1 Introduction

1.1 Conventions

The following subsections describe conventions used in Arm documents.

Glossary

The Arm Glossary is a list of terms used in Arm documentation, together with definitions for those terms. The Arm Glossary does not contain terms that are industry standard unless the Arm meaning differs from the generally accepted meaning.

See the Arm® Glossary for more information: developer.arm.com/glossary.

Typographic conventions

Arm documentation uses typographical conventions to convey specific meaning.

Convention	Use
italic	Introduces special terminology, denotes cross-references, and citations.
bold	Highlights interface elements, such as menu names. Denotes signal names. Also used for terms in descriptive lists, where appropriate.
monospace	Denotes text that you can enter at the keyboard, such as commands, file and program names, and source code.
monospace italic	Denotes arguments to monospace text where the argument is to be replaced by a specific value.
monospace bold	Denotes language keywords when used outside example code.
monospace <u>underline</u>	Denotes a permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.
<and></and>	Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example: MRC p15, 0, <rd>, <crn>, <crm>, <opcode_2></opcode_2></crm></crn></rd>
SMALL CAPITALS	Used in body text for a few terms that have specific technical meanings, that are defined in the Arm Glossary. For example, IMPLEMENTATION DEFINED, IMPLEMENTATION SPECIFIC, UNKNOWN, and UNPREDICTABLE.
Caution	This represents a recommendation which, if not followed, might lead to system failure or damage.
Warning	This represents a requirement for the system that, if not followed, might result in system failure or damage.
Danger	This represents a requirement for the system that, if not followed, will result in system failure or damage.

Convention	Use
Note	This represents an important piece of information that needs your attention.
- Tip	This represents a useful tip that might make it easier, better or faster to perform a task.
Remember	This is a reminder of something important that relates to the information you are reading.

1.2 Feedback

Arm welcomes feedback on this product and its documentation.

Feedback on this product

If you have any comments or suggestions about this product, contact your supplier and give:

- The product name.
- The product revision or version.
- An explanation with as much information as you can provide. Include symptoms and diagnostic procedures if appropriate.

Feedback on content

If you have comments on content then send an e-mail to errata@arm.com. Give:

- The title Arm Streamline Target Setup Guide for Linux.
- The number 101814 0708 00 en.
- If applicable, the page number(s) to which your comments refer.
- A concise explanation of your comments.

Arm also welcomes general suggestions for additions and improvements.

Arm tests the PDF only in Adobe Acrobat and Acrobat Reader, and cannot guarantee the quality of the represented document when used with any other PDF reader.

1.3 Other information

See the Arm website for other relevant information.

- Arm® Developer.
- Arm® Documentation.
- Technical Support
- Arm® Glossary.

2 Target Setup

This chapter explains how to set up your target and host devices ready to use Streamline for application or system profiling.

2.1 Introduction to using Streamline with a Linux device

Streamline supports system-wide profiling of applications running on Linux-based embedded devices. Analyze the behavior of the system hardware by selecting the required Arm CPU or Arm[®] Mali[™] GPU hardware performance counters for your scenario.

This analysis can be supplemented by connecting power measurement probes, such as the Arm Energy Probe or National Instruments DAQ, to provide accurate measurement of system energy use. To provide more context to the analysis, you can use software annotations in Arm software libraries, such as the Mali GPU OpenCL device driver.

Use the information in this guide to prepare your Linux target, ready for profiling with Streamline. Then refer to the Arm Streamline user guide for details about working with Streamline.

2.2 Compiling your application

When building executables for profiling with Streamline, it is best practice to use these compiler options when using GCC or Clang.

-q

Enable the debug symbols necessary for quality analysis reports.

-fno-inline

Disable inlining and substantially improve the call path quality.

-fno-omit-frame-pointer

Compile your EABI images and libraries with frame pointers. This option enables Streamline to record the call stack with each sample taken.

-mno-omit-leaf-frame-pointer

Keep the frame pointer in leaf functions.

-marm

When building for AArch32, if GCC was compiled with the --with-mode=thumb option enabled, this option is required. Using the --with-mode=thumb option without -marm breaks call stack unwinding in Streamline.

Call stack unwinding

You must provide extra compiler flags for call stack unwinding to work.

For AArch64 applications, the flag -fno-omit-frame-pointer is required. -mno-omit-leaf-frame-pointer must also be set on GCC. -mno-omit-leaf-frame-pointer is not supported on Clang, therefore the caller for samples in leaf functions is missing from the stack trace.

For AArch32 applications, the flags -fno-omit-frame-pointer, -marm, and -mapcs-frame are required.

Streamline does not support call stack unwinding for T32 (Thumb®) code. It also does not support call stack unwinding for code that Arm® Compiler version 5 and earlier (armcc) generates.

2.3 Set up your target

To profile your software using Streamline, you must have a suitably configured Linux kernel and gatord running on an Arm®-based hardware target.

Before you begin

- Download and Install Arm Development Studio.
- If you intend to use the Statistical Profiling Extension (SPE) in Streamline, there are some additional system requirements. Refer to System requirements for SPE support.

Procedure

1. Configure the Linux kernel.

The kernel configuration must include the options that are described in Kernel configuration menu options. You can usually find your kernel configuration in /proc/config.gz. If this file is not visible, depending how your system is configured, you can create it by running:

```
sudo modprobe configs
```

The following command confirms whether an option is enabled:

```
zcat /proc/config.gz | grep <OPTION>
```

For example:

```
zcat /proc/config.gz | grep CONFIG PROFILING
```

2. Install gatord on your target.

Kernel space gator (gator.ko) is no longer supported and has been removed from distribution.

Two pre-built gatord binaries are available:

- For Armv7 targets, and Armv8 targets that support AArch32 execution state.
- For Armv8 AArch64 targets.

The source code for gatord is available from the following locations:

- <install directory>/sw/streamline/gator/daemon/.
- https://github.com/ARM-software/gator. This site is the official distribution channel for all gator releases, and contains the latest source updates between Arm Development Studio releases.

The version of gatord running on the target must be compatible with the version of Streamline that you are using. Use the same version of gatord as the version of Streamline.

For more information, see gatord.

3. To ensure gatord has execute permission, enter the following command:

chmod +x gatord

4. Ensure that you have root privileges, if necessary, then enter the following to execute gatord:

./gatord

By default, gatord uses port 8080 for communication with the host, but you can specify the port by launching gatord with the port number as a parameter. For example:

./gatord -p 5050

Next steps

- Capture a profile of your application as described in the Arm Streamline user guide.
- To stop gatord at the end of a capture, press Ctrl+C.

2.4 System requirements for SPE support

When using the Statistical Profiling Extension (SPE) support in Streamline, there are some more system requirements.

• Use Linux kernel 4.16 or later. To confirm that support is available, check for the path /sys/bus/event source/devices/arm spe XX.

- Disable kernel page table isolation for the target. To ensure that kernel page table isolation is disabled, boot the device with the command-line argument kpti=off.
- For kernel versions 4.20 and later, apply the patch at http://lkml.iu.edu/hypermail/linux/kernel/1903.3/06760.html, or upgrade to a kernel version greater than or equal to 5.1-RC5.

For more information about SPE, see the Arm Streamline user guide.

2.5 gatord

To communicate with the target, Streamline requires a daemon, called gatord, to be installed and running on the target. gatord must be running before you can capture trace data.

gatord reads and processes data from applications that are running on the target. When running a headless capture, it then creates a directory, whose name ends in .apc, containing the capture data.

gatord uses the perf API to collect performance information. You can run gatord on a device with or without root permissions. Running gatord on a device with root permissions supports system-wide data collection, including profiling all applications and the kernel. When run as non-root user, gatord is limited to capturing processes that you have permission to profile. These processes are usually running as the same user.

System-wide data collection using non-root gatord falls back to /proc polling, which is deprecated. To perform system-wide data collection, use root gatord.

gatord has some restrictions, for example:

- It polls the following Linux counters every 100ms, instead of every 1ms or when they change because files in the /proc or /sys filesystem are read:
 - Memory
 - Disk I/O
 - Network

This rate is fixed and overrides the sample rate that is specified in the **Capture and Analysis Options** dialog box.

• When using gatord, the Memory: Used counter does not contain per-process information. As a result, memory statistics are not available in **Processes** mode.

2.5.1 gatord command-line options

gatord must be running before you can capture trace data. The command-line options configure how gatord captures events and how it communicates with Streamline running on your host.

gatord has two modes of operation:

Daemon mode (the default mode)

Sends captured events to a host running Streamline.

Local capture mode

To enable this mode, specify an output directory with the --output flag. gatord writes the capture to a file in this directory then exits.

Options available to all modes	Description
-h,help	Lists all the available gatord command-line options.
-c,config-xml <config_xml></config_xml>	Specify the path and filename of the configuration XML file that defines the capture options. In daemon mode, the list of counters is written to this file. In local capture mode, the list of counters is read from this file.
-e,events-xml <events_xml></events_xml>	Specify the path and filename of the events XML file to use. This file defines all the counters that Streamline collects during the capture session.
-E,append-events-xml <events_xml></events_xml>	Specify the path and filename of the events XML file to append.
-P,pmus-xml <pmu_xml></pmu_xml>	Specify the path and filename of the PMU XML file to append.
-v,version	Print version information.
-d,debug	Enable debug messages.
-A,app <cmd> <args></args></cmd>	Specify the command to execute when the capture starts. This argument must be the last argument that is passed to gatord. All subsequent arguments are passed to the launched application.
-S,system-wide <yes no></yes no>	Specify whether to capture the whole system. In daemon mode, no is only applicable whenallow-command is specified. In this mode, you must enter a command in the Start view. Defaults to yes, unlessapp,pid, orwait-process is specified.
-u,call-stack-unwinding <yes no></yes no>	Enable or disable call stack unwinding. Defaults to yes.
-r,sample-rate <none low normal high></none low normal high>	Specify the sample rate for the capture. The frequencies for each sample rate are: • high = 10kHz • normal = 1kHz • low = 100Hz • none = the lowest possible rate Defaults to normal.
-t,max-duration <s></s>	Specify the maximum duration that the capture can run for in seconds. Defaults to 0, which means unlimited.

Options available to all modes	Description
-f,use-efficient-ftrace <yes no></yes no>	Enable efficient ftrace data collection mode. Defaults to yes.
-w,app-cwd <path></path>	Specify the working directory for the application that gatord launches. Defaults to the current directory.
-x,stop-on-exit <yes no></yes no>	Stop the capture when the launched application exits. Defaults to no, unlessapp,pid, orwait-process is specified.
-Q,wait-process <command/>	Wait for a process that matches the specified command to launch before starting the capture. Attach to the specified process and profile it.
Z,mmap-pages <n></n>	The maximum number of pages to map per mmaped perf buffer is equal to $< n+1>$. n must be a power of two.
-O,disable-cpu-onlining <yes no></yes no>	Disable turning CPUs temporarily online to read their information. This option is useful for kernels that fail to handle this action correctly, for example they reboot the system. Defaults to no.

Options available to daemon mode only	Description
-p,port <port_number> uds</port_number>	Set the port number that gatord uses to communicate with the host. The default is 8080.
	If you use the argument uds, the TCP socket is disabled and an abstract Unix domain socket is created. This socket is named streamline-data.
	Alternatively, you can connect to localhost: <local_port> in Streamline using:</local_port>
	<pre>adb forward tcp:<local_port> localabstrac\ t:streamline-data</local_port></pre>
-a,allow-command	Allows you to run a command on the target during profiling. The command is specified in the Start view.
	Caution: If you use this option, an unauthenticated user could run arbitrary commands on the target using Streamline.

Options available to local capture mode only	Description
-s,session-xml <session_xml></session_xml>	Specify the session XML file that the configuration is taken from. Any additional arguments override values that are specified in this file.
-o,output <apc_dir></apc_dir>	Specify the path and filename of the output directory for a local capture. The directory path will be appended with the extension .apc if it is not already the case.
-i,pid <pids></pids>	A comma-separated list of process IDs to profile

Options available to local capture mode only	Description
-C,counters <counters></counters>	A comma-separated list of counters to enable. You can specify this option multiple times. An event code and a slot identify most hardware counters. To specify the counter for a particular slot, pass:
	counters <device>_cnt<s>:<e></e></s></device>
	Where:
	<device> is the prefix that identifies the device type.</device>
	<e> is the event code.</e>
-X,spe <id>[:events=<indexes>][:ops=<type\s>][:min_latency=<lat>]</lat></type\s></indexes></id>	Enable the Statistical Profiling Extension (SPE). Where: * <id> is the name of the SPE properties that are specified in the events XML file or the PMU XML file. It uniquely identifies the available events and counters for the SPE hardware.</id>
	• <indexes> is a comma-separated list of event indexes to fil- ter the sampling by. A sample is only recorded if all events are present.</indexes>
	• <types> is a comma-separated list of operation types to filter the sampling by. If a sample is any of the types in <types>, it is recorded. Valid types are LD for load, ST for store and B for branch.</types></types>
	• <lat> is the minimum latency. A sample is only recorded if its latency is greater than or equal to this value. The valid range is [0,4096).</lat>
-F,spe-sample-rate <n></n>	Specify the SPE periodic sampling rate. The rate, <n>, is the number of operations between each sample, and must be a nonzero positive integer. The hardware specifies the minimum rate. Values below this threshold are ignored and the hardware minimum is used instead.</n>

Argument usage examples

- Use --pmus-xml and --append-events-xml to add support for a new PMU without having to rebuild gatord.
 - --pmus-xml specifies an XML file that defines a new PMU to add to the list of PMUs that gatord has built-in support for. The list of built-in PMUs is defined in pmus.xml, which is in the gatord source directory.
 - --append-events-xml specifies an XML file that defines one or more event counters to append to the events.xml file. This option allows you to add new events to gatord without having to rebuild gatord or to entirely replace events.xml.

The events.xml file must include the XML header and elements that are shown in the following example:

```
name="loginuid" description="loginuid"/>
    </category>
</events>
```

• The Instructions Executed counter is configured in slot 0 as:

```
--counters ARMv8_Cortex_A53_cnt0:0x08
```

To configure the cycle counter, specify --counters <device> ccnt. For example:

```
--counters ARMv8_Cortex_A53_ccnt
```

Other counters do not have event codes and are identified only by name. For example:

```
--counters PERF_COUNT_SW_PAGE_FAULTS
```

2.6 Capture data locally on a target

You can run gatord from the command line to configure the counters and capture data locally on your target.

Procedure

Start gatord specifying:

- The location for the output file with --output.
- Optionally specify which counters to use with either --config-xml or --counters.

```
./gatord --output <path> --counters <counters>
```

Results

gatord captures a profile of all the processes running on your system, and writes the data to the specified location.

Next steps

Copy the .apc directory into the Streamline capture directory. This directory is usually <Home>/ Documents/Streamline.

Related information

Creating a configuration.xml file

2.7 Support for Arm CoreLink tools

Streamline supports the CoreLink Level 2 Cache Controller (L2C-310) and the CoreLink Cache Coherent Network (CCN).

Profile the CCN using perf. The perf driver for CCN is merged into Linux 3.17, but can be backported to previous versions. See https://git.kernel.org/pub/scm/linux/kernel/git/torvalds/linux.git/diff/?id=a33b0daab73a0e08cc04459dd44b0121a8e8f81b, and later bug fixes.

2.8 Enable ttrace annotations

Streamline supports thrace annotations on targets that are running Tizen version 2.4 or later.

Procedure

- 1. Select Window > Preferences > Streamline > External Tools.
- 2. In the **ADB Path** field, specify the path to SDB.
- 3. In the **Start** view, select a target Tizen device with gatord running on it.
- 4. In the **Counter Configuration** dialog box, select the ttrace events to capture from the **Ttrace** section.

Results

Streamline displays the ttrace tags as annotations in the **Timeline** view and the **Log** view.

2.9 Using Streamline with Arm NN

Streamline supports capturing profiling information from Arm NN enabled applications. This feature enables you to collect performance counters from supported Arm[®] Ethos[™] NPUs and performance data from the Arm NN library. To profile an Arm NN application, gatord must first see which events are available in the running application. Streamline can then capture a profile as normal.

Before you begin

- Build your application against Arm NN version 20.08 or later. See https://github.com/ARM-software/armnn for more information.
- When you create the runtime in your application code, you must set
 options.m_ProfilingOptions.m_EnableProfiling = true for the options
 passed to IRuntime::Create.
- Enable timeline profiling by setting options.m ProfilingOptions.m TimelineEnabled = true.

```
// Create Arm NN runtime

IRuntime::CreationOptions options; // default options
options.m_ProfilingOptions.m_EnableProfiling = true;
options.m_ProfilingOptions.m_TimelineEnabled = true;
```

IRuntimePtr run = IRuntime::Create(options);

Procedure

1. Start gatord in daemon mode as described in Set up your target.

Local capture mode is not available because gatord does not know which events are available yet.

- 2. Run your application.
- 3. Configure counters and capture a profile of the application as described in the Arm Streamline User Guide.

To get the timeline data, you must start your application again after starting the capture.

3 Customize your Streamline report

This chapter explains how to add support for a new CPU, or an uncore peripheral outside of the CPU, to Streamline.

3.1 Add a CPU to Streamline

Customize your Streamline reports with support for custom CPU Performance Monitoring Units (PMUs).

Procedure

- Create an events-cprocessor_name
 xml file and save it in
 install directory
 sw/streamline/gator/daemon/.
- 2. Include the following in the file:

```
<counter_set name="<ID>_cnt" count="<NEVENTS>"/>
<category name="<NAME>" counter_set="<ID>_cnt" per_cpu="no">
    <event .../ >
</category>
```

<ID> is a string that can contain letters, numbers, and underscores.

<NEVENTS> is the maximum number of counters in the hardware.

If the number of events is unlimited, the <counter_set> element and the counter set="<ID> cnt" attribute are not required.

- 3. Add a <pmu> element to pmus.xml .

 See the comment at the top of the pmus.xml file for the required attributes.
- 4. Rebuild gatord.

3.2 Add an uncore peripheral to Streamline

Customize your Streamline reports with support for custom uncore peripheral Performance Monitoring Units (PMUs).

Procedure

- 1. Create an events-<peripheral_name>.xml file and save it in <DS install directory>/sw/streamline/gator/daemon/.
- 2. Include the following in the file:

</category>

<ID> is a string that can contain letters, numbers, and underscores.

<NEVENTS> is the maximum number of counters in the hardware.

If the number of events is unlimited, the <counter_set> element and the counter set="<ID> cnt" attribute are not required.

- 3. Add an <uncore_pmu> element to pmus.xml.

 See the comment at the top of the pmus.xml file for the required attributes.
- 4. Rebuild gatord.

3.3 Contributing CPU and peripheral support

The gator daemon is an open-source component, licensed under the GPLv2 license, and published on GitHub. We are willing to accept pull requests from external developers to add support for custom Arm cores and supporting uncore peripherals.

The gator daemon is in this repository https://github.com/ARM-software/gator/, where you can also find the contributing guidelines.

4 Troubleshooting Common Arm Streamline Issues (Linux)

Troubleshoot known Streamline issues.

4.1 Troubleshooting target connection issues

Use these solutions for common target connection issues.

Problem	Solution
Error message generated:	Make sure gatord is running on your target. Enter the following command in the shell of your target:
Unable to connect to the gator daemon at <tar\ get_address="">.</tar\>	ps ax grep gatord
Please verify that the target is reachable and that you are running gator daemon v17 or lat\er. Installation instructions can be found in: streamline/gator/README.md.	If this command returns no results, gatord is not active. Start it by navigating to the directory that contains gatord and entering the following command:
If connecting over WiFi, please try again or use a wired connection.	sudo ./gatord &
	Try connecting to the target again.
	If gatord is active and you still receive this error message, disable any firewalls on your host machine that might interfere with communication between host and target.
Error message generated:	Make sure that you have correctly entered the name or IP address of the target in the Address field. If you have entered a name, try
Unknown host	entering an IP address instead.
When using event-based sampling, Streamline fails to find the PMU.	The PMU on your hardware might not be correctly configured to allow the processor interrupts necessary for Streamline to use event-based sampling. Test on alternate hardware or disable event-based sampling in the Counter Configuration dialog box.

Problem	Solution
The target is running a firewall, which prevents Streamline from connecting to gatord.	There are several possible ways to resolve this issue:
	Update the firewall to allow connections to gatord, which defaults to using port 8080.
	Use local captures.
	If the target accepts SSH connections, you can establish an SSH tunnel by using the ssh command on the host. For example:
	ssh <user>@<target> -L 8080:localhost:8080 -N</target></user>
	In this example, replace <user> with the username to log in as and <target> with the hostname of the target. On the target, use localhost as the hostname.</target></user>
	Note: An SSH tunnel requires extra processing on the target.
	Reverse SSH tunnels are also possible by running ssh from the target to the host. For example:
	ssh <user>@<host> -R 8080:localhost:8080 -N</host></user>

4.2 Troubleshooting gatord issues

Use these solutions for issues related to gatord.

Problem	Solution
Kernel version before 4.6 with CONFIG_CPU_PM enabled produces invalid results. For example, counters not showing any data, large spikes, and non-sensible values for counters. This issue is due to the kernel PMU driver not saving state when the processor powers down, or not restoring state when it powers up.	Upgrade to the latest version of the kernel, or apply the patch found at https://git.kernel.org/pub/scm/linux/kernel/git/torvalds/linux.git/commit/?id=da4e4f18afe0f3729d68f3785c5802f786d36e34. This patch applies cleanly to version 4.4, and it might also be possible to back port it to other versions. If you apply the patch, you might also require the patch at https://git.kernel.org/pub/scm/linux/kernel/git/torvalds/linux.git/commit/?id=cbcc72e037b8a3eb1fad3c1ae22021df21c97a51.
An Oops occurs when a processor is offlined.	The fix was merged into mainline in 3.14-rc5, see https://git.kernel.org/pub/scm/linux/kernel/git/tip/tip.git/commit/?id=e3703f8cdfcf39c25c4338c3ad8e68891cca3731, and has been backported to older kernels (3.4.83, 3.10.33, 3.12.14, and 3.13.6).
dmesg output: CPU PMU: CPUx reading wrong counter -1	Update to the latest Linux kernel.
Cro rmo. Crox reading wrong counter -1	
Scheduler switch resolutions are on exact millisecond boundaries.	Update to the latest Linux kernel.

5 Advanced target setup information (Linux)

This appendix provides extra configuration information beyond the standard setup.

5.1 Kernel configuration menu options

You must enable certain kernel configuration options to run Streamline.

The following menuconfig menus have options that are required for Streamline:

- If these options are not set correctly, you must change them and rebuild your kernel. If they are set correctly, you are ready to build and install the gator driver.
- The location of these options might change between releases. If so, use the search option in menuconfig to find them.
- Extra options are required to enable Arm[®] Mali[™] GPU support.

General Setup

Enable the **Profiling Support** option CONFIG_PROFILING, and the **Kernel performance events and counters** option CONFIG_PERF_EVENTS. CONFIG_PERF_EVENTS is required for kernel versions 3.0 and later. Enable the **Timers subsystem** > **High Resolution Timer Support** option CONFIG_HIGH_RES_TIMERS.

Kernel Features

The Enable hardware performance counter support for perf events option CONFIG_HW_PERF_EVENTS. CONFIG_HW_PERF_EVENTS is required for kernel versions 3.0 and later. If you are using Symmetric MultiProcessing (SMP), enable the **Use local timer interrupts** option CONFIG_LOCAL_TIMERS. If you are running on Linux version 3.12 or later, the CONFIG_LOCAL_TIMERS option is not necessary.

CPU Power Management

Optionally enable the **CPU Frequency scaling** option CONFIG_CPU_FREQ to enable the CPU Freq **Timeline** view chart. gatord requires kernel version 2.6.38 or greater to enable this chart.

Kernel hacking

If other trace configuration options are enabled, the **Trace process context switches and events** option CONFIG_ENABLE_DEFAULT_TRACERS might not be visible in menuconfig as an option. Enabling one of these other trace configurations, for example CONFIG_GENERIC_TRACER, CONFIG_TRACING, or CONFIG_CONTEXT_SWITCH_TRACER, is sufficient to enable tracing. Optionally enable the **Compile the kernel with debug info** option CONFIG_DEBUG_INFO. This option is only required for profiling the Linux kernel.

Kernel versions before 4.6, with CONFIG_CPU_PM enabled, produce invalid results. For example, counters not showing any data, large spikes, and nonsensible values for counters. This issue is due to the kernel PMU driver not saving state when the processor powers down, or not restoring state when it powers up. To avoid this issue, upgrade to the latest version of the kernel, or apply the patch found at https://git.kernel.org/pub/scm/linux/kernel/git/torvalds/linux.git/commit/?id=da4e4f18afe0f3729d68f3785c5802f786d36e34. This patch applies cleanly to version 4.4, and it might also be possible to back port it to other versions. If you apply the patch, you might also require the patch at https://git.kernel.org/pub/scm/linux/kernel/git/torvalds/linux.git/commit/?id=cbcc72e037b8a3eb1fad3c1ae22021df21c97a51.

5.2 Profile the Linux kernel

To ensure the statistics that the kernel generates align with source code in the Analysis Reports, include the kernel in the **Program Images** section in the **Capture and Analysis Options** dialog box. Before you can include the kernel in the **Program Images** section, you must build a version of vmlinux with kernel debug information enabled.

Procedure

- 1. Navigate to the kernel build directory.
- 2. Enter the following command to enable you to change menuconfig options:

```
make ARCH=arm CROSS_COMPILE=<cross_compiler_directory>/bin/arm-linux-gnueabihf-
menuconfig
```

- 3. In the **Kernel Hacking** menu, select the **Compile the kernel with debug info** option. This option enables the CONFIG DEBUG INFO kernel option.
- 4. Enter the following command to build a new vmlinux image:

make -j5 ARCH=arm CROSS_COMPILE=<cross_compiler_directory>/bin/arm-linux-gnueabi\
hf- uImage

You can profile a driver by either statically linking it into the kernel image or by adding the module as an image in the **Capture and Analysis Options** dialog box.

- 5. Open the **Capture and Analysis Options** dialog box.
- 6. Click the **Add ELF image...** button in the **Program Images** section.
- 7. Navigate to your vmlinux file and select it.
- 8. Click OK.
- 9. Start a new capture session.

5.3 Build gatord yourself

Build gatord yourself to apply patches for bug fixes or add support for new features.

About this task

It is not possible to build gatord on a Windows host.

Procedure

- Either download the gatord source from the daemon directory in https://github.com/ARM-software/gator, or copy the source that is supplied in <DS_install_directory>/sw/streamline/gator/daemon/.
- 2. Follow the instructions in the README.md file in the gator directory.

5.4 Add support to gatord for a new CPU or perf PMU

There are two methods for adding support for a new CPU or perf PMU to gatord. One that requires rebuilding gatord, and one that does not.

- Perf support in Linux for the PMU is required because gatord uses perf to read the hardware counters.
- Check the perf PMUs supported by your kernel by running:

ls /sys/bus/event_source/devices/

If ARMv7_Cortex_A<xx>, CCI_400, or cnn are listed, then A<xx>, CCI-400, or CNN respectively are supported.

- Only XML changes are required, no code changes are necessary.
- Rebuilding gatord after the XML changes is recommended but not required because you can pass PMUs and events to gatord on the command line.

Make the following changes, then rebuild gatord:

- 1. Add a line to <install_directory>/sw/streamline/gator/daemon/pmus.xml describing the new PMU. For CPUs, the following information is required:
 - The CPU Implementer and Primary part number from the Main ID Register.
 - The number of generic hardware counters that can be selected simultaneously.
 - Optionally, set the perf PMU name of the CPU to ensure correct operation in multi-PMU heterogenous CPU implementations, such as big.LITTLE™ or DynamIQ.
- 2. Create an events XML file, named events-<xxx>.xml in the gatord source directory that defines the events that the new PMU generates. Exclude the XML header and <events> element. See the Cortex®-A15 events XML file, <DS_install_directory/sw/ streamline/gator/daemon/events-Cortex-A15.xml for an example.

Alternatively, to add support without having to rebuild gatord, do the following:

1. Create an events XML file that defines the events that the new PMU generates. This file must include the XML header and <events> element, for example:

```
<?xml version="1.0" encoding="UTF-8"?>
<events>
  <counter set name="ARMv7 Cortex A9 cnt" count="6"/>
  <category name="Cortex-A9" counter_set="ARMv7_Cortex_A9_cnt" per_cpu="yes" sup\</pre>
ports event based sampling="yes">
   <event counter="ARMv7 Cortex A9 ccnt" event="0xff" title="Clock" name="Cy\</pre>
cles" display="hertz" units="Hz"
average_selection="yes" average_cores="yes" description="The number of core clock cycles"/>
    <event event="0x00" title="Software" name="Increment" description="Increment\</pre>
ed only on writes to the \
      Software Increment Register"/>
    <event event="0x01" title="Cache" name="Instruction refill" description="In\</pre>
struction fetch that causes \
      a refill of at least the level of instruction or unified cache closest to
 the processor"/>
   <!-- ... -->
  </category>
</events>
```

2. Create an XML file that defines information about the new PMU. For the required format, see the gator pmus.xml. For example:

- 3. Copy these files to the target and restart gatord using the following flags:
 - -E to specify the location of the events XML file. This flag causes the events to be appended to the list of events that gatord supports.
 - -P to specify the location of the PMU XML file. This option causes the new PMU to be added to the list of PMUs defined in pmus.xml that gatord has built-in support for.
