to single-precision format. The instruction then multiplies and adds these values to the overlapping single-precision elements of the destination vector.

This performs a fused multiply-add without intermediate rounding that honors all of the control bits in the [FPCR](#) that apply to single-precision arithmetic, including the rounding mode. It can also generate a floating-point exception that causes cumulative exception bits in the [FPSR](#) to be set, or a synchronous exception to be taken, depending on the enable bits in the [FPCR](#). [ID_AA64ISAR1_EL1.BF16](#) indicates whether these instruction is supported.

Vector

(FEAT_BF16)

Encoding

BFMLAL<bt> <Vd>.4S, <Vn>.8H, <Vm>.8H

Decode for this encoding

```

if !HaveBF16Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer elements = 128 DIV 32;
integer sel = UInt(Q);
    
```

Assembler symbols

- <bt> Is the bottom or top element specifier, encoded in the "Q" field. It can have the following values:
 - B when Q = 0
 - T when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(128) operand1 = V[n];
bits(128) operand2 = V[m];
bits(128) operand3 = V[d];
bits(128) result;

for e = 0 to elements-1
    bits(32) element1 = Elem[operand1, 2*e+sel, 16]:Zeros(16);
    bits(32) element2 = Elem[operand2, 2*e+sel, 16]:Zeros(16);
    bits(32) addend = Elem[operand3, e, 32];
    Elem[result, e, 32] = BFMu1Add(addend, element1, element2, FPCR[]);
    
```

V[d] = result;

C7.2.19 BFMMLA

BFLOAT16 floating-point matrix multiply-accumulate into 2x2 matrix. This instruction multiplies the 2x4 matrix of BF16 values held in the first 128-bit source vector by the 4x2 BF16 matrix in the second 128-bit source vector. The resulting 2x2 single-precision matrix product is then added destructively to the 2x2 single-precision matrix in the 128-bit destination vector. This is equivalent to performing a 4-way dot product per destination element. The instruction ignores the **FPCR** and does not update the **FPSR** exception status.

———— **Note** —————

Arm expects that the BFMMLA instruction will deliver a peak BF16 multiply throughput that is at least as high as can be achieved using two BFDOT instructions, with a goal that it should have significantly higher throughput.

Vector

(FEAT_BF16)

Encoding

BFMMLA <Vd>.4S, <Vn>.8H, <Vm>.8H

Decode for this encoding

```
if !HaveBF16Ext() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(128) op1 = V[n];
bits(128) op2 = V[m];
bits(128) acc = V[d];

V[d] = BFMatMulAdd(acc, op1, op2);
```

C7.2.20 BIC (vector, immediate)

Bitwise bit Clear (vector, immediate). This instruction reads each vector element from the destination SIMD&FP register, performs a bitwise AND between each result and the complement of an immediate constant, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

16-bit variant

Applies when cmode == 10x1.

BIC <Vd>.<T>, #<imm8>{, LSL #<amount>}

32-bit variant

Applies when cmode == 0xx1.

BIC <Vd>.<T>, #<imm8>{, LSL #<amount>}

Decode for all variants of this encoding

```
integer rd = UInt(Rd);

integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

ImmediateOp operation;
case cmode:op of
    when '0xx01' operation = ImmediateOp_MVNI;
    when '0xx11' operation = ImmediateOp_BIC;
    when '10x01' operation = ImmediateOp_MVNI;
    when '10x11' operation = ImmediateOp_BIC;
    when '110x1' operation = ImmediateOp_MVNI;
    when '1110x' operation = ImmediateOp_MOVI;
    when '11111'
        // FMOV Dn,#imm is in main FP instruction set
        if Q == '0' then UNDEFINED;
        operation = ImmediateOp_MOVI;

imm64 = AdvSIMDExpandImm(op, cmode, a:b:c:d:e:f:g:h);
imm = Replicate(imm64, datasize DIV 64);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP register, encoded in the "Rd" field.
- <T> For the 16-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|----|------------|
| 4H | when Q = 0 |
| 8H | when Q = 1 |

	For the 32-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
	2S when Q = 0
	4S when Q = 1
<imm8>	Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".
<amount>	For the 16-bit variant: is the shift amount encoded in the "cmode<1>" field. It can have the following values:
	0 when cmode<1> = 0
	8 when cmode<1> = 1
	defaulting to 0 if LSL is omitted.
	For the 32-bit variant: is the shift amount encoded in the "cmode<2:1>" field. It can have the following values:
	0 when cmode<2:1> = 00
	8 when cmode<2:1> = 01
	16 when cmode<2:1> = 10
	24 when cmode<2:1> = 11
	defaulting to 0 if LSL is omitted.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand;
bits(datasize) result;

case operation of
  when ImmediateOp_MOVI
    result = imm;
  when ImmediateOp_MVNI
    result = NOT(imm);
  when ImmediateOp_ORR
    operand = V[rd];
    result = operand OR imm;
  when ImmediateOp_BIC
    operand = V[rd];
    result = operand AND NOT(imm);

V[rd] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.21 BIC (vector, register)

Bitwise bit Clear (vector, register). This instruction performs a bitwise AND between the first source SIMD&FP register and the complement of the second source SIMD&FP register, and writes the result to the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

BIC <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

operand2 = NOT(operand2);

result = operand1 AND operand2;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.22 BIF

Bitwise Insert if False. This instruction inserts each bit from the first source SIMD&FP register into the destination SIMD&FP register if the corresponding bit of the second source SIMD&FP register is 0, otherwise leaves the bit in the destination register unchanged.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

BIF <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1;
bits(datasize) operand3;
bits(datasize) operand4 = V[n];

operand1 = V[d];
operand3 = NOT(V[m]);

V[d] = operand1 EOR ((operand1 EOR operand4) AND operand3);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.23 BIT

Bitwise Insert if True. This instruction inserts each bit from the first source SIMD&FP register into the SIMD&FP destination register if the corresponding bit of the second source SIMD&FP register is 1, otherwise leaves the bit in the destination register unchanged.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

BIT <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1;
bits(datasize) operand3;
bits(datasize) operand4 = V[n];

operand1 = V[d];
operand3 = V[m];
V[d] = operand1 EOR ((operand1 EOR operand4) AND operand3);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.24 BSL

Bitwise Select. This instruction sets each bit in the destination SIMD&FP register to the corresponding bit from the first source SIMD&FP register when the original destination bit was 1, otherwise from the second source SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

BSL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

8B	when Q = 0
16B	when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1;
bits(datasize) operand3;
bits(datasize) operand4 = V[n];

operand1 = V[m];
operand3 = V[d];
V[d] = operand1 EOR ((operand1 EOR operand4) AND operand3);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.25 CLS (vector)

Count Leading Sign bits (vector). This instruction counts the number of consecutive bits following the most significant bit that are the same as the most significant bit in each vector element in the source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. The count does not include the most significant bit itself.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

CLS <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

CountOp countop = if U == '1' then CountOp_CLZ else CountOp_CLS;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

integer count;
for e = 0 to elements-1
    if countop == CountOp_CLS then
        count = CountLeadingSignBits(Elem[operand, e, esize]);
    else
```

```
count = CountLeadingZeroBits(Elem[operand, e, esize]);  
Elem[result, e, esize] = count<esize-1:0>;  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.26 CLZ (vector)

Count Leading Zero bits (vector). This instruction counts the number of consecutive zeros, starting from the most significant bit, in each vector element in the source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

CLZ <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

CountOp countop = if U == '1' then CountOp_CLZ else CountOp_CLS;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

integer count;
for e = 0 to elements-1
    if countop == CountOp_CLS then
        count = CountLeadingSignBits(Elem[operand, e, esize]);
    else
        count = CountLeadingZeroBits(Elem[operand, e, esize]);
```

```
Elem[result, e, esize] = count<esize-1:0>;  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.27 CMEQ (register)

Compare bitwise Equal (vector). This instruction compares each vector element from the first source SIMD&FP register with the corresponding vector element from the second source SIMD&FP register, and if the comparison is equal sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

CMEQ <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size != '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean and_test = (U == '0');
```

Vector

Encoding

CMEQ <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean and_test = (U == '0');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:
 D when size = 11

The following encodings are reserved:

- size = 0x.
- size = 10.

- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
boolean test_passed;

for e = 0 to elements-1
  element1 = Elem[operand1, e, esize];
  element2 = Elem[operand2, e, esize];
  if and_test then
    test_passed = !IsZero(element1 AND element2);
  else
    test_passed = (element1 == element2);
  Elem[result, e, esize] = if test_passed then Ones() else Zeros();

V[d] = result;
  
```

Operational information

If PSTATE.DIT is 1:

 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.34 CMHS (register)

Compare unsigned Higher or Same (vector). This instruction compares each vector element in the first source SIMD&FP register with the corresponding vector element in the second source SIMD&FP register and if the first unsigned integer value is greater than or equal to the second unsigned integer value sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

CMHS <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size != '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
boolean cmp_eq = (eq == '1');
```

Vector

Encoding

CMHS <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
boolean cmp_eq = (eq == '1');
```

Assembler symbols

- <V> Is a width specifier, encoded in the "size" field. It can have the following values:
- D when size = 11
- The following encodings are reserved:
- size = 0x.
 - size = 10.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1
 - 2D when size = 11, Q = 1
- The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
boolean test_passed;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    test_passed = if cmp_eq then element1 >= element2 else element1 > element2;
    Elem[result, e, esize] = if test_passed then Ones() else Zeros();

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.35 CMLE (zero)

Compare signed Less than or Equal to zero (vector). This instruction reads each vector element in the source SIMD&FP register and if the signed integer value is less than or equal to zero sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

CMLE <V><d>, <V><n>, #0

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size != '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;

CompareOp comparison;
case op:U of
    when '00' comparison = CompareOp_GT;
    when '01' comparison = CompareOp_GE;
    when '10' comparison = CompareOp_EQ;
    when '11' comparison = CompareOp_LE;
```

Vector

Encoding

CMLE <Vd>.<T>, <Vn>.<T>, #0

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

CompareOp comparison;
case op:U of
    when '00' comparison = CompareOp_GT;
```

```
when '01' comparison = CompareOp_GE;
when '10' comparison = CompareOp_EQ;
when '11' comparison = CompareOp_LE;
```

Assembler symbols

- <V> Is a width specifier, encoded in the "size" field. It can have the following values:
- D when size = 11
- The following encodings are reserved:
- size = 0x.
 - size = 10.
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

    Elem[result, e, esize] = if test_passed then Ones() else Zeros();

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.37 CMTST

Compare bitwise Test bits nonzero (vector). This instruction reads each vector element in the first source SIMD&FP register, performs an AND with the corresponding vector element in the second source SIMD&FP register, and if the result is not zero, sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

CMTST <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size != '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean and_test = (U == '0');
```

Vector

Encoding

CMTST <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean and_test = (U == '0');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:
 D when size = 11

The following encodings are reserved:

- size = 0x.
- size = 10.

- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

  if and_test then
    test_passed = !IsZero(element1 AND element2);
  else
    test_passed = (element1 == element2);
  Elem[result, e, esize] = if test_passed then Ones() else Zeros();

V[d] = result;
  
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.38 CNT

Population Count per byte. This instruction counts the number of bits that have a value of one in each vector element in the source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4				0			
0	Q	0	0	1	1	1	0	size	1	0	0	0	0	0	0	0	1	0	1	1	0										Rn			Rd

Encoding

CNT <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size != '00' then UNDEFINED;
integer esize = 8;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 8;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
- The following encodings are reserved:
- size = 01, Q = x.
 - size = 1x, Q = x.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

integer count;
for e = 0 to elements-1
    count = BitCount(Elem[operand, e, esize]);
    Elem[result, e, esize] = count<esize-1:0>;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.39 DUP (element)

Duplicate vector element to vector or scalar. This instruction duplicates the vector element at the specified element index in the source SIMD&FP register into a scalar or each element in a vector, and writes the result to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias MOV (scalar). The alias is always the preferred disassembly.

Scalar

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0
0	1	0	0	1	1	1	1	0	0	0	0	imm5	0	0	0	0	0	1	Rn	Rd		

Encoding

DUP <V><d>, <Vn>.<T>[<index>]

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UNDEFINED;

integer index = UInt(imm5<4:size+1>);
integer idxsize = if imm5<4> == '1' then 128 else 64;

integer esize = 8 << size;
integer datasize = esize;
integer elements = 1;
```

Vector

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0
0	Q	0	0	1	1	1	0	0	0	0	0	imm5	0	0	0	0	0	1	Rn	Rd		

Encoding

DUP <Vd>.<T>, <Vn>.<Ts>[<index>]

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UNDEFINED;

integer index = UInt(imm5<4:size+1>);
integer idxsize = if imm5<4> == '1' then 128 else 64;

if size == 3 && Q == '0' then UNDEFINED;
integer esize = 8 << size;
```

```
integer datasize = if Q == '1' then 128 else 64;  
integer elements = datasize DIV esize;
```

Assembler symbols

- <T> For the scalar variant: is the element width specifier, encoded in the "imm5" field. It can have the following values:
- B when imm5 = xxxx1
 - H when imm5 = xxx10
 - S when imm5 = xx100
 - D when imm5 = x1000
- The encoding imm5 = x0000 is reserved.
- For the vector variant: is an arrangement specifier, encoded in the "imm5:Q" field. It can have the following values:
- 8B when imm5 = xxxx1, Q = 0
 - 16B when imm5 = xxxx1, Q = 1
 - 4H when imm5 = xxx10, Q = 0
 - 8H when imm5 = xxx10, Q = 1
 - 2S when imm5 = xx100, Q = 0
 - 4S when imm5 = xx100, Q = 1
 - 2D when imm5 = x1000, Q = 1
- The following encodings are reserved:
- imm5 = x0000, Q = x.
 - imm5 = x1000, Q = 0.
- <Ts> Is an element size specifier, encoded in the "imm5" field. It can have the following values:
- B when imm5 = xxxx1
 - H when imm5 = xxx10
 - S when imm5 = xx100
 - D when imm5 = x1000
- The encoding imm5 = x0000 is reserved.
- <V> Is the destination width specifier, encoded in the "imm5" field. It can have the following values:
- B when imm5 = xxxx1
 - H when imm5 = xxx10
 - S when imm5 = xx100
 - D when imm5 = x1000
- The encoding imm5 = x0000 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <index> Is the element index encoded in the "imm5" field. It can have the following values:
- imm5<4:1> when imm5 = xxxx1
 - imm5<4:2> when imm5 = xxx10
 - imm5<4:3> when imm5 = xx100
 - imm5<4> when imm5 = x1000
- The encoding imm5 = x0000 is reserved.
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(idxsize) operand = V[n];
bits(datasize) result;
bits(esize) element;

element = Elem[operand, index, esize];
for e = 0 to elements-1
    Elem[result, e, esize] = element;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.40 DUP (general)

Duplicate general-purpose register to vector. This instruction duplicates the contents of the source general-purpose register into a scalar or each element in a vector, and writes the result to the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

DUP <Vd>.<T>, <R><n>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UNDEFINED;

// imm5<4:size+1> is IGNORED

if size == 3 && Q == '0' then UNDEFINED;
integer esize = 8 << size;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "imm5:Q" field. It can have the following values:

8B	when imm5 = xxxx1, Q = 0
16B	when imm5 = xxxx1, Q = 1
4H	when imm5 = xxx10, Q = 0
8H	when imm5 = xxx10, Q = 1
2S	when imm5 = xx100, Q = 0
4S	when imm5 = xx100, Q = 1
2D	when imm5 = x1000, Q = 1

The following encodings are reserved:

- imm5 = x0000, Q = x.
- imm5 = x1000, Q = 0.

<R> Is the width specifier for the general-purpose source register, encoded in the "imm5" field. It can have the following values:

W	when imm5 = xxxx1
W	when imm5 = xxx10
W	when imm5 = xx100
X	when imm5 = x1000

The encoding `imm5 = x0000` is reserved.

Unspecified bits in "imm5" are ignored but should be set to zero by an assembler.

<n> Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(esize) element = X[n];
bits(datasize) result;

for e = 0 to elements-1
    Elem[result, e, esize] = element;
V[d] = result;
```

Operational information

If `PSTATE.DIT` is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.41 EOR (vector)

Bitwise Exclusive OR (vector). This instruction performs a bitwise Exclusive OR operation between the two source SIMD&FP registers, and places the result in the destination SIMD&FP register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

EOR <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1;
bits(datasize) operand2;
bits(datasize) operand3;
bits(datasize) operand4 = V[n];

operand1 = V[m];
operand2 = Zeros();
operand3 = Ones();
V[d] = operand1 EOR ((operand2 EOR operand4) AND operand3);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.42 EOR3

Three-way Exclusive OR performs a three-way exclusive OR of the values in the three source SIMD&FP registers, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when [FEAT_SHA3](#) is implemented.

Advanced SIMD

(FEAT_SHA3)

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	10	9	5	4	0
1	1	0	0	1	1	1	0	0	0	0	Rm	0	Ra	Rn	Rd				

Encoding

EOR3 <Vd>.16B, <Vn>.16B, <Vm>.16B, <Va>.16B

Decode for this encoding

```
if !HaveSHA3Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer a = UInt(Ra);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
- <Va> Is the name of the third SIMD&FP source register, encoded in the "Ra" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();
```

```
bits(128) Vm = V[m];
bits(128) Vn = V[n];
bits(128) Va = V[a];
V[d] = Vn EOR Vm EOR Va;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.43 EXT

Extract vector from pair of vectors. This instruction extracts the lowest vector elements from the second source SIMD&FP register and the highest vector elements from the first source SIMD&FP register, concatenates the results into a vector, and writes the vector to the destination SIMD&FP register vector. The index value specifies the lowest vector element to extract from the first source register, and consecutive elements are extracted from the first, then second, source registers until the destination vector is filled.

The following figure shows the operation of EXT doubleword operation for $Q = 0$ and $\text{imm4}\langle 2:0 \rangle = 3$.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

EXT $\langle Vd \rangle.\langle T \rangle$, $\langle Vn \rangle.\langle T \rangle$, $\langle Vm \rangle.\langle T \rangle$, $\#\langle \text{index} \rangle$

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if Q == '0' && imm4<3> == '1' then UNDEFINED;

integer datasize = if Q == '1' then 128 else 64;
integer position = UInt(imm4) << 3;
```

Assembler symbols

- $\langle Vd \rangle$ Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- $\langle T \rangle$ Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when $Q = 0$
 - 16B when $Q = 1$
- $\langle Vn \rangle$ Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- $\langle Vm \rangle$ Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
- $\langle \text{index} \rangle$ Is the lowest numbered byte element to be extracted, encoded in the "Q:imm4" field. It can have the following values:
 - $\text{imm4}\langle 2:0 \rangle$ when $Q = 0$, $\text{imm4}\langle 3 \rangle = 0$
 - imm4 when $Q = 1$, $\text{imm4}\langle 3 \rangle = x$

The encoding $Q = 0$, $\text{imm4} \langle 3 \rangle = 1$ is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) hi = V[m];  
bits(datasize) lo = V[n];  
bits(datasize*2) concat = hi:lo;  
  
V[d] = concat<position+datasize-1:position>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.44 FABD

Floating-point Absolute Difference (vector). This instruction subtracts the floating-point values in the elements of the second source SIMD&FP register, from the corresponding floating-point values in the elements of the first source SIMD&FP register, places the absolute value of each result in a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

integer elements = 1;
boolean abs = TRUE;
```

Vector half precision

(FEAT_FP16)

Encoding

FABD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean abs = (U == '1');
```

Vector single-precision and double-precision

Encoding

FABD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then UNDEFINED;
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean abs = (U == '1');
```

Assembler symbols

- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <V> Is a width specifier, encoded in the "sz" field. It can have the following values:
 - S when sz = 0
 - D when sz = 1
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.

- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
4H when Q = 0
8H when Q = 1
For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
2S when sz = 0, Q = 0
4S when sz = 0, Q = 1
2D when sz = 1, Q = 1
The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];

bits(esize) element1;
bits(esize) element2;
bits(esize) diff;
FPCRType fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[n] else Zeros();

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];

    diff = FPSub(element1, element2, fpcr);
    Elem[result, e, esize] = if abs then FPAbs(diff) else diff;

V[d] = result;
```

C7.2.45 FABS (vector)

Floating-point Absolute value (vector). This instruction calculates the absolute value of each vector element in the source SIMD&FP register, writes the result to a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FABS <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean neg = (U == '1');
```

Single-precision and double-precision

Encoding

FABS <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then UNDEFINED;
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean neg = (U == '1');
```

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
 - 8H when Q = 1
- For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
 - 4S when sz = 0, Q = 1
 - 2D when sz = 1, Q = 1
- The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    if neg then
        element = FPNeg(element);
    else
        element = FPAbs(element);
    Elem[result, e, esize] = element;

V[d] = result;
```

C7.2.46 FABS (scalar)

Floating-point Absolute value (scalar). This instruction calculates the absolute value in the SIMD&FP source register and writes the result to the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FABS <Hd>, <Hn>

Single-precision variant

Applies when ftype == 00.

FABS <Sd>, <Sn>

Double-precision variant

Applies when ftype == 01.

FABS <Dd>, <Dn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPEnabled64();  
  
FPCRTYPE fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[d] else Zeros();  
  
bits(esize) operand = V[n];  
  
Elem[result, 0, esize] = FPAbs(operand);  
V[d] = result;
```

C7.2.47 FACGE

Floating-point Absolute Compare Greater than or Equal (vector). This instruction compares the absolute value of each floating-point value in the first source SIMD&FP register with the absolute value of the corresponding floating-point value in the second source SIMD&FP register and if the first value is greater than or equal to the second value sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

  when '111' cmp = CompareOp_GT; abs = TRUE;
  otherwise UNDEFINED;
```

Assembler symbols

- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <V> Is a width specifier, encoded in the "sz" field. It can have the following values:
- | | |
|---|-------------|
| S | when sz = 0 |
| D | when sz = 1 |
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|----|------------|
| 4H | when Q = 0 |
| 8H | when Q = 1 |
- For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- | | |
|----|--------------------|
| 2S | when sz = 0, Q = 0 |
| 4S | when sz = 0, Q = 1 |
| 2D | when sz = 1, Q = 1 |
- The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];

bits(esize) element1;
bits(esize) element2;
boolean test_passed;
FPCRType fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[m] else Zeros();

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    if abs then
        element1 = FPAbs(element1);
        element2 = FPAbs(element2);
    case cmp of
        when CompareOp_EQ test_passed = FPCompareEQ(element1, element2, fpcr);
        when CompareOp_GE test_passed = FPCompareGE(element1, element2, fpcr);
        when CompareOp_GT test_passed = FPCompareGT(element1, element2, fpcr);
    Elem[result, e, esize] = if test_passed then Ones() else Zeros();

V[d] = result;
```

C7.2.49 FADD (vector)

Floating-point Add (vector). This instruction adds corresponding vector elements in the two source SIMD&FP registers, writes the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
```

Single-precision and double-precision

Encoding

FADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then UNDEFINED;
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
 - 8H when Q = 1
- For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
 - 4S when sz = 0, Q = 1
 - 2D when sz = 1, Q = 1
- The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1

integer esize = 32 << UInt(sz);
integer datasize = esize * 2;
```

Assembler symbols

<V> For the half-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:

H when sz = 0

The encoding `sz = 1` is reserved.

For the single-precision and double-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:

S when `sz = 0`

D when `sz = 1`

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> For the half-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:

2H when `sz = 0`

The encoding `sz = 1` is reserved.

For the single-precision and double-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:

2S when `sz = 0`

2D when `sz = 1`

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
V[d] = Reduce(ReduceOp_FADD, operand, esize);
```

C7.2.52 FADDP (vector)

Floating-point Add Pairwise (vector). This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements from the concatenated vector, adds each pair of values together, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FADDP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

bits(esize) element2;

for e = 0 to elements-1
    if pair then
        element1 = Elem[concat, 2*e, esize];
        element2 = Elem[concat, (2*e)+1, esize];
    else
        element1 = Elem[operand1, e, esize];
        element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPAAdd(element1, element2, FPCR[]);

V[d] = result;
```

C7.2.53 FCADD

Floating-point Complex Add.

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following computation on the corresponding complex number element pairs from the two source registers:

- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 90 or 270 degrees.
- The rotated complex number is added to the complex number from the first source register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Vector

(FEAT_FCMA)

Encoding

FCADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>, #<rotate>

Decode for this encoding

```

if !HaveFCADDExt() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '00' then UNDEFINED;
if Q == '0' && size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
if !HaveFP16Ext() && esize == 16 then UNDEFINED;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
    
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|----|-----------------------|
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The following encodings are reserved:
- size = 00, Q = x.

- size = 11, Q = 0.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
- <rotate> Is the rotation, encoded in the "rot" field. It can have the following values:
- | | |
|-----|--------------|
| 90 | when rot = 0 |
| 270 | when rot = 1 |

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
bits(esize) element1;
bits(esize) element3;

for e = 0 to (elements DIV 2)-1
  case rot of
    when '0'
      element1 = FPNeg(ElEm[operand2, e*2+1, esize]);
      element3 = ElEm[operand2, e*2, esize];
    when '1'
      element1 = ElEm[operand2, e*2+1, esize];
      element3 = FPNeg(ElEm[operand2, e*2, esize]);
  ElEm[result, e*2, esize] = FPAdd(ElEm[operand1, e*2, esize], element1, FPCR[]);
  ElEm[result, e*2+1, esize] = FPAdd(ElEm[operand1, e*2+1, esize], element3, FPCR[]);

V[d] = result;
```

C7.2.54 FCCMP

Floating-point Conditional quiet Compare (scalar). This instruction compares the two SIMD&FP source register values and writes the result to the `PSTATE`.{N, Z, C, V} flags. If the condition does not pass then the `PSTATE`.{N, Z, C, V} flags are set to the flag bit specifier.

This instruction raises an Invalid Operation floating-point exception if either or both of the operands is a signaling NaN.

A floating-point exception can be generated by this instruction. Depending on the settings in `FPCR`, the exception results in either a flag being set in `FPSR`, or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when `f`type == 11.

FCCMP <Hn>, <Hm>, #<nzc>, <cond>

Single-precision variant

Applies when `f`type == 00.

FCCMP <Sn>, <Sm>, #<nzc>, <cond>

Double-precision variant

Applies when `f`type == 01.

FCCMP <Dn>, <Dm>, #<nzc>, <cond>

Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case ftype of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            datasize = 16;
        else
            UNDEFINED;

bits(4) flags = nzc;
```

Assembler symbols

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<Hn>	Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Sn>	Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<nzcv>	Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field.
<cond>	Is one of the standard conditions, encoded in the "cond" field in the standard way.

Operation

```
CheckFPEnabled64();
```

```
bits(datasize) operand1 = V[n];  
bits(datasize) operand2;
```

```
operand2 = V[m];
```

```
if ConditionHolds(cond) then  
    flags = FPCompare(operand1, operand2, FALSE, FPCR[]);  
PSTATE.<N,Z,C,V> = flags;
```

Operational information

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands is a NaN, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. An unordered comparison sets the [PSTATE](#) condition flags to N=0, Z=0, C=1, and V=1.

C7.2.55 FCCMPE

Floating-point Conditional signaling Compare (scalar). This instruction compares the two SIMD&FP source register values and writes the result to the `PSTATE`. {N, Z, C, V} flags. If the condition does not pass then the `PSTATE`. {N, Z, C, V} flags are set to the flag bit specifier.

This instruction raises an Invalid Operation floating-point exception if either or both of the operands is any type of NaN.

A floating-point exception can be generated by this instruction. Depending on the settings in `FPCR`, the exception results in either a flag being set in `FPSR`, or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps on page D1-2495*.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when `f`type == 11.

FCCMPE <Hn>, <Hm>, #<nzc>, <cond>

Single-precision variant

Applies when `f`type == 00.

FCCMPE <Sn>, <Sm>, #<nzc>, <cond>

Double-precision variant

Applies when `f`type == 01.

FCCMPE <Dn>, <Dm>, #<nzc>, <cond>

Decode for all variants of this encoding

```
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize;
case ftype of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            datasize = 16;
        else
            UNDEFINED;

bits(4) flags = nzc;
```

Assembler symbols

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<Hn>	Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Sn>	Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<nzcv>	Is the flag bit specifier, an immediate in the range 0 to 15, giving the alternative state for the 4-bit NZCV condition flags, encoded in the "nzcv" field.
<cond>	Is one of the standard conditions, encoded in the "cond" field in the standard way.

Operation

```
CheckFPEnabled64();
```

```
bits(datasize) operand1 = V[n];  
bits(datasize) operand2;
```

```
operand2 = V[m];
```

```
if ConditionHolds(cond) then  
    flags = FPCompare(operand1, operand2, TRUE, FPCR[]);  
PSTATE.<N,Z,C,V> = flags;
```

Operational information

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands is a NaN, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. An unordered comparison sets the [PSTATE](#) condition flags to N=0, Z=0, C=1, and V=1.

C7.2.56 FCMEQ (register)

Floating-point Compare Equal (vector). This instruction compares each floating-point value from the first source SIMD&FP register, with the corresponding floating-point value from the second source SIMD&FP register, and if the comparison is equal sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.61 FCMGT (zero)

Floating-point Compare Greater than zero (vector). This instruction reads each floating-point value in the source SIMD&FP register and if the value is greater than zero sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

C7.2.62 FCMLA (by element)

Floating-point Complex Multiply Accumulate (by element).

This instruction operates on complex numbers that are represented in SIMD&FP registers as pairs of elements, with the more significant element holding the imaginary part of the number and the less significant element holding the real part of the number. Each element holds a floating-point value. It performs the following computation on complex numbers from the first source register and the destination register with the specified complex number from the second source register:

- Considering the complex number from the second source register on an Argand diagram, the number is rotated counterclockwise by 0, 90, 180, or 270 degrees.
- The two elements of the transformed complex number are multiplied by:
 - The real element of the complex number from the first source register, if the transformation was a rotation by 0 or 180 degrees.
 - The imaginary element of the complex number from the first source register, if the transformation was a rotation by 90 or 270 degrees.
- The complex number resulting from that multiplication is added to the complex number from the destination register.

The multiplication and addition operations are performed as a fused multiply-add, without any intermediate rounding.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

    when CompareOp_LT test_passed = FPCompareLT(zero, element, FPCR[]);
  Elem[result, e, esize] = if test_passed then Ones() else Zeros();

V[d] = result;
```

C7.2.65 FCMLT (zero)

Floating-point Compare Less than zero (vector). This instruction reads each floating-point value in the source SIMD&FP register and if the value is less than zero sets every bit of the corresponding vector element in the destination SIMD&FP register to one, otherwise sets every bit of the corresponding vector element in the destination SIMD&FP register to zero.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

V[d] = result;
```

C7.2.66 FCMP

Floating-point quiet Compare (scalar). This instruction compares the two SIMD&FP source register values, or the first SIMD&FP source register value and zero. It writes the result to the `PSTATE`.{N, Z, C, V} flags.

This instruction raises an Invalid Operation floating-point exception if either or both of the operands is a signaling NaN.

A floating-point exception can be generated by this instruction. Depending on the settings in `FPCR`, the exception results in either a flag being set in `FPSR`, or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps on page D1-2495*.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

- <Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPEnabled64();

bits(datasize) operand1 = V[n];
bits(datasize) operand2;

operand2 = if cmp_with_zero then FPZero('0') else V[m];

PSTATE.<N,Z,C,V> = FPCompare(operand1, operand2, signal_all_nans, FPCR[]);
```

Operational information

The IEEE 754 standard specifies that the result of a comparison is precisely one of <, ==, > or unordered. If either or both of the operands is a NaN, they are unordered, and all three of (Operand1 < Operand2), (Operand1 == Operand2) and (Operand1 > Operand2) are false. An unordered comparison sets the **PSTATE** condition flags to N=0, Z=0, C=1, and V=1.

C7.2.67 FCMPE

Floating-point signaling Compare (scalar). This instruction compares the two SIMD&FP source register values, or the first SIMD&FP source register value and zero. It writes the result to the `PSTATE`.{N, Z, C, V} flags.

This instruction raises an Invalid Operation floating-point exception if either or both of the operands is any type of NaN.

A floating-point exception can be generated by this instruction. Depending on the settings in `FPCR`, the exception results in either a flag being set in `FPSR`, or a synchronous exception being generated. For more information, see *Floating-point exceptions and exception traps on page D1-2495*.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```
CheckFPEnabled64();  
bits(datasize) result;  
  
result = if ConditionHolds(cond) then V[n] else V[m];  
  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.69 FCVT

Floating-point Convert precision (scalar). This instruction converts the floating-point value in the SIMD&FP source register to the precision for the destination register data type using the rounding mode that is determined by the [FPCR](#) and writes the result to the SIMD&FP destination register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

FPCRTYPE fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[d] else Zeros();

Elem[result, 0, dstsize] = FPConvert(operand, fpcr);

V[d] = result;
```

C7.2.70 FCVTAS (vector)

Floating-point Convert to Signed integer, rounding to nearest with ties to Away (vector). This instruction converts each element in a vector from a floating-point value to a signed integer value using the Round to Nearest with Ties to Away rounding mode and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, fpcr, rounding);

V[d] = result;
```

C7.2.71 FCVTAS (scalar)

Floating-point Convert to Signed integer, rounding to nearest with ties to Away (scalar). This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit signed integer using the Round to Nearest with Ties to Away rounding mode, and writes the result to the general-purpose destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision to 32-bit variant

Applies when sf == 0 && ftype == 11.

FCVTAS <Wd>, <Hn>

Half-precision to 64-bit variant

Applies when sf == 1 && ftype == 11.

FCVTAS <Xd>, <Hn>

Single-precision to 32-bit variant

Applies when sf == 0 && ftype == 00.

FCVTAS <Wd>, <Sn>

Single-precision to 64-bit variant

Applies when sf == 1 && ftype == 00.

FCVTAS <Xd>, <Sn>

Double-precision to 32-bit variant

Applies when sf == 0 && ftype == 01.

FCVTAS <Wd>, <Dn>

Double-precision to 64-bit variant

Applies when sf == 1 && ftype == 01.

FCVTAS <Xd>, <Dn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer intsize = if sf == '1' then 64 else 32;
integer fltsize;

case ftype of
```

```
when '00'  
    fltsize = 32;  
when '01'  
    fltsize = 64;  
when '10'  
    UNDEFINED;  
when '11'  
    if HaveFP16Ext() then  
        fltsize = 16;  
    else  
        UNDEFINED;
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPEnabled64();
```

```
FPCRType fpcr = FPCR[];  
bits(fltsize) fltval;  
bits(intsize) intval;
```

```
fltval = V[n];  
intval = FPToFixed(fltval, 0, FALSE, fpcr, FPRounding_TIEAWAY);  
X[d] = intval;
```

C7.2.72 FCVTAU (vector)

Floating-point Convert to Unsigned integer, rounding to nearest with ties to Away (vector). This instruction converts each element in a vector from a floating-point value to an unsigned integer value using the Round to Nearest with Ties to Away rounding mode and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar half precision

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
 - 8H when Q = 1
- For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
 - 4S when sz = 0, Q = 1
 - 2D when sz = 1, Q = 1
- The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];

bits(esize) element;
FPCRType fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[d] else Zeros();

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, fpcr, rounding);

V[d] = result;
```

C7.2.73 FCVTAU (scalar)

Floating-point Convert to Unsigned integer, rounding to nearest with ties to Away (scalar). This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit unsigned integer using the Round to Nearest with Ties to Away rounding mode, and writes the result to the general-purpose destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision to 32-bit variant

Applies when sf == 0 && ftype == 11.

FCVTAU <Wd>, <Hn>

Half-precision to 64-bit variant

Applies when sf == 1 && ftype == 11.

FCVTAU <Xd>, <Hn>

Single-precision to 32-bit variant

Applies when sf == 0 && ftype == 00.

FCVTAU <Wd>, <Sn>

Single-precision to 64-bit variant

Applies when sf == 1 && ftype == 00.

FCVTAU <Xd>, <Sn>

Double-precision to 32-bit variant

Applies when sf == 0 && ftype == 01.

FCVTAU <Wd>, <Dn>

Double-precision to 64-bit variant

Applies when sf == 1 && ftype == 01.

FCVTAU <Xd>, <Dn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer intsize = if sf == '1' then 64 else 32;
integer fltsize;

case ftype of
```

```
when '00'  
    fltsize = 32;  
when '01'  
    fltsize = 64;  
when '10'  
    UNDEFINED;  
when '11'  
    if HaveFP16Ext() then  
        fltsize = 16;  
    else  
        UNDEFINED;
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPEnabled64();
```

```
FPCRType fpcr = FPCR[];  
bits(fltsize) fltval;  
bits(intsize) intval;
```

```
fltval = V[n];  
intval = FPToFixed(fltval, 0, TRUE, fpcr, FPRounding_TIEAWAY);  
X[d] = intval;
```

C7.2.74 FCVTL, FCVTL2

Floating-point Convert to higher precision Long (vector). This instruction reads each element in a vector in the SIMD&FP source register, converts each value to double the precision of the source element using the rounding mode that is determined by the [FPCR](#), and writes each result to the equivalent element of the vector in the SIMD&FP destination register.

Where the operation lengthens a 64-bit vector to a 128-bit vector, the FCVTL2 variant operates on the elements in the top 64 bits of the source register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	5 4			0
0	Q	0	0	1	1	1	0	0	sz	1	0	0	0	0	1	0	1	1	1	1	0	Rn			Rd	

Encoding

FCVTL{2} <Vd>.<Ta>, <Vn>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 16 << UInt(sz);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "sz" field. It can have the following values:
- 4S when sz = 0
 - 2D when sz = 1
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 4H when sz = 0, Q = 0
 - 8H when sz = 0, Q = 1
 - 2S when sz = 1, Q = 0
 - 4S when sz = 1, Q = 1

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = Vpart[n, part];  
bits(2*datasize) result;  
  
for e = 0 to elements-1  
    Elem[result, e, 2*esize] = FPConvert(Elem[operand, e, esize], FPCR[]);  
  
V[d] = result;
```

C7.2.75 FCVTMS (vector)

Floating-point Convert to Signed integer, rounding toward Minus infinity (vector). This instruction converts a scalar or each element in a vector from a floating-point value to a signed integer value using the Round towards Minus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

Scalar half precision

```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPEnabled64();

FPCRTYPE fpcr = FPCR[];
bits(fltsize) fltval;
bits(intsize) intval;

fltval = V[n];
intval = FPToFixed(fltval, 0, TRUE, fpcr, rounding);
X[d] = intval;
```

C7.2.79 FCVTN, FCVTN2

Floating-point Convert to lower precision Narrow (vector). This instruction reads each vector element in the SIMD&FP source register, converts each result to half the precision of the source element, writes the final result to a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The rounding mode is determined by the [FPCR](#).

The FCVTN instruction writes the vector to the lower half of the destination register and clears the upper half, while the FCVTN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	5 4			0
0	Q	0	0	1	1	1	0	0	sz	1	0	0	0	0	1	0	1	1	0	1	0	Rn			Rd	

Encoding

FCVTN{2} <Vd>.<Tb>, <Vn>.<Ta>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 16 << UInt(sz);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- | | |
|-----------|------------|
| [absent] | when Q = 0 |
| [present] | when Q = 1 |
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Tb> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- | | |
|----|--------------------|
| 4H | when sz = 0, Q = 0 |
| 8H | when sz = 0, Q = 1 |
| 2S | when sz = 1, Q = 0 |
| 4S | when sz = 1, Q = 1 |
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Ta> Is an arrangement specifier, encoded in the "sz" field. It can have the following values:
- | | |
|----|-------------|
| 4S | when sz = 0 |
|----|-------------|

2D when sz = 1

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(2*datasize) operand = V[n];  
bits(datasize) result;  
  
for e = 0 to elements-1  
    Elem[result, e, esize] = FPConvert(Elem[operand, e, 2*esize], FPCR[]);  
  
Vpart[d, part] = result;
```

C7.2.80 FCVTNS (vector)

Floating-point Convert to Signed integer, rounding to nearest with ties to even (vector). This instruction converts a scalar or each element in a vector from a floating-point value to a signed integer value using the Round to Nearest rounding mode, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

Scalar half precision

(FEAT_FP16)

Encoding

FCVTNS <Hd>, <Hn>

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, fpcr, rounding);

V[d] = result;
```

C7.2.81 FCVTNS (scalar)

Floating-point Convert to Signed integer, rounding to nearest with ties to even (scalar). This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit signed integer using the Round to Nearest rounding mode, and writes the result to the general-purpose destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision to 32-bit variant

Applies when `sf == 0 && ftype == 11`.

FCVTNS <Wd>, <Hn>

Half-precision to 64-bit variant

Applies when `sf == 1 && ftype == 11`.

FCVTNS <Xd>, <Hn>

Single-precision to 32-bit variant

Applies when `sf == 0 && ftype == 00`.

FCVTNS <Wd>, <Sn>

Single-precision to 64-bit variant

Applies when `sf == 1 && ftype == 00`.

FCVTNS <Xd>, <Sn>

Double-precision to 32-bit variant

Applies when `sf == 0 && ftype == 01`.

FCVTNS <Wd>, <Dn>

Double-precision to 64-bit variant

Applies when `sf == 1 && ftype == 01`.

FCVTNS <Xd>, <Dn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

Assembler symbols

<Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.

- <V> Is a width specifier, encoded in the "sz" field. It can have the following values:
- S when sz = 0
 - D when sz = 1
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
 - 8H when Q = 1
- For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
 - 4S when sz = 0, Q = 1
 - 2D when sz = 1, Q = 1
- The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];

bits(esize) element;
FPCRType fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[d] else Zeros();

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPToFixed(element, 0, unsigned, fpcr, rounding);

V[d] = result;
```

C7.2.87 FCVTPU (scalar)

Floating-point Convert to Unsigned integer, rounding toward Plus infinity (scalar). This instruction converts the floating-point value in the SIMD&FP source register to a 32-bit or 64-bit unsigned integer using the Round towards Plus Infinity rounding mode, and writes the result to the general-purpose destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision to 32-bit variant

Applies when sf == 0 && ftype == 11.

FCVTPU <Wd>, <Hn>

Half-precision to 64-bit variant

Applies when sf == 1 && ftype == 11.

FCVTPU <Xd>, <Hn>

Single-precision to 32-bit variant

Applies when sf == 0 && ftype == 00.

FCVTPU <Wd>, <Sn>

Single-precision to 64-bit variant

Applies when sf == 1 && ftype == 00.

FCVTPU <Xd>, <Sn>

Double-precision to 32-bit variant

Applies when sf == 0 && ftype == 01.

FCVTPU <Wd>, <Dn>

Double-precision to 64-bit variant

Applies when sf == 1 && ftype == 01.

FCVTPU <Xd>, <Dn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer intsize = if sf == '1' then 64 else 32;
integer fltsize;
FPRounding rounding;
```

```
case ftype of
  when '00'
    fltsize = 32;
  when '01'
    fltsize = 64;
  when '10'
    UNDEFINED;
  when '11'
    if HaveFP16Ext() then
      fltsize = 16;
    else
      UNDEFINED;

rounding = FPDecodeRounding(rmode);
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPEnabled64();

FPCRTYPE fpcr = FPCR[];
bits(fltsize) fltval;
bits(intsize) intval;

fltval = V[n];
intval = FPToFixed(fltval, 0, TRUE, fpcr, rounding);
X[d] = intval;
```

C7.2.88 FCVTXN, FCVTXN2

Floating-point Convert to lower precision Narrow, rounding to odd (vector). This instruction reads each vector element in the source SIMD&FP register, narrows each value to half the precision of the source element using the Round to Odd rounding mode, writes the result to a vector, and writes the vector to the destination SIMD&FP register.

———— Note —————

This instruction uses the Round to Odd rounding mode which is not defined by the IEEE 754-2008 standard. This rounding mode ensures that if the result of the conversion is inexact the least significant bit of the mantissa is forced to 1. This rounding mode enables a floating-point value to be converted to a lower precision format via an intermediate precision format while avoiding double rounding errors. For example, a 64-bit floating-point value can be converted to a correctly rounded 16-bit floating-point value by first using this instruction to produce a 32-bit value and then using another instruction with the wanted rounding mode to convert the 32-bit value to the final 16-bit floating-point value.

The FCVTXN instruction writes the vector to the lower half of the destination register and clears the upper half, while the FCVTXN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

C7.2.93 FCVTZU (vector, fixed-point)

Floating-point Convert to Unsigned fixed-point, rounding toward Zero (vector). This instruction converts a scalar or each element in a vector from floating-point to fixed-point unsigned integer using the Round towards Zero rounding mode, and writes the result to the general-purpose destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

Scalar

31	30	29	28	27	26	25	24	23	22	19	18	16	15	14	13	12	11	10	9	5	4	0

integer fracbits = (esize * 2) - UInt(immh:immb);
```

```
boolean unsigned = (U == '1');  
FPRounding rounding = FPRounding_ZERO;
```

Assembler symbols

- <V> Is a width specifier, encoded in the "immh" field. It can have the following values:
- H when immh = 001x
 - S when immh = 01xx
 - D when immh = 1xxx
- The encoding immh = 000x is reserved.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
- 4H when immh = 001x, Q = 0
 - 8H when immh = 001x, Q = 1
 - 2S when immh = 01xx, Q = 0
 - 4S when immh = 01xx, Q = 1
 - 2D when immh = 1xxx, Q = 1
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
- The following encodings are reserved:
- immh = 0001, Q = x.
 - immh = 1xxx, Q = 0.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <fbits> For the scalar variant: is the number of fractional bits, in the range 1 to the operand width, encoded in the "immh:immb" field. It can have the following values:
- (32-UInt(immh:immb)) when immh = 001x
 - (64-UInt(immh:immb)) when immh = 01xx
 - (128-UInt(immh:immb)) when immh = 1xxx
- The encoding immh = 000x is reserved.
- For the vector variant: is the number of fractional bits, in the range 1 to the element width, encoded in the "immh:immb" field. It can have the following values:
- (32-UInt(immh:immb)) when immh = 001x
 - (64-UInt(immh:immb)) when immh = 01xx
 - (128-UInt(immh:immb)) when immh = 1xxx
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.
- The encoding immh = 0001 is reserved.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
  
bits(esize) element;  
FPCRType fpcr = FPCR[];  
boolean merge = elements == 1 && IsMerging(fpcr);
```

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[n] else Zeros();

Elem[result, 0, esize] = FPDiv(operand1, operand2, FPCR[]);

V[d] = result;
```

C7.2.99 FJCVTZS

Floating-point Javascript Convert to Signed fixed-point, rounding toward Zero. This instruction converts the double-precision floating-point value in the SIMD&FP source register to a 32-bit signed integer using the Round towards Zero rounding mode, and writes the result to the general-purpose destination register. If the result is too large to be represented as a signed 32-bit integer, then the result is the integer modulo 2^{32} , as held in a 32-bit signed integer.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

C7.2.100 FMADD

Floating-point fused Multiply-Add (scalar). This instruction multiplies the values of the first two SIMD&FP source registers, adds the product to the value of the third SIMD&FP source register, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when `f`type == 11.

FMADD <Hd>, <Hn>, <Hm>, <Ha>

Single-precision variant

Applies when `f`type == 00.

FMADD <Sd>, <Sn>, <Sm>, <Sa>

Double-precision variant

Applies when `f`type == 01.

FMADD <Dd>, <Dn>, <Dm>, <Da>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer a = UInt(Ra);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.

<Dm>	Is the 64-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.
<Da>	Is the 64-bit name of the third SIMD&FP source register holding the addend, encoded in the "Ra" field.
<Hd>	Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Hn>	Is the 16-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.
<Ha>	Is the 16-bit name of the third SIMD&FP source register holding the addend, encoded in the "Ra" field.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.
<Sa>	Is the 32-bit name of the third SIMD&FP source register holding the addend, encoded in the "Ra" field.

Operation

```
CheckFPEEnabled64();
```

```
bits(esize) operandA = V[a];  
bits(esize) operand1 = V[n];  
bits(esize) operand2 = V[m];
```

```
FPCRType fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[a] else Zeros();
```

```
Elem[result, 0, esize] = FPMu1Add(operandA, operand1, operand2, fpcr);
```

```
V[d] = result;
```

C7.2.101 FMAX (vector)

Floating-point Maximum (vector). This instruction compares corresponding vector elements in the two source SIMD&FP registers, places the larger of each of the two floating-point values into a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMAX <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
boolean minimum = (o1 == '1');
```

Single-precision and double-precision

Encoding

FMAX <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then UNDEFINED;
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean pair = (U == '1');  
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
 - 8H when Q = 1
- For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
 - 4S when sz = 0, Q = 1
 - 2D when sz = 1, Q = 1
- The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand1 = V[n];  
bits(datasize) operand2 = V[m];  
bits(datasize) result;  
bits(2*datasize) concat = operand2:operand1;  
bits(esize) element1;  
bits(esize) element2;  
  
for e = 0 to elements-1  
  if pair then  
    element1 = Elem[concat, 2*e, esize];  
    element2 = Elem[concat, (2*e)+1, esize];  
  else  
    element1 = Elem[operand1, e, esize];  
    element2 = Elem[operand2, e, esize];  
  
  if minimum then  
    Elem[result, e, esize] = FPMIn(element1, element2, FPCR[]);  
  else  
    Elem[result, e, esize] = FPMax(element1, element2, FPCR[]);  
  
V[d] = result;
```

C7.2.102 FMAX (scalar)

Floating-point Maximum (scalar). This instruction compares the two source SIMD&FP registers, and writes the larger of the two floating-point values to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FMAX <Hd>, <Hn>, <Hm>

Single-precision variant

Applies when ftype == 00.

FMAX <Sd>, <Sn>, <Sm>

Double-precision variant

Applies when ftype == 01.

FMAX <Dd>, <Dn>, <Dm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

- <Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPEnabled64();  
bits(esize) operand1 = V[n];  
bits(esize) operand2 = V[m];  
  
FPCRType fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[n] else Zeros();  
  
ELEM[result, 0, esize] = FPMAX(operand1, operand2, fpcr);  
V[d] = result;
```

C7.2.103 FMAXNM (vector)

Floating-point Maximum Number (vector). This instruction compares corresponding vector elements in the two source SIMD&FP registers, writes the larger of the two floating-point values into a vector, and writes the vector to the destination SIMD&FP register.

NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result placed in the vector is the numerical value, otherwise the result is identical to [FMAX \(scalar\)](#).

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Double-precision variant

Applies when ftype == 01.

FMAXNM <Dd>, <Dn>, <Dm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

<Hd>	Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Hn>	Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPEnabled64();
bits(esize) operand1 = V[n];
bits(esize) operand2 = V[m];

FPCRTYPE fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[n] else Zeros();

Elem[result, 0, esize] = FPMaXNum(operand1, operand2, fpcr);
V[d] = result;
```

C7.2.105 FMAXNMP (scalar)

Floating-point Maximum Number of Pair of elements (scalar). This instruction compares two vector elements in the source SIMD&FP register and writes the largest of the floating-point values as a scalar to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMAXNMP <V><d>, <Vn>.<T>

Decode for this encoding

```
if !HaveFP16Ext() then UNDEFINED;
```

```
integer d = UInt(Rd);
```

```
integer n = UInt(Rn);
```

```
integer esize = 16;
```

```
if sz == '1' then UNDEFINED;
```

```
integer datasize = 32;
```

Single-precision and double-precision

Encoding

FMAXNMP <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
```

```
integer n = UInt(Rn);
```

```
integer esize = 32 << UInt(sz);
```

```
integer datasize = esize * 2;
```

Assembler symbols

- <V> For the half-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
- H when sz = 0
- The encoding sz = 1 is reserved.
- For the single-precision and double-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
- S when sz = 0
- D when sz = 1
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <T> For the half-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:
- 2H when sz = 0
- The encoding sz = 1 is reserved.
- For the single-precision and double-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:
- 2S when sz = 0
- 2D when sz = 1

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
V[d] = Reduce(ReduceOp_FMAXNUM, operand, esize, FALSE);
```

C7.2.106 FMAXNMP (vector)

Floating-point Maximum Number Pairwise (vector). This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the largest of each pair of values into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result is the numerical value, otherwise the result is identical to [FMAX \(scalar\)](#).

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMAXNMP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

```

```
integer datasize = 32;
```

Single-precision and double-precision

Encoding

FMAXP <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
```

```
integer n = UInt(Rn);
```

```
integer esize = 32 << UInt(sz);
```

```
integer datasize = esize * 2;
```

Assembler symbols

- <V> For the half-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
- H when sz = 0
- The encoding sz = 1 is reserved.
- For the single-precision and double-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
- S when sz = 0
- D when sz = 1
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <T> For the half-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:
- 2H when sz = 0
- The encoding sz = 1 is reserved.
- For the single-precision and double-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:
- 2S when sz = 0
- 2D when sz = 1

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
  
V[d] = Reduce(ReduceOp_FMAX, operand, esize);
```

C7.2.109 FMAXP (vector)

Floating-point Maximum Pairwise (vector). This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements from the concatenated vector, writes the larger of each pair of values into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMAXP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
boolean minimum = (o1 == '1');
```

Single-precision and double-precision

Encoding

FMAXP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then UNDEFINED;
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean pair = (U == '1');  
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
4H when Q = 0
8H when Q = 1
For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
2S when sz = 0, Q = 0
4S when sz = 0, Q = 1
2D when sz = 1, Q = 1
The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand1 = V[n];  
bits(datasize) operand2 = V[m];  
bits(datasize) result;  
bits(2*datasize) concat = operand2:operand1;  
bits(esize) element1;  
bits(esize) element2;  
  
for e = 0 to elements-1  
  if pair then  
    element1 = Elem[concat, 2*e, esize];  
    element2 = Elem[concat, (2*e)+1, esize];  
  else  
    element1 = Elem[operand1, e, esize];  
    element2 = Elem[operand2, e, esize];  
  
  if minimum then  
    Elem[result, e, esize] = FPMIn(element1, element2, FPCR[]);  
  else  
    Elem[result, e, esize] = FPMaX(element1, element2, FPCR[]);  
  
V[d] = result;
```

C7.2.110 FMAXV

Floating-point Maximum across Vector. This instruction compares all the vector elements in the source SIMD&FP register, and writes the largest of the values as a scalar to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMAXV <V><d>, <Vn>.<T>

Decode for this encoding

```
if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
```

Single-precision and double-precision

Encoding

FMAXV <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q != '01' then UNDEFINED;

integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

<V> For the half-precision variant: is the destination width specifier, H.

For the single-precision and double-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:

5 when sz = 0

The encoding sz = 1 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

4H when Q = 0

8H when Q = 1

For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:

4S when Q = 1, sz = 0

The following encodings are reserved:

- Q = 0, sz = x.
- Q = 1, sz = 1.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];
```

```
V[d] = Reduce(ReduceOp_FMAX, operand, esize);
```

C7.2.111 FMIN (vector)

Floating-point minimum (vector). This instruction compares corresponding elements in the vectors in the two source SIMD&FP registers, places the smaller of each of the two floating-point values into a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMIN <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
boolean minimum = (o1 == '1');
```

Single-precision and double-precision

Encoding

FMIN <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

  else  
    Elem[result, e, esize] = FPMax(element1, element2, FPCR[]);  
  
V[d] = result;
```

C7.2.112 FMIN (scalar)

Floating-point Minimum (scalar). This instruction compares the first and second source SIMD&FP register values, and writes the smaller of the two floating-point values to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FMIN <Hd>, <Hn>, <Hm>

Single-precision variant

Applies when ftype == 00.

FMIN <Sd>, <Sn>, <Sm>

Double-precision variant

Applies when ftype == 01.

FMIN <Dd>, <Dn>, <Dm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

- <Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPEnabled64();  
bits(esize) operand1 = V[n];  
bits(esize) operand2 = V[m];  
  
FPCRType fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[n] else Zeros();  
  
Elem[result, 0, esize] = FMin(operand1, operand2, fpcr);  
V[d] = result;
```

C7.2.113 FMINNM (vector)

Floating-point Minimum Number (vector). This instruction compares corresponding vector elements in the two source SIMD&FP registers, writes the smaller of the two floating-point values into a vector, and writes the vector to the destination SIMD&FP register.

NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result placed in the vector is the numerical value, otherwise the result is identical to [FMIN \(scalar\)](#).

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

```

Single-precision and double-precision

Encoding

FMINNMP <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize * 2;
```

Assembler symbols

- <V> For the half-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
- H when sz = 0
- The encoding sz = 1 is reserved.
- For the single-precision and double-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
- S when sz = 0
 - D when sz = 1
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <T> For the half-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:
- 2H when sz = 0
- The encoding sz = 1 is reserved.
- For the single-precision and double-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:
- 2S when sz = 0
 - 2D when sz = 1

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
V[d] = Reduce(ReduceOp_FMINNUM, operand, esize, FALSE);
```

C7.2.116 FMINNMP (vector)

Floating-point Minimum Number Pairwise (vector). This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the smallest of each pair of floating-point values into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result is the numerical value, otherwise the result is identical to [FMIN \(scalar\)](#).

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

    element2 = Elem[operand2, e, esize];

  if minimum then
    Elem[result, e, esize] = FPMInum(element1, element2, FPCR[]);
  else
    Elem[result, e, esize] = FPMaxNum(element1, element2, FPCR[]);

V[d] = result;
```

C7.2.117 FMINNMV

Floating-point Minimum Number across Vector. This instruction compares all the vector elements in the source SIMD&FP register, and writes the smallest of the values as a scalar to the destination SIMD&FP register. All the values in this instruction are floating-point values.

NaNs are handled according to the IEEE 754-2008 standard. If one vector element is numeric and the other is a quiet NaN, the result of the comparison is the numerical value, otherwise the result is identical to [FMIN \(scalar\)](#).

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMINNMV <V><d>, <Vn>.<T>

Decode for this encoding

```
if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
```

Single-precision and double-precision

Encoding

FMINNMV <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q != '01' then UNDEFINED;    // .4S on1y

integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

- <V> For the half-precision variant: is the destination width specifier, H.
For the single-precision and double-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
S when sz = 0
The encoding sz = 1 is reserved.
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
4H when Q = 0
8H when Q = 1
For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:
4S when Q = 1, sz = 0
The following encodings are reserved:
- Q = 0, sz = x.
 - Q = 1, sz = 1.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
V[d] = Reduce(ReduceOp_FMINNUM, operand, esize, FALSE);
```

C7.2.118 FMINP (scalar)

Floating-point Minimum of Pair of elements (scalar). This instruction compares two vector elements in the source SIMD&FP register and writes the smallest of the floating-point values as a scalar to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMINP <V><d>, <Vn>.<T>

Decode for this encoding

```

if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 16;
if sz == '1' then UNDEFINED;
integer datasize = 32;
    
```

Single-precision and double-precision

Encoding

FMINP <V><d>, <Vn>.<T>

Decode for this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 32 << UInt(sz);
integer datasize = esize * 2;
    
```

Assembler symbols

- <V> For the half-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
- H when sz = 0
- The encoding sz = 1 is reserved.
- For the single-precision and double-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:
- S when sz = 0
- D when sz = 1
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <T> For the half-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:
- 2H when sz = 0
- The encoding sz = 1 is reserved.
- For the single-precision and double-precision variant: is the source arrangement specifier, encoded in the "sz" field. It can have the following values:
- 2S when sz = 0
- 2D when sz = 1

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
  
V[d] = Reduce(ReduceOp_FMIN, operand, esize);
```

C7.2.119 FMINP (vector)

Floating-point Minimum Pairwise (vector). This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements from the concatenated vector, writes the smaller of each pair of values into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMINP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean pair = (U == '1');
boolean minimum = (o1 == '1');
```

Single-precision and double-precision

Encoding

FMINP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if sz:Q == '10' then UNDEFINED;
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean pair = (U == '1');  
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
 - 8H when Q = 1
- For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
 - 4S when sz = 0, Q = 1
 - 2D when sz = 1, Q = 1
- The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand1 = V[n];  
bits(datasize) operand2 = V[m];  
bits(datasize) result;  
bits(2*datasize) concat = operand2:operand1;  
bits(esize) element1;  
bits(esize) element2;  
  
for e = 0 to elements-1  
  if pair then  
    element1 = Elem[concat, 2*e, esize];  
    element2 = Elem[concat, (2*e)+1, esize];  
  else  
    element1 = Elem[operand1, e, esize];  
    element2 = Elem[operand2, e, esize];  
  
  if minimum then  
    Elem[result, e, esize] = FPMIn(element1, element2, FPCR[]);  
  else  
    Elem[result, e, esize] = FPMaX(element1, element2, FPCR[]);  
  
V[d] = result;
```

C7.2.120 FMINV

Floating-point Minimum across Vector. This instruction compares all the vector elements in the source SIMD&FP register, and writes the smallest of the values as a scalar to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMINV <V><d>, <Vn>.<T>

Decode for this encoding

```
if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
```

Single-precision and double-precision

Encoding

FMINV <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q != '01' then UNDEFINED;

integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

<V> For the half-precision variant: is the destination width specifier, H.

For the single-precision and double-precision variant: is the destination width specifier, encoded in the "sz" field. It can have the following values:

S when sz = 0

The encoding sz = 1 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

4H when Q = 0

8H when Q = 1

For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:

4S when Q = 1, sz = 0

The following encodings are reserved:

- Q = 0, sz = x.
- Q = 1, sz = 1.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];
```

```
V[d] = Reduce(ReduceOp_FMIN, operand, esize);
```

C7.2.121 FMLA (by element)

Floating-point fused Multiply-Add to accumulator (by element). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and accumulates the results in the vector elements of the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

    element2 = Elem[operand2, e, esize DIV 2];
    if sub_op then element1 = FPNeg(element1);
    Elem[result, e, esize] = FPMulAddH(Elem[operand3, e, esize], element1, element2, FPCR[]);
V[d] = result;
```

C7.2.125 FMLS (by element)

Floating-point fused Multiply-Subtract from accumulator (by element). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and subtracts the results from the vector elements of the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

Assembler symbols

- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <V> Is a width specifier, encoded in the "sz" field. It can have the following values:
- S when sz = 0
 - D when sz = 1
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
 - 8H when Q = 1
- For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:
- 2S when Q = 0, sz = 0
 - 4S when Q = 1, sz = 0
 - 2D when Q = 1, sz = 1
- The encoding Q = 0, sz = 1 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> For the half-precision variant: is the name of the second SIMD&FP source register, in the range V0 to V15, encoded in the "Rm" field.
- For the single-precision and double-precision variant: is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.
- <Ts> Is an element size specifier, encoded in the "sz" field. It can have the following values:
- S when sz = 0
 - D when sz = 1
- <index> For the half-precision variant: is the element index, in the range 0 to 7, encoded in the "H:L:M" fields.
- For the single-precision and double-precision variant: is the element index, encoded in the "sz:L:H" field. It can have the following values:
- H:L when sz = 0, L = x
 - H when sz = 1, L = 0
- The encoding sz = 1, L = 1 is reserved.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(idxsized) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(esize) element1;
bits(esize) element2 = Elem[operand2, index, esize];
FPCRTYPE fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[d] else Zeros();

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    if sub_op then element1 = FPNeg(element1);
    Elem[result, e, esize] = FPMu1Add(Elem[operand3, e, esize], element1, element2, fpcr);

V[d] = result;
```

C7.2.126 FMLS (vector)

Floating-point fused Multiply-Subtract from accumulator (vector). This instruction multiplies corresponding floating-point values in the vectors in the two source SIMD&FP registers, negates the product, adds the result to the corresponding vector element of the destination SIMD&FP register, and writes the result to the destination SIMD&FP register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean sub_op = (op == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
 - 8H when Q = 1
- For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
 - 4S when sz = 0, Q = 1
 - 2D when sz = 1, Q = 1
- The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    if sub_op then element1 = FPNeg(element1);
    Elem[result, e, esize] = FPMu1Add(Elem[operand3, e, esize], element1, element2, FPCR[]);

V[d] = result;
```

C7.2.127 FMLSL, FMLSL2 (by element)

Floating-point fused Multiply-Subtract Long from accumulator (by element). This instruction multiplies the negated vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and accumulates the product to the corresponding vector element of the destination SIMD&FP register. The instruction does not round the result of the multiply before the accumulation.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

———— **Note** —————

[ID_AA64ISAR0_EL1.FHM](#) indicates whether this instruction is supported.

FMLSL

(FEAT_FHM)

Encoding

FMLSL <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<H[<index>]>

V[d] = result;
```

C7.2.129 FMOV (vector, immediate)

Floating-point move immediate (vector). This instruction copies an immediate floating-point constant into every element of the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FMOV <Vd>.<T>, #<imm>

Decode for this encoding

```

if !HaveFP16Ext() then UNDEFINED;

integer rd = UInt(Rd);

integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;

imm8 = a:b:c:d:e:f:g:h;
imm16 = imm8<7>:NOT(imm8<6>):Replicate(imm8<6>, 2):imm8<5:0>:Zeros(6);

imm = Replicate(imm16, datasize DIV 16);
    
```

Single-precision and double-precision

Single-precision variant

Applies when op == 0.

FMOV <Vd>.<T>, #<imm>

Double-precision variant

Applies when Q == 1 && op == 1.

FMOV <Vd>.2D, #<imm>

Decode for all variants of this encoding

```

integer rd = UInt(Rd);

integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

if cmode:op == '11111' then
    
```

```
// FMOV Dn,#imm is in main FP instruction set
if Q == '0' then UNDEFINED;

imm64 = AdvSIMDEExpandImm(op, cmode, a:b:c:d:e:f:g:h);
imm = Replicate(imm64, datasize DIV 64);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
 - 8H when Q = 1
- For the single-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 2S when Q = 0
 - 4S when Q = 1
- <imm> Is a signed floating-point constant with 3-bit exponent and normalized 4 bits of precision, encoded in "a:b:c:d:e:f:g:h". For details of the range of constants available and the encoding of <imm>, see [Modified immediate constants in A64 floating-point instructions on page C2-212](#).

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
```

```
V[rd] = imm;
```

C7.2.130 FMOV (register)

Floating-point Move register without conversion. This instruction copies the floating-point value in the SIMD&FP source register to the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FMOV <Hd>, <Hn>

Single-precision variant

Applies when ftype == 00.

FMOV <Sd>, <Sn>

Double-precision variant

Applies when ftype == 01.

FMOV <Dd>, <Dn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

`CheckFPEnabled64();`

`bits(esize) operand = V[n];`

`Elem[Zeros(), 0, esize] = operand;`

`V[d] = Zeros();`

C7.2.131 FMOV (general)

Floating-point Move to or from general-purpose register without conversion. This instruction transfers the contents of a SIMD&FP register to a general-purpose register, or the contents of a general-purpose register to a SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision to 32-bit variant

Applies when $sf == 0 \ \&\& \ ftype == 11 \ \&\& \ rmode == 00 \ \&\& \ opcode == 110$.

FMOV <Wd>, <Hn>

Half-precision to 64-bit variant

Applies when $sf == 1 \ \&\& \ ftype == 11 \ \&\& \ rmode == 00 \ \&\& \ opcode == 110$.

FMOV <Xd>, <Hn>

32-bit to half-precision variant

Applies when $sf == 0 \ \&\& \ ftype == 11 \ \&\& \ rmode == 00 \ \&\& \ opcode == 111$.

FMOV <Hd>, <Wn>

32-bit to single-precision variant

Applies when $sf == 0 \ \&\& \ ftype == 00 \ \&\& \ rmode == 00 \ \&\& \ opcode == 111$.

FMOV <Sd>, <Wn>

Single-precision to 32-bit variant

Applies when $sf == 0 \ \&\& \ ftype == 00 \ \&\& \ rmode == 00 \ \&\& \ opcode == 110$.

FMOV <Wd>, <Sn>

64-bit to half-precision variant

Applies when $sf == 1 \ \&\& \ ftype == 11 \ \&\& \ rmode == 00 \ \&\& \ opcode == 111$.

FMOV <Hd>, <Xn>

64-bit to double-precision variant

Applies when $sf == 1 \ \&\& \ ftype == 01 \ \&\& \ rmode == 00 \ \&\& \ opcode == 111$.

FMOV <Dd>, <Xn>

64-bit to top half of 128-bit variant

Applies when $sf == 1 \ \&\& \ ftype == 10 \ \&\& \ rmode == 01 \ \&\& \ opcode == 111$.

FMOV <Vd>.D[1], <Xn>

Double-precision to 64-bit variant

Applies when sf == 1 && ftype == 01 && rmode == 00 && opcode == 110.

FMOV <Xd>, <Dn>

Top half of 128-bit to 64-bit variant

Applies when sf == 1 && ftype == 10 && rmode == 01 && opcode == 110.

FMOV <Xd>, <Vn>.D[1]

Decode for all variants of this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);

integer intsize = if sf == '1' then 64 else 32;

```

C7.2.132 FMOV (scalar, immediate)

Floating-point move immediate (scalar). This instruction copies a floating-point immediate constant into the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20					13	12	11	10	9	8	7	6	5	4		0	
0	0	0	1	1	1	1	0	f	t	y	p	e	1	imm8				1	0	0	0	0	0	0	0	0	Rd	

Half-precision variant

Applies when ftype == 11.

FMOV <Hd>, #<imm>

Single-precision variant

Applies when ftype == 00.

FMOV <Sd>, #<imm>

Double-precision variant

Applies when ftype == 01.

FMOV <Dd>, #<imm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);

integer datasize;
case ftype of
    when '00' datasize = 32;
    when '01' datasize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            datasize = 16;
        else
            UNDEFINED;

bits(datasize) imm = VFPEExpandImm(imm8);
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <imm> Is a signed floating-point constant with 3-bit exponent and normalized 4 bits of precision, encoded in the "imm8" field. For details of the range of constants available and the encoding of <imm>, see [Modified immediate constants in A64 floating-point instructions on page C2-212](#).

Operation

`CheckFPEnabled64();`

`V[d] = imm;`

C7.2.133 FMSUB

Floating-point Fused Multiply-Subtract (scalar). This instruction multiplies the values of the first two SIMD&FP source registers, negates the product, adds that to the value of the third SIMD&FP source register, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FMSUB <Hd>, <Hn>, <Hm>, <Ha>

Single-precision variant

Applies when ftype == 00.

FMSUB <Sd>, <Sn>, <Sm>, <Sa>

Double-precision variant

Applies when ftype == 01.

```

```
V[d] = result;
```

C7.2.134 FMUL (by element)

Floating-point Multiply (by element). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are floating-point values.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar, half-precision

(FEAT_FP16)

Encoding

Operation

```
CheckFPEnabled64();
bits(esize) operand1 = V[n];
bits(esize) operand2 = V[m];

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[n] else Zeros();

bits(esize) product = FPMul(operand1, operand2, fpcr);
Elem[result, 0, esize] = product;

V[d] = result;
```

C7.2.137 FMULX (by element)

Floating-point Multiply extended (by element). This instruction multiplies the floating-point values in the vector elements in the first source SIMD&FP register by the specified floating-point value in the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If one value is zero and the other value is infinite, the result is 2.0. In this case, the result is negative if only one of the values is negative, otherwise the result is positive.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Assembler symbols

- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <V> Is a width specifier, encoded in the "sz" field. It can have the following values:
 - S when sz = 0
 - D when sz = 1
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 4H when Q = 0
 - 8H when Q = 1
 For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "Q:sz" field. It can have the following values:
 - 2S when Q = 0, sz = 0
 - 4S when Q = 1, sz = 0
 - 2D when Q = 1, sz = 1
 The encoding Q = 0, sz = 1 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> For the half-precision variant: is the name of the second SIMD&FP source register, in the range V0 to V15, encoded in the "Rm" field.
 For the single-precision and double-precision variant: is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.
- <Ts> Is an element size specifier, encoded in the "sz" field. It can have the following values:
 - S when sz = 0
 - D when sz = 1
- <index> For the half-precision variant: is the element index, in the range 0 to 7, encoded in the "H:L:M" fields.
 For the single-precision and double-precision variant: is the element index, encoded in the "sz:L:H" field. It can have the following values:
 - H:L when sz = 0, L = x
 - H when sz = 1, L = 0
 The encoding sz = 1, L = 1 is reserved.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(idxsized) operand2 = V[m];
bits(esize) element1;
bits(esize) element2 = Elem[operand2, index, esize];
FPCRType fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[n] else Zeros();

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    if mulx_op then
        Elem[result, e, esize] = FPMuIX(element1, element2, fpcr);
    else
        Elem[result, e, esize] = FPMuI(element1, element2, fpcr);

V[d] = result;
```

C7.2.138 FMULX

Floating-point Multiply extended. This instruction multiplies corresponding floating-point values in the vectors of the two source SIMD&FP registers, places the resulting floating-point values in a vector, and writes the vector to the destination SIMD&FP register.

If one value is zero and the other value is infinite, the result is 2.0. In this case, the result is negative if only one of the values is negative, otherwise the result is positive.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar half precision

(FEAT_FP16)

31	30	29	28	27	26	25	24	23	22	21	20	16				15	14	13	12	11	10	9	5		4	0

    element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPMuTX(element1, element2, fpcr);
V[d] = result;
```

C7.2.139 FNEG (vector)

Floating-point Negate (vector). This instruction negates the value of each vector element in the source SIMD&FP register, writes the result to a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

(FEAT_FP16)

Encoding

FNEG <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```

if !HaveFP16Ext() then UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 16;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean neg = (U == '1');
```

Single-precision and double-precision

Encoding

FNEG <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);

if sz:Q == '10' then UNDEFINED;
integer esize = 32 << UInt(sz);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean neg = (U == '1');
```

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

4H when Q = 0
8H when Q = 1

For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0
4S when sz = 0, Q = 1
2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    if neg then
        element = FPNeg(element);
    else
        element = FPAbs(element);
    Elem[result, e, esize] = element;

V[d] = result;
```

C7.2.140 FNEG (scalar)

Floating-point Negate (scalar). This instruction negates the value in the SIMD&FP source register and writes the result to the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FNEG <Hd>, <Hn>

Single-precision variant

Applies when ftype == 00.

FNEG <Sd>, <Sn>

Double-precision variant

Applies when ftype == 01.

FNEG <Dd>, <Dn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPEnabled64();  
  
FPCRTYPE fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[d] else Zeros();  
  
bits(esize) operand = V[n];  
  
Elem[result, 0, esize] = FPNeg(operand);  
V[d] = result;
```

C7.2.141 FNMADD

Floating-point Negated fused Multiply-Add (scalar). This instruction multiplies the values of the first two SIMD&FP source registers, negates the product, subtracts the value of the third SIMD&FP source register, and writes the result to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when `ftype == 11`.

FNMADD <Hd>, <Hn>, <Hm>, <Ha>

Single-precision variant

Applies when `ftype == 00`.

FNMADD <Sd>, <Sn>, <Sm>, <Sa>

Double-precision variant

Applies when `ftype == 01`.

FNMADD <Dd>, <Dn>, <Dm>, <Da>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer a = UInt(Ra);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.

<Dm>	Is the 64-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.
<Da>	Is the 64-bit name of the third SIMD&FP source register holding the addend, encoded in the "Ra" field.
<Hd>	Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Hn>	Is the 16-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.
<Ha>	Is the 16-bit name of the third SIMD&FP source register holding the addend, encoded in the "Ra" field.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.
<Sa>	Is the 32-bit name of the third SIMD&FP source register holding the addend, encoded in the "Ra" field.

Operation

```
CheckFPEabled64();
```

```
bits(esize) operandA = V[a];  
bits(esize) operand1 = V[n];  
bits(esize) operand2 = V[m];
```

```
FPCRType fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[a] else Zeros();
```

```
operandA = FPNeg(operandA);  
operand1 = FPNeg(operand1);  
E1em[result, 0, esize] = FPMu1Add(operandA, operand1, operand2, fpcr);
```

```
V[d] = result;
```

C7.2.142 FNMSUB

Floating-point Negated fused Multiply-Subtract (scalar). This instruction multiplies the values of the first two SIMD&FP source registers, subtracts the value of the third SIMD&FP source register, and writes the result to the destination SIMD&FP register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when `ftype == 11`.

FNMSUB <Hd>, <Hn>, <Hm>, <Ha>

Single-precision variant

Applies when `ftype == 00`.

FNMSUB <Sd>, <Sn>, <Sm>, <Sa>

Double-precision variant

Applies when `ftype == 01`.

FNMSUB <Dd>, <Dn>, <Dm>, <Da>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer a = UInt(Ra);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.

<Dm>	Is the 64-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.
<Da>	Is the 64-bit name of the third SIMD&FP source register holding the minuend, encoded in the "Ra" field.
<Hd>	Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Hn>	Is the 16-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.
<Hm>	Is the 16-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.
<Ha>	Is the 16-bit name of the third SIMD&FP source register holding the minuend, encoded in the "Ra" field.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
<Sn>	Is the 32-bit name of the first SIMD&FP source register holding the multiplicand, encoded in the "Rn" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register holding the multiplier, encoded in the "Rm" field.
<Sa>	Is the 32-bit name of the third SIMD&FP source register holding the minuend, encoded in the "Ra" field.

Operation

```
CheckFPEabled64();
```

```
bits(esize) operandA = V[a];  
bits(esize) operand1 = V[n];  
bits(esize) operand2 = V[m];
```

```
FPCRType fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[a] else Zeros();
```

```
operandA = FPNeg(operandA);  
Elem[result, 0, esize] = FPMulAdd(operandA, operand1, operand2, fpcr);
```

```
V[d] = result;
```

C7.2.143 FNMUL (scalar)

Floating-point Multiply-Negate (scalar). This instruction multiplies the floating-point values of the two source SIMD&FP registers, and writes the negation of the result to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FNMUL <Hd>, <Hn>, <Hm>

Single-precision variant

Applies when ftype == 00.

FNMUL <Sd>, <Sn>, <Sm>

Double-precision variant

Applies when ftype == 01.

FNMUL <Dd>, <Dn>, <Dm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

- <Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPEnabled64();
bits(esize) operand1 = V[n];
bits(esize) operand2 = V[m];

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
bits(128) result = if merge then V[n] else Zeros();

bits(esize) product = FPMul(operand1, operand2, fpcr);
product = FPNeg(product);
Elem[result, 0, esize] = product;

V[d] = result;
```

C7.2.144 FRECPE

Floating-point Reciprocal Estimate. This instruction finds an approximate reciprocal estimate for each vector element in the source SIMD&FP register, places the result in a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

Assembler symbols

- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <V> Is a width specifier, encoded in the "sz" field. It can have the following values:
 - S when sz = 0
 - D when sz = 1
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 4H when Q = 0

8H when Q = 1

For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

2S when sz = 0, Q = 0

4S when sz = 0, Q = 1

2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];

FPCRTyp e fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[d] else Zeros();
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPRecipEstimate(element, FPCR[]);

V[d] = result;
```

C7.2.145 FRECPs

Floating-point Reciprocal Step. This instruction multiplies the corresponding floating-point values in the vectors of the two source SIMD&FP registers, subtracts each of the products from 2.0, places the resulting floating-point values in a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

C7.2.147 FRINT32X (vector)

Floating-point Round to 32-bit Integer, using current rounding mode (vector). This instruction rounds a vector of floating-point values in the SIMD&FP source register to integral floating-point values that fit into a 32-bit integer size using the rounding mode that is determined by the [FPCR](#), and writes the result to the SIMD&FP destination register.

A zero input returns a zero result with the same sign. When one of the result values is not numerically equal to the corresponding input value, an Inexact exception is raised. When an input is infinite, NaN or out-of-range, the instruction returns for the corresponding result value the most negative integer representable in the destination size, and an Invalid Operation floating-point exception is raised.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

C7.2.154 FRINT64Z (scalar)

Floating-point Round to 64-bit Integer toward Zero (scalar). This instruction rounds a floating-point value in the SIMD&FP source register to an integral floating-point value that fits into a 64-bit integer size using the Round towards Zero rounding mode, and writes the result to the SIMD&FP destination register.

A zero input returns a zero result with the same sign. When the result value is not numerically equal to the {corresponding} input value, an Inexact exception is raised. When the input is infinite, NaN or out-of-range, the instruction returns {for the corresponding result value} the most negative integer representable in the destination size, and an Invalid Operation floating-point exception is raised.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Floating-point

(FEAT_FRINTTS)

Single-precision variant

Applies when ftype == 00.

FRINT64Z <Sd>, <Sn>

Double-precision variant

Applies when ftype == 01.

FRINT64Z <Dd>, <Dn>

Decode for all variants of this encoding

```

if !HaveFrintExt() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '1x' UNDEFINED;

```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPEEnabled64();  
  
FPCRTYPE fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[d] else Zeros();  
bits(esize) operand = V[n];  
  
Elem[result, 0, esize] = FPRoundIntN(operand, fpcr, FPRounding_ZERO, 64);  
  
V[d] = result;
```

C7.2.155 FRINTA (vector)

Floating-point Round to Integral, to nearest with ties to Away (vector). This instruction rounds a vector of floating-point values in the SIMD&FP source register to integral floating-point values of the same size using the Round to Nearest with Ties to Away rounding mode, and writes the result to the SIMD&FP destination register.

A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

- <Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPEnabled64();
```

```
FPCRType fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[d] else Zeros();  
bits(esize) operand = V[n];
```

```
Elem[result, 0, esize] = FPRoundInt(operand, fpcr, rounding, FALSE);
```

```
V[d] = result;
```

C7.2.163 FRINTP (vector)

Floating-point Round to Integral, toward Plus infinity (vector). This instruction rounds a vector of floating-point values in the SIMD&FP source register to integral floating-point values of the same size using the Round towards Plus Infinity rounding mode, and writes the result to the SIMD&FP destination register.

A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

Assembler symbols

- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <V> Is a width specifier, encoded in the "sz" field. It can have the following values:
 - S when sz = 0
 - D when sz = 1
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

- <T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- 4H when Q = 0
 - 8H when Q = 1
- For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
 - 4S when sz = 0, Q = 1
 - 2D when sz = 1, Q = 1
- The encoding sz = 1, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];

bits(esize) element1;
bits(esize) element2;
FPCRTYPE fpcr = FPCR[];
boolean merge = elements == 1 && IsMerging(fpcr);
bits(128) result = if merge then V[n] else Zeros();

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    Elem[result, e, esize] = FPRSqrtStepFused(element1, element2);

V[d] = result;
```

C7.2.171 FSQRT (vector)

Floating-point Square Root (vector). This instruction calculates the square root for each vector element in the source SIMD&FP register, places the result in a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#) or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

```

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> For the half-precision variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:

- 4H when Q = 0
- 8H when Q = 1

For the single-precision and double-precision variant: is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:

- 2S when sz = 0, Q = 0
- 4S when sz = 0, Q = 1
- 2D when sz = 1, Q = 1

The encoding sz = 1, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FPSqrt(element, FPCR[]);

V[d] = result;
```

C7.2.172 FSQRT (scalar)

Floating-point Square Root (scalar). This instruction calculates the square root of the value in the SIMD&FP source register and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FSQRT <Hd>, <Hn>

Single-precision variant

Applies when ftype == 00.

FSQRT <Sd>, <Sn>

Double-precision variant

Applies when ftype == 01.

FSQRT <Dd>, <Dn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hn> Is the 16-bit name of the SIMD&FP source register, encoded in the "Rn" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPEnabled64();  
  
FPCRTYPE fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[d] else Zeros();  
  
bits(esize) operand = V[n];  
  
Elem[result, 0, esize] = FPSqrt(operand, fpcr);  
  
V[d] = result;
```

C7.2.173 FSUB (vector)

Floating-point Subtract (vector). This instruction subtracts the elements in the vector in the second source SIMD&FP register, from the corresponding elements in the vector in the first source SIMD&FP register, places each result into elements of a vector, and writes the vector to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision

    diff = FPSub(element1, element2, fpcr);
    Elem[result, e, esize] = if abs then FPAbs(diff) else diff;

V[d] = result;
```

C7.2.174 FSUB (scalar)

Floating-point Subtract (scalar). This instruction subtracts the floating-point value of the second source SIMD&FP register from the floating-point value of the first source SIMD&FP register, and writes the result to the destination SIMD&FP register.

This instruction can generate a floating-point exception. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Half-precision variant

Applies when ftype == 11.

FSUB <Hd>, <Hn>, <Hm>

Single-precision variant

Applies when ftype == 00.

FSUB <Sd>, <Sn>, <Sm>

Double-precision variant

Applies when ftype == 01.

FSUB <Dd>, <Dn>, <Dm>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer esize;
case ftype of
    when '00' esize = 32;
    when '01' esize = 64;
    when '10' UNDEFINED;
    when '11'
        if HaveFP16Ext() then
            esize = 16;
        else
            UNDEFINED;
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

- <Hn> Is the 16-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Hm> Is the 16-bit name of the second SIMD&FP source register, encoded in the "Rm" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPEnabled64();  
bits(esize) operand1 = V[n];  
bits(esize) operand2 = V[m];  
  
FPCRType fpcr = FPCR[];  
boolean merge = IsMerging(fpcr);  
bits(128) result = if merge then V[n] else Zeros();  
  
ELEM[result, 0, esize] = FPSUB(operand1, operand2, fpcr);  
V[d] = result;
```

C7.2.175 INS (element)

Insert vector element from another vector element. This instruction copies the vector element of the source SIMD&FP register to the specified vector element of the destination SIMD&FP register.

This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias MOV (element). The alias is always the preferred disassembly.

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	11	10	9	5	4	0
0	1	1	0	1	1	1	0	0	0	0	imm5	0	imm4	1	Rn	Rd				

Encoding

INS <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);
if size > 3 then UNDEFINED;

integer dst_index = UInt(imm5<4:size+1>);
integer src_index = UInt(imm4<3:size>);
integer idxdsize = if imm4<3> == '1' then 128 else 64;
// imm4<size-1:0> is IGNORED

integer esize = 8 << size;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ts> Is an element size specifier, encoded in the "imm5" field. It can have the following values:
 - B when imm5 = xxxx1
 - H when imm5 = xxx10
 - S when imm5 = xx100
 - D when imm5 = x1000
 The encoding imm5 = x0000 is reserved.
- <index1> Is the destination element index encoded in the "imm5" field. It can have the following values:
 - imm5<4:1> when imm5 = xxxx1
 - imm5<4:2> when imm5 = xxx10
 - imm5<4:3> when imm5 = xx100
 - imm5<4> when imm5 = x1000
 The encoding imm5 = x0000 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<index2> Is the source element index encoded in the "imm5:imm4" field. It can have the following values:

- imm4<3:0> when imm5 = xxxx1
- imm4<3:1> when imm5 = xxx10
- imm4<3:2> when imm5 = xx100
- imm4<3> when imm5 = x1000

The encoding imm5 = x0000 is reserved.

Unspecified bits in "imm4" are ignored but should be set to zero by an assembler.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(idxsize) operand = V[n];
bits(128) result;

result = V[d];
Elem[result, dst_index, esize] = Elem[operand, src_index, esize];
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.176 INS (general)

Insert vector element from general-purpose register. This instruction copies the contents of the source general-purpose register to the specified vector element in the destination SIMD&FP register.

This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias [MOV \(from general\)](#). The alias is always the preferred disassembly.

Encoding

INS <Vd>.<Ts>[<index>], <R><n>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size = LowestSetBit(imm5);

if size > 3 then UNDEFINED;
integer index = UInt(imm5<4:size+1>);

integer esize = 8 << size;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ts> Is an element size specifier, encoded in the "imm5" field. It can have the following values:
- | | |
|---|-------------------|
| B | when imm5 = xxxx1 |
| H | when imm5 = xxx10 |
| S | when imm5 = xx100 |
| D | when imm5 = x1000 |
- The encoding imm5 = x0000 is reserved.
- <index> Is the element index encoded in the "imm5" field. It can have the following values:
- | | |
|-----------|-------------------|
| imm5<4:1> | when imm5 = xxxx1 |
| imm5<4:2> | when imm5 = xxx10 |
| imm5<4:3> | when imm5 = xx100 |
| imm5<4> | when imm5 = x1000 |
- The encoding imm5 = x0000 is reserved.
- <R> Is the width specifier for the general-purpose source register, encoded in the "imm5" field. It can have the following values:
- | | |
|---|-------------------|
| W | when imm5 = xxxx1 |
|---|-------------------|

W when imm5 = xxx10
W when imm5 = xx100
X when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<n> Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(esize) element = X[n];  
bits(128) result;  
  
result = V[d];  
Elem[result, index, esize] = element;  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.177 LD1 (multiple structures)

Load multiple single-element structures to one, two, three, or four registers. This instruction loads multiple single-element structures from memory and writes the result to one, two, three, or four SIMD&FP registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	12	11	10	9	5	4	0

Three registers, register offset variant

Applies when Rm != 11111 && opcode == 0110.

LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>

Four registers, immediate offset variant

Applies when Rm == 11111 && opcode == 0010.

LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>

Four registers, register offset variant

Applies when Rm != 11111 && opcode == 0010.

LD1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean tag_checked = wback || n != 31;
```

Assembler symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1
- 1D when size = 11, Q = 0
- 2D when size = 11, Q = 1

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

- <Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
- <Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> For the one register, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:
 #8 when Q = 0
 #16 when Q = 1
 For the two registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:
 #16 when Q = 0
 #32 when Q = 1
 For the three registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:
 #24 when Q = 0
 #48 when Q = 1
 For the four registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:
 #32 when Q = 0
 #64 when Q = 1
- <Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared decode for all encodings

```
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;

```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.178 LD1 (single structure)

Load one single-element structure to one lane of one register. This instruction loads a single-element structure from memory and writes the result to the specified lane of the SIMD&FP register without affecting the other bits of the register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

8-bit variant

Applies when opcode == 000.

LD1 { <Vt>.B } [<index>], [<Xn|SP>]

16-bit variant

Applies when opcode == 010 && size == x0.

LD1 { <Vt>.H } [<index>], [<Xn|SP>]

32-bit variant

Applies when opcode == 100 && size == 00.

LD1 { <Vt>.S } [<index>], [<Xn|SP>]

64-bit variant

Applies when opcode == 100 && S == 0 && size == 01.

LD1 { <Vt>.D } [<index>], [<Xn|SP>]

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;
```

Post-index

8-bit, immediate offset variant

Applies when Rm == 11111 && opcode == 000.

LD1 { <Vt>.B } [<index>], [<Xn|SP>], #1

8-bit, register offset variant

Applies when $Rm \neq 11111$ && opcode == 000.

LD1 { <Vt>.B }[<index>], [<Xn|SP>], <Xm>

16-bit, immediate offset variant

Applies when $Rm == 11111$ && opcode == 010 && size == x0.

LD1 { <Vt>.H }[<index>], [<Xn|SP>], #2

16-bit, register offset variant

Applies when $Rm \neq 11111$ && opcode == 010 && size == x0.

LD1 { <Vt>.H }[<index>], [<Xn|SP>], <Xm>

32-bit, immediate offset variant

Applies when $Rm == 11111$ && opcode == 100 && size == 00.

LD1 { <Vt>.S }[<index>], [<Xn|SP>], #4

32-bit, register offset variant

Applies when $Rm \neq 11111$ && opcode == 100 && size == 00.

LD1 { <Vt>.S }[<index>], [<Xn|SP>], <Xm>

64-bit, immediate offset variant

Applies when $Rm == 11111$ && opcode == 100 && S == 0 && size == 01.

LD1 { <Vt>.D }[<index>], [<Xn|SP>], #8

64-bit, register offset variant

Applies when $Rm \neq 11111$ && opcode == 100 && S == 0 && size == 01.

LD1 { <Vt>.D }[<index>], [<Xn|SP>], <Xm>

Decode for all variants of this encoding

```
integer t = UInt(Rt);

```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.179 LD1R

Load one single-element structure and Replicate to all lanes (of one register). This instruction loads a single-element structure from memory and replicates the structure to all the lanes of the SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

Encoding

LD1R { <Vt>.<T> }, [<Xn|SP>]

Decode for this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;
```

Post-index

Immediate offset variant

Applies when Rm == 11111.

LD1R { <Vt>.<T> }, [<Xn|SP>], <imm>

Register offset variant

Applies when Rm != 11111.

LD1R { <Vt>.<T> }, [<Xn|SP>], <Xm>

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean tag_checked = wback || n != 31;
```

Assembler symbols

- <Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0

16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1
1D	when size = 11, Q = 0
2D	when size = 11, Q = 1

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in the "size" field. It can have the following values:

#1	when size = 00
#2	when size = 01
#4	when size = 10
#8	when size = 11

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared decode for all encodings

```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.180 LD2 (multiple structures)

Load multiple 2-element structures to two registers. This instruction loads multiple 2-element structures from memory and writes the result to the two SIMD&FP registers, with de-interleaving.

For an example of de-interleaving, see LD3 (multiple structures).

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

Encoding

LD2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]

Decode for this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;
```

Post-index

Immediate offset variant

Applies when Rm == 11111.

LD2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>

Register offset variant

Applies when Rm != 11111.

LD2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean tag_checked = wback || n != 31;
```

Assembler symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.182 LD2R

Load single 2-element structure and Replicate to all lanes of two registers. This instruction loads a 2-element structure from memory and replicates the structure to all the lanes of the two SIMD&FP registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

Encoding

LD2R { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]

Decode for this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;
```

Post-index

Immediate offset variant

Applies when Rm == 11111.

LD2R { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>

Register offset variant

Applies when Rm != 11111.

LD2R { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean tag_checked = wback || n != 31;
```

Assembler symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0

16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1
1D	when size = 11, Q = 0
2D	when size = 11, Q = 1

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.

<Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the post-index immediate offset, encoded in the "size" field. It can have the following values:

#2	when size = 00
#4	when size = 01
#8	when size = 10
#16	when size = 11

<Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared decode for all encodings

```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.184 LD3 (single structure)

Load single 3-element structure to one lane of three registers. This instruction loads a 3-element structure from memory and writes the result to the corresponding elements of the three SIMD&FP registers without affecting the other bits of the registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

8-bit variant

Applies when opcode == 001.

LD3 { <Vt>.B, <Vt2>.B, <Vt3>.B } [<index>], [<Xn|SP>]

16-bit variant

Applies when opcode == 011 && size == x0.

LD3 { <Vt>.H, <Vt2>.H, <Vt3>.H } [<index>], [<Xn|SP>]

32-bit variant

Applies when opcode == 101 && size == 00.

LD3 { <Vt>.S, <Vt2>.S, <Vt3>.S } [<index>], [<Xn|SP>]

64-bit variant

Applies when opcode == 101 && S == 0 && size == 01.

LD3 { <Vt>.D, <Vt2>.D, <Vt3>.D } [<index>], [<Xn|SP>]

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;
```

Post-index

8-bit, immediate offset variant

Applies when Rm == 11111 && opcode == 001.

LD3 { <Vt>.B, <Vt2>.B, <Vt3>.B } [<index>], [<Xn|SP>], #3

8-bit, register offset variant

Applies when $Rm \neq 11111$ && opcode == 001.

LD3 { <Vt>.B, <Vt2>.B, <Vt3>.B }[<index>], [<Xn|SP>], <Xm>

16-bit, immediate offset variant

Applies when $Rm == 11111$ && opcode == 011 && size == x0.

LD3 { <Vt>.H, <Vt2>.H, <Vt3>.H }[<index>], [<Xn|SP>], #6

16-bit, register offset variant

Applies when $Rm \neq 11111$ && opcode == 011 && size == x0.

LD3 { <Vt>.H, <Vt2>.H, <Vt3>.H }[<index>], [<Xn|SP>], <Xm>

32-bit, immediate offset variant

Applies when $Rm == 11111$ && opcode == 101 && size == 00.

LD3 { <Vt>.S, <Vt2>.S, <Vt3>.S }[<index>], [<Xn|SP>], #12

32-bit, register offset variant

Applies when $Rm \neq 11111$ && opcode == 101 && size == 00.

LD3 { <Vt>.S, <Vt2>.S, <Vt3>.S }[<index>], [<Xn|SP>], <Xm>

```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.186 LD4 (multiple structures)

Load multiple 4-element structures to four registers. This instruction loads multiple 4-element structures from memory and writes the result to the four SIMD&FP registers, with de-interleaving.

For an example of de-interleaving, see LD3 (multiple structures).

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

Encoding

LD4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]

Decode for this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;
```

Post-index

Immediate offset variant

Applies when Rm == 11111.

LD4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>

Register offset variant

Applies when Rm != 11111.

LD4 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean tag_checked = wback || n != 31;
```

Assembler symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The encoding size = 11, Q = 0 is reserved.
- <Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
- <Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
- <Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> Is the post-index immediate offset, encoded in the "Q" field. It can have the following values:
- | | |
|-----|------------|
| #32 | when Q = 0 |
| #64 | when Q = 1 |
- <Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared decode for all encodings

```
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer datasize = if Q == '1' then 128 else 64;
integer esize = 8 << UInt(size);
integer elements = datasize DIV esize;

integer rpt; // number of iterations
integer selem; // structure elements

case opcode of
  when '0000' rpt = 1; selem = 4; // LD/ST4 (4 registers)
  when '0010' rpt = 4; selem = 1; // LD/ST1 (4 registers)
  when '0100' rpt = 1; selem = 3; // LD/ST3 (3 registers)
  when '0110' rpt = 3; selem = 1; // LD/ST1 (3 registers)
  when '0111' rpt = 1; selem = 1; // LD/ST1 (1 register)
  when '1000' rpt = 1; selem = 2; // LD/ST2 (2 registers)
  when '1010' rpt = 2; selem = 1; // LD/ST1 (2 registers)
  otherwise UNDEFINED;

// .1D format only permitted with LD1 & ST1
if size:Q == '110' && selem != 1 then UNDEFINED;
```

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();

        X[n] = address + offs;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.187 LD4 (single structure)

Load single 4-element structure to one lane of four registers. This instruction loads a 4-element structure from memory and writes the result to the corresponding elements of the four SIMD&FP registers without affecting the other bits of the registers.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

8-bit variant

Applies when opcode == 001.

LD4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>]

16-bit variant

Applies when opcode == 011 && size == x0.

LD4 { <Vt>.H, <Vt2>.H, <Vt3>.H, <Vt4>.H }[<index>], [<Xn|SP>]

32-bit variant

Applies when opcode == 101 && size == 00.

LD4 { <Vt>.S, <Vt2>.S, <Vt3>.S, <Vt4>.S }[<index>], [<Xn|SP>]

64-bit variant

Applies when opcode == 101 && S == 0 && size == 01.

LD4 { <Vt>.D, <Vt2>.D, <Vt3>.D, <Vt4>.D }[<index>], [<Xn|SP>]

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;
```

Post-index

8-bit, immediate offset variant

Applies when Rm == 11111 && opcode == 001.

LD4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>], #4

8-bit, register offset variant

Applies when $Rm \neq 11111$ && opcode == 001.

LD4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>], <Xm>

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.189 LDNP (SIMD&FP)

Load Pair of SIMD&FP registers, with Non-temporal hint. This instruction loads a pair of SIMD&FP registers from memory, issuing a hint to the memory system that the access is non-temporal. The address that is used for the load is calculated from a base register value and an optional immediate offset.

For information about non-temporal pair instructions, see [Load/store SIMD and floating-point non-temporal pair on page C3-233](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

32-bit variant

Applies when `opc == 00`.

LDNP <St1>, <St2>, [<Xn|SP>{, #<imm>}]

64-bit variant

Applies when `opc == 01`.

LDNP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]

128-bit variant

Applies when `opc == 10`.

LDNP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]

Decode for all variants of this encoding

// Empty.

Notes for all encodings

For information about the **CONSTRAINED UNPREDICTABLE** behavior of this instruction, see [Appendix K1 Architectural Constraints on UNPREDICTABLE Behaviors](#), and particularly [LDNP \(SIMD&FP\) on page K1-8415](#).

Assembler symbols

- <Dt1> Is the 64-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Dt2> Is the 64-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
- <Qt1> Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Qt2> Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
- <St1> Is the 32-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <St2> Is the 32-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> For the 32-bit variant: is the optional signed immediate byte offset, a multiple of 4 in the range -256 to 252, defaulting to 0 and encoded in the "imm7" field as <imm>/4.
 For the 64-bit variant: is the optional signed immediate byte offset, a multiple of 8 in the range -512 to 504, defaulting to 0 and encoded in the "imm7" field as <imm>/8.
 For the 128-bit variant: is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the "imm7" field as <imm>/16.

else
    address = X[n];

address = address + offset;

data1 = Mem[address, dbytes, AccType_VECSTREAM];
data2 = Mem[address+dbytes, dbytes, AccType_VECSTREAM];
if rt_unknown then
    data1 = bits(datasize) UNKNOWN;
    data2 = bits(datasize) UNKNOWN;
V[t] = data1;
V[t2] = data2;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.190 LDP (SIMD&FP)

Load Pair of SIMD&FP registers. This instruction loads a pair of SIMD&FP registers from memory. The address that is used for the load is calculated from a base register value and an optional immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Post-index

32-bit variant

Applies when `opc == 00`.

LDP <St1>, <St2>, [<Xn|SP>], #<imm>

64-bit variant

Applies when `opc == 01`.

LDP <Dt1>, <Dt2>, [<Xn|SP>], #<imm>

128-bit variant

Applies when `opc == 10`.

LDP <Qt1>, <Qt2>, [<Xn|SP>], #<imm>

Decode for all variants of this encoding

```
boolean wback = TRUE;
boolean postindex = TRUE;
```

Pre-index

32-bit variant

Applies when `opc == 00`.

LDP <St1>, <St2>, [<Xn|SP>, #<imm>]!

64-bit variant

Applies when `opc == 01`.

LDP <Dt1>, <Dt2>, [<Xn|SP>, #<imm>]!

128-bit variant

Applies when `opc == 10`.

LDP <Qt1>, <Qt2>, [<Xn|SP>, #<imm>]!

Decode for all variants of this encoding

boolean wback = TRUE;
 boolean postindex = FALSE;

Signed offset

32-bit variant

Applies when opc == 00.
 LDP <St1>, <St2>, [<Xn|SP>{, #<imm>}]

64-bit variant

Applies when opc == 01.
 LDP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]

128-bit variant

Applies when opc == 10.
 LDP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]

Decode for all variants of this encoding

boolean wback = FALSE;
 boolean postindex = FALSE;

Notes for all encodings

For information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see [LDP \(SIMD&FP\)](#) on page K1-8416, and particularly [LDNP \(SIMD&FP\)](#) on page K1-8415.

Assembler symbols

- <Dt1> Is the 64-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Dt2> Is the 64-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
- <Qt1> Is the 128-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Qt2> Is the 128-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
- <St1> Is the 32-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.
- <St2> Is the 32-bit name of the second SIMD&FP register to be transferred, encoded in the "Rt2" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
- <imm> For the 32-bit post-index and 32-bit pre-index variant: is the signed immediate byte offset, a multiple of 4 in the range -256 to 252, encoded in the "imm7" field as <imm>/4.
 For the 32-bit signed offset variant: is the optional signed immediate byte offset, a multiple of 4 in the range -256 to 252, defaulting to 0 and encoded in the "imm7" field as <imm>/4.

For the 64-bit post-index and 64-bit pre-index variant: is the signed immediate byte offset, a multiple of 8 in the range -512 to 504, encoded in the "imm7" field as <imm>/8.

For the 64-bit signed offset variant: is the optional signed immediate byte offset, a multiple of 8 in the range -512 to 504, defaulting to 0 and encoded in the "imm7" field as <imm>/8.

For the 128-bit post-index and 128-bit pre-index variant: is the signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, encoded in the "imm7" field as <imm>/16.

For the 128-bit signed offset variant: is the optional signed immediate byte offset, a multiple of 16 in the range -1024 to 1008, defaulting to 0 and encoded in the "imm7" field as <imm>/16.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
integer t2 = UInt(Rt2);
if opc == '11' then UNDEFINED;
integer scale = 2 + UInt(opc);
integer datasize = 8 << scale;
bits(64) offset = LSL(SignExtend(imm7, 64), scale);
boolean tag_checked = wback || n != 31;

boolean rt_unknown = FALSE;

if t == t2 then
    Constraint c = ConstrainUnpredictable();
    assert c IN {Constraint_UNKNOWN, Constraint_UNDEF, Constraint_NOP};
    case c of
        when Constraint_UNKNOWN rt_unknown = TRUE;    // result is UNKNOWN
        when Constraint_UNDEF    UNDEFINED;
        when Constraint_NOP      EndOfInstruction();
```

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();

bits(64) address;
bits(datasize) data1;
bits(datasize) data2;
constant integer dbytes = datasize DIV 8;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then

V[t2] = data2;

if wback then
    if postindex then
        address = address + offset;
    if n == 31 then
```

```
    SP[] = address;  
else  
    X[n] = address;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.191 LDR (immediate, SIMD&FP)

Load SIMD&FP Register (immediate offset). This instruction loads an element from memory, and writes the result as a scalar to the SIMD&FP register. The address that is used for the load is calculated from a base register value, a signed immediate offset, and an optional offset that is a multiple of the element size.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Post-index

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer size;
bits(64) offset;

case opc of
  when '00'
    size = 4;
  when '01'
    size = 8;
  when '10'
    size = 16;
  when '11'
    UNDEFINED;

offset = SignExtend(imm19:'00', 64);
```

Assembler symbols

- <Dt> Is the 64-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
- <Qt> Is the 128-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
- <St> Is the 32-bit name of the SIMD&FP register to be loaded, encoded in the "Rt" field.
- <label> Is the program label from which the data is to be loaded. Its offset from the address of this instruction, in the range +/-1MB, is encoded as "imm19" times 4.

Operation

```
CheckFPAdvSIMDEnabled64();  
  
bits(64) address = PC[] + offset;  
bits(size*8) data;  
  
if HaveMTE2Ext() then  
    SetTagCheckedInstruction(FALSE);  
  
data = Mem[address, size, AccType_VEC];  
V[t] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.193 LDR (register, SIMD&FP)

Load SIMD&FP Register (register offset). This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from a base register value and an offset register value. The offset can be optionally shifted and extended.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

8-fsreg, LDR-8-fsreg variant

Applies when size == 00 && opc == 01 && option != 011.

    when MemOp_LOAD
        data = Mem[address, datasize DIV 8, AccType_VEC];
        V[t] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.194 LDUR (SIMD&FP)

Load SIMD&FP Register (unscaled offset). This instruction loads a SIMD&FP register from memory. The address that is used for the load is calculated from a base register value and an optional immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

8-bit variant

Applies when size == 00 && opc == 01.

LDUR <Bt>, [<Xn|SP>{, #<sim>}]

16-bit variant

Applies when size == 01 && opc == 01.

LDUR <Ht>, [<Xn|SP>{, #<sim>}]

32-bit variant

Applies when size == 10 && opc == 01.

LDUR <St>, [<Xn|SP>{, #<sim>}]

64-bit variant

Applies when size == 11 && opc == 01.

LDUR <Dt>, [<Xn|SP>{, #<sim>}]

128-bit variant

Applies when size == 00 && opc == 11.

LDUR <Qt>, [<Xn|SP>{, #<sim>}]

Decode for all variants of this encoding

```
integer scale = UInt(opc<1>:size);
if scale > 4 then UNDEFINED;
bits(64) offset = SignExtend(imm9, 64);
```

Assembler symbols

- <Bt> Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Dt> Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Ht> Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Qt> Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <St> Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
MemOp memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
integer datasize = 8 << scale;
boolean tag_checked = memop != MemOp_PREFETCH && (n != 31);
```

Operation

```
CheckFPAdvSIMDEnabled64();
bits(64) address;
bits(datasize) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
    address = SP[];
else
    address = X[n];

address = address + offset;

case memop of
    when MemOp_STORE
        data = V[t];
        Mem[address, datasize DIV 8, AccType_VEC] = data;

    when MemOp_LOAD
        data = Mem[address, datasize DIV 8, AccType_VEC];
        V[t] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.195 MLA (by element)

Multiply-Add to accumulator (vector, by element). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and accumulates the results with the vector elements of the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

MLA <Vd>.<T>, <Vn>.<T>, <Vm>.<Ts>[<index>]

Decode for this encoding

```
integer idxsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean sub_op = (o2 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|----|-----------------------|
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The following encodings are reserved:
- size = 00, Q = x.
 - size = 11, Q = x.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:
- | | |
|------|----------------|
| 0:Rm | when size = 01 |
|------|----------------|

M:Rm when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Restricted to V0-V15 when element size <Ts> is H.

<Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:

H when size = 01

S when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<index> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:

H:L:M when size = 01

H:L when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(idxsize) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
integer element1;
integer element2;
bits(esize) product;

element2 = UInt(Elem[operand2, index, esize]);
for e = 0 to elements-1
    element1 = UInt(Elem[operand1, e, esize]);
    product = (element1*element2)<esize-1:0>;
    if sub_op then
        Elem[result, e, esize] = Elem[operand3, e, esize] - product;
    else
        Elem[result, e, esize] = Elem[operand3, e, esize] + product;
V[d] = result;
    
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.196 MLA (vector)

Multiply-Add to accumulator (vector). This instruction multiplies corresponding elements in the vectors of the two source SIMD&FP registers, and accumulates the results with the vector elements of the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

MLA <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean sub_op = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
bits(esize) product;
```

```
for e = 0 to elements-1
  element1 = Elem[operand1, e, esize];
  element2 = Elem[operand2, e, esize];
  product = (UInt(element1)*UInt(element2))<esize-1:0>;
  if sub_op then
    Elem[result, e, esize] = Elem[operand3, e, esize] - product;
  else
    Elem[result, e, esize] = Elem[operand3, e, esize] + product;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.197 MLS (by element)

Multiply-Subtract from accumulator (vector, by element). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, and subtracts the results from the vector elements of the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

MLS <Vd>.<T>, <Vn>.<T>, <Vm>.<Ts>[<index>]

Decode for this encoding

```
integer idxsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean sub_op = (o2 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|----|-----------------------|
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The following encodings are reserved:
- size = 00, Q = x.
 - size = 11, Q = x.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:
- | | |
|------|----------------|
| 0:Rm | when size = 01 |
|------|----------------|

M:Rm when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Restricted to V0-V15 when element size <Ts> is H.

<Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:

H when size = 01

S when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<index> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:

H:L:M when size = 01

H:L when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(idxsize) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
integer element1;
integer element2;
bits(esize) product;

element2 = UInt(Elem[operand2, index, esize]);
for e = 0 to elements-1
    element1 = UInt(Elem[operand1, e, esize]);
    product = (element1*element2)<esize-1:0>;
    if sub_op then
        Elem[result, e, esize] = Elem[operand3, e, esize] - product;
    else
        Elem[result, e, esize] = Elem[operand3, e, esize] + product;
V[d] = result;
    
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.198 MLS (vector)

Multiply-Subtract from accumulator (vector). This instruction multiplies corresponding elements in the vectors of the two source SIMD&FP registers, and subtracts the results from the vector elements of the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

MLS <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean sub_op = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
bits(esize) product;
```

```
for e = 0 to elements-1
  element1 = Elem[operand1, e, esize];
  element2 = Elem[operand2, e, esize];
  product = (UInt(element1)*UInt(element2))<esize-1:0>;
  if sub_op then
    Elem[result, e, esize] = Elem[operand3, e, esize] - product;
  else
    Elem[result, e, esize] = Elem[operand3, e, esize] + product;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.199 MOV (scalar)

Move vector element to scalar. This instruction duplicates the specified vector element in the SIMD&FP source register into a scalar, and writes the result to the SIMD&FP destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the DUP (element) instruction. This means that:

- The encodings in this description are named to match the encodings of DUP (element).
- The description of DUP (element) gives the operational pseudocode for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0
0	1	0	1	1	1	1	0	0	0	0	imm5	0	0	0	0	0	1	Rn	Rd			

Encoding

MOV <V><d>, <Vn>.<T>[<index>]

is equivalent to

DUP <V><d>, <Vn>.<T>[<index>]

and is always the preferred disassembly.

Assembler symbols

<V> Is the destination width specifier, encoded in the "imm5" field. It can have the following values:

- B when imm5 = xxxx1
- H when imm5 = xxx10
- S when imm5 = xx100
- D when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is the element width specifier, encoded in the "imm5" field. It can have the following values:

- B when imm5 = xxxx1
- H when imm5 = xxx10
- S when imm5 = xx100
- D when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<index> Is the element index encoded in the "imm5" field. It can have the following values:

- imm5<4:1> when imm5 = xxxx1
- imm5<4:2> when imm5 = xxx10
- imm5<4:3> when imm5 = xx100
- imm5<4> when imm5 = x1000

The encoding imm5 = x0000 is reserved.

Operation

The description of [DUP \(element\)](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.200 MOV (element)

Move vector element to another vector element. This instruction copies the vector element of the source SIMD&FP register to the specified vector element of the destination SIMD&FP register.

This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the INS (element) instruction. This means that:

- The encodings in this description are named to match the encodings of INS (element).
- The description of INS (element) gives the operational pseudocode for this instruction.

31 30 29 28				27 26 25 24				23 22 21 20				16 15 14			11 10 9			5 4		0	
0	1	1	0	1	1	1	0	0	0	0	0	imm5			0	imm4		1	Rn		Rd

Encoding

MOV <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]

is equivalent to

INS <Vd>.<Ts>[<index1>], <Vn>.<Ts>[<index2>]

and is always the preferred disassembly.

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in the "imm5" field. It can have the following values:

B when imm5 = xxxx1

H when imm5 = xxx10

S when imm5 = xx100

D when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<index1> Is the destination element index encoded in the "imm5" field. It can have the following values:

imm5<4:1> when imm5 = xxxx1

imm5<4:2> when imm5 = xxx10

imm5<4:3> when imm5 = xx100

imm5<4> when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<index2> Is the source element index encoded in the "imm5:imm4" field. It can have the following values:

imm4<3:0> when imm5 = xxxx1

imm4<3:1> when imm5 = xxx10

imm4<3:2> when imm5 = xx100

`imm4<3>` when `imm5 = x1000`

The encoding `imm5 = x0000` is reserved.

Unspecified bits in "imm4" are ignored but should be set to zero by an assembler.

Operation

The description of [INS \(element\)](#) gives the operational pseudocode for this instruction.

Operational information

If `PSTATE.DIT` is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.201 MOV (from general)

Move general-purpose register to a vector element. This instruction copies the contents of the source general-purpose register to the specified vector element in the destination SIMD&FP register.

This instruction can insert data into individual elements within a SIMD&FP register without clearing the remaining bits to zero.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the [INS \(general\)](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [INS \(general\)](#).
- The description of [INS \(general\)](#) gives the operational pseudocode for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0
0	1	0	0	1	1	1	0	0	0	0	imm5	0	0	0	1	1	1	Rn	Rd			

Encoding

MOV <Vd>.<Ts>[<index>], <R><n>

is equivalent to

INS <Vd>.<Ts>[<index>], <R><n>

and is always the preferred disassembly.

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ts> Is an element size specifier, encoded in the "imm5" field. It can have the following values:

B	when imm5 = xxxx1
H	when imm5 = xxx10
S	when imm5 = xx100
D	when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<index> Is the element index encoded in the "imm5" field. It can have the following values:

imm5<4:1>	when imm5 = xxxx1
imm5<4:2>	when imm5 = xxx10
imm5<4:3>	when imm5 = xx100
imm5<4>	when imm5 = x1000

The encoding imm5 = x0000 is reserved.

<R> Is the width specifier for the general-purpose source register, encoded in the "imm5" field. It can have the following values:

W	when imm5 = xxxx1
W	when imm5 = xxx10
W	when imm5 = xx100
X	when imm5 = x1000

The encoding `imm5 = x0000` is reserved.

<n> Is the number [0-30] of the general-purpose source register or ZR (31), encoded in the "Rn" field.

Operation

The description of [INS \(general\)](#) gives the operational pseudocode for this instruction.

Operational information

If `PSTATE.DIT` is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.202 MOV (vector)

Move vector. This instruction copies the vector in the source SIMD&FP register into the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the ORR (vector, register) instruction. This means that:

- The encodings in this description are named to match the encodings of ORR (vector, register).
- The description of ORR (vector, register) gives the operational pseudocode for this instruction.

Encoding

MOV <Vd>.<T>, <Vn>.<T>

is equivalent to

ORR <Vd>.<T>, <Vn>.<T>, <Vn>.<T>

and is the preferred disassembly when Rm == Rn.

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

8B when Q = 0
 16B when Q = 1

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

Operation

The description of ORR (vector, register) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.203 MOV (to general)

Move vector element to general-purpose register. This instruction reads the unsigned integer from the source SIMD&FP register, zero-extends it to form a 32-bit or 64-bit value, and writes the result to the destination general-purpose register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the UMOV instruction. This means that:

- The encodings in this description are named to match the encodings of UMOV.
- The description of UMOV gives the operational pseudocode for this instruction.

32-bit variant

Applies when Q == 0 && imm5 == xx100.

MOV <Wd>, <Vn>.S[<index>]

is equivalent to

UMOV <Wd>, <Vn>.S[<index>]

and is always the preferred disassembly.

64-reg, UMOV-64-reg variant

Applies when Q == 1 && imm5 == x1000.

MOV <Xd>, <Vn>.D[<index>]

is equivalent to

UMOV <Xd>, <Vn>.D[<index>]

and is always the preferred disassembly.

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<index> For the 32-bit variant: is the element index encoded in "imm5<4:3>".
 For the 64-reg, UMOV-64-reg variant: is the element index encoded in "imm5<4>".

Operation

The description of UMOV gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.204 MOVl

Move Immediate (vector). This instruction places an immediate constant into every vector element of the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

8-bit variant

Applies when op == 0 && cmode == 1110.

MOVl <Vd>.<T>, #<imm8>{, LSL #0}

16-bit shifted immediate variant

Applies when op == 0 && cmode == 10x0.

MOVl <Vd>.<T>, #<imm8>{, LSL #<amount>}

32-bit shifted immediate variant

Applies when op == 0 && cmode == 0xx0.

MOVl <Vd>.<T>, #<imm8>{, LSL #<amount>}

32-bit shifting ones variant

Applies when op == 0 && cmode == 110x.

MOVl <Vd>.<T>, #<imm8>, MSL #<amount>

64-bit scalar variant

Applies when Q == 0 && op == 1 && cmode == 1110.

MOVl <Dd>, #<imm>

64-bit vector variant

Applies when Q == 1 && op == 1 && cmode == 1110.

MOVl <Vd>.2D, #<imm>

Decode for all variants of this encoding

```
integer rd = UInt(Rd);

integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

ImmediateOp operation;
case cmode:op of
    when '0xx00' operation = ImmediateOp_MOVI;
    when '0xx01' operation = ImmediateOp_MVNI;
    when '0xx10' operation = ImmediateOp_ORR;
    when '0xx11' operation = ImmediateOp_BIC;
    when '10x00' operation = ImmediateOp_MOVI;
```

```

when '10x01' operation = ImmediateOp_MVNI;
when '10x10' operation = ImmediateOp_ORR;
when '10x11' operation = ImmediateOp_BIC;
when '110x0' operation = ImmediateOp_MOVI;
when '110x1' operation = ImmediateOp_MVNI;
when '1110x' operation = ImmediateOp_MOVI;
when '11110' operation = ImmediateOp_MOVI;
when '11111'
    // FMOV Dn,#imm is in main FP instruction set
    if Q == '0' then UNDEFINED;
    operation = ImmediateOp_MOVI;

imm64 = AdvSIMDExpandImm(op, cmode, a:b:c:d:e:f:g:h);
imm = Replicate(imm64, datasize DIV 64);
    
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <imm> Is a 64-bit immediate 'aaaaaaaaabbbbbbbcccccccddeeeeeeefggggggghhhhhhh', encoded in "a:b:c:d:e:f:g:h".
- <T> For the 8-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|-----|------------|
| 8B | when Q = 0 |
| 16B | when Q = 1 |
- For the 16-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|----|------------|
| 4H | when Q = 0 |
| 8H | when Q = 1 |
- For the 32-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|----|------------|
| 2S | when Q = 0 |
| 4S | when Q = 1 |
- <imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".
- <amount> For the 16-bit shifted immediate variant: is the shift amount encoded in the "cmode<1>" field. It can have the following values:
- | | |
|---|-------------------|
| 0 | when cmode<1> = 0 |
| 8 | when cmode<1> = 1 |
- defaulting to 0 if LSL is omitted.
- For the 32-bit shifted immediate variant: is the shift amount encoded in the "cmode<2:1>" field. It can have the following values:
- | | |
|----|----------------------|
| 0 | when cmode<2:1> = 00 |
| 8 | when cmode<2:1> = 01 |
| 16 | when cmode<2:1> = 10 |
| 24 | when cmode<2:1> = 11 |
- defaulting to 0 if LSL is omitted.
- For the 32-bit shifting ones variant: is the shift amount encoded in the "cmode<0>" field. It can have the following values:
- | | |
|---|-------------------|
| 8 | when cmode<0> = 0 |
|---|-------------------|

16 when cmode<0> = 1

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand;
bits(datasize) result;

case operation of
  when ImmediateOp_MOVI
    result = imm;
  when ImmediateOp_MVNI
    result = NOT(imm);
  when ImmediateOp_ORR
    operand = V[rd];
    result = operand OR imm;
  when ImmediateOp_BIC
    operand = V[rd];
    result = operand AND NOT(imm);

V[rd] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.205 MUL (by element)

Multiply (vector, by element). This instruction multiplies the vector elements in the first source SIMD&FP register by the specified value in the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

MUL <Vd>.<T>, <Vn>.<T>, <Vm>.<Ts>[<index>]

Decode for this encoding

```

integer idxdsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
    
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|----|-----------------------|
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The following encodings are reserved:
- size = 00, Q = x.
 - size = 11, Q = x.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:
- | | |
|------|----------------|
| 0:Rm | when size = 01 |
| M:Rm | when size = 10 |

The following encodings are reserved:

- size = 00.
- size = 11.

Restricted to V0-V15 when element size <Ts> is H.

<Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:

H when size = 01
S when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<index> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:

H:L:M when size = 01
H:L when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(idxsizesize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
bits(esize) product;

element2 = UInt(Elem[operand2, index, esize]);
for e = 0 to elements-1
    element1 = UInt(Elem[operand1, e, esize]);
    product = (element1*element2)<esize-1:0>;
    Elem[result, e, esize] = product;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.206 MUL (vector)

Multiply (vector). This instruction multiplies corresponding elements in the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

MUL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if U == '1' && size != '00' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean poly = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
bits(esize) product;
```

```
for e = 0 to elements-1
  element1 = Elem[operand1, e, esize];
  element2 = Elem[operand2, e, esize];
  if poly then
    product = PolynomialMult(element1, element2)<esize-1:0>;
  else
    product = (UInt(element1)*UInt(element2))<esize-1:0>;
  Elem[result, e, esize] = product;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.207 MVN

Bitwise NOT (vector). This instruction reads each vector element from the source SIMD&FP register, places the inverse of each value into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the NOT instruction. This means that:

- The encodings in this description are named to match the encodings of NOT.
- The description of NOT gives the operational pseudocode for this instruction.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4				0
0	Q	1	0	1	1	1	0	0	0	1	0	0	0	0	0	0	0	1	0	1	1	0	Rn			Rd					

Encoding

MVN <Vd>.<T>, <Vn>.<T>

is equivalent to

NOT <Vd>.<T>, <Vn>.<T>

and is always the preferred disassembly.

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

8B when Q = 0
 16B when Q = 1

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

The description of NOT gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.208 MVNI

Move inverted Immediate (vector). This instruction places the inverse of an immediate constant into every vector element of the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

16-bit shifted immediate variant

Applies when cmode == 10x0.

MVNI <Vd>.<T>, #<imm8>{, LSL #<amount>}

32-bit shifted immediate variant

Applies when cmode == 0xx0.

MVNI <Vd>.<T>, #<imm8>{, LSL #<amount>}

32-bit shifting ones variant

Applies when cmode == 110x.

MVNI <Vd>.<T>, #<imm8>, MSL #<amount>

Decode for all variants of this encoding

```
integer rd = UInt(Rd);

integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

ImmediateOp operation;
case cmode:op of
    when '0xx01' operation = ImmediateOp_MVNI;
    when '0xx11' operation = ImmediateOp_BIC;
    when '10x01' operation = ImmediateOp_MVNI;
    when '10x11' operation = ImmediateOp_BIC;
    when '110x1' operation = ImmediateOp_MVNI;
    when '1110x' operation = ImmediateOp_MOVI;
    when '11111'
        // FMOV Dn,#imm is in main FP instruction set
        if Q == '0' then UNDEFINED;
        operation = ImmediateOp_MOVI;

imm64 = AdvSIMDExpandImm(op, cmode, a:b:c:d:e:f:g:h);
imm = Replicate(imm64, datasize DIV 64);
```

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

- <T> For the 16-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|----|------------|
| 4H | when Q = 0 |
| 8H | when Q = 1 |
- For the 32-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|----|------------|
| 2S | when Q = 0 |
| 4S | when Q = 1 |
- <imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".
- <amount> For the 16-bit shifted immediate variant: is the shift amount encoded in the "cmode<1>" field. It can have the following values:
- | | |
|---|-------------------|
| 0 | when cmode<1> = 0 |
| 8 | when cmode<1> = 1 |
- defaulting to 0 if LSL is omitted.
- For the 32-bit shifted immediate variant: is the shift amount encoded in the "cmode<2:1>" field. It can have the following values:
- | | |
|----|----------------------|
| 0 | when cmode<2:1> = 00 |
| 8 | when cmode<2:1> = 01 |
| 16 | when cmode<2:1> = 10 |
| 24 | when cmode<2:1> = 11 |
- defaulting to 0 if LSL is omitted.
- For the 32-bit shifting ones variant: is the shift amount encoded in the "cmode<0>" field. It can have the following values:
- | | |
|----|-------------------|
| 8 | when cmode<0> = 0 |
| 16 | when cmode<0> = 1 |

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand;
bits(datasize) result;
```

```
case operation of
  when ImmediateOp_MOVI
    result = imm;
  when ImmediateOp_MVNI
    result = NOT(imm);
  when ImmediateOp_ORR
    operand = V[rd];
    result = operand OR imm;
  when ImmediateOp_BIC
    operand = V[rd];
    result = operand AND NOT(imm);
```

```
V[rd] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.

- The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.209 NEG (vector)

Negate (vector). This instruction reads each vector element from the source SIMD&FP register, negates each value, puts the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

NEG <V><d>, <V><n>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size != '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean neg = (U == '1');
```

Vector

Encoding

NEG <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean neg = (U == '1');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

D when size = 11

The following encodings are reserved:

- size = 0x.

- size = 10.
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
integer element;

for e = 0 to elements-1
  element = SInt(Elem[operand, e, esize]);
  if neg then
    element = -element;
  else
    element = Abs(element);
  Elem[result, e, esize] = element<size-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.210 NOT

Bitwise NOT (vector). This instruction reads each vector element from the source SIMD&FP register, places the inverse of each value into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias [MVN](#). The alias is always the preferred disassembly.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	5 4			0
0	Q	1	0	1	1	1	0	0	0	1	0	0	0	0	0	0	1	0	1	1	0	Rn			Rd	

Encoding

NOT <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 8;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 8;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|-----|------------|
| 8B | when Q = 0 |
| 16B | when Q = 1 |
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = NOT(element);

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.

- The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.211 ORN (vector)

Bitwise inclusive OR NOT (vector). This instruction performs a bitwise OR NOT between the two source SIMD&FP registers, and writes the result to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

ORN <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|-----|------------|
| 8B | when Q = 0 |
| 16B | when Q = 1 |
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

operand2 = NOT(operand2);

result = operand1 OR operand2;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.212 ORR (vector, immediate)

Bitwise inclusive OR (vector, immediate). This instruction reads each vector element from the destination SIMD&FP register, performs a bitwise OR between each result and an immediate constant, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

16-bit variant

Applies when cmode == 10x1.

ORR <Vd>.<T>, #<imm8>{, LSL #<amount>}

32-bit variant

Applies when cmode == 0xx1.

ORR <Vd>.<T>, #<imm8>{, LSL #<amount>}

Decode for all variants of this encoding

```
integer rd = UInt(Rd);

integer datasize = if Q == '1' then 128 else 64;
bits(datasize) imm;
bits(64) imm64;

ImmediateOp operation;
case cmode:op of
    when '0xx00' operation = ImmediateOp_MOVI;
    when '0xx10' operation = ImmediateOp_ORR;
    when '10x00' operation = ImmediateOp_MOVI;
    when '10x10' operation = ImmediateOp_ORR;
    when '110x0' operation = ImmediateOp_MOVI;
    when '1110x' operation = ImmediateOp_MOVI;
    when '11110' operation = ImmediateOp_MOVI;
imm64 = AdvSIMDExpandImm(op, cmode, a:b:c:d:e:f:g:h);
imm = Replicate(imm64, datasize DIV 64);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP register, encoded in the "Rd" field.
- <T> For the 16-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|----|------------|
| 4H | when Q = 0 |
| 8H | when Q = 1 |
- For the 32-bit variant: is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|----|------------|
| 2S | when Q = 0 |
| 4S | when Q = 1 |

<imm8> Is an 8-bit immediate encoded in "a:b:c:d:e:f:g:h".

<amount> For the 16-bit variant: is the shift amount encoded in the "cmode<1>" field. It can have the following values:

0	when cmode<1> = 0
8	when cmode<1> = 1

defaulting to 0 if LSL is omitted.

For the 32-bit variant: is the shift amount encoded in the "cmode<2:1>" field. It can have the following values:

0	when cmode<2:1> = 00
8	when cmode<2:1> = 01
16	when cmode<2:1> = 10
24	when cmode<2:1> = 11

defaulting to 0 if LSL is omitted.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand;
bits(datasize) result;

case operation of
  when ImmediateOp_MOVI
    result = imm;
  when ImmediateOp_MVNI
    result = NOT(imm);
  when ImmediateOp_ORR
    operand = V[rd];
    result = operand OR imm;
  when ImmediateOp_BIC
    operand = V[rd];
    result = operand AND NOT(imm);

V[rd] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.213 ORR (vector, register)

Bitwise inclusive OR (vector, register). This instruction performs a bitwise OR between the two source SIMD&FP registers, and writes the result to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias MOV (vector). See *Alias conditions* on page C7-2017 for details of when each alias is preferred.

Encoding

ORR <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer datasize = if Q == '1' then 128 else 64;
```

Alias conditions

Alias	is preferred when
MOV (vector)	Rm == Rn

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

result = operand1 OR operand2;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.214 PMUL

Polynomial Multiply. This instruction multiplies corresponding elements in the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register.

For information about multiplying polynomials see *Polynomial arithmetic over {0, 1}* on page A1-50.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

PMUL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if U == '1' && size != '00' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean poly = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
- The following encodings are reserved:
- size = 01, Q = x.
 - size = 1x, Q = x.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;
bits(esize) product;

for e = 0 to elements-1
```

```
element1 = Elem[operand1, e, esize];
element2 = Elem[operand2, e, esize];
if poly then
    product = PolynomialMult(element1, element2)<esize-1:0>;
else
    product = (UInt(element1)*UInt(element2))<esize-1:0>;
Elem[result, e, esize] = product;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.215 PMULL, PMULL2

Polynomial Multiply Long. This instruction multiplies corresponding elements in the lower or upper half of the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

For information about multiplying polynomials see *Polynomial arithmetic over {0, 1}* on page A1-50.

The PMULL instruction extracts each source vector from the lower half of each source register. The PMULL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0
0	Q	0	0	1	1	1	0	size	1	Rm	1	1	1	0	0	0	Rn	Rd				

Encoding

PMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '01' || size == '10' then UNDEFINED;
if size == '11' && !HaveBit128PMULLExt() then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

- [absent] when Q = 0
- [present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

- 8H when size = 00
- 1Q when size = 11

The following encodings are reserved:

- size = 01.
- size = 10.

The '1Q' arrangement is only allocated in an implementation that includes the Cryptographic Extension, and is otherwise RESERVED.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B	when size = 00, Q = 0
16B	when size = 00, Q = 1
1D	when size = 11, Q = 0
2D	when size = 11, Q = 1

The following encodings are reserved:

- size = 01, Q = x.
- size = 10, Q = x.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    Elem[result, e, 2*esize] = PolynomialMult(element1, element2);

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.216 RADDHN, RADDHN2

Rounding Add returning High Narrow. This instruction adds each vector element in the first source SIMD&FP register to the corresponding vector element in the second source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register.

The results are rounded. For truncated results, see [ADDHN](#), [ADDHN2](#).

The RADDHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RADDHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

RADDHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean round = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

8H when size = 00

4S when size = 01

2D when size = 10

The encoding size = 11 is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n];
bits(2*datasize) operand2 = V[m];
bits(datasize) result;
integer round_const = if round then 1 << (esize - 1) else 0;
bits(2*esize) element1;
bits(2*esize) element2;
bits(2*esize) sum;

for e = 0 to elements-1
    element1 = Elem[operand1, e, 2*esize];
    element2 = Elem[operand2, e, 2*esize];
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    sum = sum + round_const;
    Elem[result, e, esize] = sum<2*esize-1:esize>;

Vpart[d, part] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.217 RAX1

Rotate and Exclusive OR rotates each 64-bit element of the 128-bit vector in a source SIMD&FP register left by 1, performs a bitwise exclusive OR of the resulting 128-bit vector and the vector in another source SIMD&FP register, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when [FEAT_SHA3](#) is implemented.

Advanced SIMD

(FEAT_SHA3)

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0
1	1	0	0	1	1	1	0	0	1	1	Rm	1	0	0	0	1	1	Rn	Rd			

Encoding

RAX1 <Vd>.2D, <Vn>.2D, <Vm>.2D

Decode for this encoding

```
if !HaveSHA3Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) Vm = V[m];
bits(128) Vn = V[n];
V[d] = Vn EOR (ROL(Vm<127:64>, 1):ROL(Vm<63:0>, 1));
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.218 RBIT (vector)

Reverse Bit order (vector). This instruction reads each vector element from the source SIMD&FP register, reverses the bits of the element, places the results into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4				0	
0	Q	1	0	1	1	1	0	0	1	1	0	0	0	0	0	0	0	1	0	1	1	0				Rn						Rd

Encoding

RBIT <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 8;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 8;
```

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:

8B	when Q = 0
16B	when Q = 1

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(esize) element;
bits(esize) rev;

for e = 0 to elements-1
    element = Elem[operand, e, esize];
    for i = 0 to esize-1
        rev<esize-1-i> = element<i>;
    Elem[result, e, esize] = rev;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.

- The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.219 REV16 (vector)

Reverse elements in 16-bit halfwords (vector). This instruction reverses the order of 8-bit elements in each halfword of the vector in the source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

REV16 <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

// size=size:  B(0), H(1), S(1), D(S)
integer esize = 8 << UInt(size);

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.222 RSHRN, RSHRN2

Rounding Shift Right Narrow (immediate). This instruction reads each unsigned integer value from the vector in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The results are rounded. For truncated results, see [SHRN](#), [SHRN2](#).

The RSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

RSHRN{2} <Vd>.<Tb>, <Vn>.<Ta>, #<shift>

Decode for this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = (2 * esize) - UInt(immh:immb);
boolean round = (op == '1');
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
 [present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

8B when immh = 0001, Q = 0
 16B when immh = 0001, Q = 1
 4H when immh = 001x, Q = 0
 8H when immh = 001x, Q = 1
 2S when immh = 01xx, Q = 0
 4S when immh = 01xx, Q = 1

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.

- The encoding `immh = 1xxx`, `Q = x` is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:
- | | |
|----|-------------------------------|
| 8H | when <code>immh = 0001</code> |
| 4S | when <code>immh = 001x</code> |
| 2D | when <code>immh = 01xx</code> |
- See [Advanced SIMD modified immediate on page C4-373](#) when `immh = 0000`.
- The encoding `immh = 1xxx` is reserved.
- <shift> Is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:
- | | |
|---|-------------------------------|
| $(16 - \text{UInt}(\text{immh}:\text{immb}))$ | when <code>immh = 0001</code> |
| $(32 - \text{UInt}(\text{immh}:\text{immb}))$ | when <code>immh = 001x</code> |
| $(64 - \text{UInt}(\text{immh}:\text{immb}))$ | when <code>immh = 01xx</code> |
- See [Advanced SIMD modified immediate on page C4-373](#) when `immh = 0000`.
- The encoding `immh = 1xxx` is reserved.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n];
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;

for e = 0 to elements-1
    element = (UInt(Elem[operand, e, 2*esize]) + round_const) >> shift;
    Elem[result, e, esize] = element<esize-1:0>;

Vpart[d, part] = result;
    
```

Operational information

If `PSTATE.DIT` is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.223 RSUBHN, RSUBHN2

Rounding Subtract returning High Narrow. This instruction subtracts each vector element of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register.

The results are rounded. For truncated results, see [SUBHN](#), [SUBHN2](#).

The RSUBHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RSUBHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

RSUBHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean round = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

8H when size = 00

4S when size = 01

2D when size = 10

The encoding size = 11 is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n];
bits(2*datasize) operand2 = V[m];
bits(datasize) result;
integer round_const = if round then 1 << (esize - 1) else 0;
bits(2*esize) element1;
bits(2*esize) element2;
bits(2*esize) sum;

for e = 0 to elements-1
    element1 = Elem[operand1, e, 2*esize];
    element2 = Elem[operand2, e, 2*esize];
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    sum = sum + round_const;
    Elem[result, e, esize] = sum<2*esize-1:esize>;

Vpart[d, part] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.224 SABA

Signed Absolute difference and Accumulate. This instruction subtracts the elements of the vector of the second source SIMD&FP register from the corresponding elements of the first source SIMD&FP register, and accumulates the absolute values of the results into the elements of the vector of the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SABA <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean unsigned = (U == '1');
boolean accumulate = (ac == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1
 The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
bits(esize) absdiff;
```

```
result = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    absdiff = Abs(element1-element2)<esize-1:0>;
    Elem[result, e, esize] = Elem[result, e, esize] + absdiff;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.225 SABAL, SABAL2

Signed Absolute difference and Accumulate Long. This instruction subtracts the vector elements in the lower or upper half of the second source SIMD&FP register from the corresponding vector elements of the first source SIMD&FP register, and accumulates the absolute values of the results into the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The SABAL instruction extracts each source vector from the lower half of each source register. The SABAL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SABAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean accumulate = (op == '0');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1
 The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
bits(esize) absdiff;
```

```
result = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    absdiff = Abs(element1-element2)<esize-1:0>;
    Elem[result, e, esize] = Elem[result, e, esize] + absdiff;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.227 SABDL, SABDL2

Signed Absolute Difference Long. This instruction subtracts the vector elements of the second source SIMD&FP register from the corresponding vector elements of the first source SIMD&FP register, places the absolute value of the results into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The SABDL instruction extracts each source vector from the lower half of each source register, while the SABDL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SABDL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean accumulate = (op == '0');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

 - 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
 The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0

16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) absdiff;

result = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    absdiff = Abs(element1-element2)<2*esize-1:0>;
    Elem[result, e, 2*esize] = Elem[result, e, 2*esize] + absdiff;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.228 SADALP

Signed Add and Accumulate Long Pairwise. This instruction adds pairs of adjacent signed integer values from the vector in the source SIMD&FP register and accumulates the results into the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SADALP <Vd>.<Ta>, <Vn>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV (2 * esize);
boolean acc = (op == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|----|-----------------------|
| 4H | when size = 00, Q = 0 |
| 8H | when size = 00, Q = 1 |
| 2S | when size = 01, Q = 0 |
| 4S | when size = 01, Q = 1 |
| 1D | when size = 10, Q = 0 |
| 2D | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

bits(2*esize) sum;
integer op1;
integer op2;

if acc then result = V[d];
for e = 0 to elements-1
    op1 = Int(Elem[operand, 2*e+0, esize], unsigned);
    op2 = Int(Elem[operand, 2*e+1, esize], unsigned);
    sum = (op1+op2)<2*esize-1:0>;
    if acc then
        Elem[result, e, 2*esize] = Elem[result, e, 2*esize] + sum;
    else
        Elem[result, e, 2*esize] = sum;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.229 SADDL, SADDL2

Signed Add Long (vector). This instruction adds each vector element in the lower or upper half of the first source SIMD&FP register to the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

The SADDL instruction extracts each source vector from the lower half of each source register. The SADDL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SADDL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
 The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0

16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.230 SADDLP

Signed Add Long Pairwise. This instruction adds pairs of adjacent signed integer values from the vector in the source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SADDLP <Vd>.<Ta>, <Vn>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV (2 * esize);
boolean acc = (op == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 4H when size = 00, Q = 0
 - 8H when size = 00, Q = 1
 - 2S when size = 01, Q = 0
 - 4S when size = 01, Q = 1
 - 1D when size = 10, Q = 0
 - 2D when size = 10, Q = 1
 The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1
 The encoding size = 11, Q = x is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

bits(2*esize) sum;
integer op1;
integer op2;

if acc then result = V[d];
for e = 0 to elements-1
    op1 = Int(Elem[operand, 2*e+0, esize], unsigned);
    op2 = Int(Elem[operand, 2*e+1, esize], unsigned);
    sum = (op1+op2)<2*esize-1:0>;
    if acc then
        Elem[result, e, 2*esize] = Elem[result, e, 2*esize] + sum;
    else
        Elem[result, e, 2*esize] = sum;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.231 SADDLV

Signed Add Long across Vector. This instruction adds every vector element in the source SIMD&FP register together, and writes the scalar result to the destination SIMD&FP register. The destination scalar is twice as long as the source vector elements. All the values in this instruction are signed integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SADDLV <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '100' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

Assembler symbols

<V> Is the destination width specifier, encoded in the "size" field. It can have the following values:

- H when size = 00
- S when size = 01
- D when size = 10

The encoding size = 11 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 4S when size = 10, Q = 1

The following encodings are reserved:

- size = 10, Q = 0.
- size = 11, Q = x.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
integer sum;

sum = Int(Elem[operand, 0, esize], unsigned);
for e = 1 to elements-1
    sum = sum + Int(Elem[operand, e, esize], unsigned);

V[d] = sum<2*esize-1:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.232 SADDW, SADDW2

Signed Add Wide. This instruction adds vector elements of the first source SIMD&FP register to the corresponding vector elements in the lower or upper half of the second source SIMD&FP register, places the results in a vector, and writes the vector to the SIMD&FP destination register.

The SADDW instruction extracts the second source vector from the lower half of the second source register. The SADDW2 instruction extracts the second source vector from the upper half of the second source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SADDW{2} <Vd>.<Ta>, <Vn>.<Ta>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
 The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B	when size = 00, Q = 0
16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, 2*esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.233 SCVTF (vector, fixed-point)

Signed fixed-point Convert to Floating-point (vector). This instruction converts each element in a vector from fixed-point to floating-point using the rounding mode that is specified by the **FPCR**, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in **FPCR**, the exception results in either a flag being set in **FPSR**, or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SCVTF <V><d>, <V><n>, #<fbits>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '000x' || (immh == '001x' && !HaveFP16Ext()) then UNDEFINED;
integer esize = if immh == '1xxx' then 64 else if immh == '01xx' then 32 else 16;
integer datasize = esize;
integer elements = 1;

integer fracbits = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
FPRounding rounding = FPRoundingMode(FPCR[]);
```

Vector

Encoding

SCVTF <Vd>.<T>, <Vn>.<T>, #<fbits>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh == '000x' || (immh == '001x' && !HaveFP16Ext()) then UNDEFINED;
if immh<3>:Q == '10' then UNDEFINED;
integer esize = if immh == '1xxx' then 64 else if immh == '01xx' then 32 else 16;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer fracbits = (esize * 2) - UInt(immh:immb);
```

```
boolean unsigned = (U == '1');  
FPRounding rounding = FPRoundingMode(FPCR[]);
```

Assembler symbols

- <V> Is a width specifier, encoded in the "immh" field. It can have the following values:
- H when immh = 001x
 - S when immh = 01xx
 - D when immh = 1xxx
- The encoding immh = 000x is reserved.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
- 4H when immh = 001x, Q = 0
 - 8H when immh = 001x, Q = 1
 - 2S when immh = 01xx, Q = 0
 - 4S when immh = 01xx, Q = 1
 - 2D when immh = 1xxx, Q = 1
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
- The following encodings are reserved:
- immh = 0001, Q = x.
 - immh = 1xxx, Q = 0.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <fbits> For the scalar variant: is the number of fractional bits, in the range 1 to the operand width, encoded in the "immh:immb" field. It can have the following values:
- (32-UInt(immh:immb)) when immh = 001x
 - (64-UInt(immh:immb)) when immh = 01xx
 - (128-UInt(immh:immb)) when immh = 1xxx
- The encoding immh = 000x is reserved.
- For the vector variant: is the number of fractional bits, in the range 1 to the element width, encoded in the "immh:immb" field. It can have the following values:
- (32-UInt(immh:immb)) when immh = 001x
 - (64-UInt(immh:immb)) when immh = 01xx
 - (128-UInt(immh:immb)) when immh = 1xxx
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.
- The encoding immh = 0001 is reserved.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
  
bits(esize) element;  
FPCRType fpcr = FPCR[];  
boolean merge = elements == 1 && IsMerging(fpcr);
```

```
bits(128) result = if merge then V[d] else Zeros();  
  
for e = 0 to elements-1  
    element = Elem[operand, e, esize];  
    Elem[result, e, esize] = FixedToFP(element, fracbits, unsigned, fpcr, rounding);  
  
V[d] = result;
```

C7.2.234 SCVTF (vector, integer)

Signed integer Convert to Floating-point (vector). This instruction converts each element in a vector from signed integer to floating-point using the rounding mode that is specified by the [FPCR](#), and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

Scalar half precision

(FEAT_FP16)

Encoding

SCVTF <Hd>, <Hn>

Decode for this encoding

```
if !HaveFP16Ext() then UNDEFINED;
```

```
integer d = UInt(Rd);
integer n = UInt(Rn);
```

```
integer esize = 16;
integer datasize = esize;

bits(esize) element;
for e = 0 to elements-1
    element = Elem[operand, e, esize];
    Elem[result, e, esize] = FixedToFP(element, 0, unsigned, fpcr, rounding);

V[d] = result;
```

C7.2.235 SCVTF (scalar, fixed-point)

Signed fixed-point Convert to Floating-point (scalar). This instruction converts the signed value in the 32-bit or 64-bit general-purpose source register to a floating-point value using the rounding mode that is specified by the [FPCR](#), and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

32-bit to half-precision variant

Applies when `sf == 0 && ftype == 11`.

SCVTF <Hd>, <Wn>, #<fbits>

32-bit to single-precision variant

Applies when `sf == 0 && ftype == 00`.

SCVTF <Sd>, <Wn>, #<fbits>

32-bit to double-precision variant

Applies when `sf == 0 && ftype == 01`.

SCVTF <Dd>, <Wn>, #<fbits>

64-bit to half-precision variant

Applies when `sf == 1 && ftype == 11`.

SCVTF <Hd>, <Xn>, #<fbits>

64-bit to single-precision variant

Applies when `sf == 1 && ftype == 00`.

SCVTF <Sd>, <Xn>, #<fbits>

64-bit to double-precision variant

Applies when `sf == 1 && ftype == 01`.

SCVTF <Dd>, <Xn>, #<fbits>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer intsize = if sf == '1' then 64 else 32;
integer fltsize;
FPRounding rounding;
```

```

case ftype of
  when '00' fltsize = 32;
  when '01' fltsize = 64;
  when '10' UNDEFINED;
  when '11'
    if HaveFP16Ext() then
      fltsize = 16;
    else
      UNDEFINED;

if sf == '0' && scale<5> == '0' then UNDEFINED;
integer fracbits = 64 - UInt(scale);

rounding = FPRoundingMode(FPCR[]);
  
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- <Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- <fbits> For the 32-bit to double-precision, 32-bit to half-precision and 32-bit to single-precision variant: is the number of bits after the binary point in the fixed-point source, in the range 1 to 32, encoded as 64 minus "scale".
 For the 64-bit to double-precision, 64-bit to half-precision and 64-bit to single-precision variant: is the number of bits after the binary point in the fixed-point source, in the range 1 to 64, encoded as 64 minus "scale".

Operation

```

CheckFPEnabled64();

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
integer fsize = if merge then 128 else fltsize;
bits(fsize) fltval;

V[d] = fltval;
  
```

C7.2.236 SCVTF (scalar, integer)

Signed integer Convert to Floating-point (scalar). This instruction converts the signed integer value in the general-purpose source register to a floating-point value using the rounding mode that is specified by the [FPCR](#), and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

32-bit to half-precision variant

Applies when `sf == 0 && ftype == 11`.

SCVTF <Hd>, <Wn>

32-bit to single-precision variant

Applies when `sf == 0 && ftype == 00`.

SCVTF <Sd>, <Wn>

32-bit to double-precision variant

Applies when `sf == 0 && ftype == 01`.

SCVTF <Dd>, <Wn>

64-bit to half-precision variant

Applies when `sf == 1 && ftype == 11`.

SCVTF <Hd>, <Xn>

64-bit to single-precision variant

Applies when `sf == 1 && ftype == 00`.

SCVTF <Sd>, <Xn>

64-bit to double-precision variant

Applies when `sf == 1 && ftype == 01`.

SCVTF <Dd>, <Xn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer intsize = if sf == '1' then 64 else 32;
integer fltsize;
FPRounding rounding;
```

```
case ftype of
  when '00'
    fltsize = 32;
  when '01'
    fltsize = 64;
  when '10'
    UNDEFINED;
  when '11'
    if HaveFP16Ext() then
      fltsize = 16;
    else
      UNDEFINED;

rounding = FPRoundingMode(FPCR[]);
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- <Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

```
CheckFPEnabled64();

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
integer fsize = if merge then 128 else fltsize;
bits(fsize) fltval;
bits(intsize) intval;

intval = X[n];
fltval = if merge then V[d] else Zeros();
Elem[fltval, 0, fltsize] = FixedToFP(intval, 0, FALSE, fpcr, rounding);
V[d] = fltval;
```

C7.2.237 SDOT (by element)

Dot Product signed arithmetic (vector, by element). This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

———— **Note** —————

[ID_AA64ISAR0_EL1.DP](#) indicates whether this instruction is supported.

Vector

(FEAT_DotProd)

Encoding

SDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<4B[<index>]>

Decode for this encoding

integer index = UInt(H:L);

integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
    
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 2S when Q = 0
 - 4S when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.

<index> Is the element index, encoded in the "H:L" fields.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(128) operand2 = V[m];
bits(datasize) result = V[d];
for e = 0 to elements-1
    integer res = 0;
    integer element1, element2;
    for i = 0 to 3
        if signed then
            element1 = SInt(Elem[operand1, 4*e+i, esize DIV 4]);
            element2 = SInt(Elem[operand2, 4*index+i, esize DIV 4]);
        else
            element1 = UInt(Elem[operand1, 4*e+i, esize DIV 4]);
            element2 = UInt(Elem[operand2, 4*index+i, esize DIV 4]);
        res = res + element1 * element2;
    Elem[result, e, esize] = Elem[result, e, esize] + res;
V[d] = result;
```

C7.2.238 SDOT (vector)

Dot Product signed arithmetic (vector). This instruction performs the dot product of the four signed 8-bit elements in each 32-bit element of the first source register with the four signed 8-bit elements of the corresponding 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

———— **Note** —————

[ID_AA64ISAR0_EL1.DP](#) indicates whether this instruction is supported.

Vector

(FEAT_DotProd)

Encoding

SDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```

if !HaveDOTPExt() then UNDEFINED;
if size != '10' then UNDEFINED;
boolean signed = (U == '0');
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
    
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 2S when Q = 0
 - 4S when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

result = V[d];
for e = 0 to elements-1
    integer res = 0;
    integer element1, element2;
    for i = 0 to 3
        if signed then
            element1 = SInt(Elem[operand1, 4*e+i, esize DIV 4]);
            element2 = SInt(Elem[operand2, 4*e+i, esize DIV 4]);
        else
            element1 = UInt(Elem[operand1, 4*e+i, esize DIV 4]);
            element2 = UInt(Elem[operand2, 4*e+i, esize DIV 4]);
        res = res + element1 * element2;
    Elem[result, e, esize] = Elem[result, e, esize] + res;
V[d] = result;
```

C7.2.239 SHA1C

SHA1 hash update (choose).

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0
0	1	0	1	1	1	1	0	0	0	0		Rm	0	0	0	0	0	0		Rn		Rd

Encoding

SHA1C <Qd>, <Sn>, <Vm>.4S

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if !HaveSHA1Ext() then UNDEFINED;
```

Assembler symbols

<Qd> Is the 128-bit name of the SIMD&FP source and destination, encoded in the "Rd" field.

<Sn> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) X = V[d];
bits(32) Y = V[n]; // Note: 32 not 128 bits wide
bits(128) W = V[m];
bits(32) t;

for e = 0 to 3
    t = SHAchoose(X<63:32>, X<95:64>, X<127:96>);
    Y = Y + ROL(X<31:0>, 5) + t + Elem[W, e, 32];
    X<63:32> = ROL(X<63:32>, 30);
    <Y, X> = ROL(Y:X, 32);
V[d] = X;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.240 SHA1H

SHA1 fixed rotate.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4				0	
0	1	0	1	1	1	1	0	0	0	1	0	1	0	0	0	0	0	0	0	1	0											

Encoding

SHA1H <Sd>, <Sn>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HaveSHA1Ext() then UNDEFINED;
```

Assembler symbols

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.

<Sn> Is the 32-bit name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();
```

```
bits(32) operand = V[n]; // read element [0] only, [1-3] zeroed
V[d] = ROL(operand, 30);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.241 SHA1M

SHA1 hash update (majority).

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0

    X<63:32> = ROL(X<63:32>, 30);
    <Y, X> = ROL(Y:X, 32);
V[d] = X;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.242 SHA1P

SHA1 hash update (parity).

Encoding

SHA1P <Qd>, <Sn>, <Vm>.4S

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if !HaveSHA1Ext() then UNDEFINED;
```

Assembler symbols

- <Qd> Is the 128-bit name of the SIMD&FP source and destination, encoded in the "Rd" field.
- <Sn> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) X = V[d];
bits(32) Y = V[n]; // Note: 32 not 128 bits wide
bits(128) W = V[m];
bits(32) t;

for e = 0 to 3
    t = SHAParity(X<63:32>, X<95:64>, X<127:96>);
    Y = Y + ROL(X<31:0>, 5) + t + Elem[W, e, 32];
    X<63:32> = ROL(X<63:32>, 30);
    <Y, X> = ROL(Y:X, 32);
V[d] = X;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.243 SHA1SU0

SHA1 schedule update 0.

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0

Encoding

SHA1SU1 <Vd>.4S, <Vn>.4S

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
if !HaveSHA1Ext() then UNDEFINED;
```

Assembler symbols

<Vd> Is the name of the SIMD&FP source and destination register, encoded in the "Rd" field.

<Vn> Is the name of the second SIMD&FP source register, encoded in the "Rn" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();
```

```
bits(128) operand1 = V[d];
bits(128) operand2 = V[n];
bits(128) result;
bits(128) T = operand1 EOR LSR(operand2, 32);
result<31:0> = ROL(T<31:0>, 1);
result<63:32> = ROL(T<63:32>, 1);
result<95:64> = ROL(T<95:64>, 1);
result<127:96> = ROL(T<127:96>, 1) EOR ROL(T<31:0>, 2);
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.245 SHA256H2

SHA256 hash update (part 2).

Encoding

SHA256H2 <Qd>, <Qn>, <Vm>.4S

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if !HaveSHA256Ext() then UNDEFINED;
```

Assembler symbols

<Qd> Is the 128-bit name of the SIMD&FP source and destination, encoded in the "Rd" field.

<Qn> Is the 128-bit name of the second SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();
```

```
bits(128) result;
result = SHA256hash(V[n], V[d], V[m], FALSE);
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.246 SHA256H

SHA256 hash update (part 1).

Encoding

SHA256H <Qd>, <Qn>, <Vm>.4S

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if !HaveSHA256Ext() then UNDEFINED;
```

Assembler symbols

<Qd> Is the 128-bit name of the SIMD&FP source and destination, encoded in the "Rd" field.
 <Qn> Is the 128-bit name of the second SIMD&FP source register, encoded in the "Rn" field.
 <Vm> Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) result;
result = SHA256hash(V[d], V[n], V[m], TRUE);
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.247 SHA256SU0

SHA256 schedule update 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4			0

    elt = Elem[T1, e-2, 32];
    elt = ROR(elt, 17) EOR ROR(elt, 19) EOR LSR(elt, 10);
    elt = elt + Elem[operand1, e, 32] + Elem[T0, e, 32];
    Elem[result, e, 32] = elt;
```

```
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.249 SHA512H

SHA512 Hash update part 1 takes the values from the three 128-bit source SIMD&FP registers and produces a 128-bit output value that combines the sigma1 and chi functions of two iterations of the SHA512 computation. It returns this value to the destination SIMD&FP register.

This instruction is implemented only when [FEAT_SHA512](#) is implemented.

Advanced SIMD

(FEAT_SHA512)

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0
1	1	0	0	1	1	1	0	0	1	1	Rm	1	0	0	0	0	0	Rn	Rd			

Encoding

SHA512H <Qd>, <Qn>, <Vm>.2D

Decode for this encoding

```
if !HaveSHA512Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
```

Assembler symbols

- <Qd> Is the 128-bit name of the SIMD&FP source and destination register, encoded in the "Rd" field.
- <Qn> Is the 128-bit name of the second SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();
```

```
bits(128) Vtmp;
bits(64) MSigma1;
bits(64) tmp;
bits(128) X = V[n];
bits(128) Y = V[m];
bits(128) W = V[d];
```

```
MSigma1 = ROR(Y<127:64>, 14) EOR ROR(Y<127:64>, 18) EOR ROR(Y<127:64>, 41);
Vtmp<127:64> = (Y<127:64> AND X<63:0>) EOR (NOT(Y<127:64>) AND X<127:64>);
Vtmp<127:64> = (Vtmp<127:64> + MSigma1 + W<127:64>);
tmp = Vtmp<127:64> + Y<63:0>;
MSigma1 = ROR(tmp, 14) EOR ROR(tmp, 18) EOR ROR(tmp, 41);
Vtmp<63:0> = (tmp AND Y<127:64>) EOR (NOT(tmp) AND X<63:0>);
Vtmp<63:0> = (Vtmp<63:0> + MSigma1 + W<63:0>);
V[d] = Vtmp;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.250 SHA512H2

SHA512 Hash update part 2 takes the values from the three 128-bit source SIMD&FP registers and produces a 128-bit output value that combines the sigma0 and majority functions of two iterations of the SHA512 computation. It returns this value to the destination SIMD&FP register.

This instruction is implemented only when [FEAT_SHA512](#) is implemented.

Advanced SIMD

(FEAT_SHA512)

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	5	4	0

Encoding

SHA512H2 <Qd>, <Qn>, <Vm>.*2D*

Decode for this encoding

```
if !HaveSHA512Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
```

Assembler symbols

- <Qd> Is the 128-bit name of the SIMD&FP source and destination register, encoded in the "Rd" field.
- <Qn> Is the 128-bit name of the second SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the third SIMD&FP source register, encoded in the "Rm" field.

Operation

```
AArch64.CheckFPAdvSIMDEnabled();
```

```
bits(128) Vtmp;
bits(64) NSigma0;
bits(128) X = V[n];
bits(128) Y = V[m];
bits(128) W = V[d];
```

```
NSigma0 = ROR(Y<63:0>, 28) EOR ROR(Y<63:0>, 34) EOR ROR(Y<63:0>, 39);
Vtmp<127:64> = (X<63:0> AND Y<127:64>) EOR (X<63:0> AND Y<63:0>) EOR (Y<127:64> AND Y<63:0>);
Vtmp<127:64> = (Vtmp<127:64> + NSigma0 + W<127:64>);
NSigma0 = ROR(Vtmp<127:64>, 28) EOR ROR(Vtmp<127:64>, 34) EOR ROR(Vtmp<127:64>, 39);
Vtmp<63:0> = (Vtmp<127:64> AND Y<63:0>) EOR (Vtmp<127:64> AND Y<127:64>) EOR (Y<127:64> AND Y<63:0>);
Vtmp<63:0> = (Vtmp<63:0> + NSigma0 + W<63:0>);
```

```
V[d] = Vtmp;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.

- The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.251 SHA512SU0

SHA512 Schedule Update 0 takes the values from the two 128-bit source SIMD&FP registers and produces a 128-bit output value that combines the gamma0 functions of two iterations of the SHA512 schedule update that are performed after the first 16 iterations within a block. It returns this value to the destination SIMD&FP register.

This instruction is implemented only when [FEAT_SHA512](#) is implemented.

Advanced SIMD

(FEAT_SHA512)

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.253 SHADD

Signed Halving Add. This instruction adds corresponding signed integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are truncated. For rounded results, see [SRHADD](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SHADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1
 The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer sum;
```

```
for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  sum = element1 + element2;
  Elem[result, e, esize] = sum<esize:1>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.254 SHL

Shift Left (immediate). This instruction reads each value from a vector, left shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SHL <V><d>, <V><n>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = UInt(immh:immb) - esize;
```

Vector

Encoding

SHL <Vd>.<T>, <Vn>.<T>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = UInt(immh:immb) - esize;
```

Assembler symbols

<V> Is a width specifier, encoded in the "immh" field. It can have the following values:

D when immh = 1xxx

The encoding `immh = 0xxx` is reserved.

- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

8B	when <code>immh = 0001</code> , <code>Q = 0</code>
16B	when <code>immh = 0001</code> , <code>Q = 1</code>
4H	when <code>immh = 001x</code> , <code>Q = 0</code>
8H	when <code>immh = 001x</code> , <code>Q = 1</code>
2S	when <code>immh = 01xx</code> , <code>Q = 0</code>
4S	when <code>immh = 01xx</code> , <code>Q = 1</code>
2D	when <code>immh = 1xxx</code> , <code>Q = 1</code>

See [Advanced SIMD modified immediate on page C4-373](#) when `immh = 0000`, `Q = x`.

The encoding `immh = 1xxx`, `Q = 0` is reserved.

- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <shift> For the scalar variant: is the left shift amount, in the range 0 to 63, encoded in the "immh:immb" field. It can have the following values:

<code>(UInt(immh:immb)-64)</code>	when <code>immh = 1xxx</code>
-----------------------------------	-------------------------------

 The encoding `immh = 0xxx` is reserved.
 For the vector variant: is the left shift amount, in the range 0 to the element width in bits minus 1, encoded in the "immh:immb" field. It can have the following values:

<code>(UInt(immh:immb)-8)</code>	when <code>immh = 0001</code>
<code>(UInt(immh:immb)-16)</code>	when <code>immh = 001x</code>
<code>(UInt(immh:immb)-32)</code>	when <code>immh = 01xx</code>
<code>(UInt(immh:immb)-64)</code>	when <code>immh = 1xxx</code>

See [Advanced SIMD modified immediate on page C4-373](#) when `immh = 0000`.

Operation for all encodings

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

for e = 0 to elements-1
    Elem[result, e, esize] = LSL(Elem[operand, e, esize], shift);

V[d] = result;
  
```

Operational information

If `PSTATE.DIT` is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.

- The values of the NZCV flags.

C7.2.255 SHLL, SHLL2

Shift Left Long (by element size). This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, left shifts each result by the element size, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The SHLL instruction extracts vector elements from the lower half of the source register. The SHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4			0
0	Q	1	0	1	1	1	0	size	1	0	0	0	0	1	0	0	1	1	1	0	Rn			Rd						

Encoding

SHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = esize;
boolean unsigned = FALSE;    // Or TRUE without change of functionality
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
- 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
- The encoding size = 11 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1

4H when size = 01, Q = 0

8H when size = 01, Q = 1

2S when size = 10, Q = 0

4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<shift> Is the left shift amount, which must be equal to the source element width in bits, encoded in the "size" field. It can have the following values:

8 when size = 00

16 when size = 01

32 when size = 10

The encoding size = 11 is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part];
bits(2*datasize) result;
integer element;

for e = 0 to elements-1
    element = Int(Elem[operand, e, esize], unsigned) << shift;
    Elem[result, e, 2*esize] = element<2*esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.256 SHRN, SHRN2

Shift Right Narrow (immediate). This instruction reads each unsigned integer value from the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. The results are truncated. For rounded results, see [RSHRN](#), [RSHRN2](#).

The RSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the RSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SHRN{2} <Vd>.<Tb>, <Vn>.<Ta>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = (2 * esize) - UInt(immh:immb);
boolean round = (op == '1');
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
 [present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

8B when immh = 0001, Q = 0
 16B when immh = 0001, Q = 1
 4H when immh = 001x, Q = 0
 8H when immh = 001x, Q = 1
 2S when immh = 01xx, Q = 0
 4S when immh = 01xx, Q = 1

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.

- The encoding `immh = 1xxx`, `Q = x` is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:
- | | |
|----|-------------------------------|
| 8H | when <code>immh = 0001</code> |
| 4S | when <code>immh = 001x</code> |
| 2D | when <code>immh = 01xx</code> |
- See [Advanced SIMD modified immediate on page C4-373](#) when `immh = 0000`.
- The encoding `immh = 1xxx` is reserved.
- <shift> Is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:
- | | |
|-----------------------------------|-------------------------------|
| <code>(16-UInt(immh:immb))</code> | when <code>immh = 0001</code> |
| <code>(32-UInt(immh:immb))</code> | when <code>immh = 001x</code> |
| <code>(64-UInt(immh:immb))</code> | when <code>immh = 01xx</code> |
- See [Advanced SIMD modified immediate on page C4-373](#) when `immh = 0000`.
- The encoding `immh = 1xxx` is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n];
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;

for e = 0 to elements-1
    element = (UInt(Elem[operand, e, 2*esize]) + round_const) >> shift;
    Elem[result, e, esize] = element<esize-1:0>;

Vpart[d, part] = result;
```

Operational information

If `PSTATE.DIT` is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.257 SHSUB

Signed Halving Subtract. This instruction subtracts the elements in the vector in the second source SIMD&FP register from the corresponding elements in the vector in the first source SIMD&FP register, shifts each result right one bit, places each result into elements of a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SHSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1
 - The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer diff;

for e = 0 to elements-1
```

```
element1 = Int(Elem[operand1, e, esize], unsigned);  
element2 = Int(Elem[operand2, e, esize], unsigned);  
diff = element1 - element2;  
Elem[result, e, esize] = diff<esize:1>;  
  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.258 SLI

Shift Left and Insert (immediate). This instruction reads each vector element in the source SIMD&FP register, left shifts each vector element by an immediate value, and inserts the result into the corresponding vector element in the destination SIMD&FP register such that the new zero bits created by the shift are not inserted but retain their existing value. Bits shifted out of the left of each vector element in the source register are lost.

The following figure shows the operation of shift left by 3 for an 8-bit vector element.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SLI <V><d>, <V><n>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = UInt(immh:immb) - esize;
```

Vector

Encoding

SLI <Vd>.<T>, <Vn>.<T>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = UInt(immh:immb) - esize;
```

Assembler symbols

- <V> Is a width specifier, encoded in the "immh" field. It can have the following values:
- D when immh = 1xxx
- The encoding immh = 0xxx is reserved.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
- 8B when immh = 0001, Q = 0
 - 16B when immh = 0001, Q = 1
 - 4H when immh = 001x, Q = 0
 - 8H when immh = 001x, Q = 1
 - 2S when immh = 01xx, Q = 0
 - 4S when immh = 01xx, Q = 1
 - 2D when immh = 1xxx, Q = 1
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
- The encoding immh = 1xxx, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <shift> For the scalar variant: is the left shift amount, in the range 0 to 63, encoded in the "immh:immb" field. It can have the following values:
- (UInt(immh:immb)-64) when immh = 1xxx
- The encoding immh = 0xxx is reserved.
- For the vector variant: is the left shift amount, in the range 0 to the element width in bits minus 1, encoded in the "immh:immb" field. It can have the following values:
- (UInt(immh:immb)-8) when immh = 0001
 - (UInt(immh:immb)-16) when immh = 001x
 - (UInt(immh:immb)-32) when immh = 01xx
 - (UInt(immh:immb)-64) when immh = 1xxx
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) operand2 = V[d];
```

```
bits(datasize) result;  
bits(esize) mask = LSL(Ones(esize), shift);  
bits(esize) shifted;  
  
for e = 0 to elements-1  
    shifted = LSL(Elem[operand, e, esize], shift);  
    Elem[result, e, esize] = (Elem[operand2, e, esize] AND NOT(mask)) OR shifted;  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.259 SM3PARTW1

SM3PARTW1 takes three 128-bit vectors from the three source SIMD&FP registers and returns a 128-bit result in the destination SIMD&FP register. The result is obtained by a three-way exclusive OR of the elements within the input vectors with some fixed rotations, see the Operation pseudocode for more information.

This instruction is implemented only when [FEAT_SM3](#) is implemented.

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.262 SM3TT1A

SM3TT1A takes three 128-bit vectors from three source SIMD&FP registers and a 2-bit immediate index value, and returns a 128-bit result in the destination SIMD&FP register. It performs a three-way exclusive OR of the three 32-bit fields held in the upper three elements of the first source vector, and adds the resulting 32-bit value and the following three other 32-bit values:

- The bottom 32-bit element of the first source vector, V_d , that was used for the three-way exclusive OR.
- The result of the exclusive OR of the top 32-bit element of the second source vector, V_n , with a rotation left by 12 of the top 32-bit element of the first source vector.
- A 32-bit element indexed out of the third source vector, V_m .

The result of this addition is returned as the top element of the result. The other elements of the result are taken from elements of the first source vector, with the element returned in bits<63:32> being rotated left by 9.

This instruction is implemented only when [FEAT_SM3](#) is implemented.

    roundresult<127:96> = intval;
```

$V[d] = \text{roundresult};$

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.268 SMAX

Signed Maximum (vector). This instruction compares corresponding elements in the vectors in the two source SIMD&FP registers, places the larger of each pair of signed integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMAX <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean unsigned = (U == '1');
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1
 The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer maxmin;
```

```
for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  maxmin = if minimum then Min(element1, element2) else Max(element1, element2);
  Elem[result, e, esize] = maxmin<esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.269 SMAXP

Signed Maximum Pairwise. This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the largest of each pair of signed integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMAXP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
integer element1;
```

```
integer element2;
integer maxmin;

for e = 0 to elements-1
    element1 = Int(Elem[concat, 2*e, esize], unsigned);
    element2 = Int(Elem[concat, (2*e)+1, esize], unsigned);
    maxmin = if minimum then Min(element1, element2) else Max(element1, element2);
    Elem[result, e, esize] = maxmin<esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.270 SMAXV

Signed Maximum across Vector. This instruction compares all the vector elements in the source SIMD&FP register, and writes the largest of the values as a scalar to the destination SIMD&FP register. All the values in this instruction are signed integer values.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMAXV <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '100' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean min = (op == '1');
```

Assembler symbols

- <V> Is the destination width specifier, encoded in the "size" field. It can have the following values:
- | | |
|---|----------------|
| B | when size = 00 |
| H | when size = 01 |
| S | when size = 10 |
- The encoding size = 11 is reserved.
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 4S | when size = 10, Q = 1 |
- The following encodings are reserved:
- size = 10, Q = 0.
 - size = 11, Q = x.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
integer maxmin;
integer element;

maxmin = Int(Elem[operand, 0, esize], unsigned);
for e = 1 to elements-1
    element = Int(Elem[operand, e, esize], unsigned);
    maxmin = if min then Min(maxmin, element) else Max(maxmin, element);

V[d] = maxmin<esize-1:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.271 SMIN

Signed Minimum (vector). This instruction compares corresponding elements in the vectors in the two source SIMD&FP registers, places the smaller of each of the two signed integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMIN <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean unsigned = (U == '1');
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1
 The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer maxmin;
```

```
for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  maxmin = if minimum then Min(element1, element2) else Max(element1, element2);
  Elem[result, e, esize] = maxmin<esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.272 SMINP

Signed Minimum Pairwise. This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the smallest of each pair of signed integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMINP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean unsigned = (U == '1');
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
integer element1;
```

```
integer element2;  
integer maxmin;  
  
for e = 0 to elements-1  
    element1 = Int(Elem[concat, 2*e, esize], unsigned);  
    element2 = Int(Elem[concat, (2*e)+1, esize], unsigned);  
    maxmin = if minimum then Min(element1, element2) else Max(element1, element2);  
    Elem[result, e, esize] = maxmin<esize-1:0>;  
  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.273 SMINV

Signed Minimum across Vector. This instruction compares all the vector elements in the source SIMD&FP register, and writes the smallest of the values as a scalar to the destination SIMD&FP register. All the values in this instruction are signed integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMINV <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '100' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean min = (op == '1');
```

Assembler symbols

<V> Is the destination width specifier, encoded in the "size" field. It can have the following values:

- B when size = 00
- H when size = 01
- S when size = 10

The encoding size = 11 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 8B when size = 00, Q = 0
- 16B when size = 00, Q = 1
- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 4S when size = 10, Q = 1

The following encodings are reserved:

- size = 10, Q = 0.
- size = 11, Q = x.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
integer maxmin;
integer element;

maxmin = Int(Elem[operand, 0, esize], unsigned);
for e = 1 to elements-1
    element = Int(Elem[operand, e, esize], unsigned);
    maxmin = if min then Min(maxmin, element) else Max(maxmin, element);

V[d] = maxmin<esize-1:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.274 SMLAL, SMLAL2 (by element)

Signed Multiply-Add Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element in the second source SIMD&FP register, and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are signed integer values.

The SMLAL instruction extracts vector elements from the lower half of the first source register. The SMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMLAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

Decode for this encoding

```

integer idxsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean sub_op = (o2 == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 4S when size = 01
 - 2D when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The following encodings are reserved:

- size = 00, Q = x.
- size = 11, Q = x.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:

- 0:Rm when size = 01
- M:Rm when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Restricted to V0-V15 when element size <Ts> is H.

<Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:

- H when size = 01
- S when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<index> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:

- H:L:M when size = 01
- H:L when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(idxsizesize) operand2 = V[m];
bits(2*datasize) operand3 = V[d];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;

element2 = Int(Elem[operand2, index, esize], unsigned);
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
    
```

```
if sub_op then
    Elem[result, e, 2*esize] = Elem[operand3, e, 2*esize] - product;
else
    Elem[result, e, 2*esize] = Elem[operand3, e, 2*esize] + product;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.275 SMLAL, SMLAL2 (vector)

Signed Multiply-Add Long (vector). This instruction multiplies corresponding signed integer values in the lower or upper half of the vectors of the two source SIMD&FP registers, and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The SMLAL instruction extracts each source vector from the lower half of each source register. The SMLAL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMLAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
 [present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

8H when size = 00
 4S when size = 01
 2D when size = 10

The encoding size = 11 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0
 16B when size = 00, Q = 1

4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) operand3 = V[d];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;
bits(2*esize) accum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
    if sub_op then
        accum = Elem[operand3, e, 2*esize] - product;
    else
        accum = Elem[operand3, e, 2*esize] + product;
    Elem[result, e, 2*esize] = accum;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.276 SMLSL, SMLSL2 (by element)

Signed Multiply-Subtract Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and subtracts the results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The SMLSL instruction extracts vector elements from the lower half of the first source register. The SMLSL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMLSL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

Decode for this encoding

```

integer idxsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean sub_op = (o2 == '1');
    
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 4S when size = 01
 - 2D when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The following encodings are reserved:

- size = 00, Q = x.
- size = 11, Q = x.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:

- 0:Rm when size = 01
- M:Rm when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Restricted to V0-V15 when element size <Ts> is H.

<Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:

- H when size = 01
- S when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<index> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:

- H:L:M when size = 01
- H:L when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(idxszie) operand2 = V[m];
bits(2*datasize) operand3 = V[d];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;

element2 = Int(Elem[operand2, index, esize], unsigned);
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
    
```

```
if sub_op then
    Elem[result, e, 2*esize] = Elem[operand3, e, 2*esize] - product;
else
    Elem[result, e, 2*esize] = Elem[operand3, e, 2*esize] + product;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.277 SMLSL, SMLSL2 (vector)

Signed Multiply-Subtract Long (vector). This instruction multiplies corresponding signed integer values in the lower or upper half of the vectors of the two source SIMD&FP registers, and subtracts the results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The SMLSL instruction extracts each source vector from the lower half of each source register. The SMLSL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMLSL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
 [present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

8H when size = 00
 4S when size = 01
 2D when size = 10

The encoding size = 11 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0
 16B when size = 00, Q = 1

4H when size = 01, Q = 0
 8H when size = 01, Q = 1
 2S when size = 10, Q = 0
 4S when size = 10, Q = 1
 The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) operand3 = V[d];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;
bits(2*esize) accum;

for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  product = (element1*element2)<2*esize-1:0>;
  if sub_op then
    accum = Elem[operand3, e, 2*esize] - product;
  else
    accum = Elem[operand3, e, 2*esize] + product;
  Elem[result, e, 2*esize] = accum;

V[d] = result;
  
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.278 SMMLA (vector)

Signed 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of signed 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. [ID_AA64ISAR1_EL1.I8MM](#) indicates whether this instruction is supported.

Vector

(FEAT_I8MM)

Encoding

SMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B

Decode for this encoding

```
if !HaveInt8MatMu1Ext() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);
```

Assembler symbols

<Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(128) operand1 = V[n];
bits(128) operand2 = V[m];
bits(128) addend = V[d];

V[d] = MatMu1Add(addend, operand1, operand2, FALSE, FALSE);
```

C7.2.279 SMOV

Signed Move vector element to general-purpose register. This instruction reads the signed integer from the source SIMD&FP register, sign-extends it to form a 32-bit or 64-bit value, and writes the result to destination general-purpose register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

32-bit variant

Applies when Q == 0.

SMOV <Wd>, <Vn>.<Ts>[<index>]

64-reg, SMOV-64-reg variant

Applies when Q == 1.

SMOV <Xd>, <Vn>.<Ts>[<index>]

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size;
case Q:imm5 of
    when 'xxxxx1' size = 0; // SMOV [WX]d, Vn.B
    when 'xxxx10' size = 1; // SMOV [WX]d, Vn.H
    when '1xx100' size = 2; // SMOV Xd, Vn.S
    otherwise UNDEFINED;

integer idxsize = if imm5<4> == '1' then 128 else 64;
integer index = UInt(imm5<4:size+1>);
integer esize = 8 << size;
integer datasize = if Q == '1' then 64 else 32;
```

Assembler symbols

- <Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Ts> For the 32-bit variant: is an element size specifier, encoded in the "imm5" field. It can have the following values:
 - B when imm5 = xxxx1
 - H when imm5 = xxx10
 The encoding imm5 = xxx00 is reserved.

 For the 64-reg, SMOV-64-reg variant: is an element size specifier, encoded in the "imm5" field. It can have the following values:
 - B when imm5 = xxxx1

H when imm5 = xxx10
S when imm5 = xx100
The encoding imm5 = xx000 is reserved.

<index> For the 32-bit variant: is the element index encoded in the "imm5" field. It can have the following values:

imm5<4:1> when imm5 = xxxx1
imm5<4:2> when imm5 = xxx10
The encoding imm5 = xxx00 is reserved.

For the 64-reg,SMOV-64-reg variant: is the element index encoded in the "imm5" field. It can have the following values:

imm5<4:1> when imm5 = xxxx1
imm5<4:2> when imm5 = xxx10
imm5<4:3> when imm5 = xx100
The encoding imm5 = xx000 is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(idxsize) operand = V[n];  
  
X[d] = SignExtend(Elem[operand, index, esize], datasize);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.280 SMULL, SMULL2 (by element)

Signed Multiply Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, places the result in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The SMULL instruction extracts vector elements from the lower half of the first source register. The SMULL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

Decode for this encoding

```

integer idxsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
- 4S when size = 01
 - 2D when size = 10
- The following encodings are reserved:
- size = 00.

- size = 11.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|----|-----------------------|
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The following encodings are reserved:
- size = 00, Q = x.
 - size = 11, Q = x.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:
- | | |
|------|----------------|
| 0:Rm | when size = 01 |
| M:Rm | when size = 10 |
- The following encodings are reserved:
- size = 00.
 - size = 11.
- Restricted to V0-V15 when element size <Ts> is H.
- <Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:
- | | |
|---|----------------|
| H | when size = 01 |
| S | when size = 10 |
- The following encodings are reserved:
- size = 00.
 - size = 11.
- <indx> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:
- | | |
|-------|----------------|
| H:L:M | when size = 01 |
| H:L | when size = 10 |
- The following encodings are reserved:
- size = 00.
 - size = 11.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(idxs size) operand2 = V[m];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;

element2 = Int(Elem[operand2, index, esize], unsigned);
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
    Elem[result, e, 2*esize] = product;

V[d] = result;
  
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.281 SMULL, SMULL2 (vector)

Signed Multiply Long (vector). This instruction multiplies corresponding signed integer values in the lower or upper half of the vectors of the two source SIMD&FP registers, places the results in a vector, and writes the vector to the destination SIMD&FP register.

The destination vector elements are twice as long as the elements that are multiplied.

The SMULL instruction extracts each source vector from the lower half of each source register. The SMULL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
 The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0

16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    Elem[result, e, 2*esize] = (element1*element2)<2*esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.282 SQABS

Signed saturating Absolute value. This instruction reads each vector element from the source SIMD&FP register, puts the absolute value of the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SQABS <V><d>, <V><n>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean neg = (U == '1');
```

Vector

Encoding

SQABS <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean neg = (U == '1');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

B when size = 00

- H when size = 01
S when size = 10
D when size = 11
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- 8B when size = 00, Q = 0
16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
integer element;
boolean sat;

for e = 0 to elements-1
    element = SInt(Elem[operand, e, esize]);
    if neg then
        element = -element;
    else
        element = Abs(element);
    (Elem[result, e, esize], sat) = SignedSatQ(element, esize);
    if sat then FPSR.QC = '1';

V[d] = result;
```

C7.2.283 SQADD

Signed saturating Add. This instruction adds the values of corresponding elements of the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SQADD <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
```

Vector

Encoding

SQADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

B	when size = 00
H	when size = 01

- S when size = 10
 D when size = 11
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- 8B when size = 00, Q = 0
 16B when size = 00, Q = 1
 4H when size = 01, Q = 0
 8H when size = 01, Q = 1
 2S when size = 10, Q = 0
 4S when size = 10, Q = 1
 2D when size = 11, Q = 1
 The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer sum;
boolean sat;

for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  sum = element1 + element2;
  (Elem[result, e, esize], sat) = SatQ(sum, esize, unsigned);
  if sat then FPSR.QC = '1';

V[d] = result;
  
```

C7.2.284 SQDMLAL, SQDMLAL2 (by element)

Signed saturating Doubling Multiply-Add Long (by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, and accumulates the final results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

The SQDMLAL instruction extracts vector elements from the lower half of the first source register. The SQDMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SQDMLAL <Va><d>, <Vb><n>, <Vm>.<Ts>[<index>]

Decode for this encoding

```

integer idxsize = if H == '1' then 128 else 64;

  else

```

```
    accum = SInt(Elem[operand3, e, 2*esize]) + SInt(product);  
    (Elem[result, e, 2*esize], sat2) = SignedSatQ(accum, 2 * esize);  
    if sat1 || sat2 then FPSR.QC = '1';  
  
V[d] = result;
```

C7.2.285 SQDMLAL, SQDMLAL2 (vector)

Signed saturating Doubling Multiply-Add Long. This instruction multiplies corresponding signed integer values in the lower or upper half of the vectors of the two source SIMD&FP registers, doubles the results, and accumulates the final results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit `FPSR.QC` is set.

The `SQDMLAL` instruction extracts each source vector from the lower half of each source register. The `SQDMLAL2` instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

`SQDMLAL <Va><d>, <Vb><n>, <Vb><m>`

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '00' || size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
integer part = 0;

boolean sub_op = (o1 == '1');
```

Vector

Encoding

`SQDMLAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>`

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '00' || size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
```

integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0

[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

4S when size = 01

2D when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

4H when size = 01, Q = 0

8H when size = 01, Q = 1

2S when size = 10, Q = 0

4S when size = 10, Q = 1

The following encodings are reserved:

- size = 00, Q = x.
- size = 11, Q = x.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

<Va> Is the destination width specifier, encoded in the "size" field. It can have the following values:

S when size = 01

D when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vb> Is the source width specifier, encoded in the "size" field. It can have the following values:

H when size = 01

S when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) operand3 = V[d];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;
integer accum;
boolean sat1;
boolean sat2;

for e = 0 to elements-1
    element1 = SInt(Elem[operand1, e, esize]);
    element2 = SInt(Elem[operand2, e, esize]);
    (product, sat1) = SignedSatQ(2 * element1 * element2, 2 * esize);
    if sub_op then
        accum = SInt(Elem[operand3, e, 2*esize]) - SInt(product);
    else
        accum = SInt(Elem[operand3, e, 2*esize]) + SInt(product);
    (Elem[result, e, 2*esize], sat2) = SignedSatQ(accum, 2 * esize);
    if sat1 || sat2 then FPSR.QC = '1';

V[d] = result;
```

C7.2.286 SQDMLSL, SQDMLSL2 (by element)

Signed saturating Doubling Multiply-Subtract Long (by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, and subtracts the final results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

The SQDMLSL instruction extracts vector elements from the lower half of the first source register. The SQDMLSL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

    if sat then FPSR.QC = '1';

V[d] = result;
```

C7.2.289 SQDMULH (vector)

Signed saturating Doubling Multiply returning High half. This instruction multiplies the values of corresponding elements of the two source SIMD&FP registers, doubles the results, places the most significant half of the final results into a vector, and writes the vector to the destination SIMD&FP register.

The results are truncated. For rounded results, see [SQRDMULH \(vector\)](#).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SQDMULH <V><d>, <V><n>, <V><m>

Decode for this encoding

boolean sat;

for e = 0 to elements-1
    element1 = SInt(EM[operand1, e, esize]);
    element2 = SInt(EM[operand2, e, esize]);
    product = (2 * element1 * element2) + round_const;
    (EM[result, e, esize], sat) = SignedSatQ(product >> esize, esize);
    if sat then FPSR.QC = '1';

V[d] = result;
```

C7.2.290 SQDMULL, SQDMULL2 (by element)

Signed saturating Doubling Multiply Long (by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, doubles the results, places the final results in a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit `FPSR.QC` is set.

The `SQDMULL` instruction extracts the first source vector from the lower half of the first source register. The `SQDMULL2` instruction extracts the first source vector from the upper half of the first source register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

V[d] = result;

C7.2.295 SQRDMLSH (by element)

Signed Saturating Rounding Doubling Multiply Subtract returning High Half (by element). This instruction multiplies the vector elements of the first source SIMD&FP register with the value of a vector element of the second source SIMD&FP register without saturating the multiply results, doubles the results, and subtracts the most significant half of the final results from the vector elements of the destination SIMD&FP register. The results are rounded.

If any of the results overflow, they are saturated. The cumulative saturation bit, `FPSR.QC`, is set if saturation occurs.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

V[d] = result;
```

C7.2.300 SQRSHRN, SQRSHRN2

Signed saturating Rounded Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are half as long as the source vector elements. The results are rounded. For truncated results, see [SQSHRN](#), [SQSHRN2](#).

The SQRSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQRSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

| H | when immh = 001x |
| S | when immh = 01xx |
- The following encodings are reserved:
- immh = 0000.
 - immh = 1xxx.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <Va> Is the source width specifier, encoded in the "immh" field. It can have the following values:
- | | |
|---|------------------|
| H | when immh = 0001 |
| S | when immh = 001x |
| D | when immh = 01xx |

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<shift> For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:

(16-UInt(immh:immb)) when immh = 0001

(32-UInt(immh:immb)) when immh = 001x

(64-UInt(immh:immb)) when immh = 01xx

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:

(16-UInt(immh:immb)) when immh = 0001

(32-UInt(immh:immb)) when immh = 001x

(64-UInt(immh:immb)) when immh = 01xx

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

The encoding immh = 1xxx is reserved.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n];
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
boolean sat;

for e = 0 to elements-1
    element = (Int(Elem[operand, e, 2*esize], unsigned) + round_const) >> shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
    if sat then FPSR.QC = '1';

Vpart[d, part] = result;
```

C7.2.301 SQRSHRUN, SQRSHRUN2

Signed saturating Rounded Shift Right Unsigned Narrow (immediate). This instruction reads each signed integer value in the vector of the source SIMD&FP register, right shifts each value by an immediate value, saturates the result to an unsigned integer value that is half the original width, places the final result into a vector, and writes the vector to the destination SIMD&FP register. The results are rounded. For truncated results, see [SQSHRUN](#), [SQSHRUN2](#).

The SQRSHRUN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQRSHRUN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SQRSHRUN <Vb><d>, <Va><n>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then UNDEFINED;
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = esize;
integer elements = 1;
integer part = 0;

integer shift = (2 * esize) - UInt(immh:immb);
boolean round = (op == '1');
```

Vector

Encoding

SQRSHRUN{2} <Vd>.<Tb>, <Vn>.<Ta>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
```

```
integer datasize = 64;  
integer part = UInt(Q);  
integer elements = datasize DIV esize;  
  
integer shift = (2 * esize) - UInt(immh:immb);  
boolean round = (op == '1');
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

8B when immh = 0001, Q = 0
16B when immh = 0001, Q = 1
4H when immh = 001x, Q = 0
8H when immh = 001x, Q = 1
2S when immh = 01xx, Q = 0
4S when immh = 01xx, Q = 1

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.

The encoding immh = 1xxx, Q = x is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

8H when immh = 0001
4S when immh = 001x
2D when immh = 01xx

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

The encoding immh = 1xxx is reserved.

<Vb> Is the destination width specifier, encoded in the "immh" field. It can have the following values:

B when immh = 0001
H when immh = 001x
S when immh = 01xx

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<Va> Is the source width specifier, encoded in the "immh" field. It can have the following values:

H when immh = 0001
S when immh = 001x
D when immh = 01xx

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<shift> For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:

(16-UInt(immh:immb)) when immh = 0001

(32-UInt(immh:immb)) when immh = 001x

(64-UInt(immh:immb)) when immh = 01xx

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:

(16-UInt(immh:immb)) when immh = 0001

(32-UInt(immh:immb)) when immh = 001x

(64-UInt(immh:immb)) when immh = 01xx

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

The encoding immh = 1xxx is reserved.

Operation for all encodings

```

CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n];
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
boolean sat;

for e = 0 to elements-1
    element = (SInt(ELem[operand, e, 2*esize]) + round_const) >> shift;
    (ELem[result, e, esize], sat) = UnsignedSatQ(element, esize);
    if sat then FPSR.QC = '1';

Vpart[d, part] = result;
    
```

C7.2.302 SQSHL (immediate)

Signed saturating Shift Left (immediate). This instruction reads each vector element in the source SIMD&FP register, shifts each result by an immediate value, places the final result in a vector, and writes the vector to the destination SIMD&FP register. The results are truncated. For rounded results, see [UQRSHL](#).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SQSHL <V><d>, <V><n>, #<shift>

Decode for this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = esize;
integer elements = 1;

integer shift = UInt(immh:immb) - esize;

boolean src_unsigned;
boolean dst_unsigned;
case op:U of
    when '00' UNDEFINED;
    when '01' src_unsigned = FALSE; dst_unsigned = TRUE;
    when '10' src_unsigned = FALSE; dst_unsigned = FALSE;
    when '11' src_unsigned = TRUE; dst_unsigned = TRUE;
    
```

Vector

Encoding

SQSHL <Vd>.<T>, <Vn>.<T>, #<shift>

Decode for this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
    
```

```
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = UInt(immh:immb) - esize;

boolean src_unsigned;
boolean dst_unsigned;
case op:U of
  when '00' UNDEFINED;
  when '01' src_unsigned = FALSE; dst_unsigned = TRUE;
  when '10' src_unsigned = FALSE; dst_unsigned = FALSE;
  when '11' src_unsigned = TRUE; dst_unsigned = TRUE;
```

Assembler symbols

<V> Is a width specifier, encoded in the "immh" field. It can have the following values:

```
B      when immh = 0001
H      when immh = 001x
S      when immh = 01xx
D      when immh = 1xxx
```

The encoding immh = 0000 is reserved.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

```
8B      when immh = 0001, Q = 0
16B     when immh = 0001, Q = 1
4H      when immh = 001x, Q = 0
8H      when immh = 001x, Q = 1
2S      when immh = 01xx, Q = 0
4S      when immh = 01xx, Q = 1
2D      when immh = 1xxx, Q = 1
```

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.

The encoding immh = 1xxx, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<shift> For the scalar variant: is the left shift amount, in the range 0 to the operand width in bits minus 1, encoded in the "immh:immb" field. It can have the following values:

```
(UInt(immh:immb)-8)  when immh = 0001
(UInt(immh:immb)-16) when immh = 001x
(UInt(immh:immb)-32) when immh = 01xx
(UInt(immh:immb)-64) when immh = 1xxx
```

The encoding immh = 0000 is reserved.

For the vector variant: is the left shift amount, in the range 0 to the element width in bits minus 1, encoded in the "immh:immb" field. It can have the following values:

```
(UInt(immh:immb)-8)  when immh = 0001
(UInt(immh:immb)-16) when immh = 001x
(UInt(immh:immb)-32) when immh = 01xx
```

(UInt(immh:immb)-64) when immh = 1xxx

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
integer element;
boolean sat;

for e = 0 to elements-1
    element = Int(Elem[operand, e, esize], src_unsigned) << shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, dst_unsigned);
    if sat then FPSR.QC = '1';

V[d] = result;
```

C7.2.303 SQSHL (register)

Signed saturating Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts each element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are truncated. For rounded results, see [SQRSHL](#).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SQSHL <V><d>, <V><n>, <V><m>

    if sat then FPSR.QC = '1';

V[d] = result;
```

C7.2.305 SQSHRN, SQSHRN2

Signed saturating Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts and truncates each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are half as long as the source vector elements. For rounded results, see [SQRSHRN](#), [SQRSHRN2](#).

The SQSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

The following encodings are reserved:

- immh = 0000.

- immh = 1xxx.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<Va> Is the source width specifier, encoded in the "immh" field. It can have the following values:

H when immh = 0001

S when immh = 001x

D when immh = 01xx

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<shift> For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:

(16-UInt(immh:immb)) when immh = 0001

(32-UInt(immh:immb)) when immh = 001x

(64-UInt(immh:immb)) when immh = 01xx

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:

(16-UInt(immh:immb)) when immh = 0001

(32-UInt(immh:immb)) when immh = 001x

(64-UInt(immh:immb)) when immh = 01xx

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

The encoding immh = 1xxx is reserved.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n];
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
boolean sat;

for e = 0 to elements-1
    element = (Int(Elem[operand, e, 2*esize], unsigned) + round_const) >> shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
    if sat then FPSR.QC = '1';

Vpart[d, part] = result;
```

C7.2.306 SQSHRUN, SQSHRUN2

Signed saturating Shift Right Unsigned Narrow (immediate). This instruction reads each signed integer value in the vector of the source SIMD&FP register, right shifts each value by an immediate value, saturates the result to an unsigned integer value that is half the original width, places the final result into a vector, and writes the vector to the destination SIMD&FP register. The results are truncated. For rounded results, see [SQRSHRUN](#), [SQRSHRUN2](#).

The SQSHRUN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQSHRUN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SQSHRUN <Vb><d>, <Va><n>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then UNDEFINED;
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = esize;
integer elements = 1;
integer part = 0;

integer shift = (2 * esize) - UInt(immh:immb);
boolean round = (op == '1');
```

Vector

Encoding

SQSHRUN{2} <Vd>.<Tb>, <Vn>.<Ta>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
```

```
integer part = UInt(Q);  
integer elements = datasize DIV esize;  
  
integer shift = (2 * esize) - UInt(immh:immb);  
boolean round = (op == '1');
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

8B when immh = 0001, Q = 0
16B when immh = 0001, Q = 1
4H when immh = 001x, Q = 0
8H when immh = 001x, Q = 1
2S when immh = 01xx, Q = 0
4S when immh = 01xx, Q = 1

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.

The encoding immh = 1xxx, Q = x is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

8H when immh = 0001
4S when immh = 001x
2D when immh = 01xx

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

The encoding immh = 1xxx is reserved.

<Vb> Is the destination width specifier, encoded in the "immh" field. It can have the following values:

B when immh = 0001
H when immh = 001x
S when immh = 01xx

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<Va> Is the source width specifier, encoded in the "immh" field. It can have the following values:

H when immh = 0001
S when immh = 001x
D when immh = 01xx

The following encodings are reserved:

- immh = 0000.

- $immh = 1xxx$.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <shift> For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:
- (16-UInt(immh:immb)) when $immh = 0001$
 - (32-UInt(immh:immb)) when $immh = 001x$
 - (64-UInt(immh:immb)) when $immh = 01xx$
- The following encodings are reserved:
- $immh = 0000$.
 - $immh = 1xxx$.
- For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:
- (16-UInt(immh:immb)) when $immh = 0001$
 - (32-UInt(immh:immb)) when $immh = 001x$
 - (64-UInt(immh:immb)) when $immh = 01xx$
- See [Advanced SIMD modified immediate on page C4-373](#) when $immh = 0000$.
- The encoding $immh = 1xxx$ is reserved.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n];
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
boolean sat;

for e = 0 to elements-1
    element = (SInt(ELem[operand, e, 2*esize]) + round_const) >> shift;
    (ELem[result, e, esize], sat) = UnsignedSatQ(element, esize);
    if sat then FPSR.QC = '1';

Vpart[d, part] = result;
```

C7.2.307 SQSUB

Signed saturating Subtract. This instruction subtracts the element values of the second source SIMD&FP register from the corresponding element values of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SQSUB <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
```

Vector

Encoding

SQSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:
 B when size = 00

H	when size = 01
S	when size = 10
D	when size = 11
<d>	Is the number of the SIMD&FP destination register, in the "Rd" field.
<n>	Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
<m>	Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
<Vd>	Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T>	Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
8B	when size = 00, Q = 0
16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1
2D	when size = 11, Q = 1
	The encoding size = 11, Q = 0 is reserved.
<Vn>	Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer diff;
boolean sat;

for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  diff = element1 - element2;
  (Elem[result, e, esize], sat) = SatQ(diff, esize, unsigned);
  if sat then FPSR.QC = '1';

V[d] = result;

```

C7.2.308 SQXTN, SQXTN2

Signed saturating extract Narrow. This instruction reads each vector element from the source SIMD&FP register, saturates the value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements. All the values in this instruction are signed integer values.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

The SQXTN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQXTN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SQXTN <Vb><d>, <Va><n>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer part = 0;
integer elements = 1;

boolean unsigned = (U == '1');
```

Vector

Encoding

SQXTN{2} <Vd>.<Tb>, <Vn>.<Ta>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

```
boolean unsigned = (U == '1');
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0

[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0

16B when size = 00, Q = 1

4H when size = 01, Q = 0

8H when size = 01, Q = 1

2S when size = 10, Q = 0

4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

8H when size = 00

4S when size = 01

2D when size = 10

The encoding size = 11 is reserved.

<Vb> Is the destination width specifier, encoded in the "size" field. It can have the following values:

B when size = 00

H when size = 01

S when size = 10

The encoding size = 11 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Va> Is the source width specifier, encoded in the "size" field. It can have the following values:

H when size = 00

S when size = 01

D when size = 10

The encoding size = 11 is reserved.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(2*datasize) operand = V[n];  
bits(datasize) result;  
bits(2*esize) element;  
boolean sat;
```

```
for e = 0 to elements-1
  element = Elem[operand, e, 2*esize];
  (Elem[result, e, esize], sat) = SatQ(Int(element, unsigned), esize, unsigned);
  if sat then FPSR.QC = '1';

Vpart[d, part] = result;
```

C7.2.309 SQXTUN, SQXTUN2

Signed saturating extract Unsigned Narrow. This instruction reads each signed integer value in the vector of the source SIMD&FP register, saturates the value to an unsigned integer value that is half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements.

If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

The SQXTUN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SQXTUN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

 - D when size = 10
- The encoding size = 11 is reserved.
- <n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand = V[n];
bits(datasize) result;
bits(2*esize) element;
boolean sat;

for e = 0 to elements-1
    element = Elem[operand, e, 2*esize];
    (Elem[result, e, esize], sat) = UnsignedSatQ(SInt(element), esize);
    if sat then FPSR.QC = '1';
```

```
Vpart[d, part] = result;
```

C7.2.310 SRHADD

Signed Rounding Halving Add. This instruction adds corresponding signed integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see [SHADD](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SRHADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
```

```
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    Elem[result, e, esize] = (element1+element2+1)<esize:1>;

V[d] = result;
```

C7.2.311 SRI

Shift Right and Insert (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each vector element by an immediate value, and inserts the result into the corresponding vector element in the destination SIMD&FP register such that the new zero bits created by the shift are not inserted but retain their existing value. Bits shifted out of the right of each vector element of the source register are lost.

The following figure shows the operation of shift right by 3 for an 8-bit vector element.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SRI <V><d>, <V><n>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = (esize * 2) - UInt(immh:immb);
```

Vector

Encoding

SRI <Vd>.<T>, <Vn>.<T>, #<shift>

Decode for this encoding

    Elem[result, e, esize] = (Elem[operand2, e, esize] AND NOT(mask)) OR shifted;  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.312 SRSHL

Signed Rounding Shift Left (register). This instruction takes each signed integer value in the vector of the first source SIMD&FP register, shifts it by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see [SSHL](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SRSHL <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
if S == '0' && size != '11' then UNDEFINED;
```

Vector

Encoding

SRSHL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
```

Assembler symbols

<V>	Is a width specifier, encoded in the "size" field. It can have the following values: D when size = 11 The following encodings are reserved: • size = 0x. • size = 10.
<d>	Is the number of the SIMD&FP destination register, in the "Rd" field.

```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.316 SSHLL, SSHLL2

Signed Shift Left Long (immediate). This instruction reads each vector element from the source SIMD&FP register, left shifts each vector element by the specified shift amount, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

The SSHLL instruction extracts vector elements from the lower half of the source register. The SSHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias SXTL, SXTL2. See *Alias conditions* on page C7-2244 for details of when each alias is preferred.

Encoding

SSHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = UInt(immh:immb) - esize;
boolean unsigned = (U == '1');
```

Alias conditions

Alias	is preferred when
SXTL, SXTL2	immb == '000' && BitCount(immh) == 1

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

- <Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:
- | | |
|----|------------------|
| 8H | when immh = 0001 |
| 4S | when immh = 001x |
| 2D | when immh = 01xx |
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.
 The encoding immh = 1xxx is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
- | | |
|-----|-------------------------|
| 8B | when immh = 0001, Q = 0 |
| 16B | when immh = 0001, Q = 1 |
| 4H | when immh = 001x, Q = 0 |
| 8H | when immh = 001x, Q = 1 |
| 2S | when immh = 01xx, Q = 0 |
| 4S | when immh = 01xx, Q = 1 |
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
 The encoding immh = 1xxx, Q = x is reserved.
- <shift> Is the left shift amount, in the range 0 to the source element width in bits minus 1, encoded in the "immh:immb" field. It can have the following values:
- | | |
|----------------------|------------------|
| (UInt(immh:immb)-8) | when immh = 0001 |
| (UInt(immh:immb)-16) | when immh = 001x |
| (UInt(immh:immb)-32) | when immh = 01xx |
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.
 The encoding immh = 1xxx is reserved.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part];
bits(datasize*2) result;
integer element;

for e = 0 to elements-1
    element = Int(Elem[operand, e, esize], unsigned) << shift;
    Elem[result, e, 2*esize] = element<2*esize-1:0>;

V[d] = result;
    
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.317 SSHR

Signed Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, places the final result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The results are truncated. For rounded results, see [SRSHR](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SSHR <V><d>, <V><n>, #<shift>

Decode for this encoding

```

integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Vector

Encoding

SSHR <Vd>.<T>, <Vn>.<T>, #<shift>

Decode for this encoding

integer elements = 1;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Vector

Encoding

SSRA <Vd>.<T>, <Vn>.<T>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
```

```
boolean round = (o1 == '1');  
boolean accumulate = (o0 == '1');
```

Assembler symbols

- <V> Is a width specifier, encoded in the "immh" field. It can have the following values:
D when immh = 1xxx
The encoding immh = 0xxx is reserved.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
8B when immh = 0001, Q = 0
16B when immh = 0001, Q = 1
4H when immh = 001x, Q = 0
8H when immh = 001x, Q = 1
2S when immh = 01xx, Q = 0
4S when immh = 01xx, Q = 1
2D when immh = 1xxx, Q = 1
See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
The encoding immh = 1xxx, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <shift> For the scalar variant: is the right shift amount, in the range 1 to 64, encoded in the "immh:immb" field. It can have the following values:
(128-UInt(immh:immb)) when immh = 1xxx
The encoding immh = 0xxx is reserved.
For the vector variant: is the right shift amount, in the range 1 to the element width in bits, encoded in the "immh:immb" field. It can have the following values:
(16-UInt(immh:immb)) when immh = 0001
(32-UInt(immh:immb)) when immh = 001x
(64-UInt(immh:immb)) when immh = 01xx
(128-UInt(immh:immb)) when immh = 1xxx
See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
bits(datasize) operand2;  
bits(datasize) result;  
integer round_const = if round then (1 << (shift - 1)) else 0;  
integer element;  
  
operand2 = if accumulate then V[d] else Zeros();  
for e = 0 to elements-1  
    element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;  
    Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
```

V[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.319 SSUBL, SSUBL2

Signed Subtract Long. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are signed integer values. The destination vector elements are twice as long as the source vector elements.

The SSUBL instruction extracts each source vector from the lower half of each source register. The SSUBL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SSUBL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
- 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
- The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- 8B when size = 00, Q = 0

16B when size = 00, Q = 1
 4H when size = 01, Q = 0
 8H when size = 01, Q = 1
 2S when size = 10, Q = 0
 4S when size = 10, Q = 1
 The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;

V[d] = result;
    
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.320 SSUBW, SSUBW2

Signed Subtract Wide. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element in the first source SIMD&FP register, places the result in a vector, and writes the vector to the SIMD&FP destination register. All the values in this instruction are signed integer values.

The SSUBW instruction extracts the second source vector from the lower half of the second source register. The SSUBW2 instruction extracts the second source vector from the upper half of the second source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SSUBW{2} <Vd>.<Ta>, <Vn>.<Ta>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;

V[d] = result;
    
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.321 ST1 (multiple structures)

Store multiple single-element structures from one, two, three, or four registers. This instruction stores elements to memory from one, two, three, or four SIMD&FP registers, without interleaving. Every element of each register is stored.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

One register variant

Applies when opcode == 0111.

ST1 { <Vt>.<T> }, [<Xn|SP>]

Two registers variant

Applies when opcode == 1010.

ST1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>]

Three registers variant

Applies when opcode == 0110.

ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>]

Four registers variant

Applies when opcode == 0010.

ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>]

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;
```

Post-index

One register, immediate offset variant

Applies when Rm == 11111 && opcode == 0111.

ST1 { <Vt>.<T> }, [<Xn|SP>], <imm>

One register, register offset variant

Applies when Rm != 11111 && opcode == 0111.

ST1 { <Vt>.<T> }, [<Xn|SP>], <Xm>

Two registers, immediate offset variant

Applies when Rm == 11111 && opcode == 1010.

ST1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>

Two registers, register offset variant

Applies when Rm != 11111 && opcode == 1010.

ST1 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>

Three registers, immediate offset variant

Applies when Rm == 11111 && opcode == 0110.

ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <imm>

Three registers, register offset variant

Applies when Rm != 11111 && opcode == 0110.

ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T> }, [<Xn|SP>], <Xm>

Four registers, immediate offset variant

Applies when Rm == 11111 && opcode == 0010.

ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <imm>

Four registers, register offset variant

Applies when Rm != 11111 && opcode == 0010.

ST1 { <Vt>.<T>, <Vt2>.<T>, <Vt3>.<T>, <Vt4>.<T> }, [<Xn|SP>], <Xm>

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean tag_checked = wback || n != 31;
```

Assembler symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B	when size = 00, Q = 0
16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1
1D	when size = 11, Q = 0

	2D	when size = 11, Q = 1
<Vt2>	Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.	
<Vt3>	Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.	
<Vt4>	Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.	
<Xn SP>	Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.	
<imm>	For the one register, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:	
	#8	when Q = 0
	#16	when Q = 1
	For the two registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:	
	#16	when Q = 0
	#32	when Q = 1
	For the three registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:	
	#24	when Q = 0
	#48	when Q = 1
	For the four registers, immediate offset variant: is the post-index immediate offset, encoded in the "Q" field. It can have the following values:	
	#32	when Q = 0
	#64	when Q = 1
<Xm>	Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.	

Shared decode for all encodings

```

```

Post-index

Immediate offset variant

Applies when Rm == 11111.

ST2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <imm>

Register offset variant

Applies when Rm != 11111.

ST2 { <Vt>.<T>, <Vt2>.<T> }, [<Xn|SP>], <Xm>

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = UInt(Rm);
boolean wback = TRUE;
boolean tag_checked = wback || n != 31;
```

Assembler symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0

16B when size = 00, Q = 1
 4H when size = 01, Q = 0
 8H when size = 01, Q = 1
 2S when size = 10, Q = 0
 4S when size = 10, Q = 1
 2D when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
 <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
 <imm> Is the post-index immediate offset, encoded in the "Q" field. It can have the following values:
 #16 when Q = 0
 #32 when Q = 1
 <Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared decode for all encodings

```
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer datasize = if Q == '1' then 128 else 64;
integer esize = 8 << UInt(size);
integer elements = datasize DIV esize;

integer rpt; // number of iterations
integer selem; // structure elements

case opcode of
    when '0000' rpt = 1; selem = 4; // LD/ST4 (4 registers)
    when '0010' rpt = 4; selem = 1; // LD/ST1 (4 registers)
    when '0100' rpt = 1; selem = 3; // LD/ST3 (3 registers)
    when '0110' rpt = 3; selem = 1; // LD/ST1 (3 registers)
    when '0111' rpt = 1; selem = 1; // LD/ST1 (1 register)
    when '1000' rpt = 1; selem = 2; // LD/ST2 (2 registers)
    when '1010' rpt = 2; selem = 1; // LD/ST1 (2 registers)
    otherwise UNDEFINED;

// .1D format only permitted with LD1 & ST1
if size:Q == '110' && selem != 1 then UNDEFINED;
```

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();

bits(64) address;
bits(64) offs;
bits(datasize) rval;
integer tt;
constant integer ebytes = esize DIV 8;

if HaveMTE2Ext() then

        offs = offs + ebytes;
        tt = (tt + 1) MOD 32;

if wback then
  if m != 31 then
    offs = X[m];
  if n == 31 then
    SP[] = address + offs;
  else
    X[n] = address + offs;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.324 ST2 (single structure)

Store single 2-element structure from one lane of two registers. This instruction stores a 2-element structure to memory from corresponding elements of two SIMD&FP registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

8-bit variant

Applies when opcode == 000.

ST2 { <Vt>.B, <Vt2>.B }[<index>], [<Xn|SP>]

16-bit variant

Applies when opcode == 010 && size == x0.

ST2 { <Vt>.H, <Vt2>.H }[<index>], [<Xn|SP>]

32-bit variant

Applies when opcode == 100 && size == 00.

ST2 { <Vt>.S, <Vt2>.S }[<index>], [<Xn|SP>]

64-bit variant

Applies when opcode == 100 && S == 0 && size == 01.

ST2 { <Vt>.D, <Vt2>.D }[<index>], [<Xn|SP>]

Decode for all variants of this encoding

```
integer t = UInt(Rt);

Assembler symbols

<Vt> Is the name of the first or only SIMD&FP register to be transferred, encoded in the "Rt" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0

16B when size = 00, Q = 1
 4H when size = 01, Q = 0
 8H when size = 01, Q = 1
 2S when size = 10, Q = 0
 4S when size = 10, Q = 1
 2D when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

<Vt2> Is the name of the second SIMD&FP register to be transferred, encoded as "Rt" plus 1 modulo 32.
 <Vt3> Is the name of the third SIMD&FP register to be transferred, encoded as "Rt" plus 2 modulo 32.
 <Vt4> Is the name of the fourth SIMD&FP register to be transferred, encoded as "Rt" plus 3 modulo 32.
 <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.
 <imm> Is the post-index immediate offset, encoded in the "Q" field. It can have the following values:
 #32 when Q = 0
 #64 when Q = 1
 <Xm> Is the 64-bit name of the general-purpose post-index register, excluding XZR, encoded in the "Rm" field.

Shared decode for all encodings

```
MemOp memop = if L == '1' then MemOp_LOAD else MemOp_STORE;
integer datasize = if Q == '1' then 128 else 64;
integer esize = 8 << UInt(size);
integer elements = datasize DIV esize;

integer rpt;    // number of iterations
integer selem; // structure elements

case opcode of
    when '0000' rpt = 1; selem = 4;    // LD/ST4 (4 registers)
    when '0010' rpt = 4; selem = 1;    // LD/ST1 (4 registers)
    when '0100' rpt = 1; selem = 3;    // LD/ST3 (3 registers)
    when '0110' rpt = 3; selem = 1;    // LD/ST1 (3 registers)
    when '0111' rpt = 1; selem = 1;    // LD/ST1 (1 register)
    when '1000' rpt = 1; selem = 2;    // LD/ST2 (2 registers)
    when '1010' rpt = 2; selem = 1;    // LD/ST1 (2 registers)
    otherwise UNDEFINED;

// .1D format only permitted with LD1 & ST1
if size:Q == '110' && selem != 1 then UNDEFINED;
```

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();

bits(64) address;
bits(64) offs;
bits(datasize) rval;
integer tt;
constant integer ebytes = esize DIV 8;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then
    CheckSPAlignment();
```

```
    address = SP[];
else
    address = X[n];

        offs = X[m];
    if n == 31 then
        SP[] = address + offs;
    else
        X[n] = address + offs;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.328 ST4 (single structure)

Store single 4-element structure from one lane of four registers. This instruction stores a 4-element structure to memory from corresponding elements of four SIMD&FP registers.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

No offset

8-bit variant

Applies when opcode == 001.

ST4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>]

16-bit variant

Applies when opcode == 011 && size == x0.

ST4 { <Vt>.H, <Vt2>.H, <Vt3>.H, <Vt4>.H }[<index>], [<Xn|SP>]

32-bit variant

Applies when opcode == 101 && size == 00.

ST4 { <Vt>.S, <Vt2>.S, <Vt3>.S, <Vt4>.S }[<index>], [<Xn|SP>]

64-bit variant

Applies when opcode == 101 && S == 0 && size == 01.

ST4 { <Vt>.D, <Vt2>.D, <Vt3>.D, <Vt4>.D }[<index>], [<Xn|SP>]

Decode for all variants of this encoding

```
integer t = UInt(Rt);
integer n = UInt(Rn);
integer m = integer UNKNOWN;
boolean wback = FALSE;
boolean tag_checked = wback || n != 31;
```

Post-index

8-bit, immediate offset variant

Applies when Rm == 11111 && opcode == 001.

ST4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>], #4

8-bit, register offset variant

Applies when Rm != 11111 && opcode == 001.

ST4 { <Vt>.B, <Vt2>.B, <Vt3>.B, <Vt4>.B }[<index>], [<Xn|SP>], <Xm>

16-bit, immediate offset variant

Applies when Rm == 11111 && opcode == 011 && size == x0.

ST4 { <Vt>.H, <Vt2>.H, <Vt3>.H, <Vt4>.H }[<index>], [<Xn|SP>], #8

16-bit, register offset variant

Applies when Rm != 11111 && opcode == 011 && size == x0.

ST4 { <Vt>.H, <Vt2>.H, <Vt3>.H, <Vt4>.H }[<index>], [<Xn|SP>], <Xm>

32-bit, immediate offset variant

Applies when Rm == 11111 && opcode == 101 && size == 00.

ST4 { <Vt>.S, <Vt2>.S, <Vt3>.S, <Vt4>.S }[<index>], [<Xn|SP>], #16

32-bit, register offset variant

Applies when Rm != 11111 && opcode == 101 && size == 00.

ST4 { <Vt>.S, <Vt2>.S, <Vt3>.S, <Vt4>.S }[<index>], [<Xn|SP>], <Xm>

64-bit, immediate offset variant

Applies when Rm == 11111 && opcode == 101 && S == 0 && size == 01.

ST4 { <Vt>.D, <Vt2>.D, <Vt3>.D, <Vt4>.D }[<index>], [<Xn|SP>], #32

64-bit, register offset variant

Applies when Rm != 11111 && opcode == 101 && S == 0 && size == 01.

ST4 { <Vt>.D, <Vt2>.D, <Vt3>.D, <Vt4>.D }[<index>], [<Xn|SP>], <Xm>

Decode for all variants of this encoding

```

```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.329 STNP (SIMD&FP)

Store Pair of SIMD&FP registers, with Non-temporal hint. This instruction stores a pair of SIMD&FP registers to memory, issuing a hint to the memory system that the access is non-temporal. The address used for the store is calculated from an address from a base register value and an immediate offset. For information about non-temporal pair instructions, see *Load/store SIMD and floating-point non-temporal pair* on page C3-233.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

32-bit variant

Applies when `opc == 00`.

STNP <St1>, <St2>, [<Xn|SP>{, #<imm>}]

64-bit variant

Applies when `opc == 01`.

STNP <Dt1>, <Dt2>, [<Xn|SP>{, #<imm>}]

128-bit variant

Applies when `opc == 10`.

STNP <Qt1>, <Qt2>, [<Xn|SP>{, #<imm>}]

Decode for all variants of this encoding

// Empty.

Assembler symbols

- <Dt1> Is the 64-bit name of the first SIMD&FP register to be transferred, encoded in the "Rt" field.

    if n == 31 then
        SP[] = address;
    else
        X[n] = address;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.332 STR (register, SIMD&FP)

Store SIMD&FP register (register offset). This instruction stores a single SIMD&FP register to memory. The address that is used for the store is calculated from a base register value and an offset register value. The offset can be optionally shifted and extended.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

8-fsreg, STR-8-fsreg variant

Applies when size == 00 && opc == 00 && option != 011.

STR <Bt>, [<Xn|SP>, (<Wm>|<Xm>), <extend> {<amount>}]

8-fsreg, STR-8-fsreg variant

Applies when size == 00 && opc == 00 && option == 011.

STR <Bt>, [<Xn|SP>, <Xm>{, LSL <amount>}]

16-fsreg, STR-16-fsreg variant

Applies when size == 01 && opc == 00.

STR <Ht>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}]}

32-fsreg, STR-32-fsreg variant

Applies when size == 10 && opc == 00.

STR <St>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}]}

64-fsreg, STR-64-fsreg variant

Applies when size == 11 && opc == 00.

STR <Dt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}]}

128-fsreg, STR-128-fsreg variant

Applies when size == 00 && opc == 10.

STR <Qt>, [<Xn|SP>, (<Wm>|<Xm>){, <extend> {<amount>}]}

Decode for all variants of this encoding

```
integer scale = UInt(opc<1>:size);
if scale > 4 then UNDEFINED;
if option<1> == '0' then UNDEFINED; // sub-word index
ExtendType extend_type = DecodeRegExtend(option);
integer shift = if S == '1' then scale else 0;
```

Assembler symbols

<Bt> Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

<Dt>	Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.

    when MemOp_LOAD
        data = Mem[address, datasize DIV 8, AccType_VEC];
        V[t] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.333 STUR (SIMD&FP)

Store SIMD&FP register (unscaled offset). This instruction stores a single SIMD&FP register to memory. The address that is used for the store is calculated from a base register value and an optional immediate offset.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

8-bit variant

Applies when size == 00 && opc == 00.

STUR <Bt>, [<Xn|SP>{, #<sim>}]

16-bit variant

Applies when size == 01 && opc == 00.

STUR <Ht>, [<Xn|SP>{, #<sim>}]

32-bit variant

Applies when size == 10 && opc == 00.

STUR <St>, [<Xn|SP>{, #<sim>}]

64-bit variant

Applies when size == 11 && opc == 00.

STUR <Dt>, [<Xn|SP>{, #<sim>}]

128-bit variant

Applies when size == 00 && opc == 10.

STUR <Qt>, [<Xn|SP>{, #<sim>}]

Decode for all variants of this encoding

```
integer scale = UInt(opc<1>:size);
if scale > 4 then UNDEFINED;
bits(64) offset = SignExtend(imm9, 64);
```

Assembler symbols

- <Bt> Is the 8-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Dt> Is the 64-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Ht> Is the 16-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Qt> Is the 128-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <St> Is the 32-bit name of the SIMD&FP register to be transferred, encoded in the "Rt" field.
- <Xn|SP> Is the 64-bit name of the general-purpose base register or stack pointer, encoded in the "Rn" field.

<imm> Is the optional signed immediate byte offset, in the range -256 to 255, defaulting to 0 and encoded in the "imm9" field.

Shared decode for all encodings

```
integer n = UInt(Rn);
integer t = UInt(Rt);
MemOp memop = if opc<0> == '1' then MemOp_LOAD else MemOp_STORE;
integer datasize = 8 << scale;
boolean tag_checked = memop != MemOp_PREFETCH && (n != 31);
```

Operation

```
CheckFPAdvSIMDEnabled64();
bits(64) address;
bits(datasize) data;

if HaveMTE2Ext() then
    SetTagCheckedInstruction(tag_checked);

if n == 31 then

    when MemOp_LOAD
        data = Mem[address, datasize DIV 8, AccType_VEC];
        V[t] = data;
```

Operational information

If PSTATE.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

C7.2.334 SUB (vector)

Subtract (vector). This instruction subtracts each vector element in the second source SIMD&FP register from the corresponding vector element in the first source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SUB <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size != '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean sub_op = (U == '1');
```

Vector

Encoding

SUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean sub_op = (U == '1');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

D when size = 11

The following encodings are reserved:

- size = 0x.

- size = 10.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(esize) element1;
bits(esize) element2;

for e = 0 to elements-1
    element1 = Elem[operand1, e, esize];
    element2 = Elem[operand2, e, esize];
    if sub_op then
        Elem[result, e, esize] = element1 - element2;
    else
        Elem[result, e, esize] = element1 + element2;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.335 SUBHN, SUBHN2

Subtract returning High Narrow. This instruction subtracts each vector element in the second source SIMD&FP register from the corresponding vector element in the first source SIMD&FP register, places the most significant half of the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are signed integer values.

The results are truncated. For rounded results, see [RSUBHN](#), [RSUBHN2](#).

The SUBHN instruction writes the vector to the lower half of the destination register and clears the upper half, while the SUBHN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

SUBHN{2} <Vd>.<Tb>, <Vn>.<Ta>, <Vm>.<Ta>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean round = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
- | | |
|----|----------------|
| 8H | when size = 00 |
| 4S | when size = 01 |
| 2D | when size = 10 |
- The encoding size = 11 is reserved.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n];
bits(2*datasize) operand2 = V[m];
bits(datasize) result;
integer round_const = if round then 1 << (esize - 1) else 0;
bits(2*esize) element1;
bits(2*esize) element2;
bits(2*esize) sum;

for e = 0 to elements-1
    element1 = Elem[operand1, e, 2*esize];
    element2 = Elem[operand2, e, 2*esize];
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    sum = sum + round_const;
    Elem[result, e, esize] = sum<2*esize-1:esize>;

Vpart[d, part] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.336 SUDOT (by element)

Dot product index form with signed and unsigned integers. This instruction performs the dot product of the four signed 8-bit integer values in each 32-bit element of the first source register with the four unsigned 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination vector.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. [ID_AA64ISAR1_EL1.I8MM](#) indicates whether this instruction is supported.

Vector

(FEAT_I8MM)

Encoding

SUDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.#4B[<index>]

Decode for this encoding

```

if !HaveInt8MatMulExt() then UNDEFINED;
boolean op1_unsigned = (US == '1');
boolean op2_unsigned = (US == '0');
integer n = UInt(Rn);
integer m = UInt(M:Rm);
integer d = UInt(Rd);
integer i = UInt(H:L);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 32;
    
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 2S when Q = 0
 - 4S when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.
- <index> Is the immediate index of a quadruplet of four 8-bit elements in the range 0 to 3, encoded in the "H:L" fields.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(128) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
    
```

```
for e = 0 to elements-1
  bits(32) res = Elem[operand3, e, 32];
  for b = 0 to 3
    integer element1 = Int(Elem[operand1, 4*e+b, 8], op1_unsigned);
    integer element2 = Int(Elem[operand2, 4*i+b, 8], op2_unsigned);
    res = res + element1 * element2;
  Elem[result, e, 32] = res;
V[d] = result;
```

C7.2.337 SUQADD

Signed saturating Accumulate of Unsigned value. This instruction adds the unsigned integer values of the vector elements in the source SIMD&FP register to corresponding signed integer values of the vector elements in the destination SIMD&FP register, and writes the resulting signed integer values to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

SUQADD <V><d>, <V><n>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;

boolean unsigned = (U == '1');
```

Vector

Encoding

SUQADD <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

Assembler symbols

- <V> Is a width specifier, encoded in the "size" field. It can have the following values:
- | | |
|---|----------------|
| B | when size = 00 |
| H | when size = 01 |
| S | when size = 10 |
| D | when size = 11 |
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

bits(datasize) operand2 = V[d];
integer op1;
integer op2;
boolean sat;

for e = 0 to elements-1
    op1 = Int(Elem[operand, e, esize], !unsigned);
    op2 = Int(Elem[operand2, e, esize], unsigned);
    (Elem[result, e, esize], sat) = SatQ(op1 + op2, esize, unsigned);
    if sat then FPSR.QC = '1';
V[d] = result;
```

C7.2.338 SXTL, SXTL2

Signed extend Long. This instruction duplicates each vector element in the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are signed integer values.

The SXTL instruction extracts the source vector from the lower half of the source register. The SXTL2 instruction extracts the source vector from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the SSHLL, SSHLL2 instruction. This means that:

- The encodings in this description are named to match the encodings of SSHLL, SSHLL2.
- The description of SSHLL, SSHLL2 gives the operational pseudocode for this instruction.

Encoding

SXTL{2} <Vd>.<Ta>, <Vn>.<Tb>

is equivalent to

SSHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #0

and is the preferred disassembly when BitCount(immh) == 1.

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0

[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

8H when immh = 0001

4S when immh = 001x

2D when immh = 01xx

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

The encoding immh = 1xxx is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

8B when immh = 0001, Q = 0

16B when immh = 0001, Q = 1

4H when immh = 001x, Q = 0

8H when immh = 001x, Q = 1

2S when immh = 01xx, Q = 0

4S when immh = 01xx, Q = 1

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.

The encoding immh = 1xxx, Q = x is reserved.

Operation

The description of [SSHLL](#), [SSHLL2](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.339 TBL

Table vector Lookup. This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the result for that lookup is 0. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Two register table variant

Applies when len == 01.

TBL <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B }, <Vm>.<Ta>

Three register table variant

Applies when len == 10.

TBL <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B, <Vn+2>.16B }, <Vm>.<Ta>

Four register table variant

Applies when len == 11.

TBL <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B, <Vn+2>.16B, <Vn+3>.16B }, <Vm>.<Ta>

Single register table variant

Applies when len == 00.

TBL <Vd>.<Ta>, { <Vn>.16B }, <Vm>.<Ta>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 8;
integer regs = UInt(len) + 1;
boolean is_tbl = (op == '0');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|-----|------------|
| 8B | when Q = 0 |
| 16B | when Q = 1 |

- <Vn> For the four register table, three register table and two register table variant: is the name of the first SIMD&FP table register, encoded in the "Rn" field.
For the single register table variant: is the name of the SIMD&FP table register, encoded in the "Rn" field.
- <Vn+1> Is the name of the second SIMD&FP table register, encoded as "Rn" plus 1 modulo 32.
- <Vn+2> Is the name of the third SIMD&FP table register, encoded as "Rn" plus 2 modulo 32.
- <Vn+3> Is the name of the fourth SIMD&FP table register, encoded as "Rn" plus 3 modulo 32.
- <Vm> Is the name of the SIMD&FP index register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) indices = V[m];
bits(128*regs) table = Zeros();
bits(datasize) result;
integer index;

// Create table from registers
for i = 0 to regs-1
    table<128*i+127:128*i> = V[n];
    n = (n + 1) MOD 32;

result = if is_tbl then Zeros() else V[d];
for i = 0 to elements-1
    index = UInt(Elem[indices, i, 8]);
    if index < 16 * regs then
        Elem[result, i, 8] = Elem[table, index, 8];

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.340 TBX

Table vector lookup extension. This instruction reads each value from the vector elements in the index source SIMD&FP register, uses each result as an index to perform a lookup in a table of bytes that is described by one to four source table SIMD&FP registers, places the lookup result in a vector, and writes the vector to the destination SIMD&FP register. If an index is out of range for the table, the existing value in the vector element of the destination register is left unchanged. If more than one source register is used to describe the table, the first source register describes the lowest bytes of the table.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Two register table variant

Applies when len == 01.

TBX <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B }, <Vm>.<Ta>

Three register table variant

Applies when len == 10.

TBX <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B, <Vn+2>.16B }, <Vm>.<Ta>

Four register table variant

Applies when len == 11.

TBX <Vd>.<Ta>, { <Vn>.16B, <Vn+1>.16B, <Vn+2>.16B, <Vn+3>.16B }, <Vm>.<Ta>

Single register table variant

Applies when len == 00.

TBX <Vd>.<Ta>, { <Vn>.16B }, <Vm>.<Ta>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 8;
integer regs = UInt(len) + 1;
boolean is_tbl = (op == '0');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
- | | |
|-----|------------|
| 8B | when Q = 0 |
| 16B | when Q = 1 |

- <Vn> For the four register table, three register table and two register table variant: is the name of the first SIMD&FP table register, encoded in the "Rn" field.
For the single register table variant: is the name of the SIMD&FP table register, encoded in the "Rn" field.
- <Vn+1> Is the name of the second SIMD&FP table register, encoded as "Rn" plus 1 modulo 32.
- <Vn+2> Is the name of the third SIMD&FP table register, encoded as "Rn" plus 2 modulo 32.
- <Vn+3> Is the name of the fourth SIMD&FP table register, encoded as "Rn" plus 3 modulo 32.
- <Vm> Is the name of the SIMD&FP index register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) indices = V[m];
bits(128*regs) table = Zeros();
bits(datasize) result;
integer index;

// Create table from registers
for i = 0 to regs-1
    table<128*i+127:128*i> = V[n];
    n = (n + 1) MOD 32;

result = if is_tbl then Zeros() else V[d];
for i = 0 to elements-1
    index = UInt(Elem[indices, i, 8]);
    if index < 16 * regs then
        Elem[result, i, 8] = Elem[table, index, 8];

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.341 TRN1

Transpose vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places each result into consecutive elements of a vector, and writes the vector to the destination SIMD&FP register. Vector elements from the first source register are placed into even-numbered elements of the destination vector, starting at zero, while vector elements from the second source register are placed into odd-numbered elements of the destination vector.

Note

By using this instruction with TRN2, a 2 x 2 matrix can be transposed.

The following figure shows the operation of TRN1 and TRN2 halfword operations where Q = 0.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

TRN1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
integer pairs = elements DIV 2;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- 8B when size = 00, Q = 0

16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
2D when size = 11, Q = 1

The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

for p = 0 to pairs-1
    Elem[result, 2*p+0, esize] = Elem[operand1, 2*p+part, esize];
    Elem[result, 2*p+1, esize] = Elem[operand2, 2*p+part, esize];

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

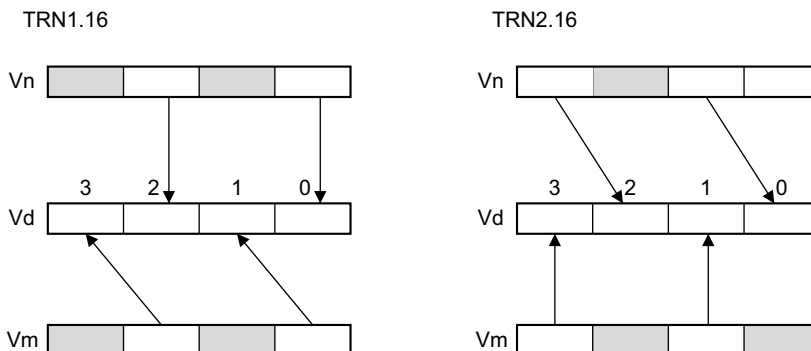

C7.2.342 TRN2

Transpose vectors (secondary). This instruction reads corresponding odd-numbered vector elements from the two source SIMD&FP registers, places each result into consecutive elements of a vector, and writes the vector to the destination SIMD&FP register. Vector elements from the first source register are placed into even-numbered elements of the destination vector, starting at zero, while vector elements from the second source register are placed into odd-numbered elements of the destination vector.

———— **Note** ————

By using this instruction with TRN1, a 2 x 2 matrix can be transposed.

The following figure shows the operation of TRN1 and TRN2 halfword operations where Q = 0.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

TRN2 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
integer pairs = elements DIV 2;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1

4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand1 = V[n];  
bits(datasize) operand2 = V[m];  
bits(datasize) result;  
  
for p = 0 to pairs-1  
    Elem[result, 2*p+0, esize] = Elem[operand1, 2*p+part, esize];  
    Elem[result, 2*p+1, esize] = Elem[operand2, 2*p+part, esize];  
  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.343 UABA

Unsigned Absolute difference and Accumulate. This instruction subtracts the elements of the vector of the second source SIMD&FP register from the corresponding elements of the first source SIMD&FP register, and accumulates the absolute values of the results into the elements of the vector of the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UABA <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean unsigned = (U == '1');
boolean accumulate = (ac == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
bits(esize) absdiff;
```

```
result = if accumulate then V[d] else Zeros();  
for e = 0 to elements-1  
    element1 = Int(Elem[operand1, e, esize], unsigned);  
    element2 = Int(Elem[operand2, e, esize], unsigned);  
    absdiff = Abs(element1-element2)<esize-1:0>;  
    Elem[result, e, esize] = Elem[result, e, esize] + absdiff;  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.344 UABAL, UABAL2

Unsigned Absolute difference and Accumulate Long. This instruction subtracts the vector elements in the lower or upper half of the second source SIMD&FP register from the corresponding vector elements of the first source SIMD&FP register, and accumulates the absolute values of the results into the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are unsigned integer values.

The UABAL instruction extracts each source vector from the lower half of each source register. The UABAL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UABAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean accumulate = (op == '0');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
 The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B	when size = 00, Q = 0
16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) absdiff;

result = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    absdiff = Abs(element1-element2)<2*esize-1:0>;
    Elem[result, e, 2*esize] = Elem[result, e, 2*esize] + absdiff;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.345 UABD

Unsigned Absolute Difference (vector). This instruction subtracts the elements of the vector of the second source SIMD&FP register from the corresponding elements of the first source SIMD&FP register, places the the absolute values of the results into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UABD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean unsigned = (U == '1');
boolean accumulate = (ac == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
bits(esize) absdiff;
```

```
result = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    absdiff = Abs(element1-element2)<esize-1:0>;
    Elem[result, e, esize] = Elem[result, e, esize] + absdiff;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.346 UABDL, UABDL2

Unsigned Absolute Difference Long. This instruction subtracts the vector elements in the lower or upper half of the second source SIMD&FP register from the corresponding vector elements of the first source SIMD&FP register, places the absolute value of the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are unsigned integer values.

The UABDL instruction extracts each source vector from the lower half of each source register. The UABDL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UABDL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean accumulate = (op == '0');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
 The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B	when size = 00, Q = 0
16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) absdiff;

result = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    absdiff = Abs(element1-element2)<2*esize-1:0>;
    Elem[result, e, 2*esize] = Elem[result, e, 2*esize] + absdiff;
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.347 UADALP

Unsigned Add and Accumulate Long Pairwise. This instruction adds pairs of adjacent unsigned integer values from the vector in the source SIMD&FP register and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UADALP <Vd>.<Ta>, <Vn>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV (2 * esize);
boolean acc = (op == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|----|-----------------------|
| 4H | when size = 00, Q = 0 |

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

bits(2*esize) sum;
integer op1;
integer op2;

if acc then result = V[d];
for e = 0 to elements-1
    op1 = Int(Elem[operand, 2*e+0, esize], unsigned);
    op2 = Int(Elem[operand, 2*e+1, esize], unsigned);
    sum = (op1+op2)<2*esize-1:0>;
    if acc then
        Elem[result, e, 2*esize] = Elem[result, e, 2*esize] + sum;
    else
        Elem[result, e, 2*esize] = sum;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.348 UADDL, UADDL2

Unsigned Add Long (vector). This instruction adds each vector element in the lower or upper half of the first source SIMD&FP register to the corresponding vector element of the second source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements. All the values in this instruction are unsigned integer values.

The UADDL instruction extracts each source vector from the lower half of each source register. The UADDL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UADDL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
 The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0

16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;

V[d] = result;
```

Operational information

- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.349 UADDLP

Unsigned Add Long Pairwise. This instruction adds pairs of adjacent unsigned integer values from the vector in the source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UADDLP <Vd>.<Ta>, <Vn>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV (2 * esize);
boolean acc = (op == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

4H	when size = 00, Q = 0
8H	when size = 00, Q = 1
2S	when size = 01, Q = 0
4S	when size = 01, Q = 1
1D	when size = 10, Q = 0
2D	when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B	when size = 00, Q = 0
16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

bits(2*esize) sum;
integer op1;
integer op2;

if acc then result = V[d];

 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.350 UADDLV

Unsigned sum Long across Vector. This instruction adds every vector element in the source SIMD&FP register together, and writes the scalar result to the destination SIMD&FP register. The destination scalar is twice as long as the source vector elements. All the values in this instruction are unsigned integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UADDLV <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '100' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

Assembler symbols

<V> Is the destination width specifier, encoded in the "size" field. It can have the following values:

H when size = 00
 S when size = 01
 D when size = 10

The encoding size = 11 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0
 16B when size = 00, Q = 1
 4H when size = 01, Q = 0
 8H when size = 01, Q = 1
 4S when size = 10, Q = 1

The following encodings are reserved:

- size = 10, Q = 0.
- size = 11, Q = x.

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(datasize) operand = V[n];  
integer sum;  
  
sum = Int(Elem[operand, 0, esize], unsigned);  
for e = 1 to elements-1  
    sum = sum + Int(Elem[operand, e, esize], unsigned);  
  
V[d] = sum<2*esize-1:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.351 UADDW, UADDW2

Unsigned Add Wide. This instruction adds the vector elements of the first source SIMD&FP register to the corresponding vector elements in the lower or upper half of the second source SIMD&FP register, places the result in a vector, and writes the vector to the SIMD&FP destination register. The vector elements of the destination register and the first source register are twice as long as the vector elements of the second source register. All the values in this instruction are unsigned integer values.

The UADDW instruction extracts vector elements from the lower half of the second source register. The UADDW2 instruction extracts vector elements from the upper half of the second source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UADDW{2} <Vd>.<Ta>, <Vn>.<Ta>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B	when size = 00, Q = 0
16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, 2*esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.352 UCVTF (vector, fixed-point)

Unsigned fixed-point Convert to Floating-point (vector). This instruction converts each element in a vector from fixed-point to floating-point using the rounding mode that is specified by the **FPCR**, and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in **FPCR**, the exception results in either a flag being set in **FPSR**, or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the **CPACR_EL1**, **CPTR_EL2**, and **CPTR_EL3** registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

    Elem[result, e, esize] = FixedToFP(element, 0, unsigned, fpcr, rounding);

V[d] = result;
```

C7.2.354 UCVTF (scalar, fixed-point)

Unsigned fixed-point Convert to Floating-point (scalar). This instruction converts the unsigned value in the 32-bit or 64-bit general-purpose source register to a floating-point value using the rounding mode that is specified by the [FPCR](#), and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the Security state and Exception level in which the instruction is executed, an attempt to execute the instruction might be trapped.

32-bit to half-precision variant

Applies when `sf == 0 && ftype == 11`.

UCVTF <Hd>, <Wn>, #<fbits>

32-bit to single-precision variant

Applies when `sf == 0 && ftype == 00`.

UCVTF <Sd>, <Wn>, #<fbits>

32-bit to double-precision variant

Applies when `sf == 0 && ftype == 01`.

UCVTF <Dd>, <Wn>, #<fbits>

64-bit to half-precision variant

Applies when `sf == 1 && ftype == 11`.

UCVTF <Hd>, <Xn>, #<fbits>

64-bit to single-precision variant

Applies when `sf == 1 && ftype == 00`.

UCVTF <Sd>, <Xn>, #<fbits>

64-bit to double-precision variant

Applies when `sf == 1 && ftype == 01`.

UCVTF <Dd>, <Xn>, #<fbits>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer intsize = if sf == '1' then 64 else 32;
integer fltsize;
FPRounding rounding;
```

```
case ftype of
  when '00' fltsize = 32;
  when '01' fltsize = 64;

    if HaveFP16Ext() then
      fltsize = 16;
    else
      UNDEFINED;

if sf == '0' && scale<5> == '0' then UNDEFINED;
integer fracbits = 64 - UInt(scale);

rounding = FPRoundingMode(FPCR[]);
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- <Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.
- <fbits> For the 32-bit to double-precision, 32-bit to half-precision and 32-bit to single-precision variant: is the number of bits after the binary point in the fixed-point source, in the range 1 to 32, encoded as 64 minus "scale".
- For the 64-bit to double-precision, 64-bit to half-precision and 64-bit to single-precision variant: is the number of bits after the binary point in the fixed-point source, in the range 1 to 64, encoded as 64 minus "scale".

Operation

```
CheckFPEnabled64();

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
integer fsize = if merge then 128 else fltsize;
bits(fsize) fltval;
bits(intsize) intval;

intval = X[n];
fltval = if merge then V[d] else Zeros();
Elem[fltval, 0, fltsize] = FixedToFP(intval, fracbits, TRUE, fpcr, rounding);
V[d] = fltval;
```

C7.2.355 UCVTF (scalar, integer)

Unsigned integer Convert to Floating-point (scalar). This instruction converts the unsigned integer value in the general-purpose source register to a floating-point value using the rounding mode that is specified by the [FPCR](#), and writes the result to the SIMD&FP destination register.

A floating-point exception can be generated by this instruction. Depending on the settings in [FPCR](#), the exception results in either a flag being set in [FPSR](#), or a synchronous exception being generated. For more information, see [Floating-point exceptions and exception traps on page D1-2495](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

32-bit to half-precision variant

Applies when sf == 0 && ftype == 11.

UCVTF <Hd>, <Wn>

32-bit to single-precision variant

Applies when sf == 0 && ftype == 00.

UCVTF <Sd>, <Wn>

32-bit to double-precision variant

Applies when sf == 0 && ftype == 01.

UCVTF <Dd>, <Wn>

64-bit to half-precision variant

Applies when sf == 1 && ftype == 11.

UCVTF <Hd>, <Xn>

64-bit to single-precision variant

Applies when sf == 1 && ftype == 00.

UCVTF <Sd>, <Xn>

64-bit to double-precision variant

Applies when sf == 1 && ftype == 01.

UCVTF <Dd>, <Xn>

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
```

```
integer intsize = if sf == '1' then 64 else 32;
integer fltsize;
FPRounding rounding;
```

```
case ftype of
  when '00'
    fltsize = 32;
  when '01'
    fltsize = 64;
  when '10'
    UNDEFINED;
  when '11'
    if HaveFP16Ext() then
      fltsize = 16;
    else
      UNDEFINED;

rounding = FPRoundingMode(FPCR[]);
```

Assembler symbols

- <Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Hd> Is the 16-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Xn> Is the 64-bit name of the general-purpose source register, encoded in the "Rn" field.
- <Wn> Is the 32-bit name of the general-purpose source register, encoded in the "Rn" field.

Operation

```
CheckFPEnabled64();

FPCRType fpcr = FPCR[];
boolean merge = IsMerging(fpcr);
integer fsize = if merge then 128 else fltsize;
bits(fsize) fltval;
bits(intsize) intval;

intval = X[n];
fltval = if merge then V[d] else Zeros();
Elem[fltval, 0, fltsize] = FixedToFP(intval, 0, TRUE, fpcr, rounding);
V[d] = fltval;
```

C7.2.356 UDOT (by element)

Dot Product unsigned arithmetic (vector, by element). This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

———— **Note** —————

[ID_AA64ISAR0_EL1.DP](#) indicates whether this instruction is supported.

Vector

(FEAT_DotProd)

Encoding

UDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<4B[<index>]

Decode for this encoding

```

if !HaveDOTPExt() then UNDEFINED;
if size != '10' then UNDEFINED;
boolean signed = (U == '0');

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(M:Rm);
integer index = UInt(H:L);

integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
    
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 2S when Q = 0
 - 4S when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.

<index> Is the element index, encoded in the "H:L" fields.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(128) operand2 = V[m];
bits(datasize) result = V[d];
for e = 0 to elements-1
    integer res = 0;
    integer element1, element2;
    for i = 0 to 3
        if signed then
            element1 = SInt(Elem[operand1, 4*e+i, esize DIV 4]);
            element2 = SInt(Elem[operand2, 4*index+i, esize DIV 4]);
        else
            element1 = UInt(Elem[operand1, 4*e+i, esize DIV 4]);
            element2 = UInt(Elem[operand2, 4*index+i, esize DIV 4]);
        res = res + element1 * element2;
    Elem[result, e, esize] = Elem[result, e, esize] + res;
V[d] = result;
```

C7.2.357 UDOT (vector)

Dot Product unsigned arithmetic (vector). This instruction performs the dot product of the four unsigned 8-bit elements in each 32-bit element of the first source register with the four unsigned 8-bit elements of the corresponding 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

        res = res + element1 * element2;
    Elem[result, e, esize] = Elem[result, e, esize] + res;
V[d] = result;
```

C7.2.358 UHADD

Unsigned Halving Add. This instruction adds corresponding unsigned integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are truncated. For rounded results, see [URHADD](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UHADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;

integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer sum;
```

```
for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  sum = element1 + element2;
  Elem[result, e, esize] = sum<esize:1>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.359 UHSUB

Unsigned Halving Subtract. This instruction subtracts the vector elements in the second source SIMD&FP register from the corresponding vector elements in the first source SIMD&FP register, shifts each result right one bit, places each result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UHSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer diff;

for e = 0 to elements-1
```

```
element1 = Int(Elem[operand1, e, esize], unsigned);  
element2 = Int(Elem[operand2, e, esize], unsigned);  
diff = element1 - element2;  
Elem[result, e, esize] = diff<esize:1>;  
  
V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.360 UMAX

Unsigned Maximum (vector). This instruction compares corresponding elements in the vectors in the two source SIMD&FP registers, places the larger of each pair of unsigned integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMAX <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean unsigned = (U == '1');
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer maxmin;
```

```
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    maxmin = if minimum then Min(element1, element2) else Max(element1, element2);
    Elem[result, e, esize] = maxmin<esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.361 UMAXP

Unsigned Maximum Pairwise. This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the largest of each pair of unsigned integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMAXP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
integer element1;
```

```
integer element2;
integer maxmin;

for e = 0 to elements-1
    element1 = Int(Elem[concat, 2*e, esize], unsigned);
    element2 = Int(Elem[concat, (2*e)+1, esize], unsigned);
    maxmin = if minimum then Min(element1, element2) else Max(element1, element2);
    Elem[result, e, esize] = maxmin<esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.362 UMAXV

Unsigned Maximum across Vector. This instruction compares all the vector elements in the source SIMD&FP register, and writes the largest of the values as a scalar to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMAXV <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '100' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean min = (op == '1');
```

Assembler symbols

<V> Is the destination width specifier, encoded in the "size" field. It can have the following values:

B when size = 00
 H when size = 01
 S when size = 10

The encoding size = 11 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0
 16B when size = 00, Q = 1
 4H when size = 01, Q = 0
 8H when size = 01, Q = 1
 4S when size = 10, Q = 1

The following encodings are reserved:

- size = 10, Q = 0.
- size = 11, Q = x.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
integer maxmin;
integer element;

maxmin = Int(Elem[operand, 0, esize], unsigned);
for e = 1 to elements-1
    element = Int(Elem[operand, e, esize], unsigned);
    maxmin = if min then Min(maxmin, element) else Max(maxmin, element);

V[d] = maxmin<esize-1:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.363 UMIN

Unsigned Minimum (vector). This instruction compares corresponding vector elements in the two source SIMD&FP registers, places the smaller of each of the two unsigned integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMIN <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

```
boolean unsigned = (U == '1');
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0
 - 4S when size = 10, Q = 1
 The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer maxmin;
```

```
for e = 0 to elements-1
  element1 = Int(Elem[operand1, e, esize], unsigned);
  element2 = Int(Elem[operand2, e, esize], unsigned);
  maxmin = if minimum then Min(element1, element2) else Max(element1, element2);
  Elem[result, e, esize] = maxmin<esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.364 UMINP

Unsigned Minimum Pairwise. This instruction creates a vector by concatenating the vector elements of the first source SIMD&FP register after the vector elements of the second source SIMD&FP register, reads each pair of adjacent vector elements in the two source SIMD&FP registers, writes the smallest of each pair of unsigned integer values into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMINP <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean minimum = (o1 == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
bits(2*datasize) concat = operand2:operand1;
integer element1;
```

```
integer element2;
integer maxmin;

for e = 0 to elements-1
    element1 = Int(Elem[concat, 2*e, esize], unsigned);
    element2 = Int(Elem[concat, (2*e)+1, esize], unsigned);
    maxmin = if minimum then Min(element1, element2) else Max(element1, element2);
    Elem[result, e, esize] = maxmin<esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.365 UMINV

Unsigned Minimum across Vector. This instruction compares all the vector elements in the source SIMD&FP register, and writes the smallest of the values as a scalar to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMINV <V><d>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '100' then UNDEFINED;
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean min = (op == '1');
```

Assembler symbols

- <V> Is the destination width specifier, encoded in the "size" field. It can have the following values:
- | | |
|---|----------------|
| B | when size = 00 |
| H | when size = 01 |
| S | when size = 10 |
- The encoding size = 11 is reserved.
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 4S | when size = 10, Q = 1 |
- The following encodings are reserved:
- size = 10, Q = 0.
 - size = 11, Q = x.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
integer maxmin;
integer element;

maxmin = Int(Elem[operand, 0, esize], unsigned);
for e = 1 to elements-1
    element = Int(Elem[operand, e, esize], unsigned);
    maxmin = if min then Min(maxmin, element) else Max(maxmin, element);

V[d] = maxmin<esize-1:0>;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.366 UMLAL, UMLAL2 (by element)

Unsigned Multiply-Add Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLAL instruction extracts vector elements from the lower half of the first source register. The UMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMLAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

Decode for this encoding

```

integer idxsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean sub_op = (o2 == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 4S when size = 01
 - 2D when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The following encodings are reserved:

- size = 00, Q = x.
- size = 11, Q = x.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:

- 0:Rm when size = 01
- M:Rm when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Restricted to V0-V15 when element size <Ts> is H.

<Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:

- H when size = 01
- S when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<index> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:

- H:L:M when size = 01
- H:L when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(idxszie) operand2 = V[m];
bits(2*datasize) operand3 = V[d];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;

element2 = Int(Elem[operand2, index, esize], unsigned);
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
  
```

```
if sub_op then
    Elem[result, e, 2*esize] = Elem[operand3, e, 2*esize] - product;
else
    Elem[result, e, 2*esize] = Elem[operand3, e, 2*esize] + product;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.367 UMLAL, UMLAL2 (vector)

Unsigned Multiply-Add Long (vector). This instruction multiplies the vector elements in the lower or upper half of the first source SIMD&FP register by the corresponding vector elements of the second source SIMD&FP register, and accumulates the results with the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLAL instruction extracts vector elements from the lower half of the first source register. The UMLAL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMLAL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
- 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
- The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1

4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) operand3 = V[d];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;
bits(2*esize) accum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
    if sub_op then
        accum = Elem[operand3, e, 2*esize] - product;
    else
        accum = Elem[operand3, e, 2*esize] + product;
    Elem[result, e, 2*esize] = accum;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.368 UMLSL, UMLSL2 (by element)

Unsigned Multiply-Subtract Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register and subtracts the results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMLSL instruction extracts vector elements from the lower half of the first source register. The UMLSL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMLSL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

Decode for this encoding

```

integer idxsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
boolean sub_op = (o2 == '1');
    
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 4S when size = 01
 - 2D when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

- 4H when size = 01, Q = 0
- 8H when size = 01, Q = 1
- 2S when size = 10, Q = 0
- 4S when size = 10, Q = 1

The following encodings are reserved:

- size = 00, Q = x.
- size = 11, Q = x.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:

- 0:Rm when size = 01
- M:Rm when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Restricted to V0-V15 when element size <Ts> is H.

<Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:

- H when size = 01
- S when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

<index> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:

- H:L:M when size = 01
- H:L when size = 10

The following encodings are reserved:

- size = 00.
- size = 11.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(idxszie) operand2 = V[m];
bits(2*datasize) operand3 = V[d];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;

element2 = Int(Elem[operand2, index, esize], unsigned);
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
    
```

```
if sub_op then
    Elem[result, e, 2*esize] = Elem[operand3, e, 2*esize] - product;
else
    Elem[result, e, 2*esize] = Elem[operand3, e, 2*esize] + product;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.369 UMLSL, UMLSL2 (vector)

Unsigned Multiply-Subtract Long (vector). This instruction multiplies corresponding vector elements in the lower or upper half of the two source SIMD&FP registers, and subtracts the results from the vector elements of the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are unsigned integer values.

The UMLSL instruction extracts each source vector from the lower half of each source register. The UMLSL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMLSL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
 [present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

8H when size = 00
 4S when size = 01
 2D when size = 10

The encoding size = 11 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0
 16B when size = 00, Q = 1

4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) operand3 = V[d];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;
bits(2*esize) accum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
    if sub_op then
        accum = Elem[operand3, e, 2*esize] - product;
    else
        accum = Elem[operand3, e, 2*esize] + product;
    Elem[result, e, 2*esize] = accum;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.370 UMMLA (vector)

Unsigned 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of unsigned 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. [ID_AA64ISAR1_EL1.I8MM](#) indicates whether this instruction is supported.

Vector

(FEAT_I8MM)

Encoding

UMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B

Decode for this encoding

```
if !HaveInt8MatMulExt() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(128) operand1 = V[n];
bits(128) operand2 = V[m];
bits(128) addend = V[d];

V[d] = MatMulAdd(addend, operand1, operand2, TRUE, TRUE);
```

C7.2.371 UMOV

Unsigned Move vector element to general-purpose register. This instruction reads the unsigned integer from the source SIMD&FP register, zero-extends it to form a 32-bit or 64-bit value, and writes the result to the destination general-purpose register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias MOV (to general). See *Alias conditions* on page C7-2376 for details of when each alias is preferred.

32-bit variant

Applies when Q == 0.

UMOV <Wd>, <Vn>.<Ts>[<index>]

64-reg, UMOV-64-reg variant

Applies when Q == 1 && imm5 == x1000.

UMOV <Xd>, <Vn>.<Ts>[<index>]

Decode for all variants of this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer size;
case Q:imm5 of
    when '0xxx1' size = 0; // UMOV Wd, Vn.B
    when '0xxx10' size = 1; // UMOV Wd, Vn.H
    when '0xx100' size = 2; // UMOV Wd, Vn.S
    when '1x1000' size = 3; // UMOV Xd, Vn.D
    otherwise UNDEFINED;

integer idxsize = if imm5<4> == '1' then 128 else 64;
integer index = UInt(imm5<4:size+1>);
integer esize = 8 << size;
integer datasize = if Q == '1' then 64 else 32;
```

Alias conditions

Alias	is preferred when
MOV (to general)	imm5 == 'x1000'
MOV (to general)	imm5 == 'xx100'

Assembler symbols

<Wd> Is the 32-bit name of the general-purpose destination register, encoded in the "Rd" field.

- <Xd> Is the 64-bit name of the general-purpose destination register, encoded in the "Rd" field.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Ts> For the 32-bit variant: is an element size specifier, encoded in the "imm5" field. It can have the following values:
- B when imm5 = xxxx1
 - H when imm5 = xxx10
 - S when imm5 = xx100
- The encoding imm5 = xx000 is reserved.
- For the 64-reg,UMOV-64-reg variant: is an element size specifier, encoded in the "imm5" field. It can have the following values:
- D when imm5 = x1000
- The following encodings are reserved:
- imm5 = x0000.
 - imm5 = xxxx1.
 - imm5 = xxx10.
 - imm5 = xx100.
- <index> For the 32-bit variant: is the element index encoded in the "imm5" field. It can have the following values:
- imm5<4:1> when imm5 = xxxx1
 - imm5<4:2> when imm5 = xxx10
 - imm5<4:3> when imm5 = xx100
- The encoding imm5 = xx000 is reserved.
- For the 64-reg,UMOV-64-reg variant: is the element index encoded in "imm5<4>".

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(idxsize) operand = V[n];
```

```
X[d] = ZeroExtend(Elem[operand, index, esize], datasize);
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.372 UMULL, UMULL2 (by element)

Unsigned Multiply Long (vector, by element). This instruction multiplies each vector element in the lower or upper half of the first source SIMD&FP register by the specified vector element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied.

The UMULL instruction extracts vector elements from the lower half of the first source register. The UMULL2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Ts>[<index>]

Decode for this encoding

```

integer idxsize = if H == '1' then 128 else 64;
integer index;
bit Rmhi;
case size of
    when '01' index = UInt(H:L:M); Rmhi = '0';
    when '10' index = UInt(H:L); Rmhi = M;
    otherwise UNDEFINED;

integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rmhi:Rm);

integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
- 4S when size = 01
 - 2D when size = 10
- The following encodings are reserved:
- size = 00.

- size = 11.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|----|-----------------------|
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
- The following encodings are reserved:
- size = 00, Q = x.
 - size = 11, Q = x.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "size:M:Rm" field. It can have the following values:
- | | |
|------|----------------|
| 0:Rm | when size = 01 |
| M:Rm | when size = 10 |
- The following encodings are reserved:
- size = 00.
 - size = 11.
- Restricted to V0-V15 when element size <Ts> is H.
- <Ts> Is an element size specifier, encoded in the "size" field. It can have the following values:
- | | |
|---|----------------|
| H | when size = 01 |
| S | when size = 10 |
- The following encodings are reserved:
- size = 00.
 - size = 11.
- <indx> Is the element index, encoded in the "size:L:H:M" field. It can have the following values:
- | | |
|-------|----------------|
| H:L:M | when size = 01 |
| H:L | when size = 10 |
- The following encodings are reserved:
- size = 00.
 - size = 11.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(idxs size) operand2 = V[m];
bits(2*datasize) result;
integer element1;
integer element2;
bits(2*esize) product;

element2 = Int(Elem[operand2, index, esize], unsigned);
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    product = (element1*element2)<2*esize-1:0>;
    Elem[result, e, 2*esize] = product;

V[d] = result;
    
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.373 UMULL, UMULL2 (vector)

Unsigned Multiply long (vector). This instruction multiplies corresponding vector elements in the lower or upper half of the two source SIMD&FP registers, places the result in a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the elements that are multiplied. All the values in this instruction are unsigned integer values.

The UMULL instruction extracts each source vector from the lower half of each source register. The UMULL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UMULL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
 The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1

4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    Elem[result, e, 2*esize] = (element1*element2)<2*esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.374 UQADD

Unsigned saturating Add. This instruction adds the values of corresponding elements of the two source SIMD&FP registers, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

UQADD <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
```

Vector

Encoding

UQADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:

B	when size = 00
H	when size = 01

S	when size = 10
D	when size = 11
<d>	Is the number of the SIMD&FP destination register, in the "Rd" field.
<n>	Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
<m>	Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
<Vd>	Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T>	Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values: 8B when size = 00, Q = 0 16B when size = 00, Q = 1 4H when size = 01, Q = 0 8H when size = 01, Q = 1 2S when size = 10, Q = 0 4S when size = 10, Q = 1 2D when size = 11, Q = 1 The encoding size = 11, Q = 0 is reserved.
<Vn>	Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer sum;
boolean sat;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    sum = element1 + element2;
    (Elem[result, e, esize], sat) = SatQ(sum, esize, unsigned);
    if sat then FPSR.QC = '1';

V[d] = result;
```

C7.2.375 UQRSHL

Unsigned saturating Rounding Shift Left (register). This instruction takes each vector element of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding vector element of the second source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are rounded. For truncated results, see [UQSHL \(immediate\)](#).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

UQRSHL <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
if S == '0' && size != '11' then UNDEFINED;
```

Vector

Encoding

UQRSHL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

```
boolean rounding = (R == '1');
boolean saturating = (S == '1');
```

Assembler symbols

- <V> Is a width specifier, encoded in the "size" field. It can have the following values:
- | | |
|---|----------------|
| B | when size = 00 |
| H | when size = 01 |
| S | when size = 10 |
| D | when size = 11 |
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

integer round_const = 0;
integer shift;
integer element;
boolean sat;

for e = 0 to elements-1
  shift = SInt(Elem[operand2, e, esize]<7:0>);
  if rounding then
    round_const = 1 << (-shift - 1); // 0 for left shift, 2^(n-1) for right shift
  element = (Int(Elem[operand1, e, esize], unsigned) + round_const) << shift;
  if saturating then
    (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
    if sat then FPSR.QC = '1';
  else
    Elem[result, e, esize] = element<esize-1:0>;

V[d] = result;
```

C7.2.376 UQRSHRN, UQRSHRN2

Unsigned saturating Rounded Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see [UQSHRN](#), [UQSHRN2](#).

The UQRSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQRSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

UQRSHRN <Vb><d>, <Va><n>, #<shift>

Decode for this encoding

integer n = UInt(Rn);

if immh == '0000' then UNDEFINED;
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = esize;
integer elements = 1;
integer part = 0;

integer shift = (2 * esize) - UInt(immh:immb);
boolean round = (op == '1');
boolean unsigned = (U == '1');
```

Vector

Encoding

UQRSHRN{2} <Vd>.<Tb>, <Vn>.<Ta>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3> == '1' then UNDEFINED;
```

```
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = (2 * esize) - UInt(immh:immb);
boolean round = (op == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
- 8B when immh = 0001, Q = 0
 - 16B when immh = 0001, Q = 1
 - 4H when immh = 001x, Q = 0
 - 8H when immh = 001x, Q = 1
 - 2S when immh = 01xx, Q = 0
 - 4S when immh = 01xx, Q = 1
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
The encoding immh = 1xxx, Q = x is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:
- 8H when immh = 0001
 - 4S when immh = 001x
 - 2D when immh = 01xx
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.
The encoding immh = 1xxx is reserved.
- <Vb> Is the destination width specifier, encoded in the "immh" field. It can have the following values:
- B when immh = 0001
 - H when immh = 001x
 - S when immh = 01xx
- The following encodings are reserved:
- immh = 0000.
 - immh = 1xxx.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <Va> Is the source width specifier, encoded in the "immh" field. It can have the following values:
- H when immh = 0001
 - S when immh = 001x
 - D when immh = 01xx

The following encodings are reserved:

- `immh = 0000`.
- `immh = 1xxx`.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<shift> For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:

`(16-UInt(immh:immb))` when `immh = 0001`

`(32-UInt(immh:immb))` when `immh = 001x`

`(64-UInt(immh:immb))` when `immh = 01xx`

The following encodings are reserved:

- `immh = 0000`.
- `immh = 1xxx`.

For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:

`(16-UInt(immh:immb))` when `immh = 0001`

`(32-UInt(immh:immb))` when `immh = 001x`

`(64-UInt(immh:immb))` when `immh = 01xx`

See [Advanced SIMD modified immediate on page C4-373](#) when `immh = 0000`.

The encoding `immh = 1xxx` is reserved.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n];
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
boolean sat;

for e = 0 to elements-1
    element = (Int(Elem[operand, e, 2*esize], unsigned) + round_const) >> shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
    if sat then FPSR.QC = '1';

Vpart[d, part] = result;
```

C7.2.377 UQSHL (immediate)

Unsigned saturating Shift Left (immediate). This instruction takes each vector element in the source SIMD&FP register, shifts it by an immediate value, places the results in a vector, and writes the vector to the destination SIMD&FP register. The results are truncated. For rounded results, see [UQRSHL](#).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

UQSHL <V><d>, <V><n>, #<shift>

```

Assembler symbols

<V> Is a width specifier, encoded in the "immh" field. It can have the following values:

```
B      when immh = 0001
H      when immh = 001x
S      when immh = 01xx
D      when immh = 1xxx
```

The encoding immh = 0000 is reserved.

<d> Is the number of the SIMD&FP destination register, in the "Rd" field.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

```
8B      when immh = 0001, Q = 0
16B     when immh = 0001, Q = 1
4H      when immh = 001x, Q = 0
8H      when immh = 001x, Q = 1
2S      when immh = 01xx, Q = 0
4S      when immh = 01xx, Q = 1
2D      when immh = 1xxx, Q = 1
```

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.

The encoding immh = 1xxx, Q = 0 is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<shift> For the scalar variant: is the left shift amount, in the range 0 to the operand width in bits minus 1, encoded in the "immh:immb" field. It can have the following values:

```
(UInt(immh:immb)-8)  when immh = 0001
(UInt(immh:immb)-16) when immh = 001x
(UInt(immh:immb)-32) when immh = 01xx
(UInt(immh:immb)-64) when immh = 1xxx
```

The encoding immh = 0000 is reserved.

For the vector variant: is the left shift amount, in the range 0 to the element width in bits minus 1, encoded in the "immh:immb" field. It can have the following values:

```
(UInt(immh:immb)-8)  when immh = 0001
(UInt(immh:immb)-16) when immh = 001x
(UInt(immh:immb)-32) when immh = 01xx
```

(UInt(immh:immb)-64) when immh = 1xxx

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
integer element;
boolean sat;

for e = 0 to elements-1
    element = Int(Elem[operand, e, esize], src_unsigned) << shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, dst_unsigned);
    if sat then FPSR.QC = '1';

V[d] = result;
```

C7.2.378 UQSHL (register)

Unsigned saturating Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts the element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift. The results are truncated. For rounded results, see [UQRSHL](#).

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

UQSHL <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
if S == '0' && size != '11' then UNDEFINED;
```

Vector

Encoding

UQSHL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

```
boolean rounding = (R == '1');
boolean saturating = (S == '1');
```

Assembler symbols

- <V> Is a width specifier, encoded in the "size" field. It can have the following values:
- | | |
|---|----------------|
| B | when size = 00 |
| H | when size = 01 |
| S | when size = 10 |
| D | when size = 11 |
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

integer round_const = 0;
integer shift;
integer element;
boolean sat;

for e = 0 to elements-1
  shift = SInt(Elem[operand2, e, esize]<7:0>);
  if rounding then
    round_const = 1 << (-shift - 1); // 0 for left shift, 2^(n-1) for right shift
  element = (Int(Elem[operand1, e, esize], unsigned) + round_const) << shift;
  if saturating then
    (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
    if sat then FPSR.QC = '1';
  else
    Elem[result, e, esize] = element<esize-1:0>;

V[d] = result;
```

C7.2.379 UQSHRN, UQSHRN2

Unsigned saturating Shift Right Narrow (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, saturates each shifted result to a value that is half the original width, puts the final result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see [UQRSHRN](#), [UQRSHRN2](#).

The UQSHRN instruction writes the vector to the lower half of the destination register and clears the upper half, while the UQSHRN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

UQSHRN <Vb><d>, <Va><n>, #<shift>

Decode for this encoding

```

```
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = (2 * esize) - UInt(immh:immb);
boolean round = (op == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- | | |
|-----------|------------|
| [absent] | when Q = 0 |
| [present] | when Q = 1 |
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
- | | |
|-----|-------------------------|
| 8B | when immh = 0001, Q = 0 |
| 16B | when immh = 0001, Q = 1 |
| 4H | when immh = 001x, Q = 0 |
| 8H | when immh = 001x, Q = 1 |
| 2S | when immh = 01xx, Q = 0 |
| 4S | when immh = 01xx, Q = 1 |
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
The encoding immh = 1xxx, Q = x is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:
- | | |
|----|------------------|
| 8H | when immh = 0001 |
| 4S | when immh = 001x |
| 2D | when immh = 01xx |
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.
The encoding immh = 1xxx is reserved.
- <Vb> Is the destination width specifier, encoded in the "immh" field. It can have the following values:
- | | |
|---|------------------|
| B | when immh = 0001 |
| H | when immh = 001x |
| S | when immh = 01xx |
- The following encodings are reserved:
- immh = 0000.
 - immh = 1xxx.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <Va> Is the source width specifier, encoded in the "immh" field. It can have the following values:
- | | |
|---|------------------|
| H | when immh = 0001 |
| S | when immh = 001x |
| D | when immh = 01xx |

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

<n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.

<shift> For the scalar variant: is the right shift amount, in the range 1 to the destination operand width in bits, encoded in the "immh:immb" field. It can have the following values:

(16-UInt(immh:immb)) when immh = 0001

(32-UInt(immh:immb)) when immh = 001x

(64-UInt(immh:immb)) when immh = 01xx

The following encodings are reserved:

- immh = 0000.
- immh = 1xxx.

For the vector variant: is the right shift amount, in the range 1 to the destination element width in bits, encoded in the "immh:immb" field. It can have the following values:

(16-UInt(immh:immb)) when immh = 0001

(32-UInt(immh:immb)) when immh = 001x

(64-UInt(immh:immb)) when immh = 01xx

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

The encoding immh = 1xxx is reserved.

Operation for all encodings

```

CheckFPAdvSIMDEnabled64();
bits(datasize*2) operand = V[n];
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;
boolean sat;

for e = 0 to elements-1
    element = (Int(Elem[operand, e, 2*esize], unsigned) + round_const) >> shift;
    (Elem[result, e, esize], sat) = SatQ(element, esize, unsigned);
    if sat then FPSR.QC = '1';

Vpart[d, part] = result;
  
```

C7.2.380 UQSUB

Unsigned saturating Subtract. This instruction subtracts the element values of the second source SIMD&FP register from the corresponding element values of the first source SIMD&FP register, places the results into a vector, and writes the vector to the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

UQSUB <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
```

Vector

Encoding

UQSUB <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
```

Assembler symbols

<V> Is a width specifier, encoded in the "size" field. It can have the following values:
 B when size = 00

- H when size = 01
 S when size = 10
 D when size = 11
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <m> Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- 8B when size = 00, Q = 0
 16B when size = 00, Q = 1
 4H when size = 01, Q = 0
 8H when size = 01, Q = 1
 2S when size = 10, Q = 0
 4S when size = 10, Q = 1
 2D when size = 11, Q = 1
 The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
integer diff;
boolean sat;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    diff = element1 - element2;
    (Elem[result, e, esize], sat) = SatQ(diff, esize, unsigned);
    if sat then FPSR.QC = '1';

V[d] = result;
    
```

C7.2.381 UQXTN, UQXTN2

Unsigned saturating extract Narrow. This instruction reads each vector element from the source SIMD&FP register, saturates each value to half the original width, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

If saturation occurs, the cumulative saturation bit `FPSR.QC` is set.

The `UQXTN` instruction writes the vector to the lower half of the destination register and clears the upper half, while the `UQXTN2` instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the `CPACR_EL1`, `CPTR_EL2`, and `CPTR_EL3` registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

`UQXTN <Vb><d>, <Va><n>`

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = esize;
integer part = 0;
integer elements = 1;

boolean unsigned = (U == '1');
```

Vector

Encoding

`UQXTN{2} <Vd>.<Tb>, <Vn>.<Ta>`

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

```
boolean unsigned = (U == '1');
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0

[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0

16B when size = 00, Q = 1

4H when size = 01, Q = 0

8H when size = 01, Q = 1

2S when size = 10, Q = 0

4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

8H when size = 00

4S when size = 01

2D when size = 10

The encoding size = 11 is reserved.

<Vb> Is the destination width specifier, encoded in the "size" field. It can have the following values:

B when size = 00

H when size = 01

S when size = 10

The encoding size = 11 is reserved.

<d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.

<Va> Is the source width specifier, encoded in the "size" field. It can have the following values:

H when size = 00

S when size = 01

D when size = 10

The encoding size = 11 is reserved.

<n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();  
bits(2*datasize) operand = V[n];  
bits(datasize) result;  
bits(2*esize) element;  
boolean sat;
```

```
for e = 0 to elements-1
    element = Elem[operand, e, 2*esize];
    (Elem[result, e, esize], sat) = SatQ(Int(element, unsigned), esize, unsigned);
    if sat then FPSR.QC = '1';

Vpart[d, part] = result;
```

C7.2.382 URECPE

Unsigned Reciprocal Estimate. This instruction reads each vector element from the source SIMD&FP register, calculates an approximate inverse for the unsigned integer value, places the result into a vector, and writes the vector to the destination SIMD&FP register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

URECPE <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz == '1' then UNDEFINED;
integer esize = 32;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
 - 4S when sz = 0, Q = 1
- The encoding sz = 1, Q = x is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(32) element;

for e = 0 to elements-1
    element = Elem[operand, e, 32];
    Elem[result, e, 32] = UnsignedRecipEstimate(element);

V[d] = result;
```

C7.2.383 URHADD

Unsigned Rounding Halving Add. This instruction adds corresponding unsigned integer values from the two source SIMD&FP registers, shifts each result right one bit, places the results into a vector, and writes the vector to the destination SIMD&FP register.

The results are rounded. For truncated results, see [UHADD](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

URHADD <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B	when size = 00, Q = 0
16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1

 The encoding size = 11, Q = x is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;
integer element1;
integer element2;
```

```
for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    Elem[result, e, esize] = (element1+element2+1)<esize:1>;

V[d] = result;
```

C7.2.384 URSHL

Unsigned Rounding Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts the vector element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

URSHL <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
if S == '0' && size != '11' then UNDEFINED;
```

Vector

Encoding

URSHL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
```

Assembler symbols

integer elements = datasize DIV esize;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
```

```
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Assembler symbols

- <V> Is a width specifier, encoded in the "immh" field. It can have the following values:
- D when immh = 1xxx
- The encoding immh = 0xxx is reserved.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
- 8B when immh = 0001, Q = 0
 - 16B when immh = 0001, Q = 1
 - 4H when immh = 001x, Q = 0
 - 8H when immh = 001x, Q = 1
 - 2S when immh = 01xx, Q = 0
 - 4S when immh = 01xx, Q = 1
 - 2D when immh = 1xxx, Q = 1
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
- The encoding immh = 1xxx, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <shift> For the scalar variant: is the right shift amount, in the range 1 to 64, encoded in the "immh:immb" field. It can have the following values:
- (128-UInt(immh:immb)) when immh = 1xxx
- The encoding immh = 0xxx is reserved.
- For the vector variant: is the right shift amount, in the range 1 to the element width in bits, encoded in the "immh:immb" field. It can have the following values:
- (16-UInt(immh:immb)) when immh = 0001
 - (32-UInt(immh:immb)) when immh = 001x
 - (64-UInt(immh:immb)) when immh = 01xx
 - (128-UInt(immh:immb)) when immh = 1xxx
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) operand2;
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;

operand2 = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
  element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;
  Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
```

V[d] = result;

C7.2.386 URSQRTE

Unsigned Reciprocal Square Root Estimate. This instruction reads each vector element from the source SIMD&FP register, calculates an approximate inverse square root for each value, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

URSQRTE <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if sz == '1' then UNDEFINED;
integer esize = 32;
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "sz:Q" field. It can have the following values:
- 2S when sz = 0, Q = 0
 - 4S when sz = 0, Q = 1
- The encoding sz = 1, Q = x is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;
bits(32) element;

for e = 0 to elements-1
    element = Elem[operand, e, 32];
    Elem[result, e, 32] = UnsignedRSqrtEstimate(element);

V[d] = result;
```

C7.2.387 URSRA

Unsigned Rounding Shift Right and Accumulate (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, and accumulates the final results with the vector elements of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are rounded. For truncated results, see [USRA](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

URSRA <V><d>, <V><n>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Vector

Encoding

URSRA <Vd>.<T>, <Vn>.<T>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
```

```
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Assembler symbols

- <V> Is a width specifier, encoded in the "immh" field. It can have the following values:
- D when immh = 1xxx
- The encoding immh = 0xxx is reserved.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.

 - (128-UInt(immh:immb)) when immh = 1xxx
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) operand2;
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;

operand2 = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
  element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;
  Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
```

V[d] = result;

C7.2.388 USDOT (vector)

Dot Product vector form with unsigned and signed integers. This instruction performs the dot product of the four unsigned 8-bit integer values in each 32-bit element of the first source register with the four signed 8-bit integer values in the corresponding 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. [ID_AA64ISAR1_EL1.I8MM](#) indicates whether this instruction is supported.

Vector

(FEAT_I8MM)

31 30 29 28 27 26 25 24 23 22 21 20				16 15 14 13 12 11 10 9				5 4		0									
0	Q	0	0	1	1	1	0	1	0	0	Rm	1	0	0	1	1	1	Rn	Rd

Encoding

USDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
if !HaveInt8MatMulExt() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 32;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 2S when Q = 0
 - 4S when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;

for e = 0 to elements-1
    bits(32) res = Elem[operand3, e, 32];
    for b = 0 to 3
        integer element1 = UInt(Elem[operand1, 4*e+b, 8]);
        integer element2 = SInt(Elem[operand2, 4*e+b, 8]);
```

```
        res = res + element1 * element2;  
    Elem[result, e, 32] = res;  
V[d] = result;
```

C7.2.389 USDOT (by element)

Dot Product index form with unsigned and signed integers. This instruction performs the dot product of the four unsigned 8-bit integer values in each 32-bit element of the first source register with the four signed 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. [ID_AA64ISAR1_EL1.I8MM](#) indicates whether this instruction is supported.

Vector

(FEAT_I8MM)

Encoding

USDOT <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<4B[<index>]>

Decode for this encoding

```

if !HaveInt8MatMulExt() then UNDEFINED;
boolean op1_unsigned = (US == '1');
boolean op2_unsigned = (US == '0');
integer n = UInt(Rn);
integer m = UInt(M:Rm);
integer d = UInt(Rd);
integer i = UInt(H:L);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV 32;
    
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 2S when Q = 0
 - 4S when Q = 1
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "Q" field. It can have the following values:
 - 8B when Q = 0
 - 16B when Q = 1
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "M:Rm" fields.
- <index> Is the immediate index of a quadruplet of four 8-bit elements in the range 0 to 3, encoded in the "H:L" fields.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(128) operand2 = V[m];
bits(datasize) operand3 = V[d];
bits(datasize) result;
    
```

```
for e = 0 to elements-1
  bits(32) res = Elem[operand3, e, 32];
  for b = 0 to 3
    integer element1 = Int(Elem[operand1, 4*e+b, 8], op1_unsigned);
    integer element2 = Int(Elem[operand2, 4*i+b, 8], op2_unsigned);
    res = res + element1 * element2;
  Elem[result, e, 32] = res;
V[d] = result;
```

C7.2.390 USHL

Unsigned Shift Left (register). This instruction takes each element in the vector of the first source SIMD&FP register, shifts each element by a value from the least significant byte of the corresponding element of the second source SIMD&FP register, places the results in a vector, and writes the vector to the destination SIMD&FP register.

If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift. For a rounding shift, see [URSHL](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

USHL <V><d>, <V><n>, <V><m>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
if S == '0' && size != '11' then UNDEFINED;
```

Vector

Encoding

USHL <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
boolean unsigned = (U == '1');
boolean rounding = (R == '1');
boolean saturating = (S == '1');
```

Assembler symbols

<V>	Is a width specifier, encoded in the "size" field. It can have the following values: D when size = 11 The following encodings are reserved: • size = 0x. • size = 10.
<d>	Is the number of the SIMD&FP destination register, in the "Rd" field.
<n>	Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
<m>	Is the number of the second SIMD&FP source register, encoded in the "Rm" field.
<Vd>	Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
<T>	Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values: 8B when size = 00, Q = 0 16B when size = 00, Q = 1 4H when size = 01, Q = 0 8H when size = 01, Q = 1 2S when size = 10, Q = 0 4S when size = 10, Q = 1 2D when size = 11, Q = 1 The encoding size = 11, Q = 0 is reserved.
<Vn>	Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
<Vm>	Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation for all encodings

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

integer round_const = 0;
integer shift;
integer element;
boolean sat;

for e = 0 to elements-1
    shift = SInt(ELem[operand2, e, esize]<7:0>);
    if rounding then
        round_const = 1 << (-shift - 1);    // 0 for left shift, 2^(n-1) for right shift
    element = (Int(ELem[operand1, e, esize], unsigned) + round_const) << shift;
    if saturating then
        (ELem[result, e, esize], sat) = SatQ(element, esize, unsigned);
        if sat then FPSR.QC = '1';
    else
        ELem[result, e, esize] = element<esize-1:0>;

V[d] = result;
    
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.391 USHLL, USHLL2

Unsigned Shift Left Long (immediate). This instruction reads each vector element in the lower or upper half of the source SIMD&FP register, shifts the unsigned integer value left by the specified number of bits, places the result into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The USHLL instruction extracts vector elements from the lower half of the source register. The USHLL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is used by the alias UXTL, UXTL2. See *Alias conditions* on page C7-2422 for details of when each alias is preferred.

Encoding

USHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3> == '1' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

integer shift = UInt(immh:immb) - esize;
boolean unsigned = (U == '1');
```

Alias conditions

Alias	is preferred when
UXTL, UXTL2	immb == '000' && BitCount(immh) == 1

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
- [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

- <Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:
- | | |
|----|------------------|
| 8H | when immh = 0001 |
| 4S | when immh = 001x |
| 2D | when immh = 01xx |
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.
 The encoding immh = 1xxx is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
- | | |
|-----|-------------------------|
| 8B | when immh = 0001, Q = 0 |
| 16B | when immh = 0001, Q = 1 |
| 4H | when immh = 001x, Q = 0 |
| 8H | when immh = 001x, Q = 1 |
| 2S | when immh = 01xx, Q = 0 |
| 4S | when immh = 01xx, Q = 1 |
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
 The encoding immh = 1xxx, Q = x is reserved.
- <shift> Is the left shift amount, in the range 0 to the source element width in bits minus 1, encoded in the "immh:immb" field. It can have the following values:
- | | |
|----------------------|------------------|
| (UInt(immh:immb)-8) | when immh = 0001 |
| (UInt(immh:immb)-16) | when immh = 001x |
| (UInt(immh:immb)-32) | when immh = 01xx |
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.
 The encoding immh = 1xxx is reserved.

Operation

```

CheckFPAdvSIMDEnabled64();
bits(datasize) operand = Vpart[n, part];
bits(datasize*2) result;
integer element;

for e = 0 to elements-1
    element = Int(Elem[operand, e, esize], unsigned) << shift;
    Elem[result, e, 2*esize] = element<2*esize-1:0>;

V[d] = result;
  
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.392 USHR

Unsigned Shift Right (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, writes the final result to a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see [URSHR](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

USHR <V><d>, <V><n>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = (esize * 2) - UInt(immh:immh);
boolean unsigned = (U == '1');
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Vector

Encoding

USHR <Vd>.<T>, <Vn>.<T>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = (esize * 2) - UInt(immh:immh);
boolean unsigned = (U == '1');
```

```
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Assembler symbols

- <V> Is a width specifier, encoded in the "immh" field. It can have the following values:
- D when immh = 1xxx
- The encoding immh = 0xxx is reserved.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
- 8B when immh = 0001, Q = 0
 - 16B when immh = 0001, Q = 1
 - 4H when immh = 001x, Q = 0
 - 8H when immh = 001x, Q = 1
 - 2S when immh = 01xx, Q = 0
 - 4S when immh = 01xx, Q = 1
 - 2D when immh = 1xxx, Q = 1
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
- The encoding immh = 1xxx, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <shift> For the scalar variant: is the right shift amount, in the range 1 to 64, encoded in the "immh:immb" field. It can have the following values:
- (128-UInt(immh:immb)) when immh = 1xxx
- The encoding immh = 0xxx is reserved.
- For the vector variant: is the right shift amount, in the range 1 to the element width in bits, encoded in the "immh:immb" field. It can have the following values:
- (16-UInt(immh:immb)) when immh = 0001
 - (32-UInt(immh:immb)) when immh = 001x
 - (64-UInt(immh:immb)) when immh = 01xx
 - (128-UInt(immh:immb)) when immh = 1xxx
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) operand2;
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;

operand2 = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
  element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;
  Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
```

V[d] = result;

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.393 USMMLA (vector)

Unsigned and signed 8-bit integer matrix multiply-accumulate. This instruction multiplies the 2x8 matrix of unsigned 8-bit integer values in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2 to Armv8.5, this is an OPTIONAL instruction. From Armv8.6 it is mandatory for implementations that include Advanced SIMD to support it. [ID_AA64ISAR1_EL1.I8MM](#) indicates whether this instruction is supported.

Vector

(FEAT_I8MM)

Encoding

USMMLA <Vd>.4S, <Vn>.16B, <Vm>.16B

Decode for this encoding

```
if !HaveInt8MatMulExt() then UNDEFINED;
integer n = UInt(Rn);
integer m = UInt(Rm);
integer d = UInt(Rd);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP third source and destination register, encoded in the "Rd" field.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(128) operand1 = V[n];
bits(128) operand2 = V[m];
bits(128) addend = V[d];

V[d] = MatMulAdd(addend, operand1, operand2, TRUE, FALSE);
```

C7.2.394 USQADD

Unsigned saturating Accumulate of Signed value. This instruction adds the signed integer values of the vector elements in the source SIMD&FP register to corresponding unsigned integer values of the vector elements in the destination SIMD&FP register, and accumulates the resulting unsigned integer values with the vector elements of the destination SIMD&FP register.

If overflow occurs with any of the results, those results are saturated. If saturation occurs, the cumulative saturation bit [FPSR.QC](#) is set.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

USQADD <V><d>, <V><n>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

integer esize = 8 << UInt(size);
integer datasize = esize;
integer elements = 1;

boolean unsigned = (U == '1');
```

Vector

Encoding

USQADD <Vd>.<T>, <Vn>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

boolean unsigned = (U == '1');
```

Assembler symbols

- <V> Is a width specifier, encoded in the "size" field. It can have the following values:
- | | |
|---|----------------|
| B | when size = 00 |
| H | when size = 01 |
| S | when size = 10 |
| D | when size = 11 |
- <d> Is the number of the SIMD&FP destination register, encoded in the "Rd" field.
- <n> Is the number of the SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |
| 4S | when size = 10, Q = 1 |
| 2D | when size = 11, Q = 1 |
- The encoding size = 11, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) result;

bits(datasize) operand2 = V[d];
integer op1;
integer op2;
boolean sat;

for e = 0 to elements-1
    op1 = Int(Elem[operand, e, esize], !unsigned);
    op2 = Int(Elem[operand2, e, esize], unsigned);
    (Elem[result, e, esize], sat) = SatQ(op1 + op2, esize, unsigned);
    if sat then FPSR.QC = '1';
V[d] = result;
```

C7.2.395 USRA

Unsigned Shift Right and Accumulate (immediate). This instruction reads each vector element in the source SIMD&FP register, right shifts each result by an immediate value, and accumulates the final results with the vector elements of the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The results are truncated. For rounded results, see [URSRA](#).

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Scalar

Encoding

USRA <V><d>, <V><n>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh<3> != '1' then UNDEFINED;
integer esize = 8 << 3;
integer datasize = esize;
integer elements = 1;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Vector

Encoding

USRA <Vd>.<T>, <Vn>.<T>, #<shift>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if immh == '0000' then SEE "Advanced SIMD modified immediate";
if immh<3>:Q == '10' then UNDEFINED;
integer esize = 8 << HighestSetBit(immh);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;

integer shift = (esize * 2) - UInt(immh:immb);
boolean unsigned = (U == '1');
```

```
boolean round = (o1 == '1');
boolean accumulate = (o0 == '1');
```

Assembler symbols

- <V> Is a width specifier, encoded in the "immh" field. It can have the following values:
- D when immh = 1xxx
- The encoding immh = 0xxx is reserved.
- <d> Is the number of the SIMD&FP destination register, in the "Rd" field.
- <n> Is the number of the first SIMD&FP source register, encoded in the "Rn" field.
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:
- 8B when immh = 0001, Q = 0
 - 16B when immh = 0001, Q = 1
 - 4H when immh = 001x, Q = 0
 - 8H when immh = 001x, Q = 1
 - 2S when immh = 01xx, Q = 0
 - 4S when immh = 01xx, Q = 1
 - 2D when immh = 1xxx, Q = 1
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.
- The encoding immh = 1xxx, Q = 0 is reserved.
- <Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.
- <shift> For the scalar variant: is the right shift amount, in the range 1 to 64, encoded in the "immh:immb" field. It can have the following values:
- (128-UInt(immh:immb)) when immh = 1xxx
- The encoding immh = 0xxx is reserved.
- For the vector variant: is the right shift amount, in the range 1 to the element width in bits, encoded in the "immh:immb" field. It can have the following values:
- (16-UInt(immh:immb)) when immh = 0001
 - (32-UInt(immh:immb)) when immh = 001x
 - (64-UInt(immh:immb)) when immh = 01xx
 - (128-UInt(immh:immb)) when immh = 1xxx
- See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

Operation for all encodings

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand = V[n];
bits(datasize) operand2;
bits(datasize) result;
integer round_const = if round then (1 << (shift - 1)) else 0;
integer element;

operand2 = if accumulate then V[d] else Zeros();
for e = 0 to elements-1
  element = (Int(Elem[operand, e, esize], unsigned) + round_const) >> shift;
  Elem[result, e, esize] = Elem[operand2, e, esize] + element<esize-1:0>;
```

$V[d] = \text{result};$

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.396 USUBL, USUBL2

Unsigned Subtract Long. This instruction subtracts each vector element in the lower or upper half of the second source SIMD&FP register from the corresponding vector element of the first source SIMD&FP register, places the result into a vector, and writes the vector to the destination SIMD&FP register. All the values in this instruction are unsigned integer values. The destination vector elements are twice as long as the source vector elements.

The USUBL instruction extracts each source vector from the lower half of each source register. The USUBL2 instruction extracts each source vector from the upper half of each source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

USUBL{2} <Vd>.<Ta>, <Vn>.<Tb>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
 The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
- <Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0

16B when size = 00, Q = 1
4H when size = 01, Q = 0
8H when size = 01, Q = 1
2S when size = 10, Q = 0
4S when size = 10, Q = 1
The encoding size = 11, Q = x is reserved.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = Vpart[n, part];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.397 USUBW, USUBW2

Unsigned Subtract Wide. This instruction subtracts each vector element of the second source SIMD&FP register from the corresponding vector element in the lower or upper half of the first source SIMD&FP register, places the result in a vector, and writes the vector to the SIMD&FP destination register. All the values in this instruction are unsigned integer values.

The vector elements of the destination register and the first source register are twice as long as the vector elements of the second source register.

The USUBW instruction extracts vector elements from the lower half of the first source register. The USUBW2 instruction extracts vector elements from the upper half of the first source register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

USUBW{2} <Vd>.<Ta>, <Vn>.<Ta>, <Vm>.<Tb>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;

boolean sub_op = (o1 == '1');
boolean unsigned = (U == '1');
```

Assembler symbols

- 2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:
 - [absent] when Q = 0
 - [present] when Q = 1
- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:
 - 8H when size = 00
 - 4S when size = 01
 - 2D when size = 10
 The encoding size = 11 is reserved.
- <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B	when size = 00, Q = 0
16B	when size = 00, Q = 1
4H	when size = 01, Q = 0
8H	when size = 01, Q = 1
2S	when size = 10, Q = 0
4S	when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(2*datasize) operand1 = V[n];
bits(datasize) operand2 = Vpart[m, part];
bits(2*datasize) result;
integer element1;
integer element2;
integer sum;

for e = 0 to elements-1
    element1 = Int(Elem[operand1, e, 2*esize], unsigned);
    element2 = Int(Elem[operand2, e, esize], unsigned);
    if sub_op then
        sum = element1 - element2;
    else
        sum = element1 + element2;
    Elem[result, e, 2*esize] = sum<2*esize-1:0>;

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.398 UXTL, UXTL2

Unsigned extend Long. This instruction copies each vector element from the lower or upper half of the source SIMD&FP register into a vector, and writes the vector to the destination SIMD&FP register. The destination vector elements are twice as long as the source vector elements.

The UXTL instruction extracts vector elements from the lower half of the source register. The UXTL2 instruction extracts vector elements from the upper half of the source register.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

This instruction is an alias of the [USHLL](#), [USHLL2](#) instruction. This means that:

- The encodings in this description are named to match the encodings of [USHLL](#), [USHLL2](#).
- The description of [USHLL](#), [USHLL2](#) gives the operational pseudocode for this instruction.

Encoding

UXTL{2} <Vd>.<Ta>, <Vn>.<Tb>

is equivalent to

USHLL{2} <Vd>.<Ta>, <Vn>.<Tb>, #0

and is the preferred disassembly when $\text{BitCount}(\text{immh}) == 1$.

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0

[present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Ta> Is an arrangement specifier, encoded in the "immh" field. It can have the following values:

8H when immh = 0001

4S when immh = 001x

2D when immh = 01xx

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000.

The encoding immh = 1xxx is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Tb> Is an arrangement specifier, encoded in the "immh:Q" field. It can have the following values:

8B when immh = 0001, Q = 0

16B when immh = 0001, Q = 1

4H when immh = 001x, Q = 0

8H when immh = 001x, Q = 1

2S when immh = 01xx, Q = 0

4S when immh = 01xx, Q = 1

See [Advanced SIMD modified immediate on page C4-373](#) when immh = 0000, Q = x.

The encoding immh = 1xxx, Q = x is reserved.

Operation

The description of [USHLL](#), [USHLL2](#) gives the operational pseudocode for this instruction.

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

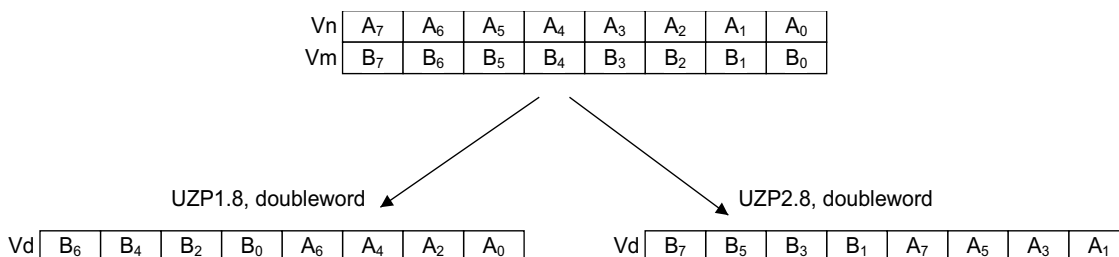

C7.2.399 UZP1

Unzip vectors (primary). This instruction reads corresponding even-numbered vector elements from the two source SIMD&FP registers, starting at zero, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

Note

This instruction can be used with UZP2 to de-interleave two vectors.

The following figure shows the operation of UZP1 and UZP2 with the arrangement specifier 8B.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UZP1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
- | | |
|-----|-----------------------|
| 8B | when size = 00, Q = 0 |
| 16B | when size = 00, Q = 1 |
| 4H | when size = 01, Q = 0 |
| 8H | when size = 01, Q = 1 |
| 2S | when size = 10, Q = 0 |

4S when size = 10, Q = 1
2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operandl = V[n];
bits(datasize) operandh = V[m];
bits(datasize) result;

bits(datasize*2) zipped = operandh:operandl;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[zipped, 2*e+part, esize];

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.400 UZP2

Unzip vectors (secondary). This instruction reads corresponding odd-numbered vector elements from the two source SIMD&FP registers, places the result from the first source register into consecutive elements in the lower half of a vector, and the result from the second source register into consecutive elements in the upper half of a vector, and writes the vector to the destination SIMD&FP register.

Note

This instruction can be used with UZP1 to de-interleave two vectors.

The following figure shows the operation of UZP1 and UZP2 with the arrangement specifier 8B.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

UZP2 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0

4S when size = 10, Q = 1
2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operandl = V[n];
bits(datasize) operandh = V[m];
bits(datasize) result;

bits(datasize*2) zipped = operandh:operandl;
for e = 0 to elements-1
    Elem[result, e, esize] = Elem[zipped, 2*e+part, esize];

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.401 XAR

Exclusive OR and Rotate performs a bitwise exclusive OR of the 128-bit vectors in the two source SIMD&FP registers, rotates each 64-bit element of the resulting 128-bit vector right by the value specified by a 6-bit immediate value, and writes the result to the destination SIMD&FP register.

This instruction is implemented only when [FEAT_SHA3](#) is implemented.

Advanced SIMD

(FEAT_SHA3)

31	30	29	28	27	26	25	24	23	22	21	20	16		15	10		9	5		4	0	
1	1	0	0	1	1	1	0	1	0	0	Rm		imm6		Rn		Rd					

Encoding

XAR <Vd>.2D, <Vn>.2D, <Vm>.2D, #<imm6>

Decode for this encoding

```
if !HaveSHA3Ext() then UNDEFINED;
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);
```

Assembler symbols

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
 <Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.
 <Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.
 <imm6> Is a rotation right, encoded in "imm6".

Operation

```
AArch64.CheckFPAdvSIMDEnabled();

bits(128) Vm = V[m];
bits(128) Vn = V[n];
bits(128) tmp;
tmp = Vn EOR Vm;
V[d] = ROR(tmp<127:64>, UInt(imm6)):ROR(tmp<63:0>, UInt(imm6));
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.402 XTN, XTN2

Extract Narrow. This instruction reads each vector element from the source SIMD&FP register, narrows each value to half the original width, places the result into a vector, and writes the vector to the lower or upper half of the destination SIMD&FP register. The destination vector elements are half as long as the source vector elements.

The XTN instruction writes the vector to the lower half of the destination register and clears the upper half, while the XTN2 instruction writes the vector to the upper half of the destination register without affecting the other bits of the register.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9				5	4				0
0	Q	0	0	1	1	1	0	size	1	0	0	0	0	1	0	0	1	0	1	0	1	0				Rn					Rd

Encoding

XTN{2} <Vd>.<Tb>, <Vn>.<Ta>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);

if size == '11' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = 64;
integer part = UInt(Q);
integer elements = datasize DIV esize;
```

Assembler symbols

2 Is the second and upper half specifier. If present it causes the operation to be performed on the upper 64 bits of the registers holding the narrower elements, and is encoded in the "Q" field. It can have the following values:

[absent] when Q = 0
 [present] when Q = 1

<Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.

<Tb> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:

8B when size = 00, Q = 0
 16B when size = 00, Q = 1
 4H when size = 01, Q = 0
 8H when size = 01, Q = 1
 2S when size = 10, Q = 0
 4S when size = 10, Q = 1

The encoding size = 11, Q = x is reserved.

<Vn> Is the name of the SIMD&FP source register, encoded in the "Rn" field.

<Ta> Is an arrangement specifier, encoded in the "size" field. It can have the following values:

8H when size = 00

4S when size = 01
2D when size = 10
The encoding size = 11 is reserved.

Operation

```
CheckFPAdvSIMDEnabled64();  
bits(2*datasize) operand = V[n];  
bits(datasize) result;  
bits(2*esize) element;  
  
for e = 0 to elements-1  
  element = Elem[operand, e, 2*esize];  
  Elem[result, e, esize] = element<esize-1:0>;  
Vpart[d, part] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.403 ZIP1

Zip vectors (primary). This instruction reads adjacent vector elements from the lower half of two source SIMD&FP registers as pairs, interleaves the pairs and places them into a vector, and writes the vector to the destination SIMD&FP register. The first pair from the first source register is placed into the two lowest vector elements, with subsequent pairs taken alternately from each source register.

———— **Note** —————

This instruction can be used with ZIP2 to interleave two vectors.

The following figure shows the operation of ZIP1 and ZIP2 with the arrangement specifier 8B.

Depending on the settings in the [CPACR_EL1](#), [CPTR_EL2](#), and [CPTR_EL3](#) registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

ZIP1 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
integer pairs = elements DIV 2;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0

4S when size = 10, Q = 1
2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

integer base = part * pairs;

for p = 0 to pairs-1
    Elem[result, 2*p+0, esize] = Elem[operand1, base+p, esize];
    Elem[result, 2*p+1, esize] = Elem[operand2, base+p, esize];

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

C7.2.404 ZIP2

Zip vectors (secondary). This instruction reads adjacent vector elements from the upper half of two source SIMD&FP registers as pairs, interleaves the pairs and places them into a vector, and writes the vector to the destination SIMD&FP register. The first pair from the first source register is placed into the two lowest vector elements, with subsequent pairs taken alternately from each source register.

———— **Note** ————

This instruction can be used with ZIP1 to interleave two vectors.

The following figure shows the operation of ZIP1 and ZIP2 with the arrangement specifier 8B.

Depending on the settings in the CPACR_EL1, CPTR_EL2, and CPTR_EL3 registers, and the current Security state and Exception level, an attempt to execute the instruction might be trapped.

Encoding

ZIP2 <Vd>.<T>, <Vn>.<T>, <Vm>.<T>

Decode for this encoding

```
integer d = UInt(Rd);
integer n = UInt(Rn);
integer m = UInt(Rm);

if size:Q == '110' then UNDEFINED;
integer esize = 8 << UInt(size);
integer datasize = if Q == '1' then 128 else 64;
integer elements = datasize DIV esize;
integer part = UInt(op);
integer pairs = elements DIV 2;
```

Assembler symbols

- <Vd> Is the name of the SIMD&FP destination register, encoded in the "Rd" field.
- <T> Is an arrangement specifier, encoded in the "size:Q" field. It can have the following values:
 - 8B when size = 00, Q = 0
 - 16B when size = 00, Q = 1
 - 4H when size = 01, Q = 0
 - 8H when size = 01, Q = 1
 - 2S when size = 10, Q = 0

4S when size = 10, Q = 1
2D when size = 11, Q = 1
The encoding size = 11, Q = 0 is reserved.

<Vn> Is the name of the first SIMD&FP source register, encoded in the "Rn" field.

<Vm> Is the name of the second SIMD&FP source register, encoded in the "Rm" field.

Operation

```
CheckFPAdvSIMDEnabled64();
bits(datasize) operand1 = V[n];
bits(datasize) operand2 = V[m];
bits(datasize) result;

integer base = part * pairs;

for p = 0 to pairs-1
    Elem[result, 2*p+0, esize] = Elem[operand1, base+p, esize];
    Elem[result, 2*p+1, esize] = Elem[operand2, base+p, esize];

V[d] = result;
```

Operational information

If PSTATE.DIT is 1:

- The execution time of this instruction is independent of:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
 - The values of the data supplied in any of its registers.
 - The values of the NZCV flags.

Part D

The AArch64 System Level Architecture

Chapter D1

The AArch64 System Level Programmers' Model

This chapter describes the AArch64 system level programmers' model. It contains the following sections:

- *Exception levels* on page D1-2454.
- *Exception terminology* on page D1-2455.
- *Execution state* on page D1-2457.
- *Security state* on page D1-2458.
- *Virtualization* on page D1-2460.
- *Registers for instruction processing and exception handling* on page D1-2463.
- *Process state, PSTATE* on page D1-2466.
- *Program counter and stack pointer alignment* on page D1-2469.
- *Reset* on page D1-2471.
- *Exception entry* on page D1-2475.
- *Exception return* on page D1-2485.
- *Synchronous exception types, routing and priorities* on page D1-2489.
- *Asynchronous exception types, routing, masking and priorities* on page D1-2500.
- *Configurable instruction enables and disables, and trap controls* on page D1-2510.
- *System calls* on page D1-2535.
- *Mechanisms for entering a low-power state* on page D1-2536.
- *Self-hosted debug* on page D1-2542.
- *Event monitors* on page D1-2544.
- *Interprocessing* on page D1-2545.
- *The effect of implementation choices on the programmers' model* on page D1-2558.

D1.1 Exception levels

The Armv8-A architecture defines a set of Exception levels, EL0 to EL3, where:

- If EL n is the Exception level, increased values of n indicate increased software execution privilege.
- Execution at EL0 is called *unprivileged execution*.
- EL2 provides support for virtualization.
- EL3 provides support for switching between two Security states, Secure state and Non-secure state.

An implementation might not include all of the Exception levels. All implementations must include EL0 and EL1. EL2 and EL3 are optional.

———— Note —————

A PE is not required to implement a contiguous set of Exception levels. For example, it is permissible for an implementation to include only EL0, EL1, and EL3.

The effect of implementation choices on the programmers' model on page D1-2558 shows some example implementations.

When executing in AArch64 state, execution can move between Exception levels only on taking an exception or on returning from an exception:

- On taking an exception, the Exception level can only increase or remain the same.
- On returning from an exception, the Exception level can only decrease or remain the same.

The Exception level that execution changes to or remains in on taking an exception is called the *target Exception level* of the exception.

Each exception type has a target Exception level that is either:

- Implicit in the nature of the exception.
- Defined by configuration bits in the System registers.

An exception cannot target EL0.

Exception levels exist within a particular Security state. *The Armv8-A security model on page D1-2458* describes this. When executing at an Exception level, the PE can access both of the following:

- The resources that are available for the combination of the current Exception level and the current Security state.
- The resources that are available at all lower Exception levels, provided that those resources are available to the current Security state.

This means that if the implementation includes EL3, then when execution is at EL3, the PE can access all resources available at all Exception levels, for both Security states.

Each Exception level other than EL0 has its own translation regime and associated control registers. For information on the translation regimes, see [Chapter D5 The AArch64 Virtual Memory System Architecture](#).

D1.1.1 Typical Exception level usage model

The architecture does not specify what software uses which Exception level. Such choices are outside the scope of the architecture. However, the following is a common usage model for the Exception levels:

EL0	Applications.
EL1	OS kernel and associated functions that are typically described as <i>privileged</i> .
EL2	Hypervisor.
EL3	Secure monitor.

D1.2 Exception terminology

The following subsections define the terms used when describing exceptions:

- [Terminology for taking an exception on page D1-2455.](#)
- [Terminology for returning from an exception on page D1-2455.](#)
- [Exception levels on page D1-2455.](#)
- [Definition of a precise exception on page D1-2455.](#)
- [Definitions of synchronous and asynchronous exceptions on page D1-2456.](#)

D1.2.1 Terminology for taking an exception

An exception is *generated* when the PE first responds to an exceptional condition. The PE state at this time is the state the exception is *taken from*. The PE state immediately after taking the exception is the state the exception is *taken to*.

D1.2.2 Terminology for returning from an exception

To return from an exception, the PE must execute an exception return instruction. The PE state when an exception return instruction is committed for execution is the state the exception *returns from*. The PE state immediately after the execution of that instruction is the state the exception *returns to*.

D1.2.3 Exception levels

An Exception level, EL_n , with a larger value of n than another Exception level, is described as being a *higher* Exception level than the other Exception level. For example, EL_3 is a higher Exception level than EL_1 .

An Exception level with a smaller value of n than another Exception level is described as being a *lower* Exception level than the other Exception level. For example, EL_0 is a lower Exception level than EL_1 .

An Exception level is described as:

- *Using AArch64* when execution in that Exception level is in the AArch64 Execution state.
- *Using AArch32* when execution in that Exception level is in the AArch32 Execution state.

D1.2.4 Definition of a precise exception

An exception is described as *precise* when the exception handler receives the PE state and memory system state that is consistent with the PE having executed all of the instructions up to but not including the point in the instruction stream where the exception was taken, and none afterwards.

An exception is described as *imprecise* if it is not precise.

Other than the *SError interrupt*, all exceptions taken to AArch64 state are required to be precise. For each occurrence of an SError interrupt, whether the interrupt is precise or imprecise is IMPLEMENTATION DEFINED.

The terms precise and imprecise can also apply to Debug entry state. See [Imprecise entry to Debug state on page H2-7342](#).

Where a synchronous exception that is taken to AArch64 state is generated as part of an instruction that performs more than one single-copy atomic memory access, the definition of precise permits that the values in registers or memory affected by the instructions can be UNKNOWN, provided that:

- The accesses affecting those registers or memory locations do not, themselves, generate exceptions.
- The registers are not involved in the calculation of the memory address used by the instruction.

Also, for synchronous Data Aborts and Watchpoints from load or store instructions executed in AArch64 state:

- If the load or store instruction specifies writeback of a new base address, the base address is restored to the original value on taking the exception.
- If the instruction was a load to either the base address register or the offset register, that register is restored to the original value. Any other destination registers become UNKNOWN.

- If the instruction was a load that does not load the base address register or the offset register, then the destination registers become UNKNOWN.

Examples of instructions that perform more than one single-copy atomic memory access are the AArch32 LDM and STM instructions and the AArch64 LDP and STP instructions.

———— **Note** —————

For the definition of a single-copy atomic access, see [Properties of single-copy atomic accesses](#) on page B2-130.

D1.2.5 Definitions of synchronous and asynchronous exceptions

An exception is described as *synchronous* if all of the following apply:

- The exception is generated as a result of direct execution or attempted execution of an instruction.
- The return address presented to the exception handler is guaranteed to indicate the instruction that caused the exception.
- The exception is precise.

For more information about synchronous exceptions, see [Synchronous exception types, routing and priorities](#) on page D1-2489.

An exception is described as *asynchronous* if any of the following apply:

- The exception is not generated as a result of direct execution or attempted execution of the instruction stream.
- The return address presented to the exception handler is not guaranteed to indicate the instruction that caused the exception.
- The exception is imprecise.

For more information about asynchronous exceptions, see [Asynchronous exception types, routing, masking and priorities](#) on page D1-2500.

D1.3 Execution state

The Execution states are:

AArch64 The 64-bit Execution state.

AArch32 The 32-bit Execution state. Operation in this state is compatible with Armv7-A operation.

[Execution state on page A1-37](#) gives more information about them.

Exception levels *use* Execution states. For example, EL0, EL1 and EL2 might all be using AArch32, under EL3 using AArch64.

This means that:

- Different software layers, such as an application, an operating system kernel, and a hypervisor, executing at different Exception levels, can execute in different Execution states.
- The PE can change Execution states only either:
 - At reset.
 - On a change of Exception level.

Note

- [Typical Exception level usage model on page D1-2454](#) shows which Exception levels different software layers might typically use.
 - [The effect of implementation choices on the programmers' model on page D1-2558](#) gives information on supported configurations of Exception levels and Execution states.
-

The interaction between the AArch64 and AArch32 Execution states is called *interprocessing*. For more information on *interprocessing*, see [Interprocessing on page D1-2545](#).

D1.4 Security state

The Armv8-A architecture provides two Security states, each with an associated physical memory address space, as follows:

- | | |
|-------------------------|---|
| Secure state | When in this state, the PE can access both the Secure physical address space and the Non-secure physical address space. |
| Non-secure state | When in this state, the PE: <ul style="list-style-type: none">• Can access only the Non-secure physical address space.• Cannot access the Secure system control resources. |

For information on how virtual addresses translate onto Secure physical and Non-secure addresses, see [About the Virtual Memory System Architecture \(VMSA\)](#) on page D5-2674.

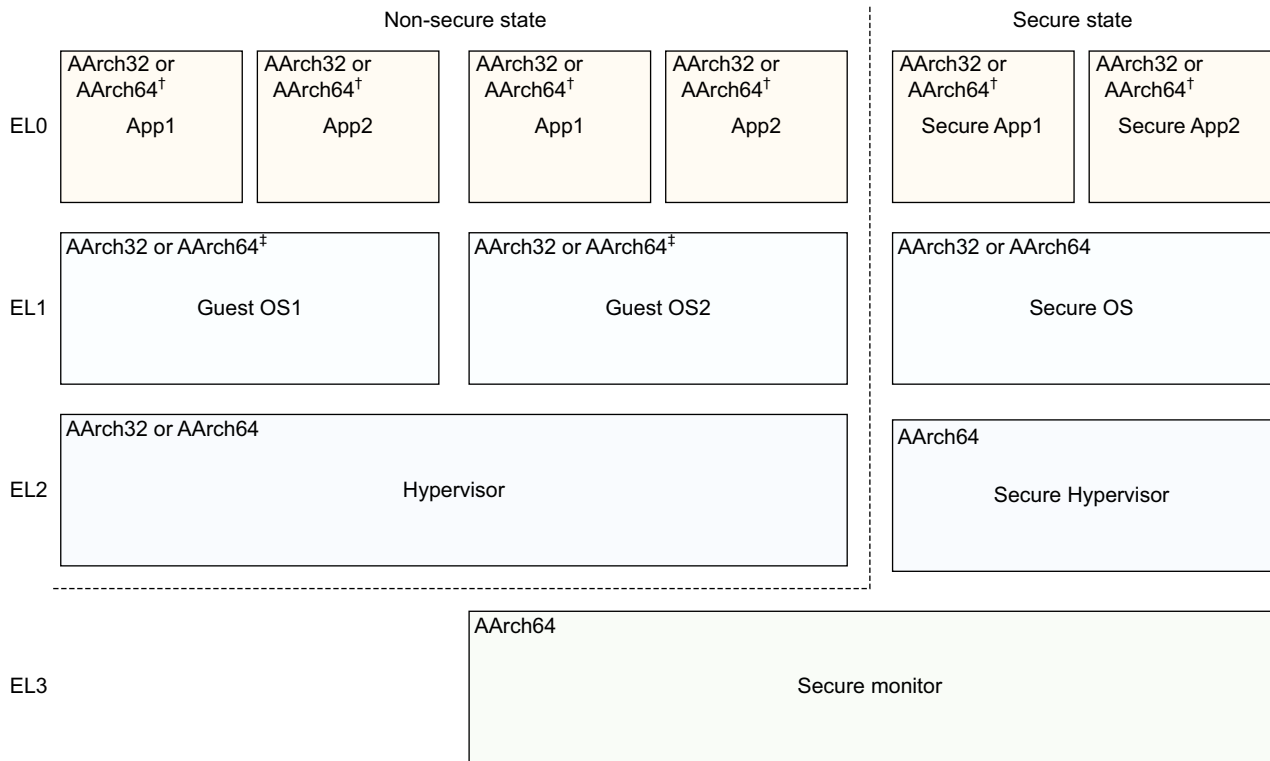

D1.4.1 The Armv8-A security model

The principles of the Armv8-A security model are:

- If the implementation includes EL3, then it has two Security states, Secure and Non-secure, and:
 - EL3 exists only in Secure state.
 - A change from Non-secure state to Secure state can only occur on taking an exception to EL3.
 - A change from Secure state to Non-secure state can only occur on an exception return from EL3.
 - If [FEAT_SEL2](#) is not implemented, EL2 exists only in Non-secure state.
 - If [FEAT_SEL2](#) is implemented, EL2 can exist in Secure state. It is enabled when the value of [SCR_EL3.EEL2](#) is 1.
- If the implementation does not include EL3, it has one Security state, that is:
 - IMPLEMENTATION DEFINED, if the implementation does not include EL2 or if [FEAT_SEL2](#) is implemented.
 - Non-secure state, if the implementation includes EL2 and [FEAT_SEL2](#) is not implemented.

Security model when EL3 is using AArch64 state

[Figure D1-1](#) on page D1-2459 shows the security model when EL3 is using AArch64 state. The figure shows how instances of EL0 and EL1 are present in both Security states. It also shows the expected software usage of the different Exception levels.

† AArch64 permitted only if EL1 is using AArch64
‡ AArch64 permitted only if EL2 is using AArch64

Figure D1-1 Armv8-A security model when EL3 is using AArch64

For an overview of the Security model when EL3 is using AArch32, see [Figure G1-1 on page G1-6020](#).

D1.5 Virtualization

The support for virtualization described in this section applies only to an implementation that includes EL2.

When enabled in the current Security state, EL2 provides a set of features that support virtualizing an Armv8-A implementation. The basic model of a virtualized system involves:

- A hypervisor, running in EL2, that is responsible for switching between *virtual machines*. A virtual machine comprises EL1 and EL0.
- A number of Guest operating systems. A Guest OS runs on a virtual machine in EL1.
- For each Guest operating system, applications, that run on the virtual machine of that Guest OS, usually in EL0.

Note

In some systems, a Guest OS is unaware that it is running on a virtual machine, and is unaware of any other Guest OS. In other systems, a hypervisor makes the Guest OS aware of these facts. The Armv8-A architecture supports both of these models.

The hypervisor assigns a [VMID](#) to each virtual machine.

EL2 supports Guest OS management and provides controls to:

- Provide virtual values for the contents of a small number of identification registers. A read of one of these registers by a Guest OS or the applications for a Guest OS returns the virtual value.
- *Trap* various operations, including memory management operations and accesses to many other registers. A trapped operation generates an exception that is taken to EL2. See [Configurable instruction enables and disables, and trap controls](#) on page D1-2510.
- Route interrupts to the appropriate one of:
 - The current Guest OS.
 - A Guest OS that is not currently running.
 - The hypervisor.

Armv8.1 introduces the Virtualization Host Extensions (VHE) that provide enhanced support for Type 2 hypervisors. For more information, see [Virtualization Host Extensions](#) on page D5-2787.

In an implementation that includes EL2:

- The implementation provides an independent translation regime for memory accesses from EL2, the EL2 translation regime. An implementation that includes [FEAT_VHE](#) also supports an alternative EL2&0 translation regime.

Note

An implementation that includes [FEAT_VHE](#) can be configured so that the EL2&0 translation regime is used both for accesses from EL2 and for accesses from EL0.

- For the EL1&0 translation regime, address translation occurs in two stages:
 - Stage 1 maps the *virtual address* (VA) to an *intermediate physical address* (IPA). This is managed at EL1, usually by a Guest OS. The Guest OS believes that the IPA is the *physical address* (PA).
 - Stage 2 maps the IPA to the PA. This is managed at EL2. The Guest OS might be completely unaware of this stage.
- When [FEAT_NV](#) is implemented, a Guest Hypervisor can be run at EL1. For more information on how this affects address translation, see [Nested virtualization](#) on page D5-2793.

- When [FEAT_NV2](#) is implemented, then accesses of EL1 and EL2 registers that would be trapped are instead transformed into memory accesses. For more information, see [Enhanced support for nested virtualization on page D5-2795](#).

For more information on the translation regimes, see [Chapter D5 The AArch64 Virtual Memory System Architecture](#).

D1.5.1 The effect of implementing EL2 on the Exception model

An implementation that includes EL2 implements the following exceptions:

- [HVC on page C6-1035](#).
- Traps to EL2. [EL2 configurable controls on page D1-2516](#), describes these.
- All of the virtual interrupts:
 - Virtual SError.
 - Virtual IRQ.
 - Virtual FIQ.

All virtual interrupts are always taken to EL1, and can only be taken from EL1 or EL0.

Each of the virtual interrupts can be independently enabled using controls at EL2.

Each of the virtual interrupts has a corresponding physical interrupt. See [Virtual interrupts on page D1-2461](#).

When a virtual interrupt is enabled, its corresponding physical exception is taken to EL2, unless EL3 has configured that physical exception to be taken to EL3.

For more information, see [Asynchronous exception types, routing, masking and priorities on page D1-2500](#).

An implementation that includes EL2 also:

- Provides controls that can be used to route some synchronous exceptions. For more information, see:
 - [Routing exceptions from EL0 to EL2 on page D1-2489](#).
 - [Routing debug exceptions on page D2-2569](#).
- Provides mechanisms to trap PE operations to EL2. For more information, see [EL2 configurable controls on page D1-2516](#).

When an operation is trapped to EL2, the hypervisor typically either:

- Emulates the required operation. The application running in the Guest OS is unaware of the trap.
- Returns an error to the Guest OS.

Virtual interrupts

The virtual interrupts have names that correspond to the physical interrupts, as shown in [Table D1-1 on page D1-2461](#).

Table D1-1 The virtual interrupt

Physical interrupt	Corresponding virtual interrupt
SError	Virtual SError
IRQ	Virtual IRQ
FIQ	Virtual FIQ

Software executing in EL2 can use virtual interrupts to signal physical interrupts to EL1 and EL0. [Example D1-1 on page D1-2462](#) shows a usage model for virtual interrupts.

Example D1-1 Virtual interrupt usage model

A virtual interrupt usage model is as follows:

1. Software executing at EL2 routes a physical interrupt to EL2.
 2. When a physical interrupt of that type occurs, the exception handler executing in EL2 determines whether the interrupt can be handled in EL2 or requires routing to a Guest OS in EL1. If the interrupt requires routing to a Guest OS:
 - If the Guest OS is currently running, the hypervisor uses the appropriate virtual interrupt type to signal the physical interrupt to the Guest OS.
 - If the Guest OS is not currently running, the physical interrupt is marked as pending for the guest OS. When the hypervisor next switches to the virtual machine that is running that Guest OS, the hypervisor uses the appropriate virtual interrupt type to signal the physical interrupt to the Guest OS.
-

A hypervisor can prevent EL1 and EL0 from distinguishing a virtual interrupt from a physical interrupt.

D1.6 Registers for instruction processing and exception handling

In the Arm architecture, registers fall into two main categories:

- Registers that provide system control or status reporting. These are described in [Chapter D13 AArch64 System Register Descriptions](#).
- Registers that are used in instruction processing, for example to accumulate a result, and in handling exceptions. This section introduces these registers, for execution in AArch64 state.

This section contains the following subsections:

- [The general-purpose registers, R0-R30](#) on page D1-2463.
- [The stack pointer registers](#) on page D1-2463.
- [The SIMD and floating-point registers, V0-V31](#) on page D1-2464.
- [Saved Program Status Registers \(SPSRs\)](#) on page D1-2464.
- [Exception Link Registers \(ELRs\)](#) on page D1-2465.

D1.6.1 The general-purpose registers, R0-R30

The general-purpose register bank is used when processing instructions in the base instruction set. It comprises 31 general-purpose registers, R0-R30.

These registers can be accessed as 31 64-bit registers, X0-X30, or 31 32-bit registers, W0-W30. See [Register size](#) on page C6-872.

For information on the format of these registers, see [Registers in AArch64 state](#) on page B1-117.

D1.6.2 The stack pointer registers

In AArch64 state, in addition to the general-purpose registers, a dedicated stack pointer register is implemented for each implemented Exception level. The stack pointer registers are:

- [SP_ELO](#) and [SP_EL1](#).
- If the implementation includes EL2, [SP_EL2](#).
- If the implementation includes EL3, [SP_EL3](#).

———— Note —————

The four stack pointer register names define an architecture state requirement for four registers. For information on how to access these registers, and access restrictions, see [Special-purpose registers](#) on page C5-408.

For information on stack pointer alignment restrictions, see [SP alignment checking](#) on page D1-2469.

Stack pointer register selection

When executing at EL0, the PE uses the EL0 stack pointer, [SP_ELO](#).

When executing at any other Exception level, the PE can be configured to use either [SP_ELO](#) or the stack pointer for that Exception level, [SP_ELx](#).

By default, taking an exception selects the stack pointer for the target Exception level, [SP_ELx](#). For example, taking an exception to EL1 selects [SP_EL1](#). Software executing at the target Exception level can then choose to change the stack pointer to [SP_ELO](#) by updating [PSTATE.SP](#).

This applies even if taking the exception does not change the Exception level. For example, if the PE is executing at EL1 and the PE is using the [SP_ELO](#) stack pointer, then on taking an exception that targets EL1, the stack pointer changes to [SP_EL1](#).

The selected stack pointer can be indicated by a suffix to the Exception level:

- t** Indicates use of the [SP_ELO](#) stack pointer.
- h** Indicates use of the [SP_ELx](#) stack pointer.

———— **Note** ————

The t and h suffixes are based on the terminology of *thread* and *handler*.

Table D1-2 on page D1-2464 shows the set of stack pointer options.

Table D1-2 AArch64 stack pointer options

Exception level (EL)	Stack pointer (SP) options
EL0	SP_EL0t
EL1	SP_EL1t, SP_EL1h
EL2	SP_EL2t, SP_EL2h
EL3	SP_EL3t, SP_EL3h

D1.6.3 The SIMD and floating-point registers, V0-V31

The SIMD and floating-point instructions share a common bank of registers for floating-point, vector, and other SIMD-related scalar operations.

The SIMD and floating-point register bank comprises 32 quadword (128-bit) registers, V0-V31.

These registers can be accessed as:

- 32 doubleword (64-bit) registers, D0-D31.
- 32 word (32-bit) registers, S0-S31.
- 32 halfword (16-bit) registers, H0-H31.
- 32 byte (8-bit) registers, B0-B31.

For information on the format of these registers, see *Registers in AArch64 state* on page B1-117.

D1.6.4 Saved Program Status Registers (SPSRs)

The *Saved Program Status Registers* (SPSRs) are used to save PE state on taking exceptions.

In AArch64 state, there is an SPSR at each Exception level exceptions can be taken to, as follows:

- **SPSR_EL1**, for exceptions taken to EL1 using AArch64.
- If EL2 is implemented, **SPSR_EL2**, for exceptions taken to EL2 using AArch64.
- If EL3 is implemented, **SPSR_EL3**, for exceptions taken to EL3 using AArch64.

———— **Note** ————

Exceptions cannot be taken to EL0.

When the PE takes an exception, the PE state is saved from PSTATE in the **SPSR** at the Exception level the exception is taken to. For example, if the PE takes an exception to EL1, the PE state is saved in **SPSR_EL1**. For more information on **PSTATE**, see *Process state, PSTATE* on page D1-2466.

Saving the PE state means the exception handler can:

- On return from the exception, restore the PE state to the state stored in the **SPSR** at the Exception level the exception is returning from. For example, on returning from EL1, the PE state is restored to the state stored in **SPSR_EL1**.
- Examine the value that PSTATE had when the exception was taken, for example to determine the Execution state and Exception level in which the instruction that caused an exception was executed.

———— **Note** ————

- All PSTATE fields are saved, including those which have no direct read and write access, and those that are meaningful only in AArch32 state.
- Those PSTATE fields that are meaningful only in AArch32 state are saved when an exception is taken from AArch32 state to AArch64 state.

The SPSRs are UNKNOWN on a Warm reset.

SPSR bits that are defined as RES0 on an exception are ignored:

- If taken from AArch32 state, on any exception return to AArch32 state.
- If taken from AArch64 state, on any exception return to AArch64 state.

Pseudocode description of SPSR operations

The `SPSR[]` pseudocode function accesses the current SPSR, and is common to AArch32 and AArch64 operations.

The `SetPSTATEFromPSR()` pseudocode function updates `PSTATE` from an SPSR.

D1.6.5 Exception Link Registers (ELRs)

Exception Link Registers hold preferred exception return addresses.

Whenever the PE takes an exception, the preferred return address is saved in the ELR at the Exception level the exception is taken to. For example, whenever the PE takes an exception to EL1, the preferred return address is saved in `ELR_EL1`.

On an exception return, the PC is restored to the address stored in the ELR. For example, on returning from EL1, the PC is restored to the address stored in `ELR_EL1`.

AArch64 state provides an ELR for each Exception level exceptions can be taken to. The ELRs that AArch64 state provides are:

- `ELR_EL1`, for exceptions taken to EL1.
- If EL2 is implemented, `ELR_EL2`, for exceptions taken to EL2.
- If EL3 is implemented, `ELR_EL3`, for exceptions taken to EL3.

On taking an exception from AArch32 state to AArch64 state, bits[63:32] of the ELR are set to zero.

The preferred return address depends on the nature of the exception. For more information, see *Preferred exception return address* on page D1-2476.

D1.7 Process state, PSTATE

In the Armv8-A architecture, Process state or PSTATE is an abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.

PSTATE includes all of the following:

- Fields that are meaningful only in AArch32 state.
- Fields that are meaningful only in AArch64 state.
- Fields that are meaningful in both Execution states.

PSTATE is defined in pseudocode as the PSTATE structure, of type [ProcState](#). [ProcState](#) is defined in [Chapter J1 Armv8 Pseudocode](#).

The PSTATE fields that are meaningful in AArch64 state are:

The Condition flags

N	Negative Condition flag.
Z	Zero Condition flag.
C	Carry Condition flag.
V	Overflow Condition flag.

[Process state, PSTATE on page B1-118](#) gives more information about these flags.

The Execution state controls

SS	Software Step bit, see Software Step exceptions on page D2-2613 . On a Warm reset or taking an exception to AArch64 state, this bit is set to 0.
IL	Illegal Execution state bit, see The Illegal Execution state exception on page D1-2488 . On a Warm reset or taking an exception to AArch64 state, this bit is set to 0.
nRW	Current Execution state, see Execution state on page D1-2457 . This bit is 0 when the current Execution state is AArch64. This bit is set to 0: <ul style="list-style-type: none">• On a Warm reset into an Exception level that is using AArch64.• On taking an exception to an Exception level that is using AArch64.
EL	Current Exception level, see Exception levels on page D1-2454 . On a Warm reset to AArch64 state, this field holds the encoding for the highest implemented Exception level. ———— Note ————— The Arm architecture requires that a PE resets into the highest implemented Exception level. —————
SP	Stack pointer register selection bit, see Stack pointer register selection on page D1-2463 . On a Warm reset or taking an exception to AArch64 state, this bit is set to 1, meaning that SP_ELx is selected.

The exception mask bits

D	Debug exception mask bit, see The PSTATE debug mask bit, D on page D1-2542 . On a Warm reset or taking an exception to AArch64 state, this bit is set to 1.						
A, I, F	Asynchronous exception mask bits: <table><tr><td>A</td><td>SError interrupt mask bit.</td></tr><tr><td>I</td><td>IRQ interrupt mask bit.</td></tr><tr><td>F</td><td>FIQ interrupt mask bit.</td></tr></table> <p>See Asynchronous exception types, routing, masking and priorities on page D1-2500. On a Warm reset or taking an exception to AArch64 state, each of these bits is set to 1.</p>	A	SError interrupt mask bit.	I	IRQ interrupt mask bit.	F	FIQ interrupt mask bit.
A	SError interrupt mask bit.						
I	IRQ interrupt mask bit.						
F	FIQ interrupt mask bit.						

Access control bits

PAN	<i>Privileged Access Never</i> (PAN) state bit. For more information, see About PSTATE.PAN on page D5-2755 .
------------	--

- This bit is implemented only when [FEAT_PAN](#) is implemented.
- UAO** *User Access Override* (UAO) bit. For more information, see [About PSTATE.UAO on page D5-2756](#).
- This bit is implemented only when [FEAT_UAO](#) is implemented.
- TCO** *Tag Check Override* (TCO) bit. For more information, see [Chapter D6 Memory Tagging Extension](#).
- This bit is implemented only when [FEAT_MTE](#) is implemented.
When [FEAT_MTE2](#) is not implemented it is CONSTRAINED UNPREDICTABLE whether this bit is RES0 or behaves as if [FEAT_MTE](#) is implemented.
- BTYPE** Branch target identification bit. For more information, see [About PSTATE.BTYPE on page D5-2756](#).
- This bit is implemented only when [FEAT_BTI](#) is implemented.

Timing control bits

- DIT** *Data Independent Timing* (DIT) bit. For more information, see [About PSTATE.DIT on page B1-123](#).
- This bit is implemented only when [FEAT_DIT](#) is implemented.
On a Warm reset to AArch64 state, this bit is set to 0.

Speculation control bits

- SSBS** *Speculative Store Bypass Safe* (SSBS) bit. For more information, see [Speculative Store Bypass Safe \(SSBS\) on page B2-145](#).
- This bit is implemented only when [FEAT_SSBS](#) is implemented.
On a Warm reset, this bit is set to an IMPLEMENTATION DEFINED value.

D1.7.1 Accessing PSTATE fields

In AArch64 state, PSTATE fields can be accessed using Special-purpose registers that can be directly read using the [MRS](#) instruction, and directly written using the [MSR \(register\)](#) instructions. [Table D1-3 on page D1-2467](#) shows the Special-purpose registers that access the PSTATE fields that hold AArch64 state, when the PE is in AArch64 state. All other PSTATE fields do not have direct read and write access.

Table D1-3 Accessing PSTATE fields using MRS and MSR (register)

Special-purpose register	PSTATE fields
NZCV	N, Z, C, V
DAIF	D, A, I, F
CurrentEL	EL
SPSel	SP
PAN	PAN
UAO	UAO
DIT	DIT
SSBS	SSBS
TCO	TCO

Software can also use the [MSR \(immediate\)](#) instruction to directly write to PSTATE. {D, A, I, F, SP, PAN, UAO, DIT, SSBS, TCO}. [Table D1-4 on page D1-2468](#) shows the [MSR \(immediate\)](#) operands that can directly write to these PSTATE fields when the PE is in AArch64 state.

Table D1-4 Accessing PSTATE.{D, A, I, F, SP} using MSR (immediate)

Operand	PSTATE fields	Notes
DAIFSet	D, A, I, F	Directly sets any of the PSTATE. {D,A, I, F} bits to 1
DAIFClr	D, A, I, F	Directly clears any of the PSTATE. {D, A, I, F} bits to 0
SPSel	SP	Directly sets PSTATE.SP to either 1 or 0
PAN	PAN	Directly sets PSTATE.PAN to either 1 or 0
UAO	UAO	Directly sets PSTATE.UAO to either 1 or 0
DIT	DIT	Directly sets PSTATE.DIT to either 1 or 0
SSBS	SSBS	Directly sets PSTATE.SSBS to either 1 or 0
TCO	TCO ^a	Directly sets PSTATE.TCO to either 1 or 0.

a. PSTATE.TCO can also be accessed by an MSR Xt instruction.

PSTATE. {N, Z, C, V, SSBS, DIT, TCO} can be accessed at EL0. Access to PSTATE. {D, A, I, F} at EL0 using AArch64 depends on [SCTLR_EL1.UMA](#), see [Traps to EL1 of EL0 accesses to the PSTATE.{D, A, I, F} interrupt masks on page D1-2514](#). All other PSTATE access instructions can be executed at EL1 or higher and are UNDEFINED at EL0.

Writes to the PSTATE fields have side-effects on various aspects of the PE operation. All of these side-effects are guaranteed:

- Not to be visible to earlier instructions in the execution stream.
- To be visible to later instructions in the execution stream.

D1.7.2 The Saved Program Status Registers (SPSRs)

On taking an exception, PSTATE is preserved in the SPSR of the Exception level the exception is taken to. The SPSRs are described in [Saved Program Status Registers \(SPSRs\) on page D1-2464](#).

D1.8 Program counter and stack pointer alignment

This section contains the following:

- [PC alignment checking on page D1-2469](#).
- [SP alignment checking on page D1-2469](#).

D1.8.1 PC alignment checking

PC alignment checking generates a PC alignment fault exception associated with the instruction fetch if, in AArch64 state, there is an attempt to architecturally execute an instruction that was fetched with a misaligned PC. A misaligned PC is when bits[1:0] of the PC are not 0b00.

———— **Note** ————

As with Instruction Aborts, speculative fetching of an instruction does not generate an exception. An exception occurs only on an attempt to architecturally execute the instruction.

If an exception is generated as a result of an instruction fetch at EL0, it is taken to EL1. If an exception occurs when [HCR_EL2.TGE](#) bit is 1 and EL2 is enabled in the current Security state, it is taken to EL2. If an exception is generated as a result of an instruction fetch at any other Exception level, the Exception level is unchanged.

A PC misalignment sets the EC field in the *Exception Syndrome Register* (ESR) to 0x22, for the ESR associated with the target Exception level.

When the exception is taken to an Exception level using AArch64, the associated Exception Link Register holds the entire PC in its misaligned form, as does the [FAR_ELx](#) for the Exception level that the exception is taken to.

[Exception return and PC alignment on page D1-2486](#) gives more information on PC alignment checking associated with exception returns.

———— **Note** ————

A misalignment of the PC is a common indication of a serious error, for example software corruption of an address.

The pseudocode function [AArch64.CheckPCAlignment\(\)](#) performs PC alignment checking in AArch64 state. When necessary it calls [AArch64.PCAlignmentFault\(\)](#) to generate an exception.

D1.8.2 SP alignment checking

A *misaligned stack pointer* is where bits[3:0] of the stack pointer are not 0b0000, when the stack pointer is used as the base address of the calculation, regardless of any offset applied by the instruction.

The PE can be configured so that if a load or store instruction uses a misaligned stack pointer, the PE generates an SP alignment fault exception on the attempt to execute the instruction. In this configuration, [CheckSPAlignment\(\)](#) performs the stack pointer check, and calls [AArch64.SPAlignmentFault\(\)](#) if a misaligned stack pointer is found.

———— **Note** ————

- As with Data Aborts, a speculative data access to memory using the stack pointer does not generate the exception. The exception occurs only on an attempt to architecturally execute the instruction.
- Prefetch memory abort instructions do not cause synchronous exceptions. See [Prefetch memory on page C3-235](#).

Stack pointer alignment checking is only performed in AArch64 state, and can be enabled for each Exception level as follows:

- [SCTLR_EL1](#).{SA0, SA} controls EL0 and EL1, respectively.
- [SCTLR_EL2](#).SA controls EL2.
- [SCTLR_EL3](#).SA controls EL3.

If an exception is generated as a result of a load or store at EL0, it is taken as an exception to EL1. If an exception occurs when the [HCR_EL2.TGE](#) bit is set and EL2 is enabled in the current Security state, it is taken to EL2. If an exception is generated as a result of a load or store at any other Exception level, the Exception level is unchanged.

A stack pointer misalignment sets the EC field to 0x26, in the ESR associated with the target Exception level. If memory alignment checking and stack pointer alignment checking are enabled, then an SP alignment fault has priority in setting the value of the EC field, in the ESR associated with the target Exception level.

The pseudocode function [CheckSPAlignment\(\)](#) performs the stack pointer alignment check. When necessary it calls [AArch64.SPAlignmentFault\(\)](#) to generate an exception.

D1.9 Reset

The Armv8-A architecture supports the following resets:

- | | |
|-------------------|---|
| Cold reset | Resets all of the logic on which the PE executes, including the integrated debug functionality.

In some contexts, this logic is described as belonging to the <i>Cold reset domain</i> . |
| Warm reset | Resets some of the logic on which the PE executes. However, some state is purposefully unchanged by a Warm reset.

In some contexts, this logic is described as belonging to the <i>Warm reset domain</i> . |

All logic on the which the PE executes that is reset by a Warm reset is also reset by a Cold reset.

———— **Note** —————

The Armv8-A architecture also supports an *external debug reset*. See [External debug register resets on page H8-7481](#).

If an [RMR_ELx](#) register is implemented:

- A Warm reset permits debugging across a reset of the PE logic.
- Writing 1 to [RMR_ELx.RR](#) requests a Warm reset.

The mechanisms, other than [RMR_ELx.RR](#), to assert these resets are IMPLEMENTATION DEFINED. It is IMPLEMENTATION DEFINED whether:

- It is possible to independently assert an External Debug reset and a Cold reset.
- It is possible to assert a Warm reset, as opposed to asserting a Cold reset, other than by the use of [RMR_ELx.RR](#).

———— **Note** —————

Arm recommends that:

- If separate Core and Debug power domains are implemented, as described in [Reset and debug on page H6-7452](#), then a Cold reset can be asserted independently of External Debug reset.
- A Warm reset can be asserted to permit debugging across a reset of the PE logic.

This means that an implementation can define other resets according to the requirements the implementation or system must fulfil. These other resets are outside the scope of the Armv8-A architecture. However, they can be mapped onto the resets described here.

In the description that follows, the term *reset* is used in contexts where there is no difference between the effect of a Cold reset and the effect of a Warm reset.

On a reset, the PE enters the highest implemented Exception level.

If the highest implemented Exception level can use either Execution state, then:

- The implementation must include a *Reset Management Register* (RMR). Only one RMR is implemented. The RMR implemented is the RMR is associated with the highest Exception level.
- On a Cold reset, the Execution state entered is determined by a configuration input signal.
- On a Warm reset, the Execution state entered is determined by [RMR_ELx.AA64](#).

If the highest implemented Exception level is configured to use AArch64 state, then on reset:

- The stack pointer for the highest implemented Exception level, [SP_ELx](#), is selected.
- Execution starts at an IMPLEMENTATION DEFINED address, anywhere in the physical address range. The RVBAR associated with the highest implemented Exception level, [RVBAR_EL1](#), [RVBAR_EL2](#), or [RVBAR_EL3](#), holds this address.

The remainder of this section contains the following:

- [PE state on reset to AArch64 state on page D1-2472](#).
- [Code sequence to use RMR_ELx.RR to request a Warm reset on page D1-2474](#).

For more information about reset, see:

- [Behavior of caches at reset on page D4-2643](#).
- [TLB behavior at reset on page D5-2814](#).
- [Reset and debug on page H6-7452](#).

D1.9.1 PE state on reset to AArch64 state

———— Note ————

See the *ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0* for the reset requirements for GIC System registers.

Immediately after a reset, much of the PE state is UNKNOWN. However, some of the PE state is defined. If the PE resets to AArch64 state using either a Cold or a Warm reset, the PE state that is defined is as follows:

- Each of the `PSTATE.{D, A, I, F}` interrupt masks is set to 1.
- The Software step control bit, `PSTATE.SS`, is set to 0.
- The IL process state bit, `PSTATE.IL`, is set to 0.
- All general-purpose, and SIMD and floating-point registers are UNKNOWN.
- The ELR and SPSR for each Exception level are UNKNOWN.
- The stack pointer register for each Exception level is UNKNOWN.
- The global exclusive monitor and local exclusive monitor for the PE are UNKNOWN.
- Unless explicitly defined in this subsection, each System register at each Exception level is in an architecturally UNKNOWN state.
- The TLBs and caches are in an IMPLEMENTATION DEFINED state. This means that the TLBs, the caches, or both, might require invalidation using IMPLEMENTATION DEFINED invalidation sequences before the memory management system is enabled or Normal memory accesses are permitted to be Cacheable.

———— Note ————

- On a Warm reset, System register Cacheability control fields force all Normal memory accesses to be treated as Non-cacheable. This applies only for the translation regime used by the Exception level and Security state entered on reset. For information about these controls see [Enabling and disabling the caching of memory accesses on page D4-2641](#).
- The implementation might include IMPLEMENTATION DEFINED resets. If it does, each of these resets might treat the cache and TLB state differently. The Armv8-A architecture permits this.
- Different IMPLEMENTATION DEFINED invalidation sequences might be required for different IMPLEMENTATION DEFINED resets.
- In some implementations, the IMPLEMENTATION DEFINED invalidation sequence might be a NOP.

- In the `SCTLR_ELx` for the highest implemented Exception level:
 - Each of the `{M, C, I}` bits is set to 0
 - The EE bit is set to an IMPLEMENTATION DEFINED value, typically defined by a configuration input.
- If an RMR is implemented, `RMR_ELx.RR` is set to 0. ELx in this context is the highest implemented Exception level.
- `PMCR_EL0.E` is set to 0.

———— **Note** —————

This means the Performance Monitors cannot assert interrupts at reset.

- [OSDLR_EL1](#).DLK bit is set to 0.
- Each of [MDCCINT_EL1](#).{TX, RX} is set to 0.
- [EDPRCR](#).CWRR is set to 0.
- [EDPRSR](#).SR is set to 1.
- If the implementation includes EL3, then each of [MDCR_EL3](#).{EPMAD, EDAD, SPME} is set to 0.
- If the implementation includes EL2, then [MDCR_EL2](#).HPMN is set to the value of [PMCR_EL0](#).N.
- [EDES](#).OSUC is set to 0.
- If [FEAT_DoPD](#) is not implemented, [EDES](#).SS is set to the value of [EDEC](#).SS.
- If [FEAT_DoPD](#) is implemented, [EDES](#).RC is set to the value of [CTIDEVCTL](#).RCE. Otherwise [EDES](#).RC is set to the value of [EDEC](#).RCE.

———— **Note** —————

On an External debug reset, [EDEC](#).{SS, RCE} are set to 0. If [FEAT_DoPD](#) is implemented, [CTIDEVCTL](#).{OSUCE, RCE} are set to 0.

Additionally, for a Cold reset into AArch64 state:

- If an RMR is implemented, [RMR_ELx](#).AA64 is set to 1. ELx in this context is the highest implemented Exception level.
- Each of [MDCCSR_EL0](#).{TXfull, RXfull} is set to 0.
- If [FEAT_DoPD](#) is not implemented, [DBGPRCR_EL1](#).CORENPDRQ is set to the value of [EDPRCR](#).COREPURQ.

———— **Note** —————

An External Debug reset sets [EDPRCR](#).COREPURQ to 0, see [External debug register resets on page H8-7481](#). If an External Debug reset and a Cold reset coincide, both [DBGPRCR_EL1](#).CORENPDRQ and [EDPRCR](#).COREPURQ are reset to 0.

If [FEAT_DoPD](#) is implemented, [DBGPRCR_EL1](#).CORENPDRQ is set to an IMPLEMENTATION DEFINED choice of 0 or 1 if the powerup request is implemented and asserted, otherwise is set to 0.

- The debug CLAIM bits are reset to 0.

———— **Note** —————

These are the bits that are set to 1 by writing to [DBGCLAIMSET_EL1](#).CLAIM, and cleared to 0 by writing to [DBGCLAIMCLR_EL1](#).CLAIM.

- Each of [EDSCR](#).{RXO, TXU, INTdis, TDA, MA, HDE, ERR, RXfull, TXfull} is set to 0.
- Each of [EDEC](#).{NSE, SE} is set to 0.
- If [FEAT_DoPD](#) is implemented, [EDEC](#).SS is set to 0.
- [OSLSR_EL1](#).OSLK is set to 1.
- In the [EDPRSR](#):
 - The SPMAD, SDAD fields are set to 0.
 - The SPD field is set to 1.

- Each field of [AMCNTENCLR0_EL0](#), [AMCNTENCLR1_EL0](#), [AMCNTENSET0_EL0](#), and [AMCNTENSET1_EL0](#) is set to 0.
- Each of the implemented architected activity monitor counters [AMEVCNTR0<n>_EL0](#) and each of the implemented auxiliary activity monitor counters [AMEVCNTR1<n>_EL0](#) are set to 0.

For more information about resets in AArch64 System registers, see [Chapter D13 AArch64 System Register Descriptions](#).

D1.9.2 Code sequence to use RMR_ELx.RR to request a Warm reset

The following assembler sequence uses [RMR_ELx.RR](#) to request a Warm reset:

```
; in addition, interrupts and debug requests for this PE should be disabled
; in the system before running this sequence to ensure the WFI suspends execution
MOV Wy, #3          ; for AArch64, #2 for AArch32; y is any register
DSB                ; ensure all stores etc are complete
MSR RMR_ELx, Wy    ; request the reset
ISB                ; synchronise change to the RMR
Loop
WFI                ; enter a quiescent state
B Loop
```

D1.9.3 Pseudocode description of reset

The [AArch64.TakeReset\(\)](#) pseudocode function performs a reset into AArch64 state.

[AArch64.TakeReset\(\)](#) calls the functions [AArch64.ResetGeneralRegisters\(\)](#), [AArch64.ResetSIMDFPRegisters\(\)](#), [AArch64.ResetSpecialRegisters\(\)](#), [AArch64.ResetSystemRegisters\(\)](#), and [ResetExternalDebugRegisters\(\)](#).

[AArch64.ResetSystemRegisters\(\)](#) resets all System registers to their reset state as defined in the register descriptions in [PE state on reset to AArch64 state on page D1-2472](#) and [Chapter D13 AArch64 System Register Descriptions](#).

———— **Note** —————

The [AArch64.ResetSystemRegisters\(\)](#) function only resets the System registers.

[ResetExternalDebugRegisters\(\)](#) resets all external debug registers to their reset state as defined in the register descriptions in [Chapter H9 External Debug Register Descriptions](#).

D1.10 Exception entry

Exceptions are targeted at particular Exception levels. The Exception level that an exception targets is either programmed by software, or is determined by the nature of the exception.

Under no circumstances do exceptions cause execution to move to a lower Exception level.

If an asynchronous exception targets a lower Exception level, the exception is not taken and remains pending. See [Asynchronous exception routing on page D1-2501](#) and [Asynchronous exception masking on page D1-2504](#).

———— Note —————

The construction of the architecture means that usually, it is impossible for an exception to target a lower Exception level.

The Security state can only change on taking an exception if taken from Non-secure state to EL3.

———— Note —————

Taking an exception to EL3 from any Exception level has no effect on the value of the [SCR_EL3.NS](#) bit.

On taking an exception to AArch64 state:

- The PE state is saved in the [SPSR_ELx](#) at the target Exception level. See [Saved Program Status Registers \(SPSRs\) on page D1-2464](#).
- The preferred return address is saved in the [ELR_ELx](#) at the target Exception level. See [Exception Link Registers \(ELRs\) on page D1-2465](#).
- All of [PSTATE](#).{D, A, I, F} are set to 1. See [Process state, PSTATE on page D1-2466](#).
- [PSTATE](#).SSBS is set to the value of [SCTLR_ELx.DSSBS](#).
- If [FEAT_UAO](#) is implemented, [PSTATE](#).UAO is set to 0. See [Process state, PSTATE on page D1-2466](#).
- If the exception is a synchronous exception or an SError interrupt, information characterizing the reason for the exception is saved in the [ESR_ELx](#) at the target Exception level. See [Use of the ESR_EL1, ESR_EL2, and ESR_EL3 on page D1-2478](#).
- If [FEAT_MTE](#) is implemented, [PSTATE](#).TCO is set to 1. See [Process state, PSTATE on page D1-2466](#).
- If [FEAT_BTI](#) is implemented, on taking an asynchronous exception from AArch64 to AArch64, [PSTATE](#).BTYP is copied to [SPSR_ELx.BTYPE](#) and then set to 0.
- If [FEAT_BTI](#) is implemented, on taking certain types of synchronous exception from AArch64 to AArch64, [PSTATE](#).BTYP is copied to [SPSR_ELx.BTYPE](#) and then set to 0. These types of synchronous exceptions are:
 - Software Step exception.
 - PC alignment fault exception.
 - Instruction Abort exception.
 - Breakpoint exceptions or Address Matching Vector Catch exception.
 - Illegal Execution state exception.
 - Software Breakpoint exception.
 - Branch Target exception.

On taking any other synchronous exception from AArch64 to AArch64, it is CONSTRAINED UNPREDICTABLE whether:

- [SPSR_ELx.BTYPE](#) is set to the value of [PSTATE.BTYPE](#).
- [SPSR_ELx.BTYPE](#) is set to 0.

[PSTATE.BTYPE](#) is then set to 0.

- The stack pointer register selected is the dedicated stack pointer register for the target Exception level. See [The stack pointer registers on page D1-2463](#).
- For a physical SError interrupt exception, the pending state of the physical SError is cleared when any of:
 - The SError interrupt is edge-triggered.
 - [FEAT_DoubleFault](#) is implemented.
 - If [The Reliability, Availability, and Serviceability Extension](#) is implemented, and on taking the SError interrupt, the syndrome recorded in [ESR_ELx](#) indicates an SError other than IMPLEMENTATION DEFINED or uncategorized SError interrupt syndrome.Otherwise, it is IMPLEMENTATION DEFINED whether the pending state of the physical SError is cleared. This IMPLEMENTATION DEFINED behavior might vary according to the nature of the SError interrupt.
- For a virtual SError interrupt exception, the pending state of the virtual SError, held in the [HCR_EL2.VSE](#) bit, is cleared to zero. See [Virtual interrupts on page D1-2506](#).
- If [FEAT_IESB](#) is implemented, when the Effective value of the [SCTLR_ELx.IESB](#) bit at the target Exception level is 1, the PE inserts an error synchronization event. See *Arm® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.
- Execution moves to the target Exception level, and starts at the address defined by the exception vector. Which exception vector is used is also an indicator of whether the exception came from a lower Exception level or the current Exception level. See [Exception vectors on page D1-2477](#).
- If an Instruction Abort exception, Data Abort exception, PC alignment fault exception, or a Watchpoint exception is taken to an Exception level using AArch64, the faulting virtual address is saved in [FAR_ELx](#). For more information, see [Validity of FAR_ELx on page D1-2484](#).
- If an Instruction Abort exception, or Data Abort exception is taken to EL2 and the fault is one connected with stage 2 translation, the faulting IPA is saved in [HPFAR_EL2](#). For more information, see [Validity of HPFAR_EL2 on page D1-2484](#).

If [FEAT_ExS](#) is implemented and [SCTLR_ELx.EIS](#) is 0, though exception entry is not a context synchronization event, the indirect writes to [ESR_ELx](#), [FAR_ELx](#), [SPSR_ELx](#), [ELR_ELx](#), and [HPFAR_EL2](#) due to exception entry are synchronized so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.

———— **Note** —————

On exception entry, the memory transactions, including instruction fetches, from an exception level always use the translation resources associated with that translation regime.

The remainder of this section contains the following:

- [Preferred exception return address on page D1-2476](#).
- [Exception vectors on page D1-2477](#).
- [Pseudocode description of exception entry to AArch64 state on page D1-2478](#).
- [Exception classes and the ESR_ELx syndrome registers on page D1-2478](#).
- [Summary of register updates on faults taken to an Exception level that is using AArch64 on page D1-2483](#).

D1.10.1 Preferred exception return address

For an exception taken to an Exception level using AArch64, the Exception Link Register for that Exception level, [ELR_ELx](#), holds the preferred exception return address. The preferred exception return address depends on the nature of the exception, as follows:

- For asynchronous exceptions, it is the address of the instruction following the instruction boundary at which the interrupt occurs. Therefore, it is the address of the first instruction that did not execute, or did not complete execution, as a result of taking the interrupt.

- For synchronous exceptions other than system calls, it is the address of the instruction that generates the exception.
- For exception generating instructions, it is the address of the instruction that follows the exception generating instruction.

———— **Note** ————

If an exception generating instruction is trapped, disabled, or is UNDEFINED because the Exception level has insufficient privilege to execute the instruction, the preferred exception return address is the address of the exception generating instruction.

When an exception is taken from an Exception level using AArch32 to an Exception level using AArch64, the top 32 bits of the modified `ELR_ELx` are 0.

D1.10.2 Exception vectors

When the PE takes an exception to an Exception level that is using AArch64, execution is forced to an address that is the *exception vector* for the exception. The exception vector exists in a *vector table* at the Exception level the exception is taken to.

A vector table occupies a number of word-aligned addresses in memory, starting at the *vector base address*.

Each Exception level has an associated *Vector Base Address Register* (VBAR), which defines the exception base address for the table at that Exception level.

For exceptions taken to AArch64 state, the vector table provides the following information:

- Whether the exception is one of the following:
 - Synchronous exception.
 - SError.
 - IRQ.
 - FIQ.
- Information about the Exception level that the exception came from, combined with information about the stack pointer in use, and the state of the register file.

Table D1-5 on page D1-2477 shows this.

Table D1-5 Vector offsets from vector table base address

Exception taken from	Offset for exception type			
	Synchron ous	IRQ or vIRQ	FIQ or vFIQ	SError or vSError
Current Exception level with <code>SP_ELO</code> .	0x000 ^a	0x080	0x100	0x180
Current Exception level with <code>SP_ELx</code> , $x > 0$.	0x200 ^a	0x280	0x300	0x380
Lower Exception level, where the implemented level immediately lower than the target level is using AArch64. ^b	0x400 ^a	0x480	0x500	0x580
Lower Exception level, where the implemented level immediately lower than the target level is using AArch32. ^b	0x600 ^a	0x680	0x700	0x780

- When `FEAT_DoubleFault` is implemented, `SCR_EL3.EASE` is set to 1, and the exception is a synchronous External abort taken to EL3, the exception is routed to the offset in the SError or vSError column.
- For exceptions taken to EL3, if EL2 is implemented, the level immediately lower than the target level is EL2 if the exception was taken from Non-secure state, but EL1 if the exception was taken from Secure EL1 or EL0.

Reset is treated as a special vector for the highest implemented Exception level. This special vector uses an IMPLEMENTATION DEFINED address that is typically set either by a hardwired configuration of the PE or by configuration input signals. The `RVBAR_ELx` register contains this reset vector address, where *x* is the number of the highest implemented Exception level.

D1.10.3 Pseudocode description of exception entry to AArch64 state

The `AArch64.TakeException()` pseudocode function describes the behavior when the PE takes an exception to an Exception level that is using AArch64. The `AArch64.ExceptionClass()` function determines the EC (Exception class) and IL (Instruction length) values required to report the exception, and `AArch64.ReportException()` reports the exception.

The pseudocode functions `AArch64.TakeException()`, `AArch64.ExceptionClass()`, and `AArch64.ReportException()` are described in [Chapter J1 Armv8 Pseudocode](#).

D1.10.4 Exception classes and the ESR_ELx syndrome registers

If the exception is a synchronous exception or an SError interrupt, information characterizing the reason for the exception is saved in the `ESR_ELx` at the Exception level the exception is taken to. The information saved is determined at the time the exception is taken, and is not changed as a result of the explicit synchronization that takes place at the start of taking the exception. See [Synchronization requirements for AArch64 System registers on page D13-3041](#). The following sections give more information:

- [Use of the ESR_EL1, ESR_EL2, and ESR_EL3 on page D1-2478](#).
- [The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1 on page D1-2483](#).

Use of the ESR_EL1, ESR_EL2, and ESR_EL3

An `ESR_ELx` holds the syndrome information for an exception that is taken to AArch64 state.

———— **Note** —————

This use of a syndrome is also the reporting model used for exceptions taken to Hyp mode when they are taken to EL2 using AArch32.

[Figure D1-2 on page D1-2478](#) shows the general format of the `ESR_ELx` registers.

Figure D1-2 Overall format of the `ESR_ELx` registers

The `ESR_ELx` fields are:

- EC, bits[31:26]** The Exception class field, that indicates the cause of the exception.
- IL, bit[25]** The Instruction length bit, for synchronous exceptions, that indicates whether a trapped instruction was a 16-bit or a 32-bit instruction.
- ISS, bits[24:0]** The Instruction specific syndrome field. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

[ESR_EL1, Exception Syndrome Register \(EL1\) on page D13-3145](#), [ESR_EL2, Exception Syndrome Register \(EL2\) on page D13-3191](#) and [ESR_EL3, Exception Syndrome Register \(EL3\) on page D13-3237](#) describe the registers in full, including:

- Listing the valid EC field values.
- Describing the ISS for each Exception class.

- Giving a full description of the use of the IL field.

Table D1-6 on page D1-2479 shows the encoding of the `ESR_ELx.EC` field, the Exception class field. For each EC value, the table references a subsection of the `ESR_ELx` register definition that describes the ISS format, with links to descriptions of possible causes of the exception, for example the configuration required to enable a trap.

Table D1-6 ESR_ELx.EC field encoding

EC	Exception class	From, state		To, Exception level			ISS encoding description
		AArch32 ^a	AArch64	EL1	EL2	EL3	
000000	Unknown reason	Yes	Yes	Yes	Yes	Yes	<i>ISS encoding for exceptions with an unknown reason on page D13-3150</i>
000001	Trapped WFE, WFI, WFET or WFIT instruction execution ^b	Yes	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from a WF* instruction on page D13-3151</i>
000011	Trapped MCR or MRC access with (coproc==0b1111) ^b that is not reported using EC 0b000000	Yes	No	Yes	Yes	Yes ^c	<i>ISS encoding for an exception from an MCR or MRC access on page D13-3153</i>
000100	Trapped MCRR or MRRC access with (coproc==0b1111) ^b that is not reported using EC 0b000000	Yes	No	Yes	Yes	Yes ^d	<i>ISS encoding for an exception from an MCRR or MRRC access on page D13-3157</i>
000101	Trapped MCR or MRC access with (coproc==0b1110) ^b	Yes	No	Yes	Yes	Yes	<i>ISS encoding for an exception from an MCR or MRC access on page D13-3153</i>
000110	Trapped LDC or STC access ^b	Yes	No	Yes	Yes	Yes	<i>ISS encoding for an exception from an LDC or STC instruction on page D13-3159</i>
000111	Access to SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN or CPTR_ELx.TFP control ^e	Yes	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps on page D13-3162</i>
001000	Trapped VMRS access, from ID group traps, that is not reported using EC 0b000111 ^f	Yes	No	No	Yes	No	<i>ISS encoding for an exception from an MCR or MRC access on page D13-3153</i>
001001	Trapped access to an FEAT_PAuth instruction	No	Yes	No	Yes	Yes	<i>ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 SCR_EL3.API == 0 on page D13-3186</i>
001010	Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction	No	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from an LD64B or ST64B* instruction on page D13-3203</i>
001100	Trapped MRRC access with (coproc==0b1110) ^b	Yes	No	Yes	Yes	Yes	<i>ISS encoding for an exception from an MCRR or MRRC access on page D13-3157</i>

Table D1-6 ESR_ELx.EC field encoding (continued)

EC	Exception class	From, state		To, Exception level			ISS encoding description
		AArch32 ^a	AArch64	EL1	EL2	EL3	
001110	Illegal Execution state	Yes	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault on page D13-3163</i>
010001	SVC instruction execution in AArch32 state	Yes	No	Yes	Yes ^g	No	<i>ISS encoding for an exception from HVC or SVC instruction execution on page D13-3164</i>
010010	HVC instruction execution in AArch32 state, when HVC is not disabled	Yes	No	No	Yes	No	
010011	SMC instruction execution in AArch32 state, when SMC is not disabled	Yes	No	No	Yes ^h	Yes	<i>ISS encoding for an exception from SMC instruction execution in AArch32 state on page D13-3164</i>
010101	SVC instruction execution in AArch64 state	No	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from HVC or SVC instruction execution on page D13-3164</i>
010110	HVC instruction execution in AArch64 state, when HVC is not disabled	No	Yes	No	Yes	Yes	
010111	SMC instruction execution in AArch64 state, when SMC is not disabled	No	Yes	No	Yes ^h	Yes	<i>ISS encoding for an exception from SMC instruction execution in AArch64 state on page D13-3166</i>
011000	Trapped MSR, MRS, or System instruction execution, that is not reported using EC 0x00, 0x01, or 0x07 When FEAT_IDST is implemented, trapped ID registers	No	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state on page D13-3166</i>
011001	Trapped access to SVE functionality, that is not reported using EC 0b000000 ⁱ	No	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps on page D13-3162</i>
011010	Trapped ERET, ERETAA or ERETAB instruction execution ^j	No	Yes	No	Yes	No	<i>ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction on page D13-3185</i>
011100	Exception from a pointer authentication instruction authentication failure	No	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from a Pointer Authentication instruction authentication failure on page D13-3187</i>

Table D1-6 **ESR_ELx.EC** field encoding (continued)

EC	Exception class	From, state		To, Exception level			ISS encoding description
		AArch32 ^a	AArch64	EL1	EL2	EL3	
011111	IMPLEMENTATION DEFINED exception taken to EL3	Yes	Yes	No	No	Yes	<i>ISS encoding for an IMPLEMENTATION DEFINED exception to EL3 on page D13-3169</i>
100000	Instruction Abort from a lower Exception level ^k	Yes	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from an Instruction Abort on page D13-3170</i>
100001	Instruction Abort taken without a change in Exception level ^k	Yes	Yes	Yes	Yes	Yes	
100010	PC alignment fault	Yes	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault on page D13-3163</i>
100100	Data Abort from a lower Exception level, excluding Data Aborts taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support ^l	Yes	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from a Data Abort on page D13-3264</i>
100101	Data Abort taken without a change in Exception level, or Data Aborts taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support ^l	Yes	Yes	Yes	Yes	Yes	
100110	SP alignment fault	No	Yes	Yes	Yes	Yes	<i>ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault on page D13-3163</i>
101000	Trapped floating-point exception taken from AArch32 state	Yes	No	Yes	Yes	No	<i>ISS encoding for an exception from a trapped floating-point exception on page D13-3179</i>
101100	Trapped floating-point exception taken from AArch64 state	No	Yes	Yes	Yes	Yes

110001	Breakpoint exception taken without a change in Exception level	Yes	Yes	Yes	Yes ^m	No	

Table D1-6 ESR_ELx.EC field encoding (continued)

EC	Exception class	From, state		To, Exception level			ISS encoding description
		AArch32 ^a	AArch64	EL1	EL2	EL3	
110010	Software Step exception from a lower Exception level	Yes	Yes	Yes	Yes ^m	No	<i>ISS encoding for an exception from a Software Step exception on page D13-3183</i>
110011	Software Step exception taken without a change in Exception level	Yes	Yes	Yes	Yes ^m	No	
110100	Watchpoint exception from a lower Exception level, excluding watchpoint exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support	Yes	Yes	Yes	Yes ^m	No	<i>ISS encoding for an exception from a Watchpoint exception on page D13-3184</i>
110101	Watchpoint exception taken without a change in Exception level, or Watchpoint exceptions taken to EL2 as a result of accesses generated associated with the VNCR_EL2 as part of nested virtualization support	Yes	Yes	Yes	Yes ^m	No	
111000	BKPT instruction execution in AArch32 state	Yes	No	Yes	Yes ^m	No	<i>ISS encoding for an exception from a Breakpoint or Vector Catch debug exception on page D13-3183</i>
111010	Vector Catch exception from AArch32 state	Yes	No	No	Yes ^m	No	
111100	BRK instruction execution in AArch64 state	No	Yes	Yes	Yes ^m	Yes ⁿ	

- a. See also [Reporting AArch32 synchronous exceptions taken to an Exception level using AArch64](#) on page D1-2483.
- b. Exceptions caused by configurable traps, enables, or disables.
- c. See [Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32](#) on page D1-2530.
- d. Only for MCRR or MRRC accesses to the [PMCCNTR_EL0](#) or [PMCCNTR](#).
- e. Excludes exceptions that are generated because the value of [HCR_EL2.TGE](#) is 1, see [The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1](#) on page D1-2483.
- f. Applies only to traps of accesses to [MVFR0](#), [MVFR1](#), [MVFR2](#), or [FPSID](#). Includes traps of VMRS accesses. Because the [MVFRn](#) registers are read-only and a VMSR access to the [FPSID](#) is ignored and not trapped, there are no MCR or VMSR accesses that can be trapped with this EC value.
- g. Only as a result of [HCR_EL2.TGE](#).
- h. Only as a result of [HCR_EL2.TSC](#).
- i. Only if [The Scalable Vector Extension \(SVE\)](#) is implemented. Otherwise the EC value is reserved.
- j. Only if [FEAT_NV](#) is implemented and [HCR_EL2.NV](#) is 1.
- k. Used for MMU faults generated by instruction accesses, and for synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.
- l. Used for MMU faults generated by data accesses, Alignment faults other than SP alignment faults and PC alignment faults, and for synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.
- m. Only as a result of [HCR_EL2.TGE](#) == 1 or [MDCR_EL2.TDE](#) == 1.
- n. Only if the BRK instruction is executed in EL3. This is the only debug exception that can be taken to EL3 when EL3 is using AArch64.

Reserved EC values

For EC values not shown in [Table D1-6 on page D1-2479](#):

- Unused EC values in the range 0b000000-0b101100 (0x00-0x2C) are reserved by Arm for future use for synchronous exceptions.
- Unused EC values in the range 0b101101-0b111111 (0x2D-0x3F) are reserved by Arm for future use, and might be used for synchronous or asynchronous exceptions.

The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1

When an exception is taken from EL0 to EL2 because the value of [HCR_EL2.TGE](#) is 1, the exception is reported in [ESR_EL2](#). The EC value and corresponding ISS encoding used to report the exception in [ESR_EL2](#) depend on how an exception of the same class would be reported in [ESR_EL1](#) when the value of [HCR_EL2.{TGE, RW}](#) is {0, 1}:

- If the exception would have been reported in [ESR_EL1](#) using the EC value 0x07 then it is reported in [ESR_EL2](#) using the EC value 0x00 and corresponding ISS encoding.
- Otherwise, the exception is reported in [ESR_EL2](#) using the EC value and ISS encoding that would have been used to report the exception [ESR_EL1](#).

Reporting AArch32 synchronous exceptions taken to an Exception level using AArch64

Although possible exception causes are generally similar for AArch32 state and AArch64 state, AArch32 state has additional exception taxonomy that is not present in AArch64 state. The following sections described named AArch32 exceptions that can, in some contexts, be taken to an Exception level that is using AArch64:

- [Undefined Instruction exception on page G1-6078](#).
- [Supervisor Call \(SVC\) exception on page G1-6082](#).
- [Secure Monitor Call \(SMC\) exception on page G1-6083](#).
- [Hypervisor Call \(HVC\) exception on page G1-6084](#).
- [Prefetch Abort exception on page G1-6085](#).
- [Data Abort exception on page G1-6089](#).

When EL2 is using AArch64 and the value of [HCR_EL2.TGE](#) is 1, these exceptions are routed to EL2, and reported in the [ESR_EL2](#). [Table D1-7 on page D1-2483](#) shows how they are reported.

Table D1-7 Syndrome reporting in [ESR_EL2](#) of [HCR_EL2](#) routing of exceptions

AArch32 exception	Pseudocode	EC value used to report exception in ESR_ELx
Undefined Instruction	AArch32.UndefinedFault()	0x00, Exception for an unknown reason
Supervisor Call	AArch32.CallSupervisor()	0x11, Exception from SVC instruction executed in AArch32 state
Secure Monitor Call	See SMC on page F5-5022 ^a	0x13, Exception from SMC instruction executed in AArch32 state
Hypervisor Call	AArch32.CallHypervisor()	0x12, Exception from HVC instruction executed in AArch32 state
Prefetch Abort	AArch32.Abort()	0x20, Exception from an Instruction abort at a lower Exception level
Data Abort	AArch32.Abort()	0x24, Exception from a Data abort at a lower Exception level

a. The pseudocode in [Operation for all encodings on page F5-5023](#) identifies when the execution of an SMC instruction in AArch32 state generates an exception that is taken to EL3 using AArch64.

D1.10.5 Summary of register updates on faults taken to an Exception level that is using AArch64

For all exceptions taken to an Exception level using AArch64 that are not listed in [Validity of FAR_ELx on page D1-2484](#), the [FAR_ELx](#) for the Exception level the exception is taken to is UNKNOWN.

For all exceptions taken to EL2 using AArch64 that are not listed in [Validity of HPFAR_EL2 on page D1-2484](#), the [HPFAR_EL2](#) is UNKNOWN.

The following sections give more information:

- [Validity of FAR_ELx on page D1-2484](#).
- [Validity of HPFAR_EL2 on page D1-2484](#).

Validity of FAR_ELx

The faulting virtual address is saved in [FAR_ELx](#) for the Exception level the exception is taken to if an exception is one of:

- An Instruction Abort exception.
- A Data Abort exception.
- A PC alignment fault exception.
- A Watchpoint exception.

The architecture permits that the [FAR_ELx](#) is UNKNOWN for synchronous External aborts other than synchronous External aborts on translation table walks. In this case, the ISS.FnV bit returned in [ESR_ELx](#) indicates whether [FAR_ELx](#) is valid.

If an exception is taken from an Exception level using AArch32 into an Exception level using AArch64, and that exception writes the [FAR_ELx](#) at the Exception level the exception is taken to, the most significant 32 bits of [FAR_ELx](#) are all zero, unless both of the following apply, in which case the most significant 32 bits of [FAR_ELx](#) are 0x00000001:

- The faulting address was generated by a load or store that sequentially incremented from address 0xFFFFFFFF. Such a load or store instruction is CONSTRAINED UNPREDICTABLE, see [Out of range VA on page K1-8396](#).
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

The [FAR_ELx](#) for an Exception level is made UNKNOWN as a result of an exception return from that Exception level.

Validity of HPFAR_EL2

The faulting IPA is saved in [HPFAR_EL2](#) if the exception is an Instruction Abort or Data Abort taken to EL2 and the fault is one of:

- A Translation or Access Flag fault on a stage 2 translation.
- A stage 2 Address Size fault.
- A fault on the stage 2 translation of an address accessed in a stage 1 translation table walk.

[HPFAR_EL2](#) is made UNKNOWN as a result of an exception return from EL2.

D1.11 Exception return

In the Armv8-A architecture, an exception return is always to the same Exception level or a lower Exception level. An exception return is used for:

- A return to a previously executing thread.
- Entry to a new execution thread. For example:
 - The initialization of a hypervisor by a Secure monitor.
 - The initialization of an operating system by a hypervisor.
 - Application entry from an operating system or hypervisor.

If [FEAT_ExS](#) is not implemented, or if [FEAT_ExS](#) is implemented and the [SCTLR_ELx.EOS](#) field is set, exception return from ELx is a context synchronization event.

An exception return requires the simultaneous restoration of the PC and [PSTATE](#) to values that are consistent with the desired state of execution on returning from the exception. The indirect write of the [PSTATE](#) information and the PC is synchronized even if the return is not a context synchronization event.

In AArch64 state, an [ERET](#), [ERETAA](#), or [ERETAB](#) instruction causes an exception return, see [ERET on page C6-1026](#), and [ERETAA, ERETAB on page C6-1027](#).

If [FEAT_IESB](#) is implemented, when the [SCTLR_ELx.IESB](#) bit at the Exception level that the exception is returning from is 1 and the exception return instruction does not generate an exception, the PE inserts an error synchronization event before the Exception return instruction. See *Arm® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

On executing an Exception return instruction at ELx:

- The PC is restored with the value held in [ELR_ELx](#).
- [PSTATE](#) is restored by using the contents of [SPSR_ELx](#).

[ELR_ELx](#) and [SPSR_ELx](#) are the [ELR_ELx](#) and [SPSR_ELx](#) at the Exception level the exception is returning from. The exception return makes this [ELR_ELx](#) and [SPSR_ELx](#) UNKNOWN.

See [Address tagging in AArch64 state on page D5-2676](#) for details of how tagged addresses are handled in an Exception return from an Exception level using AArch64 to an Exception level using AArch64.

———— Note —————

When returning from an Exception level using AArch64 to an Exception level using AArch32, the top 32 bits of the [ELR_ELx](#) are ignored.

An Exception return instruction also:

- Sets the Event Register for the PE executing the Exception return instruction. See [Mechanisms for entering a low-power state on page D1-2536](#).
- Resets the local Exclusives monitor for the PE executing the Exception return instruction. This removes the risk of errors that might be caused when a path to an exception return fails to include a [CLREX](#) instruction.

———— Note —————

This behavior prevents self-hosted debug from software stepping through a Load-Exclusive/Store-Exclusive pair. However, when self-hosted debug is using software step, it is highly probable that the Exclusives monitor state would be lost anyway, for other reasons. [Stepping code that uses Exclusives monitors on page D2-2624](#) describes this.

It is IMPLEMENTATION DEFINED whether the resetting of the local Exclusives monitor also resets the global Exclusives monitor.

The Exception return instruction is UNDEFINED in EL0.

When returning from an Exception level using AArch64 to an Exception level using AArch32, the AArch32 context is restored. The Armv8-A architecture defines the relationship between AArch64 state and AArch32 state, for:

- General-purpose registers.

- Special-purpose registers.
- System registers.

In an implementation that includes EL3, the Security state can only change on returning from an exception if the return is from EL3 to a lower Exception level.

The following sections give more information:

- [Exception return and PC alignment](#) on page D1-2486.
- [Illegal return events from AArch64 state](#) on page D1-2486.
- [Legal returns that set PSTATE.IL to 1](#) on page D1-2488.
- [The Illegal Execution state exception](#) on page D1-2488.
- [Pseudocode description of exception return](#) on page D1-2488.

D1.11.1 Exception return and PC alignment

When $SPSR_ELx.M[4] == 0$, indicating an Exception return to AArch64 state, the value of ELR_ELx is transferred to the PC. If this value is misaligned, subsequent execution results in a PC alignment fault exception.

When $SPSR_ELx.M[4] == 1$, indicating an Exception return to AArch32 state, the value of ELR_ELx is transferred to the PC except that, for a legal exception return:

- If $SPSR_ELx.T$ is 0, $ELR_ELx[1:0]$ are treated as being 0 for restoring the PC.
- If $SPSR_ELx.T$ is 1, $ELR_ELx[0]$ is treated as being 0 for restoring the PC.

This means that a PC alignment fault exception cannot occur following a legal exception return from AArch64 state to AArch32 state. However, where the Exception return with $SPSR_ELx.M[4] == 1$ is an illegal exception return then it is IMPLEMENTATION DEFINED whether a misaligned value in ELR_ELx is aligned when it is restored to the PC.

———— Note ————

In an implementation that forces the alignment of the PC value restored from $SPSR_ELx$ on an illegal exception return with $SPSR_ELx.M[4] == 1$, if $SPSR_ELx.T == 1$ the restored PC value might give rise to a PC alignment fault exception, because the PE remains in AArch64 state and only $ELR_ELx[0]$ is treated as being 0 for restoring the PC.

For more information about the illegal exception return cases, see [Illegal return events from AArch64 state](#) on page D1-2486.

D1.11.2 Illegal return events from AArch64 state

In this section:

Return In AArch64 state, refers to any of:

- Execution of an Exception return instruction.
- Execution of a DRPS instruction in Debug state.
- Exit from Debug state.

Saved process state value In AArch64 state, refers to any of:

- The value held in the $SPSR_ELx$ for an Exception return instruction.
- The value held in the $SPSR_ELx$ for a DRPS instruction executed in Debug state.
- The value held in the $DSPSR_EL0$ for a Debug state exit.

Link address In AArch64 state, refers to any of:

- The address held in ELR_ELx for an Exception return instruction.
- The address held in DLR_EL0 for a Debug state exit.

Configured from reset Indicates the state determined on powerup or reset by a configuration input signal, or by another IMPLEMENTATION DEFINED mechanism.

The Armv8 architecture has a generic mechanism for handling returns to a mode or state that is illegal. In AArch64 state, this can occur as the result of any of the following situations:

- A return where the Exception level being returned to is higher than the current Exception level.
- A return where the Exception level being returned to is not implemented. For example a return to EL2 when EL2 is not implemented.
- If [FEAT_SEL2](#) is not implemented and the value of [SCR_EL3.EEL2](#) is 0, a return to EL2 when EL3 is implemented and the value of the [SCR_EL3.NS](#) bit is 0.
- A return to EL1 when EL2 is implemented and enabled in the current Security state, and the value of the [HCR_EL2.TGE](#) bit is 1.
- A return where the value of the saved process state M[4] bit is 0, indicating a return to AArch64 state, and one of the following is true:
 - The M[1] bit is 1.
 - The M[3:0] bits are 0b0001.
 - The Exception level being returned to is using AArch32 state, as programmed by the [SCR_EL3.RW](#) or [HCR_EL2.RW](#) bits, or as configured from reset.
- A return where the value of the saved process state M[4] bit is 1, indicating a return to AArch32 state, and one of the following is true:
 - The M field value is not a valid AArch32 state PE mode. [Table G1-5 on page G1-6026](#) shows the valid encoding values for AArch32 state PE modes. This includes the case where M is 0b10000, indicating User mode, and EL0 does not support AArch32 state.
 - The Exception level being returned to is using AArch64 state as determined by the [SCR_EL3.RW](#) or [HCR_EL2.RW](#) field or the configuration from reset. This includes the case where the Exception level being returned to does not support AArch32 state.

———— **Note** —————

This means that, in an implementation that supports only AArch64 state, any attempt to return to AArch32 state is an illegal exception return.

- A Debug state exit from EL0 using AArch64 state, to EL0 using AArch32 state.

In these cases:

- [PSTATE.IL](#) is set to 1, to indicate an illegal return.
- [PSTATE.{EL, nRW, SP}](#) are unchanged. This means the Exception level, Execution state, and stack pointer selection do not change as a result of the return.
- The following [PSTATE](#) bits are restored from the saved process state value:
 - The N, Z, C, V Condition flags.
 - The D, A, I, F exception mask bits.
- If the illegal return is an illegal exception return, the [PSTATE.SS](#) bit is handled as normal for a return. That is, the SS bit is handled in the same way as an exception return that is not an illegal exception return. See [Software Step exceptions on page D2-2613](#).
In all these cases the [PSTATE.SS](#) bit is handled as it would be for a normal return, as described in [Entering the active-not-pending state on page D2-2615](#) and [Exiting Debug state on page H2-7375](#). DRPS never sets the SS bit. This is indicated in [Entering the active-not-pending state on page D2-2615](#).
- If the illegal return is not a DRPS instruction executed in Debug state, the PC is restored from the link address. However, if the value of the M[4] bit of the saved process state is 1, indicating a return to AArch32 state, then:
 - Bits[31:2] of the PC are restored from the link address.
 - Bits[63:32, 1:0] of the PC are UNKNOWN.

When the value of the `PSTATE.IL` bit is 1, any attempt to execute any instruction results in an Illegal Execution state exception. See [The Illegal Execution state exception on page D1-2488](#).

All aspects of the illegal return, other than the effects described in this section, occur as they do for a legal return.

D1.11.3 Legal returns that set `PSTATE.IL` to 1

In this section, *return*, *saved process state value*, and *link address* have the same meaning as defined in [Illegal return events from AArch64 state on page D1-2486](#).

If the value of the `IL` bit in the saved process state is 1, then it is copied to `PSTATE` by a return, meaning that `PSTATE.IL` is set to 1. In this case, if the return is not an illegal return, and targets AArch32 state, then the `PSTATE.{IT, T}` bits are either:

- Set to 0.
- Copied from the saved process state value.

The choice between these two options is determined by an implementation, and might vary dynamically within the implementation. Correspondingly software must regard the value as being an UNKNOWN choice between the two values.

The `PSTATE.{IT, T}` bits are only valid in AArch32 state, see [Process state, `PSTATE` on page G1-6035](#).

When the `PSTATE.IL` bit is 1, any attempt to execute any instruction results in an Illegal Execution state exception. See [The Illegal Execution state exception on page D1-2488](#).

D1.11.4 The Illegal Execution state exception

When the value of the `PSTATE.IL` bit is 1, any attempt to execute any instruction results in an Illegal Execution state exception. In AArch64 state, the `PSTATE.IL` bit can be set to 1 by any of:

- An illegal return, as described in [Illegal return events from AArch64 state on page D1-2486](#).
- A legal return that sets `PSTATE.IL` to 1, as described in [Legal returns that set `PSTATE.IL` to 1 on page D1-2488](#).

If an Illegal Execution state exception is generated at EL0, it is taken to EL1. If the exception occurs when EL2 is implemented and enabled in the current Security state, and `HCR_EL2.TGE == 1`, then it is taken to EL2. If an Illegal Execution state exception is generated at any other Exception level, the Exception level is unchanged.

An Illegal Execution state exception sets `ESR_ELx.EC` for the target Exception level to the value of `0x0E`.

On taking any exception to an Exception level that is using AArch64 state:

1. The value of the `PSTATE.IL` bit is copied into the `SPSR_ELx.IL` bit for the Exception level to which the exception is taken.
2. The `PSTATE.IL` bit is cleared to 0.

———— **Note** —————

This means that it is not possible for software to observe the value of `PSTATE.IL`.

For the priority of this exception class, see [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2490](#).

D1.11.5 Pseudocode description of exception return

The `AArch64.ExceptionReturn()` pseudocode function transfers the return address to the PC, and restores `PSTATE` to its saved value by calling `SetPSTATEFromPSR()`.

The `IllegalExceptionReturn()` function checks for an Illegal Execution state exception.

D1.12 Synchronous exception types, routing and priorities

Synchronous exceptions are:

- Any exception generated by attempting to execute an instruction that is UNDEFINED, including:
 - Attempts to execute instructions at an inappropriate Exception level.
 - Attempts to execute instructions when they are disabled.
 - Attempts to execute instruction bit patterns that have not been allocated.
- Illegal Execution state exceptions. These are caused by attempts to execute an instruction when the value of `PSTATE.IL` is 1, see *Illegal return events from AArch64 state on page D1-2486*.
- Exceptions caused by the use of a misaligned SP.
- Exceptions caused by attempting to execute an instruction with a misaligned PC.
- Exceptions caused by the exception-generating instructions SVC, HVC, or SMC.
- Traps on attempts to execute instructions that the System registers define as instructions that are trapped to a higher Exception level. See *Configurable instruction enables and disables, and trap controls on page D1-2510*.
- Instruction Aborts generated by the memory address translation system that are associated with attempts to execute instructions from areas of memory that generate faults.
- Data Aborts generated by the memory address translation system that are associated with attempts to read or write memory that generate faults.
- Data Aborts caused by a misaligned address.
- Data Aborts caused by a Tag Check Fault if `FEAT_MTE2` is implemented. For more information, see *Chapter D6 Memory Tagging Extension*.
- All of the debug exceptions:
 - Breakpoint Instruction exceptions.
 - Breakpoint exceptions.
 - Watchpoint exceptions.
 - Vector Catch exceptions.
 - Software Step exceptions.
- In an implementation that supports the trapping of floating-point exceptions, exceptions caused by trapped IEEE floating-point exceptions, see *Floating-point exceptions and exception traps on page D1-2495*.
- In some implementations, External aborts. External aborts are failed memory accesses, and include accesses to those parts of the memory system that occur during the address translation. The Armv8 architecture permits, but does not require, implementations to treat such exceptions synchronously. See *External aborts on page D4-2666*.

This remainder of this section contains the following:

- *Routing exceptions from EL0 to EL2 on page D1-2489*.
- *Routing debug exceptions to EL2 on page D1-2490*.
- *Routing synchronous External aborts on page D1-2490*
- *Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2490*.
- *Effect of Data Aborts and watchpoints on page D1-2494*.
- *Floating-point exceptions and exception traps on page D1-2495*.

D1.12.1 Routing exceptions from EL0 to EL2

When EL2 is enabled in the current Security state and the value of `HCR_EL2.TGE` is 1, any exception taken from EL0 that would otherwise be taken to EL1 is, instead, routed to EL2. This means that an application can execute at EL0 without using any functionality at EL1.

Note

- When EL2 is using AArch64 state, the [HCR_EL2.TGE](#) control applies regardless of whether EL0 is using AArch32 state or AArch64 state.
 - Implementations typically use the following Exception level and software hierarchy:
 - EL2** Hypervisor.
 - EL1** Operating system.
 - EL0** Application.In such an implementation, setting [HCR_EL2.TGE](#) to 1 means that an application can run at EL0 under the direct control of a hypervisor executing at EL2, with no operating system involvement.
-

D1.12.2 Routing debug exceptions to EL2

When EL2 is enabled in the current Security state and the value of [MDCR_EL2.TDE](#) is 1, debug exceptions are routed to EL2. For more information, see [Routing debug exceptions on page D2-2569](#).

When the value of [MDCR_EL2.TDE](#) is 1, each of the [MDCR_EL2](#).{TDRA, TDOSA, TDA} bits is treated as 1 for all purposes other than direct reads of the [MDCR_EL2](#).

D1.12.3 Routing synchronous External aborts

When the value of [SCR_EL3.EA](#) is 1, synchronous External aborts are taken to EL3.

When the RAS Extension is implemented, EL2 is enabled in the current Security state, and the value of [HCR_EL2.TEA](#) is 1, synchronous External aborts from EL0 and EL1 that are not routed to EL3 are routed to EL2.

D1.12.4 Synchronous exception prioritization for exceptions taken to AArch64 state

In principle, any single instruction can generate a number of different synchronous exceptions, between the fetching of the instruction, its decode, and eventual execution. For exceptions taken to an Exception level that is using AArch64, these are prioritized as follows, where 1 is the highest priority.

Note

The priority numbering in this list correlates with the equivalent AArch32 state list in [Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-6047](#) and the list in [Debug state entry and debug event prioritization on page H2-7341](#).

- 1-3** These priority numbers represent debug events.
- 4** Software Step exceptions. See [Software Step exceptions on page D2-2613](#).
- 5** This priority number represents debug events.
- 6** PC alignment fault exceptions. See [PC alignment checking on page D1-2469](#).
- 7** Instruction Abort exceptions. See [AArch64 state prioritization of synchronous aborts from a single stage of address translation on page D5-2807](#).
- 8** Breakpoint exceptions or Address Matching Vector Catch exceptions. See:
 - [Breakpoint exceptions on page D2-2579](#).
 - [Vector Catch exceptions on page D2-2612](#).Vector Catch exceptions are only taken from AArch32 state.

———— **Note** —————

An Exception Trapping Vector Catch exception is generated on exception entry for an exception that has been prioritized as described in *Synchronous exception prioritization for exceptions taken to AArch32 state on page G1-6047*. This means that it is outside the scope of the description of this section.

9 Illegal Execution state exceptions. See *Illegal return events from AArch64 state on page D1-2486*.

10 Software Breakpoint exceptions caused by the execution of a Breakpoint instruction:

- For exceptions taken from AArch64 state, BRK.
- For exceptions taken from AArch32 state, BKPT.

11 Branch Target exceptions. See *About PSTATE.BTYPE on page D5-2756*.

12 Exceptions taken from EL1 to EL2 because of one of the following configuration settings:

- [HSTR_EL2.Tn](#).
- [HCR_EL2.TIDCP](#).
- If [FEAT_NV](#) is implemented, [HCR_EL2.NV](#) or [HCR_EL2.NV1](#).

———— **Note** —————

If [FEAT_NV2](#) is implemented and [HCR_EL2](#).{NV, NV1, NV2} are set such that register accesses to EL1 are transformed into memory accesses, then [HCR_EL2](#).{NV, NV1} do not generate exceptions to EL2.

13 Exceptions that occur as a result of attempting to execute an instruction that is UNDEFINED for one or more of the following reasons:

- Attempting to execute an unallocated instruction encoding, including an encoding for an instruction that is not implemented in the PE implementation.
- Attempting to execute an instruction that is defined never to be accessible at the current Exception level and Security state regardless of any enables or traps.
- Debug state execution of an instruction encoding that is not accessible in Debug state.
- Non-debug state execution of an instruction encoding that is not accessible in Non-debug state.
- Execution of an HVC instruction, when HVC instructions are disabled by [SCR_EL3.HCE](#) or [HCR_EL2.HCD](#).
- Execution of an MSR or MRS instruction to [SP_EL0](#) when the value of [SPSel](#) is 0.
- Attempted execution of an MSR or MRS instruction using an [_EL12](#) register name when [HCR_EL2.E2H](#) == 0.
- Execution of an HLT instruction when HLT instructions are disabled by [EDSCR.HDE](#) or halting is prohibited.
- In Debug state:
 - Execution of a DCPS1 instruction in Non-secure EL0 when [HCR_EL2.TGE](#) is 1.
 - Execution of a DCPS2 instruction in EL1 or EL0 when EL2 is disabled in the current Security state or is not implemented.
 - Execution of a DCPS3 instruction when [EDSCR.SDD](#) is 1 or when EL3 is not implemented.
 - When the value of [EDSCR.SDD](#) is 1, execution in EL2, EL1, or EL0 of an instruction that is configured by EL3 control registers to trap to EL3. It is IMPLEMENTATION DEFINED whether this type of exception is prioritized at this level or has the priority of the original trap exception.

- When executing in AArch32 state, execution of an instruction that is UNDEFINED as a result of any of:
 - Being in an IT block when `SCTLR_EL1.ITD` is 1.
 - Executing a SETEND instruction executed when `SCTLR_EL1.SED` is 1.
 - Executing a `CP15DMB`, `CP15DSB`, or `CP15ISB` barrier instruction when `SCTLR_EL1.CP15BEN` is 0.

———— **Note** —————

These are the controls for exceptions taken to AArch64 state. For exceptions taken to AArch32 state the equivalent controls are `SCTLR`.{ITD, SED, CP15BEN}, with additional controls `HSCTLR`.{ITD, SED, CP15BEN}.

See [Disabling or enabling EL0 use of AArch32 optional functionality on page D1-2515](#)

- When executing in AArch32 state, execution of an instruction that is UNDEFINED because at least one of `FPCR`.{Stride, Len} is nonzero, when programming these bits to nonzero values is supported. See [Floating-point exceptions and exception traps on page E1-4268](#).

———— **Note** —————

- This case applies only when EL0 is using AArch32 and EL1 is using AArch64. The exception generated by the attempted execution at EL0 of the UNDEFINED instruction is taken to EL1 using AArch64.
- When EL1 is using AArch32, the corresponding controls are `FPSCR`.{Stride, Len}, and any exception generated by the attempted execution at EL0 or EL1 of an instruction that is UNDEFINED because of a nonzero {Stride, Len} value is taken to EL1 using AArch32.

- 14 Exceptions taken to EL1, or taken to EL2 because the value of `HCR_EL2.TGE` is 1, that are generated because of configurable access to instructions, and that are not covered by any of priorities 4-13.

———— **Note** —————

When EL2 is using AArch32, the equivalent control for routing exceptions to EL2 is `HCR.TGE`.

- 15 Exceptions taken from EL0 to EL2 because of one of the following configuration settings:

- `HSTR_EL2.Tn`.
- `HCR_EL2.TIDCP`.

———— **Note** —————

These are the controls for exceptions taken to AArch64 state. For exceptions taken to AArch32 state the equivalent controls are `HSTR.Tn` and `HCR.TIDCP`.

- 16 Exceptions taken to EL2 because of configuration settings in `CPTR_EL2`.

———— **Note** —————

These are the controls for exceptions taken to AArch64 state. For exceptions taken to AArch32 state, the equivalent controls are in `HCPTR`.

- 17 Exceptions taken to EL2 because of one of the following configuration settings:

- Any setting in `HCR_EL2` other than the {TIDCP, NV} fields, and MRS/MSR instruction using an `_EL12` register name with `HCR_EL2.E2H == 0`.
- Any setting in `CNTHCTL_EL2`.
- Any setting in `MDCR_EL2`.
- Any of the fine-grained traps in `HAFGRTR_EL2`, `HDFGRTR_EL2`, `HDFGWTR_EL2`, `HFGITR_EL2`, `HFGRTR_EL2`, `HFGWTR_EL2`.

———— **Note** —————

These are the controls for exceptions taken to AArch64 state. For exceptions taken to AArch32 state, equivalent controls are:

- Settings in [HCR](#), other than the TIDCP bit.
For exceptions taken to AArch32 state there is no control equivalent to [HCR_EL2.NV](#).
- Any setting in [CNTHCTL](#) or [HDCR](#).
- If EL1 is using AArch64 state, any of the fine-grained traps in [HAFGRTR_EL2](#), [HDFGRTR_EL2](#), [HDFGWTR_EL2](#), [HFGITR_EL2](#), [HFGRTR_EL2](#), [HFGWTR_EL2](#).

-
- 18 Exceptions taken to EL2 because of configurable access to instructions, and that are not covered by any of priorities 4-17.
- 19 Exceptions caused by the SMC instruction being UNDEFINED because the value of [SCR_EL3.SMD](#) is 1.
- 20 Exceptions caused by the execution of an Exception generating instruction not covered by priority 10:
- For exceptions taken from AArch64 state, [Branches, Exception generating, and System instructions on page C3-216](#) defines these and the priority 10 instructions.
 - When executing in AArch32 state, the exception-generating instructions are SVC, HVC, and SMC.
- 21 Exceptions taken to EL3 because of configuration settings in the [CPTR_EL3](#).

———— **Note** —————

When in Debug state and the value of [EDSCR.SDD](#) is 1, instructions executed at EL2, EL1 or EL0 that are configured by EL3 control registers to trap to EL3 are treated as UNDEFINED and generate an exception taken to EL2 or EL1. It is IMPLEMENTATION DEFINED whether these exceptions are prioritized as an UNDEFINED instruction or have the priority of the original trap exception.

-
- 22 Exceptions taken to EL3 from Secure EL1 using AArch32, because of execution of the instructions listed in [Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-2530](#).
- 23 Exceptions taken to EL3 from EL0, EL1, or EL2 because of configuration settings in the [MDCR_EL3](#).

———— **Note** —————

When in Debug state and the value of [EDSCR.SDD](#) is 1, instructions executed at EL2, EL1 or EL0 that are configured by EL3 control registers to trap to EL3 are treated as UNDEFINED and generate an exception taken to EL2 or EL1. It is IMPLEMENTATION DEFINED whether these exceptions are prioritized as an UNDEFINED instruction or have the priority of the original trap exception.

-
- 24 Exceptions taken to EL3 because of configurable access to instructions, and that are not covered by any of priorities 4-23.

———— **Note** —————

When in Debug state and the value of [EDSCR.SDD](#) is 1, instructions executed at EL2, EL1 or EL0 that are configured by EL3 control registers to trap to EL3 are treated as UNDEFINED and generate an exception taken to EL2 or EL1. It is IMPLEMENTATION DEFINED whether these exceptions are prioritized as an UNDEFINED instruction or have the priority of the original trap exception.

-
- 25 If [FEAT_FPAC](#) is implemented, exceptions generated from a pointer authentication instruction authorization failure. See [Faulting on pointer authentication on page D5-2681](#).
- 26 Trapped floating-point exceptions, if supported. See [Floating-point exceptions and exception traps on page D1-2495](#).

- 27 This priority number represents debug events.
- 28 SP alignment faults. See [SP alignment checking on page D1-2469](#).
- 29 Data Abort exceptions other than a Data Abort exception generated by a synchronous External abort that was not generated by a translation table walk or the update of a translation table entry. That is, any Data Abort exception that is not covered by item 31. See [AArch64 state prioritization of synchronous aborts from a single stage of address translation on page D5-2807](#). It is IMPLEMENTATION DEFINED whether synchronous External aborts are prioritized here or as item 31.
- 30 Watchpoint exceptions. See [Watchpoint exceptions on page D2-2598](#).
- 31 Data Abort exception:
 - Generated by a synchronous External abort that was not generated by a translation table walk or the update of a translation table entry, see [External aborts on page D4-2666](#).
 - Generated by a Tag Check Fault if FEAT_MTE2 is implemented. For more information, see [PE handling of Tag Check Fault on page D6-2846](#).
 - It is IMPLEMENTATION DEFINED whether synchronous External aborts are prioritized here or as item 29.

For items 29-31, if an instruction results in more than one single-copy atomic memory access, the prioritization between synchronous exceptions generated on each of those different memory accesses is not defined by the architecture.

———— **Note** —————

Exceptions generated by a translation table walk are reported and prioritized as either an Instruction Abort exception, priority 7 in this list, or a Data Abort exception, priority 29 in this list. See also [AArch64 state prioritization of synchronous aborts from a single stage of address translation on page D5-2807](#).

D1.12.5 Effect of Data Aborts and watchpoints

If an instruction that stores to memory generates a Data Abort or watchpoint, the value of each memory location that instruction stores to is either:

- Unchanged for any location for which one of the following applies:
 - An Alignment fault is generated.
 - An MMU fault is generated.
 - A Watchpoint exception or Watchpoint debug event is generated.
 - An External abort is generated, if that External abort is taken synchronously.

———— **Note** —————

If an External abort is taken asynchronously, using the SError interrupt, it is outside the scope of the architecture to define the effect of the store on the memory location, because it depends on the system-specific nature of the External abort. However, in general, Arm recommends that such memory locations are not updated.

- UNKNOWN for any location for which no exception and no debug event is generated.

For External aborts and Watchpoint exceptions, the size of a memory location is defined as being the size for which a memory access is single-copy atomic.

———— **Note** —————

For the definition of a single-copy atomic access, see [Properties of single-copy atomic accesses on page B2-130](#).

An External abort might signal a data corruption to the PE. For example a memory location might have been corrupted. The error that caused the External abort might have been propagated. The RAS Extension provides mechanisms for software to determine the extent of the corruption and contain propagation of the error. For more information, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

For Data Aborts from load or store instructions executed in AArch64 state, if the:

Data Abort is taken synchronously

If the load or store instruction specifies writeback of a new base address, the base address is restored to the original value on taking the exception.

If the instruction was a load to the base address register or the offset register, that register is restored to the original value. Any other destination registers become UNKNOWN.

If the instruction was a load that does not load either the base address register or the offset register, then the destination registers become UNKNOWN.

Data Abort is taken asynchronously, using the SError interrupt

If the instruction was a load, the destination registers of the load take an UNKNOWN value if the SError interrupt is taken at a point in the instruction stream after the load.

D1.12.6 Floating-point exceptions and exception traps

Execution of a floating-point instruction, or execution of an Advanced SIMD instruction that performs floating-point operations, can generate an exceptional condition, called a *floating-point exception*.

———— Note ————

In AArch64 state, an Advanced SIMD instruction that operates on floating-point values can perform multiple floating-point operations. Therefore, this section describes the handling of a floating-point exception on an *operation*, rather than on an *instruction*.

The Armv8-A architecture does not support asynchronous reporting of floating-point exceptions.

For each of the following floating-point exceptions, it is IMPLEMENTATION DEFINED whether an implementation includes synchronous exception generation:

- Input Denormal.
- Inexact.
- Underflow.
- Overflow.
- Divide by Zero.
- Invalid Operation.

If an implementation does not support synchronous exception generation from a floating-point exception, then that synchronous exception is never generated and all statements about synchronous exception generation from that floating-point exception do not apply to the implementation.

Synchronous exception generation by floating-point exceptions is enabled using the [FPCR](#) as follows:

- For each floating-point exception that has synchronous exception generation supported, the relevant control bits chosen from [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} are used to enable synchronous exception generation.
- For each floating-point exception that does not have synchronous exception generation supported, the relevant bits chosen from [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} are RAZ/WI.

Input Denormal exceptions

The cumulative floating-point exception bit [FPSR.IDC](#), and the trap enable bit [FPCR.IDE](#) both relate to Input Denormal exceptions.

If an input denormalized number is flushed to zero, the occurrence of the Input Denormal exception is determined using the value before flushing.

If an input denormalized number is flushed to zero, and [FPCR.AH](#) is 0, the occurrence of all floating-point exceptions, except Input Denormal, is determined treating the input value that is flushed to zero as zero.

If an input denormalized number is flushed to zero, and `FPCR.AH` is 1, the occurrence of all floating-point exceptions is determined treating the input value that is flushed to zero as zero.

If `FPCR.AH` is 0, when a single-precision or double-precision floating-point input is flushed to zero, an Input Denormal exception is generated.

If `FPCR.AH` is 1, and `FPCR.FIZ` is 0, if and only if none of the following apply, any operation that unpacks a denormalized floating-point input, other than unpacking a BFloat or half-precision value, generates an Input Denormal exception:

- One of the other operands of the instruction is a NaN.
- The operation generates an Invalid Operation floating-point exception.
- The operation generates a Divide-by-Zero floating-point exception.
- The instruction that generated the operation was one of: `BFCVTN`, `BFCVTN2`, `BFCVT`, and `BFCVTNT`.
- The denormalized floating-point input is flushed to zero.

When a half-precision floating-point value is flushed to zero, an Input Denormal exception is not generated.

If `FPCR.AH` is 1, or `FPCR.FZ` is 0, when `FPCR.FIZ` causes flushing of a denormalized number, an Input Denormal Exception is not generated.

Inexact exceptions

The cumulative floating-point exception bit `FPSR.IXC` and the trap enable bit `FPCR.IXE` both relate to Inexact exceptions.

If a denormalized output is flushed to zero, all of the following apply:

- If `FPCR.AH` is 1, an Inexact exception is generated.
- If `FPCR.AH` is 0, an Inexact exception is not generated.

If a result is not flushed to zero, and the result does not equal the result computed with unbounded exponent range and unbounded precision, then an Inexact exception is generated.

Underflow exceptions

The cumulative floating-point exception bit `FPSR.UFC`, and the trap enable bit `FPCR.UFE` both relate to Underflow exceptions.

If `FPCR.AH` is 1, for all floating points other than `BFMu1()` and `BFAdd()` which are used by `BFDOT` and `BFMLLA`, for the purpose of underflow floating-point exception generation, a denormalized number is detected after rounding with an unbounded exponent.

If `FPCR.AH` is 0, for the purpose of underflow floating-point exception generation, a denormalized number is detected before rounding is applied.

If the result of a floating-point operation is a denormalized number that is not flushed to zero, then:

- If `FPCR.UFE` is 0, and the result is inexact, then the underflow floating-point exception is generated.
- If `FPCR.UFE` is 1, then the underflow floating-point exception is generated.

If the result of a floating-point operation is a denormalized number that is flushed to zero, then the Underflow floating-point exception is not generated.

Overflow exceptions

The cumulative floating-point exception bit `FPSR.OFC`, and the trap enable bit `FPCR.OFE` both relate to Overflow exceptions.

If the output of an instruction rounded with an unbounded exponent is greater than the maximum normalized number for the output precision, an overflow exception is generated.

If an untrapped Overflow exception is generated, the result is determined by the rounding mode and the sign of the result before rounding as follows:

- Round to Nearest carries all overflows to infinity with the sign of the result before rounding.
- Round towards Plus Infinity carries negative overflows to the most negative finite number of the output precision, and carries positive overflows to plus infinity.
- Round towards Minus Infinity carries positive overflows to the largest finite number of the output precision, and carries negative overflows to minus infinity.
- Round towards Zero carries all overflows to the output precision's largest finite number with the sign of the result before rounding.

Divide by Zero exceptions

The cumulative floating-point exception bit [FPSR.DZC](#), and the trap enable bit [FPCR.DZE](#) both relate to Divide by Zero exceptions.

If a floating-point operation divides a finite non-zero number by zero, a Divide by Zero exception is generated.

If a floating-point operation divides a finite non-zero number by zero, and the Divide by Zero exception is untrapped, the result is a correctly signed infinity.

Invalid Operation exceptions

The cumulative floating-point exception bit [FPSR.IOC](#), and the trap enable bit [FPCR.IOE](#) both relate to Invalid Operation exceptions.

For any floating-point instruction that performs a floating-point operation, if any of the following apply, the instruction generates an Invalid Operation exception:

- At least one operand is a signaling NaN.
- Magnitude subtraction of infinities.
- Multiplying a zero by an infinity.
- Dividing a zero by a zero.
- Dividing an infinity by an infinity.
- Square root of an operand that is less than zero.

If the input is one of: a quiet NaN, an infinity, or a number that overflows the values that can be represented in the output format, and if another exception is not generated to signal the condition, then a conversion from floating-point to either integer or fixed-point format, generates an Invalid Operation exception.

For the signaling compare instructions [FCMPE](#) and [FCCMPE](#), if either of the source operands is any type of NaN, the instruction generates an Invalid Operation floating-point exception.

If [FPCR.AH](#) is 1, for [FMAX \(vector\)](#), [FMAX \(scalar\)](#), [FMAXP \(scalar\)](#), [FMAXP \(vector\)](#), [FMAXV](#), [FMIN \(vector\)](#), [FMIN \(scalar\)](#), [FMINP \(scalar\)](#), [FMINP \(vector\)](#), and [FMINV](#), if either input is any type of NaN, then an Invalid Operation floating-point exception is generated.

Operations that do not generate floating point exceptions

[BFDOT \(by element\)](#), [BFDOT \(vector\)](#), and [BFMMLA](#) do not generate floating-point exceptions.

If [FPCR.AH](#) is 1, all of the following instructions do not generate any floating-point exceptions regardless of their input values:

- BF16 instructions [BFMLALB](#), [BFMLALT \(by element\)](#), [BFMLALB](#), [BFMLALT \(vector\)](#), [BFCVT](#), [BFCVTN](#), [BFCVTN2](#), and [BFCVTNT](#).
- Single-precision, double-precision and half-precision instructions [FRECPE](#), [FRECPS](#), [FRECPSX](#), [FRSQRT](#), and [FRSQRTS](#).

- Floating-point to integer and floating-point rounding instructions: FCVTMS (scalar), FCVTMS (vector), FCVTMU (scalar), FCVTMU (vector), FCVTNS (scalar), FCVTNS (vector), FCVTNU (scalar), FCVTNU (vector), FCVTPS (scalar), FCVTPS (vector), FCVTPU (scalar), FCVTPU (vector), FCVTZS (scalar, fixed-point), FCVTZS (scalar, integer), FCVTZS (vector, fixed-point), FCVTZS (vector, integer), FCVTZU (scalar, fixed-point), FCVTZU (scalar, integer), FCVTZU (vector, fixed-point), FCVTAS (scalar), FCVTAS (vector), FCVTAU (scalar), FCVTAU (vector), FCVTZS (scalar, fixed-point), FCVTZS (scalar, integer), FCVTZS (vector, fixed-point), FCVTZS (vector, integer), FRINTA (scalar), FRINTA (vector), FRINTZ (scalar), FRINTZ (vector), FRINTM (scalar), FRINTM (vector), FRINTP (scalar), FRINTP (vector), FRINTN (scalar), FRINTN (vector), FRINTX (scalar), FRINTX (vector), FRINTI (scalar), FRINTI (vector), FRINT32X (scalar), FRINT32X (vector), FRINT32Z (scalar), FRINT32Z (vector), FRINT64X (scalar), FRINT64X (vector), FRINT64Z (scalar), and FRINT64Z (vector).

FPAbs() and FPNeg() are not classified as floating-point operations and all of the following apply to them:

- They cannot generate floating-point exceptions.
- The floating-point behavior described in the *Flushing denormalized numbers to zero* on page A1-54 does not apply to them.
- The floating-point behavior described in the section *NaN handling and the Default NaN* on page A1-57 does not apply to them.

Handling floating-point exceptions

If generating synchronous exceptions is enabled for one or more floating-point exceptions, the synchronous exceptions generated by the floating-point exception traps are taken to the lowest Exception level that can handle such an exception and that is not at a lower Exception level than where the exception was generated.

If an implementation includes synchronous exception generation for floating-point exceptions in AArch64 state, all of the following apply:

- The registers that are presented to the exception handler are consistent with the state of the PE immediately before the instruction that caused the exception, except that an implementation is permitted to not restore the cumulative floating-point exception bits in the event of such an exception.
- When the execution of separate operations in separate SIMD elements causes multiple floating-point exceptions, the ESR_ELx reports one exception associated with one element that the instruction uses. The architecture does not specify which element is reported.

The AArch64.FPTrappedException() and FPProcessException() pseudocode functions describe the handling of trapped floating-point exceptions generated in AArch64 state.

Combinations of floating-point exceptions

More than one floating-point exception can occur on the same operation. The only combinations of floating-point exceptions that can occur are:

- Overflow with Inexact.
- Underflow with Inexact.
- If FPCR.AH is 0, Input Denormal with any other floating-point exceptions.
- If FPCR.AH is 1, Input Denormal with Inexact, Underflow, or Overflow.

If two floating-point exceptions occur on the same operation, the Input Denormal exception is treated as highest priority and the Inexact exception is treated as lowest priority.

Some floating-point instructions specify more than one floating-point operation, this is indicated by the pseudocode descriptions of the instruction. In these cases, it is possible for one instruction to generate multiple exceptions. Multiple exceptions from one instruction are prioritized as follows:

- If an exception generating operation outputs a result that is used by a second exception generating operation, the exception of the operation that outputs the result is treated as higher priority than the exception of the second operation that uses the result.

- If exception generating operations do not use the outputs of other exception generating operations, it is **CONSTRAINED UNPREDICTABLE** which floating-point exception is treated as higher priority. The exception prioritized might differ between different instances of the same two floating-point exceptions being generated on the same operation during execution of the instruction.
- A trapped underflow floating-point exception has priority over a trapped inexact floating-point exception.

If none of the floating-point exceptions caused by an operation is trapped, any floating-point exception that occurs causes the associated cumulative bit in the **FPSR** to be set to 1.

When a floating-point exception is trapped, all of the following apply:

- When the trapped floating-point exception is taken, it is **IMPLEMENTATION DEFINED** whether the **FPSR** is restored to the value of the **FPSR** immediately before the instruction that generated the trapped floating-point exception.
When the trapped floating-point exception is taken, if the **FPSR** is not restored, it is **CONSTRAINED UNPREDICTABLE** which untrapped floating-point exceptions, if any, are indicated by the corresponding **FPSR** cumulative floating-point exception bits having the value 1.
- In the **ESR_ELx** to which the trapped exception is taken all of the following apply:
 - The highest priority trapped floating-point exception has a floating-point exception trapped bit set to 1.
 - If any other untrapped floating-point exceptions are generated by the same operation, each untrapped exception has a floating-point exception trapped bit set to 0. This applies to both higher priority and lower priority untrapped floating-point exceptions.
 - If any lower priority trapped floating-point exceptions are generated by the same operation, for each exception, it is **CONSTRAINED UNPREDICTABLE** whether the floating-point exception trapped bit is set to 1.

The architectural requirements for floating-point exception prioritization apply only to multiple floating-point exceptions generated on the same element of an Advanced SIMD operation. For trapped floating-point exceptions from Advanced SIMD instructions, the architecture does not define the floating-point exception prioritization between different elements of the instruction.

D1.13 Asynchronous exception types, routing, masking and priorities

In the Armv8-A architecture, asynchronous exceptions that are taken to AArch64 state are also known as *interrupts*.

There are two types of interrupts:

Physical interrupts Are signals sent to the PE from outside the PE. They are:

- SError. System Error.
- IRQ.
- FIQ.

Virtual interrupts Are interrupts that software executing at EL2 can enable and make pending. A virtual interrupt is taken from EL0 or EL1 to EL1.

Virtual interrupts have names that correspond to the physical interrupts:

- vSError.
- vIRQ.
- vFIQ.

Note

- For information about how virtual interrupts might be used, see [Virtual interrupt usage model on page D1-2462](#).
- The SError interrupt replaces the Armv7 asynchronous abort. The new name better describes the nature of the exception, and means that, in AArch64 state, it is categorized as a unique exception class, with EC encoding 0x2F.

An External abort generated by the memory system might be taken asynchronously using the SError interrupt. These SError interrupts always behave as edge-triggered interrupts. An implementation might include other sources of SError interrupt. It is IMPLEMENTATION DEFINED whether these other sources are edge-triggered or level-sensitive. See also [External aborts on page D4-2666](#).

Each physical interrupt type can be assigned a target Exception level of EL1, EL2 or EL3, as shown in [Asynchronous exception routing on page D1-2501](#).

When an interrupt occurs:

- On taking an SError or a vSError interrupt to an Exception level using AArch64, the Exception Syndrome register for that Exception level is updated to describe an SError interrupt.
When the RAS Extension is implemented, the exception syndrome for the vSError interrupt is taken from the values in the VSESR_EL2 register. See [Exception classes and the ESR_ELx syndrome registers on page D1-2478](#), and the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.
- On taking an IRQ, vIRQ, FIQ or vFIQ interrupt to an Exception level using AArch64, the Exception Syndrome register for that Exception level is not updated.

The remainder of this section contains the following:

- [Asynchronous exception routing on page D1-2501](#).
- [Asynchronous exception masking on page D1-2504](#).
- [Virtual interrupts on page D1-2506](#).
- [Prioritization and recognition of interrupts on page D1-2508](#).
- [Taking an interrupt or other exception during a multi-access load or store on page D1-2509](#).

D1.13.1 Asynchronous exception routing

The following tables show the routing of physical interrupts when the highest implemented Exception level is using AArch64:

- For implementations that include both EL2 and EL3, see [Table D1-8 on page D1-2501](#).
- For implementations that include EL3 but not EL2, see [Table D1-9 on page D1-2502](#).
- For implementations that include EL2 but not EL3, see [Table D1-10 on page D1-2503](#).

When the highest implemented Exception level is using AArch32, see [Table G1-19 on page G1-6076](#).

In the tables:

SCR	This is the <i>Effective value</i> of a field in SCR .
FIQ IRQ EA	The <i>Effective value</i> of the field that handles the asynchronous exception type in SCR , if the highest EL is using AArch32, or SCR_EL3 , if the highest EL is using AArch64.
HCR	This is the <i>Effective value</i> of a field in HCR , if EL2 is using AArch32 or HCR_EL2 if EL2 is using AArch64. When the value of the TGE is 1, the virtual exceptions are disabled. When the <i>Effective value</i> of HCR .{E2H, TGE} is: {0, 1} The <i>Effective value</i> of each of the HCR .{AMO, IMO, FMO} fields is 1. {1, 1} The <i>Effective value</i> of each of the HCR .{AMO, IMO, FMO} fields is 0.
FMO IMO AMO	The <i>Effective value</i> of the mask override field for the asynchronous exception type in HCR , if EL2 is using AArch32 or HCR_EL2 if EL2 is using AArch64.
EL2	The exception is taken to EL2 using AArch64.
EL3	The exception is taken to EL3 using AArch64.
C	The interrupt is not taken and remains pending, regardless of the PSTATE .{A, I, F} interrupt masks.
FIQ IRQ Abt	The exception is taken to the FIQ mode, the IRQ mode or the Abort mode according to the type of asynchronous exception.
Hyp	The exception is taken to AArch32 Hyp mode.
Mon	The exception is taken to AArch32 Monitor mode.
n/a	Not applicable. The field does not exist in the register in this configuration or the Exception level is not accessible in this configuration.

Table D1-8 Routing when both EL3 and EL2 are implemented

SCR				HCR				Target when taken from EL0	Target when taken from EL1	Target when taken from EL2	Target when taken from EL3
NS	EEL2 ^a	EA IRQ FIQ	RW	TGE	AMO IMO FMO	E2H	RW				
0	0	0	0	x	x	x	x	FIQ IRQ Abt	FIQ IRQ Abt	n/a	C
			1	x	x	x	x	EL1	EL1	n/a	C
		1	x	x	x	x	x	EL3	EL3	n/a	EL3
	1	0	x	0	0	0	0	FIQ IRQ Abt	FIQ IRQ Abt	C	C
							1	EL1	EL1	C	C

Table D1-8 Routing when both EL3 and EL2 are implemented (continued)

SCR				HCR				Target when taken from EL0	Target when taken from EL1	Target when taken from EL2	Target when taken from EL3
NS	EEL2 ^a	EA IRQ FIQ	RW	TGE	AMO IMO FMO	E2H	RW				
						1	x	EL1	EL1	C	C
					1		x	EL2	EL2	EL2	C
				1	x	x	x	EL2	n/a	EL2	C
		1	x	0	x	x	x	EL3	EL3	EL3	EL3
				1	x	x	x	EL3	n/a	EL3	EL3
1	x	0	0	0	0	n/a	n/a	FIQ IRQ Abt	FIQ IRQ Abt	Hyp	C
					1		n/a	Hyp	Hyp	Hyp	C
				1	x	n/a	n/a	Hyp	n/a	Hyp	C
			1	0	0	0	0	FIQ IRQ Abt	FIQ IRQ Abt	C	C
							1	EL1	EL1	C	C
						1	x	EL1	EL1	C	C
					1	x	x	EL2	EL2	EL2	C
				1	x	x	x	EL2	n/a	EL2	C
		1	x	0	x	x	x	EL3	EL3	EL3	EL3
				1	x	x	x	EL3	n/a	EL3	EL3

a. When the implementation does not include FEAT_SEL2, the SCR_EL3.EEL2 field is not implemented and the Effective value of EEL2 is 0.

Table D1-9 Routing when EL3 is implemented and EL2 is not implemented

SCR_EL3 EA IRQ FIQ	Target Exception level when executing at		
	EL0	EL1	EL3
0	EL1	EL1	C
1	EL3	EL3	EL3

Table D1-10 Routing when EL3 is not implemented and EL2 is implemented

HCR_EL2		Target Exception level when executing at		
TGE	AMO IMO FMO	EL0	EL1	EL2
0	0	EL1	EL1	C
	1	EL2	EL2	EL2
1	x	EL2	n/a	EL2

D1.13.2 Asynchronous exception masking

When an interrupt is masked, it means that it cannot be taken. Instead, it remains pending.

When executing in AArch64 state, interrupts are masked implicitly when the target Exception level of the interrupt is lower than the current Exception level.

In addition, interrupts can be masked when the target Exception level is the current Exception level. The controls for this are:

SError [PSTATE.A](#)
IRQ [PSTATE.I](#)
FIQ [PSTATE.F](#)

When the target Exception level is higher than the current Exception level:

- If the target Exception level is EL3, the interrupt cannot be masked by the [PSTATE](#).{A, I, F} bits.
- If the target Exception level is EL2, and either [HCR_EL2.E2H](#) is 0 or [HCR_EL2.TGE](#) is 0, the interrupt cannot be masked by the [PSTATE](#).{A, I, F} bits.
- If the target Exception level is EL2, [HCR_EL2.E2H](#) is 1, and [HCR_EL2.TGE](#) is 1, the interrupt can be masked by the [PSTATE](#).{A, I, F} bits.
- If the target Exception level is EL1, the interrupt can be masked by the [PSTATE](#).{A, I, F} bits.

———— **Note** —————

- The ability to execute in EL0 with interrupts to EL1 masked is required by some user level driver code.
- The [PSTATE](#).{A, I, F} bits can mask both physical interrupts and virtual interrupts.
- The Armv8-A architecture does not support *Non-maskable FIQ* (NMFI) operations. This means that it does not provide a configuration option to override the masking of FIQs by [PSTATE.F](#).

On taking any exception to an Exception level using AArch64, all of [PSTATE](#).{A, I, F} are set to 1, masking all interrupts that target that Exception level.

The following tables show the masking of physical interrupts when the highest implemented Exception level is using AArch64:

- For implementations that include both EL2 and EL3, see [Table D1-11 on page D1-2505](#).
- For implementations that include EL3 but not EL2, see [Table D1-12 on page D1-2506](#).
- For implementations that include EL2 but not EL3, see [Table D1-13 on page D1-2506](#).

For the masking of interrupts when the highest implemented Exception level is using AArch32, see [Table G1-20 on page G1-6077](#).

For the masking of virtual interrupts, see [Virtual interrupts on page D1-2506](#).

In the tables:

SCR This is the *Effective value* of a field in [SCR](#).

FIQ IRQ EA The *Effective value* of the field that handles the asynchronous exception type in [SCR](#), if the highest EL is using AArch32, or [SCR_EL3](#), if the highest EL is using AArch64.

HCR This is the *Effective value* of a field in [HCR](#).
When the value of [HCR.TGE](#) is 1, the virtual exceptions are disabled.
When the *Effective value* of [HCR](#).{E2H, TGE} is:
{0, 1} The *Effective value* of each of the [HCR](#).{AMO, IMO, FMO} fields is 1.
{1, 1} The *Effective value* of each of the [HCR](#).{AMO, IMO, FMO} fields is 0.

FMO IMO AMO The *Effective value* of the mask override field for the asynchronous exception type in [HCR](#), if EL2 is using AArch32 or [HCR_EL2](#) if EL2 is using AArch64.

A When the interrupt is asserted it is taken regardless of the value of the [PSTATE](#).{A, I, F} interrupt masks.

- B** When the interrupt is asserted it is subject to the corresponding Process state mask. If the value of the mask is 1 then the interrupt is not taken. If the value of the mask is 0 the interrupt is taken.
- A/B** When **FEAT_DoubleFault** is implemented, the interrupt is an SError interrupt, and **SCR_EL3.NMEA** is 1, then the interrupt behaves as A. Otherwise, the interrupt behaves as B.
- C** When the interrupt is asserted it is not taken, regardless of the value of the **PSTATE**. {A, I, F} interrupt masks.
- n/a** Not applicable. The PE cannot be executing at this Exception level for the specified state of **HCR** and **SCR_EL3**.

Table D1-11 Physical interrupt target and masking when both EL3 and EL2 are implemented

SCR				HCR			Effect of the interrupt mask when executing at:			
NS	EEL2^a	EA IRQ FIQ	RW	TGE	E2H^b	AMO IMO FMO	EL0	EL1	EL2	EL3
0	0	0	x	x	x	x	B	B	n/a	C
		1	x	x	x	x	A	A	n/a	A/B
	1	0	x	0	x	0	B	B	C	C
						1	A	A	B	C
				1	0	x	A	n/a	B	C
					1	x	B	n/a	B	C
		1	x	0	x	x	A	A	A	A/B
				1	x	x	A	n/a	A	A/B
1	x	0	0	0	n/a	0	B	B	B	C
						1	A	A	B	C
				1	n/a	x	A	n/a	B	C
			1	0	x	0	B	B	C	C
						1	A	A	B	C
				1	0	x	A	n/a	B	C
						1	B	n/a	B	C
		1	x	0	x	x	A	A	A	A/B
				1	x	x	A	n/a	A	A/B

- a. When the implementation does not include **FEAT_SEL2**, the **SCR_EL3.EEL2** field is not implemented and the **Effective value** of **EEL2** is 0.
- b. When the implementation does not include **FEAT_VHE**, the **HCR_EL2.E2H** field is not implemented and the **Effective value** of **E2H** is 0.

Table D1-12 Physical interrupt target and masking when EL3 is implemented and EL2 is not implemented

SCR_EL3		Target Exception level	Effect of the interrupt mask when executing at:		
NS	EA IRQ FIQ		EL0	EL1	EL3
x	0	EL1	B	B	C
	1	EL3	A	A	A/B

Table D1-13 Physical interrupt target and masking when EL3 is not implemented and EL2 is implemented

HCR_EL2			Target Exception level	Effect of the interrupt mask when executing at:		
E2H^a	TGE	AMO IMO FMO		EL0	EL1	EL2
x	0	0	EL1	B	B	C
		1	EL2	A	A	B
0	1	x	EL2	A	n/a	B
1	1	x	EL2	B	n/a	B

a. If the implementation does not include FEAT_VHE, the HCR.E2H field is not implemented and behavior is as if the value of E2H is 0.

D1.13.3 Virtual interrupts

When the value of HCR_EL2.TGE is 0, setting an HCR_EL2.{FMO, IMO, AMO} routing control bit to 1 enables the corresponding virtual interrupt. When the value of HCR_EL2.TGE is 1 all virtual interrupts are disabled.

When execution is at EL2, if enabled in the current Security state, or EL3, all types of virtual interrupts are always masked. If EL2 is not enabled in the current Security state, all types of virtual interrupts are always masked.

Virtual interrupts can only be taken from EL0 or EL1 to EL1. When a virtual interrupt type is enabled, that type of interrupt can be generated by:

- Software setting the corresponding virtual interrupt pending bit, HCR_EL2.{VSE, VI, VF}, to 1.
- For a vIRQ or a vFIQ, by an IMPLEMENTATION DEFINED mechanism. This might be a signal from an interrupt controller. See, for example, the *ARM Generic Interrupt Controller Architecture Specification*.

———— **Note** ————

For a usage model for virtual interrupts, see *Virtual interrupt usage model* on page D1-2462.

When a virtual interrupt is disabled:

- It cannot be taken.
- It cannot be seen in the ISR_EL1.

Each virtual interrupt type can be masked when execution is in EL1 or EL0, by using the same Process State mask bits that mask the physical interrupts, PSTATE.{A, I, F}.

Table D1-14 on page D1-2507 summarizes the bits that enable virtual interrupts and the bits that cause virtual interrupts to be pending.

Table D1-14 HCR_EL2 interrupt control bits

Virtual interrupt type	Enable control ^a	Cause a virtual interrupt to be pending
vSError	HCR_EL2.AMO	HCR_EL2.VSE
vIRQ	HCR_EL2.IMO	HCR_EL2.VI
vFIQ	HCR_EL2.FMO	HCR_EL2.VF

a. Applies only when the value of HCR_EL2.TGE is 0, otherwise the virtual interrupts are disabled.

On taking a vIRQ or a vFIQ interrupt, the corresponding virtual interrupt pending bit in the HCR_EL2 retains its state.

On taking a vSError interrupt, HCR_EL2.VSE is cleared to 0.

———— **Note** —————

This means that if the virtual interrupt pending bits are used, the vIRQ or vFIQ exception handler must cause software executing at EL2 or EL3 to set their corresponding virtual interrupt pending bits to 0.

Taking a vSError interrupt to an Exception level using AArch64 updates ESR_EL1 with the encoding for an SError interrupt. For the encoding, see *Exception classes and the ESR_ELx syndrome registers on page D1-2478*. When the RAS Extension is implemented, the exception syndrome for the vSError interrupt is taken from the values in the VSESR_EL2 register, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*. Taking a vIRQ or a vFIQ interrupt to an Exception level using AArch64 does not update the ESR_EL1.

The following table shows the masking of virtual interrupts when the highest implemented Exception level is using AArch64. In the table:

- B** When the interrupt is asserted it is subject to the corresponding Process state mask. If the value of the mask is 1 then the interrupt is not taken. If the value of the mask is 0 the interrupt is taken.
- C** When the interrupt is asserted it is not taken, regardless of the value of the Process state mask.
- n/a** Not applicable. The PE cannot be executing at this Exception level for the specified state of HCR and SCR_EL3.

HCR In Table D1-15 on page D1-2508, including in the table footnote:

- When EL2 is using AArch64 HCR refers to the AArch64 register HCR_EL2.
- When EL2 is using AArch32 HCR refers to the AArch32 register HCR.

When the value of HCR.TGE is 1, the virtual exceptions are disabled.

When the *Effective value* of HCR.{E2H, TGE} is:

{0, 1} The *Effective value* of each of the HCR.{AMO, IMO, FMO} fields is 1.

{1, 1} The *Effective value* of each of the HCR.{AMO, IMO, FMO} fields is 0.

Table D1-15 Virtual interrupt masking

SCR_EL3			HCR			Effect of the interrupt mask when executing at:			
EEL2	NS	EA IRQ FIQ	E2H ^a	TGE	AMO IMO FMO	EL0	EL1	EL2	EL3
0	0	x	x	x	x	C	C	n/a	C
1	0	x	x	0	0	C	C	C	C
					1	B	B	C	C
				1	x	C	n/a	C	C
x	1	x	x	0	0	C	C	C	C
					1	B	B	C	C
				1	x	C	n/a	C	C

a. If EL2 is using AArch32 or the implementation does not include FEAT_VHE, the HCR.E2H field is not implemented and behavior is as if the value of E2H is 0.

D1.13.4 Prioritization and recognition of interrupts

The prioritization of interrupts, including virtual interrupts, is IMPLEMENTATION DEFINED.

———— **Note** —————

As indicated at the start of *Asynchronous exception types, routing, masking and priorities* on page D1-2500, in AArch64 state all possible asynchronous exceptions are defined as *interrupts*.

Any interrupt that is pending before a *Context synchronization event* in the following list, is taken before the first instruction after the context synchronizing event, provided that the pending interrupt is not masked:

- Execution of an ISB instruction.
- Exception entry, if FEAT_ExS is not implemented, or if FEAT_ExS is implemented and the appropriate SCTLR_ELx.EIS bit is set.
- Exception return, if FEAT_ExS is not implemented or if FEAT_ExS is implemented and the appropriate SCTLR_ELx.EOS bit is set.
- Exit from Debug state.

———— **Note** —————

- If the first instruction after the context synchronizing event generates a synchronous exception, then the architecture does not define whether the PE takes the interrupt or the synchronous exception first.
- The ISR_EL1 identifies any pending interrupts.
- Interrupts are masked when the PE is in Debug state, and therefore this list of context synchronizing events does not include the DCPS and DRPS instructions.

An error synchronization event defines additional requirements for taking an SError interrupt, see the *Arm® Reliability, Availability, and Serviceability (RAS) Specification, ARMv8, for the ARMv8-A architecture profile*.

In the absence of a specific requirement to take an interrupt, the architecture only requires that unmasked pending interrupts are taken in finite time.

If an unmasked interrupt was pending but is changed to not pending before it is taken, then the architecture permits the interrupt to be taken, but does not require this to happen. If the interrupt is taken then it must be taken before the first *Context synchronization event* after the interrupt was changed to not pending.

D1.13.5 Taking an interrupt or other exception during a multi-access load or store

In AArch64 state, interrupts can be taken during a sequence of memory accesses caused by a single load or store instruction. This is true regardless of the memory type being accessed.

If an interrupt, or another exception, is taken from AArch64 during the execution of an instruction that performs a sequence of memory accesses, rather than a single single-copy atomic access, then:

- For a load, any register being loaded by the instruction other than ones used in the generation of the address by the instruction, can contain an UNKNOWN value. Registers used in the generation of the address are restored to their initial value.
- For a store, any data location being stored to by the instruction can contain an UNKNOWN value.
- For either a load or a store, if the instruction specifies writeback of the base address, then that register is restored to its initial value.

———— **Note** ————

- This interrupt behavior is in contrast to behavior in AArch32 state, when interrupts cannot be taken during a sequence of memory accesses caused by a single load or store instruction.
- In both Execution states, synchronous data abort exceptions can be taken during the execution of an instruction that performs a sequence of memory accesses.
- Software must avoid using multiple-register load and store instructions for accesses to Device memory, particularly to Device memory with the non-Gathering attribute, because an exception taken during the load or store can result in repeated accesses.

D1.14 Configurable instruction enables and disables, and trap controls

This section describes the controls provided by AArch64 state for enabling, disabling, and trapping particular instructions. Each control is categorized as an *instruction enable*, an *instruction disable*, or a *trap control*:

Instruction enables and instruction disables

Enable or disable the use of one or more particular instructions at a particular Exception level and Security state.

When an instruction is disabled as a result of an instruction enable or disable, it is UNDEFINED.

Trap controls A trap control determines whether one or more particular instructions, whenever executed at a particular Exception level, are *trapped*.

A trapped instruction generates a *Trap exception*.

For trap controls provided by:

EL1 Trap exceptions are taken to EL1, unless routed from EL0 to EL2 because [HCR_EL2.TGE](#) is 1 as described in [Routing exceptions from EL0 to EL2 on page D1-2489](#).

EL2 Trap exceptions are taken to EL2.
For descriptions of these controls, see [EL2 configurable controls on page D1-2516](#).

EL3 Trap exceptions are taken to EL3.
For descriptions of these controls, see [EL3 configurable controls on page D1-2528](#).

———— Note ————

The definitions of *traps* and *enables and disables* overlap, and the classification of some controls is historical. In AArch64 state, the most significant characteristic of an exception report is the [ESR_ELx.EC](#) value with which it is reported. Describing a register control field as an instruction enable, an instruction disable, or a trap control, gives no indication of how an exception that is generated as a consequence of the value of that field is handled or reported.

An exception generated as a result of an instruction enable or disable, or a trap control, is only taken if both of the following apply:

- The instruction generating the exception does not also generate a higher priority exception. [Synchronous exception prioritization for exceptions taken to AArch64 state on page D1-2490](#) defines the prioritization of different exceptions on the same instruction.
- The instruction is not UNPREDICTABLE or CONSTRAINED UNPREDICTABLE in the PE state it is executed in. UNPREDICTABLE and CONSTRAINED UNPREDICTABLE instructions can generate exceptions as a result of these controls, but the architecture does not require them to do so.

Exceptions generated as a result of these controls are synchronous exceptions.

Exceptions are reported in the [ESR_ELx](#), with an EC value that indicates the Exception class, and:

- Many cases, including all traps, are reported with a non-zero EC value and an associated syndrome.
- Some cases where an instruction is UNDEFINED are reported with an EC value `0x00`, the value for an exception for an unknown or uncategorized reason, and in these cases no syndrome is provided. [ISS encoding for exceptions with an unknown reason on page D13-3150](#) identifies the cases that are reported with EC value `0x00`.

[Table D1-6 on page D1-2479](#) lists the EC values that are used for exceptions that result from traps, enables, and disables.

———— Note ————

- A particular control might have a mnemonic that suggests it is different type of control to the control type it is categorized as. For example, [SCTLR_EL1.DZE](#) is a trap control even though DZE means DC ZVA Enable.
- In addition to the controls described in this section, a *routing control*, [HCR_EL2.TGE](#), can be used to route exceptions from EL0 to EL2. See [Routing exceptions from EL0 to EL2 on page D1-2489](#).

- An implementation might provide additional controls, in IMPLEMENTATION DEFINED registers, to provide control of trapping of IMPLEMENTATION DEFINED features.

This section is organized as follows:

- [Traps on instructions on page D1-2511.](#)
- [EL1 configurable controls on page D1-2511.](#)
- [EL2 configurable controls on page D1-2516.](#)
- [EL3 configurable controls on page D1-2528.](#)

D1.14.1 Traps on instructions

When an instruction is disabled or trapped, the exception is taken before execution of the instruction. This means the preferred exception return of the exception is the instruction that is trapped.

If a conditional instruction is trapped, in AArch32 state, the Armv8-A architecture permits, but does not require the trap to apply to conditional AArch32 instructions that fail their Condition code check. For more information, see:

- [Conditional execution of undefined instructions on page G1-6080.](#)
- [EL2 configurable controls on page G1-6126.](#)
- [EL3 configurable controls on page G1-6146.](#)
- [Limitations of the instruction pseudocode on page K14-8576.](#)

If the instruction is a register access instruction:

- No access is made before the exception is taken.
- Side-effects that are normally associated with the access do not occur before the exception is taken.

D1.14.2 EL1 configurable controls

These controls are in EL0 and EL1 System registers. The resulting exceptions might be taken from either Execution state. `SPSR_EL1.M[4]` indicates which Execution state the exception was taken from.

If `HCR_EL2.TGE` is 1 and EL2 is enabled in the current Security state, these Trap exceptions are routed to EL2 instead of EL1, see [Routing exceptions from EL0 to EL2 on page D1-2489.](#)

[Table D1-16 on page D1-2511](#) shows the EL0 and EL1 System registers that contain these controls.

Table D1-16 EL1 registers that contain instruction enables and disables, and trap controls

Register name	Register description
AMUSERENR_EL0	Activity Monitors User Enable Register
CPACR_EL1	Architectural Feature Access Control Register
MDSCR_EL1	Monitor System Debug Control Register
PMUSERENR_EL0	Performance Monitors User Enable Register

E	Enable	Instruction enables and instruction disables on page D1-2510
T	Trap	Trap controls on page D1-2510

Traps to EL1 of EL0 accesses to Activity Monitors registers

[AMUSERENR_EL0.EN](#) traps EL0 accesses to the Activity Monitors registers to EL1.

Traps to EL1 of EL0 accesses to the Generic Timer registers

[CNTKCTL_EL1](#).{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} trap EL0 accesses to the Generic Timer registers to EL1, as follows:

- [CNTKCTL_EL1.EL0PTEN](#) traps EL0 accesses to the physical timer registers.
- [CNTKCTL_EL1.EL0VTEN](#) traps EL0 accesses to the virtual timer registers.
- [CNTKCTL_EL1.EL0PCTEN](#) traps EL0 accesses to the frequency register and physical counter register.
- [CNTKCTL_EL1.EL0VCTEN](#) traps EL0 accesses to the frequency register and virtual counter register.

Accesses to the frequency register, [CNTFRQ_EL0](#) or [CNTFRQ](#), are only trapped if [CNTKCTL_EL1.EL0PCTEN](#) and [CNTKCTL_EL1.EL0VCTEN](#) are both 0.

Traps to EL1 of EL0 and EL1 System register accesses to the trace registers

[CPACR_EL1.TTA](#) traps EL0 and EL1 System register accesses to the trace registers to EL1.

———— Note ————

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the Armv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and the resulting exception is higher priority than a [CPACR_EL1.TTA](#) Trap exception.
- The Armv8-A architecture does not provide traps on trace register accesses through the OPTIONAL Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see *Traps on instructions* on page D1-2511.

Traps to EL1 of EL0 and EL1 accesses to SIMD and floating-point functionality

When EL1 is using AArch64, [CPACR_EL1.FPEN](#) traps EL0 and EL1 accesses of the following registers to EL1:

- [FPCR](#), [FPSR](#), and any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-S31 registers. See *The SIMD and floating-point registers, V0-V31* on page D1-2464.
- [FPSCR](#), and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers. See *Advanced SIMD and floating-point System registers* on page G1-6114.

The value of [CPACR_EL1.FPEN](#) determines whether the trap applies to accesses from both EL0 and EL1 using AArch64, or only to accesses from EL0 accesses from both Execution states.

Traps to EL1 of EL0 accesses to the Debug Communications Channel (DCC) registers

[MDSR_EL1.TDCC](#) traps EL0 accesses to the DCC registers to EL1.

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#) are ignored in Debug state.

Traps to EL1 of EL0 accesses to Performance Monitors registers

[PMUSERENR_EL0](#).{ER, CR, SW, EN} trap EL0 accesses to the Performance Monitors registers to EL1.

For those Performance Monitors registers that more than one [PMUSERENR_EL0](#).{ER, CR, SW, EN} control applies to, accesses are only trapped if all controls that apply are set to 0.

The accesses that these trap controls trap might be reads, writes, or both.

[PMUSERENR_EL0](#).EN traps EL0 access only if the corresponding EL1 accesses is permitted. For example, the [PMSWINC_EL0](#) and [PMSWINC](#) registers are WO at EL1, and therefore are not trapped.

Traps to EL1 of EL0 execution of single-copy atomic 64-byte instructions

If [FEAT_LS64](#) is implemented, [SCTLR_EL1](#).{EnALS, EnAS0, EnASR} traps execution of single-copy atomic 64-byte instructions to EL1 when [HCR_EL2](#).{E2H, TGE} is not {1,1}.

Enabling use of the Pointer authentication instructions, EL1&0 translation regime

If [FEAT_PAuth](#) is implemented, each of the [SCTLR_EL1](#).{EnDA, EnDB, EnIA, EnIB} fields enables the pointer authentication functionality for the corresponding Pointer authentication instructions for the EL1&0 translation regime. For more information, see [System register control of pointer authentication on page D5-2681](#).

———— Note —————

These controls cause the pointer authentication instructions to execute as NOPs. They never cause an exception to be generated.

Traps to EL1 of EL0 execution of cache maintenance instructions

[SCTLR_EL1](#).UCI traps EL0 execution using AArch64 of cache maintenance instructions to EL1.

Traps to EL1 of EL0 execution of WFE, WFI, WFET, and WFIT instructions

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, the instructions Wait for Event with Timeout (WFET) and Wait for Event with Interrupt (WFIT) are implemented as additional forms of the Wait for Event (WFE) and Wait for Interrupt (WFI) instructions.

[SCTLR_EL1](#).{nTWE, nTWI} trap EL0 execution of WFE, WFI, WFET, or WFIT instructions to EL1 if the instruction would otherwise have caused the PE to enter a low-power state.

———— Note —————

Since a WFE, WFI, WFET, or WFIT instruction can complete at any time, even without a Wakeup or local timeout event, the traps on these instructions are not guaranteed to be taken, even if the instruction is executed when there is no Wakeup or local timeout event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup or local timeout event, the trap will be taken.

For more information about these instructions, and when they can cause the PE to enter a low-power state, see:

- [Wait for Event mechanism and Send event on page D1-2536](#).
- [Wait For Interrupt on page D1-2540](#).

Traps to EL1 of EL0 accesses to the CTR_EL0

[SCTLR_EL1](#).UCT traps EL0 accesses using AArch64 to the [CTR_EL0](#) to EL1.

Traps to EL1 of EL0 execution of DC ZVA instructions

[SCTLR_EL1](#).DZE traps EL0 execution of DC ZVA instructions to EL1. If the trap is enabled, reading the [DCZID_EL0](#) returns a value that indicates that DC ZVA instructions are not implemented.

Traps to EL1 of EL0 accesses to the PSTATE.{D, A, I, F} interrupt masks

[SCTLR_EL1](#).UMA traps EL0 execution of MSR and MRS instructions that access the [PSTATE](#).{D, A, I, F} masks to EL1. If [HCR_EL2](#).TGE is 1 and EL2 is enabled in the current Security state, these Trap exceptions are routed to EL2.

Disabling or enabling EL0 use of AArch32 optional functionality

Table D1-19 on page D1-2515 shows the optional AArch32 functionality that might have disable controls in the `SCTLR_EL1`:

- The SED control is implemented if the implementation supports mixed-endian operation at any Exception level.
- Whether the ITD control is implemented is IMPLEMENTATION DEFINED.
- Whether the CP15BEN control is implemented is IMPLEMENTATION DEFINED.
- If a control is not implemented, then the associated functionality cannot be disabled.

These `SCTLR_EL1` controls apply only to execution at EL0 using AArch32. When an instruction is disabled by one of these controls, it is UNDEFINED at EL0 using AArch32. When `HCR_EL2.{E2H,TGE}` is {1, 1}, the control is from `SCTLR_EL2`.

Table D1-19 on page D1-2515 shows how the exceptions are reported in `ESR_EL1`:

Table D1-19 EL1 controls for disabling and enabling EL0 use of AArch32 optional functionality

Optional AArch32 functionality	Instruction enable or disable in the <code>SCTLR_EL1</code>	Disabled instructions	Syndrome reporting in <code>ESR_EL1</code> ^a
SETEND instructions	SED ^b	SETEND instructions	Exception for an unknown reason, using EC value 0x00
Some uses of IT instructions	ITD ^c	See the <code>SCTLR_EL1.IT</code> description	
Accesses to the <code>CP15DMB</code> , <code>CP15DSB</code> , and <code>CP15ISB</code> barrier instructions	CP15BEN ^d	MCR accesses to the <code>CP15DMB</code> , <code>CP15DSB</code> , and <code>CP15ISB</code> instructions	

- If `HCR_EL2.TGE` is 1 and EL2 is enabled in the current Security state, the exception is routed to EL2 and reported in `ESR_EL2` using the EC value shown in the table.
- SETEND instruction disable. SETEND instructions are disabled when the value of this field is 1.
- IT instruction disable. If this control is implemented, some uses of IT instructions are disabled when the value of this field is 1.
- System register (coproc==0b1111) memory barrier enable. If this control is implemented, the specified register accesses are disabled when the value of CP15BEN is 0.

————— Note —————

- The uses of the IT instruction, and use of the `CP15DMB`, `CP15DSB`, and `CP15ISB` barrier instructions, are deprecated for performance reasons.
- The `SCTLR` provides similar controls that apply when EL1 is using AArch32, and the `HSCTLR` provides similar controls that apply when EL2 is using AArch32.

Disabling Address tagging for instruction accesses, EL1&0 translation regime

This control is implemented when `FEAT_PAuth` is implemented.

When a `TCR_EL1.{TBI0, TBI1}` field enables the use of address tagging for the EL1&0 translation regime, the corresponding `TCR_EL1.{TBID0, TBID1}` field determines whether address tagging is used for both data and instruction addresses, or only for data addresses. For more information, see *Address tagging in AArch64 state on page D5-2676*.

————— Note —————

These controls determine the scope of address tagging. They never cause an exception to be generated.

D1.14.3 EL2 configurable controls

These controls are in EL2 System registers. The resulting exceptions might be taken from either Execution state. [SPSR_EL2.M\[4\]](#) indicates which Execution state the exception was taken from.

If Secure EL2 is implemented and enabled, configurable instruction controls available at EL2 apply in Secure state. If Secure EL2 is not implemented or not enabled, the configurable instruction controls available at EL2 are ignored in Secure state.

[FEAT_FGT](#) introduces additional traps to EL2 of EL1 and EL0 access to individual or small groups of System registers and instructions. The traps are independent of existing controls. If implementations have IMPLEMENTATION DEFINED registers accessible from EL1 or EL0, Arm recommends that EL2 accessible fine-grained traps are provided for these registers using a control register held in IMPLEMENTATION DEFINED space.

[Table D1-20 on page D1-2516](#) shows the EL2 System registers that contain these controls.

Table D1-20 EL2 registers that contain instruction disables and trap controls

Register name	Register description
CPTR_EL2	Architectural Feature Trap Register, EL2

a. See Table D1-22 on page D1-2519.

Table D1-22 Control types, for exceptions taken to EL1

Abbreviation	Type	See
D	Disable	Instruction enables and instruction disables on page D1-2510
E	Enable	Instruction enables and instruction disables on page D1-2510
R	Routing control	Routing exceptions from EL0 to EL2 on page D1-2489
T	Trap	Trap controls on page D1-2510

Also see the following for more general information about traps to EL2:

- [Traps on instructions on page D1-2511](#).
- For traps from an Exception level using AArch32:
 - [Instructions that fail their Condition code check on page G1-6128](#).
 - [Trapping to EL2 of instructions that are UNPREDICTABLE on page G1-6129](#).

Traps to EL2 of EL0 and EL1 accesses to the Generic Timer registers

`CNTHCTL_EL2`.{`EL1PCEN`, `EL1PCTEN`} trap EL0 and EL1 accesses to the Generic Timer registers to EL2 if enabled for the current Security state, as follows:

- `CNTHCTL_EL2`.`EL1PCEN` traps EL0 and EL1 accesses to the physical timer registers.
- `CNTHCTL_EL2`.`EL1PCTEN` traps EL0 and EL1 accesses to the physical counter register.

Trapping to EL2 of EL1 accesses to the `CPACR_EL1` or `CPACR`

`CPTR_EL2`.`TCPAC` traps EL1 accesses to the `CPACR_EL1` or `CPACR` to EL2:

———— **Note** —————

- The `CPACR_EL1` or `CPACR` is not accessible at EL0.
- In Armv7 and earlier versions of the Arm architecture, one function of the `CPACR` is as an ID register that identifies what coprocessor or conceptual coprocessor functionality is implemented. Legacy software might use this identification mechanism, and a hypervisor can use this trap to emulate this mechanism. For more information about this coprocessor model, see [Background to the System register interface on page G1-6110](#).

Traps to EL2 of EL1 and EL0 accesses to Activity Monitors registers

`CPTR_EL2`.`TAM` traps EL1 and EL0 accesses to the Activity Monitor registers to EL2.

Traps to EL2 of EL2, EL1, and EL0 System register accesses to the trace registers

`CPTR_EL2`.`TTA` traps EL2, EL1, and EL0 System register accesses to the trace registers to EL2.

———— **Note** —————

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the Armv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than a `CPTR_EL2`.`TTA` Trap exception.
- EL2 does not provide traps on trace register accesses through the Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see [Traps on instructions on page D1-2511](#).

Traps to EL2 of EL2, EL1, and EL0 accesses to SIMD and floating-point functionality

This control is applicable only when [FEAT_VHE](#) is implemented and [HCR_EL2.E2H](#) is 1.

[CPTR_EL2.FPEN](#) traps execution at EL2, EL1, and EL0 of instructions that access the Advanced SIMD and floating-point registers to EL2.

General trapping to EL2 of accesses to the SIMD and floating-point registers

[CPTR_EL2.TFP](#) traps accesses to the following SIMD and floating-point registers to EL2:

- [FPCR](#), [FPSR](#), [FPEXC32_EL2](#), and any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-S31 registers. See *The SIMD and floating-point registers, V0-V31 on page D1-2464*.
- [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), [FPSCR](#), [FPEXC](#), and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers. See *Advanced SIMD and floating-point System registers on page G1-6114*. Permitted VMSR accesses to the [FPSID](#) are ignored, but for the purposes of this trap the architecture defines a VMSR access to the [FPSID](#) from EL1 or higher as an access to a SIMD and floating-point register.

Fine-grained traps to EL2 of EL0 and EL1 read accesses to Activity Monitors registers

The fields in [HAFGRTR_EL2](#) trap read accesses to individual or pairs of Activity Monitors registers to EL2 if enabled in the current Security state. The values of the register are treated as 0 for all purposes other than direct reads of the register when [HCR_EL2.{E2H, TGE}](#) is {1,1}.

EL1 accesses are trapped from AArch64. When EL1 is using AArch64 and the functionality is accessible from EL0, EL0 accesses are trapped from AArch64 or AArch32.

If the Activity monitors extension is not implemented, [HAFGRTR_EL2](#) is not implemented. If an Activity monitor auxiliary counter is not implemented, the corresponding field in [HAFGRTR_EL2](#) is RES0.

Traps to EL2 of EL1 accesses to the RAS error record registers

[HCR_EL2.TERR](#) traps EL1 accesses to the RAS ER* registers to EL2 if enabled in the current Security state.

[HCR_EL2.FIEN](#) traps EL1 accesses to the RAS ER* registers to EL2 if enabled in the current Security state.

Trap to EL2 of EL1 accesses to AT S1E* instructions

This control is implemented when [FEAT_NV](#) is implemented.

[HCR_EL2.AT](#) traps to EL2, if enabled in the current Security state, from EL1 accesses to some Address translation instructions. Because nested virtualization is supported only in AArch64 state this control only traps from AArch64 state.

For more information, see *Effect of HCR_EL2.{NV, NV1}* on page D5-2793.

Traps to EL2 for nested virtualization

These controls are implemented when [FEAT_NV](#) is implemented.

————— Note —————

When [FEAT_NV2](#) is implemented and [HCR_EL2.NV2](#) is 1, the redirection of register accesses to memory accesses has priority over the trapping of register accesses by [HCR_EL2.{NV, NV1}](#), see *Enhanced support for nested virtualization on page D5-2795*.

[HCR_EL2.NV](#) traps the following to EL2, if enabled in the current Security state, from EL1:

- Some System register, System instruction, and Special-purpose register accesses that are UNDEFINED at EL1 when [FEAT_NV](#) is not implemented.

Only accesses that are not UNDEFINED at EL2 are trapped.

———— **Note** —————

This means that, for a register that is RO at EL2, and UNDEFINED at Non-secure EL1 when [FEAT_NV](#) is not implemented, when [FEAT_NV](#) is implemented and this trap is enabled:

- Read accesses to the register from EL1 are trapped to EL2.
- Write accesses to the register from EL1 remain UNDEFINED.

- The execution of some instructions that are UNDEFINED at EL1 when [FEAT_NV](#) is not implemented.

Because nested virtualization is supported only in AArch64 state this control only traps from AArch64 state.

———— **Note** —————

In addition, when the value of [HCR_EL2.NV](#) is 1, a read of [CurrentEL](#) returns the value 0b10 for bits[3:2].

[HCR_EL2.NV1](#) traps to EL2, if enabled in the current Security state, from EL1 accesses to some System registers and Special-purpose registers. Because nested virtualization is supported only in AArch64 state this control only traps from AArch64 state.

For more information, see [Effect of HCR_EL2.{NV, NV1} on page D5-2793](#).

Trap to EL2 of EL0 accesses to Pointer authentication instructions

This control is implemented when [FEAT_PAuth](#) is implemented.

[HCR_EL2.API](#) traps, to EL2 if enabled in the current Security state, accesses to any of the Pointer authentication instructions for which pointer authentication is enabled, for instructions executed either:

- At EL1.
- If the *Effective value* of [HCR_EL2.{TGE, E2H}](#) is not {1, 1}, at EL0.

Because pointer authentication is supported only in AArch64 state, this control only traps from AArch64 state.

For more information, including the description of when pointer authentication is enabled for an instruction, see [System register control of pointer authentication on page D5-2681](#).

Trap to EL2 of EL1 accesses to Pointer authentication key registers

This control is implemented when [FEAT_PAuth](#) is implemented.

[HCR_EL2.APK](#) traps, to EL2 if enabled in the current Security state, accesses to the Pointer authentication key registers from EL1 to EL2. Because pointer authentication is supported only in AArch64 state this control only traps from AArch64 state.

For more information, see [System register control of pointer authentication on page D5-2681](#).

Traps to EL2 of EL1 accesses to virtual memory control registers

[HCR_EL2.{TRVM, TVM}](#) trap EL1 accesses to the virtual memory control registers to EL2, if enabled in the current Security state.

———— **Note** —————

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the Non-secure memory system. A hypervisor might use this trap as part of its virtualization of memory management.

Disabling execution of HVC instructions

[HCR_EL2.HCD](#) disables execution of HVC instructions at EL2 and EL1, and any resulting exception is taken from the current Exception level to the current Exception level.

———— **Note** —————

HVC instructions are always UNDEFINED at EL0.

[HCR_EL2.HCD](#) is only implemented if EL3 is not implemented. Otherwise, it is RES0.

Traps to EL2 of EL0 and EL1 execution of DC ZVA instructions

[HCR_EL2.TDZ](#) traps EL0 and EL1 execution of DC ZVA instructions to EL2 if enabled in the current Security state, and reading the [DCZID_EL0](#) returns a value that indicates that DC ZVA instructions are not implemented.

Traps to EL2 of EL1 execution of TLB maintenance instructions

In the Armv8-A architecture, the System instruction encoding space includes TLB maintenance instructions.

[HCR_EL2.TTLB](#) traps EL1 execution of TLB maintenance instructions to EL2 if enabled in the current Security state:

———— **Note** —————

These instructions are always UNDEFINED at EL0.

For more information about these instructions, see:

- [TLB maintenance instructions on page D5-2819](#), for the AArch64 state instructions.
- [The scope of TLB maintenance instructions on page G5-6345](#), for the AArch32 state instructions.

Traps to EL2 of EL0 and EL1 execution of cache maintenance instructions

[HCR_EL2](#).{TSW, TPC, TPU} trap cache maintenance instructions to EL2, if enabled in the current Security state. Execution is trapped from EL1, or from EL0 if permitted by [SCTLR_EL1.UCI](#).

[HCR_EL2.TSW](#) traps data or unified cache maintenance by set/way instructions.

These instructions are always UNDEFINED at EL0.

[HCR_EL2.TPC](#) traps data or unified cache maintenance to point of coherency instructions.

———— **Note** —————

[DC IVAC](#) is always UNDEFINED at EL0 using AArch64.

[DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are always UNDEFINED at EL0 using AArch32.

[HCR_EL2.TPU](#) traps cache maintenance to point of unification instructions.

———— **Note** —————

[IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.

[ICIMVAU](#), [ICIALLU](#), [ICIALLUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

For more information about these instructions, see:

- [Cache maintenance instructions, and data cache zero operation on page C5-399](#) for the AArch64 instructions.
- [Cache maintenance system instructions on page K15-8631](#) for the AArch32 instructions.

Traps to EL2 of EL1 accesses to the Auxiliary Control Register

[HCR_EL2.TACR](#) traps EL1 accesses to the Auxiliary Control Registers to EL2 if enabled in the current Security state:

Note

- The [ACTLR_EL1](#), [ACTLR](#), and [ACTLR2](#) are not accessible at EL0.
 - The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.
-

Traps to EL2 of EL0 and EL1 accesses to lockdown, DMA, and TCM operations

The lockdown, DMA, and TCM features of the Armv8-A architecture are IMPLEMENTATION DEFINED. The architecture reserves the encodings of a number of System registers for control of these features.

[HCR_EL2.TIDCP](#) traps the execution of System register access instructions that access any of the encodings described in *Reserved encodings for IMPLEMENTATION DEFINED registers on page D12-3038* and any of the following AArch32 encodings:

- CRn=c9, opc1={0-7}, CRm={c0-c2, c5-c8}, opc2={0-7}.
- CRn=c10, opc1={0-7}, CRm={c0, c1, c4, c8}, opc2={0-7}.
- CRn=c11, opc1={0-7}, CRm={c0-c8, c15}, opc2={0-7}.

Execution at EL1 is trapped to EL2 if enabled in the current Security state. Execution at EL1 is an IMPLEMENTATION DEFINED choice between either a trap to EL2, or UNDEFINED with any resulting exception taken to EL1.

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

Note

- Arm expects the trapping of EL0 accesses to these functions to EL2 to be unusual, and used only when the hypervisor is virtualizing EL0 operation. Arm strongly recommends that unless the hypervisor must virtualize EL0 operation, a EL0 access to any of these functions is UNDEFINED, as it would be if the implementation did not include EL2. The PE then takes any resulting exception to EL1.
 - The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.
-

Traps to EL2 of EL1 execution of SMC instructions

[HCR_EL2.TSC](#) traps EL1 execution of SMC instructions to EL2 if enabled in the current Security state. the value of [SCR_EL3.SMD](#) is ignored.

If EL3 is not implemented, [HCR_EL2.TSC](#) is RES0.

For more information about SMC instructions, see *SMC on page C6-1316*.

Note

- This trap is implemented only if the implementation includes EL3.
 - SMC instructions are UNDEFINED at EL0.
 - [HCR_EL2.TSC](#) traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.
-

Traps to EL2 of EL0 and EL1 accesses to the ID registers

Other than the [MIDR_EL1](#), [MPIDR_EL1](#), and [PMCR_EL0.N](#), the ID registers are divided into groups, with a trap control in the [HCR_EL2](#) for each group.

[HCR_EL2.TID0](#) traps accesses to primary device identification registers at EL1 and EL0 to EL2 if enabled in the current Security state. [HCR_EL2.TID1](#) traps accesses to implementation identification registers at EL1 to EL2 if enabled in the current Security state. [HCR_EL2.TID2](#) traps accesses to cache identification registers at EL1 and EL0 to EL2 if enabled in the current Security state. [HCR_EL2.TID3](#) traps accesses to detailed feature identification registers at EL1 to EL2 if enabled in the current Security state.

———— Note ————

In AArch32 state, the detailed feature identification registers are called the CPUID registers. There is no requirement for this trap to apply to those registers that the CPUID Identification Scheme defines as reserved. See [The CPUID identification scheme on page G8-6439](#).

For the [MIDR_EL1](#) and [MPIDR_EL1](#), and for [PMCR_EL0.N](#), the architecture provides read/write aliases. The original register becomes accessible only from EL2 or Secure state, and an EL0 or EL1 read of the original register returns the value of the read/write alias. This substitution is invisible to the EL0 or EL1 software reading the register.

Table D1-23 ID register substitution

Register	Original	Alias, EL2 using AArch64
Main ID	MIDR_EL1	VPIDR_EL2
Multiprocessor Affinity	MPIDR_EL1	VMPIDR_EL2
Performance Monitors Control Register	PMCR_EL0.N	MDCR_EL2.HPMN

———— Note ————

- If the OPTIONAL Performance Monitors Extension is not implemented, [MDCR_EL2.HPMN](#) is RES0 and [PMCR_EL0](#) is reserved.
- [MDCR_EL2.HPMN](#) also controls whether a Performance Monitors counter can be accessed from EL0 or EL1. See the register description of [MDCR_EL2](#) for more information.
- [PMCR_EL0](#) contains other fields that identify the implementation. For more information about trapping accesses to the [PMCR_EL0](#), see [Traps to EL2 of EL0 and EL1 accesses to Performance Monitors registers on page D1-2527](#).

Traps to EL2 of EL0 and EL1 execution of WFE, WFI, WFET, and WFIT instructions

When [FEAT_WFXT](#) or [FEAT_WFXT2](#) is implemented, the instructions Wait for Event with Timeout (WFET) and Wait for Event with Interrupt (WFIT) are implemented as additional forms of the Wait for Event (WFE) and Wait for Interrupt (WFI) instructions.

[HCR_EL2](#).{TWE, TWI} trap EL0 and EL1 execution of WFE, WFI, WFET, or WFIT instructions to EL2 if the instruction would otherwise have caused the PE to enter a low-power state.

When [HCR_EL2](#).{E2H, TGE} is {1, 1}, [SCTLR_EL2](#).{nTWE, nTWI} trap EL0 execution of WFE, WFI, WFET, or WFIT instructions to EL2.

———— Note ————

Since a WFE, WFI, WFET, or WFIT instruction can complete at any time, even without a Wakeup or local timeout event, the traps on these instructions are not guaranteed to be taken, even if the instruction is executed when there is no Wakeup or local timeout event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup or local timeout event, the trap will be taken.

For more information about these instructions, and when they can cause the PE to enter a low-power state, see:

- [Wait for Event mechanism and Send event on page D1-2536.](#)
- [Wait For Interrupt on page D1-2540.](#)

Traps to EL2 of EL0 and EL1 execution of single-copy atomic 64-byte instructions

If [FEAT_LS64](#) is implemented, [HCRX_EL2](#).{EnALS, EnAS0, EnASR} traps execution of single-copy atomic 64-byte instructions to EL2 under the following conditions:

- The instruction is executed from EL0 when [HCR_EL2](#).{E2H, TGE} is not {1,1} and it is not trapped to EL1 as a result of the corresponding [SCTLR_EL1](#).{EnALS, EnAS0, EnASR} bit.
- The instruction is executed from EL1.

If [FEAT_LS64](#) is implemented, [SCTLR_EL2](#).{EnALS, EnAS0, EnASR} traps EL0 execution of single-copy atomic 64-byte instructions to EL2 when [HCR_EL2](#).{E2H, TGE} is {1,1}.

Fine-grained traps to EL2 of EL0 and EL1 accesses to the debug, trace, and PMU registers

The fields in [HDFGRTR_EL2](#) and [HDFGWTR_EL2](#) trap read and write accesses to individual and groups of related debug and trace registers to EL2 if enabled in the current Security state. The values of the registers are treated as 0 for all purposes other than direct reads of the register when [HCR_EL2](#).{E2H, TGE} is {1,1}.

Most RW registers have fine-grained traps for read and write accesses. However, [PMCR_EL0](#) has a trap for write accesses only. For more details, see [HDFGRTR_EL2](#) and [HDFGWTR_EL2](#).

If a fine-grained trap selects a breakpoint or watchpoint that is not implemented, the access is UNDEFINED. Accesses to unimplemented registers and unimplemented event counters are UNDEFINED.

When [FEAT_FGT](#) is implemented, access to an implemented Performance Monitors event counter <n> when n is greater than, or equal to [MDCR_EL2](#).HPMN is always trapped to EL2, and the value of the corresponding fine-grained trap field in [HDFGRTR_EL2](#) or [HDFGWTR_EL2](#) is ignored. If [FEAT_FGT](#) is not implemented, access to an implemented Performance Monitors event counter <n> when n is greater than or equal to [MDCR_EL2](#).HPMN has CONSTRAINED UNPREDICTABLE behavior.

Fine-grained traps to EL2 of EL0 and EL1 accesses to System registers

The fields in [HFGRTR_EL2](#) and [HFGWTR_EL2](#) trap read or write accesses to individual or small groups of system registers to EL2 if enabled in the current Security state. The values of the register are treated as 0 for all purposes other than direct reads of the register when [HCR_EL2](#).{E2H, TGE} is {1,1}.

EL1 accesses are trapped from AArch64. When EL1 is using AArch64 and the functionality is accessible from EL0, EL0 accesses are trapped from AArch64 or AArch32.

If a register is not implemented, the corresponding field is RES0.

Fine-grained Traps to EL2 of EL0 and EL1 accesses to instructions

The fields in [HFGITR_EL2](#) trap specific system instructions to EL2 if enabled in the current Security state. The values of the register are treated as 0 for all purposes other than direct reads of the register when [HCR_EL2](#).{E2H, TGE} is {1,1}.

If an instruction is not implemented and behaves as an unallocated instruction, the corresponding field in [HFGITR_EL2](#) is RES0.

For cache maintenance instructions to a PoC, PoU, PoP, or PoDP, if no caches are defined to be affected in the implementation before that point in the memory system, it is IMPLEMENTATION DEFINED whether the instruction is trapped when the corresponding trap enable field is set.

General trapping to EL2 of EL0 and EL1 accesses to System registers, from AArch32 state only

HSTR_EL2.{T0-T3, T5-T13, T15} trap accesses to the AArch32 System registers in the coproc==0b1111 encoding space, by the register number, {c0-c3, c5-c13, c15} used for:

- The CRn argument used when accessing the register using an MCR or MRC instruction.
- The CRm argument used when accessing the register using an MCRR or MRRC instruction.

These traps are from AArch32 state only. They are from both:

- EL1 using AArch32.
- EL0 using AArch32.

Note

HSTR_EL2[4, 14] is reserved, RES0. Although the Generic Timer AArch32 System registers are implemented in the coproc==0b1111 encoding space and accessed using a CRn or CRm value of c14, EL2 does not provide a trap on accesses to the Generic Timer System registers.

System registers in the (coproc==0b1111) encoding space with IMPLEMENTATION DEFINED access permission from EL0

For an AArch32 System register in the (coproc==0b1111) encoding space, which is accessed using a CRn or CRm value that can be trapped by a **HSTR_EL2**.Tn control, if an access to the register from EL0 is UNDEFINED when the value of the corresponding **HSTR_EL2**.Tn trap control is 0, then when that **HSTR_EL2**.Tn trap control is 1, it is IMPLEMENTATION DEFINED whether an access from Non-secure EL0 using AArch32:

- Generates a Trap exception that is taken to EL2.
- Is UNDEFINED and generates an exception that is taken to Non-secure EL1.

If the instruction is treated as UNDEFINED and generates an exception that is taken to Non-secure EL1, and Non-secure EL1 is using AArch64, the exception is reported in **ESR_EL1** as an exception for an unknown reason, using EC value 0x00.

Note

Arm expects that trapping to EL2 of Non-secure EL0 accesses to AArch32 System register in the (coproc==0b1111) encoding space will be unusual, and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, Non-secure EL0 accesses to the System registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the Non-secure EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to Non-secure EL1.

Traps to EL2 of System register accesses to the trace filter control registers

MDCR_EL2.TTRF traps System register accesses to the trace filter control registers to EL2, if enabled in the current Security state.

Traps to EL2 of EL0 and EL1 System register accesses to debug registers

MDCR_EL2.{TDRA, TDOSA, TDA} trap System register accesses to the debug registers to EL2 if enabled in the current Security state, as follows:

- **MDCR_EL2**.TDRA traps EL0 and EL1 accesses to the Debug ROM registers to EL2 if enabled in the current Security state. This trap applies to Non-secure EL0 only if it is using AArch32. If **MDCR_EL2**.TDE or **HCR_EL2**.TGE is 1, behavior is as if **MDCR_EL2**.TDRA is 1 other than for the purpose of a direct read.
- **MDCR_EL2**.TDOSA traps EL1 accesses to powerdown debug registers to EL2 if enabled in the current Security state. These registers are not accessible at EL0. If **MDCR_EL2**.TDE or **HCR_EL2**.TGE is 1, behavior is as if **MDCR_EL2**.TDOSA is 1 other than for the purpose of a direct read.

- [MDCR_EL2.TDA](#) traps EL0 and EL1 accesses to those debug System registers that are not trapped by [MDCR_EL2.TDRA](#) and [MDCR_EL2.TDOSA](#). The [MDCR_EL2.TDA](#) traps are to EL2 if enabled in the current Security state. If [MDCR_EL2.TDE](#) or [HCR_EL2.TGE](#) is 1, behavior is as if [MDCR_EL2.TDA](#) is 1 other than for the purpose of a direct read.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers can have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2. See [Traps on instructions on page D1-2511](#).

Traps to EL2 of EL0 and EL1 accesses to the Debug Communications Channel registers

If the PE is not in Debug state, [MDCR_EL2.TDCC](#) traps EL0 and EL1 accesses to DCC registers to EL2 if enabled for the current Security state.

If the PE is in Debug state, [MDCR_EL2.TDCC](#) does not trap accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), [DBGDTRTX_EL0](#), [DBGDTRRXint](#), and [DBGDTRTXint](#) that would otherwise be trapped. See [MDCR_EL2.TDCC](#) for more information.

Traps to EL2 of EL0 and EL1 accesses to Performance Monitors registers

[MDCR_EL2](#).{TPM, TPMCR} trap EL0 and EL1 accesses to the Performance Monitors registers to EL2 if enabled in the current Security state:

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

[MDCR_EL2](#).HPMN controls whether a counter can be accessed from Non-secure EL0 or EL1. See the register description of [MDCR_EL2](#) for more information.

Enabling use of the Pointer authentication instructions, EL2 translation regime

This control is implemented when [FEAT_PAAuth](#) is implemented.

Each of the [SCTLR_EL2](#).{EnDA, EnDB, EnIA, EnIB} fields enables the pointer authentication functionality for the corresponding Pointer authentication instructions for the EL2 or EL2&0 translation regime. For more information, see [System register control of pointer authentication on page D5-2681](#).

Note

These controls cause the pointer authentication instructions to execute as NOPs. They never cause an exception to be generated.

Traps to EL2 of EL0 execution of cache maintenance instructions

This control is implemented when [HCR_EL2](#).{E2H, TGE} is {1, 1}.

[SCTLR_EL2](#).UCI traps EL0 execution using AArch64 of cache maintenance instructions to EL2.

Traps to EL2 of EL0 accesses to the CTR_EL0

This control is implemented when [HCR_EL2](#).{E2H, TGE} is {1, 1}.

[SCTLR_EL2](#).UCT traps EL0 accesses using AArch64 to the [CTR_EL0](#) to EL2.

Traps to EL2 of EL0 execution of DC ZVA instructions

This control is implemented when `HCR_EL2.{E2H, TGE}` is {1, 1}.

`SCTLR_EL2.DZE` traps EL0 execution of DC ZVA instructions to EL2. If the trap is enabled, reading the `DCZID_EL0` returns a value that indicates that DC ZVA instructions are not implemented.

Disabling or enabling EL0 use of AArch32 optional functionality

These controls are implemented when `HCR_EL2.{E2H, TGE}` is {1, 1}, and apply only to execution at EL0 using AArch32, as follows:

- `SCTLR_EL2.SED` disables SETEND instructions at EL0 using AArch32.
- `SCTLR_EL2.ITD` disables some uses of IT instructions at EL0 using AArch32.
- `SCTLR_EL2.CP15BEN` enables accesses to the DMB, DSB, and ISB System instructions in the coproc==0b1111 encoding space from EL0.

See also *Disabling or enabling EL0 use of AArch32 optional functionality on page D1-2515*.

Disabling Address tagging for instruction accesses, EL2 translation regime

This control is implemented when `FEAT_PAuth` is implemented.

When a `TCR_EL2.TBI` or `TCR_EL2.{TBI0, TBI1}` field enables the use of address tagging for the EL2 translation regime, the corresponding `TCR_EL2.TBID` or `TCR_EL2.{TBID0, TBID1}` field determines whether address tagging is used for both data and instruction addresses, or only for data addresses. For more information, see *Address tagging in AArch64 state on page D5-2676*.

———— **Note** ————

These controls determine the scope of address tagging. They never cause an exception to be generated.

D1.14.4 EL3 configurable controls

These controls are in EL3 System registers. The resulting exceptions might be taken from either Execution state. `SPSR_EL3.M[4]` indicates which Execution state the exception was taken from.

Table D1-24 on page D1-2528 shows the EL3 System registers that contain these controls.

Table D1-24 EL3 registers that contain instruction enables and disables, and trap controls

Register name	Register description
<code>SCTLR_EL3</code>	System Control Register, EL3
<code>SCR_EL3</code>	Secure Configuration Register
<code>CPTR_EL3</code>	Architectural Feature Trap Register, EL3
<code>MDCR_EL3</code>	Monitor Debug Configuration Register, EL3
<code>TCR_EL3</code>	Translation Control Register, EL3

Table D1-25 on page D1-2529 summarizes the controls.

Table D1-25 Instruction enables and disables, and trap controls, provided by EL3

Control	Control type^a	Description
CPTR_EL3.TCPAC	T	Trapping to EL3 of EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR on page D1-2530
CPTR_EL3.TAM	T	Traps to EL3 of EL2, EL1, and EL0 accesses to Activity Monitors registers on page D1-2530
CPTR_EL3.TTA	T	Traps to EL3 of System register accesses to the trace registers on page D1-2530
CPTR_EL3.TFP	T	Traps to EL3 of all accesses to the SIMD and floating-point registers on page D1-2531
MDCR_EL3.TDCC	T	Traps to EL3 of EL2, EL1, and EL0 accesses to Debug Communication Channel registers on page D1-2531
MDCR_EL3.TTRF	T	Traps to EL3 of EL2 and EL1 System register accesses to the trace filter control registers on page D1-2531
MDCR_EL3.{TDOSA, TDA}	T	Traps to EL3 of EL2, EL1, and EL0 System register accesses to debug registers on page D1-2531
MDCR_EL3.TPM	T	Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers on page D1-2532
SCR_EL3.EnAS0	T	Traps to EL3 of EL2, EL1, and EL0 execution of single-copy atomic 64-byte EL0 store with return instruction on page D1-2532
SCR_EL3.FGTEn	E	Traps to EL3 of EL2 accesses to fine-grained trap registers on page D1-2532
SCR_EL3.FIEN	T	Traps to EL3 of EL1 and EL2 accesses to the RAS error record registers on page D1-2532
SCR_EL3.API	T	Trap to EL3 accesses to Pointer authentication instructions on page D1-2532
SCR_EL3.APK	T	Trap to EL3 accesses to Pointer authentication key registers on page D1-2532
SCR_EL3.TERR	T	Traps to EL3 of EL1 and EL2 accesses to the RAS error record registers on page D1-2532
SCR_EL3.{TWE, TWI}	T	Traps to EL3 of EL2, EL1, and EL0 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2533
SCR_EL3.ST	T	Traps to EL3 of Secure EL1 accesses to the Counter-timer Physical Secure timer registers on page D1-2533
SCR_EL3.HCE	E	Enabling EL3, EL2, and EL1 execution of HVC instructions on page D1-2533
SCR_EL3.SMD	D	Disabling EL3, EL2, and EL1 execution of SMC instructions on page D1-2533
SCTLR_EL3.{EnDA, EnDB, EnIA, EnIB}	E	Enabling use of the Pointer authentication instructions, EL3 translation regime on page D1-2533
TCR_EL3.TBID	D	Disabling Address tagging for instruction accesses, EL3 translation regime on page D1-2534

a. See Table D1-26 on page D1-2530.

Table D1-26 Control types, for exceptions taken to EL1

Abbreviation	Type	See
D	Disable	<i>Instruction enables and instruction disables on page D1-2510</i>
E	Enable	<i>Instruction enables and instruction disables on page D1-2510</i>
T	Trap	<i>Trap controls on page D1-2510</i>

Also see the following for more general information about traps to EL3:

- *Traps on instructions on page D1-2511.*
- *Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32 on page D1-2530.*

Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32

If EL1 is using AArch32, all of the following are trapped to EL3:

- Secure EL1 reads and writes to any of the [SCR](#), [NSACR](#), [MVBAR](#) or [SDCR](#).
- Any attempt at Secure EL1 to execute any of the following:
 - [ATS12NSO**](#) instructions.
 - SRS instructions that use the R13_mon banked register.
 - MRS or MSR instructions that access any of the SPSR_mon, R13_mon or R14_mon banked registers.

In addition, if EL1 is using AArch32:

- Secure EL1 write accesses to the [CNTFRQ](#) register are UNDEFINED. They are not trapped to EL3.
- Any attempt at Secure EL1 to change the PE mode to Monitor mode, by using a CPS or an MSR instruction, or by performing an exception return, is treated as an illegal change of the [CPSR.M](#) field. See *Illegal changes to PSTATE.M on page G1-6039*.

Note

- Reads of the [NSACR](#) from either Non-secure EL1 using AArch32 or Non-secure EL2 using AArch32 return the value 0x00000C00. See *Restricted access System registers on page G5-6397*.
- These operations are not available at EL0.

Trapping to EL3 of EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR

[CPTR_EL3.TCPAC](#) traps all of the following to EL3:

- EL2 accesses to the [CPTR_EL2](#) or [HCPTR](#).
- EL2 and EL1 accesses to the [CPACR_EL1](#) or [CPACR](#).

When [CPTR_EL3.TCPAC](#) is:

For EL1, this trap control applies to accesses from both Security states.

Traps to EL3 of EL2, EL1, and EL0 accesses to Activity Monitors registers

[CPTR_EL3.TAM](#) traps EL2, EL1, and EL0 accesses to the Activity Monitor registers to EL3.

Traps to EL3 of System register accesses to the trace registers

[CPTR_EL3.TTA](#) traps System register accesses to the trace registers, from all Exception levels, to EL3.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the Armv8-A architecture is implemented with an ETMv4 implementation, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than a [CPTR_EL3.TTA](#) Trap exception.
- EL3 does not provide traps on trace register accesses through the Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see [Traps on instructions on page D1-2511](#).

Traps to EL3 of all accesses to the SIMD and floating-point registers

[CPTR_EL3.TFP](#) traps all accesses to the following SIMD and floating-point registers, from all Exception levels, to EL3:

- [FPCR](#), [FPSR](#), [FPEXC32_EL2](#), and any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-S31 registers. See [The SIMD and floating-point registers, V0-V31 on page D1-2464](#).
- [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), [FPSCR](#), [FPEXC](#), and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers. See [Advanced SIMD and floating-point System registers on page G1-6114](#). Permitted VMSR accesses to the [FPSID](#) are ignored, but for the purposes of this trap the architecture defines a VMSR access to the [FPSID](#) from EL1 or higher is an access to a SIMD and floating-point register.

For EL0 and EL1, this trap control applies to accesses from both Security states.

Note

- [FPEXC32_EL2](#) is not accessible from EL0 using AArch64.
- [FPSID](#), [MVFR0](#), [MVFR1](#), and [FPEXC](#) are not accessible from EL0 using AArch32.

Traps to EL3 of EL2, EL1, and EL0 accesses to Debug Communication Channel registers

[MDCR_EL3.TDCC](#) traps EL2, EL1, and EL0 accesses to DCC registers to EL3.

If the PE is in Debug state, [MDCR_EL3.TDCC](#) does not trap accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), [DBGDTRTX_EL0](#), [DBGDTRRXint](#), and [DBGDTRTXint](#) that would otherwise be trapped. See [MDCR_EL3.TDCC](#) for more information.

Traps to EL3 of EL2 and EL1 System register accesses to the trace filter control registers

[MDCR_EL3.TTRF](#) traps System register accesses to the trace filter registers, from EL1 and EL2, to EL3.

Traps to EL3 of EL2, EL1, and EL0 System register accesses to debug registers

[MDCR_EL3.TDOSA](#) traps EL2, EL1, and EL0 System register accesses to the powerdown debug registers to EL3, from both Security states. For EL1, this trap control applies to accesses from both Security states.

[MDCR_EL3.TDA](#) traps EL2, EL1, and EL0 System register accesses to the debug registers that are not trapped by [MDCR_EL3.TDOSA](#), to EL3, from both Security states.

Note

EL3 does not provide traps on debug register accesses through the Memory-mapped or External debug interfaces.

System register accesses to the debug registers can have side-effects. When a System register access is trapped to EL3, no side-effects occur before the exception is taken to EL3. See [Traps on instructions on page D1-2511](#).

Traps to EL3 of EL2, EL1, and EL0 accesses to Performance Monitors registers

[MDCR_EL3](#).TPM traps EL2, EL1, and EL0 accesses to the Performance Monitors registers to EL3.

For EL0 and EL1, this trap control applies to accesses from both Security states.

Traps to EL3 of EL2, EL1, and EL0 execution of single-copy atomic 64-byte EL0 store with return instruction

If [FEAT_LS64](#) is implemented, [SCR_EL3](#).EnAS0 traps execution of the single-copy atomic 64-byte EL0 store with return instruction, ST64BV0, to EL3 under the following conditions:

- The instruction is executed from EL2.
- The instruction is executed from EL1 and is not trapped to EL2 as a result of the [HCRX_EL2](#).EnAS0 bit.
- The instruction is executed from EL0 and is not trapped to EL1 as a result of the [SCTLR_EL1](#).EnAS0 bit, or to EL2 as a result of either the [HCRX_EL2](#).EnAS0 or [SCTLR_EL2](#).EnAS0 bit.

Traps to EL3 of EL2 accesses to fine-grained trap registers

If [SCR_EL3](#).FGTE_n is set to 0, EL2 accesses to the following fine-grained trap registers are trapped to EL3:

- [HFGRTR_EL2](#), [HFGWTR_EL2](#) for System register traps.
- [HFGITR_EL2](#) for System instruction traps.
- [HDFGRTR_EL2](#), [HDFGWTR_EL2](#) for debug and trace register traps.
- [HAFGRTR_EL2](#) for activity monitor register traps.

Traps to EL3 of EL1 and EL2 accesses to the RAS error record registers

[SCR_EL3](#).FIEN traps EL1 and EL2 accesses to the RAS ERXP* registers to EL3.

[SCR_EL3](#).TERR traps EL1 and EL2 read accesses to the RAS ER* registers that are not trapped by [SCR_EL3](#).FIEN, to EL3.

Trap to EL3 accesses to Pointer authentication instructions

This control is implemented when [FEAT_PAuth](#) is implemented.

[SCR_EL3](#).API traps, to EL3, accesses to any of the Pointer authentication instructions for which pointer authentication is enabled, for instructions executed at an Exception level lower than EL3, in either Security state.

Because pointer authentication is supported only in AArch64 state this control only traps from AArch64 state.

For more information, including the description of when pointer authentication is enabled for an instruction, see [System register control of pointer authentication on page D5-2681](#).

Trap to EL3 accesses to Pointer authentication key registers

This control is implemented when [FEAT_PAuth](#) is implemented.

[SCR_EL3](#).APK traps, to EL3, accesses to the Pointer authentication key registers from EL2 or from Secure or Non-secure EL1. Because pointer authentication is supported only in AArch64 state this control only traps from AArch64 state.

For more information, see [System register control of pointer authentication on page D5-2681](#).

Traps to EL3 of EL2, EL1, and EL0 execution of WFE, WFI, WFET, and WFIT instructions

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, the instructions Wait for Event with Timeout (WFET) and Wait for Event with Interrupt (WFIT) are implemented as additional forms of the Wait for Event (WFE) and Wait for Interrupt (WFI) instructions.

[SCR_EL3](#).{TWE, TWI} trap EL2, EL1, and EL0 execution of WFE, WFI, WFET, or WFIT instructions to EL3.

———— Note ————

Since a WFE, WFI, WFET, or WFIT instruction can complete at any time, even without a Wakeup or local timeout event, the traps on these instructions are not guaranteed to be taken, even if the instruction is executed when there is no Wakeup or local timeout event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup or local timeout event, the trap will be taken.

For more information about these instructions, and when they can cause the PE to enter a low-power state, see:

- [Wait for Event mechanism and Send event on page D1-2536](#).
- [Wait For Interrupt on page D1-2540](#).

Traps to EL3 of Secure EL1 accesses to the Counter-timer Physical Secure timer registers

[SCR_EL3](#).ST traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3.

———— Note ————

- Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3.
- These registers are not accessible at EL0.

Enabling EL3, EL2, and EL1 execution of HVC instructions

[SCR_EL3](#).HCE enables HVC instruction execution at EL1 and above. Otherwise, HVC instructions are UNDEFINED at EL1, EL2, and EL3, and any resulting exception is taken from the current Exception level to the current Exception level.

For EL1, this enable control applies to Secure state only if EL2 is enabled in Secure state in the current Execution state.

If EL2 is not implemented, this bit is RES0.

———— Note ————

HVC instructions are always UNDEFINED at EL0.

Disabling EL3, EL2, and EL1 execution of SMC instructions

[SCR_EL3](#).SMD disables SMC instruction execution at EL1 and above. SMC instructions are UNDEFINED at EL1 and above, and any resulting exception is taken from the current Exception level to the current Exception level.

For EL1, this disable control applies to SMC instructions in both Security states.

———— Note ————

SMC instructions are always UNDEFINED at EL0.

If [HCR_EL2](#).TSC or [HCR](#).TSC traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

Enabling use of the Pointer authentication instructions, EL3 translation regime

This control is implemented when [FEAT_PAuth](#) is implemented.

Each of the `SCTLR_EL3`.{EnDA, EnDB, EnIA, EnIB} fields enables the pointer authentication functionality for the corresponding Pointer authentication instructions for the EL3 translation regime. For more information, see [System register control of pointer authentication on page D5-2681](#).

———— **Note** —————

These controls cause the pointer authentication instructions to execute as NOPs. They never cause an exception to be generated.

Disabling Address tagging for instruction accesses, EL3 translation regime

This control is implemented when `FEAT_PAAuth` is implemented.

When the `TCR_EL3`.TBI field enables the use of address tagging for the EL3 translation regime, the `TCR_EL3`.TBID field determines whether address tagging is used for both data and instruction addresses, or only for data addresses. For more information, see [Address tagging in AArch64 state on page D5-2676](#).

———— **Note** —————

This control determines the scope of address tagging. It never causes an exception to be generated.

D1.15 System calls

A system call is generated by the execution of an SVC, HVC, or SMC instruction:

- By default, the execution of an SVC instruction generates a Supervisor Call, a synchronous exception that targets EL1. This provides a mechanism for software executing at EL0 to make a call to an operating system or other software executing at EL1.
- In an implementation that includes EL2, the execution of an HVC instruction generates a Hypervisor Call, a synchronous exception that targets EL2 by default.

The HVC instruction is UNDEFINED:

- At EL0.
- At EL1 in Secure state.

———— **Note** —————

Software executing at EL0 cannot directly generate a Hypervisor Call.

- In an implementation that includes EL3, by default the execution of an SMC instruction generates a Secure Monitor Call, a synchronous exception that targets EL3.

The SMC instruction is UNDEFINED at EL0, meaning software executing at EL0 cannot directly generate a Secure Monitor Call.

The default behavior applies when the instruction is not UNDEFINED and both of the following are true:

- The instruction is executed at an Exception level that is the same as or lower than the target Exception level.
- The instruction is not trapped to a different Exception level.

If an SVC or HVC instruction is executed at an Exception level that is higher than the target Exception then it generates a synchronous exception that is taken to the current Exception level.

EL2 and EL3 can disable Hypervisor Call exceptions, see:

- [Disabling execution of HVC instructions on page D1-2522.](#)
- [Enabling EL3, EL2, and EL1 execution of HVC instructions on page D1-2533.](#)

EL2 can trap use of the SMC instruction, see [Traps to EL2 of EL1 execution of SMC instructions on page D1-2523.](#)

EL3 can disable Secure Monitor Call exceptions, see [Disabling EL3, EL2, and EL1 execution of SMC instructions on page D1-2533.](#)

D1.15.1 Pseudocode description of system calls

The `AArch64.CallSupervisor()` pseudocode function performs an SVC call in AArch64 state.

The `AArch64.CallHypervisor()` pseudocode function performs an HVC call in AArch64 state.

The `AArch64.CallSecureMonitor()` pseudocode function performs an SMC call in AArch64 state.

The `AArch64.CallSupervisor()`, `AArch64.CallHypervisor()`, and `AArch64.CallSecureMonitor()` functions are described in [Chapter J1 Armv8 Pseudocode](#).

D1.16 Mechanisms for entering a low-power state

The Arm architecture provides mechanisms that software can use to indicate that the PE can enter a low-power state, if it supports that state. The following sections describe those mechanisms:

- [Wait for Event mechanism and Send event on page D1-2536](#).
- [Wait For Interrupt on page D1-2540](#).

D1.16.1 Wait for Event mechanism and Send event

When `FEAT_WFxT` or `FEAT_WFxT2` is implemented, the instruction Wait for Event with Timeout (WFET) is implemented as an additional form of the Wait for Event (WFE) instruction.

A PE can use the *Wait for Event* (WFE) mechanism to enter a low-power state, depending on the value of the Event Register for that PE. To enter the low-power state, the PE executes a WFE or WFET instruction, and if the Event Register is clear, the PE can enter the low-power state.

If the PE does enter the low-power state, it remains in that low-power state until it receives a *WFE wake-up event*.

The architecture does not define the exact nature of the low-power state, except that the execution of a WFE or a WFET instruction, must not cause a loss of memory coherency.

WFE mechanism behavior depends on the interaction of all of the following, that are described in the subsections that follow:

- The Event Register for the PE. See subsection [The Event Register on page D1-2537](#).
- The Wait For Event (WFE) or Wait for Event with Timeout instruction (WFET). See subsection [The Wait For Event and Wait for Event with Timeout instructions on page D1-2537](#).
- *WFE wake-up events*. See subsection [WFE wake-up events in AArch64 state on page D1-2538](#).
- The Send Event instructions, SEV and SEVL that can cause WFE wake-up events. See subsection [The Send Event instructions on page D1-2539](#).

———— Note ————

Because the Wait for Event mechanism is associated with suspending execution on a PE for the purpose of power saving, Arm recommends that the Event Register is set only infrequently. However, software must only use the setting of the Event Register as a hint, and must not assume that any particular message is sent as a result of the setting of the Event Register.

[Example D1-2 on page D1-2536](#) describes how a spinlock implementation might use the WFE mechanism to save energy.

Example D1-2 Spinlock as an example of using Wait For Event and Send Event

A multiprocessor operating system requires locking mechanisms to protect data structures from being accessed simultaneously by multiple PEs. These mechanisms prevent the data structures becoming inconsistent or corrupted if different PEs try to make conflicting changes. If a lock is busy, because a data structure is being used by one PE, it might not be practical for another PE to do anything except wait for the lock to be released. For example, if a PE is handling an interrupt from a device, it might need to add data received from the device to a queue. If another PE is removing data from the same queue, it will have locked the memory area that holds the queue. The first PE cannot add the new data until the queue is in a consistent state and the second PE has released the lock. The first PE cannot return from the interrupt handler until the data has been added to the queue, so it must wait.

Typically, a spin-lock mechanism is used in these circumstances:

- A PE requiring access to the protected data attempts to obtain the lock using single-copy atomic synchronization primitives such as the Load-Exclusive and Store-Exclusive operations described in [Synchronization and semaphores on page B2-179](#).
- If the PE obtains the lock it performs its memory operation and then releases the lock.

- If the PE cannot obtain the lock, it reads the lock value repeatedly in a tight loop until the lock becomes available. When the lock becomes available, the PE again attempts to obtain it.

A spin-lock mechanism is not ideal for all situations:

- In a low-power system the tight read loop is undesirable because it uses energy to no effect.
- In a multiprocessor system the execution of spin-locks by multiple waiting PEs can degrade overall performance.

Using the Wait For Event and Send Event mechanism can improve the energy efficiency of a spinlock:

- A PE that fails to obtain a lock executes a WFE or WFET instruction, to request entry to a low-power state, at the time when the Exclusives monitor is set holding the address of the location holding the lock.
- When a PE releases a lock, the write to the lock location causes the Exclusives monitor of any PE monitoring the lock location to be cleared. This clearing of the Exclusives monitors generates a WFE wake-up event for each of those PEs. Then, these PEs can attempt to obtain the lock again.

For large systems, more advanced locking systems, such as ticket locks, can avoid unfairness caused by having multiple PEs simultaneously reading the lock. In such systems, the WFE mechanism can be used in a similar way to monitor the next ticket value.

The Event Register

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, the instruction Wait for Event with Timeout (WFET) is implemented as an additional form of the Wait for Event (WFE) instruction.

The Event Register is a single bit register for each PE. When set, an Event Register indicates that an event has occurred since the register was last cleared, that might require some action by the PE. Therefore, when the Event Register is set, the PE must not suspend operation on executing a WFE or a WFET instruction.

The reset value of the Event Register is UNKNOWN.

The Event Register for a PE is set by any of the following:

- A Send Event instruction, SEV, executed by any PE in the system.
- A Send Event Local instruction, SEVL, executed by the PE.
- An exception return.
- The clearing of the global monitor for the PE.
- An event from a Generic Timer event stream, see [Event streams on page D11-3015](#).
- An event sent by some IMPLEMENTATION DEFINED mechanism.

The Event Register is cleared only by a Wait For Event (WFE), or a Wait for Event with Timeout instruction (WFET), instruction.

———— **Note** —————

Software cannot read or write the value of the Event Register directly.

The Wait For Event and Wait for Event with Timeout instructions

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, the instruction Wait for Event with Timeout (WFET) is implemented as an additional form of the Wait for Event (WFE) instruction.

The action of the Wait For Event (WFE) or the Wait for Event with Timeout instructions (WFET), depend on the state of the Event Register:

- If the Event Register is set, the instruction clears the register and completes immediately.

- If the Event Register is clear the PE can suspend execution and enter a low-power state. It remains in that state until the PE detects a WFE wake-up event, or earlier if the implementation chooses, or until a reset. When the PE detects a WFE wake-up event, or earlier if chosen, the WFE or WFET instruction completes. If the wake-up event sets the Event Register, it is IMPLEMENTATION DEFINED whether on restarting execution, the Event Register is cleared.

———— **Note** —————

Software using the Wait For Event mechanism must tolerate spurious wake-up events, including multiple wake-ups.

Trapping of WFE and WFET

The WFE and WFET instructions, are available at all Exception levels. Attempts to enter a low-power state made by software executing at EL0, EL1, or EL2 might be trapped to a higher Exception level. See:

- [Traps to EL1 of EL0 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2514.](#)
- [Traps to EL2 of EL0 and EL1 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2524.](#)
- [Traps to EL3 of EL2, EL1, and EL0 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2533.](#)

If FEAT_TWED is implemented, the delay for taking a WFE trap is configurable.

The delay on the trap does not effect the priority of the traps. In particular, if execution is subject to a trap at EL1 as a result of SCTLR_EL1.nTWE==0 and HCR_EL2.TWE==1, the only trap that will be taken is a trap to EL1, even if the delay at EL1 is longer than the delay at EL2.

WFE wake-up events in AArch64 state

The following are *WFE wake-up events*:

- The execution of an SEV instruction on any PE in the multiprocessor system.
- Any physical SError interrupt, IRQ interrupt, or FIQ interrupt received by the PE, that is not disabled by EDSCR.INTdis and:
 - Is marked as **A** in the tables in [Asynchronous exception masking on page D1-2504](#), regardless of the value of the corresponding PSTATE.{A, I, F} mask bit.
 - Is marked as **B** in the tables in [Asynchronous exception masking on page D1-2504](#), if the value of the corresponding PSTATE.{A, I, F} mask bit is 0.

———— **Note** —————

Any physical SError interrupt, IRQ interrupt, or FIQ interrupt that is marked as A/B behaves as A or B. See [A/B on page D1-2505](#).

- In EL1 or EL0, any virtual SError interrupt, IRQ interrupt, or FIQ interrupt received by the PE, that is not disabled by EDSCR.INTdis and is marked as **B** in [Table D1-15 on page D1-2508](#) in [Virtual interrupts on page D1-2506](#), if the value of the corresponding PSTATE.{A, I, F} mask bit is 0.
- An asynchronous External Debug Request debug event, if halting is allowed. For the definition of *halting is allowed* see [Halting allowed and halting prohibited on page H2-7339](#).
See also [External Debug Request debug event on page H3-7395](#).
- An event sent by the timer event stream for the PE. See [Event streams on page D11-3015](#).
- An event caused by the clearing of the global monitor for the PE.
- An event sent by some IMPLEMENTATION DEFINED mechanism.
- When FEAT_WFXT or FEAT_WFXT2 is implemented, for WFIT instructions, a local timeout event caused by the virtual count threshold value, expressed in CNTVCT_EL0, being equaled or exceeded.

Not all of these wake-up events set the Event Register.

Note

The disabling of interrupts, and WFE wake-up events, by [EDSCR.INTdis](#) is possible only when external debug is enabled.

The Send Event instructions

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, the instruction Wait for Event with Timeout (WFET) is implemented as an additional form of the Wait for Event (WFE) instruction.

The Send Event instructions are:

SEV, Send Event This causes an event to be signaled to all PEs in the multiprocessor system.

SEVL, Send Event Local

This must set the local Event Register.

Note

It might signal an event to other PEs by some IMPLEMENTATION DEFINED mechanism, but is not required to do so.

The mechanism that signals an event to other PEs is IMPLEMENTATION DEFINED. The PE is not required to guarantee the ordering of this event with respect to the completion of memory accesses by instructions before the SEV instruction. Therefore, Arm recommends that software includes a DSB instruction before any SEV instruction.

Note

A DSB instruction ensures that no instructions, including any SEV instructions, that appear in program order after the DSB instruction, can execute until the DSB instruction has completed. See [Data Synchronization Barrier \(DSB\) on page B2-150](#).

The SEVL instruction appears to execute in program order relative to any subsequent WFE or WFET instruction executed on the same PE. This is without the need for any explicit insertion of barrier instructions.

The receipt of a signaled SEV or SEVL event by a PE sets the Event Register on that PE.

The SEV and SEVL instructions are available at all Exception levels.

Pseudocode description of the Wait For Event mechanism

This section identifies pseudocode functions that describe the behavior of the Wait For Event mechanism.

The [ClearEventRegister\(\)](#) pseudocode function clears the Event Register of the current PE.

The [IsEventRegisterSet\(\)](#) pseudocode function returns TRUE if the Event Register of the current PE is set and FALSE if it is clear.

The [WaitForEvent\(\)](#) pseudocode function optionally suspends execution until one of the following occurs:

- A WFE wake-up event.
- A reset.
- When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, a Wait for Event with Timeout (WFET) is executing, and a local timeout event occurs.
- The implementation chooses to resume execution.

It is IMPLEMENTATION DEFINED whether restarting execution after the period of suspension causes [ClearEventRegister\(\)](#) to be called.

The [SendEvent\(\)](#) pseudocode function sets the Event Register of every PE in the multiprocessor system.

The `SendEventLocal()` pseudocode function sets the event register for the local PE.

D1.16.2 Wait For Interrupt

When `FEAT_WFxT` or `FEAT_WFxT2` is implemented, the instruction Wait for Interrupt with Timeout (WFIT) is implemented as an additional form of the Wait for Interrupt (WFI) instruction.

Software can use the *Wait for Interrupt (WFI)* and *Wait for Interrupt with Timeout (WFIT)* instructions to cause the PE to enter a low-power state. The PE then remains in that low-power state until it receives a *WFI wake-up event*, or until some other IMPLEMENTATION DEFINED reason causes it to leave the low-power state. The architecture permits a PE to leave the low-power state for any reason, but requires that it must leave the low-power state on receipt of any architected WFI wake-up event.

———— Note ————

Because the architecture permits a PE to leave the low-power state for any reason, it is permissible for a PE to treat WFI as a NOP, but this is not recommended for lowest power operation.

When the PE leaves a low-power state that was entered as a result of a WFI or WFIT instruction, that instruction completes.

The architecture does not define the exact nature of the low-power state, except that the execution of a WFI or WFIT instruction must not cause a loss of memory coherency.

Attempts to enter a low-power state made by software executing at EL0, EL1, or EL2 might be trapped to a higher Exception level. See:

- [Traps to EL1 of EL0 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2514.](#)
- [Traps to EL2 of EL0 and EL1 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2524.](#)
- [Traps to EL3 of EL2, EL1, and EL0 execution of WFE, WFI, WFET, and WFIT instructions on page D1-2533.](#)

WFI wake-up events

The following are *WFI wake-up events*:

- Any physical SError interrupt, IRQ interrupt, or FIQ interrupt received by the PE, that is marked as **A**, **B** or **A/B** in the tables in [Asynchronous exception masking on page D1-2504](#), regardless of the value of the corresponding `PSTATE.{A, I, F}` mask bit.
- In EL1 or EL0, any virtual SError interrupt, IRQ interrupt, or FIQ interrupt received by the PE, that is marked as **B** in [Table D1-15 on page D1-2508](#) in [Virtual interrupts on page D1-2506](#), regardless of the value of the corresponding `PSTATE.{A, I, F}` mask bit.
- An asynchronous External Debug Request debug event, if halting is allowed. For the definition of *halting is allowed* see [Halting allowed and halting prohibited on page H2-7339](#).
See also [External Debug Request debug event on page H3-7395](#).
- An event sent by some IMPLEMENTATION DEFINED mechanism.
- When `FEAT_WFxT` or `FEAT_WFxT2` is implemented, a local timeout event caused by the virtual count threshold value, expressed in `CNTVCT_EL0`, being equaled or exceeded.

———— Note ————

- WFI wake-up events are never disabled by `EDSCR.INTdis`, and are never masked by the `PSTATE.{A, I, F}` mask bits. If wake-up is invoked by an interrupt that is disabled or masked the interrupt is not taken.
- Because debug events are WFI wake-up events, Arm recommends that Wait For Interrupt is used as part of an idle loop rather than waiting for a single specific interrupt event to occur and then moving forward. This ensures that the intervention of debug while waiting does not significantly change the function of the program being debugged.

- Some implementations of the WFI mechanism drain down any pending memory activity before suspending execution. This increases power saving, by increasing the area over which clocks can be stopped. The architecture does not require this operation, therefore software must not rely on the WFI mechanism operating in this way.
-

Using WFI to indicate an idle state on bus interfaces

When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, the instruction Wait for Event with Interrupt (WFIT) is implemented as an additional form of the Wait for Interrupt (WFI) instruction.

Software can use the WFI mechanism to force quiescence on a PE, and, combined with preventing any possible WFI wakeup events, this can be used to complete an entry into a powerdown state.

Because mechanisms for entering powerdown states are inherently IMPLEMENTATION DEFINED, whether an implementation uses the WFI mechanism is IMPLEMENTATION DEFINED. If it does, the WFI or WFIT instruction forces the suspension of execution, and of all associated bus activity.

The control logic that does this also tracks the activity on the bus interfaces of the PE, so that when the PE has completed all current operations and any associated bus activity has completed, it can signal to an external power controller that there is no ongoing bus activity.

However, the PE must continue to process memory-mapped and external debug interface accesses to debug registers when in the WFI state. The indication of idle state to the system normally only applies to the non-debug functional interfaces used by the PE, not the debug interfaces.

If the OS Double Lock control is implemented and [OSDLR_EL1.DLK](#) is 1, the PE must not signal this idle state to the control logic unless it can also guarantee that the debug interface is idle. For more information about the OS Double Lock, see [Debug behavior when the OS Double Lock is locked on page H6-7450](#).

———— Note —————

In a PE that implements separate Core and Debug power domains, the debug interface referred to in this section is the interface between the Core and Debug power domains, since the signal to the power controller indicates that the Core power domain is idle. For more information about the power domains, see [Power domains and debug on page H6-7439](#).

The exact nature of this interface is IMPLEMENTATION DEFINED, but the use of Wait For Interrupt as the only architecturally-defined mechanism that completely suspends execution makes it very suitable as the preferred powerdown entry mechanism.

Pseudocode description of Wait For Interrupt

The [WaitForInterrupt\(\)](#) pseudocode function optionally suspends execution until one of the following occurs:

- A WFI wake-up event.
- A reset.
- When [FEAT_WFxT](#) or [FEAT_WFxT2](#) is implemented, a Wait for Interrupt with Timeout (WFIT) is executing, and a local timeout event occurs.
- The implementation chooses to resume execution.

D1.17 Self-hosted debug

The Armv8-A architecture supports both of the following:

Self-hosted debug

The PE itself hosts a debugger. The debugger programs the PE to generate *debug exceptions*. Debug exceptions are accommodated in the Armv8-A Exception model.

External debug

The PE is controlled by an external debugger. The debugger programs the PE to generate *Debug events*, that cause the PE to enter *Debug state*. In Debug state, the PE is halted.

This section describes self-hosted debug. It includes:

- [Debug exceptions on page D1-2542](#).
- [The PSTATE debug mask bit, D on page D1-2542](#).

For external debug, see [Part H External Debug](#).

D1.17.1 Debug exceptions

Debug exceptions occur during normal program flow, if a debugger has programmed the PE to generate them.

For example, a software developer might use a debugger contained in an operating system to debug an application. To do this, the debugger might enable one or more debug exceptions.

The possible debug exceptions are:

- Breakpoint Instruction exceptions.
- Breakpoint exceptions.
- Watchpoint exceptions.
- Vector Catch exceptions.
- Software Step exceptions.

[Chapter D2 AArch64 Self-hosted Debug](#) describes these in detail for AArch64.

For the PE to generate a debug exception requires that:

- The debug exception is enabled. [The debug exception enable controls on page D2-2568](#) gives the controls for the different debug exceptions.
- Debug exceptions are enabled from the current Exception level and Security state. See [Enabling debug exceptions from the current Exception level on page D2-2571](#).

Debug exceptions are synchronous exceptions, and are accommodated in the Armv8 Exception model.

Note

Breakpoints and Watchpoints can cause entry to Debug state instead of causing debug exceptions. See [Chapter H1 About External Debug](#).

D1.17.2 The PSTATE debug mask bit, D

As with all other exceptions, when a debug exception is taken, software must take care to avoid generating another instance of an exception within the exception handler, to avoid recursive entry into the exception handler and loss of return state.

To help avoid this, the Armv8 architecture provides a debug exception mask bit, `PSTATE.D`, that can mask Watchpoint, Breakpoint, and Software Step exceptions when the target Exception level is the current Exception level.

`PSTATE.D` is set to 1 on taking an exception. This means that while handling an exception in AArch64 state, Watchpoint, Breakpoint, and Software Step exceptions are masked. This prevents recursive entry at the Exception level that debug exceptions are targeted to.

When execution is in AArch64 state, debug exceptions are also masked implicitly when the target Exception level is lower than the current Exception level.

When the target Exception level is higher than the current Exception level, debug exceptions cannot be masked by `PSTATE.D`.

Because debug exceptions are synchronous, the architecture requires that debug exceptions are not generated when `PSTATE.D` is 1. By preventing debug exception generation, debug exceptions cannot be taken at a subsequent time when the Process state D mask bit is cleared to 0.

———— **Note** —————

This differs from the behavior for interrupts, where the `PSTATE.{A, I, F}` mask has the effect of preventing the interrupt from being taken, but instead the interrupt remains pending.

D1.18 Event monitors

The Armv8-A architecture supports the following non-invasive architectural components that allow for event monitoring:

Performance Monitors

The Performance Monitors have a wide feature set, flexible selection of counted events, and are read/write in operation. See [The Performance Monitors Extension](#) on page D1-2544.

Activity Monitors

The Activity Monitors have a narrow feature set, limited selection of counted events, and are read-only in operation. See [The Activity Monitors Extension](#) on page D1-2544.

D1.18.1 The Performance Monitors Extension

The System registers provide access to a Performance Monitors Unit (PMU), defined as the OPTIONAL Performance Monitors Extension to the architecture, a non-invasive debug resource that provides information about the operation of the PE. The PMU provides:

- A 64-bit cycle counter.
- An IMPLEMENTATION DEFINED number of event counters. If `FEAT_PMUv3p5` is implemented, the event counters are 64-bit unsigned counters, otherwise the event counters are 32-bit event counters.

Each event counter can be configured to count occurrences of a specified event. The events that can be counted are:

- Architectural and microarchitectural events that are likely to be consistent across many microarchitectures. The PMU architecture uses event numbers to identify an event, and the PMU specification defines which event number must be used for each of these architectural and microarchitectural events.
- Implementation-specific events. The PMU specification reserves event numbers for implementation-specific events. See [Appendix K3 Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events](#).

For more information, see [Chapter D7 The Performance Monitors Extension](#).

D1.18.2 The Activity Monitors Extension

When the OPTIONAL Activity Monitors Extension is implemented, the System registers provide access to controls and counters for the Activity Monitors Unit (AMU). For more information, see [Chapter D8 The Activity Monitors Extension](#).

D1.19 Interprocessing

Interprocessing is the term used to describe moving between the AArch64 and AArch32 Execution states.

The Execution state can change only on a change of Exception level. This means that the Execution state can change only on taking an exception to a higher Exception level, or returning from an exception to a lower Exception level.

On taking an exception to a higher Exception level, the Execution state either:

- Remains unchanged.
- Changes from AArch32 state to AArch64 state.

On returning from an exception to a lower Exception level, the Execution state either:

- Remains unchanged.
- Changes from AArch64 state to AArch32 state.

———— **Note** —————

If, on taking or returning from an exception, the Exception level remains the same, the Execution state cannot change.

For the description of:

- Exception entry to an Exception level using AArch64, see [Exception entry on page D1-2475](#).
- Exception return from an Exception level using AArch64 state, see [Exception return on page D1-2485](#).
- Exception return to AArch32 state, see [Exception return to an Exception level using AArch32 on page G1-6065](#).

———— **Note** —————

The description in [Handling exceptions that are taken to an Exception level using AArch32 on page G1-6043](#) is outside the scope of interprocessing, because such exceptions must have been taken from an Exception level that is using AArch32, and therefore there is no change of Execution state.

The following sections describe the behavior associated with interprocessing.

- [Register mappings between AArch32 state and AArch64 state on page D1-2545](#).
- [State of the general-purpose registers on taking an exception to AArch64 state on page D1-2555](#).
- [SPSR, ELR, and AArch64 SP relationships on changing Execution state on page D1-2557](#).

D1.19.1 Register mappings between AArch32 state and AArch64 state

This section defines the architectural mappings between AArch32 state registers and AArch64 state registers.

The mappings describe:

- For exceptions taken from AArch32 state to AArch64 state, where the AArch32 register content is found.
- For exception returns from AArch64 state to AArch32 state, how the AArch32 register content is derived.

The general model is:

- The AArch32 register contents are situated in the bottom 32 bits of the AArch64 registers.
- In AArch32 state, the upper 32 bits of AArch64 registers are inaccessible and are ignored.

———— **Note** —————

System software that executes in AArch64 state, such as an OS or Hypervisor, can use these mappings for context save and restore, or to interpret and modify the AArch32 registers of an application or virtual machine.

For more information, see the following subsections:

- [Mapping of the general-purpose registers between the Execution states on page D1-2546](#).
- [Mapping of the SIMD and floating-point registers between the Execution states on page D1-2547](#).
- [Mapping of the System registers between the Execution states on page D1-2548](#).

Mapping of the general-purpose registers between the Execution states

Table D1-27 on page D1-2546 shows how each of the AArch32 general-purpose registers, R0-R12, SP, and LR, including the banked copies of these registers, maps to an AArch64 general-purpose register. A register in the *AArch64 register* on page D1-2546 column of the table provides the AArch64 view of the corresponding register in the *AArch32 register* on page D1-2546 column.

———— **Note** —————

For some exceptions, the exception syndrome given in the *ESR_ELx* identifies one or more register numbers from the issued instruction that generated the exception. Where the exception is taken from an Exception level using AArch32, these register numbers give the AArch64 view of the register. For example, if an exception is taken from AArch32 Abort mode, and the faulting instruction specified R14, the *ESR_ELx.ISS* field would report this using the EC value 0b10100, because register X20 provides the AArch64 view of LR_abt, which is the copy of R14 used in Abort mode.

Table D1-27 General-purpose register mapping between AArch32 state and AArch64 state

———— **Note** —————

For a description of the banking of AArch32 general-purpose registers R8-R12, SP, and LR, see [AArch32 general-purpose registers, the PC, and the Special-purpose registers on page G1-6031](#).

Mapping of the SIMD and floating-point registers between the Execution states

[Table D1-28 on page D1-2547](#) shows the mapping between the AArch64 V registers and the AArch32 Q registers.

Table D1-28 SIMD and floating-point register mapping between AArch64 state and AArch32 state

AArch64 register	AArch32 register
V0	Q0
V1	Q1
V2	Q2
.	.
.	.
.	.
V15	Q15

The AArch64 registers V16-V31 are not accessible from AArch32 state.

The mapping between the V, D, and S registers in AArch64 state is not the same as the mapping between the Q, D, and S registers in AArch32 state:

- In AArch64 state, there are:
 - 32 128-bit V registers, V0-V31.
 - 32 64-bit D registers, D0-D31.
 - 32 32-bit S registers, S0-S31.

A smaller register occupies the least-significant bytes of the corresponding larger register. For example, S5 is the least-significant word of D5 and V5. [Figure D1-3 on page D1-2548](#) shows this mapping.

Figure D1-3 AArch64 state SIMD and floating-point register mappings

- In AArch32 state, there are:
 - 16 128-bit Q registers, Q0-Q15.
 - 32 64-bit D registers, D0-D31.
 - 32 32-bit S registers, S0-S31.

Smaller registers are packed into larger registers. Figure D1-4 on page D1-2548 shows this mapping.

Figure D1-4 AArch32 state SIMD and floating-point register mappings

In AArch32 state:

- There are no S registers that correspond to Q8-Q15.
- D16-D31 pack into Q8-Q15. For example, D16 and D17 pack into Q8.

———— **Note** ————

A consequence of this mapping is that if software executing in AArch64 state interprets D or S registers from AArch32 state, it must unpack the D or S registers from the V registers before it uses them.

Mapping of the System registers between the Execution states

Armv8 architecturally defines the relationship between the AArch64 System registers and the AArch32 System registers, to allow supervisory code such as a hypervisor, that is executing in AArch64 state, to save, restore, and interpret the System registers belonging to a lower Exception level that is using AArch32.

Any modifications made to AArch32 System registers affects only those parts of those AArch64 registers that are mapped to the AArch32 System registers. Bits[63:32] of AArch64 registers, where they are not mapped to AArch32 registers, are unchanged by AArch32 state execution.

———— **Note** ————

This model is different to the model for the general-purpose registers described in *Mapping of the general-purpose registers between the Execution states on page D1-2546*. In this model, there are several cases where two AArch32 System registers are packed into a single AArch64 System register.

When EL3 is implemented and is using AArch32, some System registers are banked between the two Security states. When a register is banked in this way, there is an instance of the register in Secure state, and another instance of the register in Non-secure state. In *Table D1-29 on page D1-2549* these banked registers are identified by footnote^a. This banking is not supported when EL3 is using AArch64 or if EL3 is not implemented. This means that when EL3 is implemented and is using AArch64, exactly the same registers are accessed in the following states:

- Secure EL1 with EL1 using AArch32.
- Non-secure EL1 with EL1 using AArch32.

This means that, architecturally, it is not possible to determine whether an AArch64 register is mapped onto the Secure instance of the corresponding AArch32 register, or onto the Non-secure instance of that register. When EL3 is using AArch64, the interrupt asserted by the AArch64 CNTP_* timer is the same interrupt as is asserted by the Non-secure AArch32 CNTP_* timer when EL3 is using AArch32.

———— **Note** ————

Although the architecture does not require this, because it is not architecturally visible, Arm expects that implementations will map many of the AArch64 registers for use by EL3 to the Secure instances of the banked AArch32 registers, and will map many of the AArch64 registers for use by EL1 to the Non-secure instances of the banked AArch32 registers. However, if EL2 and EL3 are implemented and both support use of AArch32, this is not possible for the following registers:

- IFAR** This is because when EL3 is using AArch32, **HIFAR** is an alias of the Secure **IFAR**.
- DFAR** This is because when EL3 is using AArch32, **HDFAR** is an alias of the Secure **DFAR**.

Table D1-29 on page D1-2549 shows the mappings between the writable AArch64 System registers and the AArch32 System registers.

- a. AArch32 registers that are banked if EL3 is using AArch32.
- b. These registers have overlapping register content. One or more bits of one register appear in the other register.

There are a small number of AArch32 System registers that are not mapped to any AArch64 System registers. The AArch64 registers listed in [Table D1-30 on page D1-2554](#) can be used to access these from a higher Exception level that is using AArch64. The registers shown in the table are UNDEFINED if EL1 cannot use AArch32.

Table D1-30 AArch64 registers for accessing registers that are only used in AArch32 state

AArch32 register	Register for access from AArch64 state	Short description
DACR	DACR32_EL2	Domain Access Control Register
DBGVCR	DBGVCR32_EL2	Debug Vector Catch Register
FPEXC	FPEXC32_EL2	Floating-Point Exception Control Register
IFSR	IFSR32_EL2	Instruction Fault Status Register
SDER	SDER32_EL3	AArch32 Secure Debug Enable Register

[Table D1-31 on page D1-2554](#) shows the AArch64 System registers that allow access from AArch64 state to the AArch32 ID registers. These AArch64 registers are UNKNOWN if no Exception level can use AArch32.

Table D1-31 AArch64 registers that access the AArch32 ID registers

AArch32 register	Register for access from AArch64 state	Short description
ID_AFR0	ID_AFR0_EL1	AArch32 Auxiliary Feature Register 0

ID_PFR1	ID_PFR1_EL1	AArch32 PE Feature Register 1

D1.19.2 State of the general-purpose registers on taking an exception to AArch64 state

When an exception is taken from AArch32 state to AArch64 state, the state of a general-purpose register depends on whether, immediately before the exception, the register was accessible from AArch32 state, as follows:

If the general-purpose register was accessible from AArch32 state

The upper 32 bits either become zero, or hold the value that the same architectural register held before any AArch32 execution. The choice between these two options is IMPLEMENTATION DEFINED, and might vary dynamically within an implementation. Correspondingly, software must regard the value as being a CONSTRAINED UNPREDICTABLE choice between these two values.

This behavior applies regardless of whether any execution occurred at the Exception level that was using AArch32. That is, this behavior applies even if AArch32 state was entered by an exception return from AArch64 state, and another exception was immediately taken to AArch64 state without any instruction execution in AArch32 state.

Which general-purpose registers have their upper 32 bits affected in this way depends on both:

- The AArch64 state target Exception level.
- The values of both:
 - SCR_EL3.RW.
 - HCR_EL2.RW or HCR.RW, where HCR.RW is a notional bit that is RES0.

Table D1-32 on page D1-2555 shows which general-purpose registers can have their upper 32 bits set to zero.

Table D1-32 General-purpose registers that can have their upper 32 bits set to zero on taking an exception to AArch64 state from AArch32 state

SCR_EL3.RW	HCR_EL2.RW or HCR.RW ^a	Registers when the target Exception level is:		
		EL3	EL2	EL1
0	0	X0-X30	_b	_b
0	1	_c	_c	_c
1	0	X0-X14, X16-X30	X0-X14, X16-X30	_b
1	1	X0-X14	X0-X14	X0-X14

a. HCR.RW is a notional bit that is RES0.

b. The RW bit values are not valid for the targeted Exception level.

c. Not valid because the RW bit values would imply that EL2 is AArch32 and EL1 is AArch64.

———— **Note** ————

If EL2 is not implemented, or the [SCR_EL3.NS](#) or [SCR.NS](#) bit prevents its use, then as described in *The effects of supporting fewer than four Exception levels on page D1-2560*, the behavior is consistent with [HCR_EL2.RW](#) taking the value of [SCR_EL3.RW](#).

If the general-purpose register was not accessible from AArch32 state

The general rule is that the register retains the state it had before any AArch32 execution.

There is one exception to this rule, that is when taking an exception to EL3 using AArch64 when either EL2 is not implemented or EL1 is in Secure state. In these cases, the X15 register must be treated as if it is accessible when the value of [SCR_EL3.RW](#) is 0, and therefore the upper bits of X15 might either be set to zero or retain their previous value.

Which general-purpose registers retain their state depends on both:

- The AArch64 state target Exception level.
- The values of both:
 - [SCR_EL3.RW](#).
 - [HCR_EL2.RW](#) or [HCR.RW](#), where [HCR.RW](#) is a notional bit that is RES0.

[Table D1-33 on page D1-2556](#) shows which general-purpose registers can retain their state.

Table D1-33 General-purpose registers that can retain their state on taking an exception to AArch64 from AArch32

SCR_EL3.RW	HCR_EL2.RW or HCR.RW ^a	Registers when the target Exception level is:		
		EL3	EL2	EL1
0	0	None	_ b	_ b
0	1	_ c	_ c	_ c
1	0	X15	X15	_ b
1	1	X15-X30	X15-X30	X15-X30

- a. [HCR.RW](#) is a notional bit that is RES0.
- b. The RW bit values are not valid for the targeted Exception level.
- c. Not valid because the RW bit values would imply that EL2 is AArch32 and EL1 is AArch64.

———— **Note** ————

If EL2 is not implemented, or the [SCR_EL3.NS](#) bit prevents its use, then as described in *The effects of supporting fewer than four Exception levels on page D1-2560*, the behavior is consistent with [HCR_EL2.RW](#) taking the value of [SCR_EL3.RW](#).

D1.19.3 SPSR, ELR, and AArch64 SP relationships on changing Execution state

Table D1-34 on page D1-2557 shows the SPSR and ELR registers that are architecturally mapped between AArch32 state and AArch64 state.

Table D1-34 SPSR and ELR mappings between AArch32 state and AArch64 state

AArch32 register	AArch64 register
SPSR_svc	SPSR_EL1
SPSR_hyp	SPSR_EL2
ELR_hyp	ELR_EL2

On exception entry to EL3 using AArch64 state from an Exception level using AArch32 state, when EL2 has been using AArch32 state, the upper 32-bits of [ELR_EL2](#) are either set to zero or they retain the value before the AArch32 state execution. The implementation determines the choice between these two options, and the choice might vary dynamically within an implementation. Therefore, software must regard the upper 32-bits as being UNKNOWN.

On exception entry to an Exception level using AArch64 state from an Exception level using AArch32 state, the AArch64 Stack Pointers and Exception Link Registers associated with an Exception level that are not accessible during execution in AArch32 state at that Exception level, retain the state that they had before the execution in AArch32 state.

The following AArch32 registers are used only during execution in AArch32 state. However, they retain their state when there is execution at EL1 with EL1 using AArch64 state:

- [SPSR_abt](#).
- [SPSR_und](#).
- [SPSR_irq](#).
- [SPSR_fiq](#).

———— **Note** ————

- These registers are accessible during execution in AArch64 state at Exception levels higher than EL1, for context switching.
- If EL1 does not support execution in AArch32 state then these registers are RES0.

On exception entry to an Exception level using AArch64 from an Exception level using AArch32, the AArch64 Stack Pointers and Exception Link Registers associated with an Exception level that are not accessible during AArch32 execution at that Exception level retain the state that they had before AArch32 execution. This applies to the following registers:

- [SP_EL0](#).
- [SP_EL1](#).
- [SP_EL2](#).
- [ELR_EL1](#).

D1.20 The effect of implementation choices on the programmers' model

Three of the implementation choices in Armv8 are:

- The number of Exception levels implemented.
- Which Exception levels support AArch32 and which Exception levels support AArch64.
- Whether SIMD and floating-point support is implemented.

The following subsections give more information about how these choices affect the programmers' model:

- [Implication of Exception levels implemented on page D1-2558](#).
- [Support for Exception levels and Execution states on page D1-2559](#).
- [Implementations not including Advanced SIMD and floating-point instructions on page D1-2559](#).
- [The effects of supporting fewer than four Exception levels on page D1-2560](#).

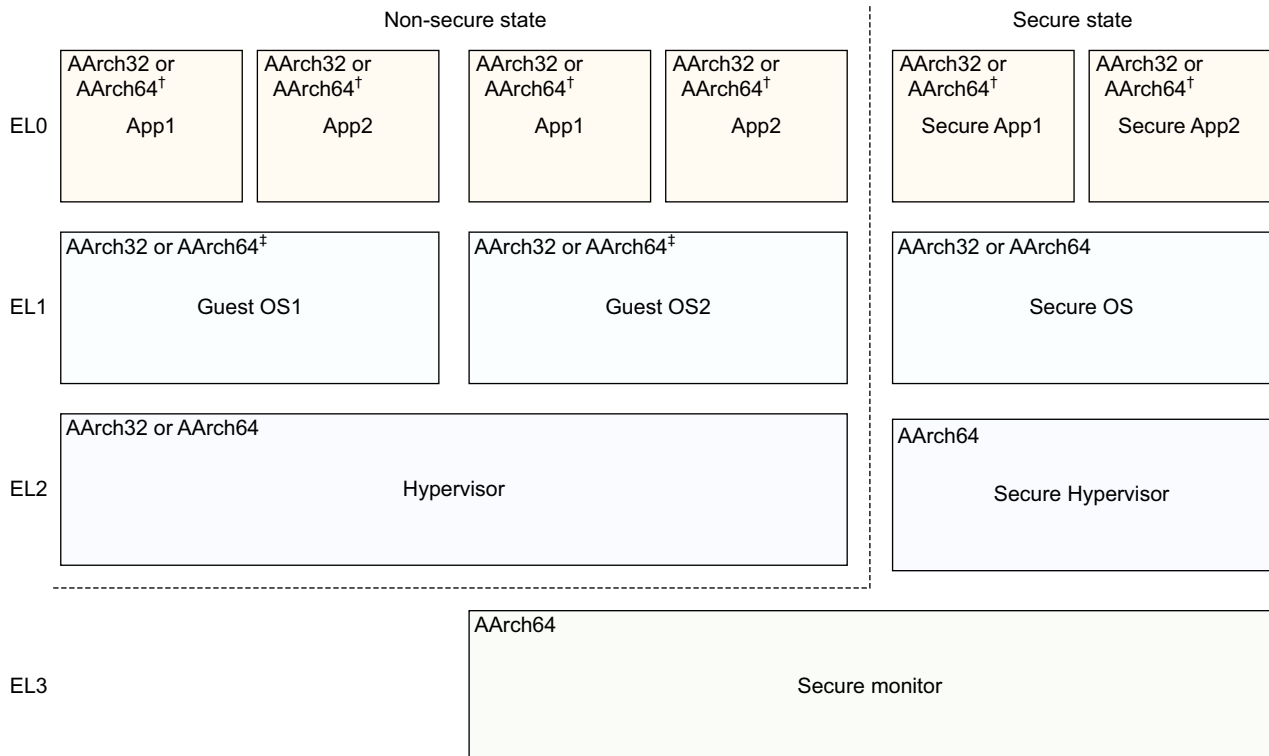

D1.20.1 Implication of Exception levels implemented

All implementations must include EL0 and EL1.

EL2 and EL3 are optional. The architecture permits all combinations of EL2 and EL3.

See also [Implementations not including Advanced SIMD and floating-point instructions on page D1-2559](#) and [The effects of supporting fewer than four Exception levels on page D1-2560](#).

For an implementation that includes all of the Exception levels [Figure D1-5 on page D1-2558](#) shows the implemented Exception levels and the possible Execution states at lower Exception levels when EL3 is using AArch64. [Figure D1-5 on page D1-2558](#) applies regardless of whether EL3 also supports use of AArch32.

[†] AArch64 permitted only if EL1 is using AArch64

[‡] AArch64 permitted only if EL2 is using AArch64

Figure D1-5 Armv8-A security model when EL3 is using AArch64

The possible combinations of Exception levels are as follows:

- EL0, EL1, and EL2. The implementation supports only a single Security state. This might be either Secure state or Non-secure state.
- EL0, EL1, and EL3. The implementation does not support Virtualization. The Exception levels and Execution states depend on whether EL3 is using AArch64 state or AArch32 state, as follows:
 - If EL3 is using AArch64, the Exception levels and Execution states are as shown in [Figure D1-5 on page D1-2558](#) with EL2 removed and no virtualization of EL1 and EL0.
 - If EL3 is using AArch32, the Exception levels and Execution states are as shown in [Figure G1-1 on page G1-6020](#) with EL2 removed and no virtualization of EL1 and EL0.
- EL0 and EL1 only. The implementation supports only a single Security state. This might be either Secure state or Non-secure state, see [Behavior when only EL1 and EL0 are implemented on page D1-2561](#).
- EL0, EL1, EL2, and EL3, as described in this section.

For more information, see [The effects of supporting fewer than four Exception levels on page D1-2560](#).

D1.20.2 Support for Exception levels and Execution states

Subject to the interprocessing rules defined in [Interprocessing on page D1-2545](#), an implementation of the Arm architecture could support:

- AArch64 state only.
- AArch64 and AArch32 states.
- AArch32 state only.

This means the Armv8-A architecture can, potentially, support implementations with very large number of combinations of Execution state and Exception level. Arm intends to license only a subset of the possible combinations.

In an implementation that:

- Supports AArch64 state, all Exception levels are included.
- Has Secure and Non-secure states, EL3 should be implemented.
- Includes all Exception levels, EL3 cannot be included in AArch32 state.

D1.20.3 Implementations not including Advanced SIMD and floating-point instructions

In general, Armv8-A requires the inclusion of the Advanced SIMD and floating-point instructions in all instruction sets. Exceptionally, for implementations targeting specialized markets that do not require support for floating-point or use of Advanced SIMD, Arm might produce or license an Armv8-A implementation that does not provide any support for Advanced SIMD and floating-point instructions. In such an implementation:

In AArch64 state

- The [CPACR_EL1.FPEN](#) field is RES0.
- The [CPTR_EL2.TFP](#) bit is RES1.
- The [CPTR_EL3.TFP](#) bit is RES1.
- Each of the [ID_AA64PFR0_EL1](#).{AdvSIMD, FP} fields is 0b1111.
- The [FPEXC32_EL2](#), [FPCR](#), and [FPSR](#) registers are not implemented, and their encodings are UNDEFINED.
- Attempted accesses to Advanced SIMD and floating-point functionality are UNDEFINED. This means:
 - All Advanced SIMD and floating-point instructions are UNDEFINED.
 - Attempts to access the Advanced SIMD and floating-point System registers are UNDEFINED.
- If at least one Exception level supports execution in AArch32 state, the [MVFR0_EL1](#), [MVFR1_EL1](#) and [MVFR2_EL1](#) registers are RAZ. When no Exception level supports execution in AArch32 state these registers are UNKNOWN.

In AArch32 state

See [AArch32 implications of not including support for Advanced SIMD and floating-point on page G1-6112](#).

D1.20.4 The effects of supporting fewer than four Exception levels

[The effect of implementation choices on the programmers' model on page D1-2558](#) defines the permitted combinations of Exception levels in an Armv8-A implementation.

In every implementation that supports the highest Exception level using either AArch64 state or AArch32 state, an IMPLEMENTATION DEFINED mechanism determines whether the highest implemented Exception level uses AArch64 state or AArch32 state from a Cold reset. Typically, this mechanism is a configuration input. When the highest level is configured to be AArch64 state, then after a Cold reset execution starts at the reset vector in that Exception level.

The unimplemented Exception levels have no effect on execution:

- No interrupts are routed to these Exception levels.
- No traps that target these Exception levels are active.
- All systems calls to unimplemented Exception levels from lower Exception levels are treated as UNDEFINED.
- There is no support for address translation from these Exception levels.
- Any exception return that targets an unimplemented Exception level is treated as an illegal exception return as described in [Illegal return events from AArch64 state on page D1-2486](#).
- Every accessible register associated with an unimplemented Exception level is RES0 unless the register is associated with the Exception level only to provide the ability to transfer execution to a lower Exception level.

———— Note —————

If, for example, EL3 is not implemented and EL2 is the highest implemented Exception level, then because none of the EL3 registers are accessible from EL2, the content of those registers is not architecturally visible.

The following subsections give more information about each of the permitted combinations of Exception levels that do not include all Exception levels.

Behavior when EL3 is not implemented

If EL3 is not implemented:

- If EL2 is implemented and Secure EL2 is not implemented, the *Effective value* of SCR_EL3.NS is 0b1.
- If Secure EL2 is implemented, the *Effective value* of SCR_EL3.EEL2 is 0b1 and the *Effective value* of SCR_EL3.NS is 0b0.
- If EL2 is not implemented, it is IMPLEMENTATION DEFINED whether the *Effective value* of SCR_EL3.NS is 0b1 or 0b0.

Behavior when EL2 is not implemented

If EL2 is not implemented and EL3 is implemented:

- If EL1 can use AArch32 then the following registers are not RES0:
 - DACR32_EL2.
 - IFSR32_EL2.
 - FPEXC32_EL2.
 - DBGVCR32_EL2.
- The VMPIDR_EL2 and VPIDR_EL2 behave as follows:
 - Reads of VMPIDR_EL2 return the value of MPIDR_EL1, writes to VMPIDR_EL2 are ignored.
 - Reads of VPIDR_EL2 return the value of MIDR_EL1, writes to VPIDR_EL2 are ignored.

- Behavior is consistent with the `HCR_EL2.RW` bit taking the value of the `SCR_EL3.RW` bit for all purposes other than reading the `HCR_EL2`.
- Virtual interrupts are disabled.
- The following address translation and TLB invalidation instructions are UNDEFINED:

- `AT S1E2R` and `AT S1E2W`.
- `TLBI VAE2`, `TLBI VAE2NXS`, `TLBI VALE2`, `TLBI VALE2NXS`, `TLBI VAE2IS`, `TLBI VAE2ISNXS`, `TLBI VALE2IS`, `TLBI VALE2ISNXS`, `TLBI VAE2OS`, `TLBI VAE2OSNXS`, `TLBI VALE2OS`, `TLBI VALE2OSNXS`, `TLBI ALLE2`, `TLBI ALLE2NXS`, `TLBI ALLE2IS`, `TLBI ALLE2ISNXS`, `TLBI ALLE2OS`, `TLBI ALLE2OSNXS`, `TLBI RVAE2`, `TLBI RVAE2NXS`, `TLBI RVALE2`, `TLBI RVALE2NXS`, `TLBI RVAE2IS`, `TLBI RVAE2ISNXS`, `TLBI RVALE2IS`, `TLBI RVALE2ISNXS`, `TLBI RVAE2OS`, `TLBI RVAE2OSNXS`, `TLBI RVALE2OS`, `TLBI RVALE2OSNXS`.

———— **Note** —————

No other TLB or address translation instructions become UNDEFINED with this combination of Exception levels.

- The `SCR_EL3.HCE` bit is RES0.

If EL2 is not implemented, regardless of whether EL3 is implemented:

- The *Effective value* of `CNTHCTL_EL2[1:0]` is 0b11.
- The *Effective value* of `MDCR_EL2.HPMN` is the value of `PMCR_EL0.N`.

Behavior when only EL1 and EL0 are implemented

If EL3 and EL2 are not implemented, it is IMPLEMENTATION DEFINED whether the *Effective value* of the `SCR_EL3.NS` bit is 0b1 or 0b0.

This means that if the PE is part of a system that supports two Security states:

- When the *Effective value* of the `SCR_EL3.NS` bit is 0b1, the PE can only access Non-secure memory.
- When the *Effective value* of the `SCR_EL3.NS` bit is 0b0, the PE can access both Secure memory and Non-secure memory.

If the *Effective value* of the `SCR_EL3.NS` bit is 0b0, then:

- The *Effective value* of `MDCR_EL3.{EPMAD, EDAD}` is {0b1, 0b1}.
- The *Effective value* of `MDCR_EL3.{SPME, NSPB}` is {0b1, 0b01}.
- The *Effective value* of `MDCR_EL3.SPD32` is 0b11.

If EL3 is not implemented, regardless of whether EL2 is implemented, the *Effective value* of `MDCR_EL3.STE` is the inverse of the *Effective value* of `SCR_EL3.NS`.

———— **Note** —————

- The behavior described in this subsection still applies if EL1 is configured to use AArch32.
- The implementation can provide a configuration input that determines, from reset, the *Effective value* of the `SCR_EL3.NS` bit.

Chapter D2

AArch64 Self-hosted Debug

When the PE is using self-hosted debug, it generates *debug exceptions*. This chapter describes the AArch64 self-hosted debug exception model. It is organized as follows:

Introductory information

- [About self-hosted debug on page D2-2564.](#)
- [The debug exception enable controls on page D2-2568.](#)

The debug Exception model

- [Routing debug exceptions on page D2-2569.](#)
- [Enabling debug exceptions from the current Exception level on page D2-2571.](#)
- [The effect of powerdown on debug exceptions on page D2-2573.](#)
- [Summary of the routing and enabling of debug exceptions on page D2-2574.](#)
- [Pseudocode description of debug exceptions on page D2-2576.](#)

The debug exceptions

- [Breakpoint Instruction exceptions on page D2-2577.](#)
- [Breakpoint exceptions on page D2-2579.](#)
- [Watchpoint exceptions on page D2-2598.](#)
- [Vector Catch exceptions on page D2-2612.](#)
- [Software Step exceptions on page D2-2613.](#)

Synchronization requirements

The behavior of self-hosted debug after changes to System registers, or after changes to the authentication interface, but before a *Context synchronization event* guarantees the effects of the changes:

- [Synchronization and debug exceptions on page D2-2626.](#)

D2.1 About self-hosted debug

Self-hosted debug supports debugging through the generation and handling of *debug exceptions*, that are taken using the exception model described in [Chapter D1 The AArch64 System Level Programmers' Model](#). This section introduces some terms that are used in describing self-hosted debug, and then introduces the debug exceptions. See:

- [Definition of a debugger in the context of self-hosted debug on page D2-2564](#).
- [Context ID and Process ID on page D2-2564](#).
- [About debug exceptions on page D2-2564](#).

D2.1.1 Definition of a debugger in the context of self-hosted debug

Within this chapter, *debugger* means that part of an operating system, or higher level of system software, that handles debug exceptions and programs the Debug System registers. An operating system with rich application environments might provide debug services that support a debugger user interface executing at EL0. From the architectural perspective, the debug services are the debugger.

D2.1.2 Context ID and Process ID

A `CONTEXTIDR_ELx` identifies the current *Context ID*, that is used by:

- The debug logic, for breakpoint and watchpoint matching.
- Implemented trace logic, to identify the current process.

In AArch64 state, the `CONTEXTIDR_ELx` has a single field, PROCID, that is defined as the *Process Identifier* (Process ID). Therefore, in AArch64 state, the Context ID and Process ID are identical.

D2.1.3 About debug exceptions

Debug exceptions occur during normal program flow if a debugger has programmed the PE to generate them. For example, a software developer might use a debugger contained in an operating system to debug an application. To do this, the debugger enables one or more debug exceptions. The debug exceptions that can be generated in stage 1 of an AArch64 translation regime are:

- [Breakpoint Instruction exceptions on page D2-2565](#).
- [Breakpoint exceptions on page D2-2565](#), generated by hardware breakpoints.
- [Watchpoint exceptions on page D2-2565](#), generated by hardware watchpoints.
- [Software Step exceptions on page D2-2566](#).

In addition, debug exceptions generated in an AArch32 translation regime might be routed to EL2 using AArch64. See [Routing debug exceptions on page D2-2569](#). [Chapter G2](#) describes the debug exceptions that can be generated in an AArch32 translation regime.

Vector Catch exceptions are exceptions that cannot be generated in an AArch64 translation regime but can be generated in stage 1 of an AArch32 translation regime and routed to EL2 using AArch64. [Vector Catch exceptions on page D2-2612](#) describes the behavior for this case.

The PE can only generate a particular debug exception when both:

1. Debug exceptions are enabled from the current Exception level and Security state.
See [Enabling debug exceptions from the current Exception level on page D2-2571](#). Breakpoint Instruction exceptions are always enabled from the current Exception level and Security state.
2. A debugger has enabled that particular debug exception.
All of the debug exceptions except for Breakpoint Instruction exceptions have an enable control contained in the `MDSR_EL1`. See [The debug exception enable controls on page D2-2568](#).

———— **Note** —————

If *halting is allowed* and `EDSCR.HDE` is 1, hardware breakpoints and watchpoints cause entry to Debug state instead of causing debug exceptions. In Debug state, the PE is halted.

For the definition of halting is allowed, see [Halting allowed and halting prohibited on page H2-7339](#).

The following list summarizes each of the debug exceptions:

Breakpoint Instruction exceptions

Breakpoint instructions generate these. Breakpoint instructions are instructions that software developers can use to cause exceptions at particular points in the program flow.

The breakpoint instruction in the A64 instruction set is BRK #<immediate>. Whenever one of these is committed for execution, the PE takes a Breakpoint Instruction exception.

PE behavior

Breakpoint Instruction exceptions cannot be masked. The PE takes Breakpoint Instruction exceptions regardless of both of the following:

- The current Exception level.
- The current Security state.

For more information, see [Breakpoint Instruction exceptions on page D2-2577](#).

Breakpoint exceptions

The Armv8-A architecture provides 2-16 hardware breakpoints. These can be programmed to generate Breakpoint exceptions based on particular instruction addresses, or based on particular PE contexts, or both.

For example, a software developer might program a hardware breakpoint to generate a Breakpoint exception whenever the instruction with address 0x1000 is committed for execution.

The Armv8-A architecture supports the following types of hardware breakpoint for use in stage 1 of an AArch64 translation regime:

- Address.
 - Comparisons are made with the virtual address of each instruction in the program flow.
- Context:
 - Context ID Match. Matches with the Context ID held in the [CONTEXTIDR_EL1](#).
 - VMID Match. Matches with the VMID value held in the [VTTBR_EL2](#).
 - Context ID and VMID Match. Matches with both the Context ID and the VMID value.

An Address breakpoint can link to a Context breakpoint, so that the Address breakpoint only generates a Breakpoint exception if the PE is in a particular context when the address match occurs.

A breakpoint generates a Breakpoint exception whenever an instruction that causes a match is committed for execution.

PE behavior

If halting is allowed and [EDSCR.HDE](#) is 1, hardware breakpoints cause entry to Debug state. That is, they halt the PE. See [Chapter H2 Debug State](#).

Otherwise:

- If debug exceptions are enabled, hardware breakpoints cause Breakpoint exceptions.
- If debug exceptions are disabled, hardware breakpoints are ignored.

For more information, see [Breakpoint exceptions on page D2-2579](#).

Watchpoint exceptions

The Armv8-A architecture provides 2-16 hardware watchpoints. These can be programmed to generate Watchpoint exceptions based on accesses to particular data addresses, or based on accesses to any address in a data address range.

For example, a software developer might program a hardware watchpoint to generate a Watchpoint exception on an access to any address in the data address range 0x1000 - 0x101F.

A hardware watchpoint can link to a hardware breakpoint if the hardware breakpoint is a *Linked Context* type. In this case, the watchpoint only generates a Watchpoint exception if the PE is in a particular context when the data address match occurs.

The smallest data address size that a watchpoint can be programmed to match on is a byte. A single watchpoint can be programmed to match on one or more bytes.

A watchpoint generates a Watchpoint exception whenever an instruction that initiates an access that causes a match is committed for execution.

PE behavior

If halting is allowed and `EDSCR.HDE` is 1, hardware watchpoints cause entry to Debug state. That is, they halt the PE. See [Chapter H2 Debug State](#).

Otherwise:

- If debug exceptions are enabled, hardware watchpoints cause Watchpoint exceptions.
- If debug exceptions are disabled, hardware watchpoints are ignored.

For more information, see [Watchpoint exceptions on page D2-2598](#).

Vector Catch exceptions

These are not generated in an AArch64 translation regime. They can only be generated in an AArch32 translation regime. See [Vector Catch exceptions on page D2-2612](#).

Software Step exceptions

Software step is a resource that a debugger can use to make the PE single-step instructions.

For example, by using software step, debugger software executing at a higher Exception level can debug software executing at a lower Exception level, by making it single-step instructions.

After the software being debugged has single-stepped an instruction, the PE takes a Software Step exception.

PE behavior

Software step can only be used by a debugger executing in an Exception level that is using AArch64. However, the instruction stepped might be executed in either Execution state, and therefore Software Step exceptions can be taken from either Execution state.

If debug exceptions are enabled, Software Step exceptions can be generated.

If debug exceptions are disabled, software step is inactive.

For more information, see [Software Step exceptions on page D2-2613](#).

[Table D2-1 on page D2-2566](#) summarizes PE behavior and shows the location of the pseudocode for each of the debug exceptions.

Table D2-1 PE behavior and pseudocode for each of the debug exceptions

Debug exception	PE behavior if debug exceptions are:		Pseudocode
	Enabled	Disabled	
Breakpoint Instruction exceptions	Takes the exception	Takes the exception	Pseudocode description of Breakpoint Instruction exceptions on page D2-2578
Breakpoint exceptions	Takes the exception ^a	Ignored	Pseudocode description of Breakpoint exceptions taken from AArch64 state on page D2-2596

Table D2-1 PE behavior and pseudocode for each of the debug exceptions (continued)

Debug exception	PE behavior if debug exceptions are:		Pseudocode
	Enabled	Disabled	
Watchpoint exceptions	Takes the exception ^a	Ignored	<i>Pseudocode description of Watchpoint exceptions taken from AArch64 state on page D2-2611</i>
Vector Catch exceptions	Takes the exception	Ignored	<i>Pseudocode description of Vector Catch exceptions on page G2-6216</i>
Software Step exceptions	Takes the exception	Not applicable ^b	<i>Pseudocode description of Software Step exceptions on page D2-2625</i>

- a. If halting is allowed and EDSCR.HDE is 1, hardware breakpoints and watchpoints cause the PE to enter Debug state instead of causing debug exceptions. See [Chapter H2 Debug State](#).
- b. Software Step is inactive if debug exceptions are disabled. No Software Step exceptions can be generated.

D2.2 The debug exception enable controls

The enable controls for each debug exception are as follows:

Breakpoint Instruction exceptions

None. Breakpoint Instruction exceptions are always enabled.

Breakpoint exceptions

[MDSR_EL1.MDE](#), plus an enable control for each breakpoint, [DBGBCR<n>_EL1.E](#).

Watchpoint exceptions

[MDSR_EL1.MDE](#), plus an enable control for each watchpoint, [DBGWCR<n>_EL1.E](#).

Vector Catch exceptions

[MDSR_EL1.MDE](#).

Software Step exceptions

[MDSR_EL1.SS](#).

In addition, for all debug exceptions other than Breakpoint Instruction exceptions, software must configure the controls that enable debug exceptions from the current Exception level and Security state. See [Enabling debug exceptions from the current Exception level on page D2-2571](#).

The PE cannot take a debug exception if debug exceptions are disabled from either the current Exception level or the current Security state.

Breakpoint Instruction exceptions are always enabled from the current Exception level and Security state.

D2.3 Routing debug exceptions

Debug exceptions are enabled and routed according to the following controls:

- MDCR_EL2.TDE.
- HCR_EL2.TGE.
- MDCR_EL3.SDD.
- The Security state when the exception is taken.
- The Exception level where the exception is taken.

Breakpoint Instructions are enabled in some situations where other Debug exceptions are disabled.

If the OS Lock is locked, or if DoubleLockStatus() == TRUE, a Debug exception cannot be taken.

———— Note —————

If EL2 is not implemented, the *Effective value* of HCR_EL2.TGE is 0 and the *Effective value* of MDCR_EL2.TDE is 0. Throughout this section, references to the values of these fields are to the *Effective values* of the fields.

If EL3 is not implemented, and the implementation is a Secure state only implementation, the *Effective value* of MDCR_EL3.SDD is 0.

The routing of debug exceptions is as follows:

Table D2-2 on page D2-2569 shows when debug exceptions are enabled from the current Security state.

Table D2-2 Whether debug exceptions are enabled from the current Security state

Current Security state	Breakpoint Instruction exceptions	All other debug exceptions
Non-secure	Enabled	Enabled
Secure	Enabled	Disabled if MDCR_EL3.SDD is 1. See <i>Disabling debug exceptions from Secure state</i> on page D2-2571. Otherwise enabled.

Debug exceptions taken when EL2 is implemented and enabled in the current Security state

The routing of debug exceptions taken depends on the values of MDCR_EL2.TDE and HCR_EL2.TGE:

If the *Effective value* of {MDCR_EL2.TDE, HCR_EL2.TGE} is not {0, 0}

Debug exceptions are routed to EL2, EL_D is EL2.

Otherwise

Debug exceptions behave as follows:

- Debug exceptions taken from EL1 and EL0 are routed to EL1. EL_D is EL1
- Breakpoint Instruction exceptions taken from EL2 are routed to EL2.
- All other debug exceptions are disabled from EL2 using AArch64.

When EL3 is implemented

Breakpoint Instruction exceptions taken from EL3 are routed to EL3.

All other debug exceptions are disabled from EL3 using AArch64.

Otherwise Debug exceptions are routed to EL1.

This means that, for all debug exceptions, the *debug target Exception level*, EL_D, is either EL1 or EL2. When executing in the same exception level as EL_D, see *Enabling debug exceptions from the current Exception level* on page D2-2571.

Table D2-3 on page D2-2570, Table D2-4 on page D2-2570, and Table D2-5 on page D2-2570 show the routing of debug exceptions. In these tables:

- NS** Means the *Effective value* of SCR_EL3.NS.
- EEL2** Means the *Effective value* of SCR_EL3.EEL2. If FEAT_SEL2 is not implemented, this is 0.
- TDE or TGE** Means the logical OR of the *Effective value* of MDCR_EL2.TDE and the *Effective value* of HCR_EL2.TGE.
- (EL_D)** Means EL_D is EL_x. However:
- All debug exceptions other than Breakpoint Instruction exceptions are disabled from this Exception level.
 - Breakpoint Instruction exceptions taken when executing in this Exception level are routed to the same Exception level. This may not be the same as the EL_D Exception level.
- EL_x** Means EL_D is EL_x.

Table D2-3 Routing when both EL3 and EL2 are implemented

NS	EEL2	TDE or TGE	EL _D when executing in:			
			EL0	EL1	EL2	EL3
0	0	x	EL1	EL1	n/a	(EL1)
0	1	0	EL1	EL1	(EL1)	(EL1)
0	1	1	EL2	EL2	EL2	(EL2)
1	x	0	EL1	EL1	(EL1)	(EL1)
1	x	1	EL2	EL2	EL2	(EL2)

Table D2-4 Routing when EL3 is implemented and EL2 is not implemented

EL _D when executing in:		
EL0	EL1	EL3
EL1	EL1	(EL1)

Table D2-5 Routing when EL3 is not implemented and EL2 is implemented

TDE	EL _D when executing in:		
	EL0	EL1	EL2
0	EL1	EL1	(EL1)
1	EL2	EL2	EL2

D2.3.1 Pseudocode description of routing debug exceptions

`DebugTarget()` returns the current debug target Exception level.

`DebugTargetFrom()` returns the debug target Exception level for the specified Security state.

These functions are described in [Chapter J1 Armv8 Pseudocode](#).

D2.4 Enabling debug exceptions from the current Exception level

A debug exception can only be taken if all of the following are true:

- The OS Lock is unlocked.
- `DoubleLockStatus() == FALSE`.
- The debug exception is enabled from the current Exception level.
- The debug exception is enabled from the current Security state.

Table D2-6 on page D2-2571 shows when debug exceptions are enabled from the current Exception level. In the table, EL_D is the Exception level that Table D2-3 on page D2-2570 defines.

Table D2-6 Whether debug exceptions are enabled from the current Exception level

Current Exception level	Breakpoint Instruction exceptions	All other debug exceptions
Any Exception level that is higher than EL_D^a	Enabled	Disabled
EL_D	Enabled	Disabled if either of the following is true: <ul style="list-style-type: none"> • The Local (kernel) Debug Enable bit, <code>MDCR_EL1.KDE</code>, is 0. • The Debug exception mask bit, <code>PSTATE.D</code>, is 1. Otherwise enabled. This means that a debugger must explicitly enable these debug exceptions from EL_D by setting <code>MDCR_EL1.KDE</code> to 1 and <code>PSTATE.D</code> to 0.
Any Exception level that is lower than EL_D	Enabled	Enabled

a. This includes EL3. EL3 is always higher than EL_D .

———— **Note** ————

`PSTATE.D` is set to 1 at reset and on exception entry.

D2.4.1 Disabling debug exceptions from Secure state

If EL3 is implemented, software executing at EL3 can set the *Secure Debug Disable* bit, `MDCR_EL3.SDD`, to 1 to disable all debug exceptions taken from AArch64 Secure state other than Breakpoint Instruction exceptions.

The Armv8-A architecture does not support disabling debug in Non-secure state.

———— **Note** ————

- If the boot software executed when reset is deasserted sets `MDCR_EL3.SDD` to 1, software operating at EL3 never has to switch the debug registers between Secure state and Non-secure state.
- The PE cannot take a debug exception unless it is enabled from the current Exception level. See Table D2-6 on page D2-2571.
- If either the OS Lock or the OS Double Lock is locked, debug exceptions other than Breakpoint Instruction exceptions are disabled.
- If EL3 and EL2 are not implemented, and the implementation is a Secure state only implementation, the PE behaves as if `MDCR_EL3.SDD` is 0.

D2.4.2 Pseudocode description of enabling debug exceptions

[AArch64.GenerateDebugExceptions\(\)](#) determines whether debug exceptions other than Breakpoint Instruction exceptions are enabled from the current Exception level and Security state.

[AArch64.GenerateDebugExceptionsFrom\(\)](#) determines whether debug exceptions other than Breakpoint Instruction exceptions are enabled from the specified Exception level and Security state.

These functions are described in [Chapter J1 Armv8 Pseudocode](#).

D2.5 The effect of powerdown on debug exceptions
