constant integer v = UInt('010':Rv);
constant integer esize = 32 << UInt(sz);
constant integer n = UInt(Zn:'00');
constant integer m = UInt(Zm:'00');
constant integer offset = UInt(off3);
constant integer nreg = 4;
```

Assembler Symbols

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Wv> Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.

<offs> Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.

<Zn1> For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2.

For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.

<Tb> Is the size specifier, encoded in “sz”:

sz	<Tb>
0	B
1	H

<Zn2> Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.

<Zm1> For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2.

For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
constant integer vectors = VL DIV 8;
constant integer vstride = vectors DIV nreg;
constant bits(32) vbase = X[v, 32];
integer vec = (UInt(vbase) + offset) MOD vstride;
bits(VL) result;

for r = 0 to nreg-1
    constant bits(VL) operand1 = Z[n+r, VL];
    constant bits(VL) operand2 = Z[m+r, VL];
    constant bits(VL) operand3 = ZAvector[vec, VL];
    for e = 0 to elements-1
        bits(esize) sum = Elem[operand3, e, esize];
        for i = 0 to 3
            constant integer element1 = UInt(Elem[operand1, 4 * e + i, esize DIV 4]);
            constant integer element2 = UInt(Elem[operand2, 4 * e + i, esize DIV 4]);
            sum = sum + element1 * element2;
        Elem[result, e, esize] = sum;
    ZAvector[vec, VL] = result;
    vec = vec + vstride;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

UMAX (multiple and single vector)

Multi-vector unsigned maximum by vector

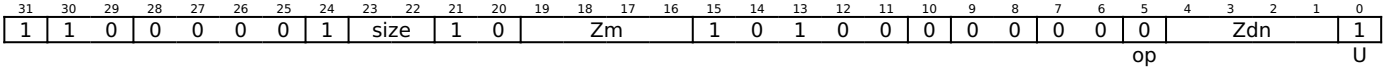
This instruction determines the unsigned maximum of elements of the second source vector and the corresponding elements of the two or four first source vectors and destructively places the results in the corresponding elements of the two or four first source vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

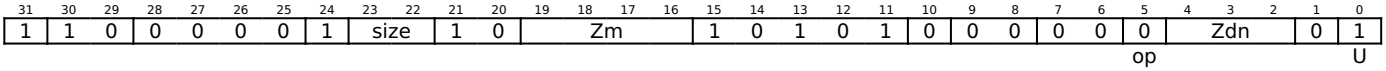
```
UMAX { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << UInt(size);
constant integer dn = UInt(Zdn:'0');
constant integer m = UInt('0':Zm);
constant integer nreg = 2;
constant boolean unsigned = TRUE;
```

Four registers

(FEAT_SME2)



Encoding

```
UMAX { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << UInt(size);
constant integer dn = UInt(Zdn:'00');
constant integer m = UInt('0':Zm);
constant integer nreg = 4;
constant boolean unsigned = TRUE;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm> Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
array [0..3] of bits(VL) results;

for r = 0 to nreg-1
    constant bits(VL) operand1 = Z[dn+r, VL];
    constant bits(VL) operand2 = Z[m, VL];
    for e = 0 to elements-1
        constant bits(esize) op1elt = Elem[operand1, e, esize];
        constant integer element1 = if unsigned then UInt(op1elt) else SInt(op1elt);
        constant bits(esize) op2elt = Elem[operand2, e, esize];
        constant integer element2 = if unsigned then UInt(op2elt) else SInt(op2elt);
        constant integer res = Max(element1, element2);
        Elem[results[r], e, esize] = res<esize-1:0>;

for r = 0 to nreg-1
    Z[dn+r, VL] = results[r];
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

UMLAL (multiple and indexed vector)

Multi-vector unsigned 16-bit integer multiply-add by indexed element to 32-bit integer

This instruction multiplies each unsigned 16-bit element in the one, two, or four first source vectors with each unsigned 16-bit indexed element of the second source vector, widens each product to 32 bits, and destructively adds these values to the corresponding 32-bit elements of the ZA double-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

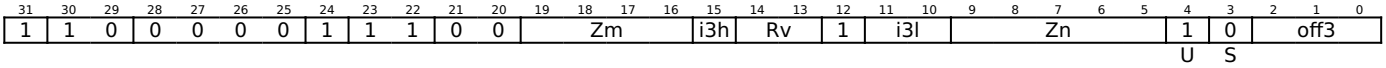
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

One ZA double-vector

(FEAT_SME2)



Encoding

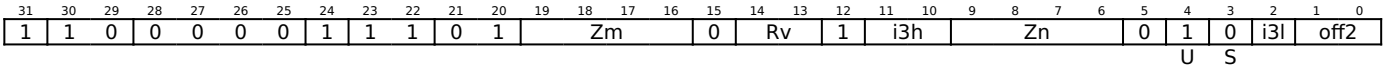
```
UMLAL ZA.S[<Wv>, <offs1>:<offs2>], <Zn>.H, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 32;
constant integer v = UInt('010':Rv);
constant integer n = UInt(Zn);
constant integer m = UInt('0':Zm);
constant integer offset = UInt(off3:'0');
constant integer index = UInt(i3h:i3l);
constant integer nreg = 1;
```

Two ZA double-vectors

(FEAT_SME2)



Encoding

```
UMLAL ZA.S[<Wv>, <offs1>:<offs2>{, VGx2}], { <Zn1>.H-<Zn2>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 32;
constant integer v = UInt('010':Rv);
constant integer n = UInt(Zn:'0');
constant integer m = UInt('0':Zm);
constant integer offset = UInt(off2:'0');
constant integer index = UInt(i3h:i3l);
constant integer nreg = 2;
```

UMLAL (multiple vectors)

Multi-vector unsigned 16-bit integer multiply-add to 32-bit integer

This instruction multiplies each unsigned 16-bit element in the two or four first source vectors with each unsigned 16-bit element in the two or four second source vectors, widens each product to 32 bits, and destructively adds these values to the corresponding 32-bit elements of the ZA double-vector groups.

The double-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo half or quarter the number of ZA array vectors.

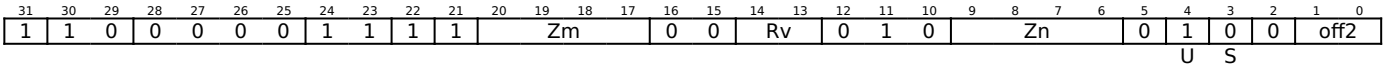
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA double-vectors and Four ZA double-vectors

Two ZA double-vectors

(FEAT_SME2)



Encoding

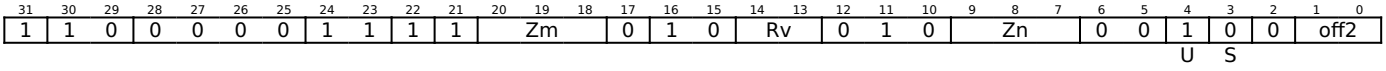
```
UMLAL ZA.S[<Wv>, <offs1>:<offs2>{, VGx2}], { <Zn1>.H-<Zn2>.H }, { <Zm1>.H-<Zm2>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 32;
constant integer v = UInt('010':Rv);
constant integer n = UInt(Zn:'0');
constant integer m = UInt(Zm:'0');
constant integer offset = UInt(off2:'0');
constant integer nreg = 2;
```

Four ZA double-vectors

(FEAT_SME2)



Encoding

```
UMLAL ZA.S[<Wv>, <offs1>:<offs2>{, VGx4}], { <Zn1>.H-<Zn4>.H }, { <Zm1>.H-<Zm4>.H }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 32;
constant integer v = UInt('010':Rv);
constant integer n = UInt(Zn:'00');
constant integer m = UInt(Zm:'00');
constant integer offset = UInt(off2:'0');
constant integer nreg = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.
<offs1>	Is the first vector select offset, encoded as "off2" field times 2.
<offs2>	Is the second vector select offset, encoded as "off2" field times 2 plus 1.

UMLALL (multiple and indexed vector)

Multi-vector unsigned integer multiply-add long long by indexed element

This instruction multiplies each unsigned 8-bit or 16-bit element in the one, two, or four first source vectors with each unsigned 8-bit or 16-bit indexed element of the second source vector, widens each product to 32 bits or 64 bits, and destructively adds these values to the corresponding 32-bit or 64-bit elements of the ZA quad-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 6 classes: One ZA quad-vector of 32-bit elements , One ZA quad-vector of 64-bit elements , Two ZA quad-vectors of 32-bit elements , Two ZA quad-vectors of 64-bit elements , Four ZA quad-vectors of 32-bit elements and Four ZA quad-vectors of 64-bit elements

```

Assembler Symbols

<T> Is the size specifier, encoded in “sz”:

sz	<T>
0	S
1	D

<Wv> Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.

<offs1> Is the first vector select offset, encoded as "o1" field times 4.

<offs4> Is the fourth vector select offset, encoded as "o1" field times 4 plus 3.

<Zn1> For the "Two ZA quad-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2.

For the "Four ZA quad-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.

<Tb> Is the size specifier, encoded in “sz”:

sz	<Tb>
0	B
1	H

<Zn2> Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.

<Zm1> For the "Two ZA quad-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2.

For the "Four ZA quad-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.

<Zm2> Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
constant integer vectors = VL DIV 8;
constant integer vstride = vectors DIV nreg;
constant bits(32) vbase = X[v, 32];
integer vec = (UInt(vbase) + offset) MOD vstride;
bits(VL) result;
vec = vec - (vec MOD 4);

for r = 0 to nreg-1
    constant bits(VL) operand1 = Z[n+r, VL];
    constant bits(VL) operand2 = Z[m+r, VL];
    for i = 0 to 3
        constant bits(VL) operand3 = ZAvector[vec + i, VL];
        for e = 0 to elements-1
            constant integer element1 = UInt(Elem[operand1, 4 * e + i, esize DIV 4]);
            constant integer element2 = UInt(Elem[operand2, 4 * e + i, esize DIV 4]);
            constant bits(esize) product = (element1 * element2)<esize-1:0>;
            Elem[result, e, esize] = Elem[operand3, e, esize] + product;
        ZAvector[vec + i, VL] = result;
    vec = vec + vstride;
```

UMLSL (multiple and indexed vector)

Multi-vector unsigned 16-bit integer multiply-subtract by indexed element from 32-bit integer

This instruction multiplies each unsigned 16-bit element in the one, two, or four first source vectors with each unsigned 16-bit indexed element of the second source vector, widens each product to 32 bits, and destructively subtracts these values from the corresponding 32-bit elements of the ZA double-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to 7.

The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

One ZA double-vector

UMLSLL (multiple and indexed vector)

Multi-vector unsigned integer multiply-subtract long long by indexed element

This instruction multiplies each unsigned 8-bit or 16-bit element in the one, two, or four first source vectors with each unsigned 8-bit or 16-bit indexed element of the second source vector, widens each product to 32 bits or 64 bits, and destructively subtracts these values from the corresponding 32-bit or 64-bit elements of the ZA quad-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The index range is from 0 to one less than the number of elements per 128-bit segment.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 6 classes: One ZA quad-vector of 32-bit elements , One ZA quad-vector of 64-bit elements , Two ZA quad-vectors of 32-bit elements , Two ZA quad-vectors of 64-bit elements , Four ZA quad-vectors of 32-bit elements and Four ZA quad-vectors of 64-bit elements

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.
<offs1>	For the "One ZA quad-vector of 32-bit elements" and "One ZA quad-vector of 64-bit elements" variants: is the first vector select offset, encoded as "off2" field times 4. For the "Four ZA quad-vectors of 32-bit elements", "Four ZA quad-vectors of 64-bit elements", "Two ZA quad-vectors of 32-bit elements", and "Two ZA quad-vectors of 64-bit elements" variants: is the first vector select offset, encoded as "o1" field times 4.
<offs4>	For the "One ZA quad-vector of 32-bit elements" and "One ZA quad-vector of 64-bit elements" variants: is the fourth vector select offset, encoded as "off2" field times 4 plus 3. For the "Four ZA quad-vectors of 32-bit elements", "Four ZA quad-vectors of 64-bit elements", "Two ZA quad-vectors of 32-bit elements", and "Two ZA quad-vectors of 64-bit elements" variants: is the fourth vector select offset, encoded as "o1" field times 4 plus 3.
<Zn>	Is the name of the first source scalable vector register, encoded in the "Zn" field.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	For the "Four ZA quad-vectors of 32-bit elements", "One ZA quad-vector of 32-bit elements", and "Two ZA quad-vectors of 32-bit elements" variants: is the element index, in the range 0 to 15, encoded in the "i4h:i4l" fields. For the "Four ZA quad-vectors of 64-bit elements", "One ZA quad-vector of 64-bit elements", and "Two ZA quad-vectors of 64-bit elements" variants: is the element index, in the range 0 to 7, encoded in the "i3h:i3l" fields.
<Zn1>	For the "Two ZA quad-vectors of 32-bit elements" and "Two ZA quad-vectors of 64-bit elements" variants: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA quad-vectors of 32-bit elements" and "Four ZA quad-vectors of 64-bit elements" variants: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
constant integer vectors = VL DIV 8;
constant integer vstride = vectors DIV nreg;
constant integer eltspersegment = 128 DIV esize;

UMLSLL (multiple and single vector)

Multi-vector unsigned integer multiply-subtract long long by vector

This instruction multiplies each unsigned 8-bit or 16-bit element in the one, two, or four first source vectors with each unsigned 8-bit or 16-bit element in the second source vector, widens each product to 32 bits or 64 bits, and destructively subtracts these values from the corresponding 32-bit or 64-bit elements of the ZA quad-vector groups.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

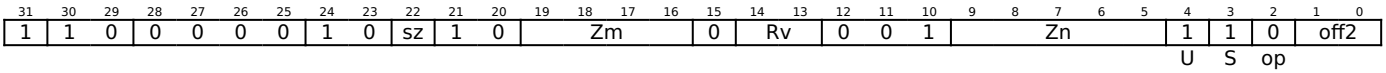
This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 3 classes: One ZA quad-vector , Two ZA quad-vectors and Four ZA quad-vectors

One ZA quad-vector

(FEAT_SME2)



Encoding

```

UMOP4A (2-way)

Unsigned 16-bit integer quarter-tile sum of outer products to 32-bit integer, accumulating

This instruction generates four independent quarter-tile unsigned integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit element ZA tile.
Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $2 \times SVL_S \div 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the second source vectors.
Each 32-bit container of the half-vectors in the first source vectors holds 2 elements of each row of a $SVL_S \div 2 \times 2$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 2 elements of each column of a $2 \times SVL_S \div 2$ sub-matrix. The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products are then destructively added to the 32-bit integer destination tile.
This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

UMOP4A (4-way)

Unsigned integer quarter-tile sum of outer products, accumulating

This instruction generates four independent quarter-tile unsigned integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit unsigned values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively added to the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
This instruction is unpredicated.

UMOP4S (2-way)

Unsigned 16-bit integer quarter-tile sum of outer products to 32-bit integer, subtracting

This instruction generates four independent quarter-tile unsigned integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 32-bit element ZA tile.
Each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $2 \times SVL_S \div 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the second source vectors.
Each 32-bit container of the half-vectors in the first source vectors holds 2 elements of each row of a $SVL_S \div 2 \times 2$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 2 elements of each column of a $2 \times SVL_S \div 2$ sub-matrix. The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products are then destructively subtracted from the 32-bit integer destination tile.
This is equivalent to performing a 2-way dot product and subtract from each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 4 classes: Single and multiple vectors , Single vectors , Multiple and single vectors and Multiple vectors

UMOP4S (4-way)

Unsigned integer quarter-tile sum of outer products, subtracting

This instruction generates four independent quarter-tile unsigned integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit unsigned values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit unsigned values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively subtracted from the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and subtract from each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 8 classes: 32-bit, single and multiple vectors , 32-bit, single vectors , 32-bit, multiple and single vectors , 32-bit, multiple vectors , 64-bit, single and multiple vectors , 64-bit, single vectors , 64-bit, multiple and single vectors and 64-bit, multiple vectors

UMOPA (2-way)

Unsigned 16-bit integer sum of outer products to 32-bit integer, accumulating

This instruction works with a 32-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. The first source holds $SVL_S \times 2$ sub-matrix of unsigned 16-bit integer values, and the second source holds $2 \times SVL_S$ sub-matrix of unsigned 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When a 16-bit source element is inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer sum of outer products is then destructively added to the 32-bit integer destination tile. This is equivalent to performing a 2-way dot product and accumulate to each of the destination tile elements.
Each 32-bit container of the first source vector holds 2 consecutive column elements of each row of a $SVL_S \times 2$ sub-matrix, and each 32-bit container of the second source vector holds 2 consecutive row elements of each column of a $2 \times SVL_S$ sub-matrix.

UMOPA (4-way)

Unsigned integer sum of outer products, accumulating

The 8-bit integer variant works with a 32-bit element ZA tile.
The 16-bit integer variant works with a 64-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of unsigned 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of unsigned 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of unsigned 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of unsigned 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively added to the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.
It has encodings from 2 classes: 32-bit and 64-bit

UQRSHR (four registers)

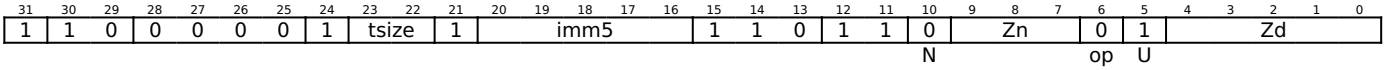
Multi-vector unsigned saturating rounding shift right narrow by immediate

This instruction shifts right by an immediate value the unsigned integer value in each element of the four source vectors, and places the rounded results in the quarter-width destination elements. Each result element is saturated to the quarter-width N-bit element's unsigned integer range 0 to (2^N)-1. The immediate shift amount is an unsigned value in the range 1 to number of bits per source element.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```
UQRSHR <Zd>.<T>, { <Zn1>.<Tb>-<Zn4>.<Tb> }, #<const>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
if tsize == '00' then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << HighestSetBitNZ(tsize);
constant integer n = UInt(Zn:'00');
constant integer d = UInt(Zd);
constant integer shift = (8 * esize) - UInt(tsize:imm5);
```

Assembler Symbols

<Zd> Is the name of the destination scalable vector register, encoded in the "Zd" field.

<T> Is the size specifier, encoded in “tsize”:

tsize	<T>
00	RESERVED
01	B
1x	H

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

URSHL (multiple and single vector)

Multi-vector unsigned rounding shift left by vector

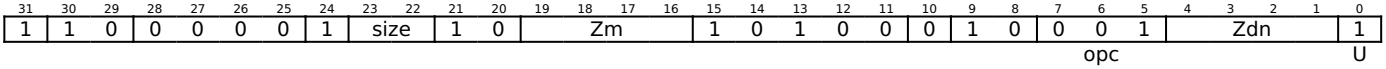
This instruction shifts the unsigned elements of the two or four first source vectors by corresponding elements of the second source vector and destructively places the rounded results in the corresponding elements of the two or four first source vectors. A positive shift amount performs a left shift, otherwise a right shift by the negated shift amount is performed.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

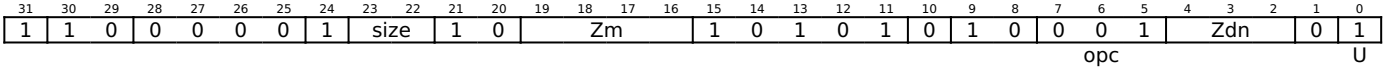
```
URSHL { <Zdn1>.<T>-<Zdn2>.<T> }, { <Zdn1>.<T>-<Zdn2>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << UInt(size);
constant integer dn = UInt(Zdn:'0');
constant integer m = UInt('0':Zm);
constant integer nreg = 2;
```

Four registers

(FEAT_SME2)



Encoding

```
URSHL { <Zdn1>.<T>-<Zdn4>.<T> }, { <Zdn1>.<T>-<Zdn4>.<T> }, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << UInt(size);
constant integer dn = UInt(Zdn:'00');
constant integer m = UInt('0':Zm);
constant integer nreg = 4;
```

Assembler Symbols

<Zdn1> For the "Two registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zdn2> Is the name of the second scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 2 plus 1.

<Zm> Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.

<Zdn4> Is the name of the fourth scalable vector register of the destination and first source multi-vector group, encoded as "Zdn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
array [0..3] of bits(VL) results;

for r = 0 to nreg-1
    constant bits(VL) operand1 = Z[dn+r, VL];
    constant bits(VL) operand2 = Z[m, VL];
    for e = 0 to elements-1
        constant integer element =  UInt(Elem[operand1, e, esize]);
        integer shift = ShiftSat(SInt(Elem[operand2, e, esize]), esize);
        integer res;
        if shift >= 0 then
            res = element << shift;
        else
            shift = -shift;
            res = (element + (1 << (shift - 1))) >> shift;

USDOT (4-way, multiple and indexed vector)

Multi-vector unsigned by signed 8-bit integer dot product by indexed element to 32-bit integer

This instruction computes the dot product of four unsigned 8-bit integer values held in each 32-bit element of the two or four first source vectors and four signed 8-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.

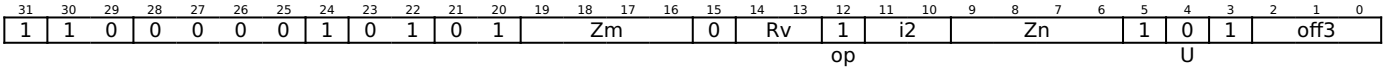
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2)



Encoding

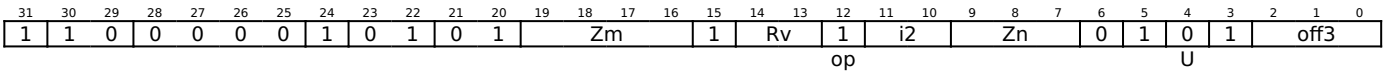
```
USDOT ZA.S[<Wv>, <offs>{, VGx2}], { <Zn1>.B-<Zn2>.B }, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer esize = 32;
constant integer n = UInt(Zn:'0');
constant integer m = UInt('0':Zm);
constant integer offset = UInt(off3);
constant integer index = UInt(i2);
constant integer nreg = 2;
```

Four ZA single-vectors

(FEAT_SME2)



Encoding

```
USDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.B-<Zn4>.B }, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer esize = 32;
constant integer n = UInt(Zn:'00');
constant integer m = UInt('0':Zm);
constant integer offset = UInt(off3);
constant integer index = UInt(i2);
constant integer nreg = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the immediate index of a 32-bit group of four 8-bit values within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

<Zn4> Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();

```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm1>	For the "Two ZA single-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 2. For the "Four ZA single-vectors" variant: is the name of the first scalable vector register of the second source multi-vector group, encoded as "Zm" times 4.
<Zm2>	Is the name of the second scalable vector register of the second source multi-vector group, encoded as "Zm" times 2 plus 1.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.

<Zm4> Is the name of the fourth scalable vector register of the second source multi-vector group, encoded as "Zm" times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
constant integer vectors = VL DIV 8;
constant integer vstride = vectors DIV nreg;
constant bits(32) vbase = X[v, 32];
integer vec = (UInt(vbase) + offset) MOD vstride;
bits(VL) result;

for r = 0 to nreg-1
    constant bits(VL) operand1 = Z[n+r, VL];
    constant bits(VL) operand2 = Z[m+r, VL];
    constant bits(VL) operand3 = ZAvector[vec, VL];
    for e = 0 to elements-1
        bits(esize) sum = Elem[operand3, e, esize];
        for i = 0 to 3
            constant integer element1 = UInt(Elem[operand1, 4 * e + i, esize DIV 4]);
            constant integer element2 = SInt(Elem[operand2, 4 * e + i, esize DIV 4]);
            sum = sum + element1 * element2;
        Elem[result, e, esize] = sum;
    ZAvector[vec, VL] = result;
    vec = vec + vstride;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

USMLALL (multiple and indexed vector)

Multi-vector unsigned by signed 8-bit integer multiply-add by indexed element to 32-bit integer

This instruction multiplies each unsigned 8-bit element in the one, two, or four first source vectors with each signed 8-bit indexed element of the second source vector, widens each product to 32 bits, and destructively adds these values to the corresponding 32-bit elements of the ZA quad-vector groups.

The elements within the second source vector are specified using an immediate element index that selects the same element position within each 128-bit vector segment. The element index range is from 0 to one less than the number of elements per 128-bit segment.

The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.

The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

It has encodings from 3 classes: One ZA quad-vector , Two ZA quad-vectors and Four ZA quad-vectors

One ZA quad-vector

(FEAT_SME2)

Encoding

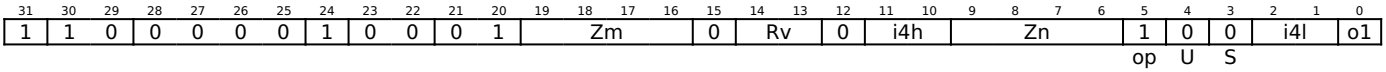
```
USMLALL ZA.S[<Wv>, <offs1>:<offs4>], <Zn>.B, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 32;
constant integer v = UInt('010':Rv);
constant integer n = UInt(Zn);
constant integer m = UInt('0':Zm);
constant integer offset = UInt(off2:'00');
constant integer index = UInt(i4h:i4l);
constant integer nreg = 1;
```

Two ZA quad-vectors

(FEAT_SME2)



Encoding

```
USMLALL ZA.S[<Wv>, <offs1>:<offs4>{, VGx2}], { <Zn1>.B-<Zn2>.B }, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);

USMOP4A

Unsigned by signed integer quarter-tile sum of outer products, accumulating

This instruction generates four independent quarter-tile unsigned by signed integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and accumulates the results to the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit signed values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit signed values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively added to the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
This instruction is unpredicated.
It has encodings from 8 classes: 32-bit, single and multiple vectors , 32-bit, single vectors , 32-bit, multiple and single vectors , 32-bit, multiple vectors , 64-bit, single and multiple vectors , 64-bit, single vectors , 64-bit, multiple and single vectors and 64-bit, multiple vectors

USMOP4S

Unsigned by signed integer quarter-tile sum of outer products, subtracting

This instruction generates four independent quarter-tile unsigned by signed integer sums of outer products from the sub-matrices in the half-vectors of the one or two first and second source vectors and subtracts the results from the corresponding elements of a 32-bit or 64-bit element ZA tile.
In case of the 8-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_S \div 2 \times 4$ sub-matrix of 8-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_S \div 2$ sub-matrix of 8-bit signed values held in the half-vectors of the second source vectors. Each 32-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_S \div 2 \times 4$ sub-matrix. Similarly, each 32-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_S \div 2$ sub-matrix.
In case of the 16-bit integer variant, each of the quarter-tile sums of outer products is generated by multiplying the $SVL_D \div 2 \times 4$ sub-matrix of 16-bit unsigned values held in the half-vectors of the first source vectors by the $4 \times SVL_D \div 2$ sub-matrix of 16-bit signed values held in the half-vectors of the second source vectors. Each 64-bit container of the half-vectors in the first source vectors holds 4 elements of each row of a $SVL_D \div 2 \times 4$ sub-matrix. Similarly, each 64-bit container of the half-vectors in the second source vector holds 4 elements of each column of a $4 \times SVL_D \div 2$ sub-matrix.
The resulting quarter-tile $SVL_S \div 2 \times SVL_S \div 2$ widened 32-bit integer sums of outer products in case of the 8-bit integer variant or $SVL_D \div 2 \times SVL_D \div 2$ widened 64-bit integer sums of outer products in case of the 16-bit integer variant are then destructively subtracted from the 32-bit or 64-bit integer destination tile respectively.
This is equivalent to performing a 4-way dot product and subtract from each of the destination tile elements.
This instruction is unpredicated.

USMOPA (4-way)

Unsigned by signed integer sum of outer products, accumulating

The 8-bit integer variant works with a 32-bit element ZA tile.
The 16-bit integer variant works with a 64-bit element ZA tile.
This instruction multiplies the sub-matrix in the first source vector by the sub-matrix in the second source vector. In case of the 8-bit integer variant, the first source holds $SVL_S \times 4$ sub-matrix of unsigned 8-bit integer values, and the second source holds $4 \times SVL_S$ sub-matrix of signed 8-bit integer values. In case of the 16-bit integer variant, the first source holds $SVL_D \times 4$ sub-matrix of unsigned 16-bit integer values, and the second source holds $4 \times SVL_D$ sub-matrix of signed 16-bit integer values.

Each source vector is independently predicated by a corresponding governing predicate. When an 8-bit source element in case of 8-bit integer variant or a 16-bit source element in case of 16-bit integer variant is Inactive, it is treated as having the value 0.
The resulting $SVL_S \times SVL_S$ widened 32-bit integer or $SVL_D \times SVL_D$ widened 64-bit integer sum of outer products is then destructively added to the 32-bit integer or 64-bit integer destination tile, respectively for 8-bit integer and 16-bit integer instruction variants. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.
In case of the 8-bit integer variant, each 32-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_S \times 4$ sub-matrix, and each 32-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_S$ sub-matrix. In case of the 16-bit integer variant, each 64-bit container of the first source vector holds 4 consecutive column elements of each row of a $SVL_D \times 4$ sub-matrix, and each 64-bit container of the second source vector holds 4 consecutive row elements of each column of a $4 \times SVL_D$ sub-matrix.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.
It has encodings from 2 classes: 32-bit and 64-bit

USTMOPA

Unsigned by signed 8-bit integer sparse sum of outer products to 32-bit integer, accumulating

This instruction generates unsigned by signed integer sum of outer products by multiplying the 2-in-4 selected elements from the dense sub-matrices in the two first source vectors with the corresponding elements of the compressed sparse sub-matrix in the second source vector and accumulates the results to the corresponding elements of a 32-bit element ZA tile.

The sum of outer products is generated by multiplying the selected two sets of 2-in-4 8-bit unsigned values from each overlapping 32-bit containers of the two $SVL_S \times 4$ sub-matrices in the first source vectors by the four 8-bit signed values from the corresponding 32-bit container of the $4 \times SVL_S$ sub-matrix in the second source vector. The four selected elements from the overlapping 32-bit containers of the first source vectors correspond to two sets of 2-in-4 elements of rows of two $SVL_S \times 4$ sub-matrices. Each 32-bit container of the second source vector holds 4 elements of columns of a compressed $4 \times SVL_S$ sub-matrix.

The two sets of 2-in-4 8-bit unsigned values from overlapping 32-bit containers of the first source vectors are selected by pairs of 4-bit controls in the indexed segment of the control vector register. If the control bit corresponding to an element in the first source vectors is 0, the element is discarded and does not contribute to the sum of products result. If more than two bits of the 4-bit control corresponding to each 32-bit container of the first source vectors are 1, only the elements corresponding to the least two significant bits are selected.

The resulting $SVL_S \times SVL_S$ widened 32-bit integer sum of outer products is then destructively added to the 32-bit integer destination tile. This is equivalent to performing a 4-way dot product and accumulate to each of the destination tile elements.

This instruction is unpredicated.

USVDOT

Multi-vector unsigned by signed 8-bit integer vertical dot product by indexed element to 32-bit integer

This instruction computes the vertical dot product of corresponding unsigned 8-bit elements from the four first source vectors and four signed 8-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product result is destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.

The vector group symbol VGx4 indicates that the ZA operand consists of four ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

UUNPK

Unpack and zero-extend multi-vector elements

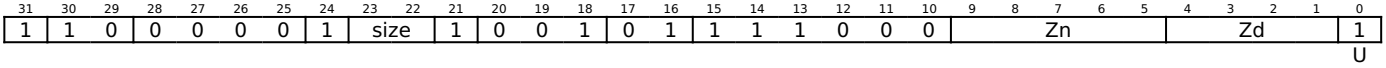
This instruction unpacks elements from one or two source vectors and then zero-extends them to place in elements of twice their size within the two or four destination vectors.

This instruction is unpredicated.

It has encodings from 2 classes: Two registers and Four registers

Two registers

(FEAT_SME2)



Encoding

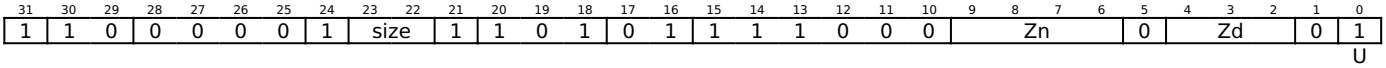
```
UUNPK { <Zd1>.<T>-<Zd2>.<T> }, <Zn>.<Tb>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
if size == '00' then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << UInt(size);
constant integer n = UInt(Zn);
constant integer d = UInt(Zd:'0');
constant integer nreg = 2;
constant boolean unsigned = TRUE;
```

Four registers

(FEAT_SME2)



Encoding

```
UUNPK { <Zd1>.<T>-<Zd4>.<T> }, { <Zn1>.<Tb>-<Zn2>.<Tb> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
if size == '00' then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << UInt(size);
constant integer n = UInt(Zn:'0');
constant integer d = UInt(Zd:'00');
constant integer nreg = 4;
constant boolean unsigned = TRUE;
```

Assembler Symbols

<Zd1> For the "Two registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

For the "Four registers" variant: is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	RESERVED
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<Zn> Is the name of the source scalable vector register, encoded in the "Zn" field.

<Tb> Is the size specifier, encoded in “size”:

size	<Tb>
00	RESERVED
01	B
10	H
11	S

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 2.

<Zn2> Is the name of the second scalable vector register of the source multi-vector group, encoded as "Zn" times 2 plus 1.

Operation

```
CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
constant integer hsize = esize DIV 2;
constant integer sreg = nreg DIV 2;
array [0..3] of bits(VL) results;

for r = 0 to sreg-1
    constant bits(VL) operand = Z[n+r, VL];
    for i = 0 to 1
        for e = 0 to elements-1
            constant bits(hsize) element = Elem[operand, i*elements + e, hsize];
            Elem[results[2*r+i], e, esize] = Extend(element, esize, unsigned);

for r = 0 to nreg-1
    Z[d+r, VL] = results[r];
```

UVDOT (2-way)

Multi-vector unsigned 16-bit integer vertical dot product by indexed element to 32-bit integer

This instruction computes the vertical dot product of the corresponding two unsigned 16-bit integer values held in the two first source vectors and two unsigned 16-bit integer values in the corresponding indexed 32-bit element of the second source vector. The widened dot product results are destructively added to the corresponding 32-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to 3.

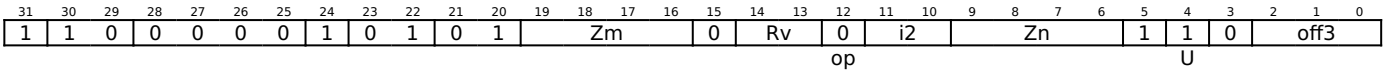
The single-vector group within each half of the ZA array is selected by the sum of the vector select register and offset, modulo half the number of ZA array vectors.

The vector group symbol VGx2 indicates that the ZA operand consists of two ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

This instruction is unpredicated.

SME2

(FEAT_SME2)



Encoding

```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer esize = 32;
constant integer n = UInt(Zn:'0');
constant integer m = UInt('0':Zm);
constant integer offset = UInt(off3);
constant integer index = UInt(i2);
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 2.
<Zn2>	Is the name of the second scalable vector register of the first source multi-vector group, encoded as "Zn" times 2 plus 1.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	Is the immediate index of a pair of 16-bit elements within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
constant integer vectors = VL DIV 8;
constant integer vstride = vectors DIV 2;
constant integer eltspersegment = 128 DIV esize;
constant bits(32) vbase = X[v, 32];
integer vec = (UInt(vbase) + offset) MOD vstride;
constant bits(VL) operand2 = Z[m, VL];
bits(VL) result;

for r = 0 to 1
    constant bits(VL) operand3 = ZAvector[vec, VL];
    for e = 0 to elements-1
        constant integer segmentbase = e - (e MOD eltspersegment);
        constant integer s = segmentbase + index;
        bits(esize) sum = Elem[operand3, e, esize];
        for i = 0 to 1
            constant bits(VL) operand1 = Z[n+i, VL];
            constant integer element1 = UInt(Elem[operand1, 2 * e + r, esize DIV 2]);
            constant integer element2 = UInt(Elem[operand2, 2 * s + i, esize DIV 2]);
            sum = sum + element1 * element2;
        Elem[result, e, esize] = sum;
    ZAvector[vec, VL] = result;
    vec = vec + vstride;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

UVDOT (4-way)

Multi-vector unsigned integer vertical dot product by indexed element

This instruction computes the vertical dot product of the corresponding four unsigned 8-bit or 16-bit integer values held in the four first source vectors and four unsigned 8-bit or 16-bit integer values in the corresponding indexed 32-bit or 64-bit element of the second source vector. The widened dot product results are destructively added to the corresponding 32-bit or 64-bit element of the ZA single-vector groups.

The groups within the second source vector are specified using an immediate element index that selects the same group position within each 128-bit vector segment. The index range is from 0 to one less than the number of groups per 128-bit segment.

The single-vector group within each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo quarter the number of ZA array vectors.

The vector group symbol VGx4 indicates that the ZA operand consists of four ZA single-vector groups. The vector group symbol is preferred for disassembly, but optional in assembler source code.

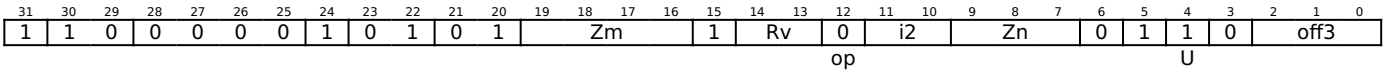
This instruction is unpredicated.

ID_AA64SMFR0_EL1.I16I64 indicates whether the 16-bit integer variant is implemented.

It has encodings from 2 classes: 8-bit to 32-bit and 16-bit to 64-bit

8-bit to 32-bit

(FEAT_SME2)



Encoding

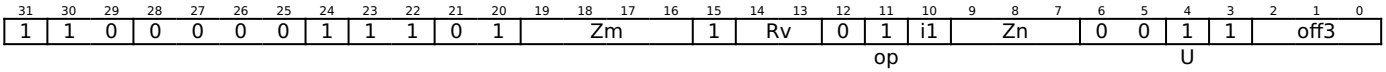
```
UVDOT ZA.S[<Wv>, <offs>{, VGx4}], { <Zn1>.B-<Zn4>.B }, <Zm>.B[<index>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer esize = 32;
constant integer n = UInt(Zn:'00');
constant integer m = UInt('0':Zm);
constant integer offset = UInt(off3);
constant integer index = UInt(i2);
```

16-bit to 64-bit

(FEAT_SME2 && FEAT_SME_I16I64)



Encoding

```
UVDOT ZA.D[<Wv>, <offs>{, VGx4}], { <Zn1>.H-<Zn4>.H }, <Zm>.H[<index>]
```

Decode for this encoding

```
if !(IsFeatureImplemented(FEAT_SME2) && IsFeatureImplemented(FEAT_SME_I16I64)) then
    EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer esize = 64;
constant integer n = UInt(Zn:'00');
constant integer m = UInt('0':Zm);
constant integer offset = UInt(off3);
constant integer index = UInt(i1);
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.
<Zn1>	Is the name of the first scalable vector register of the first source multi-vector group, encoded as "Zn" times 4.
<Zn4>	Is the name of the fourth scalable vector register of the first source multi-vector group, encoded as "Zn" times 4 plus 3.
<Zm>	Is the name of the second source scalable vector register Z0-Z15, encoded in the "Zm" field.
<index>	For the "8-bit to 32-bit" variant: is the immediate index of a 32-bit group of four 8-bit values within each 128-bit vector segment, in the range 0 to 3, encoded in the "i2" field. For the "16-bit to 64-bit" variant: is the immediate index of a 64-bit group of four 16-bit values within each 128-bit vector segment, in the range 0 to 1, encoded in the "i1" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer elements = VL DIV esize;
constant integer vectors = VL DIV 8;
constant integer vstride = vectors DIV 4;
constant integer eltspersegment = 128 DIV esize;
constant bits(32) vbase = X[v, 32];
integer vec = (UInt(vbase) + offset) MOD vstride;
constant bits(VL) operand2 = Z[m, VL];
bits(VL) result;

for r = 0 to 3
    constant bits(VL) operand3 = ZAvector[vec, VL];
    for e = 0 to elements-1
        constant integer segmentbase = e - (e MOD eltspersegment);
        constant integer s = segmentbase + index;
        bits(esize) sum = Elem[operand3, e, esize];
        for i = 0 to 3
            constant bits(VL) operand1 = Z[n+i, VL];
            constant integer element1 = UInt(Elem[operand1, 4 * e + r, esize DIV 4]);
            constant integer element2 = UInt(Elem[operand2, 4 * s + i, esize DIV 4]);
            sum = sum + element1 * element2;
        Elem[result, e, esize] = sum;
    ZAvector[vec, VL] = result;
    vec = vec + vstride;
```

UZP (four registers)

Concatenate elements from four vectors

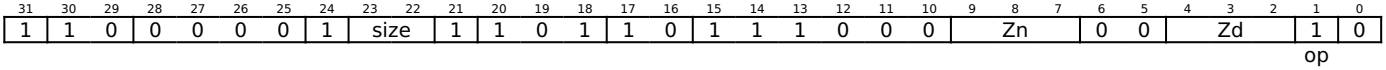
This instruction concatenates every fourth element from each of the four source vectors and places them in the corresponding elements of the four destination vectors.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit to 64-bit elements and 128-bit element

8-bit to 64-bit elements

(FEAT_SME2)



Encoding

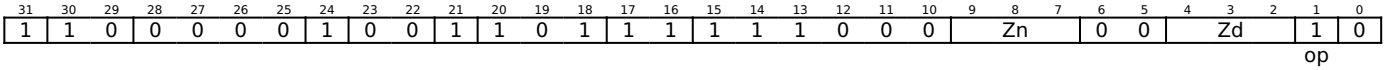
```
UZP { <Zd1>.<T>-<Zd4>.<T> }, { <Zn1>.<T>-<Zn4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
if size == '11' && MaxImplementedSVL() < 256 then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << UInt(size);
constant integer n = UInt(Zn:'00');
constant integer d = UInt(Zd:'00');
```

128-bit element

(FEAT_SME2)



Encoding

```
UZP { <Zd1>.Q-<Zd4>.Q }, { <Zn1>.Q-<Zn4>.Q }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
if MaxImplementedSVL() < 512 then EndOfDecode(Decode_UNDEF);
constant integer esize = 128;
constant integer n = UInt(Zn:'00');
constant integer d = UInt(Zd:'00');
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

<Zn4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
if VL < esize * 4 then EndOfDecode(Decode_UNDEF);
constant integer quads = VL DIV (esize * 4);
bits(VL) result0;
bits(VL) result1;
bits(VL) result2;
bits(VL) result3;

for r = 0 to 3

UZP (two registers)

Concatenate elements from two vectors

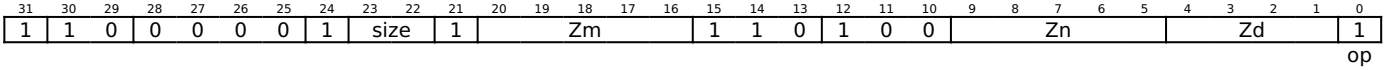
This instruction concatenates every second element from each of the first and second source vectors and places them in the corresponding elements of the two destination vectors.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit to 64-bit elements and 128-bit element

8-bit to 64-bit elements

(FEAT_SME2)



Encoding

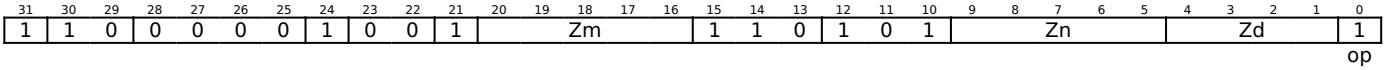
```
UZP { <Zd1>.<T>-<Zd2>.<T> }, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << UInt(size);
constant integer n = UInt(Zn);
constant integer m = UInt(Zm);
constant integer d = UInt(Zd:'0');
```

128-bit element

(FEAT_SME2)



Encoding

```
UZP { <Zd1>.Q-<Zd2>.Q }, <Zn>.Q, <Zm>.Q
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
if MaxImplementedSVL() < 256 then EndOfDecode(Decode_UNDEF);
constant integer esize = 128;
constant integer n = UInt(Zn);
constant integer m = UInt(Zm);
constant integer d = UInt(Zd:'0');
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
if VL < esize * 2 then EndOfDecode(Decode_UNDEF);
constant integer pairs = VL DIV (esize * 2);
bits(VL) result0;
bits(VL) result1;

for r = 0 to 1
    constant integer base = r * pairs;
    constant bits(VL) operand = if r == 0 then Z[n, VL] else Z[m, VL];

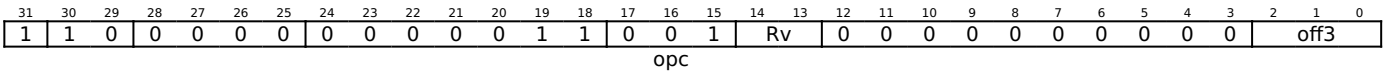
ZERO (double-vector)

Zero ZA double-vector groups

This instruction zeroes one, two, or four ZA double-vector groups.
The double-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA double-vector groups respectively.
It has encodings from 3 classes: One ZA double-vector , Two ZA double-vectors and Four ZA double-vectors

One ZA double-vector

(FEAT_SME2p1)



Encoding

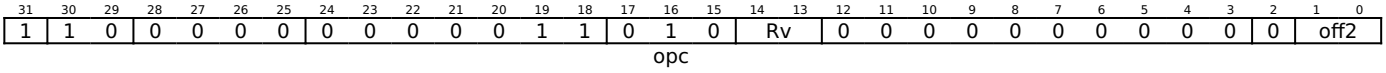
```
ZERO ZA.D[<Wv>, <offs1>:<offs2>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer offset = UInt(off3:'0');
constant integer ngrp = 1;
constant integer nvec = 2;
```

Two ZA double-vectors

(FEAT_SME2p1)



Encoding

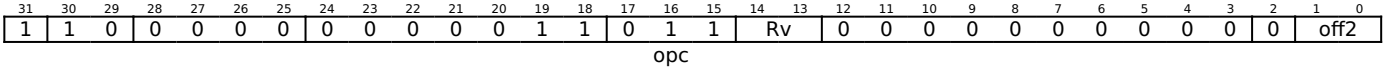
```
ZERO ZA.D[<Wv>, <offs1>:<offs2>, VGx2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer offset = UInt(off2:'0');
constant integer ngrp = 2;
constant integer nvec = 2;
```

Four ZA double-vectors

(FEAT_SME2p1)



Encoding

```
ZERO ZA.D[<Wv>, <offs1>:<offs2>, VGx4]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer offset = UInt(off2:'0');
constant integer ngrp = 4;
constant integer nvec = 2;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.
<offs1>	For the "One ZA double-vector" variant: is the first vector select offset, encoded as "off3" field times 2. For the "Four ZA double-vectors" and "Two ZA double-vectors" variants: is the first vector select offset, encoded as "off2" field times 2.
<offs2>	For the "One ZA double-vector" variant: is the second vector select offset, encoded as "off3" field times 2 plus 1.

For the "Four ZA double-vectors" and "Two ZA double-vectors" variants: is the second vector select offset, encoded as "off2" field times 2 plus 1.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer vectors = VL DIV 8;
constant integer vstride = vectors DIV ngrp;
constant bits(32) vbase = X[v, 32];
integer vec = (UInt(vbase) + offset) MOD vstride;
vec = vec - (vec MOD nvec);
for r = 0 to ngrp-1
    for i = 0 to nvec-1
        ZAvector[vec + i, VL] = Zeros(VL);
    vec = vec + vstride;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

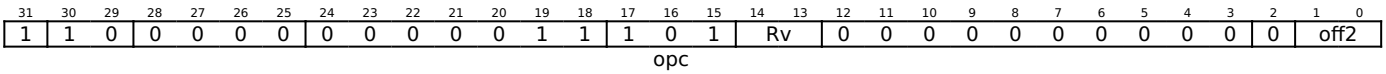
ZERO (quad-vector)

Zero ZA quad-vector groups

This instruction zeroes one, two, or four ZA quad-vector groups.
The quad-vector group within all of, each half of, or each quarter of the ZA array is selected by the sum of the vector select register and offset range, modulo all, half, or quarter the number of ZA array vectors.
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA quad-vector groups respectively.
It has encodings from 3 classes: One ZA quad-vector , Two ZA quad-vectors and Four ZA quad-vectors

One ZA quad-vector

(FEAT_SME2p1)



Encoding

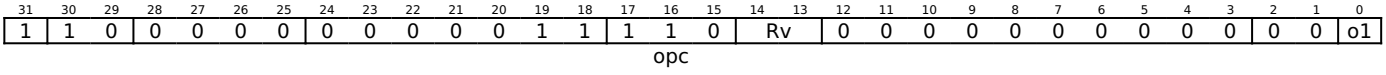
```
ZERO ZA.D[<Wv>, <offs1>:<offs4>]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer offset = UInt(off2:'00');
constant integer ngrp = 1;
constant integer nvec = 4;
```

Two ZA quad-vectors

(FEAT_SME2p1)



Encoding

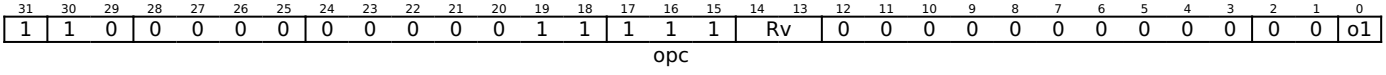
```
ZERO ZA.D[<Wv>, <offs1>:<offs4>, VGx2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer offset = UInt(o1:'00');
constant integer ngrp = 2;
constant integer nvec = 4;
```

Four ZA quad-vectors

(FEAT_SME2p1)



Encoding

```
ZERO ZA.D[<Wv>, <offs1>:<offs4>, VGx4]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer offset = UInt(o1:'00');
constant integer ngrp = 4;
constant integer nvec = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.
<offs1>	For the "One ZA quad-vector" variant: is the first vector select offset, encoded as "off2" field times 4. For the "Four ZA quad-vectors" and "Two ZA quad-vectors" variants: is the first vector select offset, encoded as "o1" field times 4.
<offs4>	For the "One ZA quad-vector" variant: is the fourth vector select offset, encoded as "off2" field times 4 plus 3.

For the "Four ZA quad-vectors" and "Two ZA quad-vectors" variants: is the fourth vector select offset, encoded as "o1" field times 4 plus 3.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer vectors = VL DIV 8;
constant integer vstride = vectors DIV ngrp;
constant bits(32) vbase = X[v, 32];
integer vec = (UInt(vbase) + offset) MOD vstride;
vec = vec - (vec MOD nvec);
for r = 0 to ngrp-1
    for i = 0 to nvec-1
        ZAvector[vec + i, VL] = Zeros(VL);
    vec = vec + vstride;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

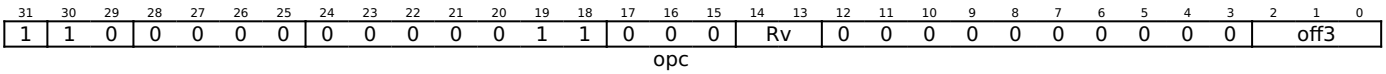
ZERO (single-vector)

Zero ZA single-vector groups

This instruction zeroes two or four ZA single-vector groups.
The single-vector group within each half of or each quarter of the ZA array is selected by the sum of the vector select register and offset, modulo half or quarter the number of ZA array vectors.
The vector group symbol, VGx2 or VGx4, indicates that the ZA operand consists of two or four ZA single-vector groups respectively.
It has encodings from 2 classes: Two ZA single-vectors and Four ZA single-vectors

Two ZA single-vectors

(FEAT_SME2p1)



Encoding

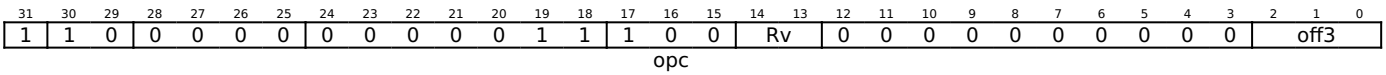
```
ZERO ZA.D[<Wv>, <offs>, VGx2]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer offset = UInt(off3);
constant integer ngrp = 2;
```

Four ZA single-vectors

(FEAT_SME2p1)



Encoding

```
ZERO ZA.D[<Wv>, <offs>, VGx4]
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2p1) then EndOfDecode(Decode_UNDEF);
constant integer v = UInt('010':Rv);
constant integer offset = UInt(off3);
constant integer ngrp = 4;
```

Assembler Symbols

<Wv>	Is the 32-bit name of the vector select register W8-W11, encoded in the "Rv" field.
<offs>	Is the vector select offset, in the range 0 to 7, encoded in the "off3" field.

Operation

```
CheckStreamingSVEAndZAEnabled();
constant integer VL = CurrentVL;
constant integer vectors = VL DIV 8;
constant integer vstride = vectors DIV ngrp;
constant bits(32) vbase = X[v, 32];
integer vec = (UInt(vbase) + offset) MOD vstride;
for r = 0 to ngrp-1
    ZAvector[vec, VL] = Zeros(VL);
    vec = vec + vstride;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

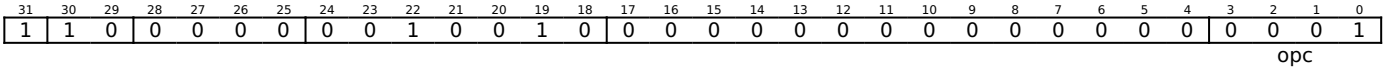
ZERO (table)

Zero ZT0

This instruction zeroes all bytes of the ZT0 register.
This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

SME2

(FEAT_SME2)



Encoding

```
ZERO { ZT0 }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
```

Operation

```
CheckSMEEnabled();
CheckSMEZT0Enabled();

ZT0[512] = Zeros(512);
```

ZERO (tiles)

Zero a list of 64-bit element ZA tiles

This instruction zeroes all bytes within each of the up to eight listed 64-bit element tiles named ZA0.D to ZA7.D, leaving the other 64-bit element tiles unmodified.

This instruction does not require the PE to be in Streaming SVE mode, and it is expected that this instruction will not experience a significant slowdown due to contention with other PEs that are executing in Streaming SVE mode.

For programmer convenience an assembler must also accept the names of 32-bit, 16-bit, and 8-bit element tiles that are converted into the corresponding set of 64-bit element tiles.

In accordance with the architecturally defined mapping between different element size tiles:

- Zeroing the 8-bit element tile name ZA0.B, or the entire array name ZA, is equivalent to zeroing all eight 64-bit element tiles named ZA0.D to ZA7.D.
- Zeroing the 16-bit element tile name ZA0.H is equivalent to zeroing 64-bit element tiles named ZA0.D, ZA2.D, ZA4.D, and ZA6.D.
- Zeroing the 16-bit element tile name ZA1.H is equivalent to zeroing 64-bit element tiles named ZA1.D, ZA3.D, ZA5.D, and ZA7.D.
- Zeroing the 32-bit element tile name ZA0.S is equivalent to zeroing 64-bit element tiles named ZA0.D and ZA4.D.
- Zeroing the 32-bit element tile name ZA1.S is equivalent to zeroing 64-bit element tiles named ZA1.D and ZA5.D.
- Zeroing the 32-bit element tile name ZA2.S is equivalent to zeroing 64-bit element tiles named ZA2.D and ZA6.D.
- Zeroing the 32-bit element tile name ZA3.S is equivalent to zeroing 64-bit element tiles named ZA3.D and ZA7.D.

The preferred disassembly of this instruction uses the shortest list of tile names that represent the encoded immediate mask.

For example:

- An immediate that encodes 64-bit element tiles ZA0.D, ZA1.D, ZA4.D, and ZA5.D is disassembled as {ZA0.S, ZA1.S}.
- An immediate that encodes 64-bit element tiles ZA0.D, ZA2.D, ZA4.D, and ZA6.D is disassembled as {ZA0.H}.
- An all-ones immediate is disassembled as {ZA}.
- An all-zeros immediate is disassembled as an empty list { }.

SME

(FEAT_SME)

Encoding

```
ZERO { {<mask>} }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME) then EndOfDecode(Decode_UNDEF);
constant bits(8) mask = imm8;
constant integer esize = 64;
```

Assembler Symbols

<mask>	Is the optional list of up to eight 64-bit element tile names separated by commas, encoded in the "imm8" field.

Operation

```
CheckSMEAndZAEnabled();
constant integer SVL = CurrentSVL;
constant integer dim = SVL DIV esize;
constant bits(dim*dim*esize) result = Zeros(dim*dim*esize);

for i = 0 to 7
    if mask<i> == '1' then ZAtile[i, esize, dim*dim*esize] = result;
```

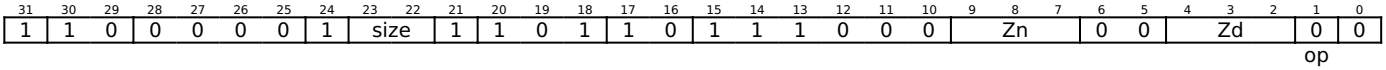
ZIP (four registers)

Interleave elements from four vectors

This instruction places the four-way interleaved elements from the four source vectors in the corresponding elements of the four destination vectors. This instruction is unpredicated.
It has encodings from 2 classes: 8-bit to 64-bit elements and 128-bit element

8-bit to 64-bit elements

(FEAT_SME2)



Encoding

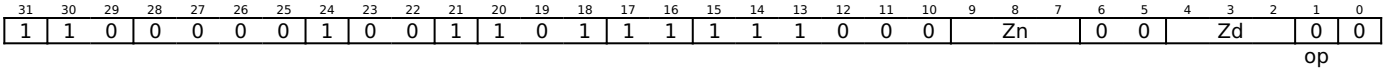
```
ZIP { <Zd1>.<T>-<Zd4>.<T> }, { <Zn1>.<T>-<Zn4>.<T> }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
if size == '11' && MaxImplementedSVL() < 256 then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << UInt(size);
constant integer n = UInt(Zn:'00');
constant integer d = UInt(Zd:'00');
```

128-bit element

(FEAT_SME2)



Encoding

```
ZIP { <Zd1>.Q-<Zd4>.Q }, { <Zn1>.Q-<Zn4>.Q }
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
if MaxImplementedSVL() < 512 then EndOfDecode(Decode_UNDEF);
constant integer esize = 128;
constant integer n = UInt(Zn:'00');
constant integer d = UInt(Zd:'00');
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 4.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd4> Is the name of the fourth scalable vector register of the destination multi-vector group, encoded as "Zd" times 4 plus 3.

<Zn1> Is the name of the first scalable vector register of the source multi-vector group, encoded as "Zn" times 4.

<Zn4> Is the name of the fourth scalable vector register of the source multi-vector group, encoded as "Zn" times 4 plus 3.

Operation

```
CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
if VL < esize * 4 then EndOfDecode(Decode_UNDEF);
constant integer quads = VL DIV (esize * 4);
constant bits(VL) operand0 = Z[n, VL];
constant bits(VL) operand1 = Z[n+1, VL];
constant bits(VL) operand2 = Z[n+2, VL];
constant bits(VL) operand3 = Z[n+3, VL];
bits(VL) result;

for r = 0 to 3
    constant integer base = r * quads;
    for q = 0 to quads-1
        Elem[result, 4*q+0, esize] = Elem[operand0, base+q, esize];
        Elem[result, 4*q+1, esize] = Elem[operand1, base+q, esize];
        Elem[result, 4*q+2, esize] = Elem[operand2, base+q, esize];
        Elem[result, 4*q+3, esize] = Elem[operand3, base+q, esize];
    Z[d+r, VL] = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

ZIP (two registers)

Interleave elements from two vectors

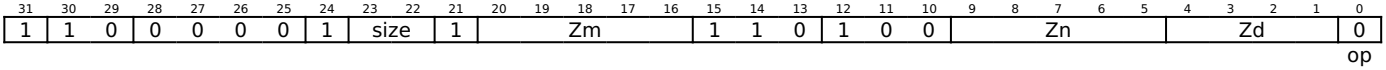
This instruction places the two-way interleaved elements from the first and second source vectors in the corresponding elements of the two destination vectors.

This instruction is unpredicated.

It has encodings from 2 classes: 8-bit to 64-bit elements and 128-bit element

8-bit to 64-bit elements

(FEAT_SME2)



Encoding

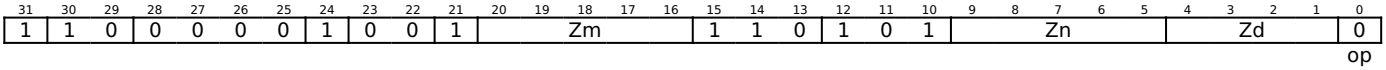
```
ZIP { <Zd1>.<T>-<Zd2>.<T> }, <Zn>.<T>, <Zm>.<T>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
constant integer esize = 8 << UInt(size);
constant integer n = UInt(Zn);
constant integer m = UInt(Zm);
constant integer d = UInt(Zd:'0');
```

128-bit element

(FEAT_SME2)



Encoding

```
ZIP { <Zd1>.Q-<Zd2>.Q }, <Zn>.Q, <Zm>.Q
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_SME2) then EndOfDecode(Decode_UNDEF);
if MaxImplementedSVL() < 256 then EndOfDecode(Decode_UNDEF);
constant integer esize = 128;
constant integer n = UInt(Zn);
constant integer m = UInt(Zm);
constant integer d = UInt(Zd:'0');
```

Assembler Symbols

<Zd1> Is the name of the first scalable vector register of the destination multi-vector group, encoded as "Zd" times 2.

<T> Is the size specifier, encoded in “size”:

size	<T>
00	B
01	H
10	S
11	D

<Zd2> Is the name of the second scalable vector register of the destination multi-vector group, encoded as "Zd" times 2 plus 1.

<Zn> Is the name of the first source scalable vector register, encoded in the "Zn" field.

<Zm> Is the name of the second source scalable vector register, encoded in the "Zm" field.

Operation

```
CheckStreamingSVEEnabled();
constant integer VL = CurrentVL;
if VL < esize * 2 then EndOfDecode(Decode_UNDEF);
constant integer pairs = VL DIV (esize * 2);
constant bits(VL) operand0 = Z[n, VL];
constant bits(VL) operand1 = Z[m, VL];
bits(VL) result;

for r = 0 to 1
    constant integer base = r * pairs;
    for p = 0 to pairs-1
        Elem[result, 2*p+0, esize] = Elem[operand0, base+p, esize];
        Elem[result, 2*p+1, esize] = Elem[operand1, base+p, esize];
    Z[d+r, VL] = result;
```

Operational information

This instruction is a data-independent-time instruction as described in *About PSTATE.DIT*.

SME2 Sparse Outer Product

The encodings in this section are decoded from SME encodings.

Decode fields						Instruction details	Feature
op0	op1	op2	op3	op4	op5		
0	0	0	0	0		FTMOPA (non-widening) — Single-precision	FEAT_SME_TMOP
0	0	0	0	1	0	UNALLOCATED	-
0	1	0	0	0		FTMOPA (widening, 4-way)	FEAT_SME_TMOP && FEAT_SME_F8F32
0	1	0	0	1	0	FTMOPA (widening, 2-way, FP8 to FP16)	FEAT_SME_TMOP && FEAT_SME_F8F16
1	0	0	0	0		BFTMOPA (widening)	FEAT_SME_TMOP
1	0	0	0	1	0	FTMOPA (non-widening) — Half-precision	FEAT_SME_TMOP && FEAT_SME_F16F16
1	1	0	0	0		FTMOPA (widening, 2-way, FP16 to FP32)	FEAT_SME_TMOP
1	1	0	0	1	0	BFTMOPA (non-widening)	FEAT_SME_TMOP && FEAT_SME_B16B16
	0	1	0	1		SME2 Int16 to Int32 sparse outer product	-
	1	1	0	1		UNALLOCATED	-
		0	0	1	1	UNALLOCATED	-
		1	0	0		SME Int8 to Int32 sparse outer product	-
			1			UNALLOCATED	-

SME2 Int16 to Int32 sparse outer product

The encodings in this section are decoded from SME2 Sparse Outer Product.

Decode fields	Instruction Details	Feature
u0		
0	STMOPA (2-way)	FEAT_SME_TMOP
1	UTMOPA (2-way)	FEAT_SME_TMOP

SME Int8 to Int32 sparse outer product

The encodings in this section are decoded from SME2 Sparse Outer Product.

Decode fields		Instruction Details	Feature
u0	u1		
0	0	STMOPA (4-way)	FEAT_SME_TMOP
0	1	SUTMOPA	FEAT_SME_TMOP
1	0	USTMOPA	FEAT_SME_TMOP
1	1	UTMOPA (4-way)	FEAT_SME_TMOP

SME FP Outer Product - 32 bit

The encodings in this section are decoded from SME encodings.

Decode fields			Instruction details	Feature
op0	op1	op2		
0	0		SME FP32 outer product	-
0	1	0	FMOPA (widening, 4-way)	FEAT_SME_F8F32
0	1	1	UNALLOCATED	-
1	0		SME BF16 widening outer product	-
1	1		SME FP16 widening outer product	-

SME FP32 outer product

The encodings in this section are decoded from SME FP Outer Product - 32 bit.

Decode fields	Instruction Details	Feature
S		
0	FMOPA (non-widening)	FEAT_SME
1	FMOPS (non-widening)	FEAT_SME

SME BF16 widening outer product

The encodings in this section are decoded from SME FP Outer Product - 32 bit.

Decode fields	Instruction Details	Feature
S		
0	BFMOPA (widening)	FEAT_SME
1	BFMOPS (widening)	FEAT_SME

SME FP16 widening outer product

The encodings in this section are decoded from SME FP Outer Product - 32 bit.

Decode fields	Instruction Details	Feature
S		
0	FMOPA (widening, 2-way, FP16 to FP32)	FEAT_SME
1	FMOPS (widening)	FEAT_SME

SME2 Outer Product - Misc

The encodings in this section are decoded from SME encodings.

Decode fields				Instruction details	Feature
op0	op1	op2	op3		
0	0			SME2 32-bit binary outer product	-
0	1	0	0	FMOPA (widening, 2-way, FP8 to FP16)	FEAT_SME_F8F16
0	1	1	0	UNALLOCATED	-
0	1		1	UNALLOCATED	-
1	0		0	SME2 FP16 non-widening outer product	-
1	1		0	SME2 BF16 non-widening outer product	-
1			1	UNALLOCATED	-

SME2 32-bit binary outer product

The encodings in this section are decoded from SME2 Outer Product - Misc.

Decode fields	Instruction Details	Feature
S		
0	BMOPA	FEAT_SME2
1	BMOPS	FEAT_SME2

SME2 FP16 non-widening outer product

The encodings in this section are decoded from SME2 Outer Product - Misc.

Decode fields	Instruction Details	Feature
S		
0	FMOPA (non-widening)	FEAT_SME_F16F16
1	FMOPS (non-widening)	FEAT_SME_F16F16

SME2 BF16 non-widening outer product

The encodings in this section are decoded from SME2 Outer Product - Misc.

Decode fields	Instruction Details	Feature
S		
0	BFMOPA (non-widening)	FEAT_SME_B16B16
1	BFMOPS (non-widening)	FEAT_SME_B16B16

SME2 Multi-vector - Memory (Contiguous)

The encodings in this section are decoded from SME encodings.

Decode fields			Instruction details
op0	op1	op2	
00x	0		SME2 multi-vec contiguous load (scalar plus scalar, two registers)
00x	1	0	SME2 multi-vec contiguous load (scalar plus scalar, four registers)
01x	0		SME2 multi-vec contiguous store (scalar plus scalar, two registers)
01x	1	0	SME2 multi-vec contiguous store (scalar plus scalar, four registers)
0x1	1	1	UNALLOCATED
100	0		SME2 multi-vec contiguous load (scalar plus immediate, two registers)
100	1	0	SME2 multi-vec contiguous load (scalar plus immediate, four registers)
110	0		SME2 multi-vec contiguous store (scalar plus immediate, two registers)
110	1	0	SME2 multi-vec contiguous store (scalar plus immediate, four registers)
1x1			UNALLOCATED
xx0	1	1	UNALLOCATED

SME2 multi-vec contiguous load (scalar plus scalar, two registers)

The encodings in this section are decoded from SME2 Multi-vector - Memory (Contiguous).

SME Integer Outer Product - 32 bit

The encodings in this section are decoded from SME encodings.

Decode fields		Instruction details
op0	op1	
0	1	SME2 Int16 two-way outer product
1	1	UNALLOCATED
	0	SME Int8 outer product

SME2 Int16 two-way outer product

The encodings in this section are decoded from SME Integer Outer Product - 32 bit.

Decode fields		Instruction Details	Feature
u0	S		
0	0	SMOPA (2-way)	FEAT_SME2
0	1	SMOPS (2-way)	FEAT_SME2
1	0	UMOPA (2-way)	FEAT_SME2
1	1	UMOPS (2-way)	FEAT_SME2

SME Int8 outer product

The encodings in this section are decoded from SME Integer Outer Product - 32 bit.

Decode fields			Instruction Details	Feature
u0	u1	S		
0	0	0	SMOPA (4-way)	FEAT_SME
0	0	1	SMOPS (4-way)	FEAT_SME
0	1	0	SUMOPA (4-way)	FEAT_SME
0	1	1	SUMOPS	FEAT_SME
1	0	0	USMOPA (4-way)	FEAT_SME
1	0	1	USMOPS	FEAT_SME
1	1	0	UMOPA (4-way)	FEAT_SME
1	1	1	UMOPS (4-way)	FEAT_SME

SME2 Quarter Tile Outer Product - 64-bit

The encodings in this section are decoded from SME encodings.

Decode fields			Instruction details
op0	op1	op2	
0	0	0	SME2 FP64 non-widening quarter tile outer product
0	0	1	UNALLOCATED
0	1		UNALLOCATED
1			SME2 Int16 to Int64 quarter tile outer product

SME2 FP64 non-widening quarter tile outer product

The encodings in this section are decoded from SME2 Quarter Tile Outer Product - 64-bit.

Decode fields			Instruction Details	Feature
M	N	S		
0	0	0	FMOP4A (non-widening) — Double-precision, single vectors	FEAT_SME_MOP4 && FEAT_SME_F64F64
0	0	1	FMOP4S (non-widening) — Double-precision, single vectors	FEAT_SME_MOP4 && FEAT_SME_F64F64
0	1	0	FMOP4A (non-widening) — Double-precision, multiple and single vectors	FEAT_SME_MOP4 && FEAT_SME_F64F64
0	1	1	FMOP4S (non-widening) — Double-precision, multiple and single vectors	FEAT_SME_MOP4 && FEAT_SME_F64F64
1	0	0	FMOP4A (non-widening) — Double-precision, single and multiple vectors	FEAT_SME_MOP4 && FEAT_SME_F64F64
1	0	1	FMOP4S (non-widening) — Double-precision, single and multiple vectors	FEAT_SME_MOP4 && FEAT_SME_F64F64
1	1	0	FMOP4A (non-widening) — Double-precision, multiple vectors	FEAT_SME_MOP4 && FEAT_SME_F64F64
1	1	1	FMOP4S (non-widening) — Double-precision, multiple vectors	FEAT_SME_MOP4 && FEAT_SME_F64F64

SME2 Int16 to Int64 quarter tile outer product

The encodings in this section are decoded from SME2 Quarter Tile Outer Product - 64-bit.

Decode fields					Instruction Details	Feature
u0	u1	M	N	S		
0	0	0	0	0	SMOP4A (4-way) — 64-bit, single vectors	FEAT_SME_MOP4 && FEAT_SME_I16I64

1	1	1	UMOPS (4-way)	FEAT_SME_I16I64

SME zero array

The encodings in this section are decoded from SME encodings.

Decode fields op0	Instruction details	Feature
0000000000	ZERO (tiles)	FEAT_SME
!= 0000000000	UNALLOCATED	-

SME2 Multiple Zero

The encodings in this section are decoded from SME encodings.

Decode fields op0	Instruction details
0000000000	SME multiple vectors zero array
!= 0000000000	UNALLOCATED

SME multiple vectors zero array

The encodings in this section are decoded from SME2 Multiple Zero.

Decode fields		Instruction Details	Feature
opc	opc2		
x1x	1xx	UNALLOCATED	-
000		ZERO (single-vector) — Two ZA single-vectors	FEAT_SME2p1
001		ZERO (double-vector) — One ZA double-vector	FEAT_SME2p1
010	0xx	ZERO (double-vector) — Two ZA double-vectors	FEAT_SME2p1
011	0xx	ZERO (double-vector) — Four ZA double-vectors	FEAT_SME2p1
100		ZERO (single-vector) — Four ZA single-vectors	FEAT_SME2p1
101	0xx	ZERO (quad-vector) — One ZA quad-vector	FEAT_SME2p1
101	1xx	UNALLOCATED	-
11x	01x	UNALLOCATED	-
110	00x	ZERO (quad-vector) — Two ZA quad-vectors	FEAT_SME2p1
111	00x	ZERO (quad-vector) — Four ZA quad-vectors	FEAT_SME2p1

SME2 zero lookup table

The encodings in this section are decoded from SME encodings.

Decode fields		Instruction Details	Feature
op0	opc		
00000000000000	0001	ZERO (table)	FEAT_SME2
00000000000000	!= 0001	UNALLOCATED	-
!= 00000000000000		UNALLOCATED	-

SME2 Move Lookup Table

The encodings in this section are decoded from SME encodings.

Decode fields			Instruction details
op0	op1	op2	
0	00		SME2 move from lookup table
0	10		UNALLOCATED
1	00		SME2 move into lookup table
1	10	0	SME2 move vector to lookup table
1	10	1	UNALLOCATED
	x1		UNALLOCATED

SME2 move from lookup table

The encodings in this section are decoded from SME2 Move Lookup Table.

Decode fields	Instruction Details	Feature
opc		
0011111	MOVT (table to scalar)	FEAT_SME2
!= 0011111	UNALLOCATED	-

SME2 move into lookup table

The encodings in this section are decoded from SME2 Move Lookup Table.

Decode fields opc	Instruction Details	Feature
0011111	MOVT (scalar to table)	FEAT_SME2
!= 0011111	UNALLOCATED	-

SME2 move vector to lookup table

The encodings in this section are decoded from SME2 Move Lookup Table.

Decode fields opc	Instruction Details	Feature
0011111	MOVT (vector to table)	FEAT_SME_LUTv2
!= 0011111	UNALLOCATED	-

SME2 Expand Lookup Table (Non-contiguous)

The encodings in this section are decoded from SME encodings.

Decode fields op0	op1	op4	op2	op3	Instruction details

SVE Integer Multiply-Add - Predicated

The encodings in this section are decoded from SVE encodings.

Decode fields op0	Instruction details
0	SVE integer multiply-accumulate writing addend (predicated)
1	SVE integer multiply-add writing multiplicand (predicated)

SVE integer multiply-accumulate writing addend (predicated)

The encodings in this section are decoded from SVE Integer Multiply-Add - Predicated.

Decode fields op	Instruction Details	Feature
0	MLA (vectors)	FEAT_SVE || FEAT_SME
1	MLS (vectors)	FEAT_SVE || FEAT_SME

SVE integer multiply-add writing multiplicand (predicated)

The encodings in this section are decoded from SVE Integer Multiply-Add - Predicated.

Decode fields op	Instruction Details	Feature
0	MAD	FEAT_SVE || FEAT_SME
1	MSB	FEAT_SVE || FEAT_SME

SVE Bitwise Logical - Unpredicated

The encodings in this section are decoded from SVE encodings.

Decode fields op0	Instruction details	Feature
0xx	UNALLOCATED	-
100	SVE bitwise logical operations (unpredicated)	-
101	XAR	FEAT_SVE2 || FEAT_SME
11x	SVE2 bitwise ternary operations	-

SVE bitwise logical operations (unpredicated)

The encodings in this section are decoded from SVE Bitwise Logical - Unpredicated.

Decode fields opc	Instruction Details	Feature
00	AND (vectors, unpredicated)	FEAT_SVE || FEAT_SME
01	ORR (vectors, unpredicated)	FEAT_SVE || FEAT_SME
10	EOR (vectors, unpredicated)	FEAT_SVE || FEAT_SME
11	BIC (vectors, unpredicated)	FEAT_SVE || FEAT_SME

SVE2 bitwise ternary operations

The encodings in this section are decoded from SVE Bitwise Logical - Unpredicated.

Decode fields opc	o2	Instruction Details	Feature
00	0	EOR3	FEAT_SVE2 || FEAT_SME
00	1	BSL	FEAT_SVE2 || FEAT_SME
01	0	BCAX	FEAT_SVE2 || FEAT_SME
01	1	BSL1N	FEAT_SVE2 || FEAT_SME
1x	0	UNALLOCATED	-
10	1	BSL2N	FEAT_SVE2 || FEAT_SME
11	1	NBSL	FEAT_SVE2 || FEAT_SME

SVE Index Generation

The encodings in this section are decoded from SVE encodings.

Decode fields op0	Instruction details	Feature
00	INDEX (immediates)	FEAT_SVE || FEAT_SME
01	INDEX (scalar, immediate)	FEAT_SVE || FEAT_SME
10	INDEX (immediate, scalar)	FEAT_SVE || FEAT_SME
11	INDEX (scalars)	FEAT_SVE || FEAT_SME

SVE Stack Allocation

The encodings in this section are decoded from SVE encodings.

Decode fields op0	op1	Instruction details
0	0	SVE stack frame adjustment
0	1	Streaming SVE stack frame adjustment
1	0	SVE stack frame size
1	1	Streaming SVE stack frame size

SVE stack frame adjustment

The encodings in this section are decoded from SVE Stack Allocation.

Decode fields op	Instruction Details	Feature
0	ADDVL	FEAT_SVE || FEAT_SME
1	ADDPL	FEAT_SVE || FEAT_SME

Streaming SVE stack frame adjustment

The encodings in this section are decoded from SVE Stack Allocation.

Decode fields op	Instruction Details	Feature
0	ADDSVL	FEAT_SME
1	ADDSPL	FEAT_SME

SVE stack frame size

The encodings in this section are decoded from SVE Stack Allocation.

Decode fields op	Decode fields opc2	Instruction Details	Feature
0	11111	RDVL	FEAT_SVE || FEAT_SME
0	!= 11111	UNALLOCATED	-
1		UNALLOCATED	-

Streaming SVE stack frame size

The encodings in this section are decoded from SVE Stack Allocation.

Decode fields op	Decode fields opc2	Instruction Details	Feature
0	11111	RDSVL	FEAT_SME
0	!= 11111	UNALLOCATED	-
1		UNALLOCATED	-

SVE2 Integer Arithmetic - Unpredicated

The encodings in this section are decoded from SVE encodings.

Decode fields op0	Instruction details	Feature
0xx	SVE2 integer multiply vectors (unpredicated)	-
10x	SVE2 signed saturating doubling multiply high (unpredicated)	-
110	ADDQP	FEAT_SVE2p3 || FEAT_SME2p3
111	ADDSUBP	FEAT_SVE2p3 || FEAT_SME2p3

SVE2 integer multiply vectors (unpredicated)

The encodings in this section are decoded from SVE2 Integer Arithmetic - Unpredicated.

Decode fields		Instruction Details	Feature
size	opc		
	00	MUL (vectors, unpredicated)	FEAT_SVE2 || FEAT_SME
	10	SMULH (unpredicated)	FEAT_SVE2 || FEAT_SME

SVE mixed sign dot product

The encodings in this section are decoded from SVE Integer Multiply-Add - Unpredicated.

Decode fields size	Instruction Details	Feature
10	USDOT (vectors)	(FEAT_SVE && FEAT_I8MM) || (FEAT_SME && FEAT_I8MM)
!= 10	UNALLOCATED	-

SVE2 Integer - Predicated

The encodings in this section are decoded from SVE encodings.

Decode fields op0	op1	Instruction details
0010	1	SVE2 integer pairwise add and accumulate long
0011	1	UNALLOCATED
011x	1	UNALLOCATED
0x0x	1	SVE2 integer unary operations (predicated)
0xxx	0	SVE2 saturating/rounding bitwise shift left (predicated)
10xx	0	SVE2 integer halving add/subtract (predicated)
10xx	1	SVE2 integer pairwise arithmetic
11xx	0	SVE2 saturating add/subtract
11xx	1	UNALLOCATED

SVE2 integer pairwise add and accumulate long

The encodings in this section are decoded from SVE2 Integer - Predicated.

Decode fields U	Instruction Details	Feature
0	SADALP	FEAT_SVE2 || FEAT_SME
1	UADALP	FEAT_SVE2 || FEAT_SME

SVE2 integer unary operations (predicated)

The encodings in this section are decoded from SVE2 Integer - Predicated.

Decode fields			Instruction Details	Feature
Q	Z	op		
0	0	0	URECPE — Merging	FEAT_SVE2 || FEAT_SME
0	0	1	URSQRTE — Merging	FEAT_SVE2 || FEAT_SME
0	1	0	URECPE — Zeroing	FEAT_SVE2p2 || FEAT_SME2p2
0	1	1	URSQRTE — Zeroing	FEAT_SVE2p2 || FEAT_SME2p2

// Hint_Prefetch()
// ===============
// Signals the memory system that memory accesses of type HINT to or from the specified address are
// likely in the near future. The memory system may take some action to speed up the memory
// accesses when they do occur, such as pre-loading the specified address into one or more
// caches as indicated by the innermost cache level target (0=L1, 1=L2, etc) and non-temporal hint
// stream. Any or all prefetch hints may be treated as a NOP. A prefetch hint must not cause a
// synchronous abort due to Alignment or Translation faults and the like. Its only effect on
// software-visible state should be on caches and TLBs associated with address, which must be
// accessible by reads, writes or execution, as defined in the translation regime of the current
// Exception level. It is guaranteed not to access Device memory.
// A Prefetch_EXEC hint must not result in an access that could not be performed by a speculative
// instruction fetch, therefore if all associated MMUs are disabled, then it cannot access any
// memory location that cannot be accessed by instruction fetches.
