Proprietary Notice

Arm Limited. Company 02557590 registered in England.

110 Fulbourn Road, Cambridge, England CB1 9NJ.

(LES-PRE-20349|version 21.0)

Confidentiality Status

This document is Non-Confidential. The right to use, copy and disclose this document may be subject to license restrictions in accordance with the terms of the agreement entered into by Arm and the party that Arm delivered this document to.

Unrestricted Access is an Arm internal classification.

Product Status

The information in this document is Final, that is for a developed product.

Feedback

Arm welcomes feedback on this product and its documentation. To provide feedback on the product, create a ticket on https://support.developer.arm.com.

To provide feedback on the document, fill the following survey: https://developer.arm.com/documentation-feedback-survey.

Inclusive language commitment

Arm values inclusive communities. Arm recognizes that we and our industry have used language that can be offensive. Arm strives to lead the industry and create change.

This document includes language that can be offensive. We will replace this language in a future issue of this document.

To report offensive language in this document, email terms@arm.com.

Contents

1. Introduction

1.1 Product revision status

The r*x*p*y* identifier indicates the revision status of the product described in this manual, for example, r1p2, where:

r*x* Identifies the major revision of the product, for example, r1.

p*y* Identifies the minor revision or modification status of the product, for example, p2.

1.2 Intended audience

This manual is for system designers, system integrators, and programmers who are designing or programming a *System on Chip* (SoC) that uses an Arm core.

1.3 Conventions

The following subsections describe conventions used in Arm documents.

Glossary

The Arm® Glossary is a list of terms used in Arm documentation, together with definitions for those terms. The Arm Glossary does not contain terms that are industry standard unless the Arm meaning differs from the generally accepted meaning.

See the Arm Glossary for more information: developer.arm.com/glossary.

Convention	Use
italic	Citations.
bold	Terms in descriptive lists, where appropriate.
`monospace`	Text that you can enter at the keyboard, such as commands, file and program names, and source code.
`monospace underline`	A permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.
`<and>`	Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example: `MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>`

Convention	Use
SMALL CAPITALS	Terms that have specific technical meanings as defined in the *Arm® Glossary*. For example, **IMPLEMENTATION DEFINED**, **IMPLEMENTATION SPECIFIC**, **UNKNOWN**, and **UNPREDICTABLE**.

Recommendations. Not following these recommendations might lead to system failure or damage.

Requirements for the system. Not following these requirements might result in system failure or damage.

Requirements for the system. Not following these requirements will result in system failure or damage.

An important piece of information that needs your attention.

A useful tip that might make it easier, better or faster to perform a task.

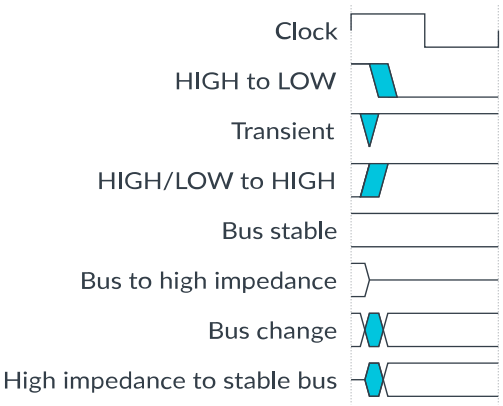
A reminder of something important that relates to the information you are reading.

Timing diagrams

The following figure explains the components used in timing diagrams. Variations, when they occur, have clear labels. You must not assume any timing information that is not explicit in the diagrams.

Shaded bus and signal areas are undefined, so the bus or signal can assume any value within the shaded area at that time. The actual level is unimportant and does not affect normal operation.

Figure 1-1: Key to timing diagram conventions



Signals

The signal conventions are:

Signal level

The level of an asserted signal depends on whether the signal is active-HIGH or active-LOW. Asserted means:

- HIGH for active-HIGH signals.
- LOW for active-LOW signals.

Lowercase n

At the start or end of a signal name, n denotes an active-LOW signal.

Register descriptions

Reset definitions

Replication Operator {}

Verilog replication operators are used for reset values over 8-bits.

For example, `{16{1'b0}}` indicated a binary value of 16 zeros.

x

Resets that are unknown are indicated with `x`.

1.4 Useful resources

This document contains information that is specific to this product. See the following resources for other useful information.

Access to Arm documents depends on their confidentiality:

- Non-Confidential documents are available at developer.arm.com/documentation. Each document link in the following tables goes to the online version of the document.

- Confidential documents are available to licensees only through the product package.

2. The Cortex-A520 core

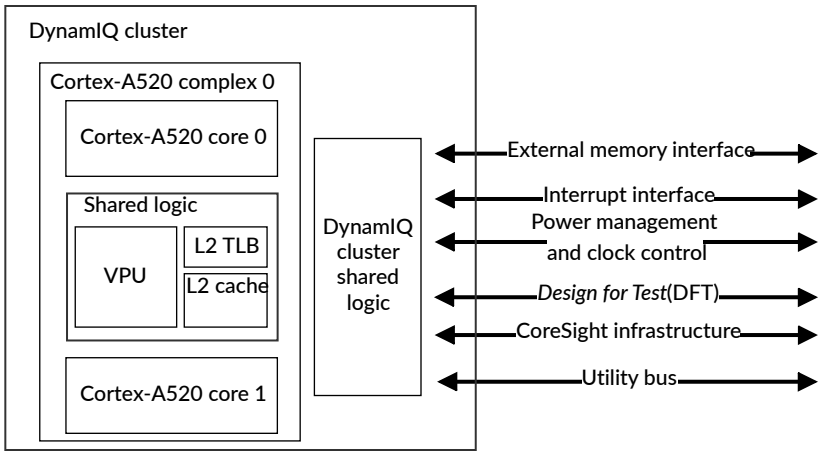
The Cortex-A520 core is a high-efficiency and low-power core that implements the Arm®v9.2-A architecture. The Arm®v9.2-A architecture extends the architecture defined in the Arm®v8-A architectures up to Arm®v8.7-A.

The Cortex-A520 core is implemented inside a DSU-120 DynamIQ™ cluster. It is connected to the *DynamIQ Shared Unit-120* that behaves as a full interconnect with L3 cache and snoop control. This connection configuration is also used in systems with different types of cores where the Cortex-A520 core is the high-efficiency core.

Cortex-A520 cores are implemented inside a block called a complex, which contains up to two cores. Within a dual-core complex, the *Vector Processing Unit* (VPU), the L2 *Translation Lookaside Buffer* (TLB), and the L2 cache logic are shared between cores.

The following figure shows an example of a dual-core configuration.

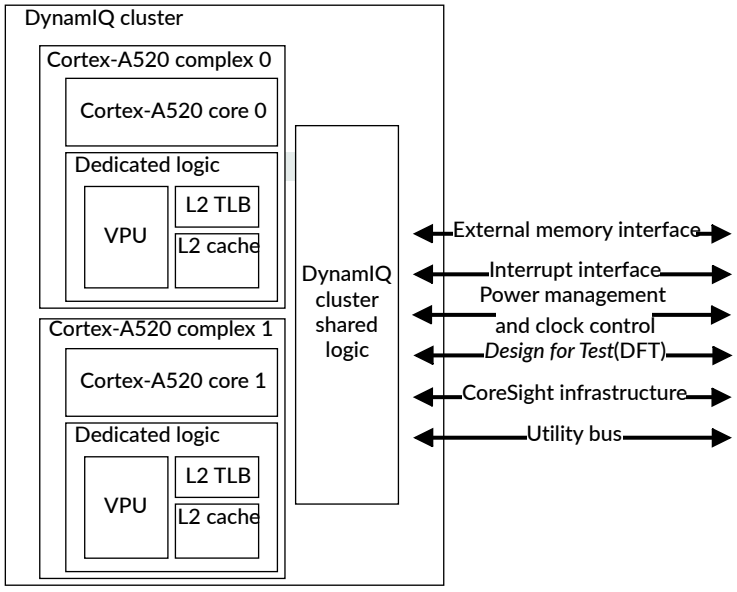
Figure 2-1: Example configuration with a Cortex-A520 dual-core complex



You can also configure a complex that contains a single Cortex-A520 core with dedicated logic. You can configure your systems so that all cores are configured in single-core complexes. This type of configuration improves performance but at the cost of area efficiency.

The following figure shows an example of a cluster with single-core complexes.

Figure 2-2: Example configuration with two Cortex-A520 single-core complexes



Note

- This manual applies to the Cortex-A520 core only. Read this manual together with the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for detailed information about the DSU-120.
- This manual does not provide a complete list of registers. Read this manual together with the *Arm® Architecture Reference Manual for A-profile architecture*.

2.1 Cortex-A520 core features

You can use the Cortex-A520 core in a standalone DynamIQ™ configuration where your homogenous DSU-120 DynamIQ™ cluster includes one or more Cortex-A520 cores. You can also use the Cortex-A520 core as the high-efficiency core in a heterogenous cluster.

Regardless of the cluster configuration, the Cortex-A520 core always has the same features as described in the following lists.

Core features

- Implementation of the Arm®v9.2-A A64 instruction set
- AArch64 Execution state at all Exception levels, EL0 to EL3
- Separate L1 data and instruction side memory systems with a *Memory Management Unit* (MMU)
- 40-bit *Physical Address* (PA) and 48-bit *Virtual Address* (VA)
- In-order pipeline with direct and indirect branch prediction

- *Generic Interrupt Controller* (GIC) CPU interface to connect to an external interrupt Distributor
- Generic Timers interface that supports 64-bit count input from an external system counter
- Implementation of the *Reliability, Availability, and Serviceability* (RAS) Extension
- *Scalable Vector Extension* (SVE) and SVE2 *Single Instruction Multiple Data* (SIMD) instruction set, offering Advanced SIMD and floating-point architecture support
- *Activity Monitoring Unit* (AMU)
- Support for the optional Cryptographic Extension

The Cryptographic Extension is licensed separately.

Cache features

- Separate L1 data and instruction caches
- Optional unified L2 cache
- L1 and L2 cache protection with *Error Correcting Code* (ECC) or parity
- Optional error protection with parity or *Error Correcting Code* (ECC) allowing:
  - *Single Error Correction and Double Error Detection* (SECDED) on L1 data cache and L2 cache, and L2 *Translation Lookaside Buffer* (TLB)
  - *Single Error Detection* (SED) on L1 instruction cache
- Support for *Memory System Resource Partitioning and Monitoring* (MPAM)

Debug features

- Arm®v9.2-A debug logic
- *Performance Monitoring Unit* (PMU)
- *Embedded Trace Extension* (ETE)
- *TRace Buffer Extension* (TRBE)
- Optional *Embedded Logic Analyzer* (ELA), ELA-600

The ELA-600 is licensed separately.

3. Technical overview on page 37

2.2 Cortex-A520 core configuration options

You can choose the options that fit your implementation needs at build-time configuration.

Some of these options:

- Apply to an individual Cortex-A520 complex
- Must be the same across all Cortex-A520 cores in the DSU-120 DynamIQ™ cluster
- Must be the same across all cores of all types in the DSU-120 DynamIQ™ cluster

Cortex-A520 core configuration options include:

Dual or single core

You can group cores into dual-core complexes, or instantiate them as single-core complexes. Dual-core complexes share the L2 cache, the L2 *Translation Lookaside Buffer* (TLB), and the *Vector Processing Unit* (VPU), while single-core complexes have a dedicated L2 cache, L2 TLB, and VPU.

Cryptographic Extension

You can configure your implementation with or without the Cryptographic Extension. There must be consistency in setting this parameter to the same value for all cores. The Cryptographic Extension is an optional separately licensable product.

Vector datapath size

The size of the vector datapaths can be 2×64-bit or 2×128-bit. This is a per-complex option.

Number of PMU event counters

The number of event counters in the *Performance Monitoring Unit* (PMU) can be 6 or 20. The selected option applies to all Cortex-A520 cores in the DSU-120 DynamIQ™ cluster.

Core cache protection

Cache protection using ECC/parity. Configure whether your core implementation includes cache protection. The selected option applies to all cores in the DynamIQ™ cluster, including non-Cortex-A520 cores.

CoreSight™ Embedded Logic Analyzer

Optionally, you can include support for integrating CoreSight™ ELA-600, as a separately licensable product. This is a per-complex option.

ELA ATB FIFO depth

If the *Embedded Logic Analyzer* (ELA) is included, the depth of the ATB FIFO in the ELA can be 4, 8, 16, 32 or 64 entries. This is a per-complex option.

L1 instruction cache size

The L1 instruction cache can be 32KB or 64KB. The selected option applies to all Cortex-A520 cores in the DynamIQ™ cluster.

L1 data cache size

The L1 data cache can be 32KB or 64KB. The selected option applies to all Cortex-A520 cores in the DynamIQ™ cluster.

L2 cache

Configure whether the L2 cache is present. This is a per-complex option.

L2 cache size

The L2 cache size for each complex can be 128KB, 192KB, 256KB, 384KB, or 512KB.

L2 slices

The number of L2 cache slices can be one or two for each complex.

L2 cache data RAM partitions

The number of partitions in the L2 cache data RAMs can be one or two for each complex.

L2 doubled clock pulse

L2 clock pulse width can be optionally doubled. This supports meeting minimum clock pulse width requirements on some RAMs.

Evict/Allocate feature

Configure whether the *Evict/Allocate* (EVA) feature is used on the L2 cache data RAMs for all Cortex-A520 complexes.

See *RTL configuration process* in the *Arm® Cortex-A520 Core Configuration and Integration Manual* for detailed configuration options and guidelines.

2.3 DSU-120 dependent features

Some *DynamIQ Shared Unit-120* features and behaviors depend on whether your licensed core supports a particular feature.

The following table describes which DSU-120 dependent features are supported in your Cortex-A520 core.

Table 2-1: Cortex-A520 core features that have a dependency on the DSU-120

Feature	Supported in the Cortex-A520 core	Dependency on the DSU-120
Direct connect	No	-
Core included in a complex	Yes	Affects the DSU-120 DynamIQ™ cluster configuration and external signals. For more information on configurations, see 2.2 Cortex-A520 core configuration options on page 25.
Cryptographic Extension	Yes, as an option	Affects the external signals of the DSU-120. For more information on MPMM, see 5.6 Performance and power management on page 57.
Maximum Power Mitigation Mechanism (MPMM)	Yes	
Performance Defined Power (PDP) feature	No	
DISPBLKy Dispatch block signal	No	

Feature	Supported in the Cortex-A520 core	Dependency on the DSU-120
Statistical Profiling Extension (SPE) architecture	No	
Physical Address (PA) width	40-bit	Affects the CHI master and AXI master port bus widths. For more details, see the following chapters of the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*: • *CHI master interface* • *AXI master interface*

Note

- The Cryptographic Extension is supplied under a separate license.

2.4 Supported standards and specifications

The Cortex-A520 core implements the Arm®v9.2-A architecture. The Arm®v9.2-A architecture extends the architecture defined in the Arm®v8-A architectures up to Arm®v8.7-A. The Cortex-A520 core also implements specific Arm®v8-A architecture extensions and supports interconnect, interrupt, timer, debug, and trace architectures.

The Cortex-A520 core supports AArch64 only at all Exception levels, EL0 to EL3.

The following tables show the features that the Cortex-A520 core implements for each of the Arm®v8-A architecture versions.

Note

For more information on the features listed in the following tables, see the *Arm® Architecture Reference Manual for A-profile architecture*.

Table 2-2: Arm®v8.0-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_PCSRv8	No	PC Sample-based Profiling Extension
Cryptographic Extension	Yes Configurable	For more information and additional cryptographic register descriptions, see the *Arm® Cortex-A520 Core Cryptographic Extension Technical Reference Manual*. This extension is licensed separately and access to the documentation is restricted by contract with Arm.
FEAT_SHA1		Advanced SIMD SHA1 instructions
FEAT_SHA256		Advanced SIMD SHA256 instructions
FEAT_AES		Advanced SIMD AES instructions

Feature	Implemented	Description
FEAT_PMULL		Advanced SIMD PMULL instructions
FEAT_DoubleLock	No	Double Lock
FEAT_CP15SDISABLE2	No	CP15DISABLE2
FEAT_FP	Yes	Floating point extension
FEAT_AdvSIMD	Yes	Advanced SIMD Extension For more information and register descriptions, see 14. Advanced SIMD and floating-point support on page 98.
FEAT_CRC32	Yes	CRC32 instructions
FEAT_PMUv3	Yes	PMU extension version 3
FEAT_nTLBPA	Yes	No intermediate caching by output address in TLB
FEAT_SB	Yes	Speculation barrier
FEAT_SSBS	Yes	Speculative Store Bypass Safe Instruction
FEAT_CSV2	Yes	Cache Speculation Variant 2
FEAT_CSV2_1p1	No	Cache Speculation Variant 2 version 1.1
FEAT_CSV2_1p2	No	Cache Speculation Variant 2 version 1.2
FEAT_CSV2_2	Yes	Cache Speculation Variant 2 version 2
FEAT_CSV3	Yes	Cache Speculation Variant 3
FEAT_SPECRES	Yes	Speculation restriction instructions
FEAT_DGH	Yes	Data Gathering Hint
FEAT_ETS	Yes	Enhanced Translation Synchronization
FEAT_ECBHB	Yes	*Exploitative Control using Branch History Buffer* information between exception levels The branch history information created in a context before an exception to a higher exception level, using AArch64, cannot be used by code before that exception. This prevents exploitative control of the execution of any indirect branches in code in a different context after the exception.

Table 2-3: Arm®v8.1-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_LSE	Yes	Large System Extensions
FEAT_RDM	Yes	Rounding double multiply accumulate
FEAT_HPDS	Yes	Hierarchical permission disables in translation tables
FEAT_VHE	Yes	Virtualization Host Extensions
FEAT_PAN	Yes	Privileged access-never
FEAT_LOR	Yes	Limited ordering regions
FEAT_HAFDBS	Yes	Hardware updates to access flag and dirty state in translation tables
FEAT_VMID16	Yes	16-bit VMID
FEAT_PMUv3p1	Yes	PMU extensions version 3.1
FEAT_Debugv8p1	Yes	Debug with VHE
FEAT_PAN3	Yes	Support for SCTLR_ELx.EPAN

Table 2-4: Arm®v8.2-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_TTCNP	Yes	Common not private translations
FEAT_XNX	Yes	Execute-never control distinction by Exception level at stage 2
FEAT_UAO	Yes	Unprivileged Access Override control
FEAT_PAN2	Yes	AT S1E1R and AT S1E1W instruction variants for PAN
FEAT_DPB	Yes	DC CVAP instruction
FEAT_Debugv8p2	Yes	Arm®v8.2-A Debug
FEAT_IESB	Yes	Implicit Error synchronization event
FEAT_AA32HPD	No	AArch32 Hierarchical permission disables
FEAT_HPDS2	Yes	Hierarchical permission disables in translation tables 2
FEAT_LSMAOC	No	Load/Store instruction multiple atomicity and ordering controls
FEAT_FP16	Yes	Half-precision floating-point data processing
FEAT_LVA	No	Large VA support
FEAT_LPA	No	Large PA and IPA support
FEAT_VPIPT	No	VMID-aware PIPT instruction cache
FEAT_PCSRv8p2	Yes	PC Sample-based profiling version 8.2
FEAT_RAS	Yes	*Reliability, Availability, and Serviceability* (RAS) Extension version 1.1
FEAT_SPE	No	*Statistical Profiling Extension* (SPE)
FEAT_SVE	Yes	*Scalable Vector Extension* (SVE)
FEAT_SHA512	Yes Configurable	Advanced SIMD SHA512 instructions
FEAT_SHA3		Advanced SIMD EOR3, RAX1, XAR, and BCAX instructions
FEAT_SM3		Advanced SIMD SM3 instructions
FEAT_SM4		Advanced SIMD SM4 instructions
FEAT_DotProd	Yes	Advanced SIMD Int8 dot product instructions
FEAT_FHM	Yes	Half-precision floating-point FMLAL instructions
FEAT_EVT	Yes	Enhanced Virtualization Traps
FEAT_DPB2	Yes	DC CVADP instruction
FEAT_BF16	Yes	AArch64 BFloat16 instructions
FEAT_AA32BF16	No	AArch32 BFloat16 instructions
FEAT_I8MM	Yes	Int8 Matrix Multiplication
FEAT_AA32I8MM	No	AArch32 Int8 Matrix Multiplication
FEAT_F32MM	No	SVE single-precision floating-point matrix multiply instruction
FEAT_F64MM	No	SVE double-precision floating-point matrix multiply instruction

Table 2-5: Arm®v8.3-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_PAuth	Yes	Pointer authentication
FEAT_EPAC	No	Enhanced Pointer authentication
FEAT_PACIMP	No	Pointer authentication - IMPLEMENTATION DEFINED algorithm
FEAT_PACQARMA5	No	Pointer authentication - QARMA5 algorithm

Feature	Implemented	Description
FEAT_PACQARMA3	Yes	Pointer authentication - QARMA3 algorithm
FEAT_CONSTPACFIELD	Yes	PAC Algorithm enhancement
FEAT_JSCVT	Yes	JavaScript FJCVTS conversion instruction
FEAT_NV	No	Nested virtualization
FEAT_LRCPC	Yes	Load-acquire RCpc instructions
FEAT_FCMA	Yes	Floating-point FCMLA and FCADD instructions
FEAT_CCIDX	Yes	Extended cache index
FEAT_SPEv1p1	No	Statistical Profiling Extensions version 1.1
FEAT_DoPD	Yes	Debug over Powerdown
FEAT_PAuth2	Yes	Enhancements to pointer authentication
FEAT_FPAC	Yes	Faulting on pointer authentication instructions *Faulting Pointer Authentication Code* (FPAC)
FEAT_FPACCOMBINE	Yes	Faulting on combined pointer authentication instructions

Table 2-6: Arm®v8.4-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_SEL2	Yes	Secure EL2
FEAT_NV2	No	Enhanced support for nested virtualization
FEAT_S2FWB	Yes	Stage 2 forced write-back
FEAT_DIT	Yes	Data Independent Timing instructions
FEAT_IDST	Yes	ID space trap handling
FEAT_FlagM	Yes	Condition flag manipulation
FEAT_LSE2	Yes	Large System Extensions version 2
FEAT_LRCPC2	Yes	Load-acquire RCpc instructions version 2
FEAT_TLBIOS	Yes	TLB invalidate outer-shared instructions
FEAT_TLBIRANGE	Yes	TLB range invalidate range instructions
FEAT_TTL	Yes	Translation Table Level
FEAT_BBM	Yes	Translation table break before make levels
FEAT_RASv1p1	Yes	*Reliability, Availability, and Serviceability* (RAS) Extension version 1.1 See 11. RAS Extension support on page 86 for more information on the implementation of this extension in the core.
FEAT_DoubleFault	Yes	Double Fault Extension
FEAT_Debugv8p4	Yes	Debug relaxations and extensions version 8.4
FEAT_PMUv3p4	Yes	PMU extension version 3.4
FEAT_TRF	Yes	Self hosted Trace Extensions
FEAT_TTST	Yes	Small translation tables
FEAT_AMUv1	Yes	Activity Monitors Extension
FEAT_MPAM	Yes	*Memory Partitioning and Monitoring* (MPAM) For more information on the *Memory System Resource Partitioning and Monitoring* (MPAM) Extension, see the *Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for A-profile architecture*.

Table 2-7: Arm®v8.5-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_FlagM2	Yes	Condition flag manipulation version 2
FEAT_FRINTTS	Yes	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions
FEAT_ExS	No	Disabling context synchronizing exception entry and exit
FEAT_GTG	Yes	Guest translation granule size
FEAT_BTI	Yes	*Branch Target Identification* (BTI)
FEAT_E0PD	Yes	Preventing EL0 access to halves of address maps
FEAT_RNG	No	Random number generator
FEAT_MTE	Yes	Instruction-only Memory Tagging Extension The Cortex-A520 core always implements the *Memory Tagging Extension* (MTE) and therefore is compliant with the CHI.E protocol. For information on CHI.E commands inferred by MTE, see the *CHI master interface* chapter in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*.
FEAT_MTE2	Yes Configurable	Full Memory Tagging Extension
FEAT_MTE3		MTE Asymmetric Fault Handling
FEAT_PMUv3p5	Yes	PMU Extension version 3.5

Table 2-8: Arm®v8.6-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_ECV	Yes	Enhanced counter virtualization
FEAT_FGT	Yes	Fine Grain Traps
FEAT_TWED	No	Delayed trapping of WFE
FEAT_AMUv1p1	No	Activity Monitors Extension version 1.1
FEAT_MPAMv0p1	No	Memory Partitioning and Monitoring version0.1
FEAT_MPAMv1p1	Yes	Memory Partitioning and Monitoring version1.1
FEAT_MTPMU	No	Multi-threaded PMU Extensions

Table 2-9: Arm®v8.7-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_AFP	Yes	Alternate floating-point behavior
FEAT_HCX	Yes	Support for the HCRX_EL2 register
FEAT_LPA2	No	Larger physical address for 4KB and 16KB translation granules
FEAT_LS64	No	Support for 64 byte loads/stores without return
FEAT_LS64_V	No	Support for 64-byte stores with return
FEAT_LS64_ACCDATA	No	Support for 64-byte EL0 stores with return
FEAT_PMUv3p7	Yes	Arm®v8.7-A PMU Extensions See 18.1 Performance monitors events on page 113.
FEAT_RPRES	No	Increased precision of Reciprocal Estimate and Reciprocal Square Root Estimate
FEAT_SPEv1p2	No	Arm®v8.7-A SPE

Feature	Implemented	Description
FEAT_WFxT	Yes	WFE and WFI instructions with timeout See 5.2.1 Wait for Interrupt and Wait for Event on page 48.
FEAT_XS	Yes	XS attribute

Table 2-10: Arm®v8.8-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_CMOW	No	Control for cache maintenance permission
FEAT_Debugv8p8	No	Debug v8.8
FEAT_HBC	No	Hinted conditional branch
FEAT_HPMN0	Yes	Setting of MDCR_EL2.HPMN to zero
FEAT_MOPS	No	Standardization of memory operations
FEAT_NMI	No	Non-maskable Interrupts
FEAT_PMUv3p8	No	Arm®v8.8-A PMU Extensions
FEAT_PMUv3_TH	No	Event counting threshold
FEAT_RNG_TRAP	No	Trapping support for RNDR and RNDRRS
FEAT_SPEv1p3	No	Arm®v8.8-A Statistical Profiling Extensions
FEAT_TIDCP1	No	EL0 use of IMPLEMENTATION DEFINED functionality

The following tables show the features that the Cortex-A520 core implements for each Arm®v9-A architecture version.

Table 2-11: Arm®v9.0-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_ETE	Yes	*Embedded Trace Extension* (ETE) See 19. Embedded Trace Extension support on page 143.
FEAT_SVE2	Yes	*Scalable Vector Extension* (SVE) version 2 See 15. Scalable Vector Extensions support on page 99.
FEAT_SVE_AES	Yes Configurable	SVE AES instructions
FEAT_SVE_PMULL128		SVE PMULL instructions
FEAT_SVE_SHA3		SVE SHA-3 instructions
FEAT_SVE_SM4		SVE SM4 instructions
FEAT_SVE_BitPerm	Yes	SVE Bit Permute
FEAT_TME	No	*Transactional Memory Extension* (TME)
FEAT_TRBE	Yes	*TRace Buffer Extension* (TRBE) See 20. Trace Buffer Extension support on page 156.

Table 2-12: Arm®v9.1-A features implemented in the Cortex-A520 core

Feature	Implemented	Description
FEAT_ETEv1p1	Yes	Embedded Trace Extension, version 1.1

The following table shows the other standards and specifications that the Cortex-A520 core supports.

Table 2-13: Other standards and specifications supported in the Cortex-A520 core

Standard or specification	Version	Description
FEAT_GICv4p1	GICv4.1	*Generic Interrupt Controller* (GIC) See the *Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4* for more information.
FEAT_Debugv8p4, Debug	-	Arm®v9.0-A architecture implemented with ARMv8.3-DoPD, Debug over powerdown and ARMv8.4-Debug, Debug relaxations and extensions support. See the *Arm® Architecture Reference Manual for A-profile architecture* for information on this architecture.
Debug	-	Arm®v9.2-A architecture implemented with Arm®v8.4-A Debug architecture support and Arm®v8.3-A Debug over powerdown support. See the *Arm®v8.5 Debug Architecture* for information on this architecture.
CoreSight	v3.0	See the *Arm® CoreSight™ Architecture Specification v3.0* for more information.
FEAT_RASv1p1	RASv1p1	*Reliability, Availability, and Serviceability* (RAS) Extension version 1.1 All extensions up to Arm®v9.0-A at full containment capability with *Error Correcting Code* (ECC) configured. See 11. RAS Extension support on page 86 for more information on the implementation of this extension in the core.

3.1 Core Components on page 37

2.5 Test features

The Cortex-A520 core provides test signals that enable the use of both *Automatic Test Pattern Generation* (ATPG) and *Memory Built-In Self Test* (MBIST) to test the core logic and memory arrays.

The Cortex-A520 core includes an ATPG test interface that provides signals to control the *Design for Test* (DFT) features of the core. To prevent problems with DFT implementation, you must carefully consider how you use these signals.

Arm also provides MBIST interfaces that enable you to test the RAMs at operational frequency. You can add your own MBIST controllers to automatically generate test patterns and perform result comparisons. Optionally, you can use your EDA tool to test the physical RAMs directly instead of using the supplied Arm interfaces.

For the list of test signals and information on their usage, see the *Design for Test integration guidelines* chapter in the *Arm® Cortex-A520 Core Configuration and Integration Manual*.

For the list of external scan control signals, see the *Design for Test integration guidelines* chapter in the *Arm® DynamIQ™ Shared Unit-120 Configuration and Integration Manual*.

Note

The *Arm® Cortex-A520 Core Configuration and Integration Manual* and *Arm® DynamIQ™ Shared Unit-120 Configuration and Integration Manual* are confidential documents that are available with the appropriate product licenses.

2.6 Design tasks

The Cortex-A520 core is delivered as a synthesizable RTL description in SystemVerilog. Before you can use the Cortex-A520 core, you must implement, integrate, and program it.

A different party can perform each of the following tasks:

Implementation

The implementer configures the RTL, adds vendor cells/RAMs, and takes the design through the synthesis and place and route (P&R) steps to produce a hard macrocell.

The implementer chooses the options that affect how the RTL source files are rendered. These options can affect the area, maximum frequency, power, and features of the resulting macrocell.

Other components such as DFT structures and, if necessary, power switches can be added to the implementation flow.

Integration

The integrator connects the macrocell into a SoC. This task includes connecting it to a memory system and peripherals.

The integrator configures some features of the core by tying inputs to specific values. These configuration settings affect the start-up behavior before any software configuration is made and can also limit the options available to the software.

Software programming

The system programmer develops the software to configure and initialize the core and tests the application software.

The programmer configures the core by programming values into registers. The programmed values affect the behavior of the core.

The operation of the final device depends on the build configuration, the configuration inputs, and the software configuration.

See *RTL configuration process* in the *Arm® Cortex-A520 Core Configuration and Integration Manual* and in the *Arm® DynamIQ™ Shared Unit-120 Configuration and Integration Manual* for implementation options. See also *Functional integration* in the *Arm® DynamIQ™ Shared Unit-120 Configuration and Integration Manual* for signal descriptions.

2.7 Product revisions

The following table indicates the main differences in functionality between product revisions.

Table 2-14: Product revisions

Revision	Notes
r0p0	First limited access release
r0p1	Added support for FEAT_ECBHB. *Exploitative Control using Branch History Buffer* information between exception levels.

Changes in functionality that have an impact on the documentation also appear in C.1 Revisions on page 844.

3. Technical overview

The components in the Cortex-A520 core are designed to make it a high-efficiency core.

The main blocks include:

- *Instruction Fetch Unit* (IFU)
- *Data Processing Unit* (DPU)
- L1 instruction and L1 data memory systems
- *Memory Management Unit* (MMU)
- Trace unit and *TRace Buffer Extension* (TRBE)
- *Vector Processing Unit* (VPU)
- *Generic Interrupt Controller* (GIC) CPU interface
- L2 *Translation Lookaside Buffer* (TLB)
- L2 memory system with optional L2 cache
- Optional Cryptographic Extension
- Optional *Embedded Logic Analyzer* (ELA)

The Cortex-A520 core interfaces with the *DynamIQ Shared Unit-120* through the CPU bridge.

The Cortex-A520 core implements the Arm®v9.2-A architecture. The Arm®v9.2-A architecture extends the architecture defined in the Arm®v8-A architectures up to Arm®v8.7-A.

The programmer's model and the architecture features implemented, such as the Generic Timer, are compliant with the standards in 2.4 Supported standards and specifications on page 28.

3.1 Core Components

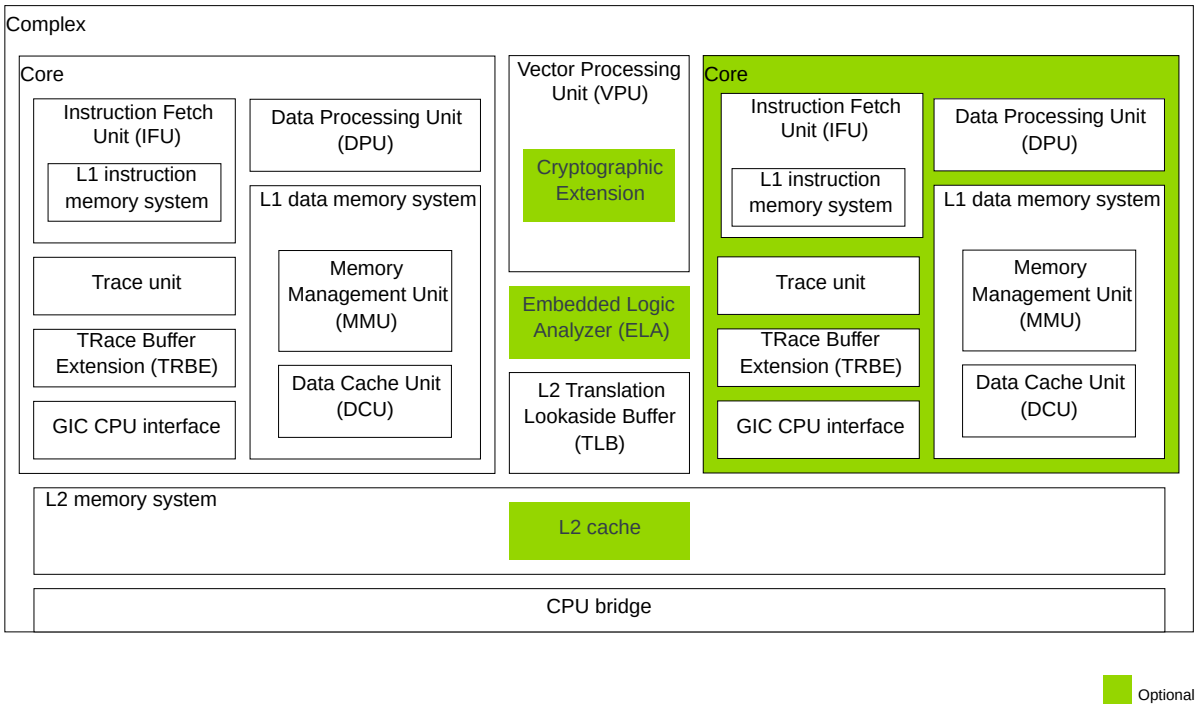
The Cortex-A520 core includes components that are designed to make it a high-efficiency, low-power, and area-efficient product.

Cortex-A520 cores are always implemented inside a complex.

A Cortex-A520 complex includes a CPU bridge that connects the complex to the *DynamIQ Shared Unit-120*. The DSU-120 connects the complex to an external memory system and to the rest of the *System on Chip* (SoC).

The following figure shows the components within a Cortex-A520 complex.

Figure 3-1: Cortex-A520 core components



Instruction Fetch Unit

The IFU fetches instructions from the instruction cache or from external memory and uses a dynamic branch predictor to predict the outcome of branches in the instruction stream. It passes the instructions to the DPU for processing.

The L1 instruction memory system includes:

- A fully associative L1 instruction TLB
- A 32KB or 64KB 4-way set associative L1 instruction cache with 64-byte cache lines

Data Processing Unit

The DPU decodes and executes instructions. It executes instructions that require data transfer to or from the memory system by interfacing with the DCU. The DPU includes the *Performance Monitoring Unit* (PMU) and the *Activity Monitoring Unit* (AMU).

Performance Monitoring Unit

The PMU provides six or twenty performance monitors that can be configured to gather statistics on the operation of each core and the memory system. The information can be used for debug and code profiling.

Activity Monitoring Unit

The Cortex-A520 core includes an AMU, which, like the PMU, counts certain events that are related to the behavior of the core. The AMU implements seven event counters. Activity

monitoring is intended for system management use whereas performance monitoring is aimed at user and debug applications.

The AMU registers are accessible using the System registers or the DSU-120 DynamIQ™ cluster utility bus.

L1 data memory system

The L1 data memory system executes load and store instructions and services memory coherency requests.

The L1 data memory system includes:

- An MMU
- A fully associative L1 data TLB
- A 32KB or 64KB, 4-way set associative cache with 64-byte cache lines
- A DCU that handles load/store and System register access operations
- A *Bus Interface Unit* (BIU) that handles the linefills to the L1 data cache
- A *STore Buffer* (STB) that handles store instructions, cache and TLB maintenance operations, and barriers

The MMU provides fine-grained memory system control through a set of virtual-to-physical address mappings and memory attributes that are held in translation tables. The TLB stores these mappings when translating an address.

Trace Unit and Trace Buffer Extension

The Cortex-A520 core supports a range of debug, test, and trace options including instruction-trace-only trace unit and *TRace Buffer Extension* (TRBE).

The Cortex-A520 core also includes a ROM table that enumerates the debug components within the complex. Debuggers can use the ROM table to determine which CoreSight components are implemented.

All the debug and trace components of the Cortex-A520 core are described in this manual. The *Arm® Cortex-A520 Core Configuration and Integration Manual* provides information about the ELA.

GIC CPU interface

The *Generic Interrupt Controller* (GIC) CPU interface, when integrated with an external Distributor component, is a resource for supporting and managing interrupts in a cluster system.

Vector Processing Unit

The Cortex-A520 complex includes a VPU that is shared between the cores of a dual-core complex. Single-core complexes have a dedicated VPU.

The VPU supports Advanced SIMD and floating-point operation. Advanced SIMD is a media and signal processing architecture that adds instructions primarily for audio, video, 3D graphics, and image and speech processing. The floating-point architecture supports half-precision, single-

precision and double-precision floating-point operations. The VPU also supports the *Scalable Vector Extension* (SVE) and SVE2 SIMD instruction sets. SVE and SVE2 complement the Advanced SIMD and floating-point functionality.

Note

The Advanced SIMD architecture, along with its associated implementations and supporting software, are also referred to as Arm® Neon™ technology.

Cryptographic Extension

The Cryptographic Extension is optional in the Cortex-A520 cores. The Cryptographic Extension adds new instructions to the Advanced SIMD and the SVE instruction sets that accelerate:

- *Advanced Encryption Standard* (AES) encryption and decryption
- The *Secure Hash Algorithm* (SHA) functions SHA-1, SHA-224, SHA-256, SHA-384, SHA-512, and SHA-3
- SM3 hash function and SM4 encryption and decryption
- Finite field arithmetic that is used in algorithms such as Galois/Counter Mode and Elliptic Curve Cryptography

Note

The optional Cryptographic Extension is not included in the base product. Arm supplies the Cryptographic Extension under a separate license to the Cortex-A520 core license.

L2 TLB

The L2 TLB is shared between the cores of a dual-core complex, while single-core complexes have a dedicated L2 TLB. The L2 TLB accepts requests from the L1 TLBs and provides *Virtual Address* (VA) to *Physical Address* (PA) translations for instruction side, data side, trace and profiling accesses, and software-accessible address translation operations.

The TLB entries are global or can include *Address Space Identifiers* (ASIDs) to prevent context switch TLB cleans. They also include *Virtual Machine Identifiers* (VMIDs) to prevent TLB cleans on virtual machine switches by the hypervisor. The Cortex-A520 core can also use the *Common not Private* (CnP) architectural feature that permits cores in a complex to share L2 TLB entries.

L2 memory system

The L2 memory system includes the optional L2 cache. The L2 cache is private to the complex and is 8-way set associative. You can configure the L2 cache size to be 128KB, 192KB, 256KB, 384KB or 512KB. The L2 memory system is connected to the DSU-120 through the CPU bridge.

The L2 cache can be configured to have one or two cache slices. Each slice consists of L2 tag and data RAMs, L2 replacement RAM, L1 duplicate tag RAMs, and associated logic. If two slices are present, most traffic from the cores, the L2 TLB, and from downstream snoops is striped across the slices, based on the value of address bit[6]. This striping increases overall throughput. Accesses to

Device non-reorderable memory and to *Distributed Virtual Memory* (DVM) operations are always handled by slice 0.

The data RAMs in each L2 cache slice can be configured to have a single partition or two partitions. Having two partitions increases peak throughput for L2 cache reads and writes by allowing concurrent accesses to different L2 ways.

CPU bridge

In a DynamIQ™ cluster, there is one CPU bridge between each Cortex-A520 complex and the DSU-120.

The CPU bridge controls buffering and synchronization between the complex and the DSU-120.

By default, the CPU bridge is asynchronous to permit different *Power Performance and Area* (PPA) implementation points for each complex and the DSU-120. When the CPU bridge runs asynchronously, the core and the DynamIQ™ cluster can run at different frequencies. You can, however, configure the CPU bridge to run synchronously with the memory bus interface without affecting the other asynchronous interfaces such as debug and trace. See *RTL configuration process* in the *Arm® DynamIQ™ Shared Unit-120 Configuration and Integration Manual* for more information.

3.2 Interfaces

The *DynamIQ Shared Unit-120* manages all Cortex-A520 core external interfaces to the *System on Chip* (SoC).

See the *Technical overview* chapter in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for detailed information on these interfaces.

3.3 Programmer's model

The Cortex-A520 core implements the Arm®v9.2-A architecture. The Arm®v9.2-A architecture extends the architecture defined in the Arm®v8-A architectures up to Arm®v8.7-A. The Cortex-A520 core supports the AArch64 Execution state at all Exception levels, EL0 to EL3.

For more information about the programmer's model, see *Arm® Architecture Reference Manual for A-profile architecture*.

Related information

2.4 Supported standards and specifications on page 28

4. Clocks and resets

To provide dynamic power savings, the Cortex-A520 core supports hierarchical clock gating. It also supports Warm and Cold resets.

Each Cortex-A520 complex has a single clock domain and receives a single clock input. This clock input is gated by an architectural clock gate in the CPU bridge. There is one architectural clock gate per core in the complex, and one for the shared logic. If the complex is configured with an asynchronous bridge, the clock input is COMPLEXCLK<n>, where n indicates the number of the complex within the DSU-120 DynamIQ™ cluster. If the complex is not configured with an asynchronous bridge, the clock input is SCLK.

In addition, the Cortex-A520 core implements extensive clock gating that includes:

- Regional clock gates to various blocks that can gate off portions of the clock tree
- Local clock gates that can gate off individual registers or banks of registers

The Cortex-A520 core receives the following reset signals from the *DynamIQ Shared Unit-120* side of the CPU bridge:

- A Warm reset for all registers in the core except for:
  - Some parts of the Debug logic
  - Some parts of the trace unit logic
  - *Reliability, Availability, and Serviceability* (RAS) logic
- A Cold reset for the logic in the complex, including the debug logic, trace logic, and RAS logic.

For a complete description of the clock gating and reset scheme of the complex, see the following sections in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*:

- *Clocks and resets*
- *Power and reset control with Power Policy Units*

5. Power management

The Cortex-A520 core provides mechanisms to control both dynamic and static power dissipation.

The dynamic power management includes the following features:

- Hierarchical clock gating
- Per-complex *Dynamic Voltage and Frequency Scaling* (DVFS)
- A *Maximum Power Mitigation Mechanism* (MPMM) to control the maximum power

The static power management includes the following features:

- Powerdown
- Dynamic retention, a low-power mode that retains the register and RAM state

5.1 Voltage and power domains

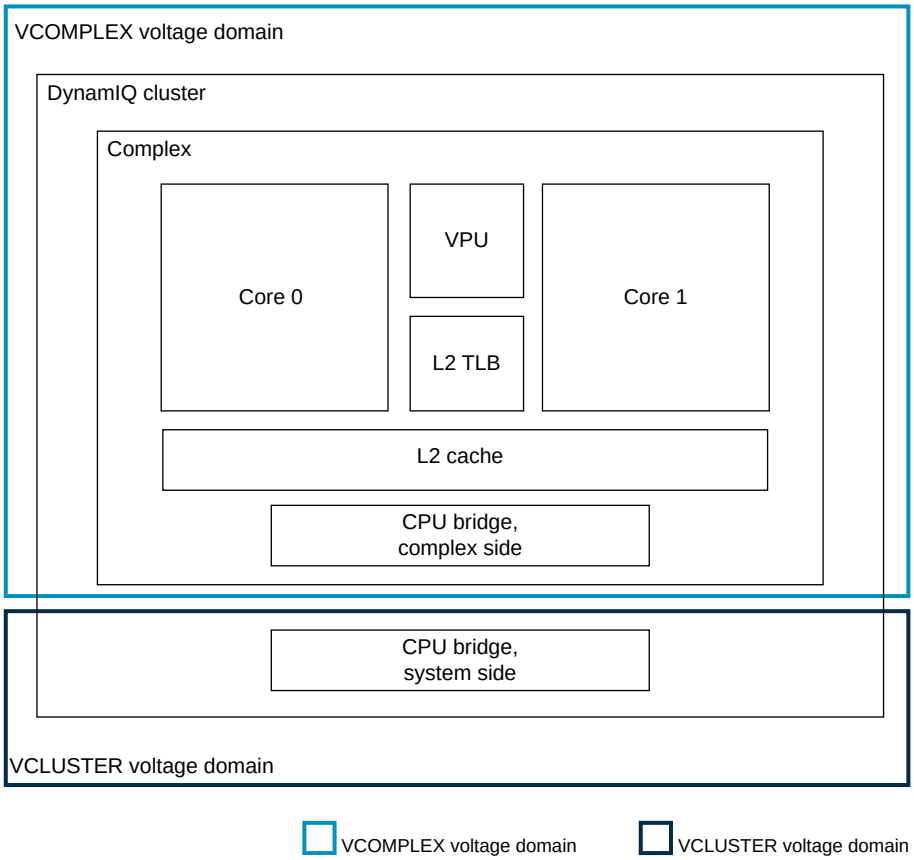
The *DynamIQ Shared Unit-120 Power Policy Units* (PPUs) control power management for the Cortex-A520 core.

A Cortex-A520 complex supports separate gated power domains for the complex, for each core inside the complex, and for the *Vector Processing Unit* (VPU).

It also supports a dedicated voltage domain for each complex, and a voltage domain for the DSU-120 DynamIQ™ cluster.

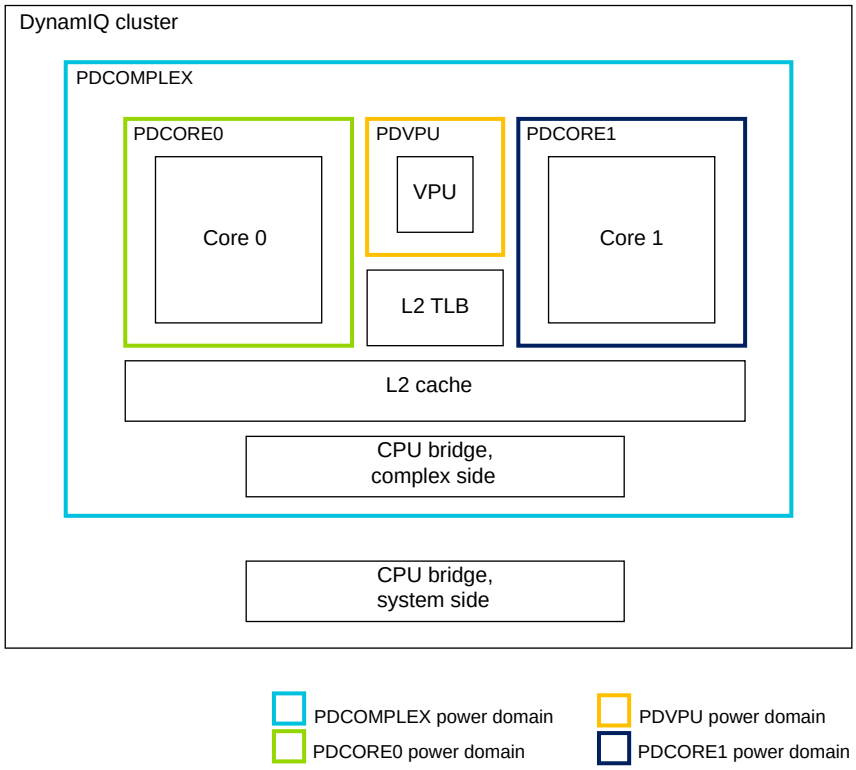
The following figure shows the voltage domains for a Cortex-A520 configuration with a dual-core complex:

Figure 5-1: Cortex-A520 voltage domains, dual core



The following figure shows the power domains for an example Cortex-A520 configuration with a dual-core complex:

Figure 5-2: Cortex-A520 power domains, dual core



A Cortex-A520 complex is instantiated within a DynamIQ™ cluster. Within the complex, the system side of the CPU bridge is within the cluster voltage domain, VCLUSTER. From the perspective of the complex, the system side of the CPU bridge is always on.

The remainder of the complex logic is in a separate VCOMPLEX voltage domain and PDCOMPLEX power domain. Within the PDCOMPLEX power domain, each core is in the PDCORE<n> power domain, where n is the core instance number.

The VPU is in the PDVPU power domain. The rest of the shared logic, consisting of the L2 *Translation Lookaside Buffer* (TLB), the L2 cache, and the complex side of the CPU bridge is in the PDCOMPLEX power domain.

PDCORE<n> is a gated power domain that can support retention. See *The DynamIQ Shared Unit* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for more information about instance numbering.

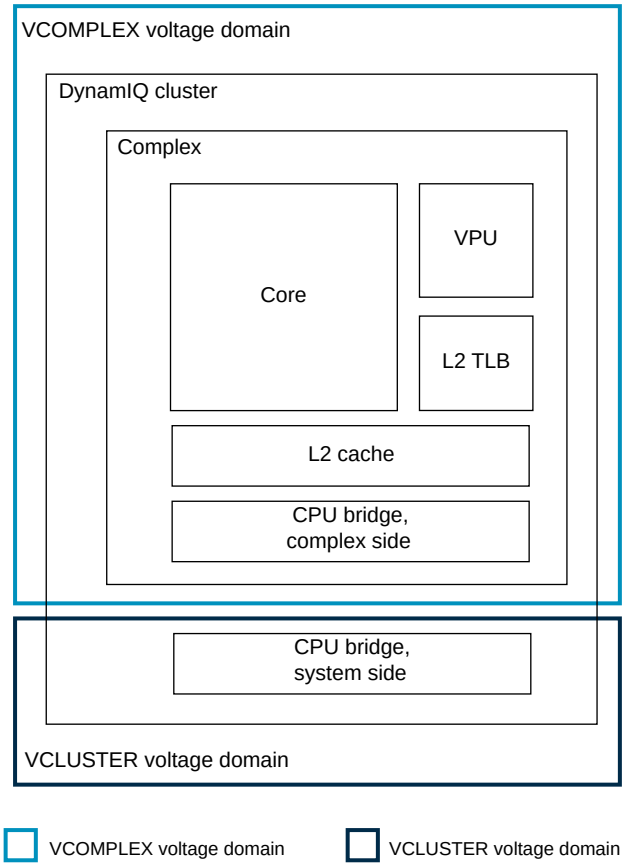
The VCOMPLEX voltage domain operates within a single clock domain, COMPLEXCLK. The CPU bridge contains high-level clock gates and generates gated clocks corresponding to each gated power domain. Also, the clock to the VPU is gated when the VPU is idle.

The CPU bridge can be configured as synchronous or asynchronous. When the CPU bridge is configured as synchronous, the complex runs on SCLK, the VCOMPLEX is merged with VCLUSTER, and the complex and the DynamIQ™ cluster are both in the same voltage domain.

The CPU bridge logic within the VCLUSTER voltage domain operates within multiple clock domains. See *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for more information.

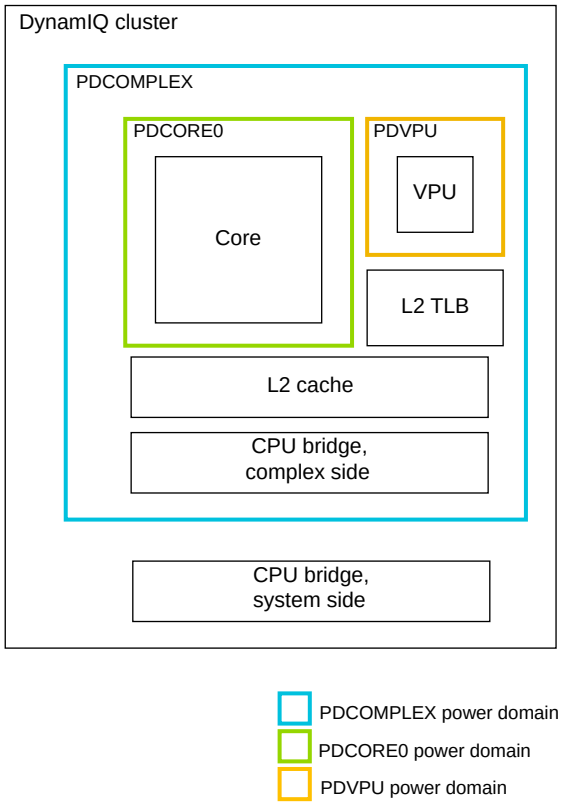
The following figure shows the voltage domains for a Cortex-A520 configuration with a single-core complex:

Figure 5-3: Cortex-A520 voltage domains, single core



The following figure shows the power domains for a Cortex-A520 configuration with a single-core complex:

Figure 5-4: Cortex-A520 power domains, single core



For a single-core complex, the voltage and power domains are similar to those for a dual-core complex.

Within the PDCOMPLEX power domain, the single core is in PDCORE0, a gated power domain that can support retention. The core has its own dedicated logic, including a VPU within its own PDVPU power domain. The L2 TLB, the L2 cache, and the CPU bridge, complex side, is in the PDCOMPLEX power domain.

5.2 Architectural clock gating modes

The `WFI`, `WFE`, `WFIT`, and `WFET` instructions put the core into a low-power mode. These instructions architecturally disable the clock at the top of the clock tree. The core remains fully powered and retains the state.

5.2.1 Wait for Interrupt and Wait for Event

Wait for Interrupt (WFI) and *Wait for Event* (WFE) are features that put a core within a Cortex-A520 complex in a low-power state by disabling most of the core clocks, while keeping the core powered

up. When the core is in WFI or WFE state, the input clock is gated externally to the core at the CPU bridge.

The logic uses a small amount of dynamic power to wake up the core from WFI or WFE low-power state. Other than this power use, the drawn power is reduced to static leakage current only.

When the core executes the `WFI`, `WFE`, `WFIT`, or `WFET` instruction, it waits for all instructions in the core, including explicit memory accesses, to retire before it enters a low-power state. The `WFI`, `WFE`, `WFIT`, and `WFET` instructions also ensure that store instructions have updated the cache or have been issued to the L3 memory system.

Note

Executing the `WFE` and `WFET` instructions when the event register is set does not cause entry into low-power state, but clears the event register.

The core exits the WFI or WFE state when one of the following events occurs:

- The core detects a reset.
- The core detects one of the architecturally defined WFI or WFE wakeup events.

WFI and WFE wakeup events can include physical and virtual interrupts.

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information about entering low-power state and wakeup events.

5.2.2 Low-power state behavior considerations

You must consider how certain events affect the *Wait for Interrupt* (WFI) and *Wait for Event* (WFE) low-power state behavior of the Cortex-A520 complex.

While the core is in WFI or WFE state, the clocks in the core are temporarily enabled when any of the following events are detected:

- An access on the utility bus interface
- A *Generic Interrupt Controller* (GIC) CPU access
- A debug access through the APB interface
- A system snoop request that must be serviced by the core L1 data cache
- A cache or *Translation Lookaside Buffer* (TLB) maintenance operation that must be serviced by the core L1 instruction cache, L1 data cache, L2 cache, or TLB
- Any access from the other core in the complex that must be serviced by the L1 data cache

Note

The core does not exit WFI or WFE state when the clocks are temporarily enabled.

Each core in a complex can enter WFI or WFE state separately, leading to the gating of its corresponding core clock. If both cores in the complex are in WFI or WFE state, the shared logic clock is also gated automatically.

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information about WFI and WFE.

5.3 Power control

The *DynamIQ Shared Unit-120 Power Policy Units* (PPUs) control all core and cluster power mode transitions.

Each core within a Cortex-A520 complex has an individual PPU for controlling its own core power domain. For example, there is a PPU for PDCORE0 and a PPU for PDCORE1.

In addition, there is a PPU for the cluster.

The PPUs decide and request any change in power mode. The targeted core within the Cortex-A520 complex then performs any actions necessary to reach the requested power mode. For example, the core might gate clocks, clean caches, or disable coherency before it accepts the request.

For more information about the PPUs for the cluster and the cores, see the following sections in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*:

- *Power management*
- *Power and reset control with Power Policy Units*

B.1.2 CPUMPMMCR, Global MPMM Configuration Register on page 494

5.4 Core power modes

Each core in a Cortex-A520 complex, as well as the shared logic, has a defined set of power modes and corresponding legal transitions between these power modes. The power mode of each core can be independent of other cores in a complex or DSU-120 DynamIQ™ cluster.

The *Power Policy Unit* (PPU) of a core manages at the cluster level the transitions between the power modes for that core. See *Power management* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for more information.

The following table shows the supported Cortex-A520 core power modes.

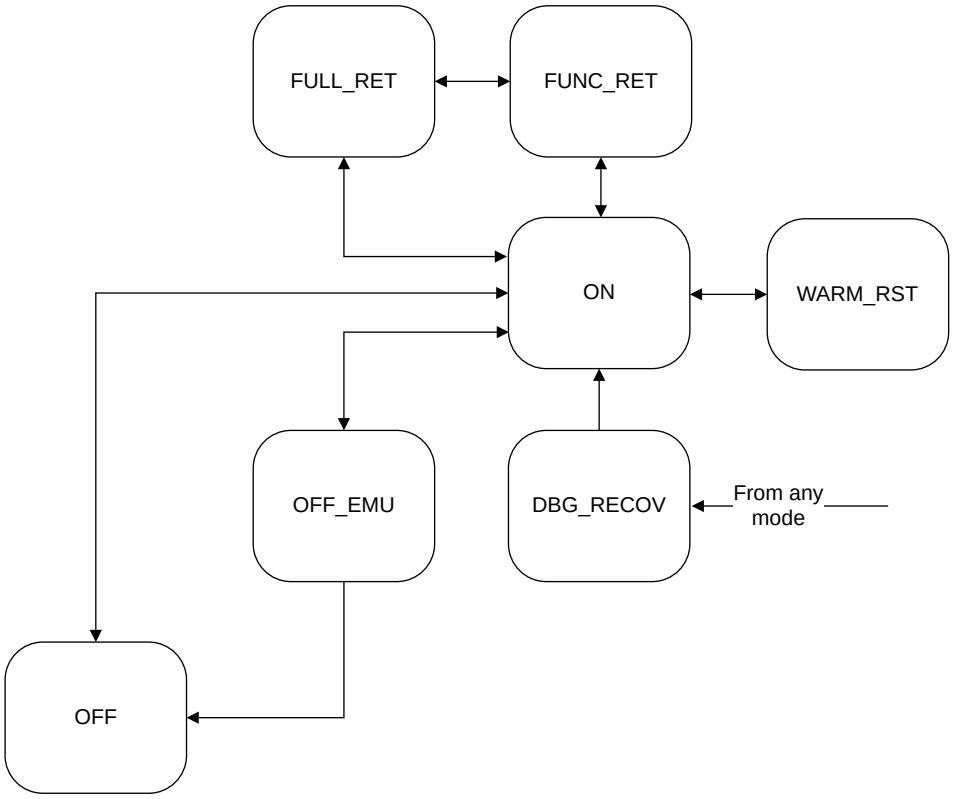
Power modes that are not shown in the following table are not supported and must not occur. Deviating from the legal power modes can lead to **UNPREDICTABLE** results. You must comply with the dynamic power management and powerup and powerdown sequences described in 5.7 Cortex-A520 core powerup and powerdown sequence on page 58.

Table 5-1: Cortex-A520 core power modes

Power mode	Short name	Power state
On	ON	The core is powered up and active.
Functional retention	FUNC_RET	The core is fully powered and operational, but the *Vector Processing Unit* (VPU) is idle.
Full retention	FULL_RET	The core is in retention. In this mode, only power that is required to retain register and RAM state is available. The core is not operational. A core must be in *Wait for Interrupt* (WFI) or *Wait for Event* (WFE) low-power state before it enters this mode.
Off	OFF	The core is powered down.
Emulated Off	OFF_EMU	Emulated off mode permits you to debug the powerup and powerdown cycle without changing the software. In this mode, the core proceeds through all the powerdown steps, except: • The clock is not gated and power is not removed when the core is powered down. • Only a Warm reset is asserted. The debug logic is preserved in the core and remains accessible by the debugger.
Debug recovery	DBG_RECOV	The RAM and logic are powered up. This mode is for applying a Warm reset to the DSU-120 DynamIQ™ cluster, while preserving memory and *Reliability, Availability, and Serviceability* (RAS) registers for debug purposes. Both cache and RAS state are preserved when transitioning from DBG_RECOV to ON. **Caution:** This mode must not be used during normal system operation.
Warm reset	WARM_RST	A Warm reset resets all state except for the debug logic, the trace unit logic, the *Activity Monitor Unit* (AMU) logic, and the debug and the RAS registers.

The following figure shows the supported modes for the Cortex-A520 core power domain and the legal transitions between them.

Figure 5-5: Permitted Cortex-A520 core power mode transitions



Related information

5.2 Architectural clock gating modes on page 48
5.2.1 Wait for Interrupt and Wait for Event on page 48
5.4.5 Full retention mode on page 53

5.4.1 On mode

In the On power mode, the Cortex-A520 core is on and fully operational.

The core can be initialized into the On mode. When a transition to the On mode is completed, all caches are accessible and coherent. Other than the normal architectural steps to enable caches, no additional software configuration is required.

5.4.2 Off mode

In the Off power mode, power is removed completely from the core and no state is retained.

In Off mode, all core logic and RAMs are off. The domain is inoperable and all core state is lost. On transition to Off mode, the L1 and L2 caches are disabled, cleaned, and the core is removed from coherency automatically.

Note

If only one core in a complex transitions to Off mode, the L2 cache is not cleaned.

An attempted debug access or utility bus access to the core when the core domain is off returns an error response on the utility bus, indicating that the core is not available. See *Utility bus* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for more information.

5.4.3 Emulated off mode

In Emulated off mode, all core domain logic and RAMs are kept on. All Debug registers must retain their state and be accessible from the external debug interface. All other functional interfaces behave as if the core were in Off mode.

5.4.4 Functional retention mode

Functional retention mode is a dynamic retention mode that is controlled using IMP_CPUPWRCTLR_EL1. On wakeup, full power to the core can be restored and execution can continue.

In Functional retention mode, the core is fully powered and operational, but the *Vector Processing Unit* (VPU) is off. The VPU can enter this mode when it is idle and the retention timer has expired. Software can enable or disable this mode and set the length of the retention timer.

If there is a VPU instruction waiting in the execution pipeline, the VPU must exit Functional retention. In a complex where two cores share a VPU, Functional retention only occurs when all cores request it.

Related information

A.1.13 IMP_CPUPWRCTLR_EL1, CPU Power Control Register on page 201

5.4.5 Full retention mode

Full retention mode is a dynamic retention mode that is controlled using the *Power Policy Unit* (PPU). On wakeup, full power to the core can be restored and execution can continue.

In Full retention mode, only power that is required to retain register and RAM state is available. The core is in retention state and is non-operational.

The core enters Full retention mode when all of the following conditions are met:

- The retention timer has expired. For more information on setting the retention timer, see A.1.13 IMP_CPUPWRCTLR_EL1, CPU Power Control Register on page 201.
- The core is in *Wait for Interrupt* (WFI) or *Wait for Event* (WFE) low-power state.

- The core clock is not temporarily enabled for any of the following reasons:
  - L1 snoops or L2 snoops
  - Cache or *Translation Lookaside Buffer* (TLB) maintenance operations
  - Debug or *Generic Interrupt Controller* (GIC) access

The core exits Full retention mode when it detects any of the following events:

- A WFI or WFE wakeup event, as defined in the *Arm® Architecture Reference Manual for A-profile architecture*.
- An event that requires the core clock to be temporarily enabled without exiting the WFI or WFE low-power state. For example:
  - L1 snoops or L2 snoops
  - Cache or TLB maintenance operations
  - Debug access on the debug *Advanced Peripheral Bus* (APB)
  - GIC access

Related information

5.2.1 Wait for Interrupt and Wait for Event on page 48

5.4.6 Debug recovery mode

Debug recovery mode supports debug of external watchdog-triggered reset events, such as watchdog timeout.

By default, the core invalidates its caches when it transitions from Off to On mode. Using Debug recovery mode allows the L1 cache and L2 cache contents that were present before the reset to be observable after the reset. In this mode, the contents of the caches are retained and are not altered on the transition back to the On mode.

In addition to preserving the cache contents, Debug recovery mode supports preserving the *Reliability, Availability, and Serviceability* (RAS) state. A transition to Debug recovery mode is made from any state, which puts the core into a Warm reset state. There is no external mechanism to apply a Warm reset mode other than programming the *DynamIQ Shared Unit-120 Power Policy Units* (PPUs).

For more information on the DSU-120 *Power Policy Units* (PPUs), see *The Power Policy Unit* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*.

Debug recovery is strictly for debug purposes. It must not be used for functional purposes, because correct operation of the caches is not guaranteed when entering this mode.

Debug recovery mode can occur at any time with no guarantee of the state of the core. A request of this type is accepted immediately, therefore its effects on the core, the DSU-120 DynamIQ™

cluster, or the wider system are **UNPREDICTABLE**, and a wider system reset might be required. In particular, any outstanding memory system transactions at the time of the reset might complete after the reset. The core is not expecting these transactions to complete after a reset, and might cause a system deadlock.

If the system sends a snoop to the DSU-120 DynamIQ™ cluster during Debug recovery mode, depending on the cluster state:

- The snoop might get a response and disturb the contents of the caches
- The snoop might not get a response and cause a system deadlock

5.4.7 Warm reset mode

A Warm reset resets all state except for the trace logic, debug registers, and *Reliability, Availability, and Serviceability* (RAS) registers.

A Warm reset is applied to the Cortex-A520 core when the core receives a Warm reset signal from the *DynamIQ Shared Unit-120* side of the CPU bridge.

The Cortex-A520 core implements the Arm®v8-A Reset Management Register, RMR_EL3. If RMR_EL3.RR is set to 1 and a `WFI` instruction is executed, then the core will request a Warm reset.

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information about RMR_EL3.

5.5 Complex power modes

For a complex containing two cores, a power mode transition in either core requires arbitration between the two cores and their shared logic. The CPU bridge handles this arbitration automatically, without involving the core *Power Policy Unit* (PPU).

The CPU bridge handles system requests for power mode transitions by translating requests into the correct power mode transitions for a particular complex configuration.

The *Power Control State Machine* (PCSM) interface is an external interface for controlling low-level technology-specific power switch and retention controls.

The following table shows all possible combinations of core power modes and corresponding power states for a dual-core complex with a shared L2 cache and a *Vector Processing Unit* (VPU).

Table 5-2: PPU mode and power domain states for a dual-core complex

PPU mode		PCSM channel		
Core0	Core1	Core0	Core1	Shared logic
On	On	ON	ON	ON
On	Functional retention	ON	ON	ON
On	Full retention	ON	FULL_RET	ON

PPU mode		PCSM channel		
Core0	Core1	Core0	Core1	Shared logic
On	Debug recovery	ON	ON	ON

Note

Emulated off mode operation for a complex is the same as the operation for a core.

In general, any PPU mode combination where only one of the cores is in DBG_RECOV is considered to be a transitional state. In such cases, both cores must eventually go into DBG_RECOV. One exception to this rule is when one core is OFF, in which case it remains OFF while the other core remains in DBG_RECOV.

Deviating from the legal power modes can lead to **UNPREDICTABLE** results. You must comply with the dynamic power management and the powerup and powerdown sequences.

In a dual-core complex, where a single core is being powered down, the shared logic might need to be kept powered on. The powerdown sequence must account for this possibility. Both the L2 cache and the VPU are shared in a dual-core complex. Therefore, when a core in a Cortex-A520 complex is being powered down:

- If the other core is not Off, the shared logic is kept on and kept in coherency state. Only interfaces that are private to the core are powered down and the core is clock gated.
- If the other core is Off, the powerdown sequence for the complex is the same as the sequence for a single core. This sequence includes taking the complex out of coherency, powering off the shared logic, gating the clocks, and disabling the interfaces.

The following table shows the PCSM power mode and corresponding power modes for the PDCORE0 and PDCORE1 power domains.

Table 5-3: PCSM power states and power modes for core power domains

PCSM power state	PDCORE power mode

5.3 Power control on page 50

5.6 Performance and power management

The Cortex-A520 core implements *Performance and Power Management* (PPM) features that can be used to limit high activity events within the core, or trade off efficiency versus peak performance.

The PPM features are:

- *Maximum Power Mitigation Mechanism* (MPMM)

5.6.1 Maximum Power Mitigation Mechanism

Maximum Power Mitigation Mechanism (MPMM) is a power management feature that detects and limits high activity events, specifically high-power load-store events and vector unit instructions.

If the count of high-activity events exceeds a pre-defined threshold during an evaluation period, MPMM temporarily limits the rate of instruction execution and memory system transactions.

MPMM provides three gears that enable it to limit certain classes of workloads. Each MPMM gear limits workloads at a different level of aggressiveness, where gear 0 produces the most aggressive throttling and gear 2 the least aggressive. The *Activity Monitoring Unit* (AMU) provides metrics for each gear. An external power controller can use these metrics to budget SoC power in the following ways:

- By limiting the number of cores that can execute higher activity workloads
- By switching to a different *Dynamic Voltage and Frequency Scaling* (DVFS) operating point

MPMM is not intended to limit workloads that operate close to typical power levels. The MPMM event detection and limiting are targeted to limit workloads that operate at significantly higher power levels than typical integer workloads.

MPMM must not be relied on as the only electrical safety mechanism. It is essentially a localized assistance mechanism that operates at core level. MPMM is not a substitute for a coarse-grained emergency power reduction scheme, but it does minimize the likelihood of such a scheme being engaged. It is a first line of defense rather than a complete solution.

5.7 Cortex-A520 core powerup and powerdown sequence

No particular sequence applies to the Cortex-A520 core powerup. There are no software steps required to bring a core into coherence after reset. For powerdown, the Cortex-A520 core uses a specific sequence.

To powerdown the Cortex-A520 core:

1. If necessary, save the state of the core to system memory, so that it can be restored during the core powerup.
2. Disable interrupts to the core.
   a. Disable the interrupt enable bits in the ICC_IGRPEN0_EL1 and ICC_IGRPEN1_EL1 registers.
   b. Set the GIC Distributor wake up request for the core using the GICR_WAKER register.
   c. Read the GICR_WAKER register to confirm that the ChildrenAsleep bit indicates that the interface is idle.
3. Disable the interrupt outputs from the *Reliability, Availability, and Serviceability* (RAS) registers or redirect the core RAS fault and error interrupt outputs to the system error manager. See Managing RAS fault and error interrupts during the core powerdown procedure.
4. Set the IMP_CPUPWRCTLR_EL1.CORE_PWRDN_EN bit to 1 to indicate to the power controller that a powerdown is requested.
5. Execute an `ISB` instruction.
6. Execute a `WFI` instruction.

After executing `WFI` and then receiving a powerdown request from the power controller, the hardware:

- Disables and cleans the core cache
- Removes the core from coherency

When the IMP_CPUPWRCTLR_EL1.CORE_PWRDN_EN bit is set, executing a `WFI` instruction automatically masks all interrupts and wakeup events in the core. As a result, applying a reset is the only way to wake up the core from the *Wait for Interrupt* (WFI) state.

Related information

A.1.13 IMP_CPUPWRCTLR_EL1, CPU Power Control Register on page 201

5.7.1 Managing RAS fault and error interrupts during the core powerdown sequence

The `WFI` instruction is the point of no return for powering down the core. For this reason, the power management architecture does not permit interrupting the core software after this `WFI` instruction is executed.

Therefore, the core software cannot be interrupted to manage any *Reliability, Availability, and Serviceability* (RAS) fault or error which is either:

- Detected before the core powerdown procedure executes the `WFI` instruction and is not cleared
- Detected after the core powerdown procedure executes the `WFI` instruction.

Any RAS fault or error interrupt output from the core that is active prevents the core from powering down. This means that:

- The core is left powered ON but the software is inactive.
- All requests from the core PPU to powerdown the core are denied.
- A full cluster reset is the only mechanism available to restart the core software.

Therefore, the status of the RAS fault and error interrupts must be managed as part of the core powerdown sequence to prevent this situation from occurring.

The two general options for managing RAS fault and error interrupts during the core powerdown procedure are:

1. Disable the generation of RAS fault and error interrupts using the ERxCTLR_EL1 registers and clear any current RAS fault or error interrupts before the core powerdown procedure executes the `WFI` instruction.
2. Reroute the RAS fault or error interrupts to a separate system error management device as part of the powerdown procedure. This device, such as a System Control Processor, is responsible for resetting the system if a fault or error is signaled. However, this approach is only possible if the system has been designed to allow the RAS interrupt outputs to be rerouted to another component.

If all the RAS fault and error interrupt outputs are disabled before the core powerdown procedure but the error detection and correction response are still enabled, then:

- Any correctable errors are corrected.
- Any deferrable errors are deferred as part of the automatic cache clean and invalidation procedures.
- The Error records for the correctable and deferrable errors are lost after the core is powered OFF.
- If there is an uncorrectable error when the core is powering off, then this error is not signaled to the system and therefore this uncorrectable error might corrupt the system behavior.

In some systems it might be preferable to disable the generation of RAS fault and error interrupts for correctable and deferrable errors but to enable the error interrupt for uncorrectable errors as follows: ERxCTLR_EL1.CFI = 0, ERxCTLR_EL1.FI = 0, and ERxCTLR_EL1.UI = 1. Using this approach, the core error interrupt output must be rerouted to the system error manager before executing the `WFI` instruction in the core powerdown procedure. If an uncorrectable error occurs during the powerdown, the core remains powered ON but the software is inactive. The system error manager is then responsible for resetting the entire cluster and the wider system that is interacting with the core and cluster. To use this approach, the system must permit the core RAS error interrupt to be rerouted to the system error manager. However, the system error manager is unable to identify where the uncorrectable error occurred within the core because the core RAS registers are only accessible to software running on the core.

5.8 Debug over powerdown

The Cortex-A520 core supports debug over powerdown, which allows a debugger to retain its connection with the core even when powered down. This behavior enables debug to continue through powerdown scenarios, rather than having to re-establish a connection each time the core is powered up.

The debug over powerdown logic is part of the DebugBlock in the *DynamIQ Shared Unit-120*. The DebugBlock is external to the DSU-120 DynamIQ™ cluster and must remain powered on during the debug over powerdown process.

See *Debug* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for more information.

6. Memory management

The *Memory Management Unit* (MMU) translates an input address to an output address.

This translation is based on address mapping and memory attribute information that is available in the Cortex-A520 core internal registers and translation tables. The MMU also controls memory access permissions, memory ordering, and cache policies for each region of memory.

An address translation from an input address to an output address is described as a stage of address translation. The Cortex-A520 core can perform:

- Stage 1 translations that translate an input *Virtual Address* (VA) to an output *Physical Address* (PA) or *Intermediate Physical Address* (IPA).
- Stage 2 translations that translate an input IPA to an output PA.
- Combined stage 1 and stage 2 translations that translate an input VA to an IPA, and then translate that IPA to an output PA. The Cortex-A520 core performs translation table walks for each stage of the translation.

In addition to translating an input address to an output address, a stage of address translation also defines the memory attributes of the output address. With a two-stage translation, the stage 2 translation can modify the attributes that the stage 1 translation defines. A stage of address translation can be disabled or bypassed, and cores can define memory attributes for disabled and bypassed stages of translation.

Each stage of address translation uses address translations and associated memory properties that are held in memory-mapped translation tables. Translation table entries can be cached into a *Translation Lookaside Buffer* (TLB). The translation table entries enable the MMU to provide fine-grained memory system control and to control the table walk hardware.

The Cortex-A520 core supports the *Common not Private* (CnP) feature. CnP is an architectural feature that permits cores in a complex to share translation tables. When CnP is enabled and in use, all cores in a complex can share L2 TLB entries and make better use of the TLB. Without it, each core in a complex might cache the same translation, reducing the effective size of the TLB.

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information.

6.1 Memory Management Unit components

The Cortex-A520 *Memory Management Unit* (MMU) includes several *Translation Lookaside Buffers* (TLBs) and a translation table prefetcher.

A TLB is a cache of recently executed page translations within the MMU. The Cortex-A520 core implements a two-level TLB structure. The TLB stores all translation table sizes and is responsible for breaking these down into smaller tables when required for the L1 data or instruction TLB.

The following table describes the MMU components.

Table 6-1: MMU components

Component	Description
L1 instruction TLB	• 16 entries • Fully associative • Located in the L1 instruction memory block • TLB hits return the *Physical Address* (PA) to the instruction cache
L1 data TLB	• 16 entries • Fully associative • Located in the L1 data memory block • TLB hits return the PA to the data cache
L2 TLB	• 8-way set associative • A main block that is located within a complex • Shared between the cores of a dual-core complex • Supports dirty bit update, that is, hardware update of access flag and access permissions • Provides translations for instruction side, data side, trace and profiling accesses, and address translation operations
TLB prefetcher	• Prefetches descriptors into the L2 cache, and translations into the L2 TLB • Can be disabled in the IMP_CMPXECTLR_EL1 register

The L2 TLB entries contain a global indicator and an *Address Space Identifier* (ASID) to allow context switches without requiring the TLB to be invalidated. The L2 TLB entries also contain a *Virtual Machine IDentifier* (VMID) to allow virtual machine switches by the hypervisor without requiring the TLB to be invalidated.

Some L2 TLB entries do not have a valid ASID and VMID, because ASID and VMID only apply to the EL1&0 translation regime. Also, ASID does not apply to the *Intermediate Physical Address* (IPA) cache.

Related information

A.1.12 IMP_CMPXECTLR_EL1, Complex Extended Control Register on page 196

6.2 Translation Lookaside Buffer match process

The Armv8-A architecture supports multiple *Virtual Address* (VA) spaces that are translated differently.

Each *Translation Lookaside Buffer* (TLB) entry is associated with a particular translation regime:

- Secure EL3
- Secure EL2
- Secure EL2 and EL0
- Non-secure EL2
- Non-secure EL2 and EL0

- Secure EL1 and EL0
- Non-secure EL1 and EL0

A TLB match entry occurs when the following conditions are met:

- Its VA[48:N], where N is $\log_2$ of the block size for that translation that is stored in the TLB entry, matches the requested address.
- Entry translation regime matches the current translation regime.
- The *Address Space IDentifier* (ASID) matches the current ASID held in the TTBR0_ELx or TTBR1_ELx register associated with the target translation regime, or the entry is marked global.
- The *Virtual Machine IDentifier* (VMID) matches the current VMID held in the VTTBR_EL2 register.

The ASID information is used for the purpose of TLB matching for entries using:

- The Secure EL1 and EL0 and Non-secure EL1 and EL0 translation regime
- The Secure EL2 and EL0 and Non-secure EL2 and EL0 translation regime

The VMID information is used for the purpose of TLB matching for entries using:

- The Secure EL1 and EL0 and Non-secure EL1 and EL0 translation regime, when EL2 is enabled.

A mapping cannot be shared between cores unless the mapping is marked as common. TLB mappings that are marked as common are available only to cores that have *Common not Private* (CnP) enabled:

- A core that has CnP disabled cannot use a TLB mapping that is marked as common.
- A core that has CnP enabled cannot use a TLB mapping that is marked as private, even if the mapping was allocated by that core.

Note

A core that has CnP enabled is one where the corresponding TTBR<n>_ELx.CnP field for the core is set to 1. For the Secure EL1 and EL0 and Non-secure EL1 and EL0 translation regimes where EL2 is enabled, CnP is enabled when VTTBR_EL2.CnP is set to 1.

6.3 Translation table walks

When the Cortex-A520 core generates a memory access, the *Memory Management Unit* (MMU) searches for the requested *Virtual Address* (VA) in the *Translation Lookaside Buffers* (TLBs). If it is not present, then it is a miss and the MMU proceeds by looking up the translation table during a translation table walk.

When the Cortex-A520 core generates a memory access, the MMU:

1. Performs a lookup for the requested VA, current *Address Space Identifier* (ASID), current *Virtual Machine Identifier* (VMID), and current translation regime in the relevant instruction or data L1 TLB.

2. If there is a miss in the relevant L1 TLB, then the MMU performs a lookup in the L2 TLB for the requested VA, current ASID, current VMID, and translation regime.
3. If there is a miss in the L2 TLB, then the MMU performs a hardware translation table walk.

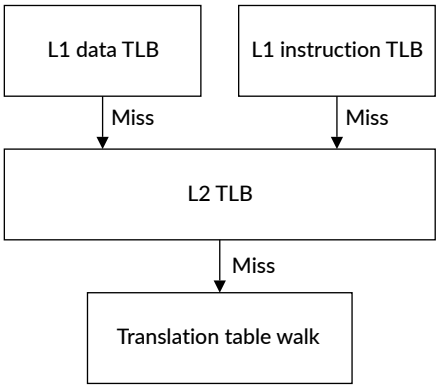
Address translation is performed only when the MMU is enabled. It can also be disabled for a particular translation base register, in which case the MMU returns a Translation Fault.

You can program the MMU to make the accesses that are generated by translation table walks cacheable. This means that translation table entries can be cached in the L2 cache, the L3 cache, and external caches.

During a lookup or translation table walk, the access permission bits in the matching translation table entry determine whether the access is permitted. If the permission checks are violated, then the MMU returns a Permission Fault. See the *Arm® Architecture Reference Manual for A-profile architecture* for more information.

The following figure shows the TLB lookup process.

Figure 6-1: Translation table walks



In translation table walks, the descriptor is fetched from the L2.

8. L1 data memory system on page 73
9. L2 memory system on page 80

6.4 Hardware management of the Access flag and dirty state

The Cortex-A520 core includes the option to perform hardware updates to the translation tables.

This feature is enabled in TCR_ELx (where x is 1-3) and VTCR_EL2. To support hardware management of dirty state, translation table descriptors include the *Dirty Bit Modifier* (DBM) field.

The Cortex-A520 core supports hardware updates to the Access flag and to dirty state only when the translation tables are held in Inner Write-Back and Outer Write-Back Normal memory regions. If software requests a hardware update in a region that is not Inner Write-Back or Outer Write-Back Normal memory, then the Cortex-A520 core returns an abort with the following encoding:

- ESR_ELx.DFSC = `0b110001` for Data Aborts
- ESR_ELx.IFSC = `0b110001` for Instruction Aborts

6.5 Responses

Certain faults and aborts can cause an exception to be taken because of a memory access.

MMU responses

When one of the following operations is completed, the *Memory Management Unit* (MMU) generates a translation response to the requester:

- An L1 instruction or data *Translation Lookaside Buffer* (TLB) hit
- An L2 TLB hit
- A translation table walk

The responses from the MMU contain the following information:

- The *Physical Address* (PA) that corresponds to the translation
- A set of permissions
- Secure or Non-secure state information
- All the information that is required to report aborts

MMU aborts

The MMU can detect faults that are related to address translation and can cause exceptions to be taken to the core. Faults can include address size faults, translation faults, access flag faults, and permission faults.

External aborts

External aborts occur in the memory system, and are different from aborts that the MMU detects. Normally, external memory aborts are rare. External aborts are caused by errors that are flagged by the external memory interfaces or are generated because of an uncorrected *Error Correcting Code* (ECC) error in the L1 data cache or L2 cache arrays.

External aborts are reported synchronously when they occur during:

- Translation table walks for instruction fetches, loads, and stores
- Data accesses that result from load operations to Normal memory
- Load operations to Device memory, including operations that have acquire semantics

Note

The address captured in the *Fault Address Register* (FAR) is the target address of the instruction that generated the synchronous external abort.

External aborts are reported asynchronously when they occur during:

- Store operations to any memory type
- Cache maintenance, TLB invalidate, and instruction cache invalidate operations

Misprogramming contiguous hints

When there is a descriptor that contains a set CH bit, the input *Virtual Address* (VA) address space must include all contiguous VAs contained in this block.

The VA address space is defined by:

- TCR_ELx.TxSZ for stage 1 translations
- VTCR_EL2.T0SZ for stage 2 translations

The Cortex-A520 core treats such a block as not causing a translation fault and disregards the value of the contiguous bit.

Conflict aborts

The Cortex-A520 core does not generate conflict aborts.

6.6 Memory behavior and supported memory types

The Cortex-A520 core supports memory types defined in the Arm®v8-A architecture.

Device memory types have the following attributes:

G – Gathering
: The capability to gather and merge requests together into a single transaction

R – Reordering
: The capability to reorder transactions

E – Early Write Acknowledgement
: The capability to accept early acknowledgement of write transactions from the interconnect

Note

In the following table, the n prefix means the capability is not allowed.

The following table shows the Device memory types that the Cortex-A520 core supports.

Table 6-2: Supported Arm®v8-A Device memory types

Memory type	Description
Device-GRE	Device Gathering, Reordering, Early Write Acknowledgement. Device-GRE is similar to Normal Non-cacheable, but does not permit Speculative accesses.
Device-nGRE	Device non-Gathering, Reordering, Early Write Acknowledgement. Transactions might be reordered within the L3 memory system, or in the system interconnect. The use of barriers is required to order accesses to Device-nGRE memory.
Device-nGnRE	Device non-Gathering, non-Reordering, Early Write Acknowledgement. Device-nGnRE is equivalent to the Device memory type in earlier versions of the architecture.
Device-nGnRnE	Device non-Gathering, non-Reordering, No Early Write Acknowledgement. Device-nGnRnE is treated the same as nGnRE inside the Cortex-A520 core, but reported differently on the bus interface.

Some behaviors are simplified and so for best performance Arm does not recommend using the following memory types:

Write-Through

Memory that is marked as Write-Through is not cached on the data side and does not make coherency requests. On the instruction side, areas that are marked as Write-Through or Write-Back can be cached in the L1 instruction cache.

Mixed Inner and Outer Cacheability

Only memory that is marked as Inner and Outer Write-Back can be cached on the data side and make coherency requests. This rule applies to the memory type only, and not to the allocation hints. All caches within the DSU-120 DynamIQ™ cluster are treated as being part of the Inner Cacheability domain.

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information about memory types.

6.7 Page-based hardware attributes

The architecture defines *Page-Based Hardware Attributes* (PBHA) as an optional **IMPLEMENTATION DEFINED** feature. This section describes how the Cortex-A520 core implements PBHA.

It allows software to set up to four bits in the translation tables, which are then propagated through the memory system with transactions and can be used in the system to control system components. The meaning of the bits is specific to the system design.

For information on how to set and enable the PBHA bits in the translation tables, see the *Arm® Architecture Reference Manual for A-profile architecture*. When disabled, the PBHA value that is propagated on the bus is 0.

For memory accesses caused by a translation table walk, the IMP_ATCR_ELx and IMP_AVTCR_EL2 registers control the PBHA values.

PBHA combination between stage 1 and stage 2 on memory accesses

PBHA should always be considered as an attribute of the physical address.

When stage 1 and stage 2 are enabled:

- If both stage 1 PBHA and stage 2 PBHA are enabled, the final PBHA is stage 2 PBHA.
- If stage 1 PBHA is enabled and stage 2 PBHA is disabled, the final PBHA is stage 1 PBHA.
- If stage 1 PBHA is disabled and stage 2 PBHA is enabled, the final PBHA is stage 2 PBHA.
- If both stage 1 PBHA and stage 2 PBHA are disabled, the final PBHA is defined to 0.

Enable of PBHA has a granularity of 1 bit, so this property is applied independently on each PBHA bit.

Mismatched aliases

If the same physical address is accessed through more than one virtual address mapping, and the PBHA bits are different in the mappings, then the results are **UNPREDICTABLE**. The PBHA value sent on the bus could be for either mapping.

7. L1 instruction memory system

The Cortex-A520 core L1 instruction memory system fetches instructions and predicts branches. It is part of the *Instruction Fetch Unit* (IFU), which includes a dynamic branch predictor. It includes the L1 instruction cache and the L1 instruction *Translation Lookaside Buffer* (TLB).

The L1 instruction memory system provides an instruction stream to the decoder. To increase overall performance and reduce power consumption, the L1 instruction memory system uses dynamic branch prediction and instruction caching.

The following table shows the L1 instruction memory system features.

Table 7-1: L1 instruction memory system features

Feature	Description
L1 instruction cache	32KB or 64KB
	4-way set associative
	Virtually-indexed, physically-tagged (VIPT) behaving as *physically-indexed, physically-tagged* (PIPT)
	Single Error Detect (SED) parity cache protection
Cache line length	64 bytes
Cache policy	Dynamic based cache replacement policy

Note

The L1 instruction TLB also resides in the L1 instruction memory system. However, it is part of the *Memory Management Unit* (MMU) and is described in 6. Memory management on page 62.

7.1 L1 instruction cache behavior

The L1 instruction cache is invalidated automatically at reset unless the core power mode is initialized to Debug Recovery.

In Debug recovery mode, the caches are not guaranteed to be functional and should not be enabled.

When the instruction Cacheability is disabled, all instruction fetches to Cacheable memory are treated as if they were Non-cacheable. All instruction fetches will not get allocated into instruction cache.

When the instruction Cacheability is enabled, lines might still be allocated into the instruction cache even if the memory is marked as Non-cacheable.

These behaviors mean that instruction fetches might not be coherent with caches in other cores, and software must account for this possibility.

Related information

5.4.6 Debug recovery mode on page 54

7.2 L1 instruction cache Speculative memory accesses

Instruction fetches are Speculative and there can be several unresolved branches in the pipeline. A branch instruction or exception in the code stream can cause a pipeline flush, discarding the currently fetched instructions.

On instruction fetches, pages with Device memory type attributes are treated as Non-Cacheable Normal Memory. To prevent instruction fetches, device memory pages must be marked with the translation table descriptor attribute bit *eXecute Never* (XN). The device and code address spaces must be separated in the physical memory map. This separation prevents Speculative fetches to read-sensitive devices when address translation is disabled.

If a speculative instruction fetches miss in the L1 instruction cache, they can still look into L2 Cache if it is enabled.
See the *Arm® Architecture Reference Manual for A-profile architecture* for more information.

7.3 Program flow prediction

The Cortex-A520 core contains program flow prediction hardware, also known as branch prediction. Branch prediction increases overall performance and enhances power efficiency.

Program flow prediction is enabled when the *Memory Management Unit* (MMU) is enabled for the current Exception level. If program flow prediction is disabled, then all taken branches incur a penalty that is associated with cleaning the pipeline. If program flow prediction is enabled, then it predicts whether a conditional or unconditional branch is to be taken, as follows:

- For conditional branches, it predicts whether the branch is to be taken and the address that the branch goes to, known as the branch target address.
- For unconditional branches, it only predicts the branch target address.

Program flow prediction hardware contains the following functionality:

- A conditional branch predictor
- An indirect branch predictor
- Dynamic branch predictor history
- The return stack, a stack of nested subroutine return addresses
- A cache that holds the branch target address of previously taken branches

Predicted and non-predicted instructions

Program flow prediction hardware predicts all branch instructions, and includes:

- Conditional branches

- Unconditional branches
- Return instructions
- Indirect branches

The following instructions are not predicted:

- Exception return instructions (including `ERET`, `ERETAA`, `ERETAB`)
- Supervisor call instructions
- Hypervisor call instructions
- Secure Monitor call instructions

Return stack

The return stack stores the return address of procedure call instructions. This address should be equal to the value written in the Link Register (X30) by these instructions.

Any of the following instructions causes a return stack push:

- `BL`
- `BLR`
- `BLRAA`
- `BLRAAZ`
- `BLRAB`
- `BLRABZ`

Any of the following instructions cause a return stack pop:

- `RET`
- `RETAA`
- `RETAB`

8. L1 data memory system

The Cortex-A520 core L1 data memory system is responsible for executing load and store instructions and specific instructions like atomics, cache maintenance operations, and memory tagging instructions. The L1 data memory system includes the L1 data cache and the L1 data *Translation Lookaside Buffer* (TLB).

The L1 data side memory system responds to load and store requests from the *Data Processing Unit* (DPU). It also responds to snoop requests from other cores, or external masters.

The following table shows the L1 data memory system features.

Table 8-1: L1 data memory system features

Feature	Description
Data Cache Unit (DCU)	Manages all load and store operations
	Includes a combined local and global exclusive monitor that is used by Load-Exclusive and Store-Exclusive instructions
STore Buffer (STB)	Handles store instructions and barriers
	Merging store buffer capability which writes to all types of memory, that is, Device, Normal cacheable, and Normal Non-cacheable
Bus Interface Unit (BIU)	Handles the linefills to the L1 data cache
	Receives requests from the cache pipeline in the L1 unit, the STB, and the *Instruction Fetch Unit* (IFU)
	Processes the requests and sends them to the L2 unit
Trace and Profiling Buffer (TPB)	Receives trace data from the trace unit and writes it to memory
Prefetch engine	Detects patterns of cache line requests. Multiple streams are allowed in parallel, capable of detecting both constant requests and patterns of requests.
L1 data cache	32KB or 64KB
	4-way set associative
	Virtually-Indexed, Physically-Tagged (VIPT) behaving as *Physically-Indexed, Physically-Tagged* (PIPT)
	Error Correcting Code (ECC) cache protection
Read path	Dual 128-bit read path from the data L1 memory system to the DPU
Write path	128-bit write path from the DPU to the L1 memory system
Cache line length	64 bytes
Cache policy	Pseudo-random cache replacement policy

8.1 L1 data cache behavior

The L1 data cache is invalidated automatically at reset unless the core power mode is initialized to Debug recovery mode.

In Debug recovery mode, the caches are not guaranteed to be functional and should not be enabled.

On a cache miss, the cache performs a critical word-first fill.

There is no operation to invalidate the entire data cache. If software requires this function, then it must be constructed by iterating over the cache geometry and executing a series of individual invalidates by set/way instructions. The `DC CSW` and `DC ISW` instructions perform both a clean and invalidate of the target set/way. The values of HCR_EL2.SWIO have no effect. See the *Arm® Architecture Reference Manual for A-profile architecture* for more information about `DC CISW` and HCR_EL2.

Data Cacheability disabled behavior

If the data Cacheability is disabled, then:

- Load and store instructions do not access any of the L1 data, L2, or the L3 caches.
- Data cache maintenance operations continue to execute normally.
- Snoop requests continue to access the L1 data, L2, and L3 caches.
- All load and store instructions to cacheable memory are treated as Non-cacheable.

It is not possible to disable data Cacheability for individual levels of cache. When data Cacheability for a core is disabled, other cores can still make accesses and cause allocations to L2 or L3 caches, as can Cacheable instruction fetches.

To maintain data coherency between multiple cores, the Cortex-A520 core uses the *Modified Exclusive Shared Invalid* (MESI) protocol.

The way that cache indices are determined means that there is no direct relationship between the *Physical Address* (PA) and set number. You cannot use targeted operations that assume a relationship between the PA and set number. To flush the entire cache, you must perform set and way maintenance operations over the number of sets and ways described in CCSIDR_EL1 for that cache.

Related information

5.4.6 Debug recovery mode on page 54

8.2 Write streaming mode

The Cortex-A520 core supports write streaming mode, sometimes referred to as read allocate mode, both for the L1 and the L2 cache.

A cache line is allocated to the L1 or L2 cache on either a read miss or a write miss. However, writing large blocks of data can pollute the cache with unnecessary data. It can also waste power and performance when a linefill is performed only to discard the linefill data, because the entire line gets overwritten by subsequent writes (for example using `memset()` or `memcpy()`). In some

situations, cache line allocation on writes is not required. For example, when executing the C standard library `memset()` function to clear a large block of memory to a known value.

To prevent unnecessary cache line allocation, the memory system detects when the core has written a sequence of full cache lines. If this situation is detected on a configurable number of consecutive linefills, then it switches into write streaming mode.

When in write streaming mode, load operations behave as normal, and can still cause linefills. Writes still look up in the cache, but if they miss, then they write out to the L2 or L3 cache rather than starting a linefill.

Note

More than the specified number of linefills might be observed on the CHI master or AXI master interface before the memory system switches to write streaming mode.

The write streaming mode remains enabled until either:

- It detects a cacheable write burst that is not a full cache line.
- There is a load operation from the same line that is being written to the L2 or the L3 cache.

When a Cortex-A520 core has switched to write streaming mode, the memory system continues to monitor the bus traffic. It signals to the L2 or L3 cache to go into write streaming mode when it observes a further number of full cache line writes.

The write streaming threshold defines the number of consecutive cache lines that are fully written without being read before store operations stop causing cache allocations. You can configure the write streaming threshold for each cache (L1, L2, and L3) and for the caches outside the cluster by writing the register A.1.11 IMP_CPUECTLR_EL1, CPU Extended Control Register on page 190.

You can configure the write streaming threshold for each cache:

- IMP_CPUECTLR_EL1.L1WSCTL configures the L1 write streaming mode threshold.
- IMP_CPUECTLR_EL1.L2WSCTL configures the L2 write streaming mode threshold.
- IMP_CPUECTLR_EL1.L3WSCTL configures the L3 write streaming mode threshold.
- IMP_CPUECTLR_EL1.L4WSCTL configures the system cache write streaming mode threshold.

8.3 Memory system implementation

The Cortex-A520 core supports a single limited order range that includes the entire memory space. It also has specific behavior for transient memory regions.

Atomic instruction implementation in the L1 data memory system

The Cortex-A520 core supports the atomic instructions added in the Arm®v8.1-A architecture. Atomic instructions to Cacheable memory can be performed either as near atomic or far atomic

instructions. Whether a near or far atomic instruction is used depends on the L1 data cache hit and miss information and on the type of operation. Atomic instruction execution location is as follows:

- Near atomic instructions are executed locally, at the L1 memory subsystem level.
- Far atomic instructions are executed in downstream caches and in memory.

Use IMP_CPUECTLR_EL1.ATOM to configure atomic instruction handling. See the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for more information about atomic instructions.

The atomic is passed on to the interconnect to perform the operation when all the following conditions apply:

- The interconnect supports far atomics.
- The master interface is configured as CHI.
- The operation misses everywhere within the DSU-120 DynamIQ™ cluster.

If the operation hits anywhere inside the DynamIQ™ cluster, or the interconnect does not support atomics, the L3 memory system performs the atomic operation and allocates the line into the L3 cache if it is not already there.

If there is a requirement to perform a specific atomic operation as a near atomic, you can precede the atomic instruction with a `PRFM PSTL1KEEP` instruction. This brings the line into the cache in a unique state. Using a `PRFM PSTL1KEEP` instruction does not guarantee that the atomic is performed near, as this action is only a performance hint.

The Cortex-A520 core supports atomics to Device or Non-cacheable memory, however this support relies on the interconnect also supporting atomics. If this type of atomic instruction is executed when the interconnect does not support them, it results in an asynchronous Data Abort.

Transient memory region

The core has a specific behavior for memory regions that are marked as Write-Back cacheable and transient, as defined in the Arm®v8-A architecture.

The transient hint is a qualifier of the cache allocation hints, and indicates that the benefit of caching is for a relatively short period.

For any load that is targeted at a memory region that is marked as transient, the following occurs:

- If the memory access misses in the L1 data cache, the returned cache line is allocated in the L1 data cache but is marked as transient.
- On eviction, if the line is clean and marked as transient, it is not allocated into the L2 cache but is marked as invalid in the L1 data cache.

Use IMP_CPUECTLR_EL1.NTCTL to configure transient and non-temporal L1 eviction.

For stores that are targeted at a memory region that is marked as transient, if the store misses in the L1 data cache, the line is not allocated into the L2 cache.

Non-temporal loads

Non-temporal loads indicate to the caches that the data is likely to be used for only short periods. For example, when streaming single-use read data that is then discarded. In addition to non-temporal loads, there are also prefetch-memory (PRFM) hint instructions with the STRM qualifier. The Load/Store Non-temporal Pair instructions provide a hint to the memory system that an access is non-temporal or streaming, and unlikely to be repeated in the near future.

Non-temporal loads cause allocation into the L1 data cache, with the same performance as normal loads. However, when a later linefill is allocated into the cache, the cache line that is marked as non-temporal has higher priority to be replaced. To prevent pollution of the L2 cache, a non-temporal line that is evicted from the L1 data cache is not allocated to L2, as would be the case for a normal line. Instead, the non-temporal data is sent directly to the L3 cache. Use IMP_CPUECTLR_EL1.NTCTL to configure transient and non-temporal L1 data cache eviction.

Note

If the core has the line in a unique state, the line is marked as non-temporal in the cache. If the line is shared with other cores, the line is treated normally.

Non-temporal stores are treated the same as stores to a memory region that is marked as transient. That is, if the store misses in the L1 data cache, the line is not allocated into the L2 cache.

Related information

A.1.11 IMP_CPUECTLR_EL1, CPU Extended Control Register on page 190

8.4 Internal exclusive monitor

The Cortex-A520 core includes an internal exclusive monitor with a 2-state, open and exclusive, state machine that manages Load-Exclusive and Store-Exclusive instructions and Clear-Exclusive instructions.

You can use these instructions to construct semaphores, ensuring synchronization between different processes running on the core. Semaphores can also ensure synchronization between different cores that are using the same coherent memory locations for the semaphore.

A Load-Exclusive instruction tags a small block of memory for exclusive access. The CTR_EL0 register defines the size of the tagged blocks as 16 words, one cache line.

Note

A Load-Exclusive or Store-Exclusive instruction is an instruction that has a mnemonic starting with LDX, LDAX, STX, or STLX.

If a Load-Exclusive instruction is performed to Non-cacheable or Device memory, and is to a region of memory in the *System on Chip* (SoC) that does not support exclusive accesses, it causes a Data Abort exception with a Data Fault status code of `0b110101`.

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information about these instructions.

Treatment of intervening store operations

When a normal store operation occurs between a Load-Exclusive and a Store-Exclusive instruction from the same core, the normal store does not produce any direct effect on the internal exclusive monitor.

After the Load-Exclusive instruction, the local monitor is in the Exclusive Access state. It remains in the Exclusive Access state after the store. It then returns to the Open Access state only after one of the following operations:

- A Store-Exclusive access
- A `CLREX` instruction
- An exception return

However, if the address that is accessed is in cacheable memory, any eviction of the cache line containing that address clears the monitor. Arm does not recommend placing any load or store instructions between the Load-Exclusive and the Store-Exclusive, because these additional instructions can cause a cache eviction. Any data cache maintenance instruction can also clear the exclusive monitor.

Exclusive monitor

In the exclusive state machine, the transitions are as follows:

- If the monitor is in the Exclusive Access state, and a Store-Exclusive instruction is performed to a different address, then the Store-Exclusive fails and does not update memory.
- If a normal store is performed to a different address, it does not affect the exclusive monitor.
- If a normal store is performed from a different core to the same address, it returns the monitor to the Open Access state. If the store is from the same core, it does not return the monitor to the Open Access state.

Related information

A.5.45 CTR_EL0, Cache Type Register on page 353

8.5 Data prefetching

Data prefetching can boost execution performance by fetching data before it is needed.

Preload instructions

For cases that cannot be handled efficiently by data prefetchers, the Cortex-A520 core supports the AArch64 prefetch memory instructions, `PRFM`.

These instructions signal to the memory system that memory accesses from a specified address are likely to occur soon. The memory system takes actions that aim to reduce the latency of memory accesses when they occur.

`PRFM` instructions perform a lookup in the cache. If they miss and the memory accesses are to a cacheable address, then a linefill starts. However, a `PRFM` instruction retires when its linefill is started, and it does not wait until the linefill is complete.

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information on prefetch memory and preloading caches.

Hardware data prefetcher

The Cortex-A520 core has a data prefetch mechanism that looks for cache line fetches with regular or repetitive patterns of data. The core includes multiple data prefetchers. If a data prefetcher detects a pattern, it signals to the memory system that memory accesses from a specified address are likely to occur soon. The memory system responds by starting new linefills to fetch the predicted addresses ahead of the demand loads. These linefills can be in the L1 data cache, the L2 cache, or the L3 cache, depending on which cache the hardware selects.

Prefetch streams end under any of the following circumstances:

- A repetitive pattern is broken.
- A *Data Synchronization Barrier* (DSB) operation is executed.
- A *Wait for Interrupt* (WFI) or *Wait for Event* (WFE) wakeup event is executed.
- A data cache maintenance operation is committed.

The prefetcher is based on virtual addresses. It can therefore cross page boundaries as long as the new page is still cacheable and has read permission.

Data cache zero

In the Cortex-A520 core, the *Data Cache Zero by Virtual Address* (`DC ZVA`) instruction sets a 64-byte block of memory, which is aligned to 64 bytes, to zero.

For more information, see the *Arm® Architecture Reference Manual for A-profile architecture*.

9. L2 memory system

The Cortex-A520 L2 memory system connects the Cortex-A520 core to the *DynamIQ Shared Unit-120* L3 memory system. It includes an optional unified L2 cache that is private to a complex.

The L2 memory system handles requests from the L1 instruction and data caches, and snoop requests from the L3 memory system. The L2 memory system forwards responses from the L3 system to the core. The core can then take precise or imprecise aborts, depending on the type of transaction.

Note

For some cores, you can implement the DSU-120 to use the Direct connect feature to connect to the core. However, the Cortex-A520 core does not support Direct connect.

For a complex with two cores, the L2 memory system is shared between the two cores. The L2 memory system also:

- Handles coherent and non-coherent operations from cores and from associated L1 evictions.
- Handles snoop operations from other cores in the DSU-120 DynamIQ™ cluster and from other *Processing Elements* (PEs) in the system, in accordance with the *AMBA® 5 CHI Architecture Specification*.
- Handles instruction cache, *Translation Lookaside Buffer* (TLB), and predictor maintenance operations as *Distributed Virtual Memory* (DVM) messages, including broadcast operations within the complex.

The following table shows the L2 memory system features.

Table 9-1: L2 memory system features

Feature	Type
L2 cache, optional	128KB, 192KB, 256KB, 384KB, or 512KB
	8-way set associative
	Per-complex unified
	Physically-Indexed, Physically-Tagged (PIPT)
	Optionally protected with *Error Correcting Code* (ECC)
Cache line length	64 bytes
Cache policy	Dynamic biased cache replacement policy
	Weakly exclusive with L1 data caches
	Weakly inclusive with L1 instruction caches
Cache protection	Tag, data, and L2 data buffer RAM structures are always protected with ECC.
Cache partitioning	The L2 cache is too small to justify partitioning. The L2 cache stores the *Memory system resource Partitioning And Monitoring* (MPAM) information and propagates it to the L1 and L3 caches.

9.1 Optional integrated L2 cache

You can implement the Cortex-A520 core with or without an L2 cache.

In general, data is allocated to the L2 cache only when evicted from the L1 memory system, not when first fetched from the system. Instructions are generally allocated to the L2 cache on an L2 miss. However, there are other cases when data or instructions are allocated to the L2 cache:

- If the Write-Allocate hint is set when the L1 cache enters write-streaming mode, cacheable writes are allocated in the L2 cache until the L2 streaming threshold is reached.
- L2 cache prefetches issued by the L1 caches are allocated in the L2 cache, regardless of the Read-Allocate hint.
- If the Read-Allocate hint is set, cacheable reads from the *Translation Lookaside Buffer* (TLB) or instruction side are allocated in the L2 cache.

Note

This list mentions the most common examples of when data might be allocated to the L2 cache, but it does not include every possible case.

Writes to a memory region that is marked as transient are not allocated to the L2 cache.

When non-temporal data is evicted from the L1 memory system, the data is sent directly to the L3 cache and is not allocated in the L2 cache. Use IMP_CPUECTLR_EL1.NTCTL to configure transient and non-temporal L1 eviction.

L2 cache RAMs are invalidated automatically at reset unless the Debug recovery mode is used.

Related information

5.4.6 Debug recovery mode on page 54
8.2 Write streaming mode on page 74
A.1.11 IMP_CPUECTLR_EL1, CPU Extended Control Register on page 190

9.2 Support for memory types

The Cortex-A520 core simplifies coherency logic by downgrading some memory types.

Memory that is marked as both Inner Write-Back Cacheable and Outer Write-Back Cacheable is cached in the L1 data cache and the L2 cache. All other memory types are not cached.

Allocation hint

Allocation hints help to determine the rules of allocation of newly fetched lines in the system.

The standard CHI attributes are passed to the *DynamIQ Shared Unit-120* with no modifications, except for translating the following architectural attributes to CHI attributes:

- Allocate hint
- Shareability
- Cacheability

Note

Inner and Outer Cacheability is merged together, as the Cortex-A520 core only allocates memory that is marked as both Inner and Outer cacheable.

Related information

A.1.11 IMP_CPUECTLR_EL1, CPU Extended Control Register on page 190

9.3 Transaction capabilities

The interface between the Cortex-A520 core L2 memory system and the *DynamIQ Shared Unit-120* provides transaction capabilities for the core.

The following table shows the maximum possible values for read, write, *Distributed Virtual Memory* (DVM) issuing, and snoop capabilities of the Cortex-A520 core L2 cache. The table includes values for single-slice L2 cache and dual slice L2 cache configurations.

Table 9-2: Cortex-A520 core transaction capabilities

Attribute	Maximum value	Description
Write issuing capability	40, for single slice 80, for dual slice	Maximum number of outstanding write transactions. **Note:** This value depends on the counting method that is used, but typical values are quoted.
Read issuing capability	31, for single slice 48, for dual slice	Maximum number of outstanding read transactions.
Snoop acceptance capability	29, for single slice 49, for dual slice	Maximum number of outstanding snoops accepted.
DVM issuing capability	18, for single slice 36, for dual slice	Maximum number of outstanding DVM operation transactions.

See the *Arm® Architecture Reference Manual for A-profile architecture* for information on the different memory types.

10. Direct access to internal memory

The Cortex-A520 core provides a mechanism to read the internal memory that the L1 caches, L2 cache, and *Translation Lookaside Buffer* (TLB) structures use through **IMPLEMENTATION DEFINED** System registers. When the coherency between the cache data and the system memory data is broken, you can use this mechanism to investigate any issues.

Direct access to internal memory is available only in EL3. In all other exception levels, executing these instructions results in an Undefined Instruction exception.

Use the **IMPLEMENTATION DEFINED** system registers to select the appropriate memory block and location. The following table shows the System register operations that read the data and the information that the cache data includes.

Table 10-1: IMPLEMENTATION DEFINED System registers for accessing internal memory

Name	Access encoding	Operation	Rd
IMP_CDBGDR0_EL3	`MRS <Xt>, S3_6_C15_C0_0`	Store data from a preceding cache debug operation	Data
SYS IMP_CDBGL1DCTR	`SYS #6, C15, C2, #0, <Xt>`	Read contents of L1 data cache tag RAM	Set and way
SYS IMP_CDBGL1ICTR	`SYS #6, C15, C2, #1, <Xt>`	Read contents of L1 instruction cache tag RAM	Set and way
SYS IMP_CDBGL2TR0	`SYS #6, C15, C2, #2, <Xt>`	Read contents of L2 TLB	Set and way
SYS IMP_CDBGL2CTR	`SYS #6, C15, C2, #3, <Xt>`	Read contents of L2 cache tag RAM	Set and way
SYS IMP_CDBGL1DCDTR	`SYS #6, C15, C2, #4, <Xt>`	Read contents of L1 data cache dirty RAM	Set and way
SYS IMP_CDBGL1DCMR	`SYS #6, C15, C3, #0, <Xt>`	Read contents of L1 data cache *Memory Tagging Extension* (MTE) tag RAM	Set and way
SYS IMP_CDBGL2TR1	`SYS #6, C15, C3, #2, <Xt>`	Read contents of L2 TLB	Set and way
SYS IMP_CDBGL2CMR	`SYS #6, C15, C3, #3, <Xt>`	Read contents of L2 cache MTE tag RAM	Set and way
SYS IMP_CDBGL1DCDR	`SYS #6, C15, C4, #0, <Xt>`	Read contents of L1 data cache data RAM	Set, way, and offset
SYS IMP_CDBGL1ICDR	`SYS #6, C15, C4, #1, <Xt>`	Read contents of L1 instruction cache data RAM	Set, way, and offset
SYS IMP_CDBGL2TR2	`SYS #6, C15, C4, #2, <Xt>`	Read contents of L2 TLB	Set and way
SYS IMP_CDBGL2CDR	`SYS #6, C15, C4, #3, <Xt>`	Read contents of L2 cache data RAM	Set, way, and offset

10.1 L1 cache encodings

Both the L1 data and instruction caches are 4-way set associative. The size of the configured cache determines the number of sets in each way.

The encoding for locating the cache data entry for tag and data memory is set in `Xn` in the appropriate `SYS` instruction.

To read the data from a particular RAM, write to the appropriate System register using the encoding shown in the table in 10. Direct access to internal memory on page 83.

For example, to read the data from the L1 data cache tag RAM, access IMP_CDBGL1DCTR as follows:

```
SYS #6, C15, C2, #0, <Xt>
```

To specify the cache line from which you want to read, use the bit description table in the System register description.

The cache tag specified is written to IMP_CDBGDR0_EL3.

Related information

A.3.1 IMP_CDBGDR0_EL3, Cache Debug Data Register 0 on page 239
A.4.1 SYS IMP_CDBGL1DCTR, L1 Data Cache Tag Read Operation on page 252

A.4.9 SYS IMP_CDBGL1DCDR, L1 Data Cache Data Read Operation on page 263
A.4.10 SYS IMP_CDBGL1ICDR, L1 Instruction Cache Data Read Operation on page 264

10.2 L2 cache encodings

The L2 cache is 8-way set associative. The size of the configured cache determines the number of sets in each way.

The encoding that is used to locate the cache data entry for tag and data memory is set in `Xn` in the appropriate `SYS` instruction.

To read the data from a particular RAM, write to the appropriate System register using the encoding shown in the table in 10. Direct access to internal memory on page 83.

For example, to read the data from the L2 cache tag RAM, access IMP_CDBGL2CTR as follows:

```
SYS #6, C15, C2, #3, <Xt>
```

To specify the cache line from which you want to read, use the bit description table in the System register description.

The cache tag specified is written to IMP_CDBGDR0_EL3.

Related information

A.3.1 IMP_CDBGDR0_EL3, Cache Debug Data Register 0 on page 239

A.4.8 SYS IMP_CDBGL2CMR, L2 Cache MTE Tag Read Operation on page 262
A.4.12 SYS IMP_CDBGL2CDR, L2 Cache Data Read Operation on page 267

10.3 L2 TLB encodings

The L2 *Translation Lookaside Buffer* (TLB) is 8-way set associative and is RAM-based. Individual TLB entries can be read into the data registers by executing the IMP_CDBGL2TDR operation.

The encoding that is used to locate the data for a TLB is set in `Xn` in the appropriate `SYS` instruction.

To read the data from a particular TLB, write to the appropriate System register using the encoding shown in the table in 10. Direct access to internal memory on page 83.

For example, to read bits[63:0] from the L2 TLB, access IMP_CDBGL2TR0 as follows:

```
SYS #6, C15, C2, #2, <Xt>
```

To specify the cache line from which you want to read, use the bit description table in the System register description.

The cache tag specified is written to IMP_CDBGDR0_EL3.

11. RAS Extension support

The Cortex-A520 core supports the *Reliability, Availability, and Serviceability* (RAS) Extension, including all extensions up to Arm®v9.2-A.

In particular, the Cortex-A520 core supports these RAS Extension features:

- *Fault Handling Interrupts* (FHIs)
- *Error Recovery Interrupts* (ERIs)
- Poison attribute on bus transfers
- Cache protection with *Single Error Detect* (SED) parity
- Cache protection with *Single Error Correct Double Error Detect* (SECDED) *Error Correcting Code* (ECC)
- Error Data Record registers to help software perform recovery actions
- Error injection capabilities to facilitate software and system debug
- The *Error Synchronization Barrier* (ESB) instruction to synchronize unrecoverable errors. When an `ESB` instruction is executed, the core ensures that all SError interrupts that are generated by instructions before the `ESB` are either taken or deferred. If the core cannot take the interrupt, it records the interrupt in the Deferred Interrupt Status Register DISR_EL1. See the *Arm® Architecture Reference Manual for A-profile architecture* for more information on DISR_EL1.

Each of the Cortex-A520 core RAMs has either cache protection with SECDED ECC or cache protection with SED parity, as defined in 11.1 Cache protection behavior on page 86.

Fault detection features are included in groups within the DSU-120 DynamIQ™ cluster and the Cortex-A520 core. Each group of fault detection features is referred to as a node. You can access each node by using either the System registers or the utility bus. The following nodes are implemented in the Cortex-A520 core and the DSU-120 DynamIQ™ cluster:

- Node 0 includes the shared L3 memory system in the *DynamIQ Shared Unit-120*.
- Node 1 includes the private L1 memory systems in the Cortex-A520 core.
- Node 2 includes the shared L2 memory systems in the complex.

For more information on the architectural RAS Extension and the definition of a node, see the *Arm® Architecture Reference Manual Supplement, Reliability, Availability, and Serviceability (RAS), for A-profile architecture*.

For information on the node that includes the shared L3 memory system, see *RAS extension support* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*.

11.1 Cache protection behavior

The configuration of the *Reliability, Availability, and Serviceability* (RAS) Extension that is implemented in the Cortex-A520 core includes cache protection. In this case, the Cortex-A520 core protects against errors that result in a RAM bitcell holding the incorrect value.

The RAMs in the Cortex-A520 core have the following capabilities:

SED parity

Single Error Detect (SED). One bit of parity is applicable to the protected data. The data size is specific for each RAM and depends on the protection granule.

SECDED ECC

Single Error Correct, *Double Error Detect* (SECDED), *Error Correcting Code* (ECC). The data size is specific for each RAM and depends on the protection granule.

The following table indicates which protection type is applied to each RAM in the Cortex-A520 core. The core can progress and remain functionally correct when there is a single-bit error in any RAM.

Table 11-1: RAM cache protection

RAM	ECC or parity
L1 instruction cache data	SED Parity
L1 instruction cache tag	
L1 data cache tag	
L2 *Translation Lookaside Buffer* (TLB)	
L1 data cache data	SECDED ECC
Duplicate L1 data cache tag	
L1 data cache dirty	
L2 cache data	
L2 cache tag	
L2 data buffer	

If there are multiple single-bit errors in different RAMs, or within different protection granules within the same RAM, then the core also remains functionally correct.

If there is a double-bit error in a single RAM within the same protection granule, then the behavior depends on the RAM:

- For RAMs with SECDED capability, the core detects, and either reports or defers the error. If the error is in a cache line containing dirty data, then that data might be lost.
- For RAMs with only SED, the core does not detect a double-bit error, which might cause data corruption.

If there are errors that are three or more bits within the same protection granule, the core might or might not detect the errors. Whether the core detects the errors or not depends on the RAM and the position of the errors within the RAM.

The cache protection feature of the core has a minimal performance impact when no errors are present.

11.2 Error containment

The Cortex-A520 core supports error containment for data errors. This means that detected data errors are not silently propagated. Data errors are deferred using data poisoning, ensuring that a consumer is aware of the error. Uncorrectable L1 data cache tag errors and L2 cache tag errors are not containable.

Error containment also implies support for poisoning if there is a double error on an eviction. This ensures that the error of the associated data is reported when it is consumed.

Support for the *Error Synchronization Barrier* (`ESB`) instruction in the core also allows further isolation of imprecise exceptions that are reported when poisoned data is consumed.

11.3 Fault detection and reporting

When the Cortex-A520 core detects a fault, it raises a *Fault Handling Interrupt* (FHI) exception or an *Error Recovery Interrupt* (ERI) exception through the fault or the error signals. FHIs and ERIs are reflected in the *Reliability, Availability, and Serviceability* (RAS) registers, which are updated in the node that detects the errors.

Fault handling interrupts

When ERR*n*CTLR.FI is set, all detected Deferred errors, Uncorrected errors, and overflows of the corrected error counters generate an FHI. When ERR*n*CTLR.CFI is set, all detected Corrected errors also generate an FHI.

FHIs from core *n* are signaled using nCOREFAULTIRQ[n].

FHIs from complex *n* are signaled using nCOMPLEXFAULTIRQ[n].

Error recovery interrupts

When ERR*n*CTLR.UI is set, all detected Uncorrected errors that are not deferred generate an ERI.

ERIs from core *n* are signaled using nCOREERRIRQ[n].

ERIs from complex *n* are signaled using nCOMPLEXERRIRQ[n].

11.4 Error detection and reporting

When the Cortex-A520 core consumes an error, it raises different exceptions depending on the error type.

The Cortex-A520 core might raise:

- A *Synchronous External Abort* (SEA)
- An *Asynchronous External Abort* (AEA)
- An *Error Recovery Interrupt* (ERI)

11.4.1 Error reporting and performance monitoring

All memory errors detected by *Error Correcting Code* (ECC) or parity errors trigger the MEMORY_ERROR event.

The *Performance Monitoring Unit* (PMU) counters count the MEMORY_ERROR event if it is selected and the counter is enabled.

In Secure state, the MEMORY_ERROR event is counted only if MDCR_EL3.SPME is asserted. See the *Arm® Architecture Reference Manual for A-profile architecture* for a description of MDCR_EL3.

Related information

18.1 Performance monitors events on page 113

11.5 Error injection

Error injection consists of inserting an error in the error detection logic to verify the error handling software.

Error injection uses the error detection and reporting registers to insert errors. The Cortex-A520 core can inject the following error types:

Corrected errors

A *Corrected Error* (CE) is generated for a single-bit *Error Correcting Code* (ECC) error on an L1 data cache access.

Deferred errors

A *Deferred Error* (DE) is generated for a double-bit ECC error on eviction of a cache line from the L1 cache to the L2 cache, or as a result of a snoop on the L1 cache.

Uncontainable errors

An *Uncontainable Error* (UC) is generated for a double-bit ECC error on the L1 dirty RAM following an eviction.

An error can be injected immediately or when a 32-bit counter reaches zero. You can control the value of the counter through the Error Pseudo-fault Generation Countdown Register,

ERR0PFGCDN. The value of the counter decrements on a per clock cycle basis. See the *Arm® Architecture Reference Manual Supplement, Reliability, Availability, and Serviceability (RAS), for A-profile architecture* for more information about ERR0PFGCDN.

Note

Error injection is a separate source of error within the system and does not create hardware faults.

11.6 AArch64 RAS registers

The summary table provides an overview of all RAS registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Table 11-2: RAS registers summary

12. Utility bus

The utility bus provides access to control registers for various system components in the *DynamIQ Shared Unit-120* and the cores within the DSU-120 DynamIQ™ cluster. The utility bus is implemented as a 64-bit AMBA AXI5 slave port, and the control registers are memory-mapped onto the utility bus.

The utility bus provides access to the following system functions in the Cortex-A520 core:

- *Reliability, Availability, and Serviceability* (RAS) registers for the cores and complex
- *Activity Monitor Unit* (AMU) registers in the cores
- *Maximum Power Mitigation Mechanism* (MPMM) registers in the cores

Information about the *Power Policy Unit* (PPU) registers for the cores in the cluster is provided in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*. For all other registers accessed by the utility bus, see *Utility bus* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*.

12.1 Base addresses for system components

Each set of System registers is grouped on separate 64KB page boundaries allowing access to be enforced by a *Memory Management Unit* (MMU).

The following table shows the base addresses for each set of system component registers and what Security state they should be accessed from.

- The base address for each set of registers for the core RAS, AMU, and MPMM registers depend on the core instance number <n>, from 0 to the total number of cores minus one.
- In the following table, any address space that is not documented is treated as **RAZ/WI**.
- The base addresses in the following table are the addresses accessed on the utility bus interface. The system interconnect typically maps these addresses into a particular address range based on the system address map. Therefore, software has to add the base address listed here onto the system address range base to get the absolute physical address of a register.

Table 12-1: Utility bus base addresses for system component registers

Base address, n is core instance number	Registers	Security state	Memory map
`0x<n>9_0000`	Core <n> AMU	Both	B.6 External AMU registers summary on page 711

Base address, n is core instance number	Registers	Security state	Memory map
0x<n>A_0000	Core <n> RAS	Secure	B.3 External Core RAS registers summary on page 550
0x<n>B_0000	Core <n> MPMM	Secure	B.1 External MPMM registers summary on page 492
0x<n>C_0000	Complex RAS, only if core <n> is the first core in the complex	Secure	B.2 External Complex RAS registers summary on page 495
0x<n>D_0000 - 0x<n>F_0000	Reserved	-	-

Note

For more information on utility bus base addresses for system component registers, see the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*.

13. GIC CPU interface

The *Generic Interrupt Controller* (GIC) supports and controls interrupts. The GIC Distributor connects to the Cortex-A520 core through a GIC CPU interface. The GIC CPU interface includes registers to mask, identify, and control the state of interrupts that are forwarded to the core.

Each core in a DSU-120 DynamIQ™ cluster has a GIC CPU interface, which connects to a common external Distributor component.

The GICv4.1 architecture implemented in the Cortex-A520 core supports:

- Two Security states
- Secure virtualization
- *Software-Generated Interrupts* (SGIs)
- Message-based interrupts
- System register access for the CPU interface
- Interrupt masking and prioritization
- Cluster environments, including systems that contain more than eight cores
- Wakeup events in power management environments

The GIC includes interrupt grouping functionality that supports:

- Configuring each interrupt to belong to either Group 0 or Group 1, where Group 0 interrupts are always Secure
- Signaling Group 1 interrupts to the target core using either the IRQ or the FIQ exception request. Group 1 interrupts can be Secure or Non-secure
- Signaling Group 0 interrupts to the target core using the FIQ exception request only
- A unified scheme for handling the priority of Group 0 and Group 1 interrupts

See the *Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 3 and version 4* for more information about interrupt groups.

13.1 Disable the GIC CPU interface

The Cortex-A520 core always includes the *Generic Interrupt Controller* (GIC) CPU interface. However, you can disable it to meet your requirements.

To disable the GIC CPU interface, assert the GICCDISABLE signal HIGH at reset. If you disable it this way, then you can use an external GIC IP to drive the interrupt signals (nFIQ, nIRQ). If the Cortex-A520 core is not integrated with an external GIC interrupt Distributor component (minimum GICv3 architecture) in the system, then you must disable the GIC CPU interface.

If you disable the GIC CPU interface, then:

- The virtual input signals nVIRQ and nVFIQ and the input signals nIRQ and nFIQ can be driven by an external GIC in the SoC.
- GIC system register access generates **UNDEFINED** instruction exceptions.

Note

If you enable the GIC CPU interface, then you must tie off nVIRQ and nVFIQ to HIGH. This is because the GIC CPU interface generates the virtual interrupt signals to the core. The nIRQ and nFIQ signals are controlled by software, therefore there is no requirement to tie them HIGH.

See *Functional integration* in the *Arm® DynamIQ™ Shared Unit-120 Configuration and Integration Manual* for more information on these signals.

13.2 AArch64 GIC system registers

The summary table provides an overview of all GIC system registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

14. Advanced SIMD and floating-point support

The Cortex-A520 core supports the Advanced SIMD and scalar floating-point instructions in the A64 instruction set without floating-point exception trapping.

The Cortex-A520 core floating-point implementation includes features up to Arm®v9.2-A. BFloat16 floating-point and Int8 matrix multiplication are part of these supported features.

The Cortex-A520 core implements all operations in hardware with support for all combinations of:

- Rounding modes
- Flush-to-zero
- Default *Not a Number* (NaN) modes

The Cortex-A520 core supports *Alternate Floating Point* behavior (FEAT_AFP), as part of Arm®v8.7-A and Arm®v9.2-A.

15. Scalable Vector Extensions support

The Cortex-A520 core supports the *Scalable Vector Extension* (SVE) and the *Scalable Vector Extension 2* (SVE2). SVE and SVE2 are intended to complement, not replace, AArch64 Advanced SIMD and floating-point functionality.

SVE is an optional extension introduced by the Armv8.2 architecture. The key features that SVE provides are:

- Predication
- Gather-load and scatter-store
- Software-managed speculative vectorization

The Cortex-A520 core implements a scalable vector length of 128 bits.

All the features and additions that SVE and SVE2 introduce are described in the *Arm® Architecture Reference Manual Supplement, The Scalable Vector Extension*.

16. System control

The system registers control and provide status information for the functions that the core implements.

The main functions of the system registers are:

- System performance monitoring
- Cache configuration and management
- Overall system control and configuration
- *Memory Management Unit* (MMU) configuration and management
- *Generic Interrupt Controller* (GIC) configuration and management

The system registers are accessible in AArch64 Execution state at EL0 to EL3. Some of the system registers are accessible through the external debug interface or utility bus interface.

16.1 AArch64 Generic System Control registers

The summary table provides an overview of all Generic System Control registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Table 16-1: Generic System Control registers summary

Name	Op0	Op1	CRn	CRm	Op2	Reset	Width	Description

17. Debug

The DSU-120 DynamIQ™ cluster provides a debug system that supports both self-hosted and external debug. It has an external DebugBlock component, and integrates various CoreSight debug related components.

The CoreSight debug related components are split into two groups, with some components in the DSU-120 DynamIQ™ cluster, and others in the separate DebugBlock.

The DebugBlock is a dedicated debug component in the DSU-120, separate from the cluster. The DebugBlock operates within a separate power domain, enabling connection to a debugger to be maintained when the cores and the DSU-120 DynamIQ™ cluster are both powered down.

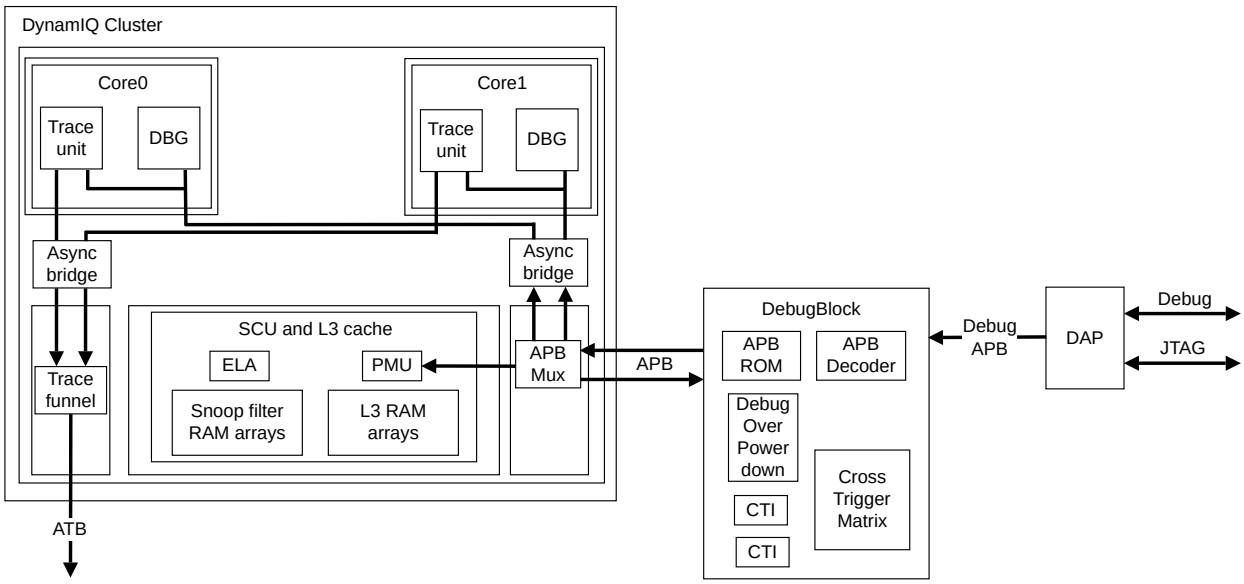
The connection between the cluster and the DebugBlock consists of a pair of *Advanced Peripheral Bus* (APB) interfaces, one in each direction. All debug traffic, except the authentication interface, takes place over this interface as read or write APB transactions. This debug traffic includes register reads, register writes, and *Cross Trigger Interface* (CTI) triggers.

The debug system implements the following CoreSight debug components:

- Per-core trace unit, integrated into the CoreSight subsystem.
- Per-core CTI, contained in the DebugBlock.
- *Cross Trigger Matrix* (CTM)
- Debug control provided by AMBA® APB interface to the DebugBlock

The following figure shows how the debug system is implemented with the DSU-120 DynamIQ™ cluster.

Figure 17-1: DSU-120 DynamIQ™ cluster debug components



The primary debug APB interface on the DebugBlock controls the debug components. The APB decoder decodes the requests on this bus before they are sent to the appropriate component in the DebugBlock or in the DSU-120 DynamIQ™ cluster. The per-core CTIs are connected to a CTM.

Each core contains a debug component that the debug APB bus accesses. The cores support debug over powerdown using modules in the DebugBlock that mirror key core information. These modules allow access to debug over powerdown CoreSight™ registers while the core is powered down.

The trace unit in each core outputs trace, which is funneled in the DSU-120 DynamIQ™ cluster down to a single AMBA® 4 ATBv1.1 interface.

See *Debug* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for more information about the DSU-120 DynamIQ™ cluster debug components.

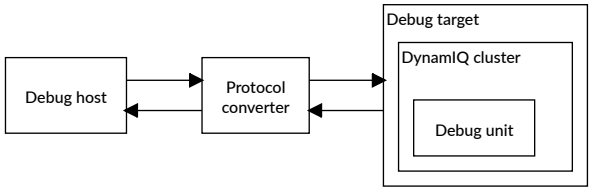
The Cortex-A520 core also supports direct access to internal memory, that is, cache debug. Direct access to internal memory allows software to read the internal memory that the L1 and L2 cache and *Translation Lookaside Buffer* (TLB) structures use. See 10. Direct access to internal memory on page 83 for more information.

17.1 Supported debug methods

The DSU-120 DynamIQ™ cluster along with its associated complexes and cores is part of a debug system that supports both self-hosted and external debug.

The following figure shows a typical external debug system.

Figure 17-2: External debug system



Debug host

A computer, for example a personal computer, that is running a software debugger such as the Arm® Debugger. You can use the debug host to issue high-level commands. For example, you can set a breakpoint at a certain location or examine the contents of a memory address.

Protocol converter

The debug host sends messages to the debug target using an interface such as Ethernet. However, the debug target typically implements a different interface protocol. A device such as DSTREAM is required to convert between the two protocols.

Debug target

The lowest level of the system implements system support for the protocol converter to access the debug unit. For DSU-120 based devices, the mechanism used to access the debug unit is based on the CoreSight architecture. The DSU-120 DebugBlock is accessed using an APB interface and the debug accesses are then directed to the selected A520 core inside the DSU-120 DynamIQ™ cluster. An example of a debug target is a development system with a test chip or a silicon part with a A520 core.

Debug unit

Helps debugging software that is running on the core:

- DSU-120 and external hardware based around the core.
- Operating systems
- Application software

With the debug unit, you can:

- Stop program execution.
- Examine and alter process and coprocessor state.
- Examine and alter memory and the state of the input or output peripherals.
- Restart the *Processing Element* (PE).

For self-hosted debug, the debug target runs debug monitor software that runs on the core in the DSU-120 DynamIQ™ cluster. This way, it does not require expensive interface hardware to connect a second host computer.

17.2 Debug register interfaces

The Cortex-A520 core implements the Arm®v9.2-A Debug architecture. It also supports the Arm®v8.4-A Debug architecture and Arm®v8.3-A Debug over powerdown.

The Debug architecture defines a set of Debug registers. The Debug register interfaces provide access to these registers either from software running on the core or from an external debugger. See *Debug* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for more information.

Related information

5.8 Debug over powerdown on page 61

17.2.1 Core interfaces

All the Debug register groups are both System register based and memory-mapped. System register access allows the Cortex-A520 core to access certain Debug registers directly.

Access to the Debug registers is partitioned as follows:

Debug

You can access the Debug register map using the *Advanced Peripheral Bus* (APB) slave port that connects into the DebugBlock of the *DynamIQ Shared Unit-120*.

Performance monitoring

You can access the performance monitor registers using the APB slave port that connects into the DebugBlock of the DSU.

Activity monitoring

You can access the activity monitor registers using the utility bus interface.

Trace

You can access the trace unit registers using the APB slave port that connects into the DebugBlock of the DSU.

ELA registers

You can access the ELA registers using the APB slave port that connects into the DebugBlock of the DSU.

The ELA-600 is licensed separately, and the ELA registers are still present even if the ELA configuration parameter indicates that support for the ELA is not included.

Note

This function is memory-mapped and is not accessible using System registers.

For information on APB slave port interface, see the *Debug* chapter or the *Interfaces* section in the *Technical overview* chapter of the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*.

17.2.2 Effects of resets on Debug registers

Cold and Warm resets are generated within the DSU-120 DynamIQ™ cluster and have different effects on the Debug registers.

A Cold reset includes reset of the core logic and the integrated debug functionality. It initializes the core logic, including the trace unit and debug logic.

A Warm reset includes reset of the core logic but not the debug, trace unit, or *Activity Monitoring Unit* (AMU) logic, or the *Reliability, Availability, and Serviceability* (RAS) registers.

17.2.3 Breakpoints and watchpoints

The Cortex-A520 core supports six breakpoints, four watchpoints, and a standard *Debug Communications Channel* (DCC).

A breakpoint consists of a breakpoint control register and a breakpoint value register. These two registers are referred to as a *Breakpoint Register Pair* (BRP). Four of the breakpoints (BRP 0-3) match only to the *Virtual Address* (VA) and the other two (BRP 4 and 5) match against either the VA or context ID, or the *Virtual Machine ID* (VMID).

You can use watchpoints to stop your target when a specific memory address is accessed by your program. All the watchpoints can be linked to two breakpoints (BRP 4 and 5) to enable a memory request to be trapped in a given process context.

17.3 Debug events

A debug event can be either a software debug event or a Halting debug event.

The Cortex-A520 core responds to a debug event in one of the following ways:

- It ignores the debug event
- It takes a debug exception
- It enters debug state

In the Cortex-A520 core, watchpoint debug events are always synchronous. Memory hint instructions and cache clean operations, except `DC ZVA`, and `DC IVAC` do not generate watchpoint debug events. Store exclusive instructions generate a watchpoint debug event even when the check for the control of exclusive monitor fails. Atomic `CAS` instructions generate a watchpoint debug event even when the compare operation fails.

A Cold reset sets the Debug OS Lock. For the debug events and debug register accesses to operate normally, the Debug OS Lock must be cleared.

17.4 Debug memory map and debug signals

The debug memory map and debug signals are handled at the DSU-120 DynamIQ™ cluster level.

See *Debug* and *ROM tables* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*.

17.5 ROM table

The Cortex-A520 core includes a ROM table that contains a list of components in the system. Debuggers must use the ROM table to determine which CoreSight components are implemented.

The ROM table is a CoreSight debug related component that aids system debug along with CoreSight SoC and is for the Cortex-A520 core. There is one ROM table for each complex and ROM tables comply with the *Arm® CoreSight™ Architecture Specification v3.0*.

The *DynamIQ Shared Unit-120* has its own ROM tables, one for the cluster and one for the DebugBlock, and has entry points in the cluster ROM table for the ROM tables belonging to each core or complex. See *ROM tables* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for more information.

Related information

17.6 CoreSight component identification

Each component associated with the Cortex-A520 core has a unique set of CoreSight™ ID values. The following table shows these values.

Table 17-1: Cortex-A520 CoreSight component identification

Component	Peripheral ID	Component ID	DevType	DevArch	Revision
Debug	0x04100BBD80	0xB105900D	0x15	0x47709A15	r0p1
Trace unit			0x13	0x47715A13	
PMU			0x16	0x47702A16	
ROM table			0x00	0x47700AF7	

17.7 CTI register identification values

The Cortex-A520 core *Cross Trigger Interface* (CTI) registers are located in the DebugBlock of the DSU-120.

For the cluster and core CTI register names and descriptions, see *External CTI registers* in the *Debug* chapter of the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual*. Only the core CTI register peripheral ID values will differ from the cluster CTI register peripheral ID values.

The core CTI register peripheral ID values are listed in the following table.

Table 17-2: Core CTI register peripheral ID values

Register	Bitfield position	Bitfield name	Value
CTIPIDR4	[7:4]	SIZE	0b0000

Register	Bitfield position	Bitfield name	Value
	[3:0]	DES_2	0b0100
CTIPIDR3	[7:4]	REVAND	0b0001
	[3:0]	CMOD	0x0

18. Performance Monitors Extension support

The Cortex-A520 core implements the Performance Monitors Extension, including Arm®v8.7-A performance monitoring features.

The Cortex-A520 core *Performance Monitoring Unit* (PMU):

- Collects events through an event interface from other units in the design. These events are used as triggers for event counters.
- Supports cycle counters through the Performance Monitors Control Register.
- Implements PMU snapshots for context samples.
- Provides six or 20 PMU 64-bit counters that count any of the events available in the core. The absolute counts that are recorded might vary because of pipeline effects. This variation has negligible effect except in cases where the counters are enabled for a very short time.

You can program the PMU using either the System registers or the external Debug APB interface.

18.1 Performance monitors events

The Cortex-A520 core *Performance Monitoring Unit* (PMU) collects events from other units in the design and uses numbers to reference these events.

18.1.1 Common event PMU events

The following table shows the Cortex-A520 core performance monitors events that are generated and the numbers that the PMU uses to reference the events.

The table also shows the bit position of each event on the event bus. Event numbers that are not listed are reserved.

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information about these PMU events.

Note

Unless otherwise indicated, each of these events can be exported to the trace unit and selected in accordance with the *Arm® Embedded Trace Extension*.

Table 18-1: Common event PMU events

Event number	Mnemonic	Description
0x0000	SW_INCR	Instruction architecturally executed, Condition code check pass, software increment The counter counts each write to the AArch64-PMSWINC_EL0 register, for each implemented event counter <n>: If AArch64-PMEVTYPER<n>_EL0.evtCount is 0x0000 then the counter counts each MSR write to AArch64-PMSWINC_EL0 with bit [n] set to 1. If the PE performs two architecturally executed writes to the AArch64-PMSWINC_EL0 register without an intervening Context Synchronization Event, then the counter is incremented twice.
0x0001	L1I_CACHE_REFILL	Level 1 instruction cache refill This event counts any instruction fetch which misses in the cache. The following instructions are not counted: • Cache maintenance instructions • Non-cacheable accesses
0x0002	L1I_TLB_REFILL	Level 1 instruction TLB refill This event counts any refill of the instruction L1 TLB from the L2 TLB, including refills that result in a translation fault. The following instructions are not counted: • TLB maintenance instructions This event counts regardless of whether the *Memory Management Unit* (MMU) is enabled
0x0003	L1D_CACHE_REFILL	Level 1 data cache refill This event counts any load or store operation or translation table walk that causes data to be read from outside the L1 cache, including accesses which do not allocate into the L1 cache. The following instructions are not counted: • Cache maintenance instructions and prefetches • Stores of an entire cache line, even if they make a coherency request outside the L1 cache • Partial cache line writes which do not allocate into the L1 cache • Non-cacheable accesses This event counts the sum of L1D_CACHE_REFILL_RD and L1D_CACHE_REFILL_WR.

Event number	Mnemonic	Description
0x0004	L1D_CACHE	Level 1 data cache access This event counts any load or store operation or translation table walk that looks up in the L1 data cache. In particular, any access that could count the L1D_CACHE_REFILL event causes this event to count. The following instructions are not counted: • Cache maintenance instructions and prefetches • Non-cacheable accesses This event counts the sum of L1D_CACHE_RD and L1D_CACHE_WR.
0x0005	L1D_TLB_REFILL	Level 1 data TLB refill This event counts any refill of the data L1 TLB from the L2 TLB. This includes refills which result in a translation fault. The following instructions are not counted: • TLB maintenance instructions This event counts regardless of whether the MMU is enabled.
0x0006	LD_RETIRED	Instruction architecturally executed, Condition code check pass, load This event counts all load and prefetch instructions, including the Armv8.1-A atomic instructions, other than the ST* variants.
0x0007	ST_RETIRED	Instruction architecturally executed, Condition code check pass, store This event counts all store instructions and the Data Cache Zero by Virtual Address (DC ZVA) instruction. The event includes all the Armv8.1-A atomic instructions. Store-Exclusive instructions that fail are not counted.
0x0008	INST_RETIRED	Instruction architecturally executed This event counts all retired instructions, including those that fail their condition check.
0x0009	EXC_TAKEN	Exception taken The counter counts each exception taken.
0x000A	EXC_RETURN	Instruction architecturally executed, Condition code check pass, exception return The counter counts each architecturally-executed exception return instruction.
0x000B	CID_WRITE_RETIRED	Instruction architecturally executed, Condition code check pass, write to CONTEXTIDR This event only counts writes using the CONTEXTIDR_EL1 mnemonic. Writes to CONTEXTIDR_EL12 and CONTEXTIDR_EL2 are not counted.
0x000C	PC_WRITE_RETIRED	Instruction architecturally executed, Condition code check pass, Software change of the PC This event counts all branches taken and popped from the branch monitor. This excludes exception entries, debug entries, and CCFAIL branches.

Event number	Mnemonic	Description
0x000D	BR_IMMED_RETIRED	Branch instruction architecturally executed, immediate This event counts all branches decoded as immediate branches, taken or not, and popped from the branch monitor. This excludes exception entries, debug entries, and CCFAIL branches.
0x000E	BR_RETURN_RETIRED	Branch instruction architecturally executed, procedure return, taken
0x0010	BR_MIS_PRED	Branch instruction speculatively executed, mispredicted or not predicted This event counts any predictable branch instruction that is mispredicted for either of the following reasons: • Dynamic misprediction • The MMU is off and the branches are statically predicted not taken
0x0011	CPU_CYCLES	Cycle The counter increments on every cycle.
0x0012	BR_PRED	Predictable branch instruction speculatively executed This event counts all predictable branches.
0x0013	MEM_ACCESS	Data memory access This event counts memory accesses due to load or store instructions. Memory accesses are not counted if they are caused by any of the following actions: • Instruction fetches • Cache maintenance instructions • Translation table walks or prefetches This event counts the sum of MEM_ACCESS_RD and MEM_ACCESS_WR.
0x0014	L1I_CACHE	Level 1 instruction cache access This event counts any instruction fetch which accesses the L1 instruction cache. The following instructions are not counted: • Cache maintenance instructions • Non-cacheable accesses
0x0015	L1D_CACHE_WB	Level 1 data cache write-back This event counts any write-back of data from the L1 data cache to L2 cache or L3 cache. The event counts both victim line evictions and snoops, including cache maintenance operations. The following instructions are not counted: • Invalidations which do not result in data being transferred out of the L1 cache • Full-line writes which write to L2 cache without writing L1 cache, such as write-streaming mode

Event number	Mnemonic	Description
0x0016	L2D_CACHE	Level 2 data cache access If the complex is configured with a per-complex L2 cache,this event counts: • Any transaction from the L1 cache which looks up in the L2 cache • Any write-back from the L1 cache to the L2 cache Snoops from outside the core and cache maintenance operations are not counted. If the complex is not configured with a per-complex L2 cache, this event counts the cluster cache event, as defined by L3D_CACHE. If neither a per-complex cache or a cluster cache are configured, then this event is not implemented.
0x0017	L2D_CACHE_REFILL	Level 2 data cache refill If the complex is configured with a per-complex L2 cache, this event counts any cacheable transaction from L1 cache which causes data to be read from outside the core. L2 cache refills that are caused by stashes into L2 cache are counted. If the complex is not configured with a per-complex L2 cache, this event is not implemented.
0x0018	L2D_CACHE_WB	Level 2 data cache write-back If the complex is configured with a per-complex L2 cache, this event counts any write-back of data from the L2 cache to a location outside the complex. The event includes snoops to the L2 cache that return data, regardless of whether they cause an invalidation. Invalidations from the L2 that do not write data outside of the complex and snoops that return data from the L1 cache are not counted. If the core is not configured with a per-complex L2 cache, this event is not implemented.
0x0019	BUS_ACCESS	Bus access This event counts for every beat of data that is transferred over the data channels between the complex and the DynamIQ ®Shared Unit (DSU). If both read and write data beats are transferred on a given cycle, this event is counted twice on that cycle. This event counts the sum of BUS_ACCESS_RD and BUS_ACCESS_WR.
0x001A	MEMORY_ERROR	Local memory error This event counts any correctable or uncorrectable memory error (ECC or parity) in the protected core RAMs.
0x001B	INST_SPEC	Operation speculatively executed This event counts issued instructions, including instructions that are later flushed due to mis-speculation.

Event number	Mnemonic	Description
0x001C	TTBR_WRITE_RETIRED	Instruction architecturally executed, Condition code check pass, write to TTBR This event only counts writes to TTBR0/TTBR1 in AArch32 and TTBR0_EL1/TTBR1_EL1 in AArch64. The following instructions are not counted: • Accesses to TTBR0_EL12/TTBR1_EL12 or TTBR0_EL2/TTBR1_EL2
0x001D	BUS_CYCLES	Bus cycle This event duplicates CPU_CYCLES.
0x001E	CHAIN	CHAIN For odd-numbered counters, this event increments the count by one for each overflow of the preceding even-numbered counter. For even-numbered counters, there is no increment. **Note:** This event is not exported to the ETM.
0x0020	L2D_CACHE_ALLOCATE	Level 2 data cache allocation without refill If the complex is configured with a per-complex L2 cache, this event counts any full cache line write into the L2 cache that does not cause a linefill. The event includes write-backs from L1 to L2 and full-line writes that do not allocate into the L1 cache. If the complex is not configured with a per-complex L2 cache, this event is not implemented.
0x0021	BR_RETIRED	Instruction architecturally executed, branch Counts all branch instructions, memory-reading and data-processing instructions that explicitly write to the PC, at retirement.
0x0022	BR_MIS_PRED_RETIRED	Branch instruction architecturally executed, mispredicted The counter counts all instructions counted by BR_RETIRED that were not correctly predicted.
0x0023	STALL_FRONTEND	No operation sent for execution due to the frontend The counter counts on any cycle when no operations are issued due to the instruction queue being empty.
0x0024	STALL_BACKEND	No operation sent for execution due to the backend The counter counts on any cycle when no operations are issued due to a pipeline stall.
0x0025	L1D_TLB	Level 1 data TLB access This event counts any load or store operation which accesses the L1 data TLB. If both a load and a store are executed on a cycle, this event counts twice. This event counts regardless of whether the MMU is enabled.

Event number	Mnemonic	Description
0x0026	L1I_TLB	Level 1 instruction TLB access This event counts any instruction fetch which accesses the instruction L1 TLB. This event counts regardless of whether the MMU is enabled.
0x002B	L3D_CACHE	Level 3 data cache access If the complex is configured with a per-complex L2 cache and the cluster is configured with an L3 cache, this event counts for any cacheable read transaction returning data from the DSU, or for any cacheable write to the DSU. If either the complex is configured without a per-complex L2 or the cluster is configured without an L3 cache, this event is not implemented.
0x002D	L2D_TLB_REFILL	Level 2 data TLB refill This event counts on any refill of the L2 TLB, caused by either an instruction or data access. This event does not count if the MMU is disabled.
0x002F	L2D_TLB	Level 2 data TLB access Attributable Level 2 unified TLB access. This event counts on any access to the L2 TLB that is caused by a refill of any of the L1 TLBs. This event does not count if the MMU is disabled.
0x0034	DTLB_WALK	Data TLB access with at least one translation table walk This event counts on any data access which causes L2D_TLB_REFILL to count.
0x0035	ITLB_WALK	Instruction TLB access with at least one translation table walk This event counts on any instruction access which causes L2D_TLB_REFILL to count.
0x0036	LL_CACHE_RD	Last level cache access, read If IMP_CPUECTLR_EL1.EXTLLC is set, this event counts any cacheable read transaction that returns a data source of "interconnect cache". If IMP_CPUECTLR_EL1.EXTLLC is not set, this event is a duplicate of the L*D_CACHE_RD event corresponding to the last level of cache implemented in the cluster. That is: • L3D_CACHE_RD, if both per-complex L2 cache and cluster L3 cache are implemented • L2D_CACHE_RD, if only one of these caches are implemented • L1D_CACHE_RD if neither is implemented.

Event number	Mnemonic	Description
0x0037	LL_CACHE_MISS_RD	Last level cache miss, read If IMP_CPUECTLR_EL1.EXTLLC is set, this event counts any cacheable read transaction that returns a data source of "DRAM", "remote", or "inter-cluster peer". If IMP_CPUECTLR_EL1.EXTLLC is not set, this event is a duplicate of the event that corresponds to the last level of cache implemented in the cluster. Therefore, this event is a duplicate of: • L3D_CACHE_REFILL_RD, if both per-complex L2 cache and cluster L3 cache are implemented • L2D_CACHE_REFILL_RD, if only one is implemented • L1D_CACHE_REFILL_RD, if neither is implemented
0x0038	REMOTE_ACCESS_RD	Access to another socket in a multi-socket system, read This event counts any read transaction that returns a data source of "remote".
0x0039	L1D_CACHE_LMISS_RD	Level 1 data cache long-latency read miss This event counts each memory read access counted by L1D_CACHE that incurs additional latency because it returns data from outside the L1 data or unified cache of this *Processing Element* (PE).
0x003A	OP_RETIRED	Micro-operation architecturally executed The counter counts each operation counted by OP_SPEC that would be executed in a Simple sequential execution of the program.
0x003B	OP_SPEC	Micro-operation speculatively executed The counter counts the number of operations executed by the PE, including those that are executed speculatively and would not be executed in a Simple sequential execution of the program.
0x003C	STALL	No operation sent for execution This event counts every Attributable cycle on which no Attributable instruction or operation was sent for execution on this PE.
0x003D	STALL_SLOT_BACKEND	No operation sent for execution on a Slot due to the backend This event counts each Slot counted by STALL_SLOT where no Attributable instruction or operation was sent for execution because the backend is unable to accept one of: • The instruction operation available for the PE on the Slot • Any operations on the Slot
0x003E	STALL_SLOT_FRONTEND	No operation sent for execution on a Slot due to the frontend This event counts each Slot counted by STALL_SLOT where no Attributable instruction or operation was sent for execution because there was no Attributable instruction or operation available to issue from the PE from the frontend for the Slot.
0x003F	STALL_SLOT	No operation sent for execution on a Slot This event counts on each Attributable cycle the number of instruction or operation Slots that were not occupied by an instruction or operation Attributable to the PE.

Event number	Mnemonic	Description
0x0040	L1D_CACHE_RD	Level 1 data cache access, read This event counts any load operation or page table walk access which looks up in the L1 data cache. In particular, any access which could count the L1D_CACHE_REFILL_RD event causes this event to count. The following instructions are not counted: • Cache maintenance instructions and prefetches • Non-cacheable accesses **Note:** This event is not exported to the ETM.
0x0041	L1D_CACHE_WR	Level 1 data cache access, write Counts any store operation which looks up in the L1 data cache. In particular, any access which could count the L1D_CACHE_REFILL event causes this event to count. The following instructions are not counted: • Cache maintenance instructions and prefetches • Non-cacheable accesses **Note:** This event is not exported to the ETM.
0x0042	L1D_CACHE_REFILL_RD	Level 1 data cache refill, read This event counts any load operation or translation table walk access which causes data to be read from outside the L1 data cache,including accesses which do not allocate into the L1 cache. The following instructions are not counted: • Cache maintenance instructions and prefetches • Non-cacheable accesses **Note:** This event is not exported to the ETM.

Event number	Mnemonic	Description
0x0043	L1D_CACHE_REFILL_WR	Level 1 data cache refill, write This event counts any store operation which causes data to be read from outside the L1 data cache, including accesses which do not allocate into L1 cache. The following instructions are not counted: • Cache maintenance instructions and prefetches. • Stores of an entire cache line, even if they make a coherency request outside the L1 cache • Partial cache line writes which do not allocate into the L1 cache • Non-cacheable accesses **Note:** This event is not exported to the ETM.
0x0044	L1D_CACHE_REFILL_INNER	Level 1 data cache refill, inner This event counts any L1 data cache linefill, as counted by L1D_CACHE_REFILL, that hits in the L2 cache, L3 cache, or another core in the cluster. **Note:** This event is not exported to the ETM.
0x0045	L1D_CACHE_REFILL_OUTER	Level 1 data cache refill, outer This event counts any L1 data cache linefill (as counted by L1D_CACHE_REFILL) that does not hit in the L2 cache, L3 cache, or another core in the cluster, and instead obtains data from outside the cluster. **Note:** This event is not exported to the ETM.
0x0050	L2D_CACHE_RD	Level 2 data cache access, read If the complex is configured with a per-complex L2 cache, this event counts any read transaction from the L1 cache that looks up in the L2 cache. Snoops from outside the complex are not counted. If the complex is configured without a per-complex L2 cache, this event counts the cluster cache event, as defined by L3D_CACHE_RD. If neither a per-complex cache or a cluster cache is configured, this event is not implemented. **Note:** This event is not exported to the ETM.

Event number	Mnemonic	Description
0x0051	L2D_CACHE_WR	Level 2 data cache access, write If the complex is configured with a per-complex L2 cache, this event counts any write transaction from the L1 cache that looks up in the L2 cache or any write-back from L1 cache that allocates into the L2 cache. Snoops from outside the complex are not counted. If the complex is configured without a per-complex L2 cache, this event is not implemented. **Note:** This event is not exported to the ETM.
0x0052	L2D_CACHE_REFILL_RD	Level 2 data cache refill, read If the complex is configured with a per-complex L2 cache, this event counts any cacheable read transaction from L1 cache that causes data to be read from outside the complex. L2 cache refills caused by stashes into L2 are not counted. Transactions such as ReadUnique are counted here as read transactions, even though they can be generated by store instructions. If the complex is configured without a per-complex L2 cache, this event counts the cluster cache event, as defined by L3D_CACHE_REFILL_RD. If neither a per-complex cache or a cluster cache is configured, this event is not implemented. **Note:** This event is not exported to the ETM.
0x0053	L2D_CACHE_REFILL_WR	Level 2 data cache refill, write If the complex is configured with a per-complex L2 cache, this event counts any write transaction from L1 cache that causes data to be read from outside the complex. L2 cache refills caused by stashes into L2 are not counted. Transactions such as ReadUnique are not counted as write transactions. If the complex is configured without a per-core L2 cache, this event is not implemented. **Note:** This event is not exported to the ETM.
0x0060	BUS_ACCESS_RD	Bus access, read This event counts for every beat of data that is transferred over the read data channel between the complex and the DSU. **Note:** This event is not exported to the ETM.

Event number	Mnemonic	Description
0x0061	BUS_ACCESS_WR	Bus access, write This event counts for every beat of data that is transferred over the write data channel between the complex and the DSU. **Note:** This event is not exported to the ETM.
0x0066	MEM_ACCESS_RD	Data memory access, read This event counts memory accesses due to load instructions. The following instructions are not counted: • Instruction fetches • Cache maintenance instructions • Translation table walks • Prefetches **Note:** This event is not exported to the ETM.
0x0067	MEM_ACCESS_WR	Data memory access, write This event counts memory accesses due to store instructions. The following instructions are not counted: • Instruction fetches • Cache maintenance instructions • Translation table walks • Prefetches **Note:** This event is not exported to the ETM.
0x006E	STREX_FAIL_SPEC	Exclusive operation speculatively executed, Store-Exclusive fail The counter counts Store-Exclusive instructions speculatively executed that fail to complete a write.
0x006F	STREX_SPEC	Exclusive operation speculatively executed, Store-Exclusive The counter counts Store-Exclusive instructions speculatively executed.
0x0070	LD_SPEC	Operation speculatively executed, load **Note:** This event is not exported to the ETM.

Event number	Mnemonic	Description
0x0071	ST_SPEC	Operation speculatively executed, store **Note:** This event is not exported to the ETM.
0x0072	LDST_SPEC	Operation speculatively executed, load or store **Note:** This event is not exported to the ETM.
0x0073	DP_SPEC	Operation speculatively executed, integer data processing This event counts retired integer data-processing instructions. **Note:** This event is not exported to the ETM.
0x0074	ASE_SPEC	Operation speculatively executed, Advanced SIMD This event counts retired Advanced SIMD instructions. **Note:** This event is not exported to the ETM.
0x0075	VFP_SPEC	Operation speculatively executed, scalar floating-point This event counts retired floating-point instructions. **Note:** This event is not exported to the ETM.
0x0076	PC_WRITE_SPEC	Operation speculatively executed, Software change of the PC This event counts retired branch instructions. **Note:** This event is not exported to the ETM.
0x0077	CRYPTO_SPEC	Operation speculatively executed, Cryptographic instruction This event counts retired Cryptographic instructions. **Note:** This event is not exported to the ETM.

Event number	Mnemonic	Description
0x0078	BR_IMMED_SPEC	Branch speculatively executed, immediate branch This event duplicates BR_IMMED_RETIRED. **Note:** This event is not exported to the ETM.
0x0079	BR_RETURN_SPEC	Branch speculatively executed, procedure return This event duplicates BR_RETURN_RETIRED. **Note:** This event is not exported to the ETM.
0x007A	BR_INDIRECT_SPEC	Branch speculatively executed, indirect branch The counter counts indirect branch instructions speculatively executed. This includes software change of the PC other than exception-generating instructions and immediate branch instructions. **Note:** This event is not exported to the ETM.
0x0086	EXC_IRQ	Exception taken, IRQ **Note:** This event is not exported to the ETM.
0x0087	EXC_FIQ	Exception taken, FIQ **Note:** This event is not exported to the ETM.
0x00A0	L3D_CACHE_RD	Level 3 data cache access, read This event counts for any cacheable read transaction returning data from the DSU. If either the complex is configured without a per-complex L2 cache or the cluster is configured without an L3 cache, this event is not implemented. **Note:** This event is not exported to the ETM.

Event number	Mnemonic	Description
0x00A2	L3D_CACHE_REFILL_RD	Level 3 data cache refill, read If either the complex is configured without a per-complex L2 cache or the cluster is configured without an L3 cache, this event is not implemented. **Note:** This event is not exported to the ETM.
0x4005	STALL_BACKEND_MEM	Memory stall cycles The counter counts each cycle counted by STALL_BACKEND_MEMBOUND where there is a demand data miss in the last level of cache within the PE clock domain or a non-cacheable data access in progress. If the complex is configured with a per-complex L2 cache, this event is based on L2 cache misses. If the complex is not configured with a per-complex L2 cache, this event is based on L1 data cache misses.
0x4006	L1I_CACHE_LMISS	Level 1 instruction cache long-latency miss The counter counts each access counted by L1I_CACHE that incurs additional latency because it returns instructions from outside the L1 instruction cache.
0x4009	L2D_CACHE_LMISS_RD	Level 2 data cache long-latency read miss If the complex is not configured with a per-complex L2 cache, this event counts the cluster cache event, as defined by L3D_CACHE_LMISS_RD. If neither a per-complex cache or a cluster cache are configured, then this event is not implemented.
0x400B	L3D_CACHE_LMISS_RD	Level 3 data cache long-latency read miss If either the complex is configured without a per-complex L2 or the cluster is configured without an L3 cache, this event is not implemented.
0x400C	TRB_WRAP	Trace buffer current write pointer wrapped The event is generated each time the current write pointer is wrapped to the base pointer.
0x400D	PMU_OVFS	PMU overflow, counters accessible to EL1 and EL0 This event is generated each time an event causes a PMEVCTNR<n>_EL1 counter overflow when PMINTENSET_EL1[n] is set to 1, for each implemented PMU counter n in the range 0 <= n <UInt(MDCR_EL2.HPMN), and the Cycle Counter (n = 31) **Note:** This event is exported to the ETM, but cannot be counted in the PMU.
0x400E	TRB_TRIG	Trace buffer Trigger Event The event is generated when a Trace Buffer Extension Trigger Event occurs.

Event number	Mnemonic	Description
0x400F	PMU_HOVFS	PMU overflow, counters reserved for use by EL2 The event is generated each time an event causes a PMEVCTNR<n>_EL1 counter overflow when PMINTENSET_EL1[n] is set to 1, for each implemented PMU counter n in the range UInt(MDCR_EL2.HPMN) <= n <UInt(PMCR_EL0.N). The event is not transmitted to a PE Trace Unit while TRCFR_EL2.E2TRE == 0b0. **Note:** This event is exported to the ETM, but cannot be counted in the PMU.
0x4010	TRCEXTOUT0	Trace unit external output 0 The event is generated each time an event is signaled by ETE external event 0. **Note:** This event is not exported to the ETM.
0x4011	TRCEXTOUT1	Trace unit external output 1 The event is generated each time an event is signaled by ETE external event 1. **Note:** This event is not exported to the ETM.
0x4012	TRCEXTOUT2	Trace unit external output 2 The event is generated each time an event is signaled by ETE external event 2. **Note:** This event is not exported to the ETM.
0x4013	TRCEXTOUT3	Trace unit external output 3 The event is generated each time an event is signaled by ETE external event 3. **Note:** This event is not exported to the ETM.
0x4018	CTI_TRIGOUT4	Cross-trigger Interface output trigger 4 The event is generated each time an event is signaled on CTI output trigger 4.
0x4019	CTI_TRIGOUT5	Cross-trigger Interface output trigger 5 The event is generated each time an event is signaled on CTI output trigger 5.
0x401A	CTI_TRIGOUT6	Cross-trigger Interface output trigger 6 The event is generated each time an event is signaled on CTI output trigger 6.

Event number	Mnemonic	Description
0x401B	CTI_TRIGOUT7	Cross-trigger Interface output trigger 7 The event is generated each time an event is signaled on CTI output trigger 7.
0x4020	LDST_ALIGN_LAT	Access with additional latency from alignment The counter counts each access counted by MEM_ACCESS that, due to the alignment of the address and size of data being accessed, incurred additional latency.
0x4021	LD_ALIGN_LAT	Load with additional latency from alignment The counter counts each Memory-read operation counted by LDST_ALIGN_LAT.
0x4022	ST_ALIGN_LAT	Store with additional latency from alignment The counter counts each Memory-write operation counted by LDST_ALIGN_LAT.
0x4024	MEM_ACCESS_CHECKED	Checked data memory access The counter counts each memory access counted by MEM_ACCESS that is checked by the *Memory Tagging Extension* (MTE).
0x4025	MEM_ACCESS_RD_CHECKED	Checked data memory access, read The counter counts each Memory-read operation counted by MEM_ACCESS_CHECKED.
0x4026	MEM_ACCESS_WR_CHECKED	Checked data memory access, write The counter counts each Memory-write operation counted by MEM_ACCESS_CHECKED.
0x8002	SVE_INST_RETIRED	Instruction architecturally executed, SVE The counter counts architecturally executed SVE instructions.
0x8006	SVE_INST_SPEC	Operation speculatively executed, SVE, including load and store The counter counts speculatively executed operations due to SVE instructions.
0x8014	FP_HP_SPEC	Floating-point operation speculatively executed, half precision
0x8018	FP_SP_SPEC	Floating-point operation speculatively executed, single precision
0x801C	FP_DP_SPEC	Floating-point operation speculatively executed, double precision
0x80E3	ASE_SVE_INT8_SPEC	Integer operation speculatively executed, Advanced SIMD or SVE 8-bit
0x80E7	ASE_SVE_INT16_SPEC	Integer operation speculatively executed, Advanced SIMD or SVE 16-bit
0x80EB	ASE_SVE_INT32_SPEC	Integer operation speculatively executed, Advanced SIMD or SVE 32-bit
0x80EF	ASE_SVE_INT64_SPEC	Integer operation speculatively executed, Advanced SIMD or SVE 64-bit
0x810C	BR_INDNR_TAKEN_RETIRED	Branch instruction architecturally executed, indirect excluding procedure return, taken
0x8110	BR_IMMED_PRED_RETIRED	Branch instruction architecturally executed, predicted immediate
0x8111	BR_IMMED_MIS_PRED_RETIRED	Branch instruction architecturally executed, mispredicted immediate
0x8114	BR_RETURN_PRED_RETIRED	Branch instruction architecturally executed, predicted procedure return
0x8115	BR_RETURN_MIS_PRED_RETIRED	Branch instruction architecturally executed, mispredicted procedure return
0x8116	BR_INDNR_PRED_RETIRED	Branch instruction architecturally executed, predicted indirect excluding procedure return
0x8117	BR_INDNR_MIS_PRED_RETIRED	Branch instruction architecturally executed, mispredicted indirect excluding procedure return
0x811C	BR_PRED_RETIRED	Branch instruction architecturally executed, predicted branch

Event number	Mnemonic	Description
0x811D	BR_IND_RETIRED	Instruction architecturally executed, indirect branch
0x8120	INST_FETCH_PERCYC	Event in progress, INST_FETCH
0x8121	MEM_ACCESS_RD_PERCYC	Event in progress, MEM_ACCESS_RD
0x8124	INST_FETCH	Instruction memory access
0x8125	BUS_REQ_RD_PERCYC	Bus read transactions in progress
0x8128	DTLB_WALK_PERCYC	Event in progress, DTLB_WALK
0x8129	ITLB_WALK_PERCYC	Event in progress, ITLB_WALK
0x8134	DTLB_HWUPD	Data TLB hardware update of translation table
0x8135	ITLB_HWUPD	Instruction TLB hardware update of translation table
0x8136	DTLB_STEP	Data TLB translation table walk, step
0x8137	ITLB_STEP	Instruction TLB translation table walk, step
0x8138	DTLB_WALK_LARGE	Data TLB large page translation table walk Large page is defined as greater than 64KB
0x8139	ITLB_WALK_LARGE	Instruction TLB large page translation table walk Large page is defined as greater than 64KB
0x813A	DTLB_WALK_SMALL	Data TLB small page translation table walk Small page is defined as less than or equal to 64KB
0x813B	ITLB_WALK_SMALL	Instruction TLB small page translation table walk Small page is defined as less than or equal to 64KB
0x813C	DTLB_WALK_RW	Data TLB demand access with at least one translation table walk
0x8154	L1D_CACHE_HWPRF	Level 1 data cache hardware prefetch
0x8155	L2D_CACHE_HWPRF	Level 2 data cache hardware prefetch If the complex is not configured with a per-complex L2 cache, this event counts the cluster cache event, as defined by L3D_CACHE_HWPRF. If neither a per-complex cache or a cluster cache are configured, then this event is not implemented.
0x8156	L3D_CACHE_HWPRF	Level 3 data cache hardware prefetch If either the complex is configured without a per-complex L2 or the cluster is configured without an L3 cache, this event is not implemented.
0x8158	STALL_FRONTEND_MEMBOUND	Frontend stall cycles, memory bound The counter counts each cycle counted by STALL_FRONTEND when no instructions are delivered from the memory system. This includes the cycles counted by STALL_FRONTEND_L1I, STALL_FRONTEND_MEM and STALL_FRONTEND_TLB.

Event number	Mnemonic	Description
0x8159	STALL_FRONTEND_L1I	Frontend stall cycles, level 1 instruction cache The counter counts each cycle counted by STALL_FRONTEND_MEMBOUND when there is a demand instruction miss in the L1 instruction cache. If the complex is configured with a per-complex L2 cache, this event does not count if STALL_FRONTEND_MEM counts. If the complex is not configured with a per-complex L2 cache, this event is not implemented.
0x815B	STALL_FRONTEND_MEM	Frontend stall cycles, last level PE cache or memory The counter counts each cycle counted by STALL_FRONTEND_MEMBOUND when there is a demand instruction miss in the last level of cache within the PE clock domain or a non-cacheable instruction fetch in progress. If the complex is configured with a per-complex L2 cache, this event is based on L2 cache misses. If the complex is not configured with a per-complex L2 cache, this event is based on L1 instruction cache misses.
0x815C	STALL_FRONTEND_TLB	Frontend stall cycles, TLB The counter counts each cycle counted by STALL_FRONTEND_MEMBOUND when there is a demand instruction miss in the L1 instruction TLB
0x8160	STALL_FRONTEND_CPUBOUND	Frontend stall cycles, processor bound The counter counts each cycle counted by STALL_FRONTEND when the frontend is stalled on a frontend processor resource, not including memory. This includes the cycles counted by STALL_FRONTEND_FLOW and STALL_FRONTEND_FLUSH.
0x8161	STALL_FRONTEND_FLOW	Frontend stall cycles, flow control The counter counts each cycle counted by STALL_FRONTEND_CPUBOUND when the frontend is stalled on unavailability of prediction flow resources.
0x8162	STALL_FRONTEND_FLUSH	Frontend stall cycles, flush recovery The counter counts each cycle counted by STALL_FRONTEND_CPUBOUND when the frontend is recovering from a flush
0x8164	STALL_BACKEND_MEMBOUND	Backend stall cycles, memory bound The counter counts each cycle counted by STALL_BACKEND when the backend is waiting for a memory access to complete. This includes the cycles counted by STALL_BACKEND_L1D, STALL_BACKEND_MEM, STALL_BACKEND_ST and STALL_BACKEND_TLB.

Event number	Mnemonic	Description
0x8165	STALL_BACKEND_L1D	Backend stall cycles, level 1 data cache The counter counts each cycle counted by STALL_BACKEND_MEMBOUND when there is a demand data miss in the L1 data cache. If the complex is configured with a per-complex L2 cache, this event does not count if STALL_BACKEND_MEM counts. If the complex is not configured with a per-complex L2 cache, this event is not implemented.
0x8167	STALL_BACKEND_TLB	Backend stall cycles, TLB The counter counts each cycle counted by STALL_BACKEND_MEMBOUND when there is a demand data miss in the L1 data TLB.
0x8168	STALL_BACKEND_ST	Backend stall cycles, store The counter counts each cycle counted by STALL_BACKEND_MEMBOUND when the backend is stalled waiting for a store.
0x816B	STALL_BACKEND_BUSY	Backend stall cycles, backend busy The counter counts each cycle counted by STALL_BACKEND when operations are available from the frontend but the backend is not able to accept an operation because an execution unit is busy.
0x816C	STALL_BACKEND_ILOCK	Backend stall cycles, input dependency The counter counts each cycle counted by STALL_BACKEND when operations are available from the frontend but at least one is not ready to be sent to the backend because of an input dependency.
0x818D	BUS_REQ_RD	Bus request, read
0x81BC	L1D_CACHE_REFILL_HWPRF	Level 1 data cache refill, hardware prefetch
0x81BD	L2D_CACHE_REFILL_HWPRF	Level 2 data cache refill, hardware prefetch

18.1.2 IMPLEMENTATION DEFINED performance monitors events

The Cortex-A520 core *Performance Monitoring Unit* (PMU) collects **IMPLEMENTATION DEFINED** events.

The following table shows the **IMPLEMENTATION DEFINED** performance monitors events. These events are not exported to the trace unit.

The table also shows the bit position of each event on the event bus. Event numbers that are not listed are reserved.

Table 18-2: Arm IMPLEMENTATION DEFINED PMU events

Event number	Mnemonic	Description
0x00C3	L2D_WS_MODE	L2 cache write streaming mode If the complex is configured with a per-complex L2 cache, this event counts for each cycle where the core is in write streaming mode and is not allocating writes into the L2 cache. If the complex is configured without a per-complex L2 cache, this event counts the cluster cache event, as defined by L3D_WS_MODE. If neither a per-complex cache or a cluster cache is configured, this event is not implemented. **Note:** This event is not exported to the ETM.
0x00C4	L1D_WS_MODE_ENTRY	L1 data cache entering write streaming mode This event counts for each entry into write streaming mode. **Note:** This event is not exported to the ETM.
0x00C5	L1D_WS_MODE	L1 data cache write streaming mode This event counts for each cycle where the core is in write streaming mode and is not allocating writes into the L1 data cache. **Note:** This event is not exported to the ETM.
0x00C7	L3D_WS_MODE	L3 cache write streaming mode This event counts for each cycle where the core is in write streaming mode and is not allocating writes into the L3 cache. If either the complex is configured without a per-complex L2 cache or the cluster is configured without an L3 cache, this event is not implemented. **Note:** This event is not exported to the ETM.

Event number	Mnemonic	Description
0x00C8	LL_WS_MODE	Last level cache write streaming mode If IMP_CPUECTLR_EL1.EXTLLC is set, this event counts for each cycle where the core is in write streaming mode and is not allocating writes into the system cache. • L3D_WS_MODE, if both per-complex L2 cache and cluster L3 cache are implemented • L2D_WS_MODE, if only one of these caches are implemented • L1D_WS_MODE if neither is implemented. **Note:** This event is not exported to the ETM.
0x00D0	L2D_WALK_TLB	L2 TLB walk cache access This event does not count if the MMU is disabled. **Note:** This event is not exported to the ETM.
0x00D1	L2D_WALK_TLB_REFILL	L2 TLB walk cache refill This event does not count if the MMU is disabled. **Note:** This event is not exported to the ETM.
0x00D4	L2D_S2_TLB	L2 TLB IPA cache access This event counts on each access to the IPA cache. If a single translation table walk needs to make multiple accesses to the IPA cache, each access is counted. If stage 2 translation is disabled, this event does not count. **Note:** This event is not exported to the ETM.
0x00D5	L2D_S2_TLB_REFILL	L2 TLB IPA cache refill This event counts on each refill of the IPA cache. If a single translation table walk needs to make multiple accesses to the IPA cache, each access that causes a refill is counted. If stage 2 translation is disabled, this event does not count. **Note:** This event is not exported to the ETM.

Event number	Mnemonic	Description
0x00D6	L2D_CACHE_STASH_DROPPED	L2 cache stash dropped This event counts on each stash request that is received from the interconnect or the Accelerator Coherency Port (ACP), that targets L2 and is dropped due to lack of buffer space to hold the request. If the core is not configured with a per-complex L2 cache, this event is not implemented. **Note:** This event is not exported to the ETM.
0x00D7	L1D_TLB_REFILL_ETS	L1D TLB refill due to ETS replay This event counts any refill counted by L1D_TLB_REFILL due to ETS replay. **Note:** This event is not exported to the ETM.
0x00DA	L2D_CACHE_REFILL_HWPRF_SPATIAL	L2 cache refill due to L2 spatial prefetcher This event counts any refill counted by L2D_CACHE_REFILL_HWPRF caused by L2 spatial prefetcher. **Note:** This event is not exported to the ETM.
0x00DB	L2D_CACHE_REFILL_HWPRF_OFFSET	L2 cache refill due to L2 offset prefetcher This event counts any refill counted by L2D_CACHE_REFILL_HWPRF caused by L2 offset prefetcher. **Note:** This event is not exported to the ETM.
0x00DC	L2D_CACHE_REFILL_HWPRF_PATTERN	L2 cache refill due to L2 pattern prefetcher This event counts any refill counted by L2D_CACHE_REFILL_HWPRF caused by the L2 pattern prefetcher. **Note:** This event is not exported to the ETM.
0x00DD	L2D_CACHE_REFILL_HWPRF_TLBD	L2 cache refill due to L2 TLB prefetcher This event counts any refill counted by L2D_CACHE_REFILL_HWPRF caused by the L2 TLB prefetcher. **Note:** This event is not exported to the ETM.

Event number	Mnemonic	Description
0x00DE	L3D_CACHE_HWPRF_STRIDE	L3 cache access due to L3 stride prefetcher This event counts any access counted by L3D_CACHE_HWPRF caused by the L3 stride prefetcher. **Note:** This event is not exported to the ETM.
0x00DF	L3D_CACHE_HWPRF_OFFSET	L3 cache access due to L3 offset prefetcher This event counts any access counted by L3D_CACHE_HWPRF caused by the L3 offset prefetcher. **Note:** This event is not exported to the ETM.
0x00E5	STALL_BACKEND_ILOCK_ADDR	No operation issued due to the backend, input dependency, address This event counts every cycle counted by STALL_BACKEND_ILOCK, where there is an input dependency on an address operand. This type of interlock is caused by a load/store instruction waiting for data to calculate the address. **Note:** This event is not exported to the ETM.
0x00E6	STALL_BACKEND_ILOCK_VPU	No operation issued due to the backend, input dependency, Vector Processing Unit (VPU). This event counts every cycle counted by STALL_BACKEND_ILOCK, where there is an input dependency on a vector or predicate register. **Note:** This event is not exported to the ETM.
0x00ED	STALL_BACKEND_BUSY_VPU_HAZARD	No operation issued due to the backend, VPU hazard. This event counts cycles where the core stalls due to contention for the VPU with the other core. **Note:** This event is not exported to the ETM.
0x00EE	STALL_SLOT_BACKEND_ILOCK	No operation sent for execution on a Slot due to the backend, input dependency For each cycle, this event counts each dispatch slot that does not issue due to an interlock. **Note:** This event is not exported to the ETM.

Event number	Mnemonic	Description
0x00F0	INST_SPEC_LDST_NUKE	Instruction re-executed, read-after-read hazard This event counts each instruction which re-executes due to read-after-read hazard **Note:** This event is not exported to the ETM.
0x82FA	DTLB_WALK_HWPRF	Data TLB access, hardware prefetcher This event counts any access counted by DTLB_WALK that is due to a hardware prefetch **Note:** This event is not exported to the ETM.

18.2 Performance monitors interrupts

The *Performance Monitoring Unit* (PMU) can be configured to generate an interrupt when one or more of the counters overflow.

When the PMU generates an interrupt, the nPMUIRQ[n] output is driven LOW.

See *Performance Monitors Extension support* in the *Arm® DynamIQ™ Shared Unit-120 Technical Reference Manual* for more information.

18.3 External register access permissions

The Cortex-A520 core supports access to the *Performance Monitoring Unit* (PMU) registers from the system register interface and a memory-mapped interface.

Access to a register depends on:

- Whether the core is powered up
- The state of the OS Lock
- The state of External Performance Monitors Access Disable

The behavior is specific to each register and is not described in this manual. For a detailed description of these features and their effects on the registers, see the *Arm® Architecture Reference Manual for A-profile architecture*. The register descriptions provided in this manual describe whether each register is read/write or read-only.

18.4 AArch64 Performance Monitors registers

The summary table provides an overview of all Performance Monitors registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Table 18-3: Performance Monitors registers summary

Name	Op0	Op1	CRn	CRm	Op2	Reset	Width	Description
PMINTENSET_EL1	3	0	C9	C14	1	—	64-bit	Performance Monitors Interrupt Enable Set register
PMINTENCLR_EL1	3	0	C9	C14	2	—	64-bit	Performance Monitors Interrupt Enable Clear register
PMMIR_EL1	3	0	C9	C14	6	—	64-bit	Performance Monitors Machine Identification Register
PMCR_EL0	3	3	C9	C12	0	—	64-bit	Performance Monitors Control Register
PMCNTENSET_EL0	3	3	C9	C12	1	—	64-bit	Performance Monitors Count Enable Set register
PMCNTENCLR_EL0	3	3	C9	C12	2	—	64-bit	Performance Monitors Count Enable Clear register

PMCCFILTR_EL0	3	3	C14	C15	7	–	64-bit	Performance Monitors Cycle Count Filter Register

18.5 External PMU registers

The summary table provides an overview of all memory-mapped PMU registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Table 18-4: PMU registers summary

Offset	Name	Reset	Width	Description

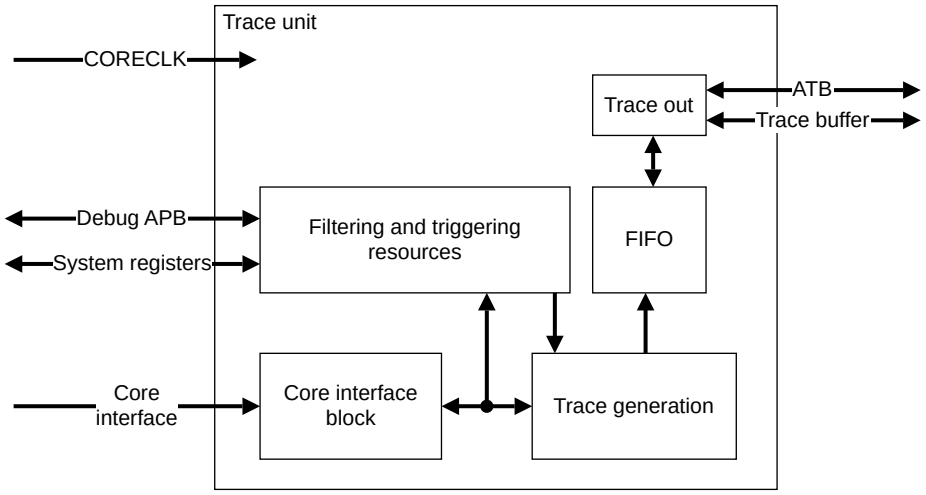
19. Embedded Trace Extension support

The Cortex-A520 core implements the *Embedded Trace Extension* (ETE). The trace unit performs real-time instruction flow tracing based on the ETE. The trace unit is a CoreSight component and is an integral part of the Arm real-time debug solution.

The following figure shows the main components of the trace unit:

Figure 19-1: Trace unit components



Core interface

The core interface monitors and generates P0 elements that are essentially executed branches and exceptions traced in program order.

Trace generation

The trace generation logic generates various trace packets based on P0 elements.

Filtering and triggering resources

You can limit the amount of trace data that the trace unit generates by filtering. For example, you can limit trace generation to a certain address range. The trace unit supports other logic analyzer style filtering options. The trace unit can also generate a trigger that is a signal to the Trace Capture Device to stop capturing trace.

FIFO

The trace unit generates trace in a highly compressed form. The *First In First Out* (FIFO) enables trace bursts to be flattened out. When the FIFO is full, the FIFO signals an overflow. The trace generation logic does not generate any new trace until the FIFO is emptied. This behavior causes a gap in the trace when viewed in the debugger.

Trace out

Trace from the FIFO is output on the AMBA ATB interface or to the trace buffer.

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information.

19.1 Trace unit resources

Trace resources include counters, external input and output signals, and comparators.

The following table shows the trace unit resources, and indicates which of these resources the A520 core implements.

Table 19-1: Trace unit resources implemented

Description	Configuration
Number of resource selection pairs implemented	8
Number of external input selectors implemented	4
Number of *Embedded Trace Extension* (ETE) events	4
Number of counters implemented	2
Reduced function counter implemented	Not implemented
Number of sequencer states implemented	4
Number of Virtual Machine ID comparators implemented	1
Number of Context ID comparators implemented	1
Number of address comparator pairs implemented	4
Number of single-shot comparator controls	1
Number of core comparator inputs implemented	0
Data address comparisons implemented	Not implemented
Number of data value comparators implemented	0

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information.

19.2 Trace unit generation options

The Cortex-A520 core trace unit implements a set of generation options.

The following table shows the trace generation options that are implemented in the Cortex-A520 core trace unit.

Table 19-2: Trace unit generation options implemented

Description	Configuration
Instruction address size in bytes	8

Description	Configuration
Data address size in bytes	0, as the *Embedded Trace Extension* (ETE) does not implement data tracing
Data value size in bytes	0, as the ETE does not implement data tracing
Virtual Machine ID size in bytes	4
Context ID size in bytes	4
Support for conditional instruction tracing	Not implemented
Support for tracing of data	Not implemented
Support for tracing of load and store instructions as P0 elements	Not implemented
Support for cycle counting in the instruction trace	Implemented
Support for branch broadcast tracing	Implemented
Number of events that are supported in the trace	4
Return stack support	Implemented
Tracing of SError exception support	Implemented
Instruction trace cycle counting minimum threshold	4
Size of Trace ID	7 bits
Synchronization period support	Read/write
Global timestamp size	64 bits
Number of cores available for tracing	1
ATB trigger support	Implemented
Low-power behavior override	Implemented
Stall control support	Not implemented
Support for overflow avoidance	Not implemented
Support for using CONTEXTIDR_EL2 in *Virtual Machine IDentifier* (VMID) comparator	Implemented

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information.

19.3 Reset the trace unit

The reset for the trace buffer is the same as a Cold reset for the core. When using the *TRace Buffer Extension* (TRBE), a Warm reset disables the trace buffer and therefore it is not possible to use the trace buffer to capture trace for a Warm reset.

If the trace unit is reset, then tracing stops until the trace unit is reprogrammed and re-enabled. However, if the core is reset using Warm reset, the last few instructions provided by the core before the reset might not be traced.

19.4 Program and read the trace unit registers

You program and read the trace unit registers using either the Debug *Advanced Peripheral Bus* (APB) interface or the System register interface.

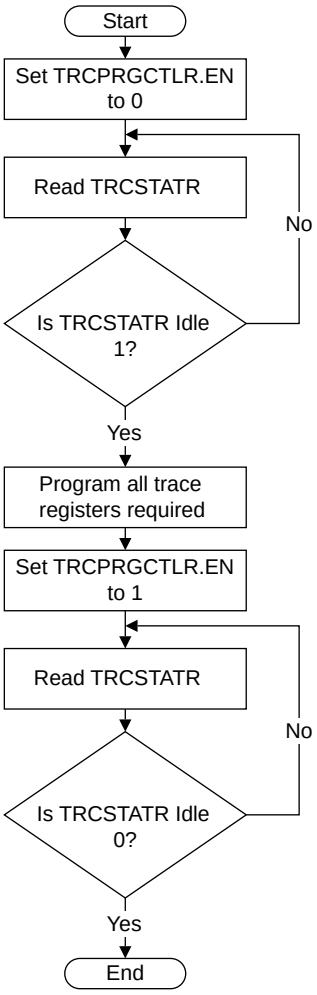
The core does not have to be in debug state when you program the trace unit registers. When you program the trace unit registers, you must enable all the changes at the same time. Otherwise, if you program the counter, it might start to count based on incorrect events before the correct setup is in place for the trigger condition. To disable the trace unit, use the TRCPRGCTLR.EN bit.

See the *Arm® Architecture Reference Manual for A-profile architecture* for more information about the following trace unit registers:

- Programming Control Register, TRCPRGCTLR
- Trace Status Register, TRCSTATR

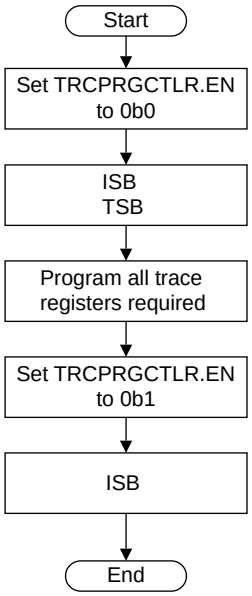
The following figure shows the flow for programming trace unit registers using the Debug APB interface:

Figure 19-2: Programming trace unit registers using the Debug APB interface



The following figure shows the flow for programming trace unit registers using the System register interface:

Figure 19-3: Programming trace registers using the System register interface



19.5 Trace unit register interfaces

The Cortex-A520 core supports an *Advanced Peripheral Bus* (APB) memory-mapped interface and a system register interface to trace unit registers.

Register accesses differ depending on the trace unit state. See the *Arm® Architecture Reference Manual for A-profile architecture* for information on the behaviors and access mechanisms.

19.6 Interaction with the Performance Monitoring Unit and Debug

The trace unit interacts with the *Performance Monitoring Unit* (PMU) and it can access the PMU events.

Interaction with the PMU

The Cortex-A520 core includes a PMU that enables events, such as cache misses and executed instructions, to be counted over time.

The PMU and trace unit function together.

Use of PMU events by the trace unit

The PMU architectural events are available to the trace unit through the extended input facility. See the *Arm® Architecture Reference Manual for A-profile architecture* for more information about PMU events.

The trace unit uses four extended external input selectors to access the PMU events. Each selector can independently select one of the PMU events, that are then active for the cycles where the relevant events occur. These selected events can then be accessed by any of the event registers within the trace unit.

Related information

18. Performance Monitors Extension support on page 113
18.1 Performance monitors events on page 113

19.7 Embedded Trace Extension events

The Cortex-A520 core trace unit collects events from other units in the design and uses numbers to reference these events.

The exported events are listed in the table in 18.1.1 Common event PMU events on page 113.

19.8 AArch64 Trace unit registers

The summary table provides an overview of all Trace unit registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

20. Trace Buffer Extension support

The Cortex-A520 core implements the *TRace Buffer Extension* (TRBE). The TRBE writes the program flow trace generated by the trace unit directly to memory. The TRBE is programmed through System registers.

When enabled, the TRBE can:

- Accept trace data from the trace unit and write it to L2 memory.
- Discard trace data from the trace unit. In this case, the data is lost.
- Reject trace data from the trace unit. In this case, the trace unit retains data until the TRBE accepts it.

When disabled, the TRBE ignores trace data and the trace unit sends trace data to the AMBA® *Trace Bus* (ATB) interface.

20.1 Program and read the trace buffer registers

You can program and read the *TRace Buffer Extension* (TRBE) registers using the System register interface.

The core does not have to be in debug state when you program the TRBE registers. When you program the TRBE registers, you must enable all the changes at the same time. Otherwise, if you program the counter, it might start to count based on incorrect events before the correct setup is in place for the trigger condition. To disable the TRBE, use the TRBLIMITR_EL1.E bit.

See the *Arm® Architecture Reference Manual for A-profile architecture* for information on the TRBE register behaviors and access mechanisms.

20.2 Trace buffer register interface

The Cortex-A520 core supports a System register interface to *TRace Buffer Extension* (TRBE) registers.

Register accesses differ depending on the TRBE state. See the *Arm® Architecture Reference Manual for A-profile architecture* for information on the behaviors and access mechanisms.

20.3 AArch64 Trace Buffer Extension registers

The summary table provides an overview of all Trace Buffer Extension registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Table 20-1: Trace Buffer Extension registers summary

Name	Op0	Op1	CRn	CRm	Op2	Reset	Width	Description
TRBLIMITR_EL1	3	0	C9	C11	0	–	64-bit	Trace Buffer Limit Address Register
TRBPTR_EL1	3	0	C9	C11	1	–	64-bit	Trace Buffer Write Pointer Register
TRBBASER_EL1	3	0	C9	C11	2	–	64-bit	Trace Buffer Base Address Register
TRBSR_EL1	3	0	C9	C11	3	–	64-bit	Trace Buffer Status/syndrome Register
TRBMAR_EL1	3	0	C9	C11	4	–	64-bit	Trace Buffer Memory Attribute Register
TRBTRG_EL1	3	0	C9	C11	6	–	64-bit	Trace Buffer Trigger Counter Register
TRBIDR_EL1	3	0	C9	C11	7	–	64-bit	Trace Buffer ID Register

21. Activity Monitors Extension support

The Cortex-A520 core implements the Activity Monitors Extension to the Arm®v8.4-A architecture. Activity monitoring has features similar to performance monitoring features, but is intended for system management use whereas performance monitoring is aimed at user and debug applications.

The activity monitors provide useful information for system power management and persistent monitoring. The activity monitors are read-only in operation and their configuration is limited to the highest Exception level implemented.

The Cortex-A520 core implements seven counters in two groups, each of which is a 64-bit counter that counts a fixed event. Group 0 has four counters 0-3, and Group 1 has three counters 0-2.

21.1 Activity monitors access

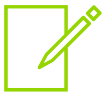
The Cortex-A520 core supports access to activity monitors from the System register interface and supports read-only memory-mapped access using the utility bus interface.

See the *Arm® Architecture Reference Manual for A-profile architecture* for information on the memory mapping of these registers.

Access enable bit

There are multiple access enable bits associated with the Activity Monitors System registers:

- AMUSERENR_EL0.EN controls access from EL0 to the Activity Monitors System registers
- CPTR_EL2.TAM controls access from EL0 and EL1 to the Activity Monitors System registers
- CPTR_EL3.TAM controls access from EL0, EL1, and EL2 to the Activity Monitors Extension System registers



Note

AMUSERENR_EL0.EN is configurable at EL1, EL2, and EL3. All other controls, as well as the value of the counters, are configurable only at the highest implemented Exception level.

For a detailed description of access controls for the registers, see the *Arm® Architecture Reference Manual for A-profile architecture*.

System register access

The activity monitors are accessible using the `MRS` and `MSR` instructions.

External memory-mapped access

Activity monitors can be memory-mapped accessed from the utility bus interface. In this case, the Activity Monitors registers only provide read access to the Activity Monitor Event Counter registers.

The base address for *Activity Monitoring Unit* (AMU) registers on the utility bus interface is `0x<n>90000`, where *n* is the Cortex-A520 core instance number in the DSU-120 DynamIQ™ cluster.

These registers are treated as RAZ/WI if either:

- The register is marked as Reserved.
- The register is accessed in the wrong Security state.

21.2 Activity monitors counters

The Cortex-A520 core implements seven activity monitors counters that map to specific *Activity Monitoring Unit* (AMU) events.

Each counter has the following characteristics:

- All events are counted in 64-bit wrapping counters that overflow when they wrap. There is no support for overflow status indication or interrupts.
- Any change in clock frequency, can affect any counter. For example, when a `WFI`, `WFE`, `WFIT`, or `WFET` instruction stops the clock.
- The activity monitor counters are reset to zero on a Cold reset of the power domain of the core. When the core is not in reset, activity monitoring is available.

21.3 Activity monitors events

Activity monitors events in the Cortex-A520 core are fixed, and they map to the activity monitors counters.

The following table shows the mapping of counters to fixed events.

Table 21-1: Mapping of counters to fixed events

Activity monitor counter <n>	Event	Event number	Description
AMEVCNTR00	CPU_CYCLES	0x0011	Core frequency cycles
AMEVCNTR01	CNT_CYCLES	0x4004	Constant frequency cycles
AMEVCNTR02	INST_RETIRED	0x0008	Instruction architecturally executed Increments for every instruction that is executed architecturally, including instructions that fail their condition code check
AMEVCNTR03	STALL_BACKEND_MEM	0x4005	Memory stall cycles Increments for each cycle in which the core is unable to dispatch instructions from the front end to the back end due to a back end stall caused by a miss in the last level of cache within the core clock domain

Activity monitor counter <n>	Event	Event number	Description
AMEVCNTR10	GEAR0_MPMM_ATHR_EXCEEDED	0x0300	*Maximum Power Mitigation System* (MPMM) Gear 0 Increments for each period where core activity is above the throttling threshold for gear 0 Reserved
AMEVCNTR11	GEAR1_MPMM_ATHR_EXCEEDED	0x0301	MPMM Gear 1 Increments for each period where core activity is above the throttling threshold for gear 1 Reserved
AMEVCNTR12	GEAR2_MPMM_ATHR_EXCEEDED	0x0302	MPMM Gear 2 Increments for each period where core activity is above the throttling threshold for gear 2 Reserved

A.1.1 ACTLR_EL1, Auxiliary Control Register (EL1)

Provides **IMPLEMENTATION DEFINED** configuration and control options for execution at EL1 and EL0.

Note

Arm recommends the contents of this register have no effect on the PE when AArch64-HCR_EL2.{E2H, TGE} is {1, 1}, and instead the configuration and control fields are provided by the AArch64-ACTLR_EL2 register. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

Configurations

This register is available in all configurations.

Bit descriptions

When AArch64-PAR_EL1.F == '0'

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.

- See the PAR_EL1.NS bit description for constraints on the value it returns.

Figure A-4: AArch64_par_el1 bit assignments

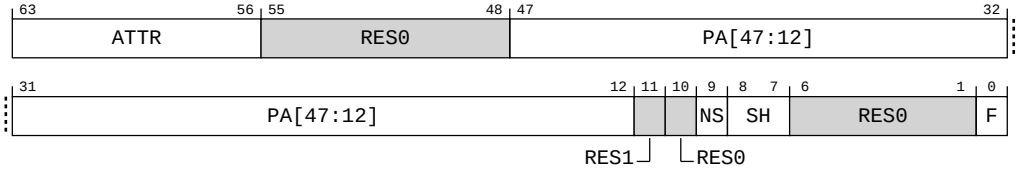

Table A-15: PAR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:56]	ATTR	Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in AArch64-MAIR_EL1, AArch64-MAIR_EL2, and AArch64-MAIR_EL3. The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor. **Note:** The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.	`8{x}`
[55:48]	**RES0**	Reserved	**RES0**
[47:12]	PA[47:12]	Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12]. For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are **RES0**.	`36{x}`
[11]	**RES1**	Reserved	**RES1**
[10]	**RES0**	Reserved	**RES0**
[9]	NS	Non-secure. The NS attribute for a translation table entry from a Secure translation regime. For a result from a Secure translation regime, when AArch64-SCR_EL3.EEL2 is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions: • In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W. Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation. For a result from a Non-secure translation regime, this bit is **UNKNOWN**.	`x`

Bits	Name	Description	Reset
[8:7]	SH	Shareability attribute, for the returned output address. **0b00** Non-shareable. **0b10** Outer Shareable. **0b11** Inner Shareable. The value 0b01 is reserved. **Note:** This field returns the value 0b10 for: • Any type of Device memory. • Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes. The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.	xx
[6:1]	**RES0**	Reserved	**RES0**
[0]	F	Indicates whether the instruction performed a successful address translation. **0b0** Address translation completed successfully.	x

When AArch64-PAR_EL1.F == '1'

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Figure A-5: AArch64_par_el1 bit assignments

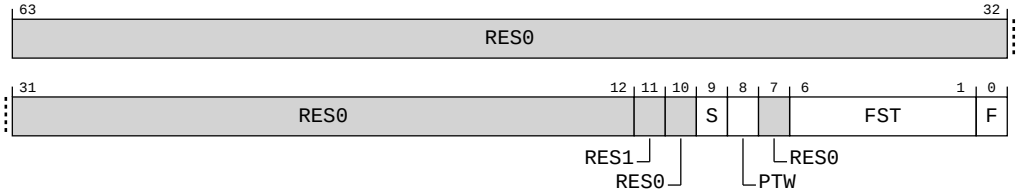

Table A-16: PAR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:12]	**RES0**	Reserved	**RES0**
[11]	**RES1**	Reserved	**RES1**
[10]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[9]	S	Indicates the translation stage at which the translation aborted: **0b0** Translation aborted because of a fault in the stage 1 translation. **0b1** Translation aborted because of a fault in the stage 2 translation.	x
[8]	PTW	If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.	x
[7]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[6:1]	FST	Fault status code, as shown in the Data Abort ESR encoding. **0b000000** Address size fault, level 0 of translation or translation table base register. **0b000001** Address size fault, level 1. **0b000010** Address size fault, level 2. **0b000011** Address size fault, level 3. **0b000100** Translation fault, level 0. **0b000101** Translation fault, level 1. **0b000110** Translation fault, level 2. **0b000111** Translation fault, level 3. **0b001001** Access flag fault, level 1. **0b001010** Access flag fault, level 2. **0b001011** Access flag fault, level 3. **0b001101** Permission fault, level 1. **0b001110** Permission fault, level 2. **0b001111** Permission fault, level 3. **0b010100** Synchronous External abort on translation table walk or hardware update of translation table, level 0. **0b010101** Synchronous External abort on translation table walk or hardware update of translation table, level 1. **0b010110** Synchronous External abort on translation table walk or hardware update of translation table, level 2. **0b010111** Synchronous External abort on translation table walk or hardware update of translation table, level 3. **0b110000** TLB conflict abort. **0b110001** Unsupported atomic hardware update fault.	6{x}

Bits	Name	Description	Reset
[0]	F	Indicates whether the instruction performed a successful address translation. **0b1** Address translation aborted.	x

Table A-41: IMP_CMPXECTLR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:46]	**RES0**	Reserved	**RES0**
[45:44]	CDEVC	Downstream Cache Control **0b00** Disables sending data when clean cache-lines are evicted. **0b01** Enables sending WriteEvictFull transactions when Unique Clean cache-lines are evicted. Shared Clean cache-line evictions do not send data. **0b10** Enables sending WriteEvictOrEvict transactions when Unique Clean cache-lines are evicted. Shared Clean cache-line evictions do not send data. **0b11** Enables sending WriteEvictOrEvict transactions when Unique Clean or Shared Clean cache-lines are evicted.	xx
[43]	FLUSHEVC	Eviction Flush Control **0b0** Disables sending data when hardware cache flushes or DC CISW instructions evict a clean cache-line. . **0b1** Sending of data when hardware cache flushes or DC CISW instructions evict clean cache-lines is controlled by Downstream Cache Control. Sending of Evict transactions is controlled by SNPFILTERP.	0b0
[42]	SNPFILTERP	Downstream Snoop Filter Present **0b0** Disables sending Evict transactions when clean cache-lines are evicted without data. **0b1** Enables sending Evict transactions when clean cache-lines are evicted without data.	0b1

Bits	Name	Description	Reset
[41:40]	PFTMM	DRAM prefetch using PrefetchTgt transactions for table walk requests. **0b00** Disable PrefetchTgt generation for requests from the Memory Management unit (MMU). **0b01** Dynamically generate PrefetchTgt for requests from the MMU. **0b11** Always generate PrefetchTgt for requests from the MMU.	0b00
[39:38]	PFTLS	DRAM prefetch using PrefetchTgt transactions for load and store requests. **0b00** Disable PrefetchTgt generation for requests from the Load-Store unit (LS). **0b01** Dynamically generate PrefetchTgt for requests from the LS. **0b11** Always generate PrefetchTgt for requests from the LS.	0b00
[37:36]	PFTIF	DRAM prefetch using PrefetchTgt transactions for instruction fetch requests. **0b00** Disable PrefetchTgt generation for requests from the Instruction Fetch unit (IF). **0b01** Dynamically generate PrefetchTgt for requests from the IF. **0b11** Always generate PrefetchTgt for requests from the IF.	0b00
[35:27]	**RES0**	Reserved	**RES0**
[26]	TLBPFDIS	Disable L2 TLB prefetcher **0b0** The L2 TLB prefetcher is enabled. **0b1** The L2 TLB prefetcher is disabled.	0b0
[25]	**RES0**	Reserved	**RES0**
[24]	TLBPART	**When the complex contains two cores** Partition L2 TLB allocations by core **0b0** Both cores are able to allocated to the full L2 TLB. **0b1** Core 0 can only allocate to ways 0-3 in the L2 TLB, and core 1 can only allocate to ways 4-7. Cores can hit entries allocated by either core. **Otherwise** RES0	x
[23:16]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[15:14]	L2CBWINSZ	Number of CBUSY responses in one sampling window. **0b00** 64 CBUSY responses per sampling window. **0b01** 128 CBUSY responses per sampling window. **0b10** 256 CBUSY responses per sampling window. **0b11** 512 CBUSY responses per sampling window.	0b10
[13:12]	L2CBSIGNF	Fraction of CBUSY responses in the sampling window necessary to be considered a valid sample of that CBUSY value. **0b00** 1/32 **0b01** 1/16 **0b10** 1/8 **0b11** 1/4	0b01
[11:10]	L2CBLVL	L2 internal CBUSY generation control. **0b00** Disable internal CBUSY generation. **0b01** Normal thresholds. **0b10** Conservative thresholds - throttles early. **0b11** Most conservative thresholds - throttles earlier.	0b01
[9:8]	FPDFTH	Prefetch data forwarding threshold. The value 0b11 disables prefetch data forwarding. **0b00** Default prefetch forwarding behaviour. **0b01** Faster prefetch forwarding timeout. **0b10** Immediate prefetch forwarding timeout (no waiting). **0b11** Prefetch forwarding is disabled.	0b00
[7]	Reserved_7	Reserved for Arm internal use	x
[6]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[5]	L2ROPFCTL	L2 ReadOnce hitting prefetched line age control **0b0** ReadOnce from TLB hitting TLB-prefetched line sets the age to allocation age. **0b1** ReadOnce from TLB hitting TLB-prefetched line sets the age to MRU.	0b0
[4]	RAMCGDIS	Disable clock gating for all RAMs in the complex other than the L2 data RAMs **0b0** Clock gating for all RAMs in the complex other than the L2 data RAMs are enabled. **0b1** Clock gating for all RAMs in the complex other than the L2 data RAMs are disabled.	0b0
[3]	Reserved_3	Reserved for Arm internal use	x
[2]	L2EVADIS	Disable L2 cache data RAM EVA accesses **0b0** Optimized evict/allocate accesses to L2 cache data RAMs using RAM EVA feature are enabled. **0b1** Optimized evict/allocate accesses to L2 cache data RAMs using RAM EVA feature are disabled.	0b0
[1:0]	L2STCTL	L2 cache stashing control **0b00** Stashes targeting L2 cache will allocate as if the line were brought in by a load. **0b01** Stashes targeting L2 cache will allocate and be marked as preferred targets for eviction. **0b10** Stashes targeting L2 cache will allocate as if the line were brought in by a load, but will only allocate to odd numbered cache ways. **0b11** Stashes targeting L2 cache will be ignored.	0b00

A.1.15 AIDR_EL1, Auxiliary ID Register

Provides **IMPLEMENTATION DEFINED** identification information.

The value of this register must be interpreted in conjunction with the value of AArch64-MIDR_EL1.

Configurations

This register is available in all configurations.

```

A.1.16 ACTLR_EL2, Auxiliary Control Register (EL2)

Provides **IMPLEMENTATION DEFINED** configuration and control options for EL2.

Note

Arm recommends the contents of this register are updated to apply to EL0 when AArch64-HCR_EL2.{E2H, TGE} is {1, 1}, gaining configuration and control fields from the AArch64-ACTLR_EL1. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

Configurations

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

```

A.1.17 HACR_EL2, Hypervisor Auxiliary Control Register

Controls trapping to EL2 of **IMPLEMENTATION DEFINED** aspects of EL1 or EL0 operation.

Note

Arm recommends that the values in this register do not cause unnecessary traps to EL2 when AArch64-HCR_EL2.{E2H, TGE} == {1, 1}.

Configurations

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Bit descriptions

Figure A-24: AArch64_actlr_el3 bit assignments

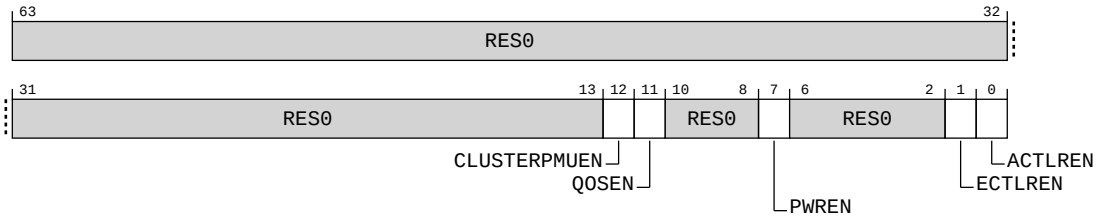

Table A-81: ACTLR_EL3 bit descriptions

Bits	Name	Description	Reset
[63:13]	**RES0**	Reserved	**RES0**
[12]	CLUSTERPMUEN	Cluster PMU Registers enable. Traps EL1 and EL2 writes to implementation-defined cluster PMU registers to EL3, subject to the exception prioritization rules. Possible values of this bit are: **0b0** This control causes writes to IMP_CLUSTERPM* at EL1 and EL2 to be trapped to EL3, subject to the exception prioritization rules.. **0b1** This control does not cause any instructions to be trapped.	0b0
[11]	QOSEN	Cluster Bus QoS Registers enable. Traps EL1 and EL2 writes to AArch64-IMP_CLUSTERBUSQOS_EL1 to EL3, subject to the exception prioritization rules. Possible values of this bit are: **0b0** This control causes writes to AArch64-IMP_CLUSTERBUSQOS_EL1 at EL1 and EL2 to be trapped to EL3, subject to the exception prioritization rules. **0b1** This control does not cause any instructions to be trapped.	0b0
[10:8]	**RES0**	Reserved	**RES0**
[7]	PWREN	Power Control Registers enable. Traps EL1 and EL2 writes to implementation-defined power control registers to EL3, subject to the exception prioritization rules. Possible values of this bit are: **0b0** This control causes writes to AArch64-IMP_CPUPWRCTLR_EL1, AArch64-IMP_CLUSTERPWRCTLR_EL1, AArch64-IMP_CLUSTERPWRDN_EL1 and IMP_CLUSTERL3*_EL1 at EL1 and EL2 to be trapped to EL3, subject to the exception prioritization rules. **0b1** This control does not cause any instructions to be trapped.	0b0
[6:2]	**RES0**	Reserved	**RES0**
[1]	ECTLREN	Extended Control Registers enable. Traps EL1 and EL2 writes to AArch64-IMP_CPUECTLR_EL1, AArch64-IMP_CMPXECTLR_EL1 and AArch64-IMP_CLUSTERECTLR_EL1 to EL3, subject to the exception prioritization rules. Possible values of this bit are: **0b0** This control causes writes to AArch64-IMP_CPUECTLR_EL1, AArch64-IMP_CMPXECTLR_EL1 and AArch64-IMP_CLUSTERECTLR_EL1 at EL1 and EL2 to be trapped to EL3, subject to the exception prioritization rules. **0b1** This control does not cause any instructions to be trapped.	0b0
[0]	ACTLREN	Auxiliary Control Registers enable. Traps EL1 and EL2 writes to AArch64-IMP_CPUACTLR_EL1, AArch64-IMP_CPUACTLR2_EL1, AArch64-IMP_CMPXACTLR_EL1 and AArch64-IMP_CLUSTERACTLR_EL1 to EL3, subject to the exception prioritization rules. Possible values of this bit are: **0b0** This control causes writes to AArch64-IMP_CPUACTLR_EL1, AArch64-IMP_CPUACTLR2_EL1, AArch64-IMP_CMPXACTLR_EL1 and AArch64-IMP_CLUSTERACTLR_EL1 at EL1 and EL2 to be trapped to EL3, subject to the exception prioritization rules. **0b1** This control does not cause any instructions to be trapped.	0b0

A.3.1 IMP_CDBGDR0_EL3, Cache Debug Data Register 0

Contains data from a preceding cache debug operation.

This register is populated after one of the following operations have been executed:

- SYS IMP_CDBGL1DCDR
- SYS IMP_CDBGL1DCMR
- SYS IMP_CDBGL1DCTR
- SYS IMP_CDBGL1ICDR
- SYS IMP_CDBGL1ICTR
- SYS IMP_CDBGL2CDR
- SYS IMP_CDBGL2CMR
- SYS IMP_CDBGL2CTR

- SYS IMP_CDBGL2TR0
- SYS IMP_CDBGL2TR1
- SYS IMP_CDBGL2TR2

Configurations

This register is available in all configurations.

A.4 AArch64 Cache Debug instructions summary

The summary table provides an overview of all Cache Debug instructions in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Table A-112: Cache Debug instructions summary

Name	Op0	Op1	CRn	CRm	Op2	Reset	Width	Description

A.5 AArch64 Identification registers summary

The summary table provides an overview of all Identification registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

A.5.2 MPIDR_EL1, Multiprocessor Affinity Register

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

Configurations

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

Bit descriptions

Figure A-53: AArch64_mpidr_el1 bit assignments

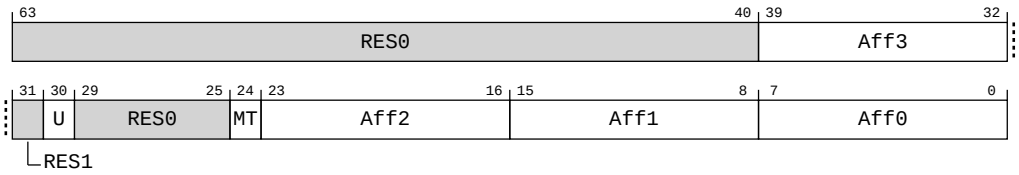

Table A-140: MPIDR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:40]	**RES0**	Reserved	**RES0**
[39:32]	Aff3	Affinity level 3. See the description of Aff0 for more information. The value will be determined by the CLUSTERIDAFF3 configuration pins.	8{x}
[31]	**RES1**	Reserved	**RES1**
[30]	U	Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. **0b0** Processor is part of a multiprocessor system.	x
[29:25]	**RES0**	Reserved	**RES0**
[24]	MT	Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. **0b1** Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.	x
[23:16]	Aff2	Affinity level 2. See the description of Aff0 for more information. The value will be determined by the CLUSTERIDAFF2 configuration pins.	8{x}
[15:8]	Aff1	Affinity level 1. See the description of Aff0 for more information. Identification number for each core in an cluster counting from zero.	8{x}
[7:0]	Aff0	Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or AArch64-MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole. **0b00000000** Thread 0 Cortex-A520 is single-threaded.	8{x}

A.5.20 MVFR0_EL1, AArch32 Media and VFP Feature Register 0

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with AArch64-MVFR1_EL1 and AArch64-MVFR2_EL1.

For general information about the interpretation of the ID registers see *Principles of the ID scheme for fields in ID registers* in the *Arm® Architecture Reference Manual for A-profile architecture*.

Configurations

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Bit descriptions

Figure A-77: AArch64_id_aa64pfr0_el1 bit assignments

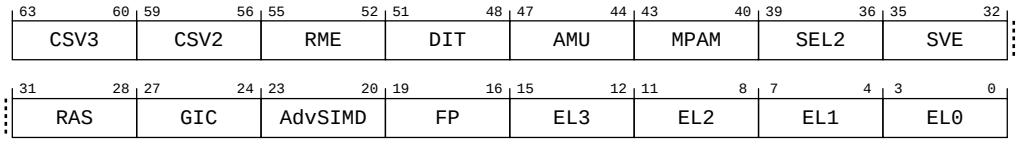

Table A-188: ID_AA64PFR0_EL1 bit descriptions

Bits	Name	Description	Reset
[63:60]	CSV3	Speculative use of faulting data. Defined values are: **0b0001** Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation.	xxxx
[59:56]	CSV2	Speculative use of out of context branch targets. Defined values are: **0b0010** Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. The SCXTNUM_ELx registers are supported and the contexts include the SCXTNUM_ELx register contexts.	xxxx
[55:52]	RME	Realm Management Extension (RME). Defined values are: **0b0000** Realm Management Extension not implemented.	xxxx

Bits	Name	Description	Reset
[51:48]	DIT	Data Independent Timing. Defined values are: **0b0001** AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.	xxxx
[47:44]	AMU	Indicates support for Activity Monitors Extension. Defined values are: **0b0001** FEAT_AMUv1 is implemented.	xxxx
[43:40]	MPAM	Indicates support for MPAM Extension. Defined values are: **0b0001** MPAM Extension version 1.1 is implemented.	xxxx
[39:36]	SEL2	Secure EL2. Defined values are: **0b0001** Secure EL2 is implemented.	xxxx
[35:32]	SVE	Scalable Vector Extension. Defined values are: **0b0001** SVE architectural state and programmers' model are implemented.	xxxx
[31:28]	RAS	RAS Extension version. Defined values are: **0b0010** FEAT_RASv1p1 present.	xxxx
[27:24]	GIC	System register GIC CPU interface. Defined values are: **0b0000** GIC CPU interface system registers not implemented. This value is reported when the GICCDISABLE input is HIGH. **0b0011** System register interface to version 4.1 of the GIC CPU interface is supported. This value is reported when the GICCDISABLE input is LOW.	xxxx
[23:20]	AdvSIMD	Advanced SIMD. Defined values are: **0b0001** Advanced SIMD is implemented, including support for the following SISD and SIMD operations: • Integer byte, halfword, word and doubleword element operations. • Half-precision, single-precision and double-precision floating-point arithmetic. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.	xxxx
[19:16]	FP	Floating-point. Defined values are: **0b0001** Floating-point is implemented, and includes support for: • Half-precision, single-precision and double-precision floating-point types. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.	xxxx
[15:12]	EL3	EL3 Exception level handling. Defined values are: **0b0001** EL3 can be executed in AArch64 state only.	xxxx

Bits	Name	Description	Reset
[11:8]	EL2	EL2 Exception level handling. Defined values are: **0b0001** EL2 can be executed in AArch64 state only.	xxxx
[7:4]	EL1	EL1 Exception level handling. Defined values are: **0b0001** EL1 can be executed in AArch64 state only.	xxxx
[3:0]	EL0	EL0 Exception level handling. Defined values are: **0b0001** EL0 can be executed in AArch64 state only.	xxxx

Figure A-78: AArch64_id_aa64pfr1_el1 bit assignments

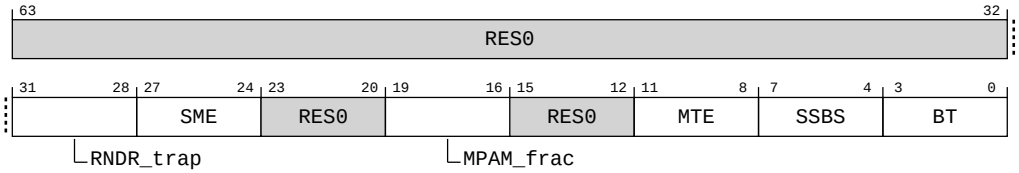

Table A-190: ID_AA64PFR1_EL1 bit descriptions

Bits	Name	Description	Reset
[63:32]	**RES0**	Reserved	**RES0**
[31:28]	RNDR_trap	Random Number trap to EL3 field. Defined values are: **0b0000** Trapping of AArch64-RNDR and AArch64-RNDRRS to EL3 is not supported.	xxxx
[27:24]	SME	Scalable Matrix Extension field. Defined values are: **0b0000** SME architectural state and programmers' model are not implemented.	xxxx
[23:20]	**RES0**	Reserved	**RES0**
[19:16]	MPAM_frac	MPAM Extension fractional field. Defined values are: **0b0001** Implements MPAM v1.1 and adds support for MPAM2_EL2.TIDR to provide trapping of MPAMIDR_EL1 when MPAMHCR_EL2 is not present.	xxxx
[15:12]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[11:8]	MTE	Support for the Memory Tagging Extension. Defined values are: **0b0001** Memory Tagging Extension instructions accessible at EL0 are implemented. Instructions and System Registers defined by the extension not configurably accessible at EL0 are Unallocated and other System Register fields defined by the extension are **RES0**. This value is reported when the BROADCASTMTE input is LOW. **0b0011** Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling. This value is reported when the BROADCASTMTE input is HIGH.	xxxx
[7:4]	SSBS	Speculative Store Bypassing controls in AArch64 state. Defined values are: **0b0010** AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe, and the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.	xxxx
[3:0]	BT	Branch Target Identification mechanism support in AArch64 state. Defined values are: **0b0001** The Branch Target Identification mechanism is implemented.	xxxx

Bits	Name	Description	Reset
[63:60]	RES0	Reserved	RES0
[59:56]	F64MM	Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are: **0b0000** FP64 matrix multiplication and related instructions are not implemented.	xxxx
[55:52]	F32MM	Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are: **0b0000** FP32 matrix multiplication instruction is not implemented.	xxxx

Bits	Name	Description	Reset
[51:48]	**RES0**	Reserved	**RES0**
[47:44]	I8MM	Indicates support for SVE Int8 matrix multiplication instructions. Defined values are: **0b0001** SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.	xxxx
[43:40]	SM4	Indicates support for SVE SM4 instructions. Defined values are: **0b0000** SVE2 SM4 instructions are not implemented. This value is reported when Cryptographic extensions are not implemented or are disabled. **0b0001** SVE2 SM4E and SM4EKEY instructions are implemented. This value is reported when Cryptographic extensions are implemented and enabled.	xxxx
[39:36]	**RES0**	Reserved	**RES0**
[35:32]	SHA3	Indicates support for the SVE SHA3 instructions. Defined values are: **0b0000** SVE2 SHA-3 instructions are not implemented. This value is reported when Cryptographic extensions are not implemented or are disabled. **0b0001** SVE2 RAX1 instruction is implemented. This value is reported when Cryptographic extensions are implemented and enabled.	xxxx
[31:24]	**RES0**	Reserved	**RES0**
[23:20]	BF16	Indicates support for SVE BFloat16 instructions. Defined values are: **0b0001** BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.	xxxx
[19:16]	BitPerm	Indicates support for SVE bit permute instructions. Defined values are: **0b0001** SVE BDEP, BEXT, and BGRP instructions are implemented.	xxxx
[15:8]	**RES0**	Reserved	**RES0**
[7:4]	AES	Indicates support for SVE AES instructions. Defined values are: **0b0000** SVE2-AES instructions are not implemented. This value is reported when Cryptographic extensions are not implemented or are disabled. **0b0010** SVE2 AESE, AESD, AESMC, and AESIMC instructions are implemented plus SVE2 PMULLB and PMULLT instructions with 64-bit source. This value is reported when Cryptographic extensions are implemented and enabled.	xxxx
[3:0]	SVEver	Indicates support for SVE. Defined values are: **0b0001** The SVE and non-optional SVE2 instructions are implemented.	xxxx

Bits	Name	Description	Reset
[63:60]	RNDR	Indicates support for Random Number instructions in AArch64 state. When FEAT_RNG_TRAP is implemented, the value returned by a direct read of ID_AA64ISAR0_EL1.RNDR is further controlled by the value of AArch64-SCR_EL3.TRNDR. Defined values are: **0b0000** No Random Number instructions are implemented.	xxxx
[59:56]	TLB	Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are: **0b0010** Outer shareable and TLB range maintenance instructions are implemented.	xxxx
[55:52]	TS	Indicates support for flag manipulation instructions. Defined values are: **0b0010** CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.	xxxx

Bits	Name	Description	Reset
[51:48]	FHM	Indicates support for FMLAL and FMLSL instructions. Defined values are: **0b0001** FMLAL and FMLSL instructions are implemented.	xxxx
[47:44]	DP	Indicates support for Dot Product instructions in AArch64 state. Defined values are: **0b0001** UDOT and SDOT instructions implemented.	xxxx
[43:40]	SM4	Indicates support for SM4 instructions in AArch64 state. Defined values are: **0b0000** No SM4 instructions implemented. This value is reported when Cryptographic extensions are not implemented or are disabled. **0b0001** SM4E and SM4EKEY instructions implemented. This value is reported when Cryptographic extensions are implemented and enabled.	xxxx
[39:36]	SM3	Indicates support for SM3 instructions in AArch64 state. Defined values are: **0b0000** No SM3 instructions implemented. This value is reported when Cryptographic extensions are not implemented or are disabled. **0b0001** SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented. This value is reported when Cryptographic extensions are implemented and enabled.	xxxx
[35:32]	SHA3	Indicates support for SHA3 instructions in AArch64 state. Defined values are: **0b0000** No SHA3 instructions implemented. This value is reported when Cryptographic extensions are not implemented or are disabled. **0b0001** EOR3, RAX1, XAR, and BCAX instructions implemented. This value is reported when Cryptographic extensions are implemented and enabled.	xxxx
[31:28]	RDM	Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are: **0b0001** SQRDMLAH and SQRDMLSH instructions implemented.	xxxx
[27:24]	TME	Indicates support for TME instructions. Defined values are: **0b0000** TME instructions are not implemented.	xxxx
[23:20]	Atomic	Indicates support for Atomic instructions in AArch64 state. Defined values are: **0b0010** LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.	xxxx
[19:16]	CRC32	Indicates support for CRC32 instructions in AArch64 state. Defined values are: **0b0001** CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.	xxxx

Bits	Name	Description	Reset
[15:12]	SHA2	Indicates support for SHA2 instructions in AArch64 state. Defined values are: **0b0000** No SHA2 instructions implemented. This value is reported when Cryptographic extensions are not implemented or are disabled. **0b0010** SHA256H, SHA256H2, SHA256SU0, SHA256SU1, SHA512H, SHA512H2, SHA512SU0, and SHA512SU1 instructions implemented. This value is reported when Cryptographic extensions are implemented and enabled. When the CRYPTO configuration parameter is true and the CRYPTODISABLE input is low at reset Cryptographic Extensions are implemented	xxxx
[11:8]	SHA1	Indicates support for SHA1 instructions in AArch64 state. Defined values are: **0b0000** No SHA1 instructions implemented. This value is reported when Cryptographic extensions are not implemented or are disabled. **0b0001** SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented. This value is reported when Cryptographic extensions are implemented and enabled. When the CRYPTO configuration parameter is true and the CRYPTODISABLE input is low at reset Cryptographic Extensions are implemented	xxxx
[7:4]	AES	Indicates support for AES instructions in AArch64 state. Defined values are: **0b0000** No AES instructions implemented. This value is reported when Cryptographic extensions are not implemented or are disabled. **0b0010** AESE, AESD, AESMC, and AESIMC instructions are implemented plus PMULL/PMULL2 instructions operating on 64-bit data quantities. This value is reported when Cryptographic extensions are implemented and enabled. When the CRYPTO configuration parameter is true and the CRYPTODISABLE input is low at reset Cryptographic Extensions are implemented	xxxx

[63:60]	LS64	Indicates support for LD64B and ST64B* instructions, and the AArch64-ACCDATA_EL1 register. Defined values of this field are: **0b0000** The LD64B and ST64B* instructions, the AArch64-ACCDATA_EL1 register, and associated traps are not supported.	xxxx
[59:56]	XS	Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the AArch64-HCRX_EL2.{FGTnXS, FnXS} fields in AArch64 state. Defined values are: **0b0001** The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the AArch64-HCRX_EL2.{FGTnXS, FnXS} fields are supported.	xxxx
[55:52]	I8MM	Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values are: **0b0001** SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.	xxxx
[51:48]	DGH	Indicates support for the Data Gathering Hint instruction. Defined values are: **0b0001** Data Gathering Hint is implemented.	xxxx
[47:44]	BF16	Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are: **0b0001** BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.	xxxx
[43:40]	SPECRES	Indicates support for prediction invalidation instructions in AArch64 state. Defined values are: **0b0001** CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.	xxxx
[39:36]	SB	Indicates support for SB instruction in AArch64 state. Defined values are: **0b0001** SB instruction is implemented.	xxxx
[35:32]	FRINTTS	Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are: **0b0001** FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.	xxxx
[31:28]	GPI	Indicates support for an **IMPLEMENTATION DEFINED** algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are: **0b0000** Generic Authentication using an **IMPLEMENTATION DEFINED** algorithm is not implemented.	xxxx
[27:24]	GPA	Indicates whether the QARMA5 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are: **0b0000** Generic Authentication using the QARMA5 algorithm is not implemented.	xxxx
[23:20]	LRCPC	Indicates support for weaker release consistency, RCpc, based model. Defined values are: **0b0010** The LDAPUR*, STLUR*, and LDAPR* instructions are implemented.	xxxx

Bits	Name	Description	Reset
[19:16]	FCMA	Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are: **0b0001** The FCMLA and FCADD instructions are implemented.	xxxx
[15:12]	JSCVT	Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are: **0b0001** The FJCVTZS instruction is implemented.	xxxx
[11:8]	API	Indicates whether an **IMPLEMENTATION DEFINED** algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the `PACGA` instruction. Defined values are: **0b0000** Address Authentication using an **IMPLEMENTATION DEFINED** algorithm is not implemented.	xxxx
[7:4]	APA	Indicates whether the QARMA5 algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the `PACGA` instruction. Defined values are: **0b0000** Address Authentication using the QARMA5 algorithm is not implemented.	xxxx
[3:0]	DPB	Data Persistence writeback. Indicates support for the DC CVAP and DC CVADP instructions in AArch64 state. Defined values are: **0b0010** DC CVAP and DC CVADP supported	xxxx

Bits	Name	Description	Reset
[27:24]	PAC_frac	Indicates whether the ConstPACField() function used as part of the PAC addition returns FALSE or TRUE. **0b0001** ConstPACField() returns TRUE.	xxxx
[23:16]	**RES0**	Reserved	**RES0**
[15:12]	APA3	Indicates whether the QARMA3 algorithm is implemented in the PE for address authentication in AArch64 state. This applies to all Pointer Authentication instructions other than the `PACGA` instruction. Defined values are: **0b0101** Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.	xxxx
[11:8]	GPA3	Indicates whether the QARMA3 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are: **0b0001** Generic Authentication using the QARMA3 algorithm is implemented. This includes the `PACGA` instruction.	xxxx
[7:4]	RPRES	When AArch64-FPCR.AH is 1, indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state. Defined values are: **0b0000** Reciprocal and reciprocal square root estimates give 8 bits of mantissa.	xxxx
[3:0]	WFxT	Indicates support for the `WFET` and `WFIT` instructions in AArch64 state. Defined values are: **0b0010** `WFET` and `WFIT` are supported, and the register number is reported in the ESR_ELx on exceptions.	xxxx

Table A-208: ID_AA64MMFR0_EL1 bit descriptions

Bits	Name	Description	Reset
[63:60]	ECV	Indicates presence of Enhanced Counter Virtualization. Defined values are: **0b0010** Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2.{EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS, ECV}, CNTKCTL_EL1.EVNTIS, CNTPCTSS_EL0 counter views, and CNTVCTSS_EL0 counter views. Extends the PMSCR_EL1.PCT, PMSCR_EL2.PCT, TRFCR_EL1.TS, and TRFCR_EL2.TS fields. Includes support for CNTPOFF_EL2.	xxxx

Bits	Name	Description	Reset
[59:56]	FGT	Indicates presence of the Fine-Grained Trap controls: • If EL2 is implemented, the AArch64-HAFGRTR_EL2, AArch64-HDFGRTR_EL2, AArch64-HDFGWTR_EL2, AArch64-HFGRTR_EL2, AArch64-HFGITR_EL2 and AArch64-HFGWTR_EL2 registers, and their associated traps. • If EL2 is implemented, AArch64-MDCR_EL2.TDCC. • If EL3 is implemented, AArch64-MDCR_EL3.TDCC. • If both EL2 and EL3 are implemented, AArch64-SCR_EL3.FGTEn. Defined values are: **0b0001** The fine-grained trap controls are implemented.	xxxx
[55:48]	**RES0**	Reserved	**RES0**
[47:44]	ExS	Indicates support for disabling context synchronizing exception entry and exit. Defined values are: **0b0000** All exception entries and exits are context synchronization events.	xxxx
[43:40]	TGran4_2	Indicates support for 4KB memory granule size at stage 2. Defined values are: **0b0010** 4KB granule supported at stage 2.	xxxx
[39:36]	TGran64_2	Indicates support for 64KB memory granule size at stage 2. Defined values are: **0b0010** 64KB granule supported at stage 2.	xxxx
[35:32]	TGran16_2	Indicates support for 16KB memory granule size at stage 2. Defined values are: **0b0010** 16KB granule supported at stage 2.	xxxx
[31:28]	TGran4	Indicates support for 4KB memory translation granule size. Defined values are: **0b0000** 4KB granule supported.	xxxx
[27:24]	TGran64	Indicates support for 64KB memory translation granule size. Defined values are: **0b0000** 64KB granule supported.	xxxx
[23:20]	TGran16	Indicates support for 16KB memory translation granule size. Defined values are: **0b0001** 16KB granule supported.	xxxx
[19:16]	**RES0**	Reserved	**RES0**
[15:12]	SNSMem	Indicates support for a distinction between Secure and Non-secure Memory. Defined values are: **0b0001** Does support a distinction between Secure and Non-secure Memory.	xxxx
[11:8]	BigEnd	Indicates support for mixed-endian configuration. Defined values are: **0b0001** Mixed-endian support. The SCTLR_ELx.EE and AArch64-SCTLR_EL1.E0E bits can be configured.	xxxx
[7:4]	ASIDBits	Number of ASID bits. Defined values are: **0b0010** 16 bits.	xxxx

Bits	Name	Description	Reset
[3:0]	PARange	Physical Address range supported. Defined values are: **0b0010** 40 bits, 1TB.	xxxx

Bit descriptions

Figure A-88: AArch64_id_aa64mmfr1_el1 bit assignments

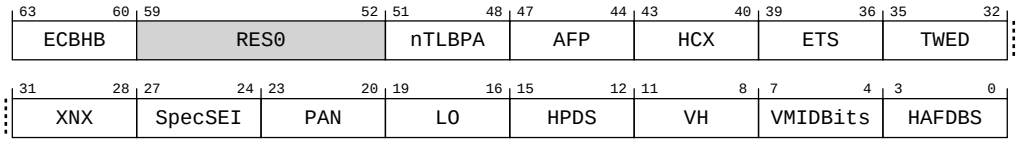

Table A-210: ID_AA64MMFR1_EL1 bit descriptions

Bits	Name	Description	Reset
[63:60]	ECBHB	Indicates support for mitigation of exploitative control using branch history information between exception levels. Defined values are: **0b0001** The branch history information created in a context before an exception to a higher exception level using AArch64 cannot be used by code before that exception to exploitatively control the execution of any code in a different context after the exception.	xxxx
[59:52]	**RES0**	Reserved	**RES0**
[51:48]	nTLBPA	Indicates support for intermediate caching of translation table walks. Defined values are: **0b0001** The intermediate caching of translation table walks does not include non-coherent caches of previous valid translation table entries since the last completed TLBI applicable to the PE where either: • The caching is indexed by the physical address of the location holding the translation table entry. • The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.	xxxx
[47:44]	AFP	Indicates support for AArch64-FPCR.{AH, FIZ, NEP}. Defined values are: **0b0001** The AArch64-FPCR.{AH, FIZ, NEP} fields are supported.	xxxx
[43:40]	HCX	Indicates support for AArch64-HCRX_EL2 and its associated EL3 trap. Defined values are: **0b0001** AArch64-HCRX_EL2 and its associated EL3 trap are supported.	xxxx
[39:36]	ETS	Indicates support for Enhanced Translation Synchronization. Defined values are: **0b0001** Enhanced Translation Synchronization is supported.	xxxx

Bits	Name	Description	Reset
[35:32]	TWED	Indicates support for the configurable delayed trapping of WFE. Defined values are: **0b0000** Configurable delayed trapping of WFE is not supported.	xxxx
[31:28]	XNX	Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are: **0b0001** Distinction between EL0 and EL1 execute-never control at stage 2 supported.	xxxx
[27:24]	SpecSEI	Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are: **0b0001** The PE might generate an SError interrupt due to an External abort on a speculative read.	xxxx
[23:20]	PAN	Privileged Access Never. Indicates support for the PAN bit in PSTATE, AArch64-SPSR_EL1, AArch64-SPSR_EL2, AArch64-SPSR_EL3, and AArch64-DSPSR_EL0. Defined values are: **0b0011** PAN supported, AT S1E1RP and AT S1E1WP instructions supported, and AArch64-SCTLR_EL1.EPAN and AArch64-SCTLR_EL2.EPAN bits supported.	xxxx
[19:16]	LO	LORegions. Indicates support for LORegions. Defined values are: **0b0001** LORegions supported.	xxxx
[15:12]	HPDS	Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are: **0b0010** Disabling of hierarchical controls supported with the TCR_EL1.{HPD1, HPD0}, TCR_EL2.HPD or TCR_EL2.{HPD1, HPD0}, and TCR_EL3.HPD bits and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for **IMPLEMENTATION DEFINED** use.	xxxx
[11:8]	VH	Virtualization Host Extensions. Defined values are: **0b0001** Virtualization Host Extensions supported.	xxxx
[7:4]	VMIDBits	Number of VMID bits. Defined values are: **0b0010** 16 bits	xxxx
[3:0]	HAFDBS	Hardware updates to Access flag and Dirty state in translation tables. Defined values are: **0b0010** Hardware update of both the Access flag and dirty state is supported.	xxxx

Table A-212: ID_AA64MMFR2_EL1 bit descriptions

Bits	Name	Description	Reset
[63:60]	E0PD	Indicates support for the E0PD mechanism. Defined values are: **0b0001** E0PDx mechanism is implemented.	xxxx
[59:56]	EVT	Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the AArch64-HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps. Defined values are: **0b0010** AArch64-HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.	xxxx
[55:52]	BBM	Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation. **0b0010** Level 2 support for changing block size is supported.	xxxx
[51:48]	TTL	Indicates support for TTL field in address operations. Defined values are: **0b0001** TLB maintenance instructions by address have bits[47:44] holding the TTL field.	xxxx
[47:44]	**RES0**	Reserved	**RES0**
[43:40]	FWB	Indicates support for AArch64-HCR_EL2.FWB. Defined values are: **0b0001** AArch64-HCR_EL2.FWB is supported.	xxxx
[39:36]	IDS	Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are: **0b0001** All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.	xxxx
[35:32]	AT	Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are: **0b0001** Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.	xxxx
[31:28]	ST	Identifies support for small translation tables. Defined values are: **0b0001** The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.	xxxx

Bits	Name	Description	Reset
[27:24]	NV	Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are: **0b0000** Nested virtualization is not supported.	xxxx
[23:20]	CCIDX	Support for the use of revised AArch64-CCSIDR_EL1 register format. Defined values are: **0b0001** 64-bit format implemented for all levels of the CCSIDR_EL1.	xxxx
[19:16]	VARange	Indicates support for a larger virtual address. Defined values are: **0b0000** VMSAv8-64 supports 48-bit VAs.	xxxx
[15:12]	IESB	Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are: **0b0001** IESB bit in the SCTLR_ELx registers is supported.	xxxx
[11:8]	LSM	Indicates support for LSMAOE and nTLSMD bits in AArch64-SCTLR_EL1 and AArch64-SCTLR_EL2. Defined values are: **0b0000** LSMAOE and nTLSMD bits not supported.	xxxx
[7:4]	UAO	User Access Override. Defined values are: **0b0001** UAO supported.	xxxx
[3:0]	CnP	Indicates support for Common not Private translations. Defined values are: **0b0001** Common not Private translations supported.	xxxx

MPAMIDR_EL1 indicates the MPAM implementation parameters of the PE.

Figure A-90: AArch64_mpamidr_el1 bit assignments

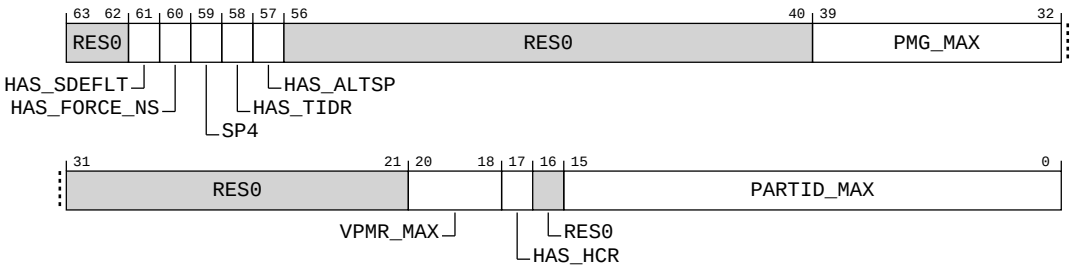

Table A-214: MPAMIDR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:62]	RES0	Reserved	RES0

Bits	Name	Description	Reset
[61]	HAS_SDEFLT	HAS_SDEFLT indicates support for AArch64-MPAM3_EL3.SDEFLT bit. Defined values are: **0b1** The SDEFLT bit is implemented in AArch64-MPAM3_EL3.	x
[60]	HAS_FORCE_NS	HAS_FORCE_NS indicates support for AArch64-MPAM3_EL3.FORCE_NS bit. Defined values are: **0b0** The FORCE_NS bit is not implemented in AArch64-MPAM3_EL3.	x
[59]	SP4	Supports 4 MPAM PARTID spaces. **0b0** MPAM supports 2 PARTID spaces.	x
[58]	HAS_TIDR	HAS_TIDR indicates support for AArch64-MPAM2_EL2.TIDR bit. Defined values are: **0b1** The TIDR bit is implemented in AArch64-MPAM2_EL2.	x
[57]	HAS_ALTSP	HAS_ALTSP indicates support for alternative PARTID spaces. **0b0** Alternative PARTID spaces are not implemented.	x
[56:40]	**RES0**	Reserved	**RES0**
[39:32]	PMG_MAX	The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX. **0b00000001** Max PMG field is 1	8{x}
[31:21]	**RES0**	Reserved	**RES0**
[20:18]	VPMR_MAX	Indicates the maximum register index n for the MPAMVPM<n>_EL2 registers. **0b001** 2 MPAMVPMn_EL2 registers are implemented	xxx
[17]	HAS_HCR	HAS_HCR indicates that the PE implementation supports MPAM virtualization, including AArch64-MPAMHCR_EL2, AArch64-MPAMVPMV_EL2, and MPAMVPM<n>_EL2 with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either Security state. **0b1** MPAM virtualization is supported.	x
[16]	**RES0**	Reserved	**RES0**
[15:0]	PARTID_MAX	The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX. **0b0000000000111111** Max PARTID field is 63	16{x}

Table A-216: IMP_CPUCFR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:20]	**RES0**	Reserved	**RES0**
[19]	L2PRESENT	Indicates whether an L2 cache is present in the complex containing this core. **0b0** An L2 cache is not present in the complex. **0b1** An L2 cache is present in the complex.	x
[18:17]	**RES0**	Reserved	**RES0**
[16]	CORES	The number of cores in the complex containing this core. **0b0** One core. **0b1** Two cores.	x
[15:14]	**RES0**	Reserved	**RES0**
[13]	L2EVA	Indicates whether the L2 cache optimized evict/allocate accesses are implemented. Possible values of this field are: **0b0** Not implemented. **0b1** Implemented.	x
[12:11]	**RES0**	Reserved	**RES0**
[10]	L2PARTS	Indicates the configured number of L2 cache partitions. Possible values of this field are: **0b0** One partition. **0b1** Two partitions.	x
[9:8]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[7]	L2SLICES	Indicates the configured number of L2 cache slices. Possible values of this field are: **0b0** One slice. **0b1** Two slices.	x
[6:5]	**RES0**	Reserved	**RES0**
[4]	VPU	Describes the configured VPU datapath width. Possible values of this field are: **0b0** Two 64-bit datapaths are configured. **0b1** Two 128-bit datapaths are configured.	x
[3]	**RES1**	Reserved	**RES1**
[2]	SCU	Indicates whether the SCU is present or not. Possible values of this bit are: **0b0** The SCU is present.	x
[1:0]	ECC	Indicates whether ECC is present or not. Possible values of this field are: **0b00** ECC is not present. **0b01** ECC is present.	xx

Reset value

XXXX XXXX XXXX XXXX XXXX XXXX XXXX XXXX XXXX XXXX XXXX XXXX XXXX XXXX XXXX XXXX

Note

Where the reset reads xxxx, see individual bits

Bit descriptions

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Figure A-92: AArch64_ccsidr_el1 bit assignments

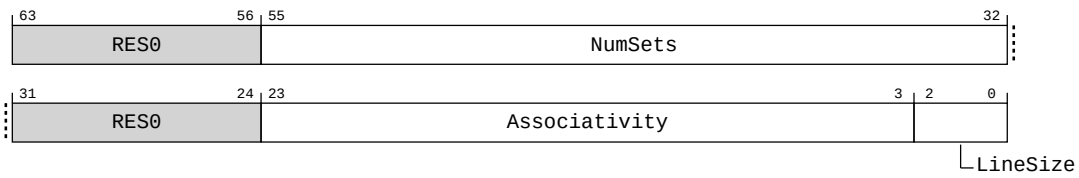

Table A-218: CCSIDR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:56]	RES0	Reserved	RES0

Bits	Name	Description	Reset
[55:32]	NumSets	(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.	24{x}
[31:24]	**RES0**	Reserved	**RES0**
[23:3]	Associativity	(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.	21{x}
[2:0]	LineSize	(Log_2(Number of bytes in cache line)) - 4. For example: • For a line length of 16 bytes: $Log_2(16) = 4$, LineSize entry = 0. This is the minimum line length. • For a line length of 32 bytes: $Log_2(32) = 5$, LineSize entry = 1. When FEAT_MTE2 is implemented and enabled, where a cache only holds Allocation tags, this field is **RES0**.	xxx

Access

If AArch64-CSSELR_EL1.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR_EL1 the behavior is **CONSTRAINED UNPREDICTABLE**, and can be one of the following:

- The CCSIDR_EL1 read is treated as NOP.
- The CCSIDR_EL1 read is UNDEFINED.
- The CCSIDR_EL1 read returns an **UNKNOWN** value.

MRS <Xt>, CCSIDR_EL1

A.5.42 CLIDR_EL1, Cache Level ID Register

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

Configurations

This register is available in all configurations.

Bits	Name	Description	Reset
[63:47]	**RES0**	Reserved	**RES0**
[46:45]	Ttype7	Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. **0b00** No Tag Cache.	xx
[44:43]	Ttype6	Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. **0b00** No Tag Cache.	xx
[42:41]	Ttype5	Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. **0b00** No Tag Cache.	xx
[40:39]	Ttype4	Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. **0b00** No Tag Cache.	xx
[38:37]	Ttype3	Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. **0b00** No Tag Cache. This value is reported if the BROADCASTMTE pin is low or either the Cortex-A520 complex is configured without an L2 cache or the DSU is configured without an L3 cache. **0b10** Unified Allocation Tag and Data cache, Allocation Tags and Data in unified lines. This value is reported if the BROADCASTMTE pin is high and both the Cortex-A520 complex is configured with an L2 cache and the DSU is configured with an L3 cache.	xx
[36:35]	Ttype2	Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. **0b00** No Tag Cache. This value is reported if the BROADCASTMTE pin is low or both the Cortex-A520 complex is configured without an L2 cache and the DSU is configured without an L3 cache. **0b10** Unified Allocation Tag and Data cache, Allocation Tags and Data in unified lines. This value is reported if the BROADCASTMTE pin is high and either the Cortex-A520 complex is configured with an L2 cache or the DSU is configured with an L3 cache.	xx

Bits	Name	Description	Reset
[34:33]	Ttype1	Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. **0b00** No Tag Cache. This value is reported if the BROADCASTMTE pin is low. **0b10** Unified Allocation Tag and Data cache, Allocation Tags and Data in unified lines. This value is reported if the BROADCASTMTE pin is high.	xx
[32:30]	ICB	Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions. **0b001** L1 cache is the highest Inner Cacheable level. This value is reported if both the Cortex-A520 complex is configured without an L2 cache and the DSU is configured without an L3 cache. **0b010** L2 cache is the highest Inner Cacheable level. This value is reported if either but not both of the Cortex-A520 complex is configured with an L2 cache or the DSU is configured with an L3 cache. **0b011** L3 cache is the highest Inner Cacheable level. This value is reported if both the Cortex-A520 complex is configured with an L2 cache and the DSU is configured with an L3 cache.	xxx
[29:27]	LoUU	Level of Unification Uniprocessor for the cache hierarchy. **Note:** When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches. **0b000** Level of Unification Uniprocessor is before the L1 D-cache.	xxx
[26:24]	LoC	Level of Coherence for the cache hierarchy. **0b001** Level of Coherency is after the L1 D-cache. This value is reported if both the Cortex-A520 complex is configured without an L2 cache and the DSU is configured without an L3 cache. **0b010** Level of Coherency is after the L2 cache. This value is reported if either but not both of the Cortex-A520 complex is configured with an L2 cache or the DSU is configured with an L3 cache. **0b011** Level of Coherency is after the L3 cache. This value is reported if both the Cortex-A520 complex is configured with an L2 cache and the DSU is configured with an L3 cache.	xxx
[23:21]	LoUIS	Level of Unification Inner Shareable for the cache hierarchy. **Note:** When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches. **0b000** Level of Unification Inner Shareable is before the L1 D-cache.	xxx

Bits	Name	Description	Reset
[20:18]	Ctype7	Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are: **0b000** No cache.	xxx
[17:15]	Ctype6	Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are: **0b000** No cache.	xxx
[14:12]	Ctype5	Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are: **0b000** No cache.	xxx
[11:9]	Ctype4	Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are: **0b000** No cache.	xxx
[8:6]	Ctype3	Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are: **0b000** No cache. This value is reported if either the Cortex-A520 complex is configured without an L2 cache or the DSU is configured without an L3 cache. **0b100** Unified cache. This value is reported if both the Cortex-A520 complex is configured with an L2 cache and the DSU is configured with an L3 cache.	xxx
[5:3]	Ctype2	Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are: **0b000** No cache. This value is reported if both the Cortex-A520 complex is configured without an L2 cache and the DSU is configured without an L3 cache. **0b100** Unified cache. This value is reported if either the Cortex-A520 complex is configured with an L2 cache or the DSU is configured with an L3 cache.	xxx
[2:0]	Ctype1	Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are: **0b011** Separate instruction and data caches.	xxx

A.5.46 DCZID_EL0, Data Cache Zero ID register

Indicates the block size that is written with byte values of 0 by the DC ZVA (Data Cache Zero by Address) System instruction.

If FEAT_MTE is implemented, this register also indicates the granularity at which the DC GVA and DC GZVA instructions write.

Configurations

This register is available in all configurations.

A.6 AArch64 GIC system registers summary

The summary table provides an overview of all GIC system registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Reset value

xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx

Note

Where the reset reads xxxx, see individual bits

Bit descriptions

Figure A-99: AArch64_icc_ap0r0_el1 bit assignments

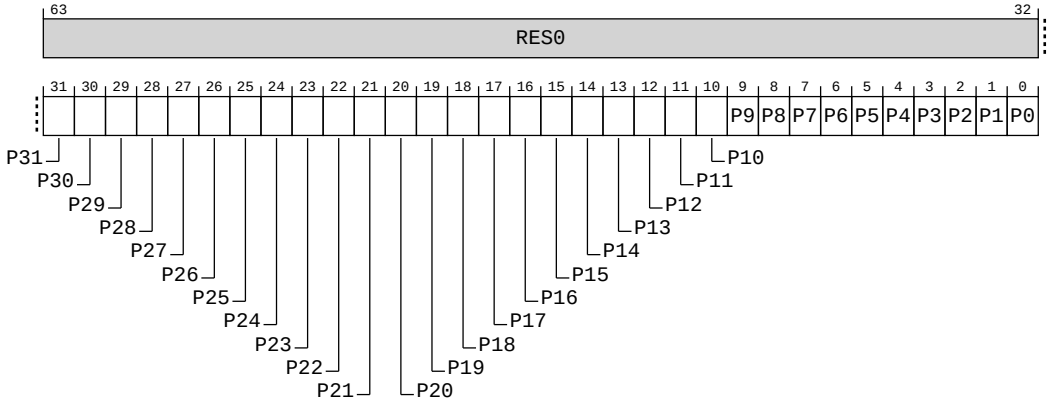

Table A-235: ICC_AP0R0_EL1 bit descriptions

Bits	Name	Description	Reset
[63:32]	**RES0**	Reserved	**RES0**
[31:0]	P<x>	Provides the access to the active priorities for Group 0 interrupts. Possible values of each bit are: **0b0** There is no Group 0 interrupt active with this priority level, or all active Group 0 interrupts with this priority level have undergone priority-drop. **0b1** There is a Group 0 interrupt active with this priority level which has not undergone priority drop. There are 32 preemption levels, and the active state of these preemption levels are held in the bits corresponding to Priority[7:3].	32{x}

The contents of these registers are **IMPLEMENTATION DEFINED** with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Access

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 0 active priorities) might result in **UNPREDICTABLE** behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICC_AP0R2_EL1 and ICC_AP0R3_EL1 are only implemented in implementations that support 7 or more bits of priority. Unimplemented registers are **UNDEFINED**.

Note

The number of bits of preemption is indicated by AArch64-ICH_VTR_EL2.PREbits.

Writing to the active priority registers in any order other than the following order will result in **UNPREDICTABLE** behavior:

- ICC_AP0R<n>_EL1.
- Secure AArch64-ICC_AP1R<n>_EL1.
- Non-secure AArch64-ICC_AP1R<n>_EL1.

Bit descriptions

Figure A-101: AArch64_icc_ap1r0_el1 bit assignments

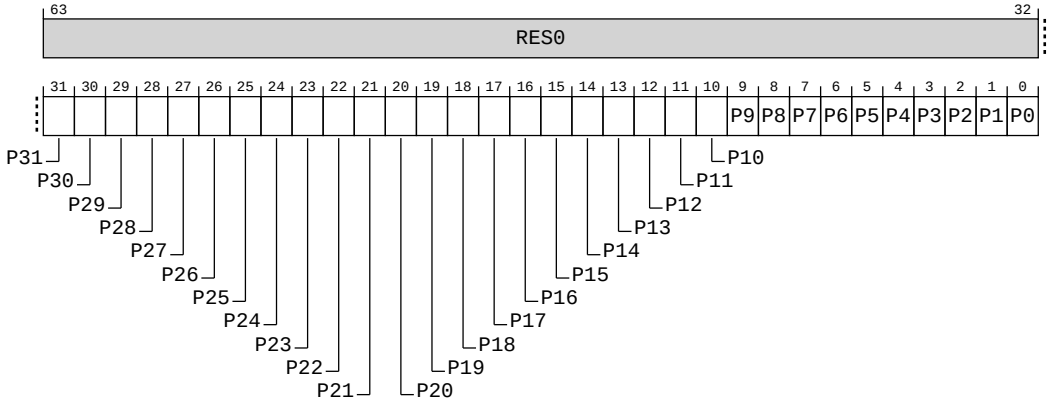

Table A-241: ICC_AP1R0_EL1 bit descriptions

Bits	Name	Description	Reset
[63:32]	RES0	Reserved	RES0
[31:0]	P<x>	Group 1 interrupt active priorities. When AArch64-SCR_EL3.NS == '1', accesses the priorities for Non-secure Group 1 interrupts, and when AArch64-SCR_EL3.NS == '0' accesses the priorities for Secure Group 1 interrupts. Possible values of each bit are: **0b0** There is no Group 1 interrupt active with this priority level, or all active Group 1 interrupts with this priority level have undergone priority-drop. **0b1** There is a Group 1 interrupt active with this priority level which has not undergone priority drop. There are 32 preemption levels, and the active state of these preemption levels are held in the bits corresponding to Priority[7:3]. When accessed from non-secure EL2 or EL1, only the 16 lowest-priority interrupts are visible in bits [15:0] of this register.	32{x}

The contents of these registers are **IMPLEMENTATION DEFINED** with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Access

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 1 active priorities) might result in **UNPREDICTABLE** behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP1R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICC_AP1R2_EL1 and ICC_AP1R3_EL1 are only implemented in implementations that support 7 or more bits of priority. Unimplemented registers are **UNDEFINED**.

Note

The number of bits of preemption is indicated by AArch64-ICH_VTR_EL2.PREbits.

Writing to the active priority registers in any order other than the following order will result in **UNPREDICTABLE** behavior:

- AArch64-ICC_AP0R<n>_EL1.
- Secure ICC_AP1R<n>_EL1.
- Non-secure ICC_AP1R<n>_EL1.

MRS <Xt>, ICC_AP1R0_EL1

Bit descriptions

Figure A-103: AArch64_icc_ctlr_el1 bit assignments

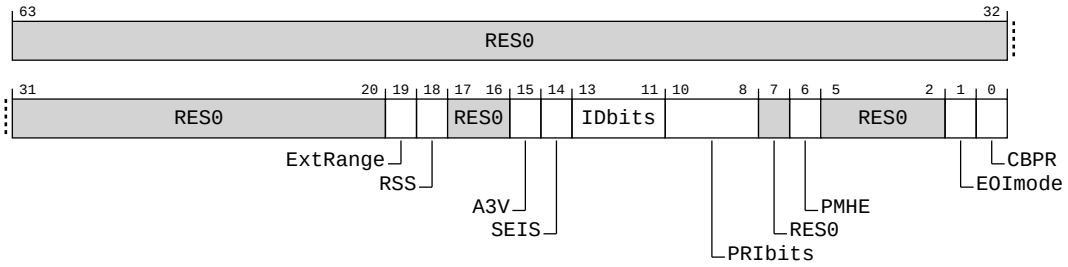

Table A-247: ICC_CTLR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:20]	**RES0**	Reserved	**RES0**
[19]	ExtRange	Extended INTID range (read-only). **0b1** CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.	x

Bits	Name	Description	Reset
[18]	RSS	Range Selector Support. Possible values are: **0b0** Targeted SGIs with affinity level 0 values of 0 - 15 are supported.	x
[17:16]	**RES0**	Reserved	**RES0**
[15]	A3V	Affinity 3 Valid. Read-only and writes are ignored. Possible values are: **0b1** The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.	x
[14]	SEIS	SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs: **0b0** The CPU interface logic does not support local generation of SEIs.	x
[13:11]	IDbits	Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported: **0b000** 16 bits.	xxx
[10:8]	PRIbits	Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one. An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits). An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits). **Note:** This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of ext-GICD_CTLR.DS. For physical accesses, this field determines the minimum value of AArch64-ICC_BPR0_EL1. If EL3 is implemented, physical accesses return the value from AArch64-ICC_CTLR_EL3.PRIbits. **0b100** 5 bits of priority are implemented	xxx
[7]	**RES0**	Reserved	**RES0**
[6]	PMHE	Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution: **0b0** Disables use of AArch64-ICC_PMR_EL1 as a hint for interrupt distribution. **0b1** Enables use of AArch64-ICC_PMR_EL1 as a hint for interrupt distribution. If EL3 is implemented, this bit is an alias of AArch64-ICC_CTLR_EL3.PMHE. Whether this bit can be written as part of an access to this register depends on the value of ext-GICD_CTLR.DS: • If ext-GICD_CTLR.DS == 0, this bit is read-only. • If ext-GICD_CTLR.DS == 1, this bit is read/write.	x
[5:2]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[1]	EOImode	EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt: **0b0** AArch64-ICC_EOIR0_EL1 and AArch64-ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to AArch64-ICC_DIR_EL1 are **UNPREDICTABLE**. **0b1** AArch64-ICC_EOIR0_EL1 and AArch64-ICC_EOIR1_EL1 provide priority drop functionality only. AArch64-ICC_DIR_EL1 provides interrupt deactivation functionality. The Secure AArch64-ICC_CTLR_EL1.EOImode is an alias of AArch64-ICC_CTLR_EL3.EOImode_EL1S. The Non-secure AArch64-ICC_CTLR_EL1.EOImode is an alias of AArch64-ICC_CTLR_EL3.EOImode_EL1NS	x
[0]	CBPR	Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts: **0b0** AArch64-ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. AArch64-ICC_BPR1_EL1 determines the preemption group for Group 1 interrupts. **0b1** AArch64-ICC_BPR0_EL1 determines the preemption group for both Group 0 and Group 1 interrupts. If EL3 is implemented: • This bit is an alias of AArch64-ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state. • If ext-GICD_CTLR.DS == 0, this bit is read-only. • If ext-GICD_CTLR.DS == 1, this bit is read/write.	x

Bit descriptions

Figure A-104: AArch64_icv_ctlr_el1 bit assignments

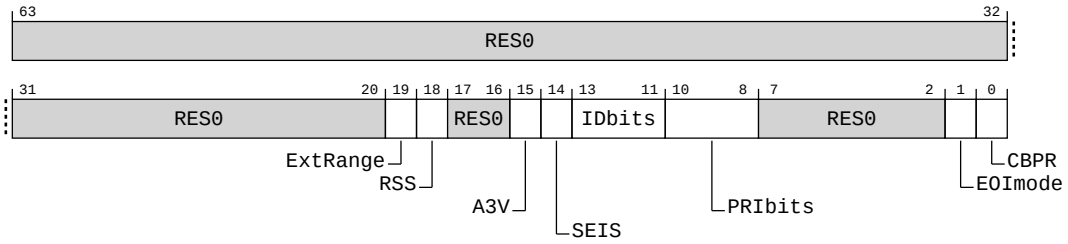

Table A-250: ICV_CTLR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:20]	RES0	Reserved	RES0

Bits	Name	Description	Reset
[19]	ExtRange	Extended INTID range (read-only). **0b1** CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.	x
[18]	RSS	Range Selector Support. Possible values are: **0b0** Targeted SGIs with affinity level 0 values of 0 - 15 are supported.	x
[17:16]	**RES0**	Reserved	**RES0**
[15]	A3V	Affinity 3 Valid. Read-only and writes are ignored. Possible values are: **0b1** The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.	x
[14]	SEIS	SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs: **0b0** The virtual CPU interface logic does not support local generation of SEIs.	x
[13:11]	IDbits	Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported: **0b000** 16 bits.	xxx
[10:8]	PRIbits	Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one. An implementation must implement at least 32 levels of physical priority (5 priority bits). **Note:** This field always returns the number of priority bits implemented. The division between group priority and subpriority is defined in the binary point registers AArch64-ICV_BPR0_EL1 and AArch64-ICV_BPR1_EL1. **0b100** 5 bits of priority are implemented	xxx
[7:2]	**RES0**	Reserved	**RES0**
[1]	EOImode	Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt: **0b0** AArch64-ICV_EOIR0_EL1 and AArch64-ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to AArch64-ICV_DIR_EL1 are **UNPREDICTABLE**. **0b1** AArch64-ICV_EOIR0_EL1 and AArch64-ICV_EOIR1_EL1 provide priority drop functionality only. AArch64-ICV_DIR_EL1 provides interrupt deactivation functionality.	x

Bits	Name	Description	Reset
[0]	CBPR	Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts: **0b0** AArch64-ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts. **0b1** Non-secure reads of AArch64-ICV_BPR1_EL1 return AArch64-ICV_BPR0_EL1 plus one, saturated to 0b111. Non-secure writes to AArch64-ICV_BPR1_EL1 are ignored. Secure reads of AArch64-ICV_BPR1_EL1 return AArch64-ICV_BPR0_EL1. Secure writes of AArch64-ICV_BPR1_EL1 modify AArch64-ICV_BPR0_EL1.	x

A.6.7 ICH_VTR_EL2, Interrupt Controller VGIC Type Register

Reports supported GIC virtualization features.

Configurations

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Bit descriptions

Figure A-105: AArch64_ich_vtr_el2 bit assignments

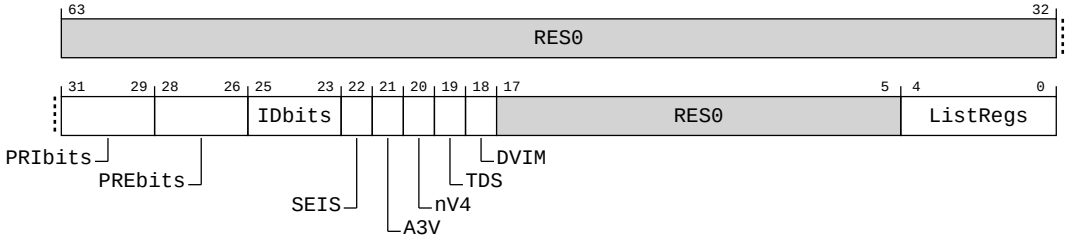

Table A-253: ICH_VTR_EL2 bit descriptions

Bits	Name	Description	Reset
[63:32]	**RES0**	Reserved	**RES0**
[31:29]	PRIbits	Priority bits. The number of virtual priority bits implemented, minus one. An implementation must implement at least 32 levels of virtual priority (5 priority bits). This field is an alias of AArch64-ICV_CTLR_EL1.PRIbits. **0b100** 5 virtual priority bits are implemented	xxx

Bits	Name	Description	Reset
[28:26]	PREbits	The number of virtual preemption bits implemented, minus one. An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits). The value of this field must be less than or equal to the value of ICH_VTR_EL2.PRIbits. The maximum value of this field is 6, indicating 7 bits of preemption. This field determines the minimum value of AArch64-ICH_VMCR_EL2.VBPR0. **0b100** 5 virtual pre-emption bits are implemented	xxx
[25:23]	IDbits	The number of virtual interrupt identifier bits supported: **0b000** 16 bits.	xxx
[22]	SEIS	SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs: **0b0** The virtual CPU interface logic does not support generation of SEIs.	x
[21]	A3V	Affinity 3 Valid. Possible values are: **0b1** The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.	x
[20]	nV4	Direct injection of virtual interrupts not supported. Possible values are: **0b0** The CPU interface logic supports direct injection of virtual interrupts.	x
[19]	TDS	Separate trapping of EL1 writes to AArch64-ICV_DIR_EL1 supported. **0b1** Implementation supports AArch64-ICH_HCR_EL2.TDIR.	x
[18]	DVIM	Masking of directly-injected virtual interrupts. **0b0** Masking of Directly-injected Virtual Interrupts not supported.	x
[17:5]	**RES0**	Reserved	**RES0**
[4:0]	ListRegs	The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented. **0b00011** Four list registers are implemented.	5{x}

Bit descriptions

Figure A-106: AArch64_icc_ctlr_el3 bit assignments

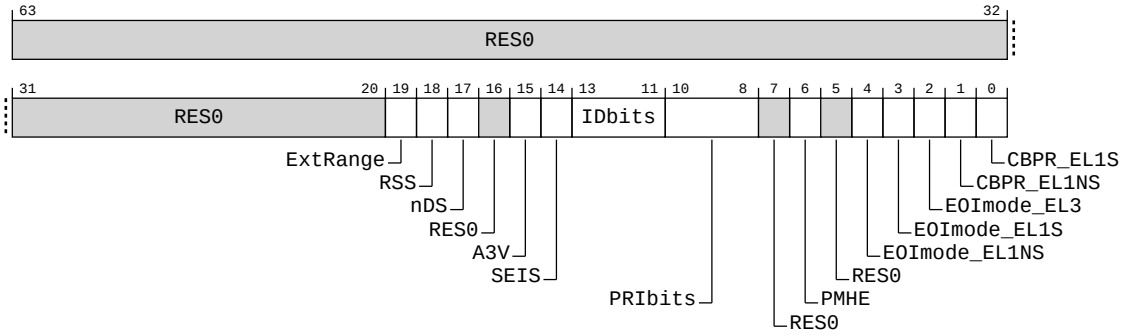

Table A-255: ICC_CTLR_EL3 bit descriptions

Bits	Name	Description	Reset
[63:20]	**RES0**	Reserved	**RES0**
[19]	ExtRange	Extended INTID range (read-only). **0b1** CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.	x
[18]	RSS	Range Selector Support. **0b0** Targeted SGIs with affinity level 0 values of 0-15 are supported.	x
[17]	nDS	Disable Security not supported. Read-only and writes are ignored. **0b1** The CPU interface logic does not support disabling of security, and requires that security is not disabled.	x
[16]	**RES0**	Reserved	**RES0**
[15]	A3V	Affinity 3 Valid. Read-only and writes are ignored. **0b1** The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.	x
[14]	SEIS	SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs: **0b0** The CPU interface logic does not support generation of SEIs.	x
[13:11]	IDbits	Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported. **0b000** 16 bits.	xxx

Bits	Name	Description	Reset
[10:8]	PRIbits	Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one. An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits). An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits). **Note:** This field always returns the number of priority bits implemented, regardless of the value of SCR_EL3.NS or the value of ext-GICD_CTLR.DS. The division between group priority and subpriority is defined in the binary point registers AArch64-ICC_BPR0_EL1 and AArch64-ICC_BPR1_EL1. This field determines the minimum value of ICC_BPR0_EL1. **0b100** 5 bits of priority are implemented	xxx
[7]	**RES0**	Reserved	**RES0**
[6]	PMHE	Priority Mask Hint Enable. **0b0** Disables use of the priority mask register as a hint for interrupt distribution. **0b1** Enables use of the priority mask register as a hint for interrupt distribution. Software must write AArch64-ICC_PMR_EL1 to 0xFF before clearing this field to 0. • An implementation might choose to make this field **RAO/WI** if priority-based routing is always used • An implementation might choose to make this field RAZ/WI if priority-based routing is never used If EL3 is present, AArch64-ICC_CTLR_EL1.PMHE is an alias of ICC_CTLR_EL3.PMHE.	0b0
[5]	**RES0**	Reserved	**RES0**
[4]	EOImode_EL1NS	EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt. **0b0** AArch64-ICC_EOIR0_EL1 and AArch64-ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to AArch64-ICC_DIR_EL1 are **UNPREDICTABLE**. **0b1** AArch64-ICC_EOIR0_EL1 and AArch64-ICC_EOIR1_EL1 provide priority drop functionality only. AArch64-ICC_DIR_EL1 provides interrupt deactivation functionality. If EL3 is present, AArch64-ICC_CTLR_EL1(NS).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS.	x

Bits	Name	Description	Reset
[3]	EOImode_EL1S	EOI mode for interrupts handled at Secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt. **0b0** AArch64-ICC_EOIR0_EL1 and AArch64-ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to AArch64-ICC_DIR_EL1 are **UNPREDICTABLE**. **0b1** AArch64-ICC_EOIR0_EL1 and AArch64-ICC_EOIR1_EL1 provide priority drop functionality only. AArch64-ICC_DIR_EL1 provides interrupt deactivation functionality. If EL3 is present, AArch64-ICC_CTLR_EL1(S).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.	x
[2]	EOImode_EL3	EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt. **0b0** AArch64-ICC_EOIR0_EL1 and AArch64-ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to AArch64-ICC_DIR_EL1 are **UNPREDICTABLE**. **0b1** AArch64-ICC_EOIR0_EL1 and AArch64-ICC_EOIR1_EL1 provide priority drop functionality only. AArch64-ICC_DIR_EL1 provides interrupt deactivation functionality.	x
[1]	CBPR_EL1NS	Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2. **0b0** AArch64-ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. AArch64-ICC_BPR1_EL1 determines the preemption group for Non-secure Group 1 interrupts. **0b1** AArch64-ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to ext-GICC_BPR and AArch64-ICC_BPR1_EL1 access the state of AArch64-ICC_BPR0_EL1. If EL3 is present, AArch64-ICC_CTLR_EL1(NS).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1NS.	x
[0]	CBPR_EL1S	Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts at EL1 and EL2. **0b0** AArch64-ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. AArch64-ICC_BPR1_EL1 determines the preemption group for Secure Group 1 interrupts. **0b1** AArch64-ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses to AArch64-ICC_BPR1_EL1 access the state of AArch64-ICC_BPR0_EL1. If EL3 is present, AArch64-ICC_CTLR_EL1(S).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1S.	x

A.7 AArch64 Performance Monitors registers summary

The summary table provides an overview of all Performance Monitors registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Bit descriptions

Figure A-107: AArch64_pmmir_el1 bit assignments

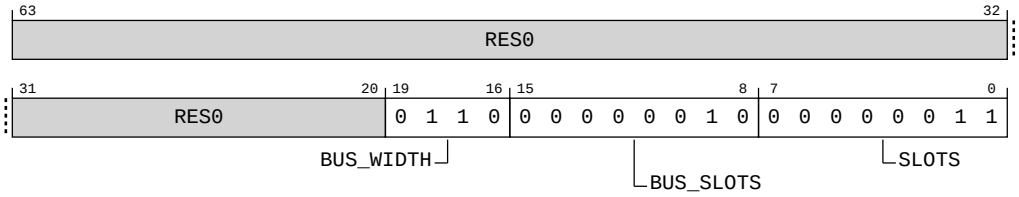

Table A-259: PMMIR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:20]	RES0	Reserved	RES0
[19:16]	BUS_WIDTH	Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log_2(number of bytes), plus one. Defined values are: **0b0110** 32 bytes.	0b0110
[15:8]	BUS_SLOTS	Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle. **0b00000010** The largest value by which the BUS_ACCESS PMU event may increment in one cycle is 2.	0x02
[7:0]	SLOTS	Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero. **0b00000011** The largest value by which the STALL_SLOT PMU event may increment in one cycle is 3.	0x03

Bit descriptions

Figure A-108: AArch64_pmcr_el0 bit assignments

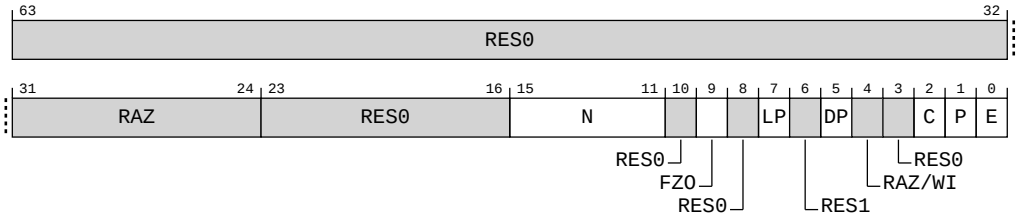

Table A-261: PMCR_EL0 bit descriptions

Bits	Name	Description	Reset
[63:32]	**RES0**	Reserved	**RES0**
[31:24]	**RAZ**	Reserved	**RAZ**
[23:16]	**RES0**	Reserved	**RES0**
[15:11]	N	Indicates the number of event counters implemented. This value is in the range of `0b00000-0b11111`. If the value is `0b00000`, then only AArch64-PMCCNTR_EL0 is implemented. If the value is `0b11111`, then AArch64-PMCCNTR_EL0 and 31 event counters are implemented. When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of AArch64-MDCR_EL2.HPMN. **`0b10100`** Twenty PMU Counters Implemented **`0b00110`** Six PMU Counters Implemented	The reset values can be the following: `0b10100`, `0b00110`, respective to the value.
[10]	**RES0**	Reserved	**RES0**
[9]	FZO	Freeze-on-overflow. Stop event counters on overflow. In the description of this field: • If EL2 is implemented and is using AArch64, PMN is AArch64-MDCR_EL2.HPMN. • If EL2 is not implemented, PMN is PMCR_EL0.N. **`0b0`** Do not freeze on overflow. **`0b1`** Event counter AArch64-PMEVCNTR<n>_EL0 does not count when AArch64-PMOVSCLR_EL0[(PMN-1):0] is nonzero and n is in the range of affected event counters. If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)]. This field does not affect the operation of other event counters and AArch64-PMCCNTR_EL0. The operation of this field applies even when EL2 is disabled in the current Security state.	`x`
[8]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[7]	LP	Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit. In the description of this field: • If EL2 is implemented and is using AArch64, PMN is AArch64-MDCR_EL2.HPMN. • If EL2 is not implemented, PMN is PMCR_EL0.N. **0b0** Event counter overflow on increment that causes unsigned overflow of AArch64-PMEVCNTR<n>_EL0[31:0]. **0b1** Event counter overflow on increment that causes unsigned overflow of AArch64-PMEVCNTR<n>_EL0[63:0]. If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)]. This field does not affect the operation of other event counters and AArch64-PMCCNTR_EL0. The operation of this field applies even when EL2 is disabled in the current Security state.	x
[6]	**RES1**	Reserved	**RES1**
[5]	DP	Disable cycle counter when event counting is prohibited. **0b0** Cycle counting by AArch64-PMCCNTR_EL0 is not affected by this mechanism. **0b1** Cycle counting by AArch64-PMCCNTR_EL0 is disabled in prohibited regions: • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and AArch64-MDCR_EL2.HPMD is 1, then cycle counting by AArch64-PMCCNTR_EL0 is disabled at EL2. • If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and AArch64-MDCR_EL3.MPMX is 1, then cycle counting by AArch64-PMCCNTR_EL0 is disabled at EL3. • If EL3 is implemented, AArch64-MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or AArch64-MDCR_EL3.MPMX is 0, then cycle counting by AArch64-PMCCNTR_EL0 is disabled at EL3 and in Secure state. If AArch64-MDCR_EL2.HPMN is not 0, this is when event counting by event counters in the range [0..(AArch64-MDCR_EL2.HPMN-1)] is prohibited. For more information see *Prohibiting event counting* in the *Arm® Architecture Reference Manual for A-profile architecture*.	x
[4]	**RAZ/WI**	Reserved	**RAZ/WI**
[3]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[2]	C	Cycle counter reset. The effects of writing to this bit are: **0b0** No action. **0b1** Reset AArch64-PMCCNTR_EL0 to zero. **Note:** Resetting AArch64-PMCCNTR_EL0 does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset. Access to this field is: WO/**RAZ**	0b0
[1]	P	Event counter reset. In the description of this field: • If EL2 is implemented and is using AArch64, PMN is AArch64-MDCR_EL2.HPMN. • If EL2 is not implemented, PMN is PMCR_EL0.N. **0b0** No action. **0b1** If n is in the range of affected event counters, resets each event counter AArch64-PMEVCNTR<n> to zero. The effects of writing to this bit are: • If EL2 is implemented and enabled in the current Security state, in EL0 and EL1, if PMN is not 0, a write of 1 to this bit resets event counters in the range [0 .. (PMN-1)]. • If EL2 is disabled in the current Security state, a write of 1 to this bit resets all the event counters. • In EL2 and EL3, a write of 1 to this bit resets all the event counters. • This field does not affect the operation of other event counters and AArch64-PMCCNTR_EL0. **Note:** Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the values of AArch64-MDCR_EL2.HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset. Access to this field is: WO/**RAZ**	0b0

Bits	Name	Description	Reset
[0]	E	Enable. If EL2 is implemented and is using AArch64, PMN is AArch64-MDCR_EL2.HPMN. If EL2 is not implemented, PMN is PMCR_EL0.N. **0b0** AArch64-PMCCNTR_EL0 is disabled and event counters AArch64-PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are disabled. **0b1** AArch64-PMCCNTR_EL0 and event counters AArch64-PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are enabled by AArch64-PMCNTENSET_EL0. If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)]. This field does not affect the operation of other event counters. The operation of this field applies even when EL2 is disabled in the current Security state.	0b0

A.7.3 PMCEID0_EL0, Performance Monitors Common Event Identification register 0

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

For more information about the Common events and the use of the PMCEID<n>_EL0 registers see *The PMU event number space and common events* in the *Arm® Architecture Reference Manual for A-profile architecture*.

Configurations

AArch64 register PMCEID0_EL0 bits [31:0] are architecturally mapped to External System register B.4.28 PMCEID0, Performance Monitors Common Event Identification register 0 on page 642 bits [31:0].

AArch64 register PMCEID0_EL0 bits [63:32] are architecturally mapped to External System register B.4.30 PMCEID2, Performance Monitors Common Event Identification register 2 on page 651 bits [31:0].

A.7.4 PMCEID1_EL0, Performance Monitors Common Event Identification register 1

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0020 to 0x003F and 0x4020 to 0x403F.

For more information about the Common events and the use of the PMCEID<n>_EL0 registers see *The PMU event number space and common events* in the *Arm® Architecture Reference Manual for A-profile architecture*.

Configurations

AArch64 register PMCEID1_EL0 bits [31:0] are architecturally mapped to External System register B.4.29 PMCEID1, Performance Monitors Common Event Identification register 1 on page 646 bits [31:0].

AArch64 register PMCEID1_EL0 bits [63:32] are architecturally mapped to External System register B.4.31 PMCEID3, Performance Monitors Common Event Identification register 3 on page 655 bits [31:0].

A.8 AArch64 Generic Timer registers summary

The summary table provides an overview of all Generic Timer registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Table A-268: Generic Timer registers summary

Name	Op0	Op1	CRn	CRm	Op2	Reset	Width	Description
CNTKCTL_EL1	3	0	C14	C1	0	–	64-bit	Counter-timer Kernel Control register

A.11.1 AMCFGR_EL0, Activity Monitors Configuration Register

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configurations

AArch64 register AMCFGR_EL0 bits [31:0] are architecturally mapped to External System register B.6.9 AMCFGR, Activity Monitors Configuration Register on page 727 bits [31:0].

Bit descriptions

Figure A-111: AArch64_amcfgr_el0 bit assignments

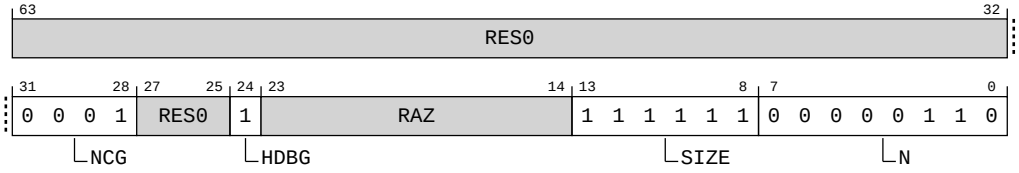

Table A-272: AMCFGR_EL0 bit descriptions

Bits	Name	Description	Reset
[63:32]	**RES0**	Reserved	**RES0**
[31:28]	NCG	Defines the number of counter groups. The following value is specified for this product. **0b0001** Two counter groups are implemented	0b0001

Bits	Name	Description	Reset
[27:25]	**RES0**	Reserved	**RES0**
[24]	HDBG	Halt-on-debug supported. This feature must be supported, and so this bit is `0b1`. **0b1** AArch64-AMCR_EL0.HDBG is read/write.	`0b1`
[23:14]	**RAZ**	Reserved	**RAZ**
[13:8]	SIZE	Defines the size of activity monitor event counters. The size of the activity monitor event counters implemented by the activity monitors Extension is [AMCFGR_EL0.SIZE + 1]. **Note:** Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses. **0b111111**	`0b111111`
[7:0]	N	Defines the number of activity monitor event counters. The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR_EL0.N + 1]. **0b00000110** Seven activity monitor event counters	`0x06`

A.12 AArch64 RAS registers summary

The summary table provides an overview of all RAS registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

[15:0]	NUM	Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates no records can be accessed through the Error Record System registers. Each implemented record is owned by a node. A node might own multiple records. **0b0000000000000011** Three Records Present.	16{x}

A.12.2 ERRSELR_EL1, Error Record Select Register

Selects an error record to be accessed through the Error Record System registers.

Configurations

If AArch64-ERRIDR_EL1 indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR_EL1 is UNDEFINED or RES0.

A.13 AArch64 Trace unit registers summary

The summary table provides an overview of all Trace unit registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

A.13.18 TRCCLAIMSET, Claim Tag Set Register

In conjunction with AArch64-TRCCLAIMCLR, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configurations

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

AArch64 register TRCCLAIMSET bits [31:0] are architecturally mapped to External System register B.7.22 TRCCLAIMSET, Claim Tag Set Register on page 777 bits [31:0].

A.14 AArch64 Trace Buffer Extension registers summary

The summary table provides an overview of all Trace Buffer Extension registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Table A-341: Trace Buffer Extension registers summary

Name	Op0	Op1	CRn	CRm	Op2	Reset	Width	Description
TRBLIMITR_EL1	3	0	C9	C11	0	–	64-bit	Trace Buffer Limit Address Register
TRBPTR_EL1	3	0	C9	C11	1	–	64-bit	Trace Buffer Write Pointer Register
TRBBASER_EL1	3	0	C9	C11	2	–	64-bit	Trace Buffer Base Address Register
TRBSR_EL1	3	0	C9	C11	3	–	64-bit	Trace Buffer Status/syndrome Register
TRBMAR_EL1	3	0	C9	C11	4	–	64-bit	Trace Buffer Memory Attribute Register
TRBTRG_EL1	3	0	C9	C11	6	–	64-bit	Trace Buffer Trigger Counter Register
TRBIDR_EL1	3	0	C9	C11	7	–	64-bit	Trace Buffer ID Register

A.14.1 TRBIDR_EL1, Trace Buffer ID Register

Describes constraints on using the Trace Buffer Unit to software, including whether the Trace Buffer Unit can be programmed at the current Exception level.

Configurations

This register is available in all configurations.

Bit descriptions

Figure A-142: AArch64_trbidr_el1 bit assignments

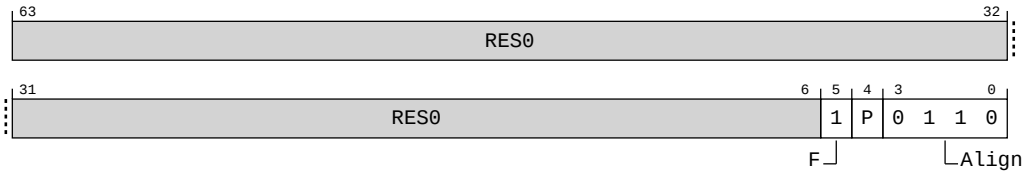

Table A-342: TRBIDR_EL1 bit descriptions

Bits	Name	Description	Reset
[63:6]	RES0	Reserved	RES0
[5]	F	Flag updates. Describes how address translations performed by the Trace Buffer Unit manage the Access flag and dirty state. **0b1** Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is controlled in the same way as explicit memory accesses in the trace buffer owning translation regime.	0b1

Bits	Name	Description	Reset
[4]	P	Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the trace buffer is owned by a higher Exception level or another Security state. Defined values are: **0b0** Programming is allowed. **0b1** Programming not allowed. The value read from this field depends on the current Exception level and the Effective values of AArch64-MDCR_EL3.NSTB and AArch64-MDCR_EL2.E2TB: • If EL3 is implemented, and the owning Security state is Secure state, this field reads as one from: ◦ Non-secure EL1 and Non-secure EL2. ◦ If Secure EL2 is implemented and enabled, and AArch64-MDCR_EL2.E2TB is 0b00, Secure EL1. • If EL3 is implemented, and the owning Security state is Non-secure state, this field reads as one from: ◦ Secure EL1. ◦ If Secure EL2 is implemented, Secure EL2. ◦ If EL2 is implemented and AArch64-MDCR_EL2.E2TB is 0b00, Non-secure EL1. • If EL3 is not implemented, EL2 is implemented, and AArch64-MDCR_EL2.E2TB is 0b00, this field reads as one from EL1. • Otherwise, this field reads as zero.	x
[3:0]	Align	Defines the minimum alignment constraint for writes to AArch64-TRBPTR_EL1 and AArch64-TRBTRG_EL1. Defined values are: **0b0110** 64 bytes.	0b0110

Appendix B External registers

This appendix contains the descriptions for the Cortex-A520 external registers.

This manual does not provide a complete list of registers. Read this manual together with the *Arm® Architecture Reference Manual for A-profile architecture*.

B.1 External MPMM registers summary

The summary table provides an overview of all memory-mapped MPMM registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

0xFFC	ERRCIDR3	—	32-bit	Component Identification Register 3

B.2.1 ERR0FR, Error Record Feature Register

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED is not 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED is 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configurations

This register is available in all configurations.

Table B-7: ERR0FR bit descriptions

Bits	Name	Description	Reset
[63:55]	**RES0**	Reserved	**RES0**
[54:53]	CE	Corrected Error recording. Describes the types of Corrected errors the node can record, if any. **0b10** Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ext-ERR<n>STATUS.CE to 0b10.	xx
[52]	DE	Deferred Error recording. Describes whether the node supports recording Deferred errors. **0b1** Records Deferred errors.	x
[51]	UEO	Latent or Restartable Error recording. Describes whether the node supports recording Latent or Restartable errors. **0b1** Records Latent or Restartable errors.	x
[50]	UER	Signaled or Recoverable Error recording. Describes whether the node supports recording Signaled or Recoverable errors. **0b0** Does not record Signaled or Recoverable errors.	x
[49]	UEU	Unrecoverable Error recording. Describes whether the node supports recording Unrecoverable errors. **0b0** Does not record Unrecoverable errors.	x
[48]	UC	Uncontainable Error recording. Describes whether the node supports recording Uncontainable errors. **0b1** Records Uncontainable errors.	x
[47:32]	**RES0**	Reserved	**RES0**
[31]	FRX	Feature Register extension. Defines whether ERR<n>FR[63:48] are architecturally defined. **0b1** ERR<n>FR[63:48] are defined by the architecture.	x
[30:26]	**RES0**	Reserved	**RES0**
[25:24]	TS	Timestamp Extension. Indicates whether, for each error record <m> owned by this node, ERR<m>MISC3 is used as the timestamp register, and, if it is, the timebase used by the timestamp. **0b00** Does not support a timestamp register.	xx
[23:22]	CI	Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node. **0b00** Does not support the critical error interrupt. ext-ERR<n>CTLR.CI is **RES0**.	xx
[21:20]	INJ	Fault Injection Extension. Indicates whether the Common Fault Injection Model Extension is implemented by the node. **0b01** Supports the Common Fault Injection Model Extension. See ext-ERR<n>PFGF for more information.	xx
[19:18]	CEO	Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded and a first Corrected error has previously been recorded by an error record <m> owned by the node. **0b00** Keeps the previous error syndrome.	xx

Bits	Name	Description	Reset
[17:16]	DUI	Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors is supported by the node. **0b10** Enabling and disabling of error recovery interrupts on deferred errors is supported and controllable using ext-ERR<n>CTLR.DUI.	xx
[15]	RP	Repeat counter. Indicates whether the node implements a second Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. **0b1** Implements a first (repeat) counter and a second (other) counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter.	x
[14:12]	CEC	Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter mechanisms in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. **0b010** Implements an 8-bit Corrected error counter in ERR<m>MISC0[39:32] for each error record <m> owned by the node that can record countable errors.	xxx
[11:10]	CFI	Fault handling interrupt for corrected errors control. Indicates whether the enabling and disabling of fault handling interrupts on corrected errors is supported by the node. **0b10** Enabling and disabling of fault handling interrupts on corrected errors is supported and controllable using ext-ERR<n>CTLR.CFI.	xx
[9:8]	UE	In-band error reponse (External Abort). Indicates whether the in-band error response and associated controls are implemented by the node. **0b01** In-band error response is supported and always enabled. ext-ERR<n>CTLR.UE is **RES0**.	xx
[7:6]	FI	Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented by the node. **0b10** Fault handling interrupt is supported and controllable using ext-ERR<n>CTLR.FI.	xx
[5:4]	UI	Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented by the node. **0b10** Error handling interrupt is supported and controllable using ext-ERR<n>CTLR.UI.	xx
[3:2]	**RES0**	Reserved	**RES0**
[1:0]	ED	Error reporting and logging. Indicates error record <n> is the first record owned the node, and whether the node implements the controls for enabling and disabling error reporting and logging. **0b10** Error reporting and logging is controllable using ext-ERR<n>CTLR.ED.	xx

Accessibility

Component	Offset	Instance	Range
Complex RAS	0x0	ERR0FR	None

This interface is accessible as follows:

RO

B.2.2 ERR0CTLR, Error Record Control Register

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for uncorrected errors.

For each bit, if the node does not support the feature, then the bit is **RES0**. The definition of each record is IMPLEMENTATION DEFINED.

Configurations

ERR0FR describes the features implemented by the node.

Bit descriptions

Figure B-4: complex_ras.err0ctlr bit assignments

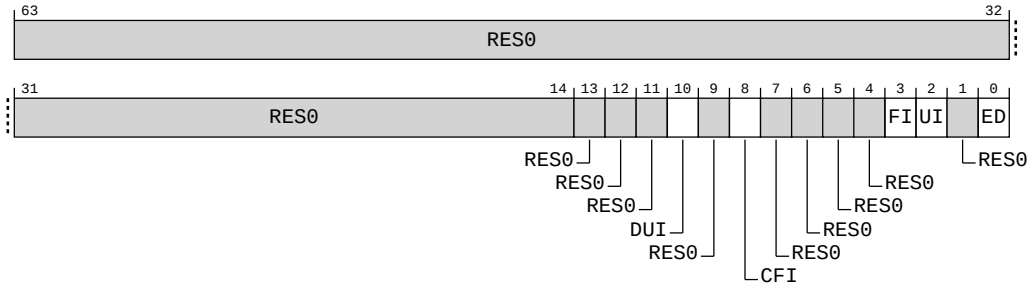

Table B-9: ERR0CTLR bit descriptions

Bits	Name	Description	Reset
[63:11]	**RES0**	Reserved	**RES0**
[10]	DUI	Error recovery interrupt for Deferred errors enable. When ext-ERR<n>FR.DUI == `0b10`, this control applies to errors arising from both reads and writes. When enabled, the error recovery interrupt is generated for all errors recorded as Deferred error. **`0b0`** Error recovery interrupt not generated for Deferred errors. **`0b1`** Error recovery interrupt generated for Deferred errors. The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.	x
[9]	**RES0**	Reserved	**RES0**
[8]	CFI	Fault handling interrupt for Corrected errors enable. When ext-ERR<n>FR.CFI == `0b10`, this control applies to errors arising from both reads and writes. When enabled: • If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see ext-ERR<n>MISC0. • Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error. **`0b0`** Fault handling interrupt not generated for Corrected errors. **`0b1`** Fault handling interrupt generated for Corrected errors. The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.	x
[7:4]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[3]	FI	Fault handling interrupt enable. When ext-ERR<n>FR.FI == `0b10`, this control applies to errors arising from both reads and writes. When enabled: • The fault handling interrupt is generated for all errors recorded as either Deferred error or Uncorrected error. • If the fault handling interrupt for Corrected errors control is not implemented: ◦ If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1. ◦ Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error. **0b0** Fault handling interrupt disabled. **0b1** Fault handling interrupt enabled. The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.	x
[2]	UI	Uncorrected error recovery interrupt enable. When ext-ERR<n>FR.UI == `0b10`, this control applies to errors arising from both reads and writes. When enabled, the error recovery interrupt is generated for all errors recorded as Uncorrected error. **0b0** Error recovery interrupt disabled. **0b1** Error recovery interrupt enabled. The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.	x
[1]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[0]	ED	Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an **IMPLEMENTATION DEFINED** control for error injection. **0b0** Error reporting disabled. **0b1** Error reporting enabled. It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrected errors might result in corrupt data being silently propagated by the node. **Note:** If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this field is set to 0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be **UNKNOWN**.	x

Component	Offset	Instance	Range
Complex RAS	0x8	ERR0CTLR	None

This interface is accessible as follows:

RW

B.2.3 ERR0STATUS, Error Record Primary Status Register

Contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An **IMPLEMENTATION DEFINED** extended error code.

Within this register:

- ERR<n>STATUS.{AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- ERR<n>STATUS.{UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- ERR<n>STATUS.{CI, ER, PN, IERR, SERR} are syndrome fields.

Configurations

ERR0FR describes the features implemented by the node.

Bit descriptions

Figure B-5: complex_ras.err0status bit assignments

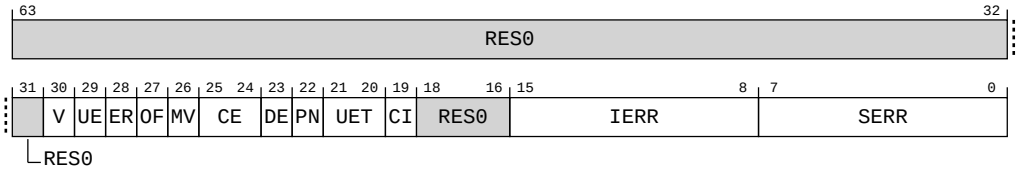

Table B-11: ERR0STATUS bit descriptions

Bits	Name	Description	Reset
[63:31]	RES0	Reserved	RES0

Bits	Name	Description	Reset
[30]	V	Status Register Valid. **0b0** ERR<n>STATUS not valid. **0b1** ERR<n>STATUS valid. At least one error has been recorded. Access to this field is: W1C	0b0
[29]	UE	Uncorrected Error. **0b0** No errors have been detected, or all detected errors have been either corrected or deferred. **0b1** At least one detected error was not corrected and not deferred. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x

Bits	Name	Description	Reset
[28]	ER	Error Reported. **0b0** No in-band error response (External Abort) signaled to the Requester making the access or other transaction. **0b1** An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors. It is **IMPLEMENTATION DEFINED** whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0. **Note:** An in-band error response signaled by the component might be masked and not generate any exception. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero. **When ext-ERR0STATUS.UE == '0' && ext-ERR0STATUS.DE == '0' && this field can be set to 0b1 by a Deferred error** Access to this field is: **UNKNOWN**/WI **When ext-ERR0STATUS.UE == '0' && this field is never set to 0b1 by a Deferred error** Access to this field is: **UNKNOWN**/WI **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x

Bits	Name	Description	Reset
[27]	OF	Overflow. Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs: • A Corrected error counter is implemented, an error is counted, and the counter overflows. • ERR<n>STATUS.V was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded. • ERR<n>STATUS.V was previously 1, and a type of error other than a Corrected error is recorded. Otherwise, this field is unchanged when an error is recorded. If a Corrected error counter is implemented: • A direct write that modifies the counter overflow flag indirectly might set this field to an **UNKNOWN** value. • A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an **UNKNOWN** value. **0b0** Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed. **0b1** Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x
[26]	MV	Miscellaneous Registers Valid. **0b0** ERR<n>MISC<m> not valid. **0b1** The **IMPLEMENTATION DEFINED** contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record. **Note:** If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded. Access to this field is: W1C	0b0

Bits	Name	Description	Reset
[25:24]	CE	Corrected Error. **0b00** No errors were corrected. **0b10** At least one error was corrected. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	xx
[23]	DE	Deferred Error. **0b0** No errors were deferred. **0b1** At least one error was not corrected and deferred. Support for deferring errors is **IMPLEMENTATION DEFINED**. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x
[22]	PN	Poison. **0b0** Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded. **0b1** Uncorrected error or Deferred error recorded because a poison value was detected. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero. **When ext-ERR0STATUS.V == '0' || (ext-ERR0STATUS.DE == '0' && ext-ERR0STATUS.UE == '0')** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x

Bits	Name	Description	Reset
[21:20]	UET	Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error. **0b00** Uncorrected error, Uncontainable error (UC). **0b01** Uncorrected error, Unrecoverable error (UEU). **0b10** Uncorrected error, Latent or Restartable error (UEO). **0b11** Uncorrected error, Signaled or Recoverable error (UER). **Note:** Software might use the information in the error record registers to determine what recovery is necessary. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero. **When ext-ERR0STATUS.V == '0' || ext-ERR0STATUS.UE == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	xx
[19]	CI	Critical Error. Indicates whether a critical error condition has been recorded. **0b0** No critical error condition. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x
[18:16]	**RES0**	Reserved	**RES0**
[15:8]	IERR	**IMPLEMENTATION DEFINED** error code. Used with any primary error code ERR<n>STATUS.SERR value. Further **IMPLEMENTATION DEFINED** information can be placed in the ERR<n>MISC<m> registers. The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is **UNKNOWN**. **Note:** This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: RW	8{x}

Bits	Name	Description	Reset
[7:0]	SERR	Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry. **0b00000110** Data value from associative memory. For example, ECC error on cache data. **0b00000111** Address/control value from associative memory. For example, ECC error on cache tag. **0b00001000** Data value from a TLB. For example, ECC error on TLB data. **0b00001100** Data value from (non-associative) external memory. For example, ECC error in SDRAM. **0b00010010** Error response from Completer of access. For example, error response from cache write-back. **0b00010101** Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: RW	8{x}

Access

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is **IMPLEMENTATION DEFINED**. See also ext-ERR<n>PFGF.SYN.

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.

- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as **UNKNOWN** where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as **UNKNOWN** values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the W1C fields that are nonzero in the read value.
- Write zero to all the W1C fields that are zero in the read value.
- Write zero to all the RW fields.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also ext-ERR<n>PFGF.SYN.

Accessibility

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also ext-ERR<n>PFGF.SYN.

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.
- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as UNKNOWN where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the W1C fields that are nonzero in the read value.
- Write zero to all the W1C fields that are zero in the read value.
- Write zero to all the RW fields.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also ext-ERR<n>PFGF.SYN.

Figure B-6: complex_ras.err0misc0 bit assignments

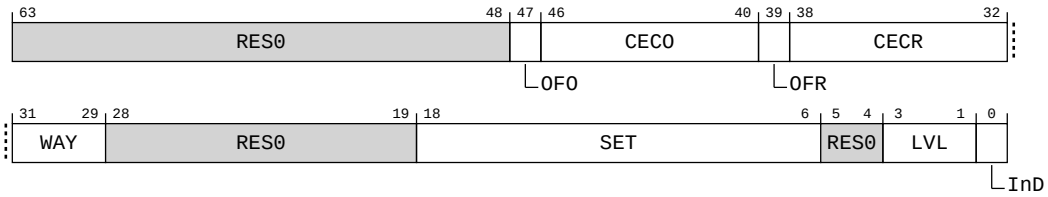

Table B-13: ERR0MISC0 bit descriptions

Bits	Name	Description	Reset
[63:48]	**RES0**	Reserved	**RES0**
[47]	OFO	Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero. **0b0** Other counter has not overflowed. **0b1** Other counter has overflowed. A direct write that modifies this field might indirectly set ext-ERR<n>STATUS.OF to an **UNKNOWN** value and a direct write to ext-ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an **UNKNOWN** value.	x
[46:40]	CECO	Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.	7{x}
[39]	OFR	Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero. **0b0** Repeat counter has not overflowed. **0b1** Repeat counter has overflowed. A direct write that modifies this field might indirectly set ext-ERR<n>STATUS.OF to an **UNKNOWN** value and a direct write to ext-ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an **UNKNOWN** value.	x
[38:32]	CECR	Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is **IMPLEMENTATION DEFINED** and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors. **Note:** For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the **IMPLEMENTATION DEFINED** ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.	7{x}
[31:29]	WAY	The way that contained the error If the encoding of the way for the reported RAM requires fewer bits than the width of this field, the most significant bits of this field record the way, and the least significant bits are **RES0**. **When ext-ERR0STATUS.MV == '1'** Access to this field is: RO **Otherwise** Access to this field is: RW	xxx
[28:19]	**RES0**	Reserved	**RES0**

[5:4]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[3:1]	LVL	Cache level **0b000** L1. **0b001** L2. **When ext-ERR0STATUS.MV == '1'** Access to this field is: RO **Otherwise** Access to this field is: RW	xxx
[0]	InD	Instruction or Data cache **0b0** Data or unified cache. **0b1** Instruction cache. **When ext-ERR0STATUS.MV == '1'** Access to this field is: RO **Otherwise** Access to this field is: RW	x

Access

Reads from ERR<n>MISC0 return an **IMPLEMENTATION DEFINED** value and writes have **IMPLEMENTATION DEFINED** behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<q>PFGF.MV is 1, then some parts of this register are read/write when ext-ERR<n>STATUS.MV is 1. See ext-ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ext-ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

Accessibility

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<q>PFGF.MV is 1, then some parts of this register are read/write when ext-ERR<n>STATUS.MV is 1. See ext-ERR<n>PFGF.MV for more information.

Bit descriptions

Figure B-10: complex_ras.err0pfgf bit assignments

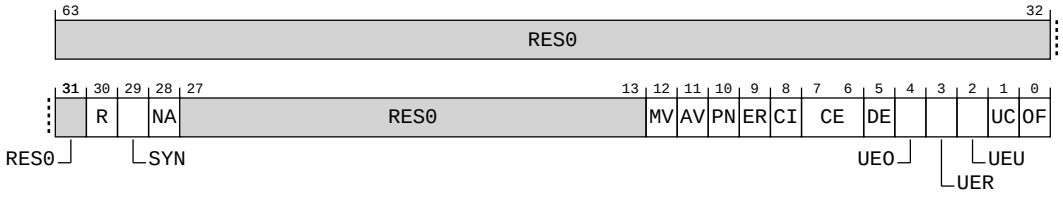

Table B-21: ERR0PFGF bit descriptions

Bits	Name	Description	Reset
[63:31]	**RES0**	Reserved	**RES0**
[30]	R	Restartable. Support for Error Generation Counter restart mode. **0b1** Error Generation Counter restart mode is implemented and is controlled by ext-ERR<n>PFGCTL.R. ext-ERR<n>PFGCTL.R is a read/write field.	x
[29]	SYN	Syndrome. Fault syndrome injection. **0b0** When an injected error is recorded, the node sets ext-ERR<n>STATUS.{IERR, SERR} to IMPLEMENTATION DEFINED values. ext-ERR<n>STATUS.{IERR, SERR} are **UNKNOWN** when ext-ERR<n>STATUS.V is 0.	x
[28]	NA	No access required. Defines whether this component fakes detection of the error on an access to the component or spontaneously in the fault injection state. **0b0** The component fakes detection of the error on an access to the component.	x

Bits	Name	Description	Reset
[27:13]	**RES0**	Reserved	**RES0**
[12]	MV	Miscellaneous syndrome. Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded. It is **IMPLEMENTATION DEFINED** which ERR<n>MISC<m> syndrome fields, if any, are updated by the node when an injected error is recorded. Some syndrome fields might always be updated by the node when an error, including an injected error, is recorded. For example, a corrected error counter might always be updated when any countable error, including a injected countable error, is recorded. **0b0** When an injected error is recorded, the node might update the ERR<n>MISC<m> registers: • If any syndrome is recorded by the node in the ERR<n>MISC<m> registers, then ext-ERR<n>STATUS.MV is set to 1. • Otherwise, ext-ERR<n>STATUS.MV is unchanged. If the node always sets ext-ERR<n>STATUS.MV to 1 when recording an injected error then ext-ERR<n>PFGCTL.MV might be RAO/WI. Otherwise ext-ERR<n>PFGCTL.MV is **RES0**.	x
[11]	AV	Address syndrome. Defines whether software can control the address recorded in ext-ERR<n>ADDR when an injected error is recorded. **0b0** When an injected error is recorded, the node might record an address in ext-ERR<n>ADDR. If an address is recorded in ext-ERR<n>ADDR, then ext-ERR<n>STATUS.AV is set to 1. Otherwise, ext-ERR<n>ADDR and ext-ERR<n>STATUS.AV are unchanged. If the node always records an address and sets ext-ERR<n>STATUS.AV to 1 when recording an injected error then ext-ERR<n>PFGCTL.AV might be RAO/WI. Otherwise ext-ERR<n>PFGCTL.AV is **RES0**.	x
[10]	PN	Poison flag. Describes how the fault generation feature of the node sets the ext-ERR<n>STATUS.PN status flag. **0b0** When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ext-ERR<n>STATUS.PN to 1. ext-ERR<n>PFGCTL.PN is **RES0**.	x
[9]	ER	Error Reported flag. Describes how the fault generation feature of the node sets the ext-ERR<n>STATUS.ER status flag. **0b0** When an injected error is recorded, the node sets ext-ERR<n>STATUS.ER according to the architecture-defined rules for setting the ER field. ext-ERR<n>PFGCTL.ER is **RES0**.	x
[8]	CI	Critical Error flag. Describes how the fault generation feature of the node sets the ext-ERR<n>STATUS.CI status flag. **0b0** When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ext-ERR<n>STATUS.CI to 1. ext-ERR<n>PFGCTL.CI is **RES0**.	x
[7:6]	CE	Corrected Error generation. Describes the types of Corrected error that the fault generation feature of the node can generate. **0b01** The fault generation feature of the node allows generation of a non-specific Corrected error, that is, a Corrected error that is recorded by setting ext-ERR<n>STATUS.CE to 0b10. ext-ERR<n>PFGCTL.CE is a read/write field. The values 0b10 and 0b11 in ext-ERR<n>PFGCTL.CE are reserved.	xx

Bits	Name	Description	Reset
[5]	DE	Deferred Error generation. Describes whether the fault generation feature of the node can generate Deferred errors. **0b1** The fault generation feature of the node allows generation of Deferred errors. ext-ERR<n>PFGCTL.DE is a read/write field.	x
[4]	UEO	Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate Latent or Restartable errors. **0b0** The fault generation feature of the node does not generate Latent or Restartable errors. ext-ERR<n>PFGCTL.UEO is **RES0**.	x
[3]	UER	Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate Signaled or Recoverable errors. **0b0** The fault generation feature of the node does not generate Signaled or Recoverable errors. ext-ERR<n>PFGCTL.UER is **RES0**.	x
[2]	UEU	Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate Unrecoverable errors. **0b0** The fault generation feature of the node does not generate Unrecoverable errors. ext-ERR<n>PFGCTL.UEU is **RES0**.	x
[1]	UC	Uncontainable Error generation. Describes whether the fault generation feature of the node can generate Uncontainable errors. **0b1** The fault generation feature of the node allows generation of Uncontainable errors. ext-ERR<n>PFGCTL.UC is a read/write field.	x
[0]	OF	Overflow flag. Describes how the fault generation feature of the node sets the ext-ERR<n>STATUS.OF status flag. **0b0** When an injected error is recorded, the node sets ext-ERR<n>STATUS.OF according to the architecture-defined rules for setting the OF field. ext-ERR<n>PFGCTL.OF is **RES0**.	x

Table B-23: ERR0PFGCTL bit descriptions

Bits	Name	Description	Reset
[63:32]	**RES0**	Reserved	**RES0**
[31]	CDNEN	Countdown Enable. Controls transfers of the value held in ext-ERR<n>PFGCDN to the Error Generation Counter and enables this counter. **0b0** The Error Generation Counter is disabled. **0b1** The Error Generation Counter is enabled. On a write of 1 to this field, the Error Generation Counter is set to ext-ERR<n>PFGCDN.CDN.	0b0
[30]	R	Restart. Controls whether the Error Generation Counter restarts or stops counting on reaching zero. **0b0** On reaching zero, the Error Generation Counter will stop counting. **0b1** On reaching zero, the Error Generation Counter is set to ext-ERR<n>PFGCDN.CDN.	x

Bits	Name	Description	Reset
[29:13]	**RES0**	Reserved	**RES0**
[12]	MV	Miscellaneous syndrome. The value written to ext-ERR<n>STATUS.MV when an injected error is recorded. **0b1** Reserved, **RAO/WI**. ext-ERR<n>STATUS.MV is set to 1 when an injected error is recorded.	x
[11]	AV	Address syndrome. The value written to ext-ERR<n>STATUS.AV when an injected error is recorded. **0b0** **RES0**. An address will not be generated by the fault generation feature of the node.	x
[10]	PN	Poison flag. The value written to ext-ERR<n>STATUS.PN when an injected error is recorded. **0b0** **RES0**. ext-ERR<n>STATUS.PN is set to 0 when an injected error is recorded.	x
[9]	ER	Error Reported flag. The value written to ext-ERR<n>STATUS.ER when an injected error is recorded. **0b0** **RES0**. ext-ERR<n>STATUS.ER is set to 0 when an injected error is recorded.	x
[8]	CI	Critical Error flag. The value written to ext-ERR<n>STATUS.CI when an injected error is recorded. **0b0** **RES0**. A critical error condition will not be generated by the fault generation feature of the node.	x
[7:6]	CE	Corrected Error generation enable. Controls the type of injected Corrected error generated by the fault injection feature of the node. **0b00** An injected Corrected error will not be generated by the fault injection feature of the node. **0b01** An injected non-specific Corrected error is generated in the fault injection state. ext-ERR<n>STATUS.CE is set to 0b10 when the injected error is recorded. **0b10** Reserved **0b11** Reserved	xx
[5]	DE	Deferred Error generation enable. Controls whether an injected Deferred error is generated by the fault injection feature of the node. **0b0** An injected Deferred error will not be generated by the fault generation feature of the node. **0b1** An injected Deferred error is generated in the fault injection state. The node enters the fault injection state when the Error Generation Counter decrements to zero. It is **IMPLEMENTATION DEFINED** whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.	x
[4]	UEO	Latent or Restartable Error generation enable. Controls whether an injected Latent or Restartable error is generated by the fault injection feature of the node. **0b0** **RES0**. An injected Latent or Restartable error will not be generated by the fault generation feature of the node.	x

Bits	Name	Description	Reset
[3]	UER	Signaled or Recoverable Error generation enable. Controls whether an injected Signaled or Recoverable error is generated by the fault injection feature of the node. **0b0** **RES0**. An injected Signaled or Recoverable error will not be generated by the fault generation feature of the node.	x
[2]	UEU	Unrecoverable Error generation enable. Controls whether an injected Unrecoverable error is generated by the fault injection feature of the node. **0b0** An injected Unrecoverable error will not be generated by the fault generation feature of the node. **0b1** An injected Unrecoverable error is generated in the fault injection state. The node enters the fault injection state when the Error Generation Counter decrements to zero. It is **IMPLEMENTATION DEFINED** whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.	x
[1]	UC	Uncontainable Error generation enable. Controls whether an injected Uncontainable error is generated by the fault injection feature of the node. **0b0** An injected Uncontainable error will not be generated by the fault generation feature of the node. **0b1** An injected Uncontainable error is generated in the fault injection state. The node enters the fault injection state when the Error Generation Counter decrements to zero. It is **IMPLEMENTATION DEFINED** whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.	x
[0]	OF	Overflow flag. The value written to ext-ERR<n>STATUS.OF when an injected error is recorded. **0b0** **RES0**. ext-ERR<n>STATUS.OF is set to 0 when an injected error is recorded.	x

Bit descriptions

Figure B-13: complex_ras.erriidr bit assignments

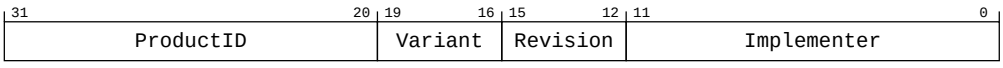

Table B-27: ERRIIDR bit descriptions

Bits	Name	Description	Reset
[31:20]	ProductID	Part number, bits [11:0]. The part number is selected by the designer of the component. If ext-ERRPIDR0 and ext-ERRPIDR1 are implemented, ext-ERRPIDR0.PART_0 matches bits [7:0] of ERRIIDR.ProductID and ext-ERRPIDR1.PART_1 matches bits [11:8] of ERRIIDR.ProductID.	`12{x}`
[19:16]	Variant	Component major revision. This field distinguishes product variants or major revisions of the product. If ext-ERRPIDR2 is implemented, ext-ERRPIDR2.REVISION matches ERRIIDR.Variant.	`xxxx`
[15:12]	Revision	Component minor revision. This field distinguishes minor revisions of the product. If ext-ERRPIDR3 is implemented, ext-ERRPIDR3.REVAND matches ERRIIDR.Revision.	`xxxx`
[11:0]	Implementer	Contains the JEP106 code of the company that implemented the RAS component. For an Arm implementation, this field has the value `0x43B`. Bits [11:8] contain the JEP106 continuation code of the implementer, and bits [6:0] contain the JEP106 identity code of the implementer. Bit 7 is **RES0**. If ext-ERRPIDR4 is implemented, ext-ERRPIDR2 is implemented, and ext-ERRPIDR1 is implemented, ext-ERRPIDR4.DES_2 matches bits [11:8] of ERRIIDR.Implementer, ext-ERRPIDR2.DES_1 matches bits [6:4] of ERRIIDR.Implementer, and ext-ERRPIDR1.DES_0 matches bits [3:0] of ERRIIDR.Implementer.	`12{x}`

Accessibility

Component	Offset	Instance	Range
Complex RAS	0xE10	ERRIIDR	None

This interface is accessible as follows:

RO

B.2.12 ERRDEVAFF, Device Affinity Register

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of AArch64-MPIDR_EL1 or part of AArch64-MPIDR_EL1:

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as AArch64-MPIDR_EL1, and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of AArch64-MPIDR_EL1, and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in AArch64-MPIDR_EL1.{Aff3,Aff2}, and these values are equal to ERRDEVAFF.{Aff3,Aff2}.
- ERRDEVAFF.Aff1 is nonzero and not 0x80, and ERRDEVAFF.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is 0b100, then the group of error records has affinity with the up-to 8 PEs that have AArch64-MPIDR_EL1.Aff1[7:3] == ERRDEVAFF.Aff1[7:3].

If RAS System Architecture v1.1 is not implemented, ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

Configurations

ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

B.2.21 ERRCIDR1, Component Identification Register 1

Provides discovery information about the component.

For more information, see *About the Peripheral identification scheme* in the *Arm® Architecture Reference Manual for A-profile architecture*.

Configurations

ERRCIDR1 is implemented only as part of a memory-mapped group of error records.

B.3 External Core RAS registers summary

The summary table provides an overview of all memory-mapped Core RAS registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Table B-53: Core RAS registers summary

Offset	Name	Reset	Width	Description
0x0	ERR0FR	—	64-bit	Error Record Feature Register
0x8	ERR0CTLR	—	64-bit	Error Record Control Register

0xFFC	ERRCIDR3	–	32-bit	Component Identification Register 3

B.3.1 ERR0FR, Error Record Feature Register

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED is not 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED is 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configurations

This register is available in all configurations.

Figure B-26: core_ras.err0fr bit assignments

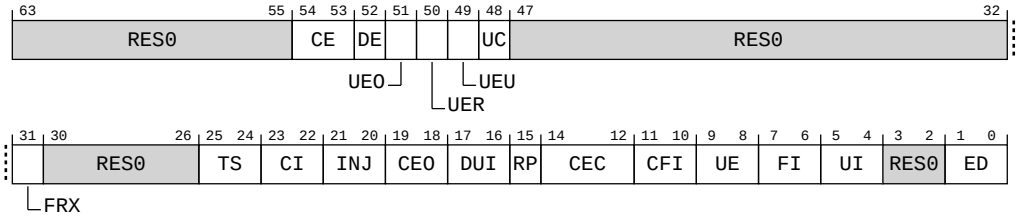

Table B-54: ERR0FR bit descriptions

Bits	Name	Description	Reset
[63:55]	**RES0**	Reserved	**RES0**
[54:53]	CE	Corrected Error recording. Describes the types of Corrected errors the node can record, if any. **0b10** Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ext-ERR<n>STATUS.CE to 0b10.	xx
[52]	DE	Deferred Error recording. Describes whether the node supports recording Deferred errors. **0b1** Records Deferred errors.	x
[51]	UEO	Latent or Restartable Error recording. Describes whether the node supports recording Latent or Restartable errors. **0b0** Does not record Latent or Restartable errors.	x
[50]	UER	Signaled or Recoverable Error recording. Describes whether the node supports recording Signaled or Recoverable errors. **0b0** Does not record Signaled or Recoverable errors.	x
[49]	UEU	Unrecoverable Error recording. Describes whether the node supports recording Unrecoverable errors. **0b1** Records Unrecoverable errors.	x
[48]	UC	Uncontainable Error recording. Describes whether the node supports recording Uncontainable errors. **0b1** Records Uncontainable errors.	x
[47:32]	**RES0**	Reserved	**RES0**
[31]	FRX	Feature Register extension. Defines whether ERR<n>FR[63:48] are architecturally defined. **0b1** ERR<n>FR[63:48] are defined by the architecture.	x

Bits	Name	Description	Reset
[30:26]	**RES0**	Reserved	**RES0**
[25:24]	TS	Timestamp Extension. Indicates whether, for each error record <m> owned by this node, ERR<m>MISC3 is used as the timestamp register, and, if it is, the timebase used by the timestamp. **0b00** Does not support a timestamp register.	xx
[23:22]	CI	Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node. **0b00** Does not support the critical error interrupt. ext-ERR<n>CTLR.CI is **RES0**.	xx
[21:20]	INJ	Fault Injection Extension. Indicates whether the Common Fault Injection Model Extension is implemented by the node. **0b01** Supports the Common Fault Injection Model Extension. See ext-ERR<n>PFGF for more information.	xx
[19:18]	CEO	Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded and a first Corrected error has previously been recorded by an error record <m> owned by the node. **0b00** Keeps the previous error syndrome.	xx
[17:16]	DUI	Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors is supported by the node. **0b10** Enabling and disabling of error recovery interrupts on deferred errors is supported and controllable using ext-ERR<n>CTLR.DUI.	xx
[15]	RP	Repeat counter. Indicates whether the node implements a second Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. **0b1** Implements a first (repeat) counter and a second (other) counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter.	x
[14:12]	CEC	Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter mechanisms in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. **0b010** Implements an 8-bit Corrected error counter in ERR<m>MISC0[39:32] for each error record <m> owned by the node that can record countable errors.	xxx
[11:10]	CFI	Fault handling interrupt for corrected errors control. Indicates whether the enabling and disabling of fault handling interrupts on corrected errors is supported by the node. **0b10** Enabling and disabling of fault handling interrupts on corrected errors is supported and controllable using ext-ERR<n>CTLR.CFI.	xx
[9:8]	UE	In-band error reponse (External Abort). Indicates whether the in-band error response and associated controls are implemented by the node. **0b01** In-band error response is supported and always enabled. ext-ERR<n>CTLR.UE is **RES0**.	xx
[7:6]	FI	Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented by the node. **0b10** Fault handling interrupt is supported and controllable using ext-ERR<n>CTLR.FI.	xx

Bits	Name	Description	Reset
[5:4]	UI	Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented by the node. **0b10** Error handling interrupt is supported and controllable using ext-ERR<n>CTLR.UI.	xx
[3:2]	**RES0**	Reserved	**RES0**
[1:0]	ED	Error reporting and logging. Indicates error record <n> is the first record owned the node, and whether the node implements the controls for enabling and disabling error reporting and logging. **0b10** Error reporting and logging is controllable using ext-ERR<n>CTLR.ED.	xx

This interface is accessible as follows:

RO

B.3.2 ERR0CTLR, Error Record Control Register

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for uncorrected errors.

For each bit, if the node does not support the feature, then the bit is **RES0**. The definition of each record is IMPLEMENTATION DEFINED.

Configurations

ERR0FR describes the features implemented by the node.

Bit descriptions

Figure B-27: core_ras.err0ctlr bit assignments

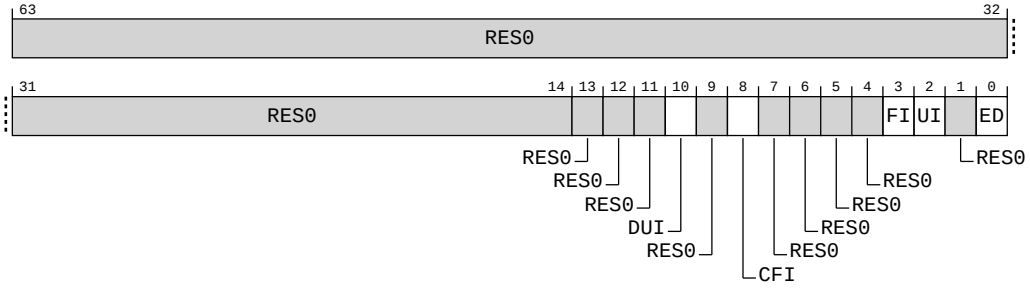

Table B-56: ERR0CTLR bit descriptions

Bits	Name	Description	Reset
[63:11]	**RES0**	Reserved	**RES0**
[10]	DUI	Error recovery interrupt for Deferred errors enable. When ext-ERR<n>FR.DUI == 0b10, this control applies to errors arising from both reads and writes. When enabled, the error recovery interrupt is generated for all errors recorded as Deferred error. **0b0** Error recovery interrupt not generated for Deferred errors. **0b1** Error recovery interrupt generated for Deferred errors. The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.	x
[9]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[8]	CFI	Fault handling interrupt for Corrected errors enable. When ext-ERR<n>FR.CFI == `0b10`, this control applies to errors arising from both reads and writes. When enabled: • If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see ext-ERR<n>MISC0. • Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error. **0b0** Fault handling interrupt not generated for Corrected errors. **0b1** Fault handling interrupt generated for Corrected errors. The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.	x
[7:4]	**RES0**	Reserved	**RES0**
[3]	FI	Fault handling interrupt enable. When ext-ERR<n>FR.FI == `0b10`, this control applies to errors arising from both reads and writes. When enabled: • The fault handling interrupt is generated for all errors recorded as either Deferred error or Uncorrected error. • If the fault handling interrupt for Corrected errors control is not implemented: ◦ If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1. ◦ Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error. **0b0** Fault handling interrupt disabled. **0b1** Fault handling interrupt enabled. The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.	x
[2]	UI	Uncorrected error recovery interrupt enable. When ext-ERR<n>FR.UI == `0b10`, this control applies to errors arising from both reads and writes. When enabled, the error recovery interrupt is generated for all errors recorded as Uncorrected error. **0b0** Error recovery interrupt disabled. **0b1** Error recovery interrupt enabled. The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.	x
[1]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[0]	ED	Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an **IMPLEMENTATION DEFINED** control for error injection. **0b0** Error reporting disabled. **0b1** Error reporting enabled. It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrected errors might result in corrupt data being silently propagated by the node. **Note:** If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this field is set to 0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be **UNKNOWN**.	x

Core RAS	0x8	ERR0CTLR	None

This interface is accessible as follows:

RW

B.3.3 ERR0STATUS, Error Record Primary Status Register

Contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An **IMPLEMENTATION DEFINED** extended error code.

Within this register:

- ERR<n>STATUS.{AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- ERR<n>STATUS.{UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- ERR<n>STATUS.{CI, ER, PN, IERR, SERR} are syndrome fields.

Configurations

ERR0FR describes the features implemented by the node.

Bit descriptions

Figure B-28: core_ras.err0status bit assignments

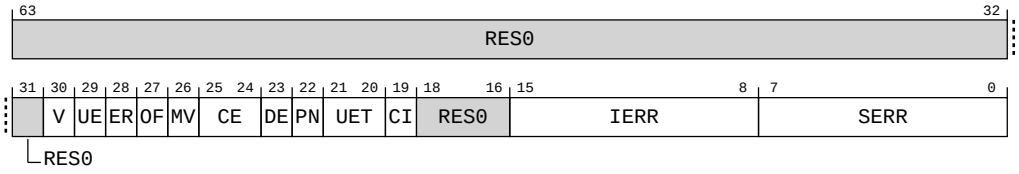

Table B-58: ERR0STATUS bit descriptions

Bits	Name	Description	Reset
[63:31]	RES0	Reserved	RES0

Bits	Name	Description	Reset
[30]	V	Status Register Valid. **0b0** ERR<n>STATUS not valid. **0b1** ERR<n>STATUS valid. At least one error has been recorded. Access to this field is: W1C	0b0
[29]	UE	Uncorrected Error. **0b0** No errors have been detected, or all detected errors have been either corrected or deferred. **0b1** At least one detected error was not corrected and not deferred. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x

Bits	Name	Description	Reset
[28]	ER	Error Reported. **0b0** No in-band error response (External Abort) signaled to the Requester making the access or other transaction. **0b1** An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors. It is **IMPLEMENTATION DEFINED** whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0. **Note:** An in-band error response signaled by the component might be masked and not generate any exception. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero. **When ext-ERR0STATUS.UE == '0' && ext-ERR0STATUS.DE == '0' && this field can be set to 0b1 by a Deferred error** Access to this field is: **UNKNOWN**/WI **When ext-ERR0STATUS.UE == '0' && this field is never set to 0b1 by a Deferred error** Access to this field is: **UNKNOWN**/WI **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x

Bits	Name	Description	Reset
[27]	OF	Overflow. Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs: • A Corrected error counter is implemented, an error is counted, and the counter overflows. • ERR<n>STATUS.V was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded. • ERR<n>STATUS.V was previously 1, and a type of error other than a Corrected error is recorded. Otherwise, this field is unchanged when an error is recorded. If a Corrected error counter is implemented: • A direct write that modifies the counter overflow flag indirectly might set this field to an **UNKNOWN** value. • A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an **UNKNOWN** value. **0b0** Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed. **0b1** Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x
[26]	MV	Miscellaneous Registers Valid. **0b0** ERR<n>MISC<m> not valid. **0b1** The **IMPLEMENTATION DEFINED** contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record. **Note:** If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded. Access to this field is: W1C	0b0

Bits	Name	Description	Reset
[25:24]	CE	Corrected Error. **0b00** No errors were corrected. **0b10** At least one error was corrected. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	xx
[23]	DE	Deferred Error. **0b0** No errors were deferred. **0b1** At least one error was not corrected and deferred. Support for deferring errors is **IMPLEMENTATION DEFINED**. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x
[22]	PN	Poison. **0b0** Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded. **0b1** Uncorrected error or Deferred error recorded because a poison value was detected. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero. **When ext-ERR0STATUS.V == '0' || (ext-ERR0STATUS.DE == '0' && ext-ERR0STATUS.UE == '0')** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x

Bits	Name	Description	Reset
[21:20]	UET	Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error. **0b00** Uncorrected error, Uncontainable error (UC). **0b01** Uncorrected error, Unrecoverable error (UEU). **0b10** Uncorrected error, Latent or Restartable error (UEO). **0b11** Uncorrected error, Signaled or Recoverable error (UER). **Note:** Software might use the information in the error record registers to determine what recovery is necessary. When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero. **When ext-ERR0STATUS.V == '0' || ext-ERR0STATUS.UE == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	xx
[19]	CI	Critical Error. Indicates whether a critical error condition has been recorded. **0b0** No critical error condition. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: W1C	x
[18:16]	**RES0**	Reserved	**RES0**
[15:8]	IERR	**IMPLEMENTATION DEFINED** error code. Used with any primary error code ERR<n>STATUS.SERR value. Further **IMPLEMENTATION DEFINED** information can be placed in the ERR<n>MISC<m> registers. The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is **UNKNOWN**. **Note:** This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: RW	8{x}

Bits	Name	Description	Reset
[7:0]	SERR	Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry. **0b00000110** Data value from associative memory. For example, ECC error on cache data. **0b00000111** Address/control value from associative memory. For example, ECC error on cache tag. **0b00001000** Data value from a TLB. For example, ECC error on TLB data. **0b00001100** Data value from (non-associative) external memory. For example, ECC error in SDRAM. **0b00010010** Error response from Completer of access. For example, error response from cache write-back. **0b00010101** Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further. **When ext-ERR0STATUS.V == '0'** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: RW	8{x}

Access

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is **IMPLEMENTATION DEFINED**. See also ext-ERR<n>PFGF.SYN.

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.

- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as **UNKNOWN** where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as **UNKNOWN** values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the W1C fields that are nonzero in the read value.
- Write zero to all the W1C fields that are zero in the read value.
- Write zero to all the RW fields.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also ext-ERR<n>PFGF.SYN.

Accessibility

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also ext-ERR<n>PFGF.SYN.

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.
- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as UNKNOWN where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the W1C fields that are nonzero in the read value.
- Write zero to all the W1C fields that are zero in the read value.
- Write zero to all the RW fields.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also ext-ERR<n>PFGF.SYN.

Component	Offset	Instance	Range
Core RAS	0x10	ERR0STATUS	None

Access

Reads from ERR<n>MISC0 return an **IMPLEMENTATION DEFINED** value and writes have **IMPLEMENTATION DEFINED** behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<q>PFGF.MV is 1, then some parts of this register are read/write when ext-ERR<n>STATUS.MV is 1. See ext-ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ext-ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

Accessibility

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<q>PFGF.MV is 1, then some parts of this register are read/write when ext-ERR<n>STATUS.MV is 1. See ext-ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

Figure B-33: core_ras.err0pfgf bit assignments

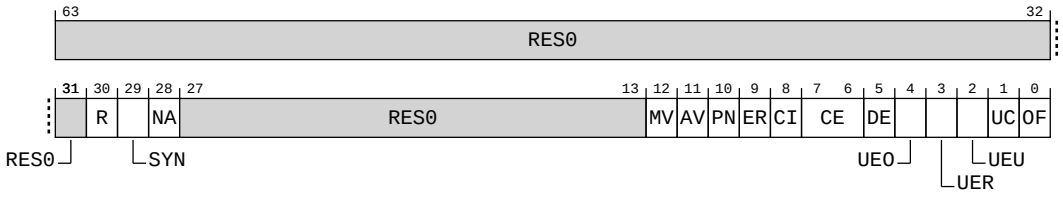

Table B-68: ERR0PFGF bit descriptions

Bits	Name	Description	Reset
[63:31]	**RES0**	Reserved	**RES0**
[30]	R	Restartable. Support for Error Generation Counter restart mode. **0b1** Error Generation Counter restart mode is implemented and is controlled by ext-ERR<n>PFGCTL.R. ext-ERR<n>PFGCTL.R is a read/write field.	x

Bits	Name	Description	Reset
[29]	SYN	Syndrome. Fault syndrome injection. **0b0** When an injected error is recorded, the node sets ext-ERR<n>STATUS.{IERR, SERR} to IMPLEMENTATION DEFINED values. ext-ERR<n>STATUS.{IERR, SERR} are **UNKNOWN** when ext-ERR<n>STATUS.V is 0.	x
[28]	NA	No access required. Defines whether this component fakes detection of the error on an access to the component or spontaneously in the fault injection state. **0b0** The component fakes detection of the error on an access to the component.	x
[27:13]	**RES0**	Reserved	**RES0**
[12]	MV	Miscellaneous syndrome. Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded. It is **IMPLEMENTATION DEFINED** which ERR<n>MISC<m> syndrome fields, if any, are updated by the node when an injected error is recorded. Some syndrome fields might always be updated by the node when an error, including an injected error, is recorded. For example, a corrected error counter might always be updated when any countable error, including a injected countable error, is recorded. **0b0** When an injected error is recorded, the node might update the ERR<n>MISC<m> registers: • If any syndrome is recorded by the node in the ERR<n>MISC<m> registers, then ext-ERR<n>STATUS.MV is set to 1. • Otherwise, ext-ERR<n>STATUS.MV is unchanged. If the node always sets ext-ERR<n>STATUS.MV to 1 when recording an injected error then ext-ERR<n>PFGCTL.MV might be RAO/WI. Otherwise ext-ERR<n>PFGCTL.MV is **RES0**.	x
[11]	AV	Address syndrome. Defines whether software can control the address recorded in ext-ERR<n>ADDR when an injected error is recorded. **0b0** When an injected error is recorded, the node might record an address in ext-ERR<n>ADDR. If an address is recorded in ext-ERR<n>ADDR, then ext-ERR<n>STATUS.AV is set to 1. Otherwise, ext-ERR<n>ADDR and ext-ERR<n>STATUS.AV are unchanged. If the node always records an address and sets ext-ERR<n>STATUS.AV to 1 when recording an injected error then ext-ERR<n>PFGCTL.AV might be RAO/WI. Otherwise ext-ERR<n>PFGCTL.AV is **RES0**.	x
[10]	PN	Poison flag. Describes how the fault generation feature of the node sets the ext-ERR<n>STATUS.PN status flag. **0b0** When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ext-ERR<n>STATUS.PN to 1. ext-ERR<n>PFGCTL.PN is **RES0**.	x
[9]	ER	Error Reported flag. Describes how the fault generation feature of the node sets the ext-ERR<n>STATUS.ER status flag. **0b0** When an injected error is recorded, the node sets ext-ERR<n>STATUS.ER according to the architecture-defined rules for setting the ER field. ext-ERR<n>PFGCTL.ER is **RES0**.	x

Bits	Name	Description	Reset
[8]	CI	Critical Error flag. Describes how the fault generation feature of the node sets the ext-ERR<n>STATUS.CI status flag. **0b0** When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ext-ERR<n>STATUS.CI to 1. ext-ERR<n>PFGCTL.CI is **RES0**.	x
[7:6]	CE	Corrected Error generation. Describes the types of Corrected error that the fault generation feature of the node can generate. **0b01** The fault generation feature of the node allows generation of a non-specific Corrected error, that is, a Corrected error that is recorded by setting ext-ERR<n>STATUS.CE to 0b10. ext-ERR<n>PFGCTL.CE is a read/write field. The values 0b10 and 0b11 in ext-ERR<n>PFGCTL.CE are reserved.	xx
[5]	DE	Deferred Error generation. Describes whether the fault generation feature of the node can generate Deferred errors. **0b1** The fault generation feature of the node allows generation of Deferred errors. ext-ERR<n>PFGCTL.DE is a read/write field.	x
[4]	UEO	Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate Latent or Restartable errors. **0b0** The fault generation feature of the node does not generate Latent or Restartable errors. ext-ERR<n>PFGCTL.UEO is **RES0**.	x
[3]	UER	Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate Signaled or Recoverable errors. **0b0** The fault generation feature of the node does not generate Signaled or Recoverable errors. ext-ERR<n>PFGCTL.UER is **RES0**.	x
[2]	UEU	Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate Unrecoverable errors. **0b1** The fault generation feature of the node allows generation of Unrecoverable errors. ext-ERR<n>PFGCTL.UEU is a read/write field.	x
[1]	UC	Uncontainable Error generation. Describes whether the fault generation feature of the node can generate Uncontainable errors. **0b1** The fault generation feature of the node allows generation of Uncontainable errors. ext-ERR<n>PFGCTL.UC is a read/write field.	x
[0]	OF	Overflow flag. Describes how the fault generation feature of the node sets the ext-ERR<n>STATUS.OF status flag. **0b0** When an injected error is recorded, the node sets ext-ERR<n>STATUS.OF according to the architecture-defined rules for setting the OF field. ext-ERR<n>PFGCTL.OF is **RES0**.	x

This interface is accessible as follows:

RW

B.3.10 ERRGSR, Error Group Status Register

Shows the status for the records in the group.

Configurations

ERRGSR is implemented only as part of a memory-mapped group of error records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

Bit descriptions

Figure B-36: core_ras.erriidr bit assignments

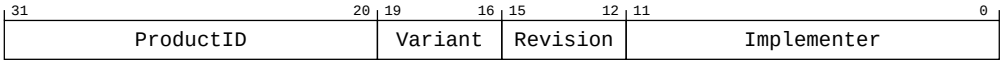

Table B-74: ERRIIDR bit descriptions

Bits	Name	Description	Reset
[31:20]	ProductID	Part number, bits [11:0]. The part number is selected by the designer of the component. If ext-ERRPIDR0 and ext-ERRPIDR1 are implemented, ext-ERRPIDR0.PART_0 matches bits [7:0] of ERRIIDR.ProductID and ext-ERRPIDR1.PART_1 matches bits [11:8] of ERRIIDR.ProductID.	`12{x}`
[19:16]	Variant	Component major revision. This field distinguishes product variants or major revisions of the product. If ext-ERRPIDR2 is implemented, ext-ERRPIDR2.REVISION matches ERRIIDR.Variant.	`xxxx`
[15:12]	Revision	Component minor revision. This field distinguishes minor revisions of the product. If ext-ERRPIDR3 is implemented, ext-ERRPIDR3.REVAND matches ERRIIDR.Revision.	`xxxx`
[11:0]	Implementer	Contains the JEP106 code of the company that implemented the RAS component. For an Arm implementation, this field has the value `0x43B`. Bits [11:8] contain the JEP106 continuation code of the implementer, and bits [6:0] contain the JEP106 identity code of the implementer. Bit 7 is **RES0**. If ext-ERRPIDR4 is implemented, ext-ERRPIDR2 is implemented, and ext-ERRPIDR1 is implemented, ext-ERRPIDR4.DES_2 matches bits [11:8] of ERRIIDR.Implementer, ext-ERRPIDR2.DES_1 matches bits [6:4] of ERRIIDR.Implementer, and ext-ERRPIDR1.DES_0 matches bits [3:0] of ERRIIDR.Implementer.	`12{x}`

This interface is accessible as follows:

RO

B.3.12 ERRDEVAFF, Device Affinity Register

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of AArch64-MPIDR_EL1 or part of AArch64-MPIDR_EL1:

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as AArch64-MPIDR_EL1, and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of AArch64-MPIDR_EL1, and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in AArch64-MPIDR_EL1.{Aff3,Aff2}, and these values are equal to ERRDEVAFF.{Aff3,Aff2}.
- ERRDEVAFF.Aff1 is nonzero and not 0x80, and ERRDEVAFF.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is 0b100, then the group of error records has affinity with the up-to 8 PEs that have AArch64-MPIDR_EL1.Aff1[7:3] == ERRDEVAFF.Aff1[7:3].

If RAS System Architecture v1.1 is not implemented, ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

Configurations

ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

Note

Where the reset reads xxxx, see individual bits

Bit descriptions

Figure B-49: ext_pmpcssr bit assignments

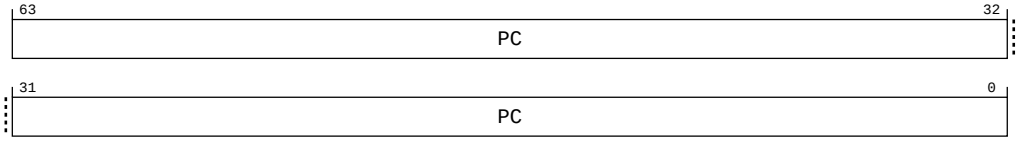

Table B-101: PMPCSSR bit descriptions

Bits	Name	Description	Reset
[63:0]	PC	Sampled PC. The instruction address for the sampled instruction. The sampled instruction must be an instruction recently executed by the PE. The architecture does not require that all instructions are eligible for sampling. However, it must be possible to reference instructions at branch targets. The branch target for a conditional branch instruction that fails its Condition code check is the instruction following the conditional branch target. The sampled instruction must be architecturally executed. However, in exceptional circumstances, such as a change in security state or other boundary condition, it is permissible to sample an instruction that was speculatively executed and not architecturally executed. **Note:** The ARM architecture does not define recently executed.	64{x}

Accessibility

PMPCSSR is set to an UNKNOWN value by a read of the EDPCSRlo or PMPCSR[31:0] register.

Component	Offset
PMU	0x600

This interface is accessible as follows:

RO

B.4.2 PMCIDSSR, Snapshot CONTEXTIDR_EL1 Sample Register

Captured copy of the CONTEXTIDR_EL1 register.

The value captured must relate to the instruction captured in PMPCSSR.

Configurations

This register is available in all configurations.

Bit descriptions

Figure B-51: ext_pmsssr bit assignments

Table B-105: PMSSSR bit descriptions

Bits	Name	Description	Reset
[31:1]	RES0	Reserved	RES0

Bits	Name	Description	Reset
[0]	NC	No capture. Indicates whether the PMU counters have been captured. **0b0** PMU counters captured. **0b1** PMU counters not captured. The event counters are only not captured by the PE in the event of a security violation. The external Monitor is responsible for keeping track of whether it managed to capture the snapshot registers from the PE. PMSSR.NC does not reflect the status of the captured Program Counter Sample registers. PMSSR.NC is reset to 1 by PE Warm reset, but is overwritten at the first capture. Tools need to be aware that capturing over reset or power-down might lose data, as they are reliant on software saving and restoring the PMU state (including PMSSCR). There is no sampled sticky reset bit.	0b1

Accessibility

Component	Offset
PMU	0x610

This interface is accessible as follows:

RO

B.4.4 PMOVSSR, PMU Overflow Status Snapshot Register

Captured copy of PMOVSR. Once captured, the value in PMOVSSR is unaffected by writes to PMOVSSET_EL0 and PMOVSCLR_EL0.

Configurations

If PMSSRR is not implemented, PMOVSSR is optional.

Figure B-74: ext_pmcfgr bit assignments

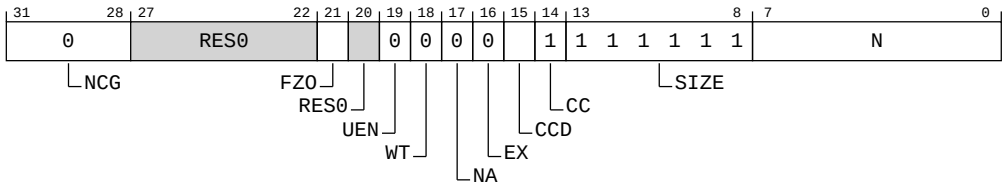

Table B-151: PMCFGR bit descriptions

Bits	Name	Description	Reset
[31:28]	NCG	This feature is not supported, so this field is **RAZ**. **0b0000**	0b0000
[27:22]	**RES0**	Reserved	**RES0**
[21]	FZO	Freeze-on-overflow supported. Defined values are: **0b1** Freeze-on-overflow mechanism is supported. ext-PMCR_EL0.FZO is RW.	x
[20]	**RES0**	Reserved	**RES0**
[19]	UEN	User-mode Enable Register supported. AArch64-PMUSERENR_EL0 is not visible in the external debug interface, so this bit is **RAZ**. **0b0**	0b0
[18]	WT	This feature is not supported, so this bit is **RAZ**. **0b0**	0b0
[17]	NA	This feature is not supported, so this bit is **RAZ**. **0b0**	0b0
[16]	EX	Export supported. Value is **IMPLEMENTATION DEFINED**. **0b0** ext-PMCR_EL0.X is **RES0**.	0b0
[15]	CCD	Cycle counter has prescale. This field is **RAZ** **0b0** ext-PMCR_EL0.D is **RES0**.	x
[14]	CC	Dedicated cycle counter (counter 31) supported. **0b1**	0b1
[13:8]	SIZE	Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit. From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111. This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses. **0b111111**	0b111111
[7:0]	N	Number of counters implemented in addition to the cycle counter, ext-PMCCNTR_EL0. The maximum number of event counters is 31. **0b00010100** Twenty PMU Counters Implemented **0b00000110** Six PMU Counters Implemented	8{x}

Access

Bit descriptions

Figure B-75: ext_pmcr_el0 bit assignments

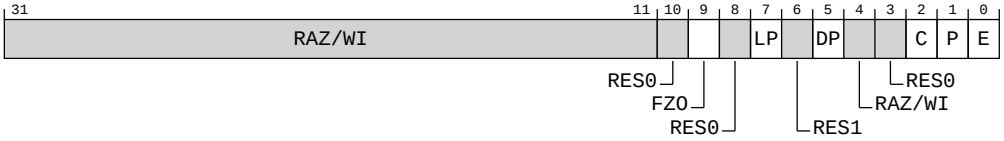

Table B-153: PMCR_EL0 bit descriptions

Bits	Name	Description	Reset
[31:11]	**RAZ/WI**	Reserved	**RAZ/WI**
[10]	**RES0**	Reserved	**RES0**
[9]	FZO	Freeze-on-overflow. Stop event counters on overflow. In the description of this field: • If EL2 is implemented and is using AArch64, PMN is AArch64-MDCR_EL2.HPMN. • If EL2 is not implemented, PMN is PMCR_EL0.N. **0b0** Do not freeze on overflow. **0b1** Event counter ext-PMEVCNTR<n>_EL0 does not count when AArch64-PMOVSCLR_EL0[(PMN-1):0] is nonzero and n is in the range of affected event counters. If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)]. This field does not affect the operation of other event counters and AArch64-PMCCNTR_EL0. The operation of this field applies even when EL2 is disabled in the current Security state.	x
[8]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[7]	LP	Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit. In the description of this field: • If EL2 is implemented and is using AArch64, PMN is AArch64-MDCR_EL2.HPMN. • If EL2 is not implemented, PMN is PMCR_EL0.N. **0b0** Event counter overflow on increment that causes unsigned overflow of ext-PMEVCNTR<n>_EL0[31:0]. **0b1** Event counter overflow on increment that causes unsigned overflow of ext-PMEVCNTR<n>_EL0[63:0]. If PMN is not 0, this bit affects the operation of event counters in the range [0 .. (PMN-1)]. The field does not affect the operation of other event counters and ext-PMCCNTR_EL0. The operation of this field applies even when EL2 is disabled in the current Security state.	x
[6]	**RES1**	Reserved	**RES1**
[5]	DP	Disable cycle counter when event counting is prohibited. The possible values of this bit are: **0b0** Cycle counting by ext-PMCCNTR_EL0 is not affected by this mechanism. **0b1** Cycle counting by ext-PMCCNTR_EL0 is disabled in prohibited regions: • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and AArch64-MDCR_EL2.HPMD is 1, then cycle counting by ext-PMCCNTR_EL0 is disabled at EL2. • If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and AArch64-MDCR_EL3.MPMX is 1, then cycle counting by ext-PMCCNTR_EL0 is disabled at EL3. • If EL3 is implemented, AArch64-MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or AArch64-MDCR_EL3.MPMX is 0, then cycle counting by ext-PMCCNTR_EL0 is disabled at EL3 and in Secure state. If AArch64-MDCR_EL2.HPMN is not 0, this is when event counting by event counters in the range [0.. (AArch64-MDCR_EL2.HPMN-1)] is prohibited. For more information, see *Prohibiting event counting* in the *Arm® Architecture Reference Manual for A-profile architecture*.	x
[4]	**RAZ/WI**	Reserved	**RAZ/WI**
[3]	**RES0**	Reserved	**RES0**

Bits	Name	Description	Reset
[2]	C	Cycle counter reset. The effects of writing to this bit are: **0b0** No action. **0b1** Reset ext-PMCCNTR_EL0 to zero. **Note:** Resetting ext-PMCCNTR_EL0 does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset. Access to this field is: WO/**RAZ**	0b0
[1]	P	Event counter reset. The effects of writing to this bit are: **0b0** No action. **0b1** Reset all event counters, not including ext-PMCCNTR_EL0, to zero. **Note:** Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the value of AArch64-MDCR_EL2.HLP, or PMCR_EL0.LP is ignored and bits [63:0] of all affected event counters are reset. Access to this field is: WO/**RAZ**	0b0
[0]	E	Enable. In the description of this field: • If EL2 is implemented and is using AArch64, PMN is AArch64-MDCR_EL2.HPMN. • If EL2 is not implemented, PMN is PMCR_EL0.N. **0b0** ext-PMCCNTR_EL0 is disabled and event counters ext-PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are disabled. **0b1** ext-PMCCNTR_EL0 and event counters ext-PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are enabled by ext-PMCNTENSET_EL0. If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)]. This field does not affect the operation of other event counters. The operation of this field applies even when EL2 is disabled in the current Security state.	0b0

B.4.30 PMCEID2, Performance Monitors Common Event Identification register 2

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

For more information about the Common events and the use of the PMCEIDn registers, see *The PMU event number space and common events* in the *Arm® Architecture Reference Manual for A-profile architecture*.

Configurations

External register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register A.7.3 PMCEID0_EL0, Performance Monitors Common Event Identification register 0 on page 399 bits [63:32].

B.5 External Debug registers summary

The summary table provides an overview of all memory-mapped Debug registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Table B-191: Debug registers summary

Offset	Name	Reset	Width	Description
0x020	EDESR	–	32-bit	External Debug Event Status Register
0x024	EDECR	–	32-bit	External Debug Execution Control Register
0x030	EDWAR[31:0]	–	32-bit	External Debug Watchpoint Address Register
0x034	EDWAR[63:32]	–	32-bit	External Debug Watchpoint Address Register
0x080	DBGDTRRX_EL0	–	32-bit	Debug Data Transfer Register, Receive
0x084	EDITR	–	32-bit	External Debug Instruction Transfer Register
0x088	EDSCR	–	32-bit	External Debug Status and Control Register
0x08C	DBGDTRTX_EL0	–	32-bit	Debug Data Transfer Register, Transmit
0x090	EDRCR	–	32-bit	External Debug Reserve Control Register
0x098	EDECCR	–	32-bit	External Debug Exception Catch Control Register
0x300	OSLAR_EL1	–	32-bit	OS Lock Access Register
0x310	EDPRCR	–	32-bit	External Debug Power/Reset Control Register
0x314	EDPRSR	–	32-bit	External Debug Processor Status Register
0x400	DBGBVR0_EL1[63:0]	–	64-bit	Debug Breakpoint Value Registers

Bit descriptions

Figure B-94: ext_edrcr bit assignments

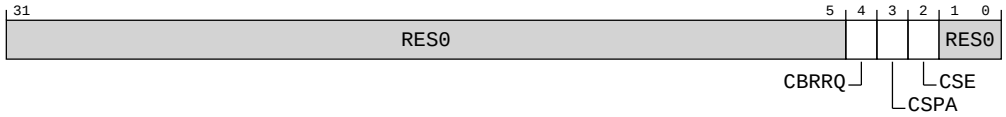

Table B-192: EDRCR bit descriptions

Bits	Name	Description	Reset
[31:5]	**RES0**	Reserved	**RES0**
[4]	CBRRQ	Allow imprecise entry to Debug state. The actions on writing to this bit are: **0b0** No action. **0b1** Allow imprecise entry to Debug state, for example by canceling pending bus accesses. 'Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1. This feature is optional and implemented on ' + $Name + '.'	x

Bits	Name	Description	Reset
[3]	CSPA	Clear Sticky Pipeline Advance. This bit is used to clear the ext-EDSCR.PipeAdv bit to 0. The actions on writing to this bit are: **0b0** No action. **0b1** Clear the ext-EDSCR.PipeAdv bit to 0.	x
[2]	CSE	Clear Sticky Error. Used to clear the ext-EDSCR cumulative error bits to 0. The actions on writing to this bit are: **0b0** No action. **0b1** Clear the ext-EDSCR.{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the ext-EDSCR.ITO bit, to 0.	x
[1:0]	**RES0**	Reserved	**RES0**

Accessibility

Component	Offset	Instance	Range

Bit descriptions

Figure B-95: ext_edprcr bit assignments

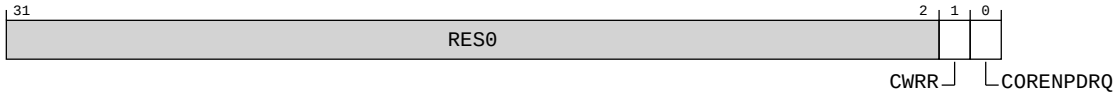

Table B-194: EDPRCR bit descriptions

Bits	Name	Description	Reset
[31:2]	**RES0**	Reserved	**RES0**
[1]	CWRR	Warm reset request. The extent of the reset is **IMPLEMENTATION DEFINED**, but must be one of: • The request is ignored. • Only this PE is Warm reset. • This PE and other components of the system, possibly including other PEs, are Warm reset. Arm deprecates use of this bit, and recommends that implementations ignore the request. **0b0** No action. **0b1** Request Warm reset. This field is in the Core power domain The PE ignores writes to this bit if any of the following are true: • ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented. In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal. **When OSLockStatus()** Access to this field is: **RAZ/WI** **Otherwise** Access to this field is: WO/**RAZ**	0b0

Bits	Name	Description	Reset
[0]	CORENPDRQ	Core no powerdown request. Requests emulation of powerdown. This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the **IMPLEMENTATION DEFINED** nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1. **0b0** If the system responds to a powerdown request, it powers down Core power domain. **0b1** If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain. When this bit reads as **UNKNOWN**, the PE ignores writes to this bit. This field is in the Core power domain, and permitted accesses to this field map to the AArch32-DBGPRCR.CORENPDRQ and AArch64-DBGPRCR_EL1.CORENPDRQ fields. In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal. It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see *Core power domain power states* in the *Arm® Architecture Reference Manual for A-profile architecture*. **Note:** Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted. **When OSLockStatus()** Access to this field is: **UNKNOWN**/WI **Otherwise** Access to this field is: RW	x [1]

Accessibility

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

Component	Offset	Instance	Range
Debug	0x310	EDPRCR	None

This interface is accessible as follows:

When IsCorePowered()

RW

Otherwise

ERROR

[1] On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is an **IMPLEMENTATION DEFINED** choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

B.5.3 MIDR_EL1, Main ID Register

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configurations

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch64 System register A.5.1 MIDR_EL1, Main ID Register on page 270 bits [31:0].

B.6 External AMU registers summary

The summary table provides an overview of all memory-mapped AMU registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

Bit descriptions

Figure B-121: ext_amcfgr bit assignments

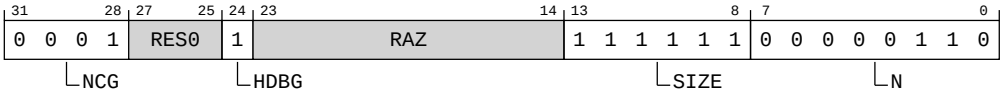

Table B-249: AMCFGR bit descriptions

Bits	Name	Description	Reset
[31:28]	NCG	Defines the number of counter groups. The following value is specified for this product. **0b0001** Two counter groups are implemented	0b0001
[27:25]	**RES0**	Reserved	**RES0**
[24]	HDBG	Halt-on-debug supported. This feature must be supported, and so this bit is 0b1. **0b1** ext-AMCR.HDBG is read/write.	0b1
[23:14]	**RAZ**	Reserved	**RAZ**
[13:8]	SIZE	Defines the size of activity monitor event counters. The size of the activity monitor event counters implemented by the Activity Monitors Extension is [AMCFGR.SIZE + 1]. The counters are 64-bit. **Note:** Software also uses this field to determine the spacing of counters in the memory-map. The counters are at doubleword-aligned addresses. **0b111111**	0b111111
[7:0]	N	Defines the number of activity monitor event counters. The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR.N + 1]. **0b00000110** Seven activity monitor event counters	0x06

Accessibility

B.7 External ETE registers summary

The summary table provides an overview of all memory-mapped ETE registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

B.8 External ROM table registers summary

The summary table provides an overview of all memory-mapped ROM table registers in the core.

For more information on registers listed in the table, click on the link associated with the register name.

If a register does not have a link in the summary table, you can find more information about this Architecturally defined register in the *Arm® Architecture Reference Manual for A-profile architecture*.

For registers without a listed reset value, refer to the individual field resets documented on the register description pages or to the *Arm® Architecture Reference Manual for A-profile architecture*.

B.8.1 ROMENTRY0, Class 0x9 ROM Table Entries

A Class 0x9 ROM Table contains up to 512 ROM Table entries. Each entry that is present, ext-ROMENTRY<n>, provides the address offset of the address space of one CoreSight component, component <n>, along with information about its power domain.

The series of ROM Table entries starts at the base address of the Class 0x9 ROM Table:

- The first entry, entry 0, has offset 0x000.
- ext-ROMENTRY<n> has the offset 0x000 + <n>×4, where 0 ≤ <n> ≤ 511.
- If the number of components, N, is lower than the maximum supported number, 512, the offsets of the ROM Table entries are in the following range:
  - ROM Table entries representing components have offsets from 0x000 to (N-1)×4.
  - The ext-ROMENTRY<n> at offset N×4, which has a PRESENT field with the value 0b00, indicates the end of the ROM Table.
- If the number of components is equal to the maximum supported number, the ROM Table entries have offsets from 0x000 to 0x7FC. If a ROM Table entry is present at offset 0x7FC, its PRESENT field must have a value of either 0b00 or 0b11, and it must be interpreted as the final entry of the ROM Table, even if its PRESENT field has the value 0b11.

A component that requires differentiation between external and internal accesses may provide two views, one for internal and one for external accesses. For these components, Arm strongly recommends that ROM Tables provide a pointer only to the external view.

Configurations

If ext-DEVID.FORMAT has the value 0x0, ext-ROMENTRY<n> are 512 32-bit registers.

This value is reported when the complex is configured with two cores.	The reset values can be the following: 0b00000000000000000000, 0b00000000000010010000, respective to the value.
[11:3]	**RES0**	Reserved	**RES0**
[2]	POWERIDVALID	Indicates if the Power domain ID field contains a Power domain ID. **0b0** A power domain ID is not provided.	0b0

Bits	Name	Description	Reset
[1:0]	PRESENT	Indicates whether an entry is present at this location in the ROM Table. **0b00** The ROM entry is not present. This value is reported when the complex is configured with one core. **0b11** The ROM entry is present. This value is reported when the complex is configured with two cores.	The reset values can be the following: 0b00, 0b11, respective to the value.

Accessibility

A ROM Table does not have to use power domain IDs. If none of the ROM Table entries provides a power domain ID, all the components that pointed to by the ROM Table are in the same power domain as the ROM Table.

Component	Offset
ROM table	0x10

This interface is accessible as follows:

RO

B.8.6 ROMENTRY5, Class 0x9 ROM Table Entries

A Class 0x9 ROM Table contains up to 512 ROM Table entries. Each entry that is present, ext-ROMENTRY<n>, provides the address offset of the address space of one CoreSight component, component <n>, along with information about its power domain.

The series of ROM Table entries starts at the base address of the Class 0x9 ROM Table:

- The first entry, entry 0, has offset 0x000.
- ext-ROMENTRY<n> has the offset 0x000 + <n>×4, where 0 ≤ <n> ≤ 511.
- If the number of components, N, is lower than the maximum supported number, 512, the offsets of the ROM Table entries are in the following range:
  - ROM Table entries representing components have offsets from 0x000 to (N-1)×4.
  - The ext-ROMENTRY<n> at offset N×4, which has a PRESENT field with the value 0b00, indicates the end of the ROM Table.
- If the number of components is equal to the maximum supported number, the ROM Table entries have offsets from 0x000 to 0x7FC. If a ROM Table entry is present at offset 0x7FC, its PRESENT field must have a value of either 0b00 or 0b11, and it must be interpreted as the final entry of the ROM Table, even if its PRESENT field has the value 0b11.

A component that requires differentiation between external and internal accesses may provide two views, one for internal and one for external accesses. For these components, Arm strongly recommends that ROM Tables provide a pointer only to the external view.

Configurations

If ext-DEVID.FORMAT has the value 0x0, ext-ROMENTRY<n> are 512 32-bit registers.

Figure B-179: ext_romentry5 bit assignments

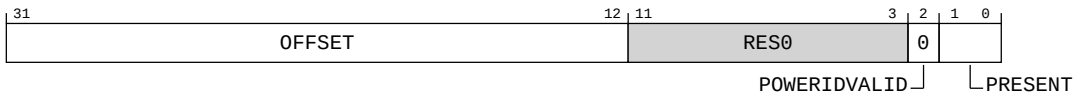

Table B-367: ROMENTRY5 bit descriptions

Bits	Name	Description	Reset
[31:12]	OFFSET	The component address, relative to the base address of this ROM Table. The component address is calculated using the following equation: Component Address = ROM Table Base Address + (OFFSET << 12). If a component occupies more than a single 4KB block, OFFSET points to the 4KB block which contains the Peripheral ID and Component ID registers for the component. Negative values of OFFSET are permitted, using two's complement. **0b00000000000000000000** This value is reported when the complex is configured with one core. **0b00000000000010100000** Core 1 PMU. This value is reported when the complex is configured with two cores.	The reset values can be the following: 0b00000000000000000000, 0b00000000000010100000, respective to the value.
[11:3]	**RES0**	Reserved	**RES0**
[2]	POWERIDVALID	Indicates if the Power domain ID field contains a Power domain ID. **0b0** A power domain ID is not provided.	0b0
[1:0]	PRESENT	Indicates whether an entry is present at this location in the ROM Table. **0b00** The ROM entry is not present. This value is reported when the complex is configured with one core. **0b11** The ROM entry is present. This value is reported when the complex is configured with two cores.	The reset values can be the following: 0b00, 0b11, respective to the value.

Accessibility

A ROM Table does not have to use power domain IDs. If none of the ROM Table entries provides a power domain ID, all the components that pointed to by the ROM Table are in the same power domain as the ROM Table.

Component	Offset
ROM table	0x14

This interface is accessible as follows:

RO

B.8.7 ROMENTRY6, Class 0x9 ROM Table Entries

A Class 0x9 ROM Table contains up to 512 ROM Table entries. Each entry that is present, ext-ROMENTRY<n>, provides the address offset of the address space of one CoreSight component, component <n>, along with information about its power domain.

The series of ROM Table entries starts at the base address of the Class 0x9 ROM Table:

- The first entry, entry 0, has offset 0x000.
- ext-ROMENTRY<n> has the offset 0x000 + <n>×4, where 0 ≤ <n> ≤ 511.
- If the number of components, N, is lower than the maximum supported number, 512, the offsets of the ROM Table entries are in the following range:
  - ROM Table entries representing components have offsets from 0x000 to (N-1)×4.
  - The ext-ROMENTRY<n> at offset N×4, which has a PRESENT field with the value 0b00, indicates the end of the ROM Table.
- If the number of components is equal to the maximum supported number, the ROM Table entries have offsets from 0x000 to 0x7FC. If a ROM Table entry is present at offset 0x7FC, its PRESENT field must have a value of either 0b00 or 0b11, and it must be interpreted as the final entry of the ROM Table, even if its PRESENT field has the value 0b11.

A component that requires differentiation between external and internal accesses may provide two views, one for internal and one for external accesses. For these components, Arm strongly recommends that ROM Tables provide a pointer only to the external view.

Configurations

If ext-DEVID.FORMAT has the value 0x0, ext-ROMENTRY<n> are 512 32-bit registers.
